The injectors were also removed from the unit to allow for a boroscope and inspection of the cylinders and piston tops for carbon buildup as well. Upon inspection it was noted that carbon deposits were evident on both the bottom of the cylinder heads around the valve faces as well as on the top of the pistons, but again no a surprise knowing the fact of the turbo oil seal issues, and as on the inside of the heads, evidence of carbon breaking off can be seen in the photographs. Disassembly of the engine and cleaning of the related components which are seen to have carbon build up, would most likely extend the life expectancy of those parts, but the unit would possibly make it to the next overhaul interval without major issues, assuming that the oil consumption issue is alleviated with the turbo repair.

The issue of varying cylinder temperatures between cylinders may be more than one issue. It would be in my opinion that the quality of fuel has nothing to do with the issue, but rather issues with the possible wrong turbo group installed, causing less than normal boost pressures as well as some slight wear in the linkages which can cause a variation in cylinder temperatures. The unit can be tuned to match up cylinder temperatures by adjusting the individual synchronization for each injector, therefore ensuring all cylinders run at the same temps, as long as the pyrometer for each cylinder is accurate, and only small adjustments are made to make up for small amounts of linkage wear. Once the linkage is worn past spec it still requires replacement. The injectors did have a small amount of carbon on them, but it was easily wiped off with a cloth, and from previous experience is found on units idling down with cool intake temps, causing a slight incomplete burn, but usually is burnt off when loaded up. When the injectors were reinstalled into the unit, the original timing spec of 117.8mm was used just for trial purposes to see if a slightly advanced timing will help the cylinder temps come closer together, valve lash, bridge adjustments and rack synchronization were also performed at this time.

The group number of the turbo charger, 7E9669, was noted during removal of the turbo, and when checked against the original turbo group number which updated to 7E9668, was found to be the incorrect group for this application, according to a response from the TC department. The 7E9669 turbo group is found used on a 1000rpm marine application, where as the 7E9668, is used in the 900rpm EPG application. After a quick look at a parts consist of both groups, the only difference appeared to be the nozzles used between them, which could explain the issues the customer is having with turbo stall and as stated earlier, may have an effect on cylinder temperatures due to different boost pressures, and although the TC department suggests that the boost pressures would be higher with the 7E9669 turbo, without running the unit to confirm, this would just be speculation.

As far as the issue with the oil seals leaking on the turbo, there were some concerns that the orifice in the oil block for the turbo oil feed line may be too large for the turbo, but I would have to question that, as the oil block is the same one from the original installation, and the unit does have 135000hrs, and also there appeared to be no issue before the turbo was installed. The prelube pressure cutout switch was also checked to ensure the pressure was within spec, and upon testing the switch with a regulator and air pressure to slowly raise the pressure, as well as with the prelube pump and a gauge at the turbo feed block, both instances produced after several tests, the same pressure of 19KPA, which is well within spec. The reason for the seals failing is still undetermined at this time, and it may be that the turbo had faulty seals to begin with, or from thermal shock from cold intake air temperatures, or it could have been from a build up of carbon deposits on the turbine wheel causing an imbalance from excessive oil consumption from the break in period, since this unit has no turbo wash system, but that is just speculation.

The intake piping was inspected for signs of soot intake, but no evidence was found. The soot may be caused by the centrifugal force of the turbo compressor wheel spinning, and just like a centrifuge, only the soot is left. It is in my opinion that this should correct itself after the turbo repairs. The intake piping also has a manual adjusting door to allow the customer to blend the intake air during cold outside ambient air temps which may also explain some of the soot due to small exhaust leaks on other units, although functional, it does seem small to allow for the proper amount of air flow to maintain a warmer air intake temperature, but again age of the system proves that although it could be improved upon, there has not been issues with the system in the past.

Coolant leaks with the unit due to the cylinder block repairs performed during the overhaul are being addressed and a solution is forthcoming. Other small leaks that appear to be from seals and connections, in my experience are typical with the use of extended life coolant in older units, and especially if the unit does not run continuously. Once the unit is able to run more consistently, the issues should be less evident over time.

It is in my opinion that while the facility has been there for some time now that improvements to the air flow through the building should be looked at. I would suggest improving the cooling air flow through the generators to allow for decreased temperatures in the building as well as within the generators. Air flow through a generator is from rear to the flywheel, airflow through the building is across the building from unit 1 to unit 6, depending on the units online, the air flow past unit 6 is substantially higher than that of unit 1. Exhaust fans on the long wall in front of the engines as well as the addition of cold air intakes across the long wall behind the units would definitely increase cooling efficiency of the building, but placement may be an issue due to existing equipment. It would bring down winding and bearing temperatures in the warm months, as well as allow more air in the building in the colder months to blend with, also decreasing the premature wear of components due to heat. It would also be a suggestion to install a newer style drain on the 3500 series units to allow for better extraction of waste oil from the crankcase, leaving less residual oil during oil changes, as well as it may also be beneficial to look into installing a oil make up system with flow counters on each unit to track oil consumptions more accurately. Also the installation of an auto blending air intake system for the 3606 would reduce turbo surge during cold weather and assist with recycling of the air within the building, but again these are just suggestions.

When reviewing this report, please refer to the photographs taken with the digital boroscope as well as a digital camera. All photographs are labeled to assist with identification of components.

Brian Brent
Field Service Technician
Finning (Canada)

2007

Sep	121712 hrs	Major overhaul

2008

May 20	122726 hrs	#4 cylinder, injector repair
Jul 02	123572 hrs	#3 cylinder, injector repair
Oct 22	126150 hrs	oil leak at intake side of turbo, report to Finning

2009

Mar 28	128130 hrs	unit shutdown by operators due to metal on metal noise and high crankcase pressures
Apr 11		Finning on site inspection found that the turbo was rubbing on the housing, on the cold side, and that there was play in the shaft. Turbo was sent out for repair.
Apr 16		Finning installing a brand new turbo
Apr 21	128252 hrs	#1 cylinder, injector repair
Apr 27	128390 hrs	block repairs due to excessive glycol leak when shutdown
Jul 15	129746 hrs	Finning in for tune-up and to investigate exhaust side of turbo and high temp readings on cylinder #1 and stack
Oct 06	131583 hrs	repair coolant leak at turbo
Oct 27	132077 hrs	#6 cylinder, injector repair
Dec 13		noted that turbo was stalling, air intake mix was adjusted
Dec 23	133436 hrs	#5 cylinder, injector repair

2010

Jan 09	133844 hrs	Finning in for tune-up and turbo inspection due to issue with turbo stall. No definitive answer to cause.
Mar 01	134940 hrs	Turbo issues result in unit being out of service. Finning inspect #2 and #3 cylinder for low compression, #2 cylinder and injector repair, turbo removed and sent to OEM.
May 20	135252 hrs	#4 cylinder, injector repair
Jun 03		oil leak at intake side of turbo. Finning notified
Jun 08		presence of oil in airbox confirmed. Unit shutdown as this is a continuation of major issue with turbo.
Jul 05		Brian Brent (Finning Power Systems) was in the plant inspecting and testing Unit #4
Jul 07		turbo removed and eventually sent to Whitehorse to determine cause of oil leak and repair.
Aug 09		turbo re installed, however oil leaking resumed.
Aug 13		turbo removed and sent to ABB for independent testing and evaluation.
Oct 22		turbo re installed, Finning ran tests on it over 7 day period. Test showed operating parameters to be normal. Turbo still leaking, result is questionable reliability of unit.

List of Forced Projects 2008 to 2012

Project Name	Project Categoy	Appropriation Type	2008	2009	2010	2011	2012

Test and Treat Pole Program	A	Distribution Improvements	$ 72,000		$ 57,000		$ 153,000	$ 110,000	$ 120,000	$ 130,000
Tagish Bridge Conduit Replacement	A	Distribution Improvements	$ 60,000							
Echo Lake Road Upgrade	A	Distribution Improvements	$ 52,000	$ 75,000						
McIntyre Subdivision 34.5kV Upgrade	A	Distribution Improvements	$ 47,000							
Morley Bay Line Upgrade	A	Distribution Improvements	$ 46,000							
Birch Alley Upgrade	A	Distribution Improvements	$ 45,000	$ 32,000						
Campbell Highway Relocation	A	Distribution Improvements	$ 43,000							
Carmacks Upper Bench Rerouting	A	Distribution Improvements	$ 31,000							
Paddlewheel Line Relocation	A	Distribution Improvements	$ 30,000							
Carmacks Planned Pole Replacements	A	Distribution Improvements	$ 28,000							
Porter Creek Regulator Upgrade	A	Distribution Improvements	$ 26,000							
Beaver Creek Planned Pole Replacements	A	Distribution Improvements	$ 25,000							
North Star Clearance Upgrade	A	Distribution Improvements	$ 24,000							
McDonald Road to Centennial Road Upgrade	A	Distribution Improvements	$ 23,000	$ 24,000						
McIntyre Creek Pumphouse Upgrade	A	Distribution Improvements	$ 23,000							
Arkell Subdivision Upgrade	A	Distribution Improvements	$ 21,000	$ 197,000						
Marwell Subdivision Improvements	A	Distribution Improvements	$ 21,000							
Wickstrom Road Line Relocation for Whitehorse General Hospital Residence and Medical Building	A	Distribution Improvements		$ 83,000						
Liard River Crossing	A	Distribution Improvements		$ 29,000						
System Upgrade on Hotsprings River Road	A	Distribution Improvements		$ 22,000						
Teslin and Klondike Road Upgrade	A	Distribution Improvements		$ 20,000	$ 30,000					
Watson Lake Hotel Upgrade	A	Distribution Improvements		$ 20,000						
Whistlebend 34.5kV Substation Distribution Lines	A	Distribution Improvements			$ 492,000	$ 156,000				
Takhini North Upgrade	A	Distribution Improvements			$ 134,000					
Watson Lake 3-Phase System Protection Upgrade	A	Distribution Improvements			$ 100,000					
Main Steel Alley 4th - 7th Avenue Upgrade	A	Distribution Improvements			$ 98,000					
Old Crow Pole Change Outs	A	Distribution Improvements			$ 46,000					
Main Street Alley Upgrade	A	Distribution Improvements			$ 44,000					
Nordenskiold River Bridge Rerouting	A	Distribution Improvements			$ 42,000					
Mount Sima Subdivision	A	Distribution Improvements			$ 42,000					
Destruction Bay Main Feeder	A	Distribution Improvements			$ 42,000					
North Klondike Grounding Improvements	A	Distribution Improvements			$ 42,000					
4L316 Two Mile Hill Conductor Upgrade	A	Distribution Improvements			$ 38,000					
Pole Removal Wickstrom Road	A	Distribution Improvements			$ 25,000					
McIntyre Subdivision Prebuilding Work	A	Distribution Improvements			$ 22,000					
Whistle Bend Substation	A	Distribution Improvements				$ 1,690,000	$ 423,000			
System Upgrade, Extension of 5L628 to Grizzly Valley	A	Distribution Improvements				$ 454,000				
5L626 Double Circuit Line to Whistle Bend Substation	A	Distribution Improvements				$ 200,000				
Hotsprings Road Upgrade	A	Distribution Improvements				$ 190,000				
Upgrade Laberge Substation Transformer to 10 MVA	A	Distribution Improvements				$ 189,000				
Whistle Bend Substation Transformer	A	Distribution Improvements				$ 127,000				
Line Upgrade and Relocation Army Beach	A	Distribution Improvements				$ 92,000				
Line Upgrade and Relocation Lot 56 Paint Mountain	A	Distribution Improvements				$ 69,000				
System Upgrade 113 Copper Road	A	Distribution Improvements				$ 53,000				
Line Relocation Eagle Way	A	Distribution Improvements				$ 30,000				
Carcross Town Pole Replacements	A	Distribution Improvements				$ 27,000				
Configure Pelly Substation to Yukon Interconnected System	A	Distribution Improvements				$ 23,000				
Centennial Street Upgrades	A	Distribution Improvements				$ 20,000				
5L628 Crestview to Mayo Road Corner Double Circuit	A	Distribution Improvements					$ 628,000			
Shipyard's Substation Transformer Failure and Upgrades	A	Distribution Improvements					$ 473,000			
Laberge Substation 34.5kV Conductor Upgrade	A	Distribution Improvements					$ 103,000			
Whitehorse Elementary School Transformer Upgrade	A	Distribution Improvements					$ 94,000			
97 Lewes Boulevard Transformer Upgrade	A	Distribution Improvements					$ 70,000			
Laberge Substation Upgrade	A	Distribution Improvements					$ 57,000			
Range Road Line Rerouting	A	Distribution Improvements					$ 56,000			
Ponderosa Road Vault Addition and Service Upgrade	A	Distribution Improvements					$ 35,000			
Whitehorse Service Area Line Clearance Upgrades	A	Distribution Improvements					$ 25,000			
Marsh Lake Structure Upgrade	A	Distribution Improvements					$ 21,000			
System Improvements Lowe Street	A	Distribution Improvements					$ 21,000			
McIntyre Subdivision Replacement Stage 1	A	Distribution Improvements						$ 475,000	$ 250,000	
Downtown Whitehorse 4L313 Labert Street to Elliot Street - Replace with Underground Lines	A	Distribution Improvements						$ 424,000		
Hotsprings Road Main Line Relocation and Upgrade	A	Distribution Improvements						$ 325,000		
Tagish 5L600 Rebuild	A	Distribution Improvements						$ 300,000		$ 276,000

The Yukon Electrical Company Limited
Distribution Improvement Project Listing By Priority 2008-2015

Project Name	Priority	Appropriation Type	2008	2009	2010	2011	2012	2013	2014	2015
Crestview to Mayo Road 5L628 Upgrade to 266 MCM	A	Distribution Improvements						$ 250,000		
Old Alaska Highway Bypass	A	Distribution Improvements						$ 248,000		
Jack Hulland School Upgrades	A	Distribution Improvements						$ 100,000		
Carmacks North Main Line Rebuild	A	Distribution Improvements						$ 100,000		
Whitehorse Area Line Clearance Upgrades	A	Distribution Improvements						$ 65,000	$ 70,000	
Teslin Area Pole Upgrades	A	Distribution Improvements						$ 53,000		
Teslin Sawmill Road Upgrade for New Subdivision	A	Distribution Improvements						$ 38,000		
Lot 1037 Range Road Line Upgrade	A	Distribution Improvements						$ 34,000		
Whitehorse Safety Code Corrections	A	Distribution Improvements						$ 30,000		
Whitehorse 5L628 and New 34.5kV Build	A	Distribution Improvements							$ 1,890,000	
Downtown Whitehorse 25kV Conversion	A	Distribution Improvements							$ 450,000	$ 450,000
Takhini/Marwell 4L315 Upgrade to 266 ACSR	A	Distribution Improvements							$ 250,000	$ 350,000
Marwell Lot 14 Transformer Upgrade	A	Distribution Improvements							$ 100,000	
Riverdale Lewes Substation 25kV Transformer	A	Distribution Improvements							$ 100,000	
Whitehorse Hotsprings Road 3 Phase Conversion	A	Distribution Improvements								$ 363,000
MacDonald Road Pole Change	A	Distribution Improvements								$ 250,000
Riverdale Line 4L317 Tagish Road	A	Distribution Improvements								$ 250,000
Watson Lake Underground Subdivision Replacement	A	Distribution Improvements								$ 100,000
Grey Mountain 4L320 Tie Upgrade	A	Distribution Improvements								$ 65,000
Upgrade of S2278	A	Distribution Improvements								$ 45,000
Pelly Crescent to Grey Mountain H Frames	A	Distribution Improvements								
Carcross Relocate 34 kV Stage 2	A	Distribution Improvements								
Carmacks One Phase Line by Heli Pad on Highway	A	Distribution Improvements								
Tagish Section to Taku 2.5 km	A	Distribution Improvements								
Lambert Street - DQ Alley	A	Distribution Improvements								
Little Atlin Lake Area 3 Phase Pole Upgrades	B	Distribution Improvements	$ 60,000							
Convert Spirit Lake to 14.4kV	B	Distribution Improvements	$ 22,000							
Robinson Substation Upgrade	B	Distribution Improvements		$ 39,000						
Whitehorse Airport Conversion	B	Distribution Improvements		$ 29,000						
Porter Creek Breaker Replacement	B	Distribution Improvements			$ 54,000					
Destruction Bay Distribution Breaker Addition	B	Distribution Improvements			$ 54,000					
Haines Junction Distribution Breaker Addition	B	Distribution Improvements			$ 51,000					
System Frequency Upgrades at S150 Substation	B	Distribution Improvements			$ 39,000	$ 37,000				
Whitehorse Copper Rebuild	B	Distribution Improvements			$ 27,000					
Laberge Substation Distribution Upgrades	B	Distribution Improvements				$ 416,000				
PCB Identification and Transformer Change Outs	B	Distribution Improvements				$ 239,000	$ 401,000	$ 175,000	$ 100,000	$ 100,000
Regulator to North Klondike Highway	B	Distribution Improvements					$ 154,000			
Breaker Replacement in Services Substation	B	Distribution Improvements					$ 84,000			
Old Crow 3rd Distribution Breaker	B	Distribution Improvements					$ 78,000			
Marsh Lake Substation Upgrade	B	Distribution Improvements					$ 45,000			
CRE Breaker Replacement in Lewes Boulevard	B	Distribution Improvements					$ 30,000			
Ross River Recloser for S7580	B	Distribution Improvements					$ 30,000			
Porter Creek Underground Vaults Replacement	B	Distribution Improvements					$ 28,000			
Downtown Whitehorse 4L316 6th Avenue 266 Reconductor	B	Distribution Improvements						$ 250,000	$ 300,000	
Pelly Crossing Substation Fence	B	Distribution Improvements						$ 100,000		
Whitehorse Asset Management - Create a New Pole Database	B	Distribution Improvements						$ 75,000	$ 75,000	
Takhini/Marwell Completion of Mountain Air Subdivision	B	Distribution Improvements								$ 300,000
Lewes Lake Substation Conversion	B	Distribution Improvements								$ 146,000
Whitehorse Airport Hanger D Area Rebuild	B	Distribution Improvements								$ 140,000
Upper Liard - Replace Liard River Crossing	B	Distribution Improvements								$ 100,000
McLintock Substation Upgrade	B	Distribution Improvements								$ 90,000
Spirit Lake Substation Upgrade	B	Distribution Improvements								$ 88,000
Deep Creek Subdivision Connection to Whitehorse Distribution	B	Distribution Improvements								$ 60,000
Stewart Crossing West Town Conversion	B	Distribution Improvements								$ 60,000

The Yukon Electrical Company Limited
Actual 2008/2009 Capital Additions vs. 2008/2009 GRA Capital Forecast

Project Name	2008 GRA	2008 Actual	Variance	%	2009 GRA	2009 Actual	Variance	%	Variance Explanations (>10% Variance)
Haines Junction Plant Upgrades	91,500	100,000	(8,500)	-9.29%			-		
Pelly Crossing Tie into Transmission Grid	120,000	92,500	27,500	22.92%			-		Scope was adjusted after filing GRA.
Fish Lake Unit #1 Generator Rebuild	125,000	463,000	(338,000)	-270.40%			-		Original estimate was created from 3rd party shutdown and inspection of generator that recommended the generator needed to be cleaned and stator core work. When unit was removed from service and sent to generator shop, an indepth inspection found generator at end of life which required a complete rebuild of the unit.
Other 2008	677,500	56,000	621,500	91.73%			-		Other projects were forecasted based on historical capital costs and does not relate to one specific project.
Destruction Bay Compton Protection Relay Replacement and Battery Charg		65,000	(65,000)	-100.00%			-		This project was done in preparation for plc upgrade.
Watson Lake Generator Upgrades and Fresh Air Intakes		76,500	(76,500)	-100.00%			-		This project was completed to counter the new low sulphur diesel fuel which burned hotter and drier on the intake valves.
Destruction Bay Programmable Logic Controller Upgrade			-		77,000		77,000	100.00%	Project was deferred due to the delay in the first step of upgrading Compton protection relays.
Fish Lake Control Room Monitor Upgrade			-			52,000	(52,000)	-100.00%	These are monitors for the water levels at various location on the system. These monitors were required by YESAB in preparation of our long term licence application.
Fish Lake Incremental Purchase Power	69,000	-	-		69,000	69,000	(69,000)	-100.00%	Purchase power as directed by YUB
Fish Lake Unit # 1 Replacement Wheel			-			80,000	(80,000)	-100.00%	This is a partial payment for the replacement wheel for unit #1. This was not in previous budgets due to previously good reports on the wheel condition. When generator was rebuilt the wheel was inspected and it needed replacing.
Fish Lake Unit #2 New Wheel, Shaft and Bearing Pedestal			-		130,000	153,000	(23,000)	-17.69%	The cost of the new wheel and shaft were higher than budgeted.
Haines Junction Plant Controls Upgrade			-			324,000	(324,000)	-100.00%	Project was not budgeted as a part of the 2008/2009 GRA. During upgrade work in 2008, the plant foundation was sinking. A new concrete foundation was put in place. This required significant civil works, electrical and fuel system adjustments.
Old Crow Plant Expansion			-		100,000		100,000	100.00%	The project was deferred as scope changed as a result of inability to expand current facility.
Other 2009			-		590,000	69,000	521,000	88.31%	Other projects were forecasted based on historical capital costs and does not relate to one specific project.
Swift River Unit # 1 Replacement			-			32,000	(32,000)	-100.00%	Purchase of unit for 2010 installation. Purchased unit ahead of install for a contingency during winter months.
Fish Lake Weir in Ditch # 3 or Gate			-		150,000		150,000	100.00%	This project was deferred based on Dam Safety Report
Old Crow Design PLC Replacement			-		77,000		77,000	100.00%	The project was deferred as it was tied to expansion project.
	1,083,000	**853,000**	**161,000**	**14.87%**	**1,193,000**	**779,000**	**345,000**	**28.92%**	
CIS Billing System Conversion	1,008,000	1,035,000	(27,000)	-2.68%			-		
	1,008,000	**1,035,000**	**(27,000)**	**-2.68%**	**-**	**-**	**-**		
Land Rights	90,000	100,000	(10,000)	-11.11%	90,000	56,000	34,000	37.78%	Land rights are licences to secure right of way for power line and the small variance is due to additional licences required based on customer demand for power lines.
4th Ave and Strickland Condominiums	98,850	92,000	6,850	6.93%			-		
Little Atlin Feeder Tap	150,000	178,000	(28,000)	-18.67%			-		Customer driven project where the final construction costs came in higher than forecast due to difficulty in digging in the ground.
Miscellaneous New U/G Services	165,000	95,000	70,000	42.42%	219,615	36,000	183,615	83.61%	The forecast is based on historical actuals and known customer demand. The variance is due to changes in customer demand in the year.
Ta'an Kwach'an Council Subdivision - Klondike Highway N	168,590		168,590	100.00%		60,000	(60,000)		This project was deferred at customer's request from 2008 to 2009 and completed in 2010.
Stan McCowan Subdivision	214,925	126,000	88,925	41.37%			-		This project was customer driven and the actual scope of the subdivision was less than estimated when created GRA budget.
Yukon Government Whitehorse Copper Phase II	225,000	262,000	(37,000)	-16.44%			-		This project was customer driven and the actual scope of the subdivision was more than we estimated when created GRA budget.
Hamilton Boulevard Main Infrastructure Extension	300,000	266,000	34,000	11.33%		100,000	(100,000)	-100.00%	This project was customer driven and the actual scope of the subdivision was less than we estimated when created GRA budget.
New Customer Connection at Minto Crossing	350,000	40,000	310,000	88.57%			-		This project was customer driven and when we started this project in 2008 and did not complete the work until 2012 due to customer funding amd land issues.
Mountain Air Subdivision	382,160	317,000	65,160	17.05%			-		This project was customer driven and the actual scope of the subdivision was less than we estimated when created GRA budget.
Other 2008	996,475	79,000	917,475	92.07%			-		Other projects were forecasted based on historical capital costs and does not relate to one specific project.
Lot 10 Centennial Street		28,000	(28,000)	-100.00%			-		This project was customer driven and not known until after the 2008/2009 GRA was filed
Carcross Tagish First Nation Carcross Line Rerouting		32,000	(32,000)	-100.00%			-		This project was customer driven and not known until after the 2008/2009 GRA was filed
Whitehorse Cadet Camp Three Phase Service		40,000	(40,000)	-100.00%			-		This project was customer driven and not known until after the 2008/2009 GRA was filed
General Drafting and Mapping		46,000	(46,000)	-100.00%		75,000	(75,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Connection of Minto Landing into Yukon Interconnected System		47,000	(47,000)	-100.00%			-		This project was customer driven and not known until after the 2008/2009 GRA was filed
Lot 16 Marwell Subdivision		53,000	(53,000)	-100.00%			-		This project was customer driven and not known until after the 2008/2009 GRA was filed
Skookum Asphalt Plant		61,000	(61,000)	-100.00%			-		This project was customer driven and not known until after the 2008/2009 GRA was filed
Arkell Subdivision Infill		78,000	(78,000)	-100.00%	650,000	717,000	(67,000)	-10.31%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Miscellaneous O/H Services - Various Subdivisions		1,304,000	(1,304,000)	-100.00%	95,167	969,000	(873,833)	-918.21%	Miscellaneous other overhead extensions is made up of all the small new extensions that are majorily customer contributed. This was budgeted in Other Projects, but shown separately in the 2013-2015 GRA.
35 Unit Condominium Wann Road			-			53,000	(53,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Burns Road Lot Development			-			86,000	(86,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Champagne Aishihik First Nation Subdivision			-			36,000	(36,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
City of Whitehorse Public Safety Building			-			61,000	(61,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Lot 1095 Gentain Lane			-			41,000	(41,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
New Whitehorse Correctional Centre			-			90,000	(90,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Northwestel Communication Tower Hotsprings Road			-			27,000	(27,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed

The Yukon Electrical Company Limited
Actual 2008/2009 Capital Additions vs. 2008/2009 GRA Capital Forecast

Project Name	2008 GRA	2008 Actual	Variance	%	2009 GRA	2009 Actual	Variance	%	Variance Explanations (>10% Variance)
Other 2009			-		1,717,218	100,000	1,617,218	94.18%	Other projects were forecasted based on historical capital costs and does not relate to one specific project.
Selkirk First Nation Child Care Center			-			36,000	(36,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Takhini Lot 1371			-			33,000	(33,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Takhini North Infill			-			341,000	(341,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Teslin Seniors 8-Plex			-			40,000	(40,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed

Whistle Bend Subdivision Stage 1 & 2			-		190,000		190,000	100.00%	This project was deferred until the 2011 year due to developer demands
Whitehorse General Hospital Staff Residence			-			32,000	(32,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Whitehorse Lot 1097			-			46,000	(46,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Yukon Government Army Beach Sweage Lagoon			-			47,000	(47,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Yukon Government Carcross Water Front Place			-			35,000	(35,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Yukon Government Carmacks Sewer Treatment Plant			-			32,000	(32,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Yukon Government New Airport Parking Area			-			58,000	(58,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
Yukon Housing 8-Plex			-			88,000	(88,000)	-100.00%	This project was customer driven and not known until after the 2008/2009 GRA was filed
	3,141,000	**3,244,000**	**(103,000)**	**-3.28%**	**2,962,000**	**3,437,000**	**(475,000)**	**-16.04%**	
Cadet Camp Three Phase Service System Improvement	85,000	83,000	2,000	2.35%			-		
Right of Way Widening	110,000	268,000	(158,000)	-143.64%		240,000	(240,000)	-100.00%	In 2008, the scope increased on the basis of line patrols as Yukon Electrical focused on completing brushing of our mountain top distribution lines in Whitehorse and Stewart Crossing. In 2009, the right of way brushing program continued.
5L628 Squanga Road Rebuild	140,000	290,000	(150,000)	-107.14%			-		The original scope and estimate of the project was to rebuild the powerline in an overhead configuration. Due to location of existing water lines being different than original plan a new route was needed. Due to conficts with property lines, existing vegetation, water lines and the existing power line the new power line was built with underground infrastructure.
Connect Pelly Crossing into Yukon Interconnected Systen	140,000	435,000	(295,000)	-210.71%			-		The original scope and budget was to build infrastructur to connect to YEC substation. YEC did not build the substation as planned and temporarily energized the new 138kv line at 25 kv from Minto substation to supply Pelly Crossing from the YIS. Yukon Electrical built a mini substation that required site preperation including a ground grid, a regulator bank, metering equipment and temporary underground line to connect to YEC supply on the 138kV pole.
Miscellaneous Pole Replacements	146,500	92,000	54,500	37.20%	160,500	22,000	138,500	86.29%	Miscellaneous pole change outs depend upon the need to replace the poles in the system. Each year we budget certain amount and the need to change is driven by the test results that come from test & treat program and line patrols.
9L - Km 129 to Km 132 South Klondike Highway - Distribu	150,000	189,000	(39,000)	-26.00%			-		Project increase was due to terrain and access difficulties for this section of line.
Ketza Court Live Front Transformers Replacement	175,000	346,000	(171,000)	-97.71%			-		Original scope and estimate was for 2 transformers and underground cable. Increased scope to complete all 5 transformers in the complex and associated underground infrastructure.
9L Reliability Upgrade Squanga Lake Area	180,000	77,000	103,000	57.22%	180,000	51,000	129,000	71.67%	The project scope was significantly reduced as structure upgrades were possible in multiple locations without having to change pole. The existing pole and wire were able to be re used. This significantly cut the costs and time to complete work while successfully increasing reliability.
Tagish 5L600 Rebuild	180,000		180,000	100.00%			-		This project was deferred due to higher priority projects and adequate performance of feeder.
Pelly Crescent to Grey Mountain H Frames	200,000		200,000	100.00%			-		This project was deferred due to higher priority projects and adequate performance of feeder.
4L311 Upgrade Distribution Lines Between 1st and 6th Av	400,000	439,000	(39,000)	-9.75%			-		
Other 2008	1,060,500	291,000	769,500	72.56%			-		Other projects were forecasted based on historical capital costs and does not relate to one specific project.
Arkell Substation Upgrade		21,000	(21,000)	-100.00%		197,000	(197,000)	-100.00%	Distribution load growth was exceeding the existing 5MVA transformer. The transformer was replaced with a 10MVA and small upgrades were needed in the substation also.
Marwell Subdivision Improvements		21,000	(21,000)	-100.00%			-		Fixed clearance issues and leaning pole on quartz road crossing.
Convert Spirit Lake to 14.4kV		22,000	(22,000)	-100.00%			-		Design completed.
McDonald Road to Centennial Road Upgrade		23,000	(23,000)	-100.00%		24,000	(24,000)	-100.00%	This project addressed clearance concerns identified by system inspections.
McIntyre Creek Pumphouse Upgrade		23,000	(23,000)	-100.00%			-		Upgrade due to load and new requirements.
North Star Clearance Upgrade		24,000	(24,000)	-100.00%			-		Fixed clearance issue
Beaver Creek Planned Pole Replacements		25,000	(25,000)	-100.00%			-		This project was identified by system inspections.
Porter Creek Regulator Upgrade		26,000	(26,000)	-100.00%			-		Replaced a regulator
Carmacks Planned Pole Replacements		28,000	(28,000)	-100.00%			-		This project was identified by system inspections.
Paddlewheel Line Relocation		30,000	(30,000)	-100.00%			-		Forced project due to customer project in the area.
Carmacks Upper Bench Rerouting		31,000	(31,000)	-100.00%			-		This project was identified by system inspections.
Campbell Highway Relocation		43,000	(43,000)	-100.00%			-		Yukon Government highway widening required pole relocations.
Birch Alley Upgrade		45,000	(45,000)	-100.00%		32,000	(32,000)	-100.00%	This project was identified by system inspections.
Morley Bay Line Upgrade		46,000	(46,000)	-100.00%			-		Project upgraded a 1970 line for improved reliability and performance.
McIntyre Subdivision 34.5kV Upgrade		47,000	(47,000)	-100.00%			-		Project built new overhead powerline to bypass and remove failing underground system
Echo Lake Road Upgrade		52,000	(52,000)	-100.00%		75,000	(75,000)	-100.00%	This project was identified by system inspections.
Little Atlin Lake Area 3 Phase Pole Upgrades		60,000	(60,000)	-100.00%			-		This project was done at the same time as a new customer extension. YECL's upgrade was for reinforced infrastructure in preparation for future upgrade of line.
Tagish Bridge Conduit Replacement		60,000	(60,000)	-100.00%			-		This project was identified by system inspections. Old conduit system had separated exposing cable. New system is designed to flex not separate.
Test and Treat Pole Program		72,000	(72,000)	-100.00%			-		Originally included in the Other Projects budget.
Hillcrest Subdivision Conversion		93,000	(93,000)	-100.00%	250,000	152,000	98,000	39.20%	Project was designed and started to convert from 12kV to 25kV to off load the mountainview sub.
System Upgrades Lot 1378/79 Range Road		93,000	(93,000)	-100.00%	184,000		184,000	100.00%	Forced project due to customer project in the area.
Liard River Crossing			-			29,000	(29,000)	-100.00%	This project was identified by system inspections. The project is designed.
Other 2009			-		832,500	168,000	664,500	79.82%	Other projects were forecasted based on historical capital costs and does not relate to one specific project.

The Yukon Electrical Company Limited
Actual 2008/2009 Capital Additions vs. 2008/2009 GRA Capital Forecast

Project Name	2008 GRA	2008 Actual	Variance	%	2009 GRA	2009 Actual	Variance	%	Variance Explanations (>10% Variance)
Robinson Substation Upgrade			-			39,000	(39,000)	-100.00%	This project was identified by system inspections.
System Upgrade on Hotsprings River Road			-			22,000	(22,000)	-100.00%	Pole Relocation due to Yukon Government building sewer lift station in the area.
Teslin and Klondike Road Upgrade			-		200,000	20,000	180,000	90.00%	Project was started in 2009 and not completed until 2010.
Watson Lake Hotel Upgrade			-			20,000	(20,000)	-100.00%	Forced project due to customer project in the area.
Whitehorse Airport Conversion			-			29,000	(29,000)	-100.00%	Forced project due to customer project in the area.
Wickstrom Road Line Relocation for Whitehorse General Hospital Residence and Medical B			-			83,000	(83,000)	-100.00%	Forced project due to customer project in the area.
Carcross Relocate 34 kV Stage 2			-		150,000		150,000	100.00%	This project was deferred due to higher priority projects and adequate performance of feeder. Brushing was also completed in the area.
Carmacks One Phase Line by Heli Pad on Highway			-		75,000		75,000	100.00%	This project was deferred due to higher priority projects and adequate performance of feeder.
Tagish Section to Taku 2.5 km			-		200,000		200,000	100.00%	This project was deferred due to higher priority projects and adequate performance of feeder.
Lambert Street - DQ Alley			-		300,000		300,000	100.00%	This project was deferred due to higher priority projects and adequate performance of feeder.
	2,967,000	**3,395,000**	**(428,000)**	**-14.43%**	**2,532,000**	**1,203,000**	**1,329,000**	**52.49%**	
4th Ave and Strickland Condominiums	100,000	84,000	16,000	16.00%			-		This project was part of a customer driven distribution project. We upgraded the street lights when the trench was open. Cost savings due to co-ordination with the distribution project.
ALSEK/Highland Area	100,000		100,000	100.00%			-		This project was deferred due to higher priority jobs at the time.
Pine Street Light Replacement	106,000	25,000	81,000	76.42%			-		Design work and part of civil work were done in 2008. Due to the priority of other projects at the time, Yukon Electrical could not complete this project in 2008. Project was deferred.
Hamilton Boulevard Extension	200,000	435,000	(235,000)	-117.50%		41,000	(41,000)	-100.00%	A Yukon Government contributed project, scope was increased at customers request.
Carmacks High Pressure Sodium Light Upgrade		20,000	(20,000)	-100.00%			-		Project was completed as existing lights had failed.
Quartz Road Street Lights Relocation		21,000	(21,000)	-100.00%			-		Customer contributed and forced project for a sidewalk installation.
4th Ave & Strickland Light Upgrade		41,000	(41,000)	-100.00%			-		This was a customer driven project due to work in the area.
Foxhaven Street Lights Relocation		82,000	(82,000)	-100.00%			-		A customer driven light change that was fully contributed.
Whitehorse Copper Light Additions		131,000	(131,000)	-100.00%			-		A customer driven light change that was fully contributed.
Miscellaneous Street Light Replacements			-		230,000		230,000	100.00%	This was a budget based on small project historical actuals. The actual costs for this project are represented by the unbudgeted projects performed in 2009.
Other 2009			-		15,000	60,000	(45,000)	-300.00%	Other projects were forecasted based on historical capital costs and does not relate to one specific project.
Ta'an Kwach'an Council Subdivision			-			54,000	(54,000)	-100.00%	Customer driven fully contributed project that was part of the new Ta'an Kwachin subdivision on Mayo Road.
Takhini North Subdivision			-			86,000	(86,000)	-100.00%	Customer driven fully contributed project that was part of the new Takhini subdivision.
Yukon Government Ingram Subdivision Street Lights			-			113,000	(113,000)	-100.00%	Customer driven fully contributed project that was part of the new Ingram subdivision.
Mountainview/Other			-		250,000		250,000	100.00%	This project was deferred in part due to discussions with CoW of possible other improvements in area.
	506,000	**839,000**	**(333,000)**	**-65.81%**	**495,000**	**354,000**	**141,000**	**28.48%**

Reference: Street Lighting

Table 1 (Yukon Electrical Sales by Customer Class) on page 2-2 of the GRA document shows MWh for streetlights increasing from 3,598 in 2011 (actual) to 3,854 (predicted) in 2015. On GRA page 2-6, it explains that: "the energy forecast for street and private lighting is based on wattage and customer additions."

A total of $4,519,000 has been and will be spent on streetlights from 2009 to 2015 (2009: $354,000; 2010: $486,000; 2011: $1,045,000; 2012: $456,000; 2013: $420,000; 2014: $945,000; 2015: $813,000).

Request:

Please explain whether LED street lights were used for the completed new lighting installations. Why or why not?

Response:

LED street lights were not used for any street light installations for the years 2009 - 2012. Yukon Electrical has partnered with YEC in a joint pilot project study to determine the LED technology best suited for the Yukon. This pilot project is currently testing four different LED lights including a stock ATCO Electric 43W LED light. The pilot project study will be completed by the end of 2013. Yukon Electrical will fully consider the results of the LED light study for future installations of street lights.

Yukon Electrical believes that it is prudent to have thorough testing completed prior to installing LED lights in order to ensure that the LED lights perform to the standard for light intensity and lighting patterns for the Yukon.

YCS-YECL-1-2

Table 1 (Yukon Electrical Sales by Customer Class) on page 2-2 of the GRA document shows MWh for streetlights increasing from 3,598 in 2011 (actual) to 3,854 (predicted) in 2015. On GRA page 2-6, it explains that: "the energy forecast for street and private lighting is based on wattage and customer additions."

A total of $4,519,000 has been and will be spent on streetlights from 2009 to 2015 (2009: $354,000; 2010: $486,000; 2011: $1,045,000; 2012: $456,000; 2013: $420,000; 2014: $945,000; 2015: $813,000).

Request:

Please explain whether LED street lights will be used for the upcoming lighting installations. Why or why not?

Response:

The forecast included in Yukon Electrical's Application does not incorporate the installation of LED street lights in the test period. However, Yukon Electrical has partnered with YEC in a joint pilot project study to determine the LED technology best suited for the Yukon. This pilot project is currently testing four different LED lights, including the 43W LED light which is the standard LED light kept in stock by ATCO Electric. The pilot project study will be completed by the end of 2013.

Yukon Electrical believes that it is prudent to have thorough testing completed prior to installing LED lights in order to ensure that the LED lights perform to the standard for light intensity and lighting patterns for the Yukon.

YCS-YECL-1-3

Table 1 (Yukon Electrical Sales by Customer Class) on page 2-2 of the GRA document shows MWh for streetlights increasing from 3,598 in 2011 (actual) to 3,854 (predicted) in 2015. On GRA page 2-6, it explains that: "the energy forecast for street and private lighting is based on wattage and customer additions."

A total of $4,519,000 has been and will be spent on streetlights from 2009 to 2015 (2009: $354,000; 2010: $486,000; 2011: $1,045,000; 2012: $456,000; 2013: $420,000; 2014: $945,000; 2015: $813,000).

Request:

Please explain why there are no predicted reductions in energy use for street lighting when technology exists to significantly reduce electricity consumption in street lighting.

Response:

Yukon Electrical has partnered with Yukon Energy in a joint pilot project study to determine the best suited LED streetlight technology for the Yukon. This pilot project is currently testing four different LED lights including the selected brand and model of 43W LED light that ATCO Electric uses. The pilot project study is expected to be completed by the end of 2013.

To date Yukon Electrical has not installed any LED streetlights other than a select few for testing purposes. Yukon Electrical has determined that it is prudent to have thorough testing completed to ensure the LED lights perform to standard light intensities and lighting patterns for the Yukon. Therefore, Yukon Electrical has not incorporated any LED streetlight conversions in the sales forecast. As a result, the wattage and average use per light is constant. Therefore, there are no predicted reductions in energy use for street lighting.

YCS-YECL-1-4

Reference: Street Lighting

Table 1 (Yukon Electrical Sales by Customer Class) on page 2-2 of the GRA document shows MWh for streetlights increasing from 3,598 in 2011 (actual) to 3,854 (predicted) in 2015. On GRA page 2-6, it explains that: "the energy forecast for street and private lighting is based on wattage and customer additions."

A total of $4,519,000 has been and will be spent on streetlights from 2009 to 2015 (2009: $354,000; 2010: $486,000; 2011: $1,045,000; 2012: $456,000; 2013: $420,000; 2014: $945,000; 2015: $813,000).

Request:

Please provide any reporting or results from any LED streetlight pilot programs undertaken by the utility (as in, results showing the cost difference in LED street lights versus HPS lights, how much electricity is saved, what is the payback time, what is the lighting effectiveness, what are potential issues, do LEDs meet highway lighting standards, etc).

Response:

Although ATCO Electric has a stock item 43W LED light to replace 100W street lights, Yukon Electrical has partnered with YEC in a joint pilot project study to determine the LED street light technology best suited for the Yukon. This pilot project is currently testing four different LED lights, including the selected ATCO Electric 43W LED light. The pilot project study will be completed by the end of 2013.

In addition to the pilot project study, Yukon Electrical has discussed with ATCO Electric the benefits and performance of this light in ATCO Electric's northern Alberta communities. To date, Yukon Electrical has not installed LED streetlights other than a select few for testing purposes. Yukon Electrical believes that it is prudent to have thorough testing completed prior to installing LED lights in order to ensure that the LED lights perform to the standard for light intensity and lighting patterns for the Yukon.

YCS-YECL-1-5

Reference: Street Lighting

Table 1 (Yukon Electrical Sales by Customer Class) on page 2-2 of the GRA document shows MWh for streetlights increasing from 3,598 in 2011 (actual) to 3,854 (predicted) in 2015. On GRA page 2-6, it explains that: "the energy forecast for street and private lighting is based on wattage and customer additions."

A total of $4,519,000 has been and will be spent on streetlights from 2009 to 2015 (2009: $354,000; 2010: $486,000; 2011: $1,045,000; 2012: $456,000; 2013: $420,000; 2014: $945,000; 2015: $813,000).

Request:

Please explain how street lighting fits or doesn't fit into the DSM Plan and its overall goal for reducing energy consumption and increasing efficiency for lighting.

Response:

A joint study by Yukon Electrical and Yukon Energy is underway to determine the technology that will be best suited for the Yukon, with a report of the results expected to be delivered by the end of 2013. The results of this technology evaluation work will be utilized separately from the DSM plan to outline a proposed approach for rate design approval by the YUB that addresses the higher capital cost of LED streetlights and the reduced electricity consumption cost.

YCS-YECL-2-1

Reference: Watson Lake Bi-Fuel Project

"Phase 1 of the project (2013) involves the modification of Watson Lake power plant generation unit #5 to a bi-fuel system, which allows the unit to run on a combination of diesel and natural gas. The purpose of this phase is to verify that NG injection into the engine provides reliable electricity generation for a utility power system along with the environmental benefit to reduce emissions."

Request:

Please provide peer-reviewed reference documentation and describe the basis of YECL's assumption and claims that burning LNG with diesel rather NG injection into the engine will result in an environmental benefit.

Response:

By chemical composition, natural gas is known to result in fewer environmental emissions than diesel.

For the purposes of clarification, liquefied natural gas (LNG) is non-combustible until it is vaporized back to natural gas.

The primary driver for the Watson Lake Bi-Fuel project is to provide local emissions reductions. It is predicted that there will be a reduction in CO_2, particulate matter (PM) emissions, important to people with compromised lung function, and NOx and SOx, contributing to smog and acid rain.

A bi-fuel system can have different characteristics than a unit which uses 100% natural gas or 100% diesel. In December 2012, SENES (please refer to YCS-YECL-2-1 Attachment 1 for *Literature Review: Air Contaminant Emissions from Dual-Fuelled and Conventional Diesel Generator Operations*) completed a literature study to summarize existing information on air contaminant emissions for bi-fuel systems and used this information to predict how previously modeled air emissions are affected by the proposed bi-fuel modification of one engine in the power plant. SENES concluded that emission levels for nitrogen oxide (NO_x), particulate matter (PM) or soot, and sulphur dioxides (SO_2) are expected to decrease, while emissions of unburned hydrocarbons (HC) and carbon monoxide (CO) are expected to increase. The increase

in CO, however, is expected to remain well below Yukon air quality standards. There are no Yukon standards that apply to the HC that are expected to be emitted; however, the actual quantities are expected to be low.

As emissions of CO_2, CO, NO_x and unburned HCs in the combustion products are engine specific, the details on emissions will not be fully understood until the project is in operation and emissions sampling is complete.

For additional information, please refer to YCS-YECL-2-7 and YUB-YECL-42(f).

1.0 INTRODUCTION

The Yukon Electrical Company Limited (YECL) is proposing to conduct a pilot-scale dual-fuelled power generation testing program at its current power generating station in Watson Lake, YK. The pilot-scale testing program will determine the feasibility of operating one of the diesel generators on a combination of diesel and natural gas. If the pilot scale program is successful, YECL will consider converting the remaining five units at the station to dual-fuelled operation.

YECL is proposing to use a ComAp Bi-Fuel™ system on a Cat 3508 700kW engine at the Watson Lake generating station. It should be noted that the term *Bi-Fuel* can be defined as the simultaneous combustion of two fuels. In the case of the Bi-Fuel System, natural gas is utilized in conjunction with diesel fuel to operate the engine. After conversion, the engine is able to operate on either 100% diesel fuel, or alternately, on a mixture of diesel fuel and natural gas (or other methane-based fuels). At no time would the engine be able to operate on natural gas exclusively. In practice, the terms *Bi-Fuel* and *Dual Fuel* are often used interchangeably, and this is the way that the terms are used in this report and in the literature cited in this report.

As part of the assessment of the dual-fuelled testing program, YECL retained SENES to provide assistance on air quality-related issues for the proposed testing program. SENES completed a dispersion modelling analysis of emissions from the existing diesel-fuelled generators at the Watson Lake station in 2009 in support of the station's permit renewal application. Since emissions for the dual-fuelled generators will differ from pure diesel-fuelled operation, a literature search was conducted to assess the potential effect that converting from diesel to dual-fuel operation might have on anticipated air contaminant emissions and subsequent air concentrations for common air contaminants.

Only a limited number of published papers were identified in the literature search which were considered to be directly applicable to the YECL pilot-scale testing program. However, the information gathered from these published studies is sufficient to provide an estimate of the likely changes in emissions that could result from the switch from diesel to dual-fuelled operation, and the potential effect these emission changes would have on predicted ambient concentrations based on the previous air dispersion modelling analysis.

2.0 CHANGES IN EMISSIONS

The following provides a summary of information about the types of changes in emissions of nitric oxide (NO), carbon monoxide (CO), unburned hydrocarbons (HC), sulphur dioxide (SO_2) and soot or particulate matter (PM) that have been reported in published literature on the differences between operating power generators on diesel only and on a combination of diesel and natural gas.

2.1 NO EMISSIONS

The overall conclusion of all published sources reviewed for this report is that dual-fuel operation results in lower nitrogen oxide (NOx) emissions. A study was performed by R.G. Papagiannakis and D.T. Hountalas (2003) observing emissions of contaminants during dual-fuel operation of a diesel engine using natural gas as the secondary fuel. The study showed that NO emissions are lower during dual-fuel operation when natural gas is used as the secondary fuel. According to the study,

> *"..a possible explanation…is the less intense premixed combustion, the reduction of gas temperature due to increase of the specific heat capacity, the slower combustion and finally the reduction of oxygen concentration due to presence of the natural gas mass ration, which replaces an equal amount of air in the cylinder charge."*

Abdelghaffar (2011), citing previous work by Papagiannakis and Hountalas, also stated that NOx concentrations in exhaust are lower for dual-fuelled operation compared to normal diesel operation. This was also confirmed by R.G. Papagiannakis et al. (2010) who showed in a controlled study that:

> *"...for the same combination of engine operating conditions (i.e., engine speed and load), the increase of the liquid fuel supplementary ratio (x>0%)* [the higher the percentage of natural gas] *leads to lower NO concentrations compared to the ones observed under normal diesel operation (x=0%)".*

The study also noted that at high loads and engine speeds, NO emissions start to increase beyond a certain natural gas percentage. R.G. Papagiannakis et al. (2010) speculate that this is caused by warmer engine temperatures and an increase in turbulence within the combustion chamber.

Figure 2.1 shows the changes in NO emissions reported by Papagiannakis et al. (2010) for various engine loads, engine speeds and the relative proportion of natural gas substitution for diesel in the fuel. The authors reported that:

- at low and intermediate load conditions and for all engine speeds
    - Increased gaseous fuel substitution results in a decrease in NO emissions, with reductions of up to 60% at low load operation
- at high load and low engine speeds, NO emissions may be reduced by up to 47%
- at high load and high engine speeds, specific NO emission rates start to decrease with the increase in diesel fuel substitution rates, but still remain lower than when the engine is run on diesel alone.

At 80% load and high engine speed, Papagiannakis et al. (2010b) estimated that NO emission concentrations could, theoretically, approach or slightly exceed emissions under normal diesel fuel operations at high inlet air temperatures (90˚C), but would remain lower than for diesel only operations at lower inlet air temperatures.

Similar results are shown in Sahoo et al. (2009), who reported that:

> *"…at low loads the NOx concentration under dual fuel operation is slightly lower compared to the one under normal diesel operating conditions…At higher load, the NOx concentration under dual fuel operation is considerably lower compared to the one under normal diesel operation."*

As indicated in Figure 2.2, Sahoo et al. reported that NOx concentrations under dual-fuel operations were slightly lower than for normal diesel operations at low engine loads, but considerably lower at high engine loads. The authors also noted that the increase in engine speed under dual-fuel operation resulted in further decreases in NOx concentrations as compared with normal diesel operation.

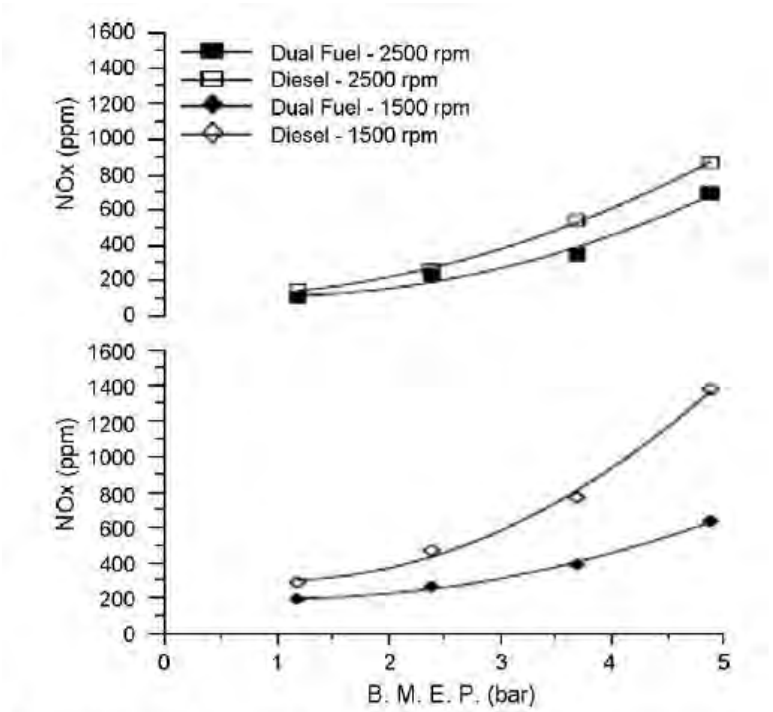

Fig. 10. Variation of nitric oxide under normal diesel and dual-fuel operation versus load at 1500 and 2500 rpm engine speed [19].

2.2 CO EMISSIONS

All published sources considered in this literature review were in agreement that dual-fuel operation results in an increase in CO concentrations in exhaust emissions. The increases are highest at low engine load and low inlet air temperatures, with theoretical maximum increases in CO emissions of up to 600% (Papagiannakis et al. 2010b). Emission increases of 200-300% for dual-fuel operations would be more typical at high engine loads.

According to the R.G. Papagiannakis and D.T. Hountalas (2003) study:

> *"..in general CO emission values under dual fuel operation are considerably higher compared to normal diesel operation."*

Increased CO emissions are a result of the slow combustion rate of the gaseous fuel, *"which maintains the charge temperature at low levels resulting [in] a reduction of the oxidation process of carbon monoxide"*.

However, the study does note that with high engine loads (80% load), as mass ratios of natural gas increase above ~50%, CO emissions begin to decrease. This reduction is assumed to be the result of higher gas temperatures and faster combustion rates.

In Papagiannakis et al. (2010), tests showed that:

> *"for the same operating point (i.e., engine speed and load) CO emissions under dual fuel operation are significantly higher compared to the respective [emissions] under normal diesel operations."*

According to the 2010 study, and as indicated in Figure 2.3, this effect is more pronounced at low loads where the increase of CO emissions can be up to 600%. At intermediate loads, the maximum increase in CO emissions is up to 270%. At high engine loads and low engine speeds, the maximum increase in CO emissions is only 70% compared to that under normal diesel only operations.

Based on a third study performed by Papagiannakis et al. (2010b):

> *"..the negative impacts of dual fuel operation on CO emissions could be curtailed by preheating air intake and increasing pilot fuel quantity as well. However, this appears to affect negatively NO emissions with the effects* [becoming] *more intense at high engine load. Thus from the viewpoint of pollutant emissions, the increase of the pilot fuel quantity has to be accompanied by a limited increase of intake air temperature."*

Figure 2.3: CO Emissions at Various Loads, Engine Speeds and Natural Gas Percentages (Source: Papagiannakis et al. 2010)

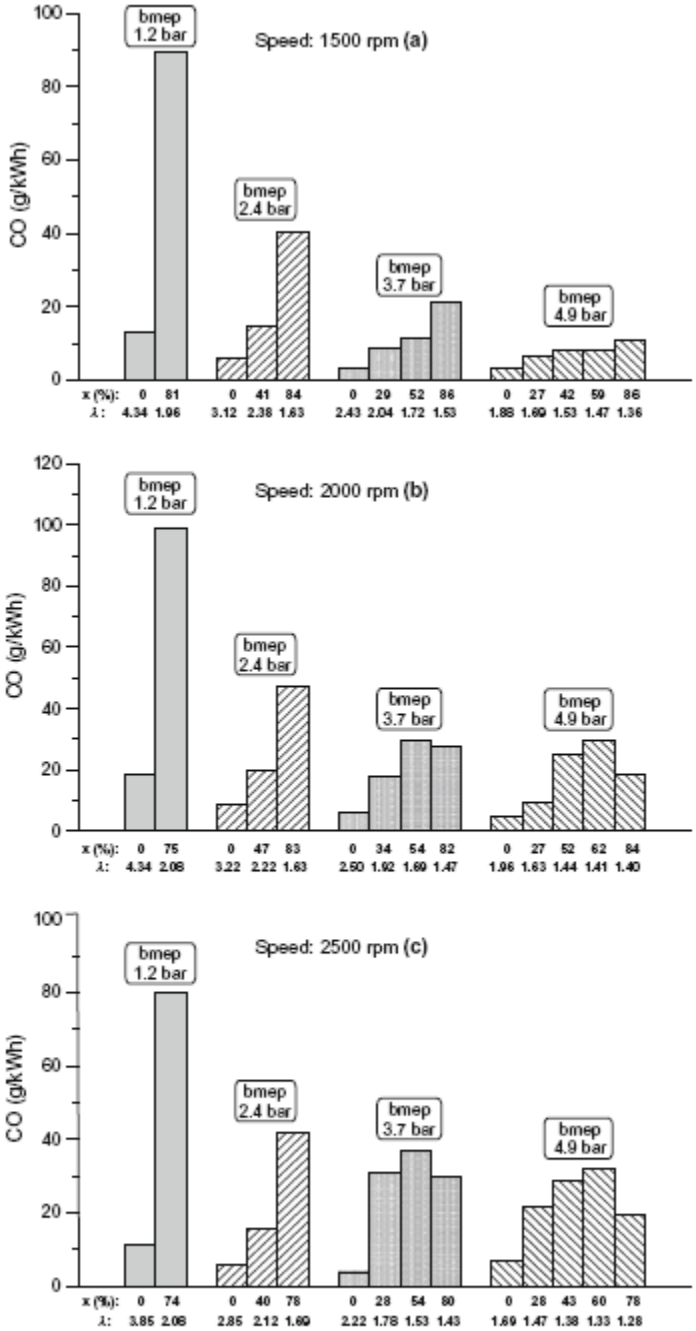

Fig. 5. Bar chart diagram of the emitted specific carbon monoxide (CO) at various loads (bmep) as function of the supplementary ratio 'x' and corresponding total relative air–fuel ratio 'λ', for the engine speeds of 1500 rpm (a), 2000 rpm (b), and 2500 rpm (c).

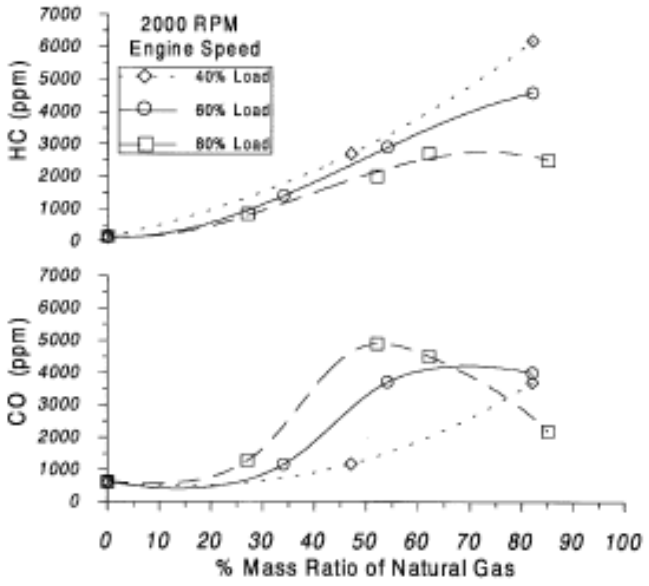
2.3 UNBURNED HC EMISSIONS

Emissions of unburned hydrocarbons can be expected to increase in dual-fuel mode operations as compared with diesel only operations. Papagiannakis and Hountalas (2003) showed that as the fractional mass ratios of natural gas increases in the fuel feed to the engine, unburned HC emissions increase for all load levels. The study speculated that this increase was caused by:

> *"..the filling of crevice volumes with unburned mixture of air and gaseous fuel during compression and combustion while the cylinder pressure continues to rise".*

Figure 2.4 indicates that, at low engine loads (i.e., 40% load factor), HC emissions increase with the increasing percentage of natural gas added to the dual fuel mix. As the load factor increases, the emission of unburned HC decreases somewhat, but always remains greater than that for normal diesel only operations. The magnitude of the increase may range from a 2500 fold increase at high load factor above the level and 70% natural gas ratio to over 6000 times that of diesel only operations at low load and 80% natural gas ratio.

Figure 2.4: Unburned HC and CO Concentrations as a Function of Natural Gas Ratio for Various Engine Loads (Source: Papagiannakis and Hountalas 2003)



The authors reported that in the high load scenario, the slight decrease in unburned HC emissions for the high load factor scenario observed after ~70% natural gas ratio is minimal. The slight decrease is attributed to higher burnt gas temperatures which promote oxidation of unburned

hydrocarbons. These results were confirmed by Papagiannakis et al. (2010) who showed that the difference is *"more intense at low load conditions, thus revealing the considerable amount of gaseous fuel escaping the combustion process."* This is illustrated in Figure 2.5 below.

Figure 2.5: Unburned HC Emissions at Various Loads, Engine Speeds and Natural Gas Percentages (Source: Papagiannakis et al. 2010)

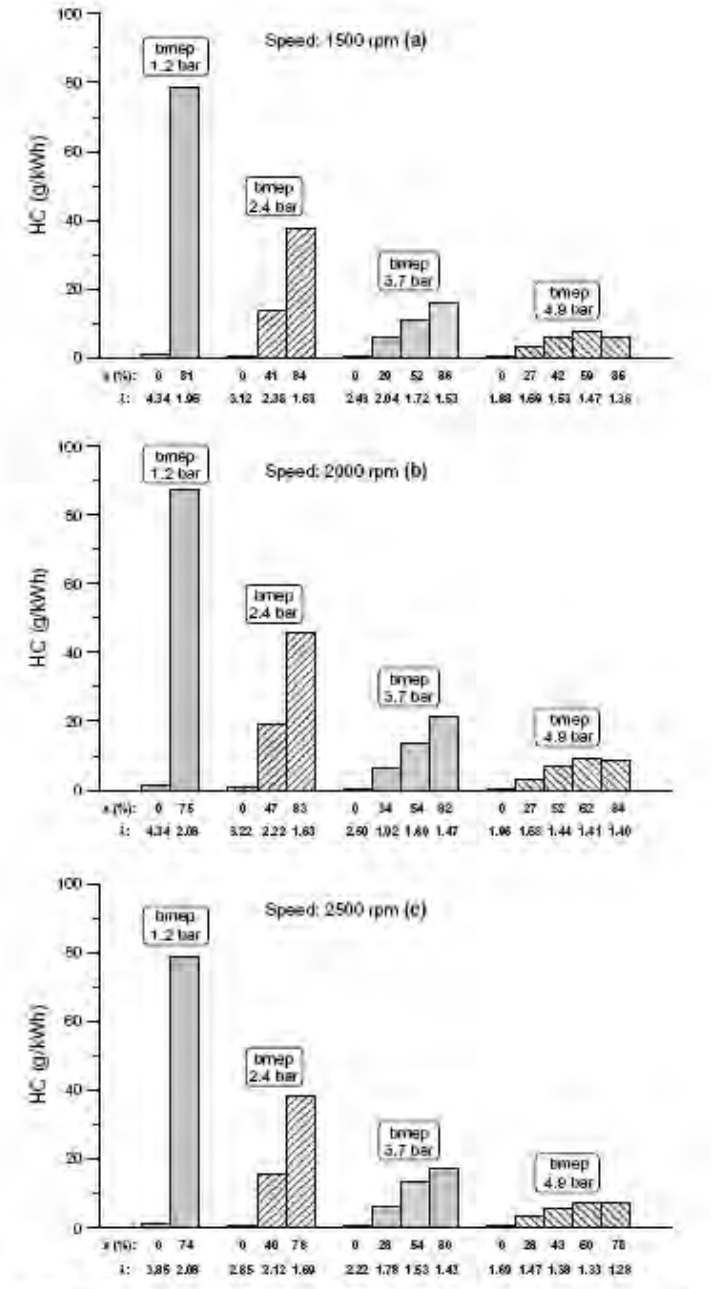


Fig. 6. Bar chart diagram of the emitted specific unburned hydrocarbons (HC) at various loads (bmep) as function of the supplementary ratio 'x' and corresponding total relative air–fuel ratio 'λ', for the engine speeds of 1500 rpm (a), 2000 rpm (b), and 2500 rpm (c).

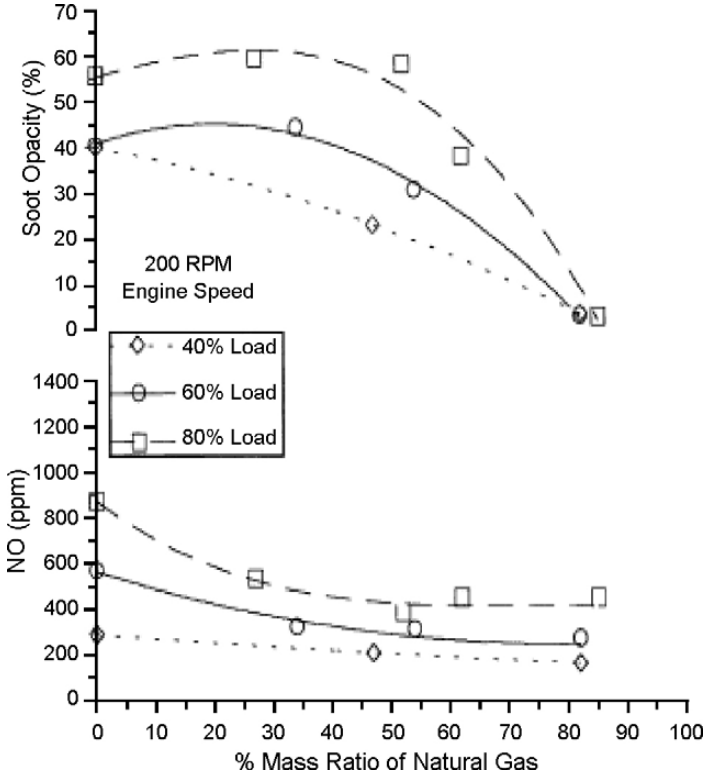
2.4 PARTICULATE MATTER (PM) OR SOOT

Dual-fuel operation results in substantially lower PM emissions as compared with normal diesel only operations, and this effect is greatest at high engine loads and near stochiometric air-fuel ratios (Papagiannakis et al. 2010). This is illustrated in Figure 2.6.

Figure 2.6: Soot Opacity and NO Concentration as a Function of Natural Gas Ratio for Various Engine Loads (Source: Papagiannakis and Hountalas 2003)



Papagiannakis and Hountalas (2003) observed that soot production decreases at partial load factors as the percent mass ratio of natural gas increases. At higher loads and low percent mass ratios, soot initially increases (as the charge temperature is inferior to pure diesel operation), but then begins to decrease as the percent mass ratio of natural gas increases further. According to the authors: *"This is probably due to the higher gas temperature that promotes soot oxidation rate contributing to a further decrease of soot concentration"*. This is corroborated by Papagiannakis et al. (2010), however it was also reported in the latter study that, at high engine loads and an engine speed of 2000 rpm, an increase in PM emissions was noted between 27% and 52% natural gas, which was then reduced once more as the percentage of natural gas was increased further.

Figure 2.7: Soot emissions at Various Loads, Engine Speeds and Natural Gas Percentages (Source: Papagiannakis et al. 2010)

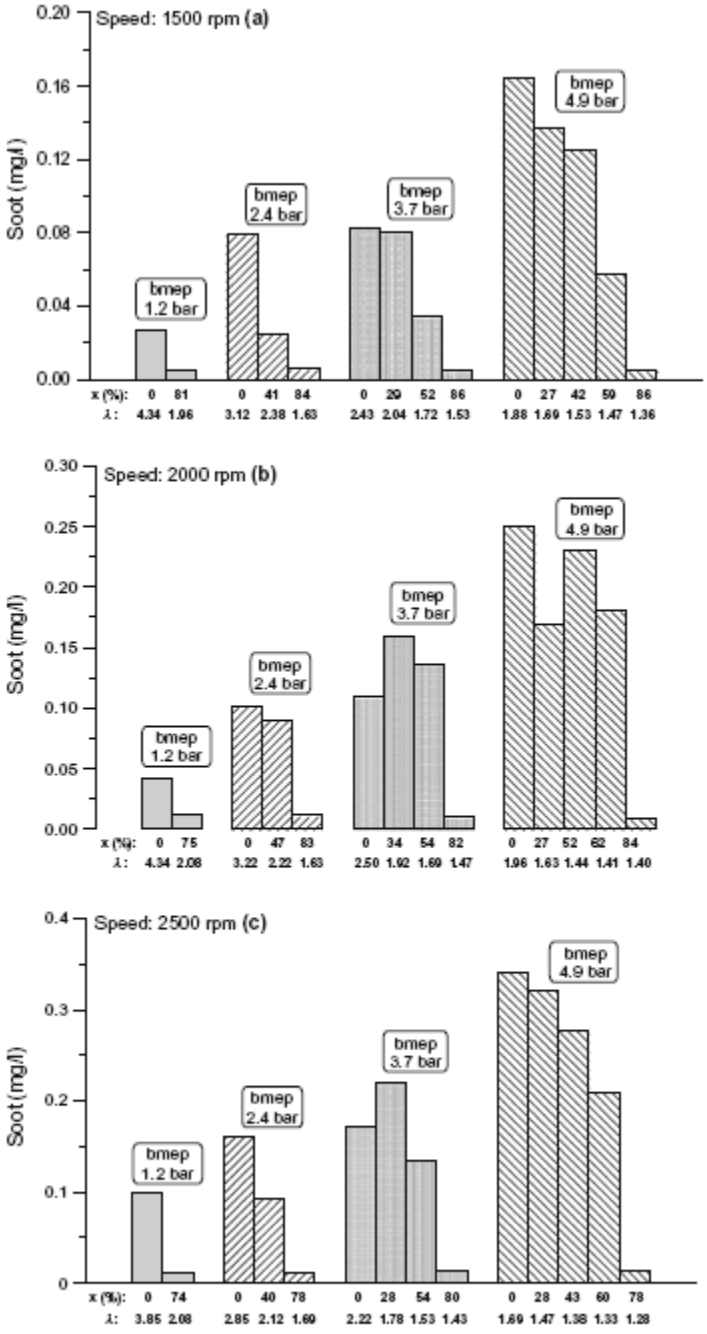


Fig. 7. Bar chart diagram of the emitted soot (smoke) density at various loads (bmep) as function of the supplementary ratio 'x' and corresponding total relative air–fuel ratio 'λ', for the engine speeds of 1500 rpm (a), 2000 rpm (b), and 2500 rpm (c).

2.5 CONTROLLED FUELLING

A study conducted by Abdelghaffar (2011) examined the effect of dual-fuel versus controlled dual-fuel operation modes on air emissions. In controlled dual-fuel mode, the amount of diesel fuel injected into the engine with the natural gas is manually controlled. Experiments showed that while emissions of CO and HC increased in dual-fuel mode, the emission increases can be reduced if the amount of diesel fuel injected into the engine is controlled. Controlled fuel injection also decreases NOx emissions.

3.0 CONCLUSIONS

The overall conclusion of the literature review is that emissions of NOx and PM from the pilot scale testing of one unit at the Watson Lake generating station would be expected to decrease in dual-fuel mode operation, while emissions of CO and unburned HC would be expected to increase. SO_2 emissions are a function of the amount of sulphur in the fuel fed to the engine. As such, any decrease in the overall amount of sulphur in dual-fuel operation as compared with diesel only operation will result in a proportional decrease in SO_2 emissions.

Table 3.1 lists the maximum predicted concentrations of common air contaminants for emissions from the six generating units at the YECL Watson Lake generating station based on diesel fuel operation. The data indicate that the incremental contribution (i.e., excluding background air quality from other sources) of YECL emissions to ambient air quality levels in Watson Lake is well below the ambient air quality standards that were adopted for the Yukon in 2010. The highest contributions are for 24-hour average $PM_{2.5}$ and 1-hour average NO_2 concentrations. Under dual-fuel operation, the emission of both of these contaminants would be expected to decrease further. The YECL contribution to SO_2 concentrations is marginal, such that any changes in SO_2 emissions would have no measurable effect on ambient air concentrations.

Table 3.1: Summary of Maximum Predicted Concentrations for Simultaneous Operation of Six Diesel Engines at the YECL Watson Lake Generating Station

Pollutant	Timeframe	Maximum Predicted Concentration[1] µg/m^3	Yukon Standards µg/m^3	% of Yukon Standard
NO_2	1 Hour	88.40	400	22.1%
	24 Hour	26.77	200	13.4%
	Annual	1.44	60	2.4%
$PM_{2.5}$	24 Hour	8.81	30	29.4%
SO_2	1 Hour	1.86	450	0.4%
	24 Hour	0.77	150	0.5%
	Annual	0.04	30	0.1%
CO	1 Hour	333.85	15000	2.2%

[1] excluding background concentrations

However, as discussed in Section 2.2 above, CO emissions may increase substantially for dual fuel operations over current diesel only operations. The increase may be on the order of 200-270% under intermediate engine load operations, to as much as 600% increase at low engine load operations. At high engine load operations, the increase in CO emissions would be lower at only about 70% as compared with diesel only operations. Because the data in Table 3.1

represent the joint contributions assuming the operation of all six units at the Watson Lake generating station, a 600% increase in CO emissions from the one unit undergoing dual-fuel pilot testing will not result in a concomitant 600% increase in the incremental impact of CO emissions from the station as a whole. Assuming an equal contribution from all six units to the maximum predicted 1-hour average CO concentration of 333.85 $\mu g/m^3$, a 600% increase in CO emissions from the one dual-fuel pilot test unit would result in a maximum 1-hour average CO concentration of 612.06 $\mu g/m^3$, or a factor 1.8 increase over the total CO concentration from all six units running on diesel alone. This would represent 4.1% of the Yukon ambient air quality standard for 1-hour average CO concentrations.

Although the emission of unburned hydrocarbons is likely to increase under dual-fuel operation more than for any other contaminant, the emission of these compounds is relatively low under diesel only operations. The primary HC contaminant of potential concern would be benzene. The increase in HC emissions will amount to a relatively large increase of small initial quantities. There are no Yukon ambient air quality standards for any of the HC contaminants whose emissions are likely to increase.

"Phase 1 of the project (2013) involves the modification of Watson Lake power plant generation unit #5 to a bi-fuel system, which allows the unit to run on a combination of diesel and natural gas. The purpose of this phase is to verify that NG injection into the engine provides reliable electricity generation for a utility power system along with the environmental benefit to reduce emissions."

Request:

Please explain in detail how YECL plans to measure and report on the changes in various emissions in this bi-fuel project compared to the diesel plants in Phase 1.

Response:

At this time, Yukon Electrical has received direction from the Decision Body on the application for this project to the Yukon Environmental and Socio-economic Assessment Board (YESAB), which provides guidance on emissions testing protocols and reporting requirements. Yukon Electrical is currently assessing these requirements.

In the project submission and subsequent Information Requests, Yukon Electrical submitted to YESAB that emissions from exhaust stack of the first unit conversion, or Phase 1, will be tested to better understand the emissions performance results. Emissions testing will be conducted on Unit # 5, the first unit to be converted as part of Phase 1 of the pilot project. Testing will be performed while the unit is utilizing 100% diesel fuel as well as in bi-fuel operating mode.

YCS-YECL-2-3

Reference: Watson Lake Bi-Fuel Project

"The availability of LNG allows for reduced emissions in existing generating units through the displacement of diesel fuels." In terms of greenhouse gas emissions, it is understood that methane has a far greater global warming potential (GWP) than Carbon Dioxide CO2. Unburned methane from incomplete combustion will result in more methane-based GHG emissions. This is significant especially when considering methane's potency over a 20-year time frame (GWP = 72 CO2e) or even over a 100-year time frame (GWP = 25 CO2e). It is accepted by the scientific community that we don't, in fact, have anywhere near 100 years to meet the challenge of the climate crisis. We need to break our dependency on fossil fuels immediately and not release methane into the atmosphere.

Request:

Please provide peer-reviewed reference documentation and describe the basis of your assumption that burning LNG with diesel rather than exclusively diesel will result in reduced emissions.

Response:

The primary driver for the Watson Lake Bi-Fuel project is to provide local emissions reductions. It is predicted that there will be a reduction in particulate matter (PM) emissions, important to people with compromised lung function, and NOx and SOx, contributing to smog and acid rain.

Please refer to YCS-YECL-2-1 for peer-reviewed information.

YCS-YECL-2-4

Reference: Watson Lake Bi-Fuel Project

"In addition to the environmental benefits of this project to reduce emissions of particulate matter, sulfur oxides, nitrogen oxides and carbon dioxide, this initiative will assist in determining the operational and financial benefits of the use of LNG as an alternate fuel for electricity generation."

Request:

Please describe any potential negative environmental impacts or increased emissions from burning an LNG/diesel mix in terms of emissions (i.e., Carbon Monoxide, Volatile Organic Compounds, such as carcinogenic benzene) and provide the source of this information.

Response:

By chemical composition, natural gas is known to result in fewer environmental emissions than diesel for species of note: particulate matter (PM), NO_x, and SO_2.

A bi-fuel system can have different characteristics than a unit which uses 100% natural gas or 100% diesel. In December 2012 SENES (please refer to YCS-YECL-2-1 Attachment 1 for *Literature Review: Air Contaminant Emissions from Dual-Fuelled and Conventional Diesel Generator Operations*) completed a literature study to summarize existing information on air contaminant emissions for bi-fuel systems and used this information to predict how previously modeled air emissions are affected by the proposed bi-fuel modification of one engine in the power plant. SENES concluded that emission levels for nitrogen oxide (NO_x), particulate matter (PM) or soot, and sulphur dioxides (SO_2) are expected to decrease, while emissions of unburned hydrocarbons (HC) and carbon monoxide (CO) are expected to increase. The increase in CO, however, is expected to remain well below Yukon air quality standards. There are no Yukon standards that apply to the HC that are expected to be emitted; the actual quantities are expected to be low.

As submitted by Yukon Electrical on February 15, 2013 in response to a request for information from the Yukon Environmental and Socio-economic Assessment Board (YESAB):

> The U.S. Environmental Protection Agency's (USEPA) AP-42 compilation of emission factors Section 3.4 on emissions from Large Stationary and All Stationary Dual-fuel Engines provides information on unburned hydrocarbons from one diesel-fuel engine, and an emission factor for Total Organic Carbon (TOC) from one dual-fuel engine. There was no speciated emission data from any of the other published literature sources reviewed in the SENES [2012] report on bi-fuel engines. (Note: the terms dual-fuel and bi-fuel are used interchangeably in the literature).

There is a lack of publicly available information on bi-fuel operations to be able to provide an accurate predictor of the change in unburned hydrocarbon emissions between diesel and bi-fuel operations. Furthermore, as emissions of CO_2, CO, NO_x and unburned HCs in the combustion products are engine specific, the details of emissions will not be fully understood until the project is in operation and emissions sampling and analysis is complete.

YCS-YECL-2-5

Reference: Watson Lake Bi-Fuel Project

"Phase II will be undertaken if phase 1 is successful."

Request:

Please describe in detail how YECL defines success of Phase 1.

Response:

Phase 1 of the Watson Lake Bi-Fuel Project will evaluate the ability of Unit #5 (the first unit to be converted to bi-fuel operation in Phase 1) to operate safely and reliably, and also to demonstrate that the project meets emissions requirements. In addition, the initial phase of the project will provide insight into the viability of a natural gas supply chain.

YCS-YECL-2-6

Reference: Watson Lake Bi-Fuel Project

"Business Drivers" states that a primary objective of this project is to reduce emissions from the production of electricity, particularly in light of increased reliance on diesel. And "Deliver an environmental benefit to the community of Watson Lake through the reduction of emissions of particulate matter, Sox, NOx, and CO2."

Request:

Please explain why YECL is claiming an environmental benefit to the community of Watson Lake when it is predicted that Carbon Monoxide (CO) emissions and unburned hydrocarbons/Volatile Organic Compounds will significantly increase from burning LNG with diesel.

Response:

A primary driver for the Watson Lake Bi-Fuel project is to provide local emissions reductions through the displacement of diesel. It is predicted that there will be a reduction in CO_2, particulate matter (PM) emissions, important to people with compromised lung function, and NOx and SOx, contributing to smog and acid rain.

At this time, there is no reason for Yukon Electrical to believe that Carbon Monoxide (CO) emissions and unburned hydrocarbons (HC)/Volatile Organic Compounds will increase beyond regulated levels from bi-fuel (natural gas and diesel) combustion. An increase in Carbon Monoxide from bi-fuel combustion in the order of 2 to 6 times that of diesel-only operation is dependent on the loading level of individual generating units. The present emission level of CO is approximately 2.2% of the Yukon standard for concentration. The resultant increase is below Yukon standards and the actual quantities are expected to be low.

For further discussion on this, please refer to YCS-YECL 2-1.

YCS-YECL-2-7

Reference: Watson Lake Bi-Fuel Project

"Business Drivers" states that a primary objective of this project is to reduce emissions from the production of electricity, particularly in light of increased reliance on diesel. And "Deliver an environmental benefit to the community of Watson Lake through the reduction of emissions of particulate matter, SOx, NOx, and CO2."

Request:

If a primary driver of this project is reducing emissions from the production of electricity, please describe your understanding of the life cycle emissions and pollution from the extraction, processing, liquefaction and transportation of LNG and diesel. Please provide references.

Response:

Project proponents conducted an internal life cycle CO_2 estimate of the total emissions of a liquefied natural gas scenario, using emission factors from the "2012 B.C. Best Practices Methodology for Quantifying Greenhouse Gas Emissions" and Environment Canada. The estimate takes into account emissions attributable to the extraction & processing of the natural gas, its liquefaction & transportation from Delta, B.C. to Watson Lake, Yukon, and its combustion on site. This scenario was then compared to a baseline which takes into account the emissions attributable to the production of diesel, its transportation from Edmonton, Alberta to Watson Lake, Yukon, and its combustion on site.

The estimate revealed that upon full LNG project implementation (all engines on site converted to bi-fuel), the CO_2 savings would be on the order of 20% for every GJ of diesel fuel displaced.

For additional information, please refer to the reference in YUB-YECL-42(f).

YCS-YECL-2-8

Reference: Watson Lake Bi-Fuel Project

"Business Drivers" states that a primary objective of this project is to reduce emissions from the production of electricity, particularly in light of increased reliance on diesel. And "Deliver an environmental benefit to the community of Watson Lake through the reduction of emissions of particulate matter, Sox, NOx, and CO2."

Request:

If a primary driver is reducing emissions from the production of electricity, please describe any efforts YECL has made in Watson Lake and its other diesel-powered communities to reduce the overall consumption of fossil fuel generated electricity.

Response:

A feasibility study for a wind-diesel system at Destruction Bay/Burwash Landing was completed in 2010 with a levelized cost of electricity estimated at 50 cents/kWh. Yukon Electrical is participating in a hydroelectric study to provide long-term renewable electricity for the Watson Lake electrical system. Yukon Electrical is participating in a geothermal energy study as an additional long term renewable alternative. Yukon Electrical assisted with integration of solar Photo Voltaic generating capacity into the community of Old Crow. Yukon Electrical is proposing Demand Side Management initiatives for electricity conservation that is applicable to diesel communities and is co-participating in development of a Net Metering Policy for customers to self-generate utilizing renewable technologies.

YCS-YECL-2-9

Section 4 – fuel costs pages 4-1 and 4-2 states that: "Beginning in 2013, a supply of Liquid Natural Gas (LNG) for the Watson Lake power plant will be sourced from Fortis B.C. Page 4-3 states: For the usage of LNG in Watson Lake, fuel costs will be converted to equivalent Diesel litres using the following industry standard conversion factors for LNG for the calculation of the fuel price flow through deferral balance: LNG Energy Content of Diesel 58%. Page 5-5 states: Beginning in the fall of 2013, Yukon Electrical will be leasing liquid natural gas (LNG) storage and vaporization equipment from an affiliate company, ATCO Gas, related to the Watson Lake Bi-Fuel project."

Request:

Please explain why this project is necessary and why now.

Response:

This project is necessary to advance community and Yukon Electrical objectives for reducing emissions from diesel generating sources while longer term solution technologies such as hydro, wind and geothermal are being advanced.

Other technologies face significant challenges with respect to their higher cost of electricity and/or the time required to implement. Natural gas provides the capability to meet firm power capacity requirements in addition to straight energy displacement. Natural gas has been identified as having the potential to generate lower cost power with lower overall emissions.

Relatively simple technology exists to modify stationary reciprocating diesel engines so that they can use supplemental amounts of natural gas without the need to invest the capital cost of new generating units.

The availability of LNG offers a viable means to provide natural gas to communities that are not on a gas pipe system and provides fuel diversity.

This project advances Yukon Electrical's on-going commitment to meet the growing energy requirements of the Yukon. This project also advances a strategic objective to provide the lowest cost electrical production possible to the residents of the Yukon, in an environmentally sound manner. The Watson Lake project will allow Yukon Electrical

to continue its commitment to these objectives at existing diesel power plants and possible future power plants in the Yukon.

YCS-YECL-2-10

Reference: Watson Lake Bi-Fuel Project

Section 4 – fuel costs pages 4-1 and 4-2 states that: "Beginning in 2013, a supply of Liquid Natural Gas (LNG) for the Watson Lake power plant will be sourced from Fortis B.C. Page 4-3 states: For the usage of LNG in Watson Lake, fuel costs will be converted to equivalent Diesel litres using the following industry standard conversion factors for LNG for the calculation of the fuel price flow through deferral balance: LNG Energy Content of Diesel 58%. Page 5-5 states: Beginning in the fall of 2013, Yukon Electrical will be leasing liquid natural gas (LNG) storage and vaporization equipment from an affiliate company, ATCO Gas, related to the Watson Lake Bi-Fuel project."

Request:

Please describe in detail the anticipated cost savings (including all assumptions and calculations) from burning a combination of LNG/diesel as opposed to exclusively diesel.

Response:

Please refer to YUB-YECL-42(a) for the anticipated cost savings related to the Watson Lake Bi-Fuel Project.

YCS-YECL-2-11

Section 4 – fuel costs pages 4-1 and 4-2 states that: "Beginning in 2013, a supply of Liquid Natural Gas (LNG) for the Watson Lake power plant will be sourced from Fortis B.C. Page 4-3 states: For the usage of LNG in Watson Lake, fuel costs will be converted to equivalent Diesel litres using the following industry standard conversion factors for LNG for the calculation of the fuel price flow through deferral balance: LNG Energy Content of Diesel 58%. Page 5-5 states: Beginning in the fall of 2013, Yukon Electrical will be leasing liquid natural gas (LNG) storage and vaporization equipment from an affiliate company, ATCO Gas, related to the Watson Lake Bi-Fuel project."

Request:

Please describe the methodology and assumptions used in projecting future costs of LNG, especially in light of planned export LNG facilities in BC enabling currently landlocked fossil fuel resources to reach and compete in the global market, where natural gas prices are significantly higher. Please provide financial scenarios for LNG costs doubling, tripling or quadrupling due to LNG exports. How will those future cost scenarios affect the predicted cost effectiveness of LNG bi-fuel?

Response:

Export projects are anticipated only to proceed given a wide price differential between "global" and North American natural gas prices. As the LNG market matures, contracts are trending towards "natural gas plus" instead of "petroleum minus", and they are becoming of shorter duration (a "spot" LNG market may eventually develop). Therefore, a major decrease in price differential (i.e. an increase in North American natural gas pricing) will lead to a reduction in exports, and a subsequent reduction in pricing pressure for North America. This "high price cure for high prices" effect is well known and observed in almost all mature and healthy commodity markets.

Furthermore, natural gas commodity is only approximately 20% of the overall cost of LNG delivered to Watson Lake. Therefore, a quadrupling of the cost of natural gas (400%) will only increase the cost of LNG by 60%. (In comparison, unrefined oil makes up 50% of the overall cost of diesel and, therefore, diesel is much more sensitive to commodity price increases).

Note that LNG can also provide Yukon Electrical with greater cost certainty in that commercial natural gas contracts can currently be locked in for up to 5 years. In comparison, diesel contracts are typically shorter term. Furthermore, bi-fuel systems allow Yukon Electrical to use greater or lesser amounts of each type of fuel depending on pricing conditions.

Reference: Automated Meter Reading

"Capital meter additions include new meters that are required to replace obsolete or end of life meters as identified by measurement Canada. For 2010 and forward, this also includes the installation of new meters required to accommodate load growth associated with customer requests for service. Prior to 2010, these meters were grouped with new extensions. These expenditures allow Yukon Electrical to meet its obligation to provide metered service connections. The capital meter additions are forecasted based on known areas of development and expected connection requests."

Request:

Please explain how these new meters will or will not have the technological capability to accommodate load management (peak shaving and load shifting) programs such as time-of-use pricing and utility- or customer-controlled appliances (such as hot water heaters).

Response:

The TWACS meters do have an optional ability to incorporate utility-controlled devices that can communicate and control customer equipment and appliances. This optional ability is not included in Yukon Electrical's business case at this time. The time of use ability of the TWACS meters is not currently Measurement Canada approved for revenue metering. Yukon Electrical intends on utilizing the time of use capability of the TWACS meters for system load studies.

Prior to 2010, these meters were grouped with new extensions. These expenditures allow Yukon Electrical to meet its obligation to provide metered service connections. The capital meter additions are forecasted based on known areas of development and expected connection requests."

Request:

Please explain how these new meters will or will not have the technological capability to accommodate net-metering programs (customer generated energy for consumption and surplus sales back to the grid).

Response:

These AMR meters will not have net metering capability. However, Yukon Electrical has addressed the need for net metering in a current pilot project and will be able to accommodate a future net metering policy. Yukon Electricl is currently able to provide a net meter that requires manual reading.

YCS-YECL-4-1

Reference: Old Crow Plant Expansion and Unit #3 Replacement

Request:

Please describe any attempts or investments that YECL has made (i.e., partnerships and or discussions with Yukon Government and or Vuntut Gwitchin Government, studies, pilot projects, etc.) to supplement the exclusive fossil fuel-generated electricity in this community with solar, wind or any other renewable energy option to reduce greenhouse gas emissions and other pollution associated with burning fossil fuels.

Response:

A feasibility study for a wind-diesel system at Destruction Bay/Burwash Landing was completed in 2010 with a levelized cost of electricity estimated at 50 cents/kWh. The selected study location was deemed to be one of the most attractive from a wind resource perspective of the communities served by Yukon Electrical. The community of Old Crow was viewed as a more challenging location that would be developed after.

Yukon Electrical assisted with the integration of solar Photo Voltaic generating capacity into the community of Old Crow.

Yukon Electrical visited the community of Old Crow in June 2011 and met with Vuntut Gwitchin Chief and Council as well as held a public information session to discuss electricity conservation, potential opportunities and the efforts related to Demand Side Management.

Yukon Electrical is co-participating in development of a Net Metering Policy for customers to self-generate utilizing renewable technologies that will be applicable to the community. Yukon Electrical is participating in a hydroelectric study and a geothermal energy study that may provide long-term renewable opportunities for the community of Old Crow.

YCS-YECL-4-2

Reference: Old Crow Plant Expansion and Unit #3 Replacement

Request:

Please describe any efforts made by YECL to help customers reduce consumption of electricity therefore reducing the combustion of fossil fuels to reduce costs and emissions, in all communities that YECL services exclusively with diesel.

Response:

A feasibility study for a wind-diesel system at Destruction Bay/Burwash Landing was completed in 2010. The selected study location was deemed to be one of the most attractive from a wind resource perspective of the communities served by Yukon Electrical. The results of this study are applicable to other communities served by Yukon Electrical diesel generating units.

Yukon Electrical assisted with the integration of solar Photo Voltaic generating capacity into the community of Old Crow.

Yukon Electrical visited a number of communities in 2011 and 2012 to discuss electricity conservation, potential opportunities and the efforts related to demand side management.

Yukon Electrical participated in a technical evaluation to assist the community of Destruction Bay/Burwash Landing as they look to implement energy monitoring and management opportunities for the community that may also be applicable to other northern communities.

Yukon Electrical participated in the Community Energy and Emissions Inventory study for Kluane First Nation – Yukon Research Centre Partnership Project.

Yukon Electrical participated in an Energy Summit conference in March, 2013 held by the Kluane First Nation.

Yukon Electrical is co-participating in development of a Net Metering Policy for customers to self-generate utilizing renewable technologies that will be applicable to communities. In preparation for the government approval of the net metering policy,

Yukon Electrical is piloting the first net-metering project in the community of Burwash Landing.

Yukon Electrical is participating in a hydroelectric study and a geothermal energy study that may provide long-term renewable opportunities for the communities served by Yukon Electrical.

Yukon Electrical provides presentations at the Association of Yukon Communities related to energy conservation opportunities.

As part of the Conservation Potential Review and development of the Demand Side Management Plan, Yukon Electrical has met in various communities and discussed efficiency and conservation opportunities with many stakeholders.

Reference: Demand Side Management Plan

Request:

Please describe all internal DSM projects that the utilities have undertaken or plan to undertake to reduce their overall consumption of electricity in their operations, or to shift their consumption away from peak times.

Response:

Yukon Electrical continues to make internal system efficiency improvements and to address opportunities to improve energy efficiency within its various facilities. Improvements include: the conversion of Hillcrest subdivision to a higher voltage to reduce losses; designing the large transformers at Whistle Bend and at the Shipyard substation to ensure impedances are optimized to reduce internal losses; the current plans for building envelope improvements for the downtown office; insulation upgrades implemented in various plants; and air handling balancing and HVAC replacement in the service complex building. These improvements are outside the scope of the joint DSM plan.

Yukon Energy has completed some additional internal efficiency projects, pilot projects and public education initiatives, these activities along with the joint utility initiatives are outlined in section 5.3.1.5 of Yukon Energy's 2012-2013 General Rate Application and Yukon Energy's IR response YUB-YEC-1-46(d) Attachment 1. These activities are not part of the joint DSM plan. Costs associated with Yukon Energy's activities outside the joint DSM plan are not part of this application.

Reference: Demand Side Management Plan

Conservation Potential Review Technical Summary Customer-side Renewable and Alternative Energy Technologies, Page 37 states: "Solar PV could provide considerable generation under the upper scenario, even though the penetration of this technology is expected to start later than for the others." Also noted in exhibits 18 and 19 is that no achievable potential from solar PV is predicted until 2025.

Request:

Please explain the assumptions that went into this prediction that solar PV would have no penetration until 2025.

Response:

Small-scale solar PV systems do not currently meet the CPR study's economic threshold; however, there is a general expectation that they are likely to become competitive with other electricity generation options sometime within the 20-year period covered by this study. For example, the U.S. Department of Energy's SunShot Initiative is aiming to achieve grid parity by 2020. Recently, a report by Ernst & Young suggested that retail grid parity might generally be achieved between 2012 and 2015. It is difficult to estimate at what point this might occur in the Yukon. On one hand, the installed cost per system will be more expensive than in other areas in Canada and the amount of electricity generated will be lower due to the lower insolation; on the other hand, the cost of electricity generated conventionally is also more expensive. Due to the possibility of PV grid parity during the study period, it was decided to include this technology within the Achievable Potential. During the achievable potential workshops, participants agreed that significant penetration of this technology is not likely to occur until 2025.

Conservation Potential Review Technical Summary Customer-side Renewable and Alternative Energy Technologies, Page 37 states: "Solar PV could provide considerable generation under the upper scenario, even though the penetration of this technology is expected to start later than for the others." Also noted in exhibits 18 and 19 is that no achievable potential from solar PV is predicted until 2025.

Request:

Please explain why considerable generation from solar PV could not happen now to supplement grid power and especially to displace fossil fuels in diesel communities, as opposed to waiting until 2025.

Response:

Yukon Electrical continues to examine renewable electricity generation sources including solar energy and wind energy. In the context of the DSM program, supply side generation was not examined.

YCS-YECL-7-4

Conservation Potential Review Technical Summary Customer-side Renewable and Alternative Energy Technologies, Page 37 states: "Solar PV could provide considerable generation under the upper scenario, even though the penetration of this technology is expected to start later than for the others." Also noted in exhibits 18 and 19 is that no achievable potential from solar PV is predicted until 2025.

Request:

Please describe how the programs in the DSM Plan will be accessible to customers outside of Whitehorse, and particularly in diesel-powered communities.

Response:

All residential and general service ratepayers will be eligible for programs listed in the joint DSM plan regardless of location in the Yukon.

YCS-YECL-7-6

Reference: Demand Side Management Plan

Conservation Potential Review Technical Summary Customer-side Renewable and Alternative Energy Technologies, Page 37 states: "Solar PV could provide considerable generation under the upper scenario, even though the penetration of this technology is expected to start later than for the others." Also noted in exhibits 18 and 19 is that no achievable potential from solar PV is predicted until 2025.

Request:

Please describe what programs exist in the DSM Plan to manage the load, as in to shift the demand from the peaks to the valleys. If there are no programs designed with the intention to shift demand from peaks to valleys, why not?

Response:

All programs included in the DSM Plan have coincidental peak savings, as outlined for each program shown in Exhibit 4 on page 15 and Exhibit 5 on page 16 of the *Yukon Five Year Demand Side Management Plan* included in the Application. There are no specific programs to address peak shifting included in the DSM plan. Peak shifting programs tend to be costly and complex to administer as they require a high degree of customer participation and generally require enforceable regulation to ensure the technology is used during those peak times. Under the current rate structure and customer available data, there is no customer incentive to develop programing to address peak shifting. In developing their first DSM programs, the utilities focused on electricity usage savings which is more cost effective and results in coincidental peak savings.

Reference: Overall Revenue Requirement – Requested Rate Increases and Revenue Requirement

Request:

(a) Please confirm that the requested year-over-year rate increase is 6.1% for 2013, 3.2% for 2014 and 2.0% for 2015.

(b) If a) is not confirmed, please provide details of the requested year-over-year rate increase calculations for 2013, 2014 and 2015.

(c) Please provide Schedule 8.1 for 2008-2015 without 2013-2015 GRA, i.e. forecast Return on Equity (ROE), equity ratios and Rate Base forecast for 2013-2015 years without GRA application.

Response:

(a) Confirmed.

(b) n/a

(c) Please refer to YEC-YECL-1(c) Attachment 1.

YEC-YECL-2

Reference: Section 2 – Sales and Revenue – Sales Forecast

Request:

(a) Please provide a table with comparison of YECL's forecast (YECL internal and GRA) and actual sales by rate class and by rate zone (Hydro, Large Diesel, Small Diesel and Old Crow) for 2008, 2009, 2010, 2011 and 2012.

(b) Please provide Table 2 on page 2-2 by comparing 2008 - 2009 GRA forecasts to the actual sales, instead of actual normalized sales.

(c) Is the sales forecast method proposed in this application the same as used in YECL's 2008/09 General Rate Application? If not, please enumerate any differences and provide an explanation for why the forecasting method was changed.

Response:

(a) Please refer to YEC-YECL-2(a) Attachment 1 for tables comparing Yukon Electrical's 2008 and 2009 forecast and sales by rate class by rate zone. As lighting rates are the same for all rate zones, the forecast is not available on a rate zone basis. Yukon Electrical did not prepare sales forecasts for 2010, 2011 or 2012 with the same level of detail, rigor or comprehensiveness as it does for GRA test years. Accordingly, Yukon Electrical is not prepared to submit a sales variance comparison for those years as it does not view such a comparison as being appropriate.

(b) Please refer to YEC-YECL-2(b) Schedule 1.

(c) Please refer to YEC-YECL-2(c) Attachment 1.

2) Schedule 2.1, Compliance Filing, Board Order 2009-5

3) Line 29, Schedule 2.1, 2013-2015 GRA

A Comparison of Yukon Electrical's GRA Sales Forecast Methodologies

Revenue Class/Variable	2008-2008 GRA	2013-2015 GRA	Rationale
Residential:			
Customer	· Based on Yukon Electrical's work in the community and consultation with local officials/developers and the Yukon Gov't and trend analysis.	· The same approach as in the 2008-2009 GRA.	
UPC	· For all communities with the exception of Whitehorse and Watson Lake, the most recent 3-year average UPC was used. · For Whitehorse and Watson Lake, the most recent 3-year average weather-normalized UPC.	· For all communities with the exception of Keno City, Stewart Crossing, Swift River and Whitehorse, the most recent 3-year average weather-normalized UPC. · For Keno City, Stewart Crossing and Swift River, the most recent 3-year average UPC because there are very few customers in these communities and a poor correlation between their average UPC and HDD. · For Whitehorse, 2013 was forecast by escalating the 2012 normalized UPC by the 3-year average growth rate of normalized UPC, and was kept constant for 2014 and 2015.	· YECL believes using a weather-normalized approach, whenever possible, which eliminates the impact of an abnormally cold/warm year, is a preferable method of forecasting energy consumption for a jurisdiction.
Commercial:			
Customer	· Based on YECL's work in the community and consultation with local officials/developers and the Yukon Gov't. and trend analysis.	· The same approach as in the 2008-2009 GRA.	
UPC	· For all communities with the exception of Whitehorse and Watson Lake, the most recent 3-year average UPC was used. · For Whitehorse and Watson Lake, the most recent 3-year average weather-normalized UPC.	· The same approach as in the 2008-2009 GRA for all communities except for Watson Lake where the base year UPC was forecast based on the most recent 3-year average UPC.	· Watson Lake R^2 is low.

Lighting:	· Based on YECL's work in the community and consultation with local officials/developers number of lights (streetlights and private lights) · Energy for streetlights and private lights is calculated by multiplying the number of lights with average use per light.	· The same approach as in the 2008-2009 GRA · The same approach as in the 2008-2009 GRA	No new LED conversions are incorporated into the forecast and average use per light is constant. Therefore, the main driver of the energy forecast is the additional number of lights.

YEC-YECL-3

Reference: Section 2 – Sales and Revenue – Residential Sales Forecast

Request:

(a) Please provide details of residential customer forecast for 2013, 2014 and 2015. Please include list of "all known residential property developments" (page 2-5, line 1) included in forecast as well as the estimated additional number of customers for each development area.

(b) Does the residential customer forecast also consider population growth forecasts? If so please provide the source of the population growth forecasts. If not, please explain why population growth forecasts are not considered.

(c) Please provide the impact for each forecast year of using the three-year average usage per customer (UPC) for Whitehorse. Please provide calculations in an excel file.

(d) Given the poor R2 correlation factor for residential customer UPC using single variable regression did YECL consider multiple variable regression analysis for UPC? If not, why not.

(e) Please provide any assessments as to sensitivity of such regressions as between different months or seasons.

(f) Please confirm that YECL used a twenty year rolling average of Heating Degree Days (HDD) [page 2-5, line 22].

(g) If f) above is confirmed please explain why attachments 1 through 21 show data only for 1998-2012. Please provide calculations in an excel file.

(h) Please provide actual (2008-2012) and forecast (2013-2015) sales by month for each test year and rate zone (Hydro, Large Diesel, Small Diesel and Old Crow) in excel file.

Response:

(a) Details of residential customer forecast with all known residential property developments are provided in YEC-YECL-3(a) Attachment 1.

(b) No, Yukon Electrical did not consider the population growth because we are not aware of the availability of a population forecast for the test period by community from a reliable independent source, which can be used in its customer count forecast.

(c) Please refer to YEC-YECL-3(c) Attachment 1.

(d) Yukon Electrical did not consider the use of a multi-variant regression because adding more independent variables to the regression equation, the sole purpose of which is to identify and quantify the impact of weather on average consumption, would obscure the impact of the weather variable.

In addition, as Attachment 21 of the Application indicates, the R^2 for the regression between UPC and HDD for the various communities ranges between 50% to 84%, with a t-stat greater than 2. This indicates that the HDD variable is significant at a 5% confidence interval. In other words the temperature (HDD) is responsible for at least 50% to 84% of variations in average electricity consumption in those communities. Given the small size of these communities and the lack of appropriate data, Yukon Electrical believes it is reasonable to use the approach it has used in forecasting the future energy consumption for the test period.

(e) If Yukon Electrical's understanding of this question is correct, the question is asking to perform 320 regressions, (20 communities * (12 months + 4 seasons)) for the assessment of the monthly and seasonal sensitivities. Yukon Electrical does not see the relevance of this question with respect to its proposed sales forecast and, given the significant amount of work it entails, is not prepared to complete the analysis to answer the question.

(f) Confirmed.

(g) Yukon Electrical used 15 years of data for the UPC and HDD regression because that is the highest number of years for which Yukon Electrical has data for all communities. Please refer to YUB-YECL-57 Attachments for details.

(h) Please refer to YEC-YECL-3(h) Attachment 1 for billed sales by month for each test year by rate zone. The forecast is created on a monthly billed basis and is then converted to an earned forecast, which aligns with Schedule 2.1 in this Application.

YEC-YECL-4

Reference: Section 2 – Sales and Revenue – Commercial Sales Forecast

Request:

(a) Please provide details of commercial customer forecast for 2013, 2014 and 2015. Please include a list of the twelve new large commercial customers with the forecast load for each customer for all test years. Provide for each year included in the GRA (2010-2015) the number of new commercial customers in Whitehorse and the average UPC each year for these new customers.

(b) Please confirm that for Watson Lake the most recent three-year average actual UPC was used.

(c) Please discuss why weather normalized UPC is not used for commercial sales forecast.

(d) Please provide the impact for each forecast year of using the three-year average UPC for Whitehorse. Please provide calculations in an excel file.

(e) Please provide the 2012 actual loads for the "several secondary commercial customers" who converted to primary service as referenced (page 2-12, lines 13-15).

(f) Please provide actual (2008-2012) and forecast (2013-2015) sales by month for each test year and rate zone (Hydro, Large Diesel, Small Diesel and Old Crow) in an excel file.

Response:

(a) Please refer to the response to information request CW-YECL-3.

(b) Confirmed.

(c) As stated on Page 2-5 and 2-6 of the Application, actual weather-normalized UPC is used for determining the forecast of the commercial sales in Whitehorse. However, weather normalization was not used for the remaining communities

because of a poor correlation between the average UPC and HDD for those individual communities.

(d) As indicated in YEC-YECL-4(d) Attachment 1, the 3 year average actual commercial UPC would result in a lower energy forecast than the proposed values in Yukon Electrical's 2013-15 GRA.

(e) As detailed in the table below, the 2012 actual load for the 12 customers who converted from secondary to primary service was 2,489 MWh.

Customer ID	Load (MWh)
Customer 1	163
Customer 2	17
Customer 3	42
Customer 4	86
Customer 5	19
Customer 6	2
Customer 7	292
Customer 8	-
Customer 9	-
Customer 10	6
Customer 11	1,862
Customer 12	-
Total	2,489

(f) Please refer to YEC-YECL-4(f) Attachment 1 for billed sales by month for each test year by rate zone. The forecast is created on a monthly billed basis and then converted to an earned forecast which aligns with Schedule 2.1 of the Application.

The Yukon Electrical Company Limited
Commercial UPC and Energy - 3 Year Average Actual vs Normalized

	Annual 3 Year Average Actual UPC (kWh)	Annual Normalized UPC (kWh)	Annual Average Customer (kWh)
2013	66,969	67,270	2,031
2014	66,969	67,923	2,055
2015	66,969	68,355	2,087

	Annual 3 Year Average Actual UPC_Energy (MWh)	Annual Normalized UPC_Energy (MWh)	Difference (MWh)
2013	135,993	136,605	(612)
2014	137,619	139,580	(1,961)
2015	139,732	142,625	(2,893)

YEC-YECL-5

Reference: Section 2 – Sales and Revenue – Lighting Sales Forecast

Request:

(a) Please provide forecast method for streetlight sales, including average usage per light for each lighting type (kW.h/year/light type) and number of lights by lighting type and by community.

(b) Please provide actual (2008-2012) and forecast (2013-2015) sales by month for each test year and rate zone (Hydro, Large Diesel, Small Diesel and Old Crow) in excel file.

Response:

(a) Forecast Method for streetlight sales:

Streetlight Energy Sales = (Number of streetlights) x (Average use per light)

Rate	Light Type	Use per light (kwh)		
		2013	2014	2015

YEC-YECL-6 AMENDED

Reference: Section 2 – Sales and Revenue – Industrial Sales Forecast

Request:

(a) Please provide details of the industrial load forecast, including the forecast provided by Whitehorse Copper Tailings (WHCT).

(b) Please provide monthly sales and demand forecasts.

(c) Please discuss winter load requirements for WHCT, if any.

(d) Please provide details of the proposed deferral account relating to WHCT sales uncertainty, including trigger points when the difference between forecast and actual will be refunded to or collected from customers, and how YECL proposes to collect/refund the difference. Please provide examples by assuming WHCT actual sales for the test years are higher than forecast and lower than forecast.

(e) Please confirm that such a deferral account reduces YECL's regulatory risk and transfers this to the ratepayer. If so, why is it necessary to do so? If not, why not.

(f) Please provide examples of other similar deferral accounts used by other regulated utilities in Canada.

Response:

(a & b) Please refer to UCG-YECL-8(e) Attachment 1. Whitehorse Copper Tailings provided load and the approximate start-up time in which Yukon Electrical based the sales forecast on.

(c) WHCT has advised Yukon Electrical that it intends on being in operation for 9 months in a year: March to November.

(d) Unless the deferral account grows to greater than 0.5% of Yukon Electrical's revenue requirement (approximately $300,000), Yukon Electrical would propose to collect/refund the difference as part of its next GRA. If the deferral did grow to this level, Yukon Electrical would make an application to the Board to

dispense of the balance. Please refer to YEC-YECL-6(d) Attachment 1 for an example of the proposed deferral calculation assuming WHCT sales are higher than forecast or lower than forecast, as well as if WHCT does not start up operations in 2013-2015.

(e) Not confirmed. No industrial customers were forecast as part of Yukon Electrical's 2008/2009 GRA. Therefore, the requested deferral account does not reduce Yukon Electrical's risk profile but rather keeps it constant.

(f) Yukon Electrical is aware of two examples of similar deferrals used by other regulated utilities in Canada.

- Northland Utilities (NWT) Limited ("Northland") requested a very similar deferral as part of its 2008-2010 GRA. Northland did not have any industrial customers but was in discussions at the time the Application was filed with a potential mining customer, Tamerlane Ventures Inc., regarding the provision of electrical service starting in the fourth quarter of 2008. Northland applied for a deferral account to capture revenues and costs associated with providing service to the potential new industrial customer, as the start-up date and load could not be reasonably forecast. In Decision 25-2008, the NWTPUB approved this deferral.

- In the Yukon in 1998, the Board ordered the creation of a deferral account related to the sales of Yukon Energy to the Faro mine site under Rate Schedule 34. In Board Order 1998-5, the Board stated:

> All revenue derived from Rate Schedule 34, less reasonable incremental costs associated with supplying the Faro mine site under this rate schedule, shall be placed in a deferral account for subsequent application to the benefit of customers as directed by the Board.

Other than the above examples, Yukon Electrical is not aware of any other similar deferral accounts used by other regulated utilities in Canada that would be applicable to the unique start-up timing and load uncertainties currently being faced by Yukon Electrical as part of this Application.

The Yukon Electrical Company Limited
Sample Calculation of Proposed Whitehorse Copper Tailings Deferral

	2013	2014	2015
Forecast Load (MWh) (per Schedule 2.1 of the Application)	1,025	4,620	4,620
Forecast Revenue per kWh (per Schedule 2.1 of the Application)	$ 0.1391	$ 0.1326	$ 0.1326
Forecast Purchase Power Rate per kWh (per Schedule 3.1 of the Application)	$ 0.0830	$ 0.0830	$ 0.0830
Forecast Line Losses (Per Schedule 3.2 of the Application)	6.2%	6.2%	6.2%
Scenario #1 - Whitehorse Copper Load is 50% Lower Than Forecast			
Actual Load (MWh)	512	2,310	2,310
Change in Revenues	$ 71,289	$ 306,198	$ 306,198
Change in Purchase Power Costs	$ (45,155)	$ (203,568)	$ (203,568)
Amount to Be Collected From (Refunded To) Customers	$ 26,134	$ 102,630	$ 102,630
Scenario #2 - Whitehorse Copper Load is 50% Higher Than Forecast			
Actual Load (MWh)	1,537	6,930	6,930
Change in Revenues	$ (71,289)	$ (306,198)	$ (306,198)
Change in Purchase Power Costs	$ 45,155	$ 203,568	$ 203,568
Amount to Be Collected From (Refunded To) Customers	$ (26,134)	$ (102,630)	$ (102,630)
Scenario #3 - Whitehorse Copper Does Not Start Operations in the Test Period			
Actual Load (MWh)	-	-	-
Change in Revenues	$ 142,579	$ 612,396	$ 612,396
Change in Purchase Power Costs	$ (90,310)	$ (407,136)	$ (407,136)
Amount to Be Collected From (Refunded To) Customers	$ 52,269	$ 205,260	$ 205,260

YEC-YECL-7

Reference: Section 2 – Sales and Revenue – YECL/YEC Retail Revenue

Request:

(a) Please provide details of the YECL revenue forecast calculation by rate class for each test year, including assumed average rate per kW.h, assumed sales and revenue by rate blocks for each rate class and assumed sales and revenue by government and non-government customer type for each rate class.

(b) Please provide details of YEC revenue forecast calculation for test year as shown in Schedule 2.1.

Response:

(a) Please refer to YEC-YECL-7(a) Attachment 1 for the requested calculations.

(b) Please refer to YEC-YECL-7(b) Attachment 1 for the details of the Yukon Energy revenue forecast for the test years as provided by Yukon Energy by e-mail on May 3, 2013.

YEC-YECL-8

Reference: Section 3 – Purchase Power – Generation and Purchased Power forecast

Request:

(a) Please provide details of requested Purchase Power Flow Through deferral account, including:

(i) Please confirm the balance of this account is zero.

(ii) Please confirm that the Purchase Power Flow Through deferral account requires a collection mechanism to be implemented and approval by the YUB prior to collecting or refunding any balances.

(iii) Please provide any updates regarding the status of any future collection mechanism to be proposed by YECL.

Response:

(a) (i) Yukon Electrical is able to confirm the balance was zero at least with respect to what it knew as of December 31, 2012. It is presently unclear as to whether a final Board decision on Wholesale Rate Schedule 42 and the associated Energy Reconciliation Adjustment (ERA) will, or will not, result in a deferral balance as of December 31, 2012 and for periods thereafter.

(ii) Confirmed.

(iii) There is no update regarding the status of any future collection mechanism.

YEC-YECL-9

Reference: Section 4 – Fuel Cost – Fuel Price Flow Through deferral account

Request:

(a) Please provide details of any consultation with YEC and other stakeholders regarding the Fuel Price Flow Through deferral account. If no consultations have taken place, please explain why?

(b) Please provide details of the Fuel Price Flow Through deferral account by providing examples for next five years:

(i) assuming diesel/LNG fuel prices are higher than GRA approved; and

(ii) assuming diesel/LNG fuel prices are lower than GRA approved

Response:

(a) Yukon Electrical did not have any consultation with YEC or other parties regarding Yukon Electrical's proposed change to the Fuel Price Flow Through Deferral for Watson Lake fuel. While Yukon Electrical consulted parties on a variety of areas issues associated with this Application, (please refer to UCG-YECL-2 for discussion of the consultation that took place) this particular deferral request is not complex in nature and is best served by having it reviewed and tested as part of this Application.

(b) (i) Please refer to YEC-YECL-9(b) Attachment 1.

(ii) Please refer to YEC-YECL-9(b) Attachment 2.

YEC-YECL-10

Reference: Defined Benefit Deferral Account

Request:

(a) Please confirm that such a deferral account reduces YECL's regulatory risk and transfers this to the ratepayer. If so, why is it necessary to do so? If not, why not.

(b) Please provide examples of other similar deferral accounts used by other regulated utilities in Canada.

Response:

(a) Not confirmed in the context of this GRA as compared to the 2008-2009 GRA. When Yukon Electrical filed its last GRA in 2008, Federal pension regulations in place at that time required updated actuarial valuations to be completed for defined benefit ("DB") pension plans once every three years. An actuarial valuation for the DB plan that Yukon Electrical participates in was completed as at December 31, 2006 to determine the required funding for the years 2007-2009. The level of the required contributions was known for the three year period 2007-2009 which, in turn, covered the test period 2008-2009.

In 2010, regulations amending certain Federal pension regulations came into force. As a result, Federally-regulated pension plans, such as the plan in which Yukon Electrical participates, are now generally required to file updated actuarial valuation reports on an annual basis. As the valuation reports determine the required funding for the next year, this means that Yukon Electrical's required contributions will fluctuate on a yearly basis throughout the 2013-2015 test period. The required contributions can both increase or decrease depending on market conditions and the performance of the pension plan assets in any year. That means that there is forecast risk for both Yukon Electrical (in the case of an increase in required contributions over the amounts included in Yukon Electrical's revenue requirement) and the ratepayer (in the case of a decrease in required contributions over the amounts included in Yukon Electrical's revenue requirement) if a deferral account is not approved. To provide further context for the need for this deferral, Yukon Electrical's contributions between 2006 and 2012 have varied between a low of $0 per year and a high of $1,268,000 per year.

(b) Yukon Electrical has not completed an exhaustive search of other utilities in Canada with similar deferral accounts. Yukon Electrical is, however, able to advise that both Northland Utilities (Yellowknife) Limited and Northland Utilities (NWT) Limited have similar deferral accounts approved that cover all increases or decreases to required cash contributions to the defined benefit pension plan as compared to forecast.

YEC-YECL-11

Reference: Section 7 – Depreciation – Depreciation Expense

Request:

(a) Please reconcile the depreciation rates on schedules 7.2 -7.4 to the Depreciation Study results performed by Gannett Fleming. Please explain if any difference.

(b) Please provide a comparison by account of the proposed depreciation rates to the last approved depreciation rates.

(c) Please provide schedules using YECL's last approved depreciation rates similar to schedules 7.2-7.4.

(d) Please identify the amounts included as expense in the 2013-15 GRA revenue requirements with respect to net salvage costs. Indicate under which account or category these forecast expenses are included.

Response:

(a) The Depreciation Study results performed by Gannett Fleming and provided in Section 7, Attachment 1 are based on its depreciation analysis as of December 31, 2011. The results of Gannett Fleming's 2011 study produced depreciation parameters of Iowa Curve, average service life, and net salvage percentage. To more accurately reflect the actual depreciation rates that will be used for actual 2013-2015 data, Yukon Electrical has applied Gannett Fleming's recommended depreciation parameters to Yukon Electrical's forecast year end balances.

(b) The YUB approves depreciation parameters of Iowa Curve, Average Service Life and Net Salvage Percentages. The depreciation rates are the result of the application of these recommended depreciation parameters to forecast balances. Please refer to YEC-YECL-11(b) Attachments 1 to 3 for a comparison of 2013-2015 depreciation rates using the depreciation parameters approved in the 2008/2009 GRA to the forecast depreciation parameters for the 2013-2015 GRA.

(c) Please refer to YUB-YECL-83(a) Attachment 1.

(d) There are no net salvage costs included in expense. Please refer to the following for the Net Salvage costs included as part of the Reserve for site restoration (per YEC-YECL-12(b) Attachment 1).

Costs of Removal	49	50	185	100	64
Gross Salvage	(74)	(14)	(68)	(38)	(10)

YEC-YECL-12

Reference: Section 7 – Depreciation – Depreciation Study

Request:

(a) The YUB ruled in decision 2009-02 that YECL was not entitled to collect a provision for salvage. Please explain what has changed in Yukon that justifies YECL requesting this large increase in depreciation expense.

(b) Please provide a continuity schedule of the reserve for site restoration for each year 2008-2012. For each year, please provide a schedule of individual charges to the Fund and, for each charge, provide the justification for each charge to the fund.

(c) Please provide further detailed explanation regarding how the proposed deferral account to allow the ability to file future applications, as necessary, to change its depreciation parameters within the 2013-2015 test period, and flow through the impact of any such change to customers within the test period would operate. Please provide any illustrative examples.

(d) Please provide examples of other similar deferral accounts used by other regulated utilities in Canada.

Response:

(a) The first issue that has changed since Board Order 2009-02 is that sending the right price signal to customers has taken on added importance as a result of diesel generation once again being on the margin in the Yukon. As Yukon Energy is aware, price signals that reflect the full cost to serve customers were discussed as part of the 2010 Yukon Electrical and Yukon Energy Joint Phase II Rate Application. While a large amount of the rate design discussion centered on economy and efficiency principles within the rate design of runoff rates and what exactly was meant by the term “economy and efficiency”, Yukon Electrical notes the following statements in Board Order 2010-13 (paragraphs 196-197):

> The Board has considered the views of all the Parties and notes that there clearly is no consensus on this issue. However, it is clear that the Companies agree that in the past, economy and efficiency has been linked to the incremental cost of diesel generation.
>
> In terms of pricing signals, the Board is of the view that the best pricing signals to customers are those prices that reflect the full cost to serve those customers. Arguments on incremental cost of diesel generation, or what portion of the incremental cost of diesel generation should be reflected in the runoff rates should take a distant backseat to the proper alignment of costs to revenues for each rate class. Once rebalancing has occurred for the rate classes, then issues relating to runoff can be examined in greater detail.

While the above statements were in the context of runoff rates, it is for this exact reason of prices reflecting the full cost to serve customer that Yukon Electrical is requesting to once again collect negative net salvage as part of its revenue requirement.

A second large change since Board Order 2009-02 has been the development and inclusion in this Application of the Joint Yukon Electrical and Yukon Energy Demand Side Management (DSM) program. As Yukon Energy is aware, this program will promote energy conservation and will result in lower energy consumption. It is Yukon Electrical's position that it is counter intuitive to be investing in this DSM program while, at the same time, not sending the right price signal by not fully charging current customers for the cost to provide electric service; namely the cost associated with net salvage.

A third large change since Board Order 2009-02 has been the cessation of collection of net salvage resulting in Yukon Electrical falling considerably behind in its required recovery of the funds for future removal of assets. In the 3 year period from 2009 through 2011, an increase in the amount of Future Removal and Site Restoration (i.e. FRSR) deficiency transfer from current users of the Yukon Electrical utility assets to future rate-payers of $7.9 million has accrued to a total balance of over $12 million. It is noted that this significant increase in transfer to future rate-payers is caused by two significant forces. Firstly, the retirement costs associated with assets that have retired over the past 3 year

period have drawn down the FRSR by over 6.2%[1] of the balance that existed at December 31, 2008. However, this draw down of the FRSR was caused by retirements of only approximately 3% of the plant in service as at December 2008[2]. In other words, the FRSR balance is drawing down at approximately twice the rate of the asset retirement activity of the plant in service balance that existed at December 31, 2008.

The second cause of the significant increase in the accumulated FRSR deficiency is the fact that older vintages of assets are now 3 years closer to expected retirement, providing less time for these vintages to recover the FRSR deficiency. While approximately 3% of the investment in plant in service as of 2008 has retired over the period from 2009 through 2011, this pace of retirements is expected to significantly increase in future years, which will require significantly increased amounts of cost of removal funding. For example, over the past 16 years, 4 diesel generating units have been removed and retired from service. However, over the next 3 year period 7 units will require replacement due to age and condition. As such, the pace of retirements will significantly increase over the next few years.

Gannett Fleming has advised that the level of accumulated FRSR deficiency will continue to increase at an increasingly rapid pace in future years, if FRSR funding is not re-instated into the deprecation calculations. As noted above there are two independent forces that are causing increases in the amount of the deficiency, that will cause the deficiency to grow at an exponential rate, as witnessed over the past 3 year period. The inter-generational inequity of the current process as mandated by the Board in Decision 2009-02 has already caused future rate-payers to bear $7.9 million of additional burden, and continuation of this practice will see this burden increase by exponential amounts in future years.

The concept of inclusion of net salvage provisions into the depreciation rate calculations has been a topic of debate in many regulatory jurisdictions across Canada since the issuance of the YUB Board Decision 2009-02. As indicated in the Additional Evidence of Larry Edwin Kennedy filed with the current Yukon Electrical Application, this topic has received considerable attention in the

[1] Calculated by comparing the 2008 FRSR balance of $4,688,112 to the 2012 balance of $4.395,151
[2] Based on2009 through 2012 retirement transactions of $3.3 million compared to the 2008 plant in service balance of $115.7 million

depreciation rate filings in many jurisdictions. However, notwithstanding the significant amount of regulatory debate, the inclusion of net salvage percentages in the depreciation rate calculations continues to be widely accepted throughout Canada and North America. Furthermore, the topic of re-instatement of net salvage into depreciation rate calculations has been specifically discussed in hearings in British Columbia in 2011, in which the BCUC specifically allowed FortisBC Energy Inc. to re-instate collection of net salvage as part of their depreciation rate calculations. As stated by the BCUC in FortisBC Energy's 2012-2013 Revenue Requirements and Rates Decision, dated April 12, 2012, pages 83-84:

> The Commission Panel accepts the FEU's proposed application of the traditional method of providing negative salvage in rates during the test period. Using a "pay as you go system" to recover salvage costs could see ratepayers of tomorrow paying higher prices to retire assets which were used to the benefit of today's ratepayers. Further the Commission Panel also does not believe a phased in approach is appropriate. In our view, such treatment will only further defer costs of today for payment by future ratepayers and, given current fuel prices, such treatment does not appear warranted.
>
> While net negative salvage rates are an estimate, the Commission Panel accepts that the rates are based on the recommendations of an independent expert. The Panel also accepts that net negative salvage is a widely used utility practice in Canada and is within the recommended accounting practices of FERC.

(b) Please refer to YEC-YECL-12(b) Attachment 1. The charges to the reserve are related to capital projects for replacement of assets.

(c) Please refer to YEC-YECL-12(c) Attachment 1 for an illustrative example of how the proposed deferral would operate.

(d) Yukon Electrical is not aware of any other similar deferral accounts currently approved / used by other regulated utilities in Canada.

The Yukon Electrical Company Limited
Illustrative Example of Proposed Depreciation Deferral

For account 47300, the Average Service Life determined by the depreciation study is 45 years. New information becomes available to Yukon Electrical that causes the company to believe that this assumption may no longer be accurate, and that the actual Average Service Life is now only 39 years. As a result, the change in life depreciation expense is as follows:

Based on depreciation parameters determined by the current depreciation study:

Account	Description	Life Parameter	Forecast Cost	Life Expense	Life Rate
47300	Poles & Fixtures	R3-45	36,821,587	883,748	2.40%

Based on updated parameters:

Account	Description	Life Parameter	Forecast Cost	Life Expense	Life Rate
47300	Poles & Fixtures	R3-40	36,821,587	1,006,220	2.73%

As a result, Yukon Electrical would have to record an additional $122,472 of depreciation expense in its financial statements for 2014.

Pre-Tax Impact of Change in Depreciation Expense	174,960
Pre-Tax Impact of Change in Rate Base	(5,505)
Additional Amount to Be Collected From (Refunded to) Customers	169,454

YEC-YECL-13

Reference: Section 8 – Return on Rate Base – Cost of Capital

Request:

(a) Please provide a copy of BCUC Order G-75-13.

(b) Please provide details and discuss YECL's proposal of using Automatic Adjustment Mechanism (AAM) and ROE Deferral Account, including:

(i) if YECL proposing that the AAM method for YECL will be the same as for the utilities in British Columbia affected by British Columbia Utilities Commission (BCUC) Order G-75-13 and any future changes to BCUC Order G-75-13 will affect YECL ROE;

(ii) how and when (beginning of the year, when Canada Bond yield changes or other) YECL is proposing to calculate AAM;

(iii) what would be basis for calculating of difference in ROE, including Rate Base (timing and amount, i.e. YUB approved Rate Base for test year or actual Rate Base at the time of adjustment), common equity ratio (timing and ratio);

(iv) by providing examples and impacts to the test years by assuming 10% higher and 10% lower long-term Canada Bond yield compared to the yield rate used for calculation of 9.21% ROE.

(c) Please confirm that per paragraph 3 of British Columbia Utilities Commission Order G-75-13 "[t]he implementation of the model [AAM] will be subject to conditions outlined in the Decision."

(d) Please provide details of the conditions outlined in the BCUC Order G-75-13 as per c) above.

(e) Please confirm that the proposed AAM and ROE deferral account does not go beyond 2013-2015 test years. If not confirmed please explain why?

(f) Please confirm that such a deferral account reduces YECL's regulatory risk and transfers this to the ratepayer. If so, why is it necessary to do so? If not, why not.

(g) Please provide examples of other similar deferral accounts used by other regulated utilities in Canada.

Response:

(a) Please refer to YEC-YECL-13(a) Attachment 1.

(b) (i) Yukon Electrical is proposing to adjust its 2014 and 2015 ROE in accordance with any adjustments that may be made to the ROE of the benchmark utility in British Columbia as a result of the application of the AAM formula, as calculated and determined by the BCUC.

(ii) It will be the BCUC that calculates the quantum of the AAM. The precise timing and mechanics of the AAM formula and its application are currently being determined by the BCUC, but Yukon Electrical understands the intent is for the AAM formula to be applied annually in advance of any given test year.

(iii) Should there be a change in the 2014 or 2015 BCUC GCOC ROE benchmark as a result of the AAM, Yukon Electrical proposes to base the adjustment on the YUB approved rate base and common equity ratio for each of those years.

(iv) Please refer to WL-YECL-16(b) for an illustration of the impact to ROE and Yukon Electrical's revenue requirement as a result of potential changes in the Long Canada Bond Forecast.

(c) Confirmed.

(d) As per pages 91 and 92 of the May 10, 2013 BCUC GCOC Decision:

> "To deal with this the Commission Panel directs that any change in ROE resulting from the AAM formula be subject to an actual long Canada bond yield of 3.8 percent being met or exceeded.

> Accordingly, the AAM formula will not be operative as long as the long Canada bond yield is below 3.8 percent."
>
> "FEI is directed to file an application for the review of the common equity component and the ROE approved in Order G-75-13 by no later than November 30, 2015."

(e) Confirmed.

(f) Not confirmed. The BCUC is re-instituting an AAM as it has the potential to contribute to regulatory efficiency by avoiding frequent costly and time consuming ROE proceedings, and did not note in its decision any impact the AAM formula has on the risk profile of the benchmark utility.

(g) Yukon Electrical has not conducted an exhaustive search of similar mechanisms used in other regulatory jurisdictions. In British Columbia, the AAM will be used by: FortisBC Inc., FortisBC Energy (Vancouver Island), FortisBC Energy (Whistler), Pacific Northern Gas Ltd. and Pacific Northern Gas (N.E.) Ltd.

In accordance with prior Yukon Board direction, Yukon Electrical is proposing to link its ROE to the recently approved BCUC GCOC benchmark rate plus a risk premium, and, consistent with the BCUC Decision, to include a mechanism for adjusting its ROE in step with any changes to the ROE of the BCUC benchmark utility resulting from the application of the AAM formula.

IN THE MATTER OF

BRITISH COLUMBIA UTILITIES COMMISSION

GENERIC COST OF CAPITAL PROCEEDING
(STAGE 1)

DECISION

EXECUTIVE SUMMARY

By Order G-20-12 on February 28, 2012, the British Columbia Utilities Commission (Commission) initiated the Generic Cost of Capital (GCOC) proceeding pursuant to section 82 of the *Utilities Commission Act* to review and determine among other things, the following:

- The setting of the appropriate cost of capital for a benchmark low-risk utility;
- The possible return to an automatic adjustment mechanism (AAM) for setting the return on equity (ROE) for the benchmark utility each year; and
- The establishment of a deemed capital structure and deemed cost of capital methodology, particularly for those utilities without third party debt.

By Order G-48-12 on October 11, 2012, the Commission established the following:

- The proceeding will have two stages; Stage 1 will determine the cost of capital for the benchmark utility and Stage 2 will establish the cost of capital for other utilities as compared to the benchmark.
- Fortis Energy Inc. (FEI) in its pre-amalgamation state will serve as the benchmark utility for the GCOC proceeding; and
- An oral public hearing commencing on December 12, 2012, will be held to determine the cost of capital for the benchmark utility.

Fair Return Standard

The Fair Return Standard is foundational for cost of capital proceedings and has three requirements for a fair and reasonable return on capital: the comparable investment requirement, the financial integrity requirement, and the capital attraction requirement. The Commission Panel, consistent with previous decisions and the regulatory compact, confirms that the Commission has a duty to approve rates that will provide a reasonable opportunity to earn a fair return on invested capital. In the current proceeding, the Commission Panel has not considered the rate impacts of the revenue required to yield the fair return but has noted that by seeking an optimal capital structure and the opportunity cost of capital, the needs of customers are being served.

Contextual Issues

Three important issues were raised that were contextual in nature; the significance of past cost of capital decisions, the significance of decisions from other jurisdictions and the relevance of the disparity between "allowed" and "actual" ROE.

With respect to past cost of capital decisions and appropriate points of reference, the Commission Panel accepts that the 2009 Decision is a reasonable point of reference with respect to long-term risk as this is the most recent proceeding and has been used extensively by the parties. The Panel also remains open to looking back to the 2006 ROE Decision where appropriate.

With respect to reliance upon data from US jurisdictions, the Commission Panel has determined that it is appropriate to continue to accept the use of historical and forecast data but do not accept that US data should be considered to be the same or be given equal weight as data for Canadian utilities. Concerning Canadian jurisdictional decisions, the Panel acknowledges the importance of considering methodologies, approaches, and regulatory principles related to other jurisdictions' decisions but does not accept the use of results and values for the purpose of calibration.

Concerning the relevance of disparity between FEI's "allowed" and "actual" ROE, the Panel concludes that debt and equity investors, who in their risk assessment consider both long and short-term cash flows as well as risk of financial disruption, will derive some comfort from FEI's positive track record. However, the relevance of disparity between allowed and actual ROE of FEI is entrenched in the regulatory compact, revenue requirements proceedings, and management's proactive approach. Additionally, the Panel is of the view that these differences are assessed in revenue requirement proceedings.

Capital Structure

In determining an appropriate capital structure for the benchmark utility, the Commission Panel considered FEI's long and short-term risk, development of an optimal capital structure, credit ratings and metrics and experiences of other jurisdictions.

The Commission Panel is supportive of maintaining an "A" category credit rating but only to the extent that it can be maintained without going beyond what is required by the Fair Return Standard. The Commission Panel finds that reductions in long-term risk are warranted with respect to provincial climate and energy policies as well as the competitive position of natural gas relative to electricity. While acknowledging that there has been little change in short-term risk since the 2009 Decision, the Panel has determined that only minimal weight can be given to short-term risk as an impediment to earning a fair return. In consideration of both long and short-term risks, the Commission Panel has determined that a reduction in common equity ratio of 1.5 percent to 38.5 percent is appropriate. The Commission Panel considers a 38.5 percent common equity ratio reflects the reduced long-term risk, yet balances this against potential disruption caused by a significant weakening of credit metrics. The awarded common equity ratio falls within the upper end of the range of comparative utilities in other Canadian jurisdictions.

Return on Equity

The Commission Panel considered expert evidence on various model approaches to determine ROE. The Panel finds that the discounted cash flow model and the capital asset pricing model should be given equal weight in determining the ROE of the benchmark utility. No weight was given to the equity risk premium and comparative earnings models. The Commission has determined that an ROE of 8.75 percent inclusive of a 0.50 percent allowance for financial flexibility is appropriate for the benchmark utility. The benchmark utility ROE will be effective January 1, 2013 and will be effective until December 31, 2015, subject to updating as a result applying the AAM formula.

Automatic Adjustment Formula

Consideration was given to re-instituting an AAM formula for annually setting the ROE for a benchmark utility between proceedings, which had been eliminated in the 2009 Decision. In addition, consideration was given to the status of AAMs in other jurisdictions and what optional AAMs might be considered. The Commission Panel has determined that it is appropriate to re-establish an AAM formula noting that it better meets the FRS than giving no consideration to the market changes over the period between ROE proceedings. The Panel has directed that a two variable model considering changes to utility bond spreads and the long-term Canada bond yield be

established to determine the benchmark ROE on an annual basis commencing in the 2014 calendar year. Implementation of the AAM will be subject to an actual Canada bond yield of 3.8 percent being met or exceeded. Therefore, the AAM formula will not be in effect as long as the long Canada bond yield is below 3.8 percent.

Cost of Capital – Small Utilities

Stage 1 of the GCOC proceeding considered the cost of capital for the benchmark utility, FEI. Stage 2 will assess the differences in short and long-term risk faced by regulated utilities in British Columbia other than FEI and their impact on the capital structure and ROE for these utilities. The Commission Panel has recommended that the utilities be separated into three groups, each of which will be handled separately. The Commission Panel has also made a number of determinations and findings with respect to the handling of the size factor as a business risk and deemed short and long-term debt interest rates.

1.0 INTRODUCTION

1.1 Background

The 2009 ROE Decision[1] (2009 Decision) was issued concurrently with Order G-158-09 on December 16, 2009. The Order set the return on equity for FEI, the benchmark utility in British Columbia, at 9.5 percent effective July 1, 2009, and the equity ratio at 40 percent effective January 1, 2010. Order G-158-09 also eliminated the AAM, which had been utilized to set the ROE for the benchmark utility annually. Since that Order, there have been no further adjustments to the ROE or capital structure of the benchmark utility.

This Decision for Stage 1 of the Generic Cost of Capital (GCOC) proceeding sets out:

- the new approved ROE and capital structure for FEI;
- the new automatic adjustment formula and the conditions under which it will be in effect; and
- the framework to review the cost of capital for small utilities.

Stating that changes have occurred in the financial markets since the 2009 Decision, the Commission, by Order G-20-12 dated February 28, 2012, initiated the GCOC proceeding pursuant to section 82 of the *Utilities Commission Act* (*UCA*) to review and determine, among other things, the following:

- the ROE and capital structure for a benchmark low-risk utility;
- the possible return to an AAM to set the ROE for the benchmark utility each year; and
- a deemed capital structure and deemed ROE for small utilities, particularly those utilities without short-term debt.

Order G-20-12 established that all public utilities would be considered applicants in the GCOC proceeding and included a preliminary scoping document, which set out a list of matters to be examined and determined within the proceeding. The Order further divided the list of utilities regulated by the BCUC into Affected Utilities and Other Utilities. The Affected Utilities have been so designated given their active participation in previous ROE proceedings or their anticipated interest

[1] In the Matter of Terasen Gas Inc., Terasen Gas (Vancouver Island) Inc., Terasen Gas (Whistler) Inc. and Return on Equity and capital Structure Decision, December 16, 2009.

in the GCOC proceeding as investor-owned utilities. These utilities were expected to take a lead role in filing evidence for cost of capital matters that may impact them. The Other Utilities are so designated as they have not actively participated in previous ROE proceedings and they were not expected to file evidence in the GCOC proceeding.

On April 18, 2012, the Commission, by Order G-47-12, issued a final scoping document, which set out the purpose and scope of the proceeding. On April 19, 2012, the Commission issued a preliminary draft of the minimum filing requirements. Following submissions by Registered Interveners, the Commission issued Order G-72-12 on June 1, 2012, which set out the minimum filing requirements for those utilities expected to participate and a preliminary regulatory timetable. In an attachment to Appendix A to the Order, the Commission also placed on the record the terms of reference for a Survey of Cost of Capital Practices in Canada prepared by the Commission consultant, the Brattle Group (Brattle Report).

On October 11, 2012, following a procedural conference held on October 4, 2012, the Commission by Order G-148-12 established that in 2012, FEI in its pre-amalgamation state, will serve as the benchmark utility for the GCOC proceeding. The Order also established an oral public hearing to commence on December 12, 2012, to hear the cost of capital for the benchmark utility. In addition, it was determined that the proceeding will have two stages: Stage 1 establishing the ROE and capital structure for FEI the benchmark utility, and Stage 2, establishing a cost of capital for other utilities as compared to the benchmark utility.

1.2 Purpose and Scope of the Generic Cost of Capital Proceeding

The Commission determined the purpose and scope of the GCOC proceeding in Order G-47-12, with certain outstanding matters such as the appropriate utility, which would serve as the benchmark utility, determined by Order G-148-12 dated October 11, 2012. The purpose and scope of this proceeding are as follows:

PURPOSE OF THE PROCEEDING

The main purposes of the GCOC Proceeding are:

I. to establish a method to determine the appropriate cost of capital for a benchmark low-risk utility in British Columbia, commencing January 1, 2013, and to establish how the Benchmark return on equity (ROE) will be reviewed, and if required, adjusted on a regular basis;

II. to establish a generic methodology or process on how to establish each utility's cost of capital based on the cost of capital for a benchmark low-risk utility; and

III. to establish a framework for determining the appropriate cost of capital for other smaller utilities in the province.

SCOPE OF THE PROCEEDING

I. The appropriate cost of capital for a benchmark low-risk utility effective January 1, 2013. Cost of capital includes capital structure, return on common equity, and interest on debt.

II. Establishment of a Benchmark ROE based on a benchmark low-risk utility effective January 1, 2013 to December 31, 2013 for the initial transition year.

III. Whether re-establishment of an ROE automatic adjustment mechanism (AAM) is warranted. If a return to the use of a formulaic ROE AAM is accepted as a result of the GCOC Proceeding, it would be implemented January 1, 2014. If not, a future regulatory process will be set to review the ROE for a benchmark low-risk utility beyond December 31, 2013 on a regular basis.

IV. A generic methodology or process for each utility to determine its unique cost of capital in reference to the benchmark low-risk utility.

V. In certain circumstances, a methodology to establish a deemed capital structure and deemed cost of capital, particularly for those utilities without third-party debt. This would involve setting a methodology on how to calculate a deemed interest rate.

VI. In certain circumstances for those utilities that require a deemed interest rate, a methodology to establish a deemed interest rate automatic adjustment mechanism (Interest AAM). If warranted, the Interest AAM would be implemented for January 1, 2014. If not warranted, setting a future regulatory process on how the deemed interest for a benchmark low-risk utility would be adjusted in future years beyond December 31, 2013.

1.3 Regulatory Process

As noted previously, the Commission retained The Brattle Group to prepare a survey report on the Cost of Capital Practices in Canada. The Brattle Report, filed as Exhibit A2-3 on June 8, 2012, provides a description of the cost of capital estimation methods and the common approaches in implementing the results in Canadian jurisdictions. The Brattle Report was intended to provide context and background for the establishment of the cost of capital of a low-risk benchmark utility

in B.C. All parties were provided with the opportunity to file Information Requests (IRs) on the Report.

In accordance with Order G-72-12, the following utilities filed minimum filing requirements:

- FEI, FortisBC Inc. , FortisBC Energy (Vancouver Island) Inc. (FEVI), and FortisBC (Whistler) Inc. (FEW),[collectively (FBCU)];
- Pacific Northern Gas Ltd. and Pacific Northern Gas (N.E.) Ltd. [collectively (PNG)]; and
- Corix Utilities (Corix).

The Industrial Customers Group of FortisBC Inc. (ICG) and the BC Utility Customers comprising the Association of Major Power Customers of BC (AMPC), the British Columbia Pensioners' and Seniors' Organization (BCPSO), and the Commercial Energy Consumers of BC (CEC) were active in the proceeding. Two rounds of IRs with respect to evidence filed by Affected Utilities and one round of IRs on evidence filed by Interveners took place.

The oral public hearing, including an *in camera* session on FBCU's confidential reports, took place over a period of seven days between December 12, 2012 and December 21, 2012. FBCU tendered five witness panels for cross-examination and Corix, BC Utility Customers, and the ICG each had one witness panel for cross-examination.

A list of procedural orders in the GCOC proceeding is included in Appendix A. A list of Appearances is included in Appendix B and Appendix C contains a list of witness panels that gave evidence. Appendix D contains the List of Exhibits. Appendix E contains a risk matrix used in a recent Commission decision with respect to a small utility that is Appendix B to Order C-1-13, Appendix F contains summary tables of ROE estimates by expert witnesses retained by the utilities and ratepayer groups, and. Appendix G is a list of acronyms.

1.4 Approach to Decision

The legal framework for determining a fair return for a regulated utility is called the "Fair Return Standard" and is discussed in Section 2.

There are a number of broader issues of importance, which were raised by this proceeding. These are contextual in nature and include the following:

- importance of past cost of capital decisions;
- consideration of decisions from other jurisdictions; and
- the relevance of the disparity between "allowed" and "actual" ROE.

These issues are discussed in Section 3 and provide the Commission Panel with a context to assist in reviewing and assessing the evidence.

Section 4 deals with an appropriate capital structure given FEI's level of risk with consideration of credit ratings and metrics and decisions in other jurisdictions. Section 5 considers the appropriate ROE for the benchmark utility with a review of some of the key issues and models employed by the expert witnesses. Section 6 examines potential AAM models and whether there is justification to return to a reliance on such a mechanism. Section 7 considers issues related to cost of capital for small utilities, and Section 8 examines the need for financial models presented in proceedings such as this to have a sound theoretical basis.

2.0 LEGISLATIVE FRAMEWORK – THE FAIR RETURN STANDARD

2.1 Legislative Requirement

The enabling legislation for the BCUC, the *UCA*, provides that a public utility must not make, demand or receive:

(a) an unjust, unreasonable, unduly discriminatory or unduly preferential rate for a service provided by it in British Columbia;

(b) a rate that otherwise contravenes this Act, the regulations, orders of the commission or any other law.

A rate is "unjust" or "unreasonable" if it is:

(a) more than a fair and reasonable charge for service of the nature and quality provided by the utility;

(b) insufficient to yield a fair and reasonable compensation for the service provided by the utility, or a fair and reasonable return on the appraised value of its property; or

(c) unjust and unreasonable for any other reason.[2]

The *UCA*, and other Canadian legislation delegating power to regulatory tribunals, follow what is known as the "Regulatory Compact." In general terms, the Regulatory Compact states that in exchange for an exclusive franchise to serve a defined area:

- a regulated utility must provide safe, reliable, non-discriminatory service to its ratepayers at cost-based rates as prescribed by the regulatory tribunal, and
- the regulatory tribunal must allow the regulated utility an opportunity to earn a fair return on its invested capital.

(Exhibit C4-9, p. 7; BCPSO Final Submission, p. 3)

The approach to determining a fair return on the cost of invested capital in a regulated utility has normally been referred to as the Fair Return Standard (FRS).

---

[2] *UCA* sections 59 (1) (a) (b), 59(5), 60 (1) (a) (b) (i)

2.2 Elements of a Fair Return Standard

The Supreme Court of Canada decision in *Northwestern Utilities Ltd*. v. *Edmonton (City),* [1929] S.C.R. 186, (*Northwestern Utilities*) at pages 192-193 describes the FRS as follows:

> "The duty of the Board was to fix fair and reasonable rates; rates which, under the circumstances, would be fair to the consumer on the one hand, and which, on the other hand, would secure to the company a fair return for the capital invested. By a fair return is meant that the company will be allowed as large a return on the capital invested in its enterprise, (which will be net to the company,) as it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise." (per Lamont J.)

The Brattle Report notes that the legal decisions, which provide the overarching principles of the FRS, do not prescribe how to determine comparability, how to estimate the cost of capital for the comparable companies, or how to apply those estimates when setting allowable rates. The cost of capital is the expected rate of return in capital markets on alternative investments of equivalent risk. The expected rate of return investors require is based on the risk-return alternatives available in competitive capital markets. In other words, the cost of capital is a type of opportunity cost: it represents the rate of return that investors could expect to earn elsewhere without bearing more risk. (Exhibit A2-3, pp. 2-3)

On page 8 in the 2009 Decision, the Commission endorsed the National Energy Board's (NEB) articulation of the Fair Return Standard in NEB Decision RH-1-2008 where NEB stated:

> "The Fair Return Standard requires that a fair or reasonable overall return on capital should:
>
> - Be comparable to the return available from the application of the invested capital to other enterprises of like risk (comparable investment requirement);
> - Enable the financial integrity of the regulated enterprise to be maintained (financial integrity requirement); and
> - Permit incremental capital to be attracted to the enterprise on reasonable terms and conditions (capital attraction requirement)."

Ms. McShane, the expert witness for FBCU, submitted that the standards for a fair return arise from legal precedents and there are three requirements the utility must:

1. Earn a return on investment commensurate with that of comparable risk enterprises;
2. Maintain its financial integrity; and
3. Attract capital on reasonable terms.

According to Ms. McShane, the legal precedents make it clear that the three requirements are separate and distinct. The FRS is met only if all three requirements are satisfied. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 8)

Dr. Laurence Booth, the expert witness for the BC Utility Customers, submitted that the definition of a fair rate of return was confirmed in *BC Electric* [*Railway Co. Ltd. v. Public Utilities Commission of B.C. et al ([1960] S.C.R. 837)*] when Mr. Justice Lamont adopted the definition of a fair rate of return, put forward in *Northwestern Utilities*.

Dr. Booth submitted that the definition in the *Northwestern Utilities* is referred to as an opportunity cost, in that the fair return is what could be earned by investing in similar securities elsewhere. Only if the owners of a utility earn their opportunity cost will the returns accruing to them be fair, i.e., they will neither reward the owners with excessive profits, nor ratepayers by charging prices below cost. Dr. Booth further submitted that to any modern financial economist, Mr. Justice Lamont's definition of a fair rate of return as an opportunity cost means a risk adjusted discount rate or expected rate of return. (Exhibit C6-12, pp. 7, 8)

2.3 Application of the Fair Return Standard

The Commission Panel observes that the application of the FRS leaves room for disagreement, judgment and discretion. The methods relied upon by various regulators and practitioners therefore differ substantially. For example, while some regulators set rates by determining the weighted-average cost of debt and equity that the regulated company should be allowed to earn on its invested capital (as a whole), others determine separately the cost of equity and possibly the percentage of equity that should be allowed in the regulated company's capital structure. (Exhibit A2-3, p. 2)

The Panel also notes the words of the Alberta Utilities Commission (AUC) on this subject related to conflicting evidence and applying judgment:

> "....the determination of a fair return on equity for Alberta utilities requires the assessment of three criteria: return on comparable investments, ability to attract capital and maintenance of financial integrity. As noted by Mr. Justice Rothstein in the TransCanada Pipelines decision cited above, the determination of the rate of return on equity for a regulated utility is difficult given that the correct answer is not readily apparent. This determination requires an expert tribunal to apply its judgment in assessing often conflicting evidence and to consider the differing interests and perspectives on risk of debt and equity investors. This exercise is even more complex in Canada, and in Alberta in particular, given the limited number of stand-alone utilities issuing debt and the lack of any utilities that issue equity directly to investors."[3]

The Commission Panel further notes the words of the Federal Court of Appeal's ruling in *TransCanada Pipelines Ltd. v. National Energy Board, 2004 FCA 149* on just and reasonable tolls. It quotes the *Northwestern Utilities* and states:

> "Tolls which reflect a fair return on capital will be just and reasonable to both the Mainline and its users.

It further states:

> To put the matter another way, when the cost of service methodology is used to determine just and reasonable tolls, if the Board does not permit the Mainline to recover its costs because it has understated the Mainline's cost of equity capital, the Mainline will be unable to earn a fair return on equity. The tolls will therefore not be just and reasonable from the point of view of the Mainline's point of view. On the other hand, the tolls must also be just and reasonable from the point of view of the Mainline's customers and the ultimate consumers who rely on service from the Mainline. Therefore, customers and consumers have an interest in ensuring Mainline's costs are not overstated .... And, specific to this appeal, customers and consumers have an interest in ensuring that the Mainline's cost of equity is not overstated."

---

[3] AUC 2009 Generic Cost of Capital Decision, November 12, 2009, p. 28

Submissions by Parties

None of the parties disagree with the Fair Return Standard as the applicable test. The Utilities and Interveners, however, disagree on how this test should be applied.

FBCU take the position that the overall rate of return allowed for FEI must be based on the utility's true cost of capital without compromising the legitimate cost of service to achieve lower rates in the short-run. FBCU submit that the combination of allowed ROE and capital structure should permit FEI to maintain credit ratings that are at a minimum in the "A" credit category in varying market conditions. This matter is further addressed in Section 4.5.

FBCU argue that a fair return is not synonymous with the lowest possible return. It pointed out that in the 2006 ROE Decision (2006 Decision),[4] the Commission had articulated that the "lowest possible" was not the appropriate test. Therefore, FBCU submit that the Commission should not rely on evidence on rate impacts and that the view of Dr. Safir, ICG's expert witness, that the outcome of a "fair return" should always favour the lower range is fundamentally inconsistent with the authorities on the FRS. (FBCU Final Submission, pp. 1, 7, 11-12)

The AMPC/CEC do not dispute the definition of the FRS based on the NEB Decision RH-1-2008 and endorsed by the Commission in the 2009 Decision. However, the AMPC/CEC disagree with FBCU's submission that the three requirements listed are the only factors to be considered when deciding what constitutes a fair return, with no consideration of the Commission's broader mandate to balance the interest of customers and regulated utilities. AMPC/CEC submit that when acting as the surrogate for competition, the Commission cannot and must not protect FEI from all business and financial risk by unnecessarily raising the ROE and common equity at the expense of customers; and the Commission must scrutinize whether the cushion FEI asks for is truly necessary to meet the FRS in light of its broader mandate to protect consumers. In Section 4.5 of this Decision, the Commission Panel discusses the application of the FRS and the role of credit metrics in the implementation of the FRS requirements.

[4] In the Matter of Terasen Gas Inc. and Terasen Gas (Vancouver Island) Inc. Application to Determine the Appropriate Return on Equity and Capital Structure and to Review and Revise the Automatic Adjustment Mechanism Decision and Order G-14-06, March 2, 2006.

According to AMPC/CEC, Dr. Booth's evidence shows that he recommended a fair return by applying the principle in the FRS that "only if the owners of a utility earn their opportunity cost will the returns accruing to them be fair." In addition, AMPC/CEC state that among other things, Dr. Booth checked his findings against numerous independent, reputable sources which confirmed that his estimates were reasonable. (AMPC/CEC Final Submission, pp. 5-7)

The BCPSO agrees with FBCU's characterization of the FRS and agrees that utilities are entitled to a competitive return as defined in the FRS' three tests regardless of the rate impact. However, BCPSO submits that it is not the same as to say that customer interests carry no weight in setting an appropriate deemed cost of capital as utility customers have an interest in ensuring that the utility's cost of capital is not overstated. BCPSO submit that a fair return is one that takes into account the right of utility customers to pay no more than a fair and reasonable charge for the service provided. Based on its logic, BCPSO submits that the evidence from Exhibit B1-42 which compares the rate impact of a 5 percent change in the equity ratio to a 50 and 100 basis point change in ROE is admissible; and furthermore, if the utility can be provided a competitive return with less rate impact, that option should be chosen. (BCPSO Final Submission, pp. 3-5)

ICG submits that the interests of customers should be paramount to those of the shareholders and reiterates Dr. Safir's testimony that where a range of competitive returns is available for evaluation, the outcome of a "fair return" should always favour the lower range presented. (ICG Final Submission, p. 3)

In Reply, FBCU submit that the Commission would err in accepting ICG's argument that regulation is simply to benefit customers. FBCU submitted that the Commission, in the 2009 Decision, had been explicit that it was not accounting for rate impacts in reaching its decision. (FBCU Reply, pp. 2-3)

Commission Determination

In previous decisions, the Commission concluded that the opportunity to earn a fair return must be provided to each regulated utility as a separate obligation from those service and financing requirements detailed in other sections of the *UCA*. For instance, on page 8 of its 2006 ROE Decision, the Commission said:

> "In coming to a conclusion of a fair return, the Commission does not consider the rate impacts of the revenue required to yield the fair return. Once the decision is made as to what is a fair return, the Commission has a duty to approve rates that will provide a reasonable opportunity to earn a fair return on invested capital."

The Commission Panel confirms that the approval of rates to meet the FRS is not optional for the Commission. In other words, the Commission has a duty to approve rates that will provide a reasonable opportunity to earn a fair return on invested capital, which is consistent with the previous ROE decisions and the Regulatory Compact. In determining the fair return, this Commission Panel examines the overall return, i.e., the ROE and the common equity component, allowed to the utility. This Decision reiterates the principle articulated in the 2006 ROE Decision and the 2009 Decision, and argued by FBCU on pages 7 to 9 in its Final Submission, that the Commission does not consider the rate impacts of the revenue required to yield the fair return. However, by seeking an optimal capital structure and the opportunity cost of capital we are serving the needs of the customer.

While this Commission Panel has not considered the rate impacts of the revenue required to yield the fair return *per se*, we are of the view that the capital structure of the utility should be set efficiently and, therefore, there is value in finding an optimal capital structure. Exhibit B1-42 provides comparative information on revenue requirements for FEI based on either a change in equity thickness or a change in ROE. The ICG submits that the Commission should reduce the ROE before reducing the capital structure of FEI. (ICG Final Submission, p. 4) In this regard, the Commission Panel finds the information on rate impacts as presented in Exhibit B1-42 useful. An optimal capital structure is discussed further in Section 4.4.

3.0 CONTEXTUAL ISSUES

This section considers important issues raised by this proceeding that are contextual in nature; they include:

- The significance of past cost of capital decisions;
- The relevance of US data and the significance of decisions from other jurisdictions; and
- The relevance of the disparity between "allowed" and "actual" ROE.

3.1 Past Cost of Capital Decisions

An important issue arising within the 2012 GCOC proceeding is whether a previous cost of capital decision is an appropriate reference point against which evidence in the current proceeding can be compared. Specifically, the questions facing the Commission Panel are: (1) whether a reference point is required, and (2) in the event it is, what reference point would be most appropriate and to what extent should it be relied upon in the Commission Panel's decision - making process. Within this proceeding, the primary comparative reference point has been the 2009 Decision, which has been relied on to illustrate changes in capital markets as well as changes in short and long-term risk since that time. Each of these referenced areas will be discussed in turn.

Submissions by Parties

3.1.1 Changes in Capital Markets

Throughout this proceeding, the FBCU have relied upon and underlined the Commission's statement that changes have occurred in capital markets since the 2009 Decision was issued. They have taken the position that capital markets are similar (albeit for different reasons) to what they were in the fall of 2009 when the previous cost of capital proceeding took place. The FBCU have relied very heavily on the 2009 Decision as a reference point for the current proceeding and have provided comparisons between what they believe exists today as opposed to conditions which existed at the time of the 2009 Decision. FBCU have relied upon the opinion evidence prepared by two of their expert witnesses, Ms. McShane and Mr. Engen, which showed that many of the key indicators of conditions within capital markets are similar and in some cases worse than the same indicators reflecting capital markets late in 2009. FBCU maintain that the experts along with market indicators

and Bank of Canada published information all suggest that equity capital markets in Canada are challenging and volatile and the market cost of equity has risen since 2009. In summary, FBCU maintain that current market conditions provide no basis for reducing FEI's overall return as argued by interveners. (FBCU Final Submission, pp. 1-2, 16-30)

ICG takes issue with FBCU on their choice of 2009 as an appropriate reference point and argue that a more appropriate reference point was the 2006 Decision. ICG submits that the 2009 Decision did not appropriately balance the interests of customers and shareholders and gave inappropriate weight to the interests of shareholders. Moreover, ICG submits that the 2009 Decision represented a significant departure from previous Commission cost of capital decisions. With respect to its Canadian peers, ICG points out that the weighted equity return component was materially lower (by 0.47) in 2005 through 2009 and materially higher (by 0.57) in the 2010 to 2012 period. ICG argues that the 2009 Decision should not be a point of reference for this decision given a steady decline in FEI's business risks since 2005. (ICG Final Submission, pp. 11-12)

BCPSO also takes issue with the use of the 2009 Decision as a reference point for this decision, expressing concern as to whether the capital market conditions comparator dates are consistent across the two proceedings. BCPSO submits that the current proceeding is forward looking with respect to capital conditions and snapshot-style evidence of past capital conditions is of limited value. In its view, the economic tests such as equity risk premium (ERP), comparable earnings (CE) and discounted cash flow (DCF) provide a better basis in assessing cost of capital stating that they "are more precise, forward looking, and can be made industry or company specific." The primary value of evidence relating to general market conditions lies in the trends it demonstrates. (BCPSO Final Submission, p. 6)

AMPC/CEC submit that regulators do not base a cost of capital decision on immediate circumstances only. They assert that the Commission will consider economic and financial conditions occurring since the last hearing and will also consider the outlook on a going forward basis. Referring to Mr. Engen's S&P/TSX Composite Index 10 Year Performance data, AMPC/CEC state that the difference now "is that the last few years have witnessed the market hold or increase ground it recovered, whereas in the lead up to the 2009 hearing, it had just suffered a dramatic crash." They further point out the FBCU argument that capital markets are similar to what they were in 2009 is in conflict

with their own witnesses' (Ms. McShane and Dr. Vander Weide) DCF calculations, which have declined considerably since the close of evidence in the last hearing. (AMPC/CEC Final Submission, pp. 28-29; Exhibit B-1-9-6, FBCU Evidence, p. 14, updated in Exhibit B-1-49)

In Reply to ICG, the FBCU state that the choice of 2009 as a point of comparison is because that proceeding is where the Commission most recently assessed FEI's business risk. To disregard this in favour of the 2006 Decision because ICG preferred the outcome in FBCU's view is indefensible. (FBCU Reply, p. 21)

Concerning the AMPC/CEC's submissions regarding the inconsistency in capital markets being similar to 2009 and FBCU's witnesses' DCF calculations, the FBCU state the following:

- Mr. Engen's evidence relates to the overall capital market and trends in the market cost of equity which indicate the market cost of equity is higher today.
- Ms. McShane's and Dr. Vander Weide's DCF calculations relate to a narrow segment of the overall market and deal specifically with FEI's cost of equity. (FBCU Reply, p. 5)

3.1.2 Changes in Long-Term Risk

While there has been considerable disagreement with respect to relying upon 2009 capital markets as a reference point for comparison, there has been little concern raised by the parties with respect to using the 2009 Decision as a reference for changes in long-term risk. Both the FBCU and interveners have relied heavily on what has changed since 2009 and in some cases referred back to the period prior to the 2006 Decision as a source of comparison.

Commission Discussion

The Commission Panel accepts that many of the indicators reflecting the current state of the capital markets are similar to what they were in 2009. This, however, does not mean that the conditions under which the 2009 Decision was made are the same as they are today. As noted in Mr. Engen's evidence, the current period is characterized by concerns for a sustained US economic recovery, fears of an economic slowdown related to weak economic data from the US and the European Union and the European sovereign debt crisis, among other things. These are not at all descriptive

of the period in latter 2009. (Exhibit B1-9-6, Appendix E, Engen Evidence, pp. 7-8) Moreover, as pointed out by AMPC/CEC, since that time markets have demonstrated a degree of stabilization in sharp contrast to the situation preceding the 2009 Decision which followed a dramatic crash. Therefore, while there are some similarities between the current period and late 2009, the Panel is of the view there are significant differences. By contrast, the markets, while maintaining volatility, have experienced a few years of comparative stability and the investor has been distanced from the financial conditions characterizing the period leading to the 2009 proceeding.

The Commission Panel is mindful that many of the key indicators of capital market conditions are similar to those of 2009 but does not consider them alone to be determinative in reaching a decision on the cost of equity. While considering changes in capital markets, pricing models some of which reflect the market outlook, are very important in reaching a determination on the appropriate rate of return in this proceeding.

The Commission Panel does accept that the period leading up to the 2009 Decision is a reasonable point of comparison with respect to changes in long-term risk as this is the most recent proceeding and notes that this has been used extensively by the parties. However, the Panel remains open to looking back further to the 2006 Decision where appropriate. In the view of the Panel, a determination on the degree of change in long-term risk is a much more discrete process. It is dependent upon an assessment of the level of risk, which exists in the current circumstances as compared to those which existed at a previous point in time. Therefore, we consider the periods prior to both the 2009 Decision and the 2006 Decision as appropriate reference points in assessing the level of long-term risk faced by FEI.

The Commission Panel does not accept ICG's argument that the 2009 Decision fails to appropriately balance the interests of customers and shareholders. In the view of the Panel, there is no value in re-examining the 2009 Decision nor is there evidence to support the need for doing so.

3.2 Consideration of Other Jurisdictions

Throughout the evidentiary portion of this proceeding there has been considerable reliance among the parties upon data and cost of capital decisions from both US and Canadian jurisdictions. The Commission Panel considers these separately as the issues related to each differ.

3.2.1 Relevance of US Data and Decisions

In the 2006 Decision, two issues related to reliance upon US data in cost of capital proceedings were dealt with by the Commission:

1) Opportunities exist for investors to commit capital on a global basis. The Commission Panel noted that there was considerable foreign exchange risk and was not convinced that the Federal Government's easing of foreign content in retirement portfolios was sufficient reason to raise the equity return of a utility.
2) The necessity of looking beyond Canadian data in measuring the risk premium. The Commission accepted the use of historical and forecast data for US utilities "when applied as a check to Canadian data; as a substitute for Canadian data when those data do not exist in significant quantity or quality; or as a supplement to Canadian data when Canadian data give unreliable results." (2006 Decision, p. 50)

In the 2009 Decision, the Commission accepted the use of historical and forecast data of US utilities as outlined in the 2006 Decision. In addition, the Commission supported the need for utilities to compete in a global marketplace and reiterated its acceptance of the use of historical and forecasting data. In the 2009 Decision, the Commission also noted the lack of relevant Canadian data and considered the potential for US gas utilities to act as a proxy in the determination of cost of capital and credit metrics. (2009 ROE Decision, pp. 15-16)

Submissions by Parties

In the current proceeding, the FBCU take the position that the Commission should find that US data remains useful and that US utilities can be appropriate comparators based on total investment risk. In support of this, they rely on the evidence of Ms. McShane and Dr. Vander Weide who make the following assertions:

- The operating, regulatory and business environments for US and Canadian regulated companies are generally similar.
- Capital markets in Canada and the US are significantly integrated and the cost of capital environment is similar.

In further support of their argument, the FBCU note that Dr. Safir acknowledged the integration of capital markets in his evidence and utilized US companies in his Capital Asset Pricing Model (CAPM) and DCF analysis. Further, the FBCU argue that Dr. Booth, in spite of his concern with the use of US data, conceded there was a high degree of integration between US and Canadian markets. (FBCU Final Submission, pp. 96-97)

AMPC/CEC's witness Dr. Booth raised two concerns with the use of US data:

- US financial markets exhibit greater risk than Canadian markets and have generated higher premia in the past.
- Regulatory implementation differs even though US and Canadian principles of regulation are the same.

  (Exhibit C6-12, Dr. Booth Evidence, Appendix B, p. 106)

AMPC/CEC submit that there is ample support for Dr. Booth's assertion that US markets are riskier than those in Canada. They point out his evidence demonstrates that over the period 1926-2011, US returns showed greater volatility than Canadian returns and the risk premium was higher in the US than the equivalent in Canada. They further submit that during Ms. McShane's cross-examination, she agreed that a typical US utility could be viewed as higher risk than a Canadian one and point out that her report aligns with Dr. Booth's as it presents a historical risk premium of 4.7-4.8 percent for Canada compared to 5.5-5.7 percent for the US. (AMPC Final Submission, p. 46) Concerning the difference between Canada and the US with respect to the implementation of regulatory principles, AMPC/CEC state that the Commission in the 2009 Decision was cognizant of the danger of relying on US comparables and cites the following statement of the Commission Panel in that decision:

> "The Commission Panel agrees with Dr. Booth that "significant risk adjustments" to US utility data are required in this instance to recognize the fact that TGI possesses a full array of deferral mechanisms which give it more certainty that it will, in the short term, earn its allowed return than the Value Line US natural gas LDC enjoy." [emphasis added by AMPC/CEC]

Additionally, AMPC/CEC point to Dr. Booth's finding that Canadian utilities have higher bond ratings in spite of poorer financial ratios, which in his view reflects the importance bond rating agencies place on the differing regulatory approaches in Canada and the US. In summary, AMPC/CEC submit that the Commission should continue to approach US data based results with caution, adjusting them downward to reflect differences in financial and regulatory contexts between the two countries. (AMPC/CEC Final Submission, pp. 46-47)

FBCU argue that the evidence does not support a downward adjustment to US results and state the following:

> "Since the financial crisis, long term interest rates have been similar in Canada and the US across a broad range of bond types, equity market volatility has been virtually identical, and market risk premium surveys show virtual identical values." (FBCU Reply, p. 28)

None of the parties have suggested that the Commission should put no weight on US data and decisions.

Commission Determination

The Commission Panel reaffirms the 2009 Decision determination on when to use historical and forecast data for US utilities. Canadian utilities need to be able to compete in a global marketplace and be allowed a return for them to do so. In addition, the Panel accepts that there continues to be limited Canadian data upon which to rely and considers that there may be times when natural gas companies operating within the US may prove to be a useful proxy in determining the cost of capital. **Accordingly, we have determined that it is appropriate to continue to accept the use of historical and forecast data for US utilities and securities as outlined in the 2006 Decision and again in the 2009 Decision.**

In making this determination the Commission Panel would like to be clear that while we accept there are similarities between the two jurisdictions, we do not accept that US data should be considered to be the same or necessarily be given equal weight as the data for Canadian utilities. Canadian investors considering US utility investments are subject to currency exchange risk that would not be the case with Canadian utility investments. Additionally, the US regulatory

environment while similar is not identical to that of Canada. The 2009 Decision's reference to the array of deferral mechanisms resulting in greater certainty for the Canadian utility is just one example of potential differences between the jurisdictions. Moreover, Ms. McShane has acknowledged under cross-examination that the universe of US utilities is focused on vertically integrated utilities and, to the extent that there is a smaller number of Canadian investor-owned, vertically integrated utilities, the typical US utility could be viewed as higher risk than the typical Canadian utility. (T3:466-467) Therefore, in the view of the Commission Panel, the use of US data must be considered on a case by case basis and weighed with consideration to the sample being relied upon and any jurisdictional differences which may exist.

3.2.2 Consideration from other Canadian Jurisdictions

Throughout this proceeding the parties have chosen to utilize information and related decisions from other Canadian jurisdictions as support for the position they have taken on an issue. The Commission Panel notes that decisions in all jurisdictions result from the judgment of evidence specific to a region or a particular utility that in each case is unique. To the extent that the ROE and equity thickness of a specific utility in another jurisdiction can be used as a comparator, we are open to considering it if it helps inform our decision. However, considerable reliance on decisions from other jurisdictions in our view would lead to circularity that would ensure that only the status quo is maintained -- perhaps at the risk of common sense. The Commission Panel acknowledges the importance of considering the methodologies, approaches and regulatory principles related to other jurisdictions' decisions. However, we do not accept that it is appropriate for results and values to be used for the purpose of calibration in B.C.

3.3 Relevance of Disparity between "Allowed" and "Actual ROE"

3.3.1 Outline of the Issue

As described in Section 2.1, when setting a rate under the subsection 60 of *UCA,* the Commission must have due regard for, among other things, whether the rate is insufficient to yield fair and reasonable compensation for the service provided by the utility, or a fair and reasonable return on the appraised value of its property. This standard does not mean, however, that a utility must be guaranteed its allowed return on equity. It simply means that a utility must be given an opportunity to earn this return. In any particular year, the actual ROE earned may be below or above the

allowed ROE. The rates are set based on a forecast revenue requirement for the year, which includes a provision for the allowed ROE, grossed up for income taxes. The utility's actual performance during the fiscal year will determine how close the actual ROE will be to the allowed ROE.

Short-run risks in general relate to a utility's ability to annually earn its allowed return on equity. The issue for the Panel, therefore, is to determine the relevance of the difference of realized and allowed ROE. From the investors' perspective, this risk relates to the relative stability of year-to-year variations in earnings or cash flows and the value of those cash flows. Therefore, the Panel first has to assess the relevance of the disparity between "allowed" and "actual" ROE in relation to the question of whether FEI faces any short-run risks. FEI has a track record of generally achieving, and often exceeding, the allowed ROE in any particular year. Does this strong track record imply FEI having "no material short-run risk, or the risk of return on capital" as claimed by Dr. Booth? (T8:1464)

FEI's track record was explored extensively in the proceeding as shown below:

- From 2002 to 2011, there was only one year when the actual ROE was below the allowed ROE, whether assessed on a pre or post earnings sharing mechanism basis. This year was 2010, when 9.42 percent was achieved as compared to the 9.50 percent allowed, resulting in a net income variance of $1.2 million. (Exhibit B1-20, BCUC 1.95.1)
- A similar trend is also apparent from 1994 to 2001. (Exhibit B1-10, BC Utility Customers 1.2.1; Exhibit C6-12, pp. 27-29)
- FBCU stated that the data set used by Dr. Booth is largely from years in which a Performance Based Rate (PBR) mechanism was in place for FEI. During the PBR period, O&M and capital were set through a formula, not based on forecast spending. The PBR formula approach was designed to result in savings to be shared with customers, primarily from the operational consolidation of three separate utilities. The Commission–approved framework expressly anticipated earnings that were above the allowed ROE. FBCU argue that when the periods under PBR are excluded, the variances between FEI's achieved return and allowed ROE from 1994 to 2011 were not that significant. (FBCU Final Submission, p. 40; Exhibit B1-20, BCUC 1.96.1.1)
- For the PBR period 2004 to 2009, after sharing, the average ROE over the period is .67 percent over the allowed ROE. (Exhibit B1-32, Rebuttal Evidence, p. 3)

Submissions by Parties

FBCU submit that the relative consistency of utility sector earnings in Canada tends to suggest lower short-term risk than for non-regulated companies, but "is not synonymous with an absence of short-term risk." (FBCU Final Submission, p. 39)

ICG submits that the Commission Panel should not accept that consistent over-earnings can be explained by PBR, and that consistent over-earning is attributable to how effectively FEI manages the regulatory risk, which it claims is its largest risk, not how effectively FEI operates the utility. ICG further argues that one should think of over-earnings during the PBR period as a regulatory benefit that can be enhanced to provide increased earnings that exceed the Fair Return Standard, and that "…the historic returns suggest that FBCU have come to expect returns that exceed a fair return." (ICG Final Submission, p. 16)

AMPC/CEC first observe that FEI has not experienced any significant risk as "the shareholder has not cumulatively lost any money whatsoever since 1994." AMPC/CEC submit that "year after year, FEI continues to face very little short-run risk, such that this pattern of consistent overearnings is clearly a long-term phenomenon." (AMPC/CEC Final Submission, p. 9)

In Reply, FBCU submit "the similarly long track record among Canadian utilities of achieving or exceeding their allowed ROE suggests that Canadian regulators have long recognized that it is reasonable for a well-managed utility to be able to achieve its allowed ROE on a consistent basis." (FBCU Reply, p. 10)

Commission Determination

The Panel notes that FBCU did not explain why, even after allowance for the sharing mechanism, the over earnings have continued. For instance, in 2011 the actual ROE was 10.15 percent as compared to the 9.50 percent allowed. Consequently, the Panel observes a noteworthy asymmetry between allowed and actual ROEs that is apparent in the frequent occurrence of annual overearnings in contrast to very few years of under earnings.

In the view of the Panel, the differences in actual and allowed ROE relate to revenue requirements and are influenced by management's ability first to forecast and then to control costs for each test period.

The Commission Panel concludes that debt and equity investors, who in their risk assessment consider both long and short-term cash flows as well as risk of financial disruption, will derive some comfort from the track record of FEI. However, there is no evidence to suggest they are likely to make a major distinction between short-term and long-term risk. Accordingly, the relevance of disparity between allowed and actual ROE of FEI is entrenched in the regulatory compact, revenue requirements proceedings, and management's proactive approach.

4.0 CAPITAL STRUCTURE

4.1 Definition of Risk

Dr. Booth has described the most basic definition of risk as "the probability of incurring harm, which in a financial sense means losing money." Ms. McShane agreed with this definition noting that it was consistent with her own testimony which defined risk as the probability that the utility's future returns (including the return on and of capital) will fall short of returns that investors expect and require. Mr. Dall'Antonia put a finer point on it as he described a loss as not earning a fair return or more specifically, a loss is anything that is less than the allowed ROE. (Exhibit B6-12, Dr. Booth Evidence, p. 26; Exhibit B1-15, AMPC 1.4.1; T2:123-124)

The Commission Panel takes no issue with the basic definition of risk as provided by Dr. Booth. However, for this Decision, the Commission Panel views risk as the probability that future cash flows will not be realized or will be variable resulting in a failure to meet investor expectations. In addition, the Panel recognizes the risk of potential financial disruption. We also accept the distinction outlined in both the 2006 Decision and the 2009 Decision where investment risk was described as comprising the sum of business risk, financial risk and regulatory risk.

Both Ms. McShane and Dr. Booth addressed business risk in terms of short-term and long-term risks, a distinction the Commission Panel considers appropriate. Each of these is discussed separately in Sections 4.2 and 4.3.

Dr. Booth has described short run utility risk as the risk of earning a return on capital and long run utility risk as the risk of earning a return of capital. (Exhibit C6-12, p. 25) Ms. McShane comments that both the capital structure and the ROE incorporate elements of long-term and short-term risks. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 39) The Commission Panel does not disagree with Ms. McShane but notes that long-term risk, which Ms. McShane outlines as being of primary importance to the utility investor, is primarily reflected in the equity structure determined for FEI considering the investors' ability to recover their invested capital. This is because if the underlying risk decreases, more debt can be issued; if it increases, the common equity ratio would increase resulting in less debt. Therefore, as pointed out in the 2009 Decision: "The assessment of risks has

a significant bearing on the application of the fair return standard and the determination of an appropriate common equity ratio for regulatory purposes."

4.2 FEI's Long-Term Risk

In the 2009 Decision, eight factors that influenced FEI's long-term risk were identified. They were:

1. Provincial Government climate and energy policies;
2. The effect of aboriginal rights issues;
3. The competitive position of natural gas relative to electricity;
4. Percentage of new construction being captured by Terasen Gas Inc. (TGI);
5. Natural gas vs. Electricity in high density housing;
6. The impact of Alternative Energy Sources on TGI;
7. Changes in demand related to fuel switching; and
8. Use of natural gas per customer account.

FBCU has stated that the same risk factors are at play in the current proceeding, although they have been expressed and organized somewhat differently. (FBCU Final Submission, pp. 47-48)
For the purposes of examining the long-term risk of FEI, items 4 and 5 related to the capture rate of new construction and the energy choice for high density housing are combined under the more general heading "Customer Growth." Items 7 and 8 related to use per customer and fuel switching related demand are also combined under the new "Market Demand and Throughput" heading. In addition, two new factors which received little or no coverage in the 2009 proceeding are addressed: "Supply Risk" and "Regulatory Risk."

4.2.1 Provincial Government Climate and Energy Policies

In the 2009 Decision, the provincial government climate and energy policies of the previous few years played a significant role. During the period leading up to the proceeding, the provincial government published the "BC 2007 Energy Plan," introduced numerous pieces of legislation (principally in the area of greenhouse gas emissions reduction) and in 2008 implemented the BC Carbon Tax. In the 2009 Decision, the Commission was in agreement with TGI's position that the climate change legislation had created a level of uncertainty which did not exist during the 2005

hearing and stated that the change in government policy "will quite probably cause potential customers not to opt for natural gas and persuade potential retrofitters to opt for electricity." (2009 Decision, pp. 36-38)

Submissions by Parties

The Commission Panel notes that there is considerable disagreement among the parties concerning the level of risk related to provincial government climate and energy policies. In the current proceeding, FBCU have ranked political risks in the number 2 risk category and submit that the risks associated with policy and legislation are equal to if not greater than in 2009. FBCU note that all of the legislation and policy relied upon by the Commission in the 2009 Decision remains in place and the introduction of the *2010 Clean Energy Act (CEA)* has had the following impacts:

- It has precluded natural gas utilities from using incentives to promote fuel switching (electricity to gas).
- It has required the Commission to account for enumerated energy objectives in the course of considering certain types of applications.

(FBCU Final Submission, pp. 53-56)

Both BCPSO and AMPC/CEC submit that conditions are far more favourable today and the resulting political risks are much lower today than TGI portrayed in 2009. In support of these submissions, they point to a number of factors:

- the lack of plans to increase the carbon tax;
- the introduction of the BC Natural Gas Strategy and its support of natural gas as a transportation fuel; and
- a collapse of the Western Climate Initiative and lack of progress on emissions-trading initiatives.

(BCPSO Final Submission, pp. 15-16; AMPC Final Submission, pp. 22-23)

Commission Determination

The Commission Panel finds that the risks related to provincial government climate and energy policy are less significant when compared to the period leading up to the 2009 Decision. At the time of the 2009 proceeding, there was considerable concern and uncertainty related to provincial

energy policies, how they would be shaped in the future and what impact this would have on Terasen's gas utilities. In addition, the Commission placed importance on the Nyboer Report as reflected in the following statement:

> "In addition, the Commission Panel considers that the Nyboer Report presents a scenario that did not exist in 2005 under which the three Terasen utilities might not earn a return of their capital. The scenario that now exists is described in a publication of a reputable consulting group which appears to have the attention of policymakers." (2009 Decision, p. 37)

The Commission Panel does not consider the current environment to be as threatening to FEI as it was perceived to be in the period leading to the 2009 Decision. As BCPSO points out, there are no plans to raise the carbon tax beyond the current $1.50 per GJ level and as AMPC/CEC reports, the Western Climate Initiative has collapsed and emission trading has become a dormant issue. These all reflect a less threatening current environment and with it, a lessening of risk associated with provincial government climate and energy policies.

4.2.2 Aboriginal Rights

In the 2009 Decision, the Commission Panel acknowledged that risks posed by First Nations did not exist previously and to the extent that they were currently perceived, represented an increase in risk over natural gas local distribution companies operating in other provinces. However, the Commission did not consider that risks posed by First Nations cast doubt over Terasen Gas Inc.'s "ability to earn a return on or of its capital." (2009 Decision, p. 37)

Submissions by Parties

FBCU acknowledge that aboriginal rights issues, which they rank in category 2, are much the same now as they were in 2009 and note that this issue was not addressed by the parties in IRs or at the hearing. (FBCU Final Submission, p. 49)

BCPSO argue the amount of aboriginal rights risk should be reduced relative to 2009, given the FBCU experience and understanding of aboriginal rights and title claims resulting from First Nation consultations tied into CPCN Applications. (BCPSO Final Submission, p. 17)

AMPC/CEC submit that this risk remains unchanged from 2009 where it was given no weight and this remains appropriate. (AMPC/CEC Final Submission, p. 24)

Commission Determination

The Commission Panel agrees with the FBCU and AMPC/CEC and find that there is no evidence to suggest that there has been a significant change to risk associated with aboriginal rights based on the evidentiary record of this proceeding. We also concur with the 2009 Decision that the risk associated with aboriginal rights has little impact on the FEI's ability to earn a return.

4.2.3 Competitive Position of Natural Gas Relative to Electricity

The competitive position of natural gas to electricity is an existing risk which bears scrutiny at each cost of capital proceeding. In the 2009 Decision, the Commission Panel took note of the interveners' position that the risk related to the competitive price of natural gas and electricity had diminished since 2005. However, the Panel considered that the competitive edge which existed was dependent on too many significant variables to be considered permanent. (2009 Decision, p. 36)

Submissions by Parties

The FBCU acknowledge that natural gas prices have fallen but submit that this occurred prior to the 2009 Decision and take no issue with the fact that the development of shale gas is a "game changer" or that there has been an increase in electricity prices. They do take issue with Dr. Booth's conclusion that long-term business risk has declined since 2009 and argue that his reliance on considerations related to cost-effectiveness paints an incomplete, distorted view of FEI's overall competitive position. FBCU make the following arguments in support of their position:

- Natural gas prices fell substantially prior to the 2009 hearing due to shale gas development and this was reflected in the evidentiary record leading to the 2009 Decision.
- Volatility in natural gas prices affect natural gas to electricity competitiveness and has increased due to the suspension of hedging instrument tools resulting from the 2011 Price

Risk Management Decision (PRMP Decision).[5] Looking ahead to 2017 there is a wide potential price range for natural gas based on the AECO Forward Curve. (see Figure 2 below)

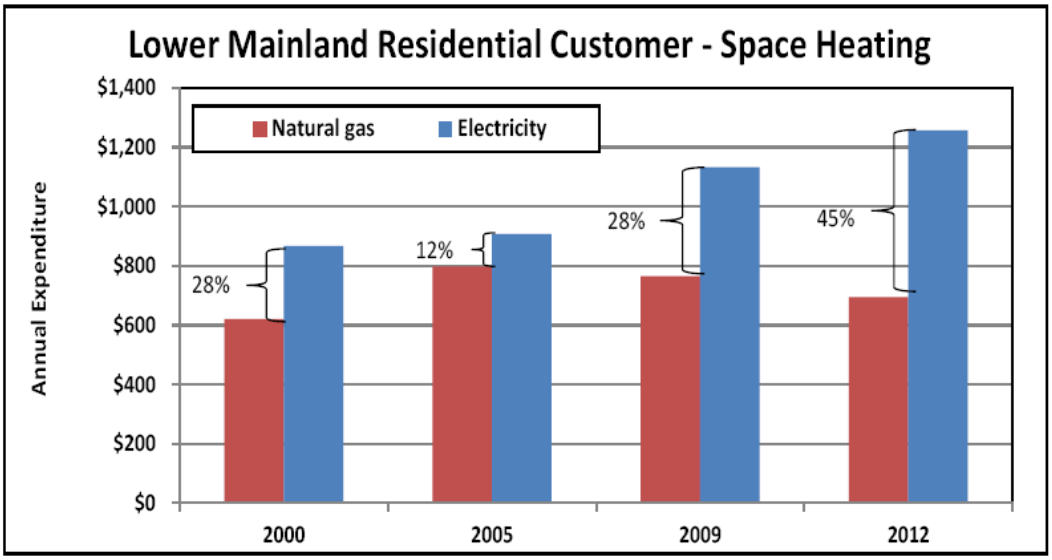
- The price of the natural gas commodity has decreased but the delivered cost of natural gas remains almost the same as 2009.
- Higher capital costs for natural gas heating materially diminish the operating cost advantage of natural gas over electricity.
- Non-price factors such as the desire to create a smaller carbon footprint have resulted in more customers being willing to adopt lower carbon and renewable energy sources.

(FBCU Final Submission, pp. 57-71)

ICG, relying on Figure 1 below, argues that there has been a significant improvement with respect to cost competitiveness between natural gas and electricity since both the 2005 and the 2009 proceedings.

Figure 1: Estimated Annual Expenditure

Figure 1: Estimated Annual Expenditure for FEI Lower Mainland Residential Customer – Natural Gas and Electricity for Space Heating

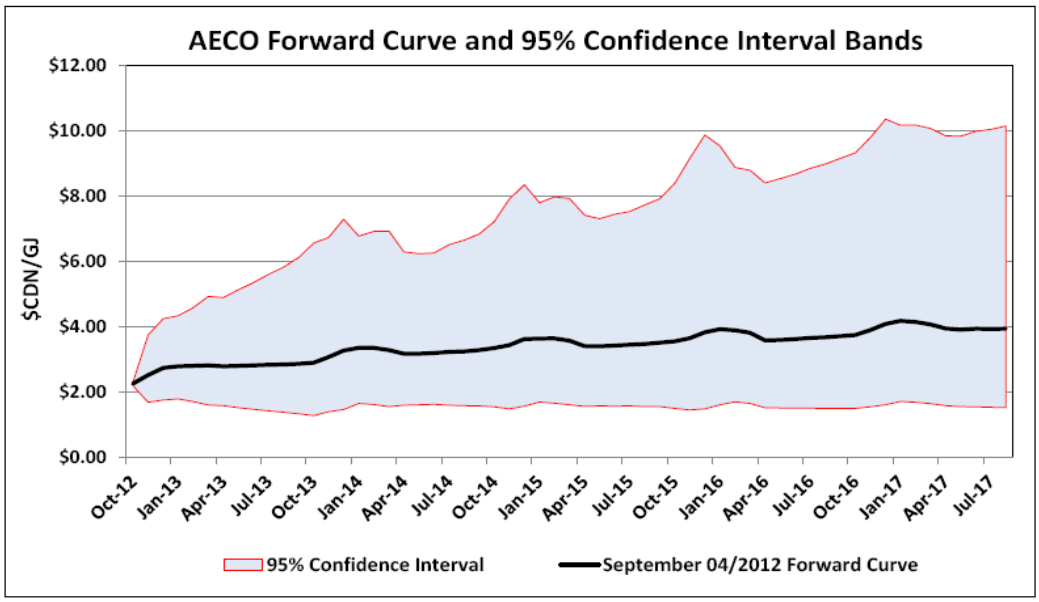


(Source: Exhibit B1-11, FBCU Response to BC Utility Customers, 1.4.2)

ICG contends that shale gas has been a game changer for natural gas prices, which has resulted in a "seismic" shift in the competitiveness of natural gas versus electricity. (ICG Final Submission, p. 11)

[5] Order G-163-11

Figure 2: AECO Forward Curve



(Source: Exhibit B1-20, BCUC 1.105.1)

BCPSO notes that there has been no change in FBCU's rating of capital cost and it is the same as in 2009. It argues there is no evidence that the effect of higher capital costs will offset any competitive gain made through lower commodity prices. Further, BCPSO submits that the AECO Forward Curve relied upon by FBCU demonstrates only an increasing level of price uncertainty over time, not volatility. BCPSO also takes issue with the FBCU claim that there is effectively no reduction in the customers overall bill. The important comparison is not natural gas against itself but against electricity, and this comparison is very favourable to FEI. (BCPSO Final Submission, pp. 9-10)

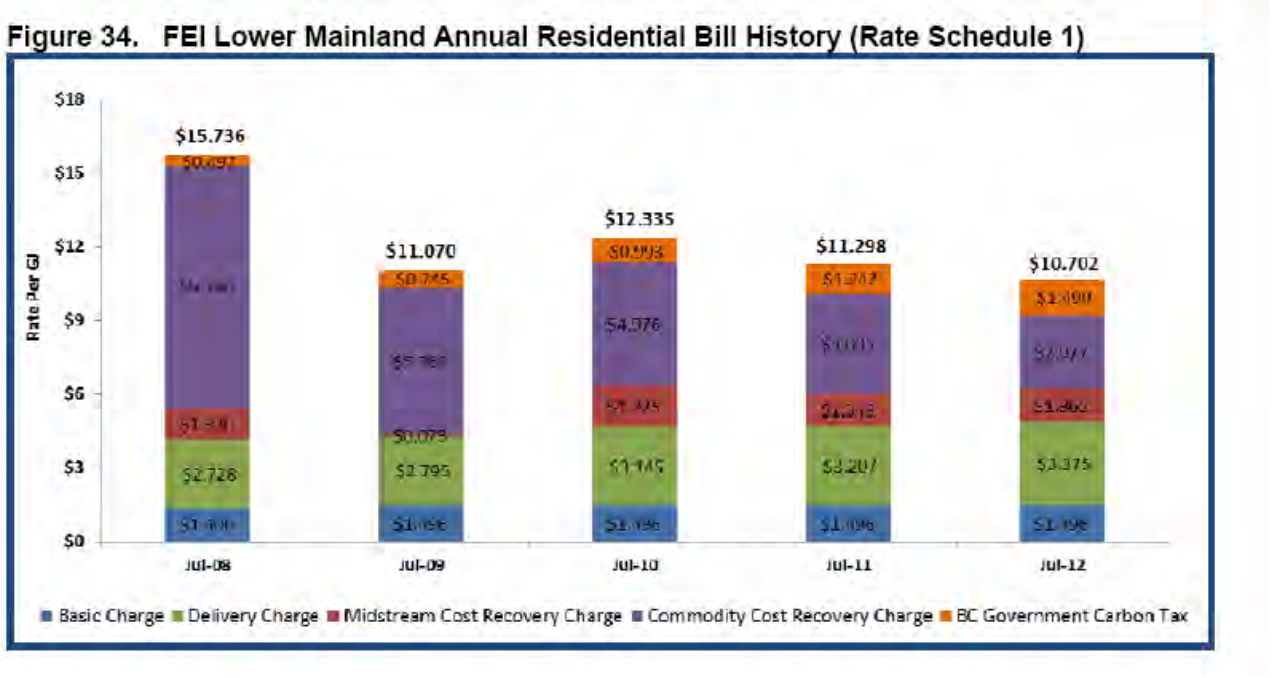
AMPC/CEC state that price is a key determinant of natural gas competitiveness and deserves the greatest weight when considering changes to FEI's business risk. In answer to FBCU's claim that the delivered cost of natural gas is similar to 2009, AMPC/CEC argue that prices are at or near a ten-year low and by FBCU's evidence (in Figure 3 below) are lower than 2009 and even more so when compared against 2005. (AMPC/CEC Final Submission, pp. 11-13)

AMPC/CEC assert that the volatility is manageable through options, including equal payment plans and deferral accounts which FEI currently uses. AMPC/CEC notes than in addition to these options, FEI is proactive in communicating the natural gas cost advantage relative to other sources.

AMPC/CEC also submit that a telling point with regard to competitiveness is how it compares to electricity. They assert that FBCU's response to AMPC/CEC 1.4.2 (Exhibit B1-15) outlines the savings of natural gas over electricity for space heating (and to a lesser extent water heating) and demonstrates a trend that continues to widen. In their view, this information demonstrates that FEI is the beneficiary of both a reduction in gas prices and rising BC Hydro rates. (AMPC/CEC Final Submission, pp. 11-16)

In Reply, FBCU argue that using November 2009 rather than July 2009 is a more appropriate point of comparison and represents a variance of less than 3 percent. They also point out that this difference has been insufficient to drive behavioral changes in new and existing customers. (FBCU Reply, p. 14)

Figure 3: Delivered Cost of Natural Gas



(Source: Revised Exhibit B1-9-6, Appendix H, p. 51, Figure 34)

Additionally, FBCU state that they have not suggested that there is an increase in price volatility, but rather they have fewer tools to deal with it. Overall, FBCU submit that commodity price volatility is a risk factor which remains undiminished since 2009. (FBCU Reply, pp. 14-15)

Commission Determination

The Commission Panel considers price, because of the importance placed on it by the consumer, to be a key determinant and deserves significant weight when considering changes to FEI's risk. **The Commission Panel finds that there has been some reduction in the level of risk associated with the competitive position of natural gas as compared to electricity.** It is difficult to reach any other conclusion given there has been a reduction in the total billing costs while over the same period the cost of electricity has risen regardless of the timeline one chooses for comparison. The evidence relied upon by the interveners in Figure 1, which details the growing variance between natural gas and electricity, is persuasive and it is unlikely that a price conscious customer would move away from natural gas in these circumstances. Looking ahead, and relying upon the information in Figure 2 above, the Panel notes that in spite of the range considered to fall under the 95 percent interval band, the September 4, 2012 AECO Forward Curve projects relatively stable natural gas commodity costs looking out to 2017. While hardly definitive, this does point to some level of stability over the next few years.

Notwithstanding these favourable conditions, the Commission Panel does place some weight on the lack of change in the purchasing behaviour of new and existing customers. In our view, some of this relates to the higher capital costs required to convert to or install natural gas service and the move to multi-family dwellings, which is discussed in Section 4.2.4.

FBCU state that price volatility is a risk factor that remains undiminished since 2009. Based on the evidentiary record we agree. However, we are not in agreement with the assertion that FEI have fewer tools to manage volatility. In the PRMP Decision, the Commission Panel offered a number of suggestions or options FEI may wish to consider. Included among these was offering the PRMP program to existing customers on a permission basis. There is no evidence before the Panel to indicate any action that FBCU has taken to bring alternatives forward.

4.2.4 Customer Growth

Submissions by Parties

FBCU note that a continuing trend has been its lower capture rate on new construction and reports a decline in the rate of net residential customer additions when 2011 is compared against 2007. In addition, the FBCU submits that new customer usage is roughly half what it used to be and therefore, the trend that existed in 2009 has not changed. FBCU states that this trend is closely associated with growth of multi-family dwellings in BC, a market where FEI has low penetration driven by unfavourable installation economics. This shift toward multi-family dwellings means that FEI's capture rate will further decline over time. (FBCU Final Submission, pp. 50-51; Exhibit B1-9, Appendix H, pp. 33-37)

AMPC/CEC point out that in spite of the challenges faced by FEI in growing customers, its total customer base continues to grow. The number of residential customers grew by 8 percent over the period 2005-2011 and the number of commercial customers grew by 5 percent over the same period while there was some decline in the number if not the consumption of industrial customers. (AMPC/CEC Final Submission, pp. 16; Exhibit B1-11, BCUC 1.4.4)

Commission Determination

The Commission Panel notes that the circumstances related to unfavourable installation economics and the shift toward multi-family dwellings existed at the time of the 2009 Decision. In spite of this, the total number of customers continues to grow if not the market share of potential new customers. **Therefore, the Commission Panel finds that there is no persuasive evidence to suggest there has been a shift in risk related to customer growth.**

4.2.5 Impact of Alternate Energy Services on FEI

Submissions by Parties

FBCU state that the "adoption of energy forms produced in combination with newer technologies represents a challenge to FEI's core business for providing natural gas for space and water heating." The recent number of energy projects approved serves to demonstrate the momentum behind

alternative energy which FBCU rate in the number 2 risk category. In FBCU's view, the growing consumer awareness of alternative energy and its green attributes and increasing cost effectiveness demonstrate the importance of this risk factor for FEI. (FBCU Final Submission, p. 52; Exhibit B1-9, Appendix H, p. 28)

AMPC/CEC argue that this represents double counting and there is no evidence to suggest that there is more risk posed by alternative energy to FEI than that which existed in 2009. Further, they argue that the new transportation technology will result in improved prospects as it allows natural gas to replace diesel in heavy trucking thereby increasing natural gas demand in the future. (AMPC/CEC Final Submission, p. 18)

Commission Determination

The Commission Panel notes that the impact of AES sources on FEI is not a new risk. However, we do acknowledge that in the three years since the 2009 proceeding, there has been greater momentum behind alternative energy forms and the adoption of new technology related to them. Therefore, the Panel is mindful that there is the potential for an increase in risk related to AES but, given that much of this risk has been accounted for in reference to FBCU's share of multi-family dwellings, it is difficult to quantify.

4.2.6 Market Demand and Throughput

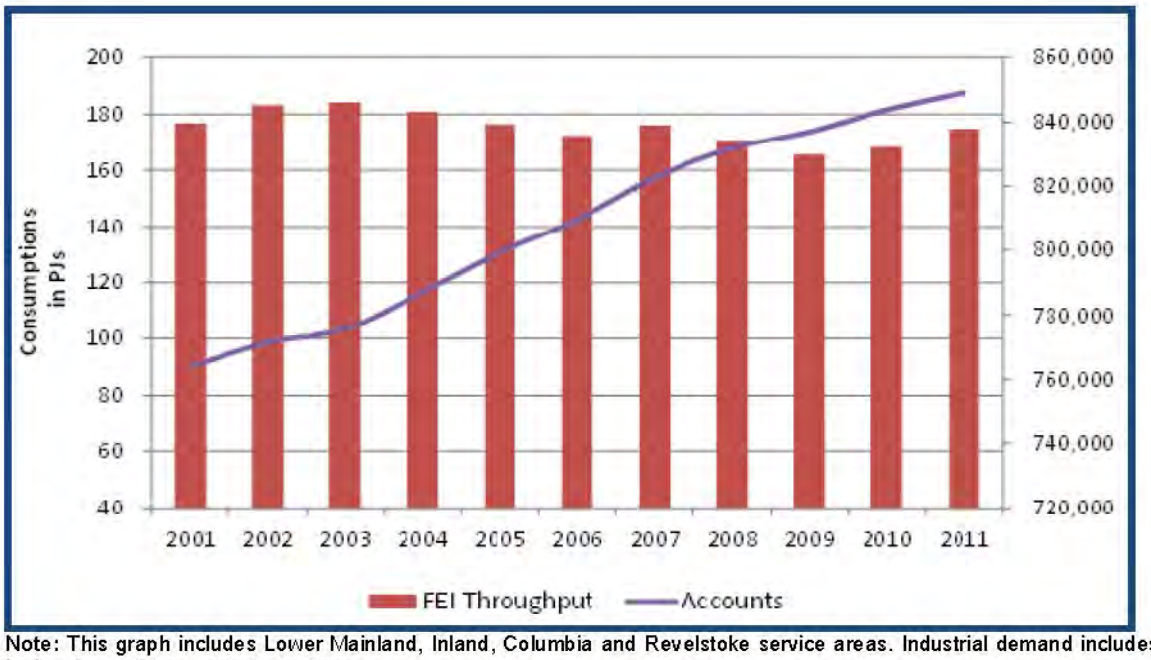
Submissions by Parties

The FBCU state that FEI's use per customer (UPC) for both new and existing customers has been declining; this trend, based on a Conservation Potential Review Study, is expected to continue until 2030. Contributing to this decline are a variety of factors including technological advances and energy efficiency improvements. In addition, the decline in UPC can, in part, be attributed to increased efficiency standards, better building envelopes and a move to smaller dwellings. Further, FBCU state that new construction research since the 2009 hearing shows that natural gas has been increasingly used as a secondary fuel source in new homes rather than the primary source. The FBCU state that there is no reason to believe the drivers behind these market trends will cease. (FBCU Final Submission, pp. 52-53; Exhibit B1-9-6, Appendix H, FBCU Evidence, pp. 32-35)

ICG states that Exhibit B1-41 shows that there has been no decline in system throughput since 2009. In addition, ICG asserts that there is an upward trend in industrial throughput, which is reflective of lower natural gas prices over the same period. Given this recent trend, ICG argues that the Commission should not accept the FBCU's 2013-2016 lower industrial throughput evidence and conclude that business risks are in fact lower than in 2009. (Exhibit B1-41, Undertaking No. 6, p. 3; ICG Final Submission, pp. 7-9)

BCPSO notes that the Commission acknowledged the risks related to throughput in its 2009 Decision and, as a result, they are not new. BCPSO, like AMPC/CEC, further submit that based on graphical information in Figure 4 below, the trend of declining throughput has reversed itself in 2009 and has increased each year since. (BCPSO Final Submission, pp. 13-14)

Figure 4: FEI's Total Throughput (Normalized Demand vs. Customer Accounts)



Note: This graph includes Lower Mainland, Inland, Columbia and Revelstoke service areas. Industrial demand includes both sales and transportation volumes.

(Source: Exhibit B1-9-6, Section H, p. 9)

AMPC/CEC submit that the evidence presented by FBCU shows that both commercial and industrial UPC has increased since 2009, while residential UPC has decreased only marginally.

AMPC/CEC further submit that as the Commission considers the issue of declining UPC, it should consider two points:

- The residential throughput would have to decrease by 83 percent in 2012 to drive its distribution margin to a level equal to BC Hydro Tier 2 Rates; and
- The negative trend related to the creation of energy efficiency is no different than that faced by BC Hydro.

AMPC/CEC argues that these energy trends are not new and there is only risk if they affect the utility's ability to earn a fair return which, in their view, is not supported by the evidence on the record. (AMPC/CEC Final Submission, pp. 16-18)

In Reply, FBCU submit that revenues related to increased throughput are largely unaffected due to the structure of industrial contracts that only generate additional revenue if consumption exceeds an agreed upon level. Therefore, the declines in residential and commercial UPC continue to have a disproportionate impact on FEI. FBCU also point out that AMPC/CEC's reliance on Tier 2 rates is inappropriate. In addition, they argue that the AMPC/CEC's position is based on the view that existing customers will not leave natural gas until there is no longer a price advantage. FBCU state that this assumption is unwarranted given recent research that people are less committed to natural gas, irrespective of price. (FBCU Reply, pp. 16-17)

Commission Determination

The Commission Panel finds that there is insufficient evidence to support a finding that there has been a shift in risk related to market demand and throughput.

The Commission Panel notes that the decline in UPC and overall throughput were issues raised in the 2009 proceeding. Based on the evidence in this proceeding, it is apparent that the overall throughput has increased since 2009 and UPC, while decreasing overall, has increased for both commercial and industrial customers. In the view of the Panel, these are all positive but not conclusive signs.

The Commission Panel places little weight on the FBCU submission that the increased throughput has not resulted in increased revenue due to the structure of industrial contracts. Notwithstanding our understanding that industrial contracts are subject to competitive negotiations, in our view, FBCU nonetheless has some control over the structure of and risks related to the contracts it negotiates.

The Commission Panel does not consider the research indicating existing customers are less committed to natural gas in spite of the price advantage to be persuasive. The Panel notes that much of the research referred to in this context was related to AES options, which have been considered as part of the growth of multi-family dwellings addressed in Section 4.2.4. (Exhibit B1-9-6, Appendix H, FBCU Evidence, pp. 32-35)

4.2.7 Supply Risk

Submissions by Parties

FBCU's position is that BC's shale deposits do not guarantee a reliable supply of natural gas at reasonable prices. Due to the higher cost of development relative to other areas and a lack of infrastructure for resource development and market connection, FBCU state that growth of production in northeastern BC has stopped and there is risk of current levels declining. This is in contrast to developments like the Marcellus Formation in the northeast part of the continent that is thriving. FBCU submit that this leads to the possibility of stranded resources or, at a minimum, higher market prices and an expansion of access infrastructure to encourage expansion of BC's shale gas resources.

FBCU also submit there is a lack of new development of infrastructure to move gas to FEI's service territory. They argue that the development of gas transmission infrastructure projects connecting BC sources with Alberta and Eastern markets, combined with the potential for LNG exports, could change the historical pricing relationship between BC supply and Alberta production leading to higher consumer prices in the future. (FBCU Final Submission, pp. 60-61)

AMPC/CEC describe the potential for stranded resources in northwestern BC as nonsensical. They submit that the impact of shale gas development on prices was not recognized, as it was not mentioned in the 2009 Decision. They also refer to the following statement of Ms. Des Brisay in the current proceeding:

> "What was not fully understood is how low the cost could be in terms of how we produced that resource, and that's really where we have seen the shifting of the curve has been as we have a better understanding of the economic feasibility of the development of shale gas reserves in different parts of North America." (T2:161)

Therefore, AMPC/CEC argues the existence of reserves may have been known in 2009, but the understanding of the economic feasibility of development has shifted since then. (AMPC/CEC Final Submission, p. 19)

AMPC/CEC submit that any weight the security of supply factor deserves pales when compared to the availability of supply. The Commission Panel notes they did not comment directly on the potential change to the historic pricing relationship between Alberta and BC. (AMPC/CEC Final Submission, pp. 18-20)

As noted previously, FBCU acknowledge that shale gas has been a "game changer" and that supply risk has declined. They did make the following points:

- There was knowledge of natural gas reserves prior to the 2009 proceeding.
- The price of natural gas must be higher (leading to higher rates) before supply will be extracted.
- FEI's ability to access cost effective supply could be challenged as there are competing markets for natural gas.

FBCU argue that it is the factors affecting demand for delivered natural gas, not energy supply considerations, that are the key supply risk for FEI. (FBCU Reply, pp. 19-20)

Commission Determination

The Commission Panel finds that there has been a decrease in the risk associated with the supply of gas but an increase in the risk associated with access to this gas at low prices. Balancing the two, there has been no material change in the level of risk related to energy supply.

The Commission Panel accepts the statement of Ms. Des Brisay as informative and a reasonably accurate reflection of where matters stood at the time leading up to the 2009 Decision. There is clearly no disagreement among the parties with respect to the existence of adequate supply of natural gas and FBCU have conceded that the actual supply risk has declined. Therefore, the issue is not whether natural gas will be available but whether sufficient natural gas will be available at the low commodity price levels that the consumer has come to expect. To this end, FBCU have laid out a number of facts and potential scenarios which they argue will have a significant impact on the supply of low cost natural gas. None of the interveners have challenged this information except AMPC/CEC who characterized the potential stranding of assets as "ludicrous."

In our view, the potential for some of FBCU's concerns to become a reality cannot be dismissed. The stability of the current environment remains uncertain, as does the magnitude of future development of the LNG business. Until this has been determined, the continuity of current low price levels for natural gas will be at some risk. However, the risk of supply to the extent that it existed, has abated and shifted to the risk associated with maintaining existing commodity price levels with no resulting increase in overall risk.

4.2.8 Regulatory Risk

Submissions by Parties

FBCU has ranked regulatory risk as their highest risk area with a number of factors in the "higher risk" category. In assigning this weighting, FBCU states that FEI is dependent on regulatory approvals that determine its revenue requirements, cost of service recovery and approval of investments. FBCU submit that the pace of change in the energy policy and environment has

increased at a time when the Commission's role in implementing and applying policy has expanded. This has contributed to increased uncertainty in the regulatory environment and added process as compared to 2009. (Exhibit B1-9-1, Section H, pp. 5-6)

BCPSO points out the FBCU witnesses have confirmed that the regulatory environment is predictable and stable and regulatory risk should not be viewed as its number one risk factor. (BCPSO Final Submission, pp. 14-15)

AMPC/CEC questions the FBCU ranking of regulatory risk as there is no compelling evidence to suggest that FEI faces greater regulatory uncertainty than it did in 2009. (AMPC/CEC Final Submission, pp. 10, 20)

In Reply, FBCU acknowledge that the relative stability and predictability of the BC regulatory framework reduces regulatory risk. However, they point out that the breadth of the Commission's influence on FEI's business is undeniable and individual decisions can have significant implications for FEI particularly in the short-term. While they identify "regulatory risk as being 'higher,' any change since 2009 was not material to FEI's overall risk." (FBCU Reply, p. 12)

Commission Determination

The Commission Panel finds that there has been no material change in the level of risk associated with regulatory risk.

The Commission Panel accepts that the BC regulatory framework has a significant influence on FEI's business and that individual decisions can have significant implications for FEI. However, we agree with the parties that argue there has not been a material change since the 2009 Decision.

4.3 FEI's Short-Term Risk

There are two issues that must be considered by the Commission Panel with respect to short-term risk. The first is whether there has been a change in short-term risk since the 2009 Decision. The second is how much of FEI's short-term risk has been mitigated and, as a result, how much of the remaining risk must be considered. In the view of the Commission Panel, this will be determinative

as to the level of weight to be placed upon the short-term risk in this proceeding. FBCU has expressed disagreement with the need to determine the level of short-term risk in reply to BCSPO submissions:

> "The Commission need not attempt to characterize or quantify FEI's short-term risk to determine a fair return for FEI. The question requiring a determination is the extent to which FEI's short-term risk has changed since 2009." (FBCU Reply, p. 9)

The Commission Panel disagrees. There are many measures of risk. The overall level of risk may not have changed substantially but one needs to consider the individual risk elements and their weighting. These may have changed and therefore, not considering them may be a mistake.

4.3.1 Change in Short-Term Risk

Submissions by Parties

The FBCU submit that short-term risk is essentially the same as in 2009. (FBCU Final Submission, p. 45)

Both FBCU and the interveners have focused their submissions on two areas in examining short-term risk:

- FEI's record of generally being able to earn its allowed ROE; and
- The amount of risk mitigation provided by deferral accounts.

Matters related to FEI's history of typically earning its ROE were dealt with in Section 3.3, where it was determined that actual earnings versus approved earnings history is more appropriately a matter for consideration in revenue requirements proceedings.

Concerning the use of deferral accounts, FBCU submit that "FEI's ability to manage short-term risk with deferral accounts is a function of the portion of the overall revenue requirement covered by deferrals, irrespective of the number of accounts providing that coverage." They also submit that there has been no material change in the collective scope of deferrals having an effect on earnings

volatility. In the view of FBCU, their evidence on deferral accounts shows that the percentage of revenue requirements covered by deferral accounts has decreased and has resulted in a credit to customers. (FBCU Final Submission, pp. 38-45)

AMPC/CEC acknowledge that some of the additions in deferral accounts since 2009 are a reflection of accounting changes, but submit that three new accounts (Compliance to Emission Regulation Account, Customer Service Variance Account and Depreciation Variance Account) are significant. They further submit that while the new accounts may not represent a monumental change, they are an indication of FEI's ability to obtain such accounts. Therefore, this risk factor is lower today than in 2009. (AMPC/CEC Final Submission, p. 22)

BCPSO agrees with the submissions of AMPC/CEC and submits that the addition of the three new accounts demonstrates the Commission's willingness to mitigate the impact of short-term uncertainties. It concludes that the new accounts indicate short-term risk is no greater and likely less. In sum, BCPSO submit that short-term business risk is lower than in 2009. (BCPSO Final Submission, pp. 8-9)

FBCU, in reply, assert that the submissions of AMPC/CEC are at odds with the evidence of their witness, Dr. Booth, "who admitted that FEI risk hadn't changed "in the slightest."" The Commission Panel notes that Dr. Booth (T8:1475) was referring to ROE and not overall risk. FBCU conclude that short-term risk when compared to risk faced by its peers in other jurisdictions, remains unchanged. (FBCU Reply, p. 9)

Commission Determination

The Commission Panel, after reviewing the evidence, finds that there has not been a material change to FEI's short-term risk since the 2009 Decision. However, to the extent that there have been additional deferral accounts added, there is a greater ability to mitigate short-term risk. The Commission Panel agrees with BCPSO that the Commission's approval of the new deferral accounts demonstrates a willingness on the part of the Commission to mitigate the impact of uncertainty. However, in the Panel's view it is not important how the deferral account came to be. It is the

effect. Therefore, the fact that the Depreciation Variance Account was ordered by the Commission, as noted by FBCU, in our view, is immaterial. More important is the fact that the deferral account now exists, as it reduces the risk associated with unforeseen variances in depreciation amounts.

4.3.2 Magnitude of Short-Term Risk

The second question to be considered by the Commission Panel with respect to short-term risk relates to the level of mitigation which has or could be applied against short-term risk. Much of the evidence related to this was focused on the use of deferral accounts which we explore below.

Revenue Related Deferral Accounts

The FBCU consider the overall risk for residential and commercial sales to be moderate and have assessed the risk of industrial sales to be high.

In 2011, residential and commercial sales accounted for 87.9 percent or $485.4 million of the total delivery margin revenue of $552.3 million. FBCU are protected for changes in use per customer for residential and commercial sales through the Rate Stabilization Adjustment Mechanism (RSAM). In assessing these risks as moderate, FBCU point out they are not protected for any differences in actual and forecast number of new customers in a given test period. The Commission Panel notes that impact of any variance in customer additions is likely to be minor, given the relatively small number of new customer additions as a function of the existing customer base. **Given the relatively heavy reliance on existing customers for most of the revenue and the existence of the RSAM, the Commission Panel finds the short-term risk related to residential and commercial sales to be low rather than moderate as suggested by FBCU.**

Industrial sales account for 12.1 percent or $66.8 million of the delivery margin revenue in 2011. FBCU assess the risk as high in this area because there are no deferral accounts utilized with this customer group. (Exhibit B1-20, BCUC 1.96.1)

In reviewing the submissions, the Commission Panel notes the following statement made by FBCU in reply to AMPC/CEC submissions: "Increased consumption by industrial customers only generates additional revenue if the consumption **exceeds a customer's fixed contract demand** (i.e., the 'take

or pay' volume)." [emphasis added] Notwithstanding the impact on revenue as addressed in this statement, it appears to the Panel that the lack of deferral accounts in the industrial category is because there is no need as this area is run on a contract basis with a reliance on "take or pay" contracts. (FBCU Reply, p. 16) It is therefore evident that potential risk is mitigated to a large extend by the existence of such contracts. **For these reasons, the Commission Panel finds that a "high" risk rating for industrial sales is inappropriate and a moderate to low rating is more appropriate to the level of risk.**

Expense Related Deferral Accounts

Table 1 of the FBCU response to BCUC IR 1.96.1.1 indicates that in 2011, 75.3 percent ($1,160.7 million) of the FEI revenue requirement or 31.0 percent ($171.1 million) of the Revenue Margin Delivery Requirement was covered by way of deferral accounts. Overall, the single biggest expense item was cost of gas, which at $989.6 million is 100 percent covered by deferral mechanisms.

FBCU's Operation and Maintenance (O&M) Expense totalled $184.6 million. Of this, approximately 9 percent encompassing Pension & OPEB Variance, Insurance Variance and BCUC Levies Variance Deferral is covered by deferral accounts. FBCU rates the overall risk of O&M Expense as high citing the small portion covered by deferral accounts in explanation.

The Commission Panel also notes that of the remaining revenue requirements categories, Property and Sundry Taxes ($50.2 million), Financing Costs ($108.5 million) and Depreciation and Amortization ($99.9 million) are at or near 100 percent deferral account protection levels. (Exhibit B1-24, BCUC 2.182.1; Exhibit B1-20, BCUC 1.96.1)

The most significant area not covered to a large degree by deferral accounts is O&M Expenses. O&M Expenses are also an area where there is a history of under spending approved O&M amounts. Under cross-examination, Mr. Dall'Antonia explained that risks at the start of each test year are the same and the success of managing within budgets can be attributed to management's experience and being sound managers. (T3:344) While the Commission Panel does not take issue with Mr. Dall'Antonia's comments, we are of the view that in addition to this, FEI has a broad range of options available to it to manage O&M budgets effectively. For example, many of the initiatives in an approved O&M plan can be postponed for short periods or in some cases not implemented

within the test period. This could include items such as routine maintenance, new staff additions, replacement of staff vacancies or delaying of new programs or initiatives. This may, in part, account for the fact that O&M expenditures were less than forecast in 8 of the last 9 years. (Exhibit B1-24, BCUC 2.182.1) Therefore, in the view of the Commission Panel, this is an area where FEI has a high degree of control. **Accordingly, the Commission Panel finds that a high risk rating for O&M expenses is not appropriate and a moderate to low rating is more reflective of the risk FEI faces.**

Another area with a high risk rating due to limited use of deferral accounts is Other Operating Revenue which encompasses things like late payment charges, NSF cheques, and connection charges. This item has been in the $20 to $25 million range over the last nine years, which is a relatively small part of revenue requirements. However, as outlined in Undertaking No. 8, there have been consistent negative variances (meaning revenues were less than approved) in the $2 million range for all but the most recent completed year. (Exhibit B1-24, BCUC 182.1; Exhibit B1-20, BCUC 1.96.1; T2:293-294; Exhibit B1-43)

The Commission Panel acknowledges that many of the Other Operating Revenue areas are less predictable and controllable in nature and most items are not covered by deferral accounts. Therefore, the Commission Panel finds that a high risk rating is appropriate.

Commission Determination

Given our findings with respect to revenue risks and risks in expense areas not covered by deferral accounts, the Commission Panel is not persuaded that on balance FEI faces significant short-term risks to its achieving its allowed ROE in a given test period. While including items that are less predictable or controllable, the Other Operating Revenue item generally shows a consistent pattern of under earning revenues. However, their impact on the total revenue requirements is relatively small. **Therefore, acknowledging that there has been little change in short-term risk since the 2009 Decision, the Commission Panel has determined that only minimal weight can be given short-term risk as an impediment to earning a fair return.**

4.4 Developing an Optimal Capital Structure

An important component of the Panel's task is to determine an allowed capital structure. This section is devoted to the discussion of the evidence presented that relates to the capital structure decision and presents the Commission Panel's findings. In this section, we set out the context within which this evidence has been considered.

4.4.1 Capital Structure and the Fair Return Standard

Background on the role of capital structure on the cost of capital is provided in the Brattle Report, which recognizes that "underlying asset risk in each company is typically divided between debt and equity holders – making them derivatives of the underlying asset return." In addition, the result of a specific capital structure is a particular Weighted Average Cost of Capital.

$$WACC = r_d(1 - T_C).\frac{D}{V} + r_E\frac{E}{V}$$

where: r_d = market cost of debt; r_E = market cost of equity; T_C = corporate income tax rate; D = market value of debt; E= market value of equity; and V = the market value of the firm (i.e., V= D+E).

(Exhibit A2-3, pp. 38-40)

This cost of capital reflects the equity risk and the debt risk, both of which in turn reflect both operating and financial risk, as well as the tax advantage of debt.

The integration of the capital structure decision with the ROE decision is recognized in the argument of AMPC/CEC:

> "Capital structure is important for two main reasons: (1) the cost of equity is higher to reflect the greater risk of investing in shares as opposed to bonds, and (2) the cost of debt (interest) is tax deductible, whereas the cost of equity (dividends) is paid out of after-tax income. Consequently, equity is substantially more expensive than debt. . . . FEI's customers have a right to expect that its capital structure will be efficient and the common equity component will reflect the real risks equity shareholders are exposed to." (AMPC/CEC Final Submission, p. 32)

Ms. McShane submits that the inter-dependence between capital structure and ROE is largely based on the FRS with its three requirements i) the ability to attract capital on reasonable terms, ii) maintenance of financial integrity; and iii) comparability of returns. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 34)

These considerations translate into a focus on credit metrics and the need to maintain a particular credit rating. The FBCU does, however, discuss at length the possible disruptions that might take place if FBCU experienced a rating downgrade. AMPC/CEC submit that FBCU's credit metrics are not weak and that a 35 percent common equity ratio (as compared to its existing 40 percent ratio) "is entirely consistent with the objective of maintaining FEI's existing credit rating." (Exhibit B1-9-6, McShane Evidence, Appendix F, pp. 35-37; FBCU Final Submission, pp. 12-15; AMPC/CEC Submission, pp. 32, 34-36)

4.4.2 Commission Panel Discussion

The Commission Panel accepts the view put forth by AMPC/CEC that the capital structure should be set efficiently. The Panel also notes that debt comes with advantages, primarily the deductibility of interest payments from taxes.

At the same time, the Commission Panel recognizes the argument made by FBCU that the excessive use of debt could disrupt the operations of the company by making it difficult to finance the ongoing operations.

The Commission Panel accepts, therefore, that there are both expected benefits and expected costs associated with the use of debt. The task faced by the Panel is to determine the 'optimal' capital structure, one that is efficient in reducing the total or WACC through the use of debt without creating potential financing disruptions that could offset these benefits to the point where the net benefit is reduced.

The discussion of the capital structure evidence and determination found in this section reflects the Panel's desire to find an efficient or optimal capital structure. In doing so it applies the following principles to guide its analysis:

1. While credit ratings are important indicators of the risk of disruption, a particular rating is not in and of itself the definition of an efficient capital structure. Possible ratings downgrades are important but must be considered in terms of the attendant costs and benefits.
2. The long-run risks discussed by all parties are important considerations in determining an optimal capital structure. They indicate operating uncertainties that can cause financial distress and the possible attendant disruption and distraction of management. Since the concern is with financial disruption, both diversifiable and non-diversifiable risks must be recognized in assessing the risk of financial disruption.
3. The stand-alone principle implies that the risk of disruption due to financial distress is assessed within the context of the risks to the benchmark utility. It is in this sense that the Panel agrees with FBCU's view that FEI is not a diversified investor. (FBCU Final Submission, pp. 130-131) As discussed in Section 5, however, this does not imply that the Panel accepts this view with regard to the ROE.

4.5 Credit Ratings and Metrics

An important issue for the Commission Panel is to determine how important it is for FEI, as the benchmark utility, to maintain an "A" category credit rating among credit agencies. Credit ratings are important indicators of potential financial disruption as discussed in Section 4.4. A lowering of credit agency ratings raises concerns about the cost of debt and access to the credit market at reasonable cost. Therefore, there are clearly advantages of maintaining an ROE and capital structure which will allow for existing credit agency ratings to be maintained. However, the Commission Panel must consider whether there is a point where maintenance of a particular credit rating may result in a capital structure or ROE that is suboptimal in the circumstances. In such instances, what importance should the Commission Panel place on the maintenance of a credit rating and at what additional cost?

Presently, FEI is rated by Moody's and DBRS, with Moody's providing the lower credit rating at A3, which is just one level above a Baa rating. DBRS provides a slightly higher A rating, which is comparable to a Moody's A2 rating. (Exhibit B1-58) The Moody's rating is considered to be more vulnerable to a downgrade due to weaker credit metrics, which, with further deterioration and a less predictable and supportive regulatory environment, could result in a drop to the Baa rating. (Exhibit B1-9-6, Appendix F, Ms. McShane Evidence, p. 59) This Baa rating could reduce the financial integrity of FEI by reducing its ability to maintain credit and access capital on as reasonable terms as an A3 rating.

The Commission determined in the 2009 Decision that Moody's rating should be the focus of attention because it was the lower in the group, and that the Moody's A3 rating should be maintained with a margin of cushion to ensure the financial integrity of FEI. (2009 Decision, p. 15)

None of the interveners took the position that FEI's 'A' rating should be jeopardized. AMPC/CEC submit that a reduction of the ROE to 7.5 percent at the existing 40 percent equity ratio would still leave FEI with strong credit metrics, including a cash flow coverage ratio of 2.67, and that a combined ROE reduction to 7.5 percent and lower equity ratio to 35 percent would leave FEI with a 2.35 ratio, which would still be above Moody's stated threshold of 2.3 to maintain the A3 rating. (AMPC/CEC Final Submission, pp. 35-36)

FBCU state that their current credit metrics are already weak for the existing rating and that the combined reduction in ROE and equity ratio as suggested by AMPC/CEC would not allow it to have a margin of comfort. (FBCU Final Submission, p. 15) FBCU also state that Moody's assessment of regulatory support had already weakened because of BC provincial energy policy. (T3:366) FBCU further state that under the Trust Indenture, Dr. Booth's recommendation would result in a coverage ratio of approximately 1.97. (FBCU Final Submission, p. 77)

Ms. McShane noted that the importance of 'A' category credit ratings arises from two factors: market access and cost. With respect to market access, Ms. McShane testified that regulated issuers can at times be closed out of the market if they have less than an 'A' category rating. Ms McShane further testified that "during the period June 2008 to January 2009, there was not a single issuer without at least one "A" credit rating who was able to issue long term debt <u>on any terms</u> in the Canadian market." With respect to cost, Ms. McShane states that in addition to market access issues, a rating downgrade would result in a cost increase to additional debt the company needs to raise. Further, it will also affect all of the utilities' outstanding debt as the increased cost of new debt will increase the required yield on existing debt and reduce the value of that debt. This higher cost of debt to the utility results in a higher cost of debt for ratepayers.
Ms. McShane further submits that institutional investors continue to have limits upon the amount of 'sub A' category debt they are able to hold or are restricted from holding Baa/BBB debt at all. This underscores the importance of 'A' credit ratings given the relatively small size of the Canadian market for Baa/BBB debt. (Exhibit B1-9-6, Appendix F, Ms. McShane Evidence, p. 35-37)

Mr. Engen submits that the 10 year bond yield spread for BBB/A rated utilities has been volatile and as of July 6, 2012, is at 38 basis points (bps). This is less than the 100 bps common during the 2008 financial crisis. According to Ms. McShane, over the past 15 years, the average spread between typical A and BBB rated utilities has been 75 bps. (Exhibit B1-9-6, Engen Evidence, Appendix E, p. 34; Exhibit B1-9-6, Appendix F, Ms. McShane Evidence, p. 36**)**

Commission Determination

The Commission Panel accepts that continued access to debt capital at an attractive price is an important element which benefits the shareholder and may benefit the customer. Based on the evidence of Ms. McShane and Mr. Engen, a drop to the equivalent of a BBB rating by both rating agencies would result in a borrowing rate difference which would be significant. That being said, the Panel is mindful that credit agencies like Moody's rely upon the embedded cost of debt rather than the marginal cost of debt when calculating a utility's credit metrics as argued by AMPC/CEC. (FBCU Reply, p. 22) Based on the testimony of Ms. McShane the approved cost of debt for 2013 (at 40 percent equity) is 6.8 percent. The Panel notes that current marginal rates are substantially below this level. Therefore, we conclude that the embedded cost of debt is likely to be reduced over time, even in the event of a credit downgrade.

The Commission Panel will continue to be guided by the Fair Return Standard with its three tests of financial integrity, capital attraction and comparable return in determining an appropriate capital structure and ROE. The Panel supports the maintenance of an "A" category credit rating but only to the extent that it can be maintained without going beyond what is required by the Fair Return Standard.

The Commission Panel finds that there is sufficient evidence to conclude that the maintenance of an "A" category credit rating is desirable, but not at all costs.

4.6 Other Jurisdictions

There is general agreement among the parties that the major natural gas utilities in Canada should serve as comparables for FEI for the purposes of assessing FEI's capital structure. This group which includes ATCO Gas, Union Gas, Enbridge Gas Distribution and Gaz Metro was used extensively throughout the proceeding as comparators. Dr. Booth also identified Nova Scotia Power Inc. as a reasonable comparator, being a province-wide integrated electric utility.

The equity thickness ratios of the comparator group of utilities are listed below in Figure 5. The equity ratios of the Canadian comparator group range from 36 percent to 39 percent in contrast to Dr. Booth's recommended equity ratio of 35 percent and FEI's current equity ratio of 40 percent:

Figure 5: Canadian Comparative Utility Equity Ratios

Company	Equity Ratio (%)
FEI	40.00
Dr. Booth on FEI	35.00
ATCO	39.00
Union Gas	36.00
Enbridge Gas Distribution	36.00
Gaz Métro *(*Quebec)*	38.50

(Source: FBCU Final Submission, p. 78)

While there is common agreement as to comparable gas utilities, there is considerable disagreement among the parties as to what these comparables suggest about FEI's required common equity ratio. (FBCU Final Submission, p. 78)

4.6.1 FEI Risk Level Relative to Alberta and Ontario Utilities

FBCU submit that the Commission should find that FEI faces higher long-term risk than natural gas distribution utilities in Alberta and Ontario for the following reasons:

- Alberta and Ontario marketplaces are more favourable from the perspective of supply and infrastructure for natural gas, overall marketplace liquidity, the number of storage facilities and pipeline companies that operate in the regions, and overall gas flows;
- Electricity costs in Alberta and Ontario are not heavily influenced by low embedded costs of "heritage hydroelectricity;"
- Eastern based utilities, by virtue of their proximity to the Marcellus Formation, have seen greater benefits from shale gas than FEI;
- The growing prevalence of multi-family dwellings in BC. The FBCU note that in a hearing before the Alberta Utilities Commission in 2011, Dr. Booth described this "condification" as a "significant competitive pressure;" and
- Government policy and legislation is a long-term risk factor for FEI. Among the provinces, BC is at the forefront of GHG reduction initiatives.

  (FBCU Final Submission, pp. 77-81)

FBCU point out that regardless of the analysis relied upon by Dr. Booth, his approach ended up recommending a 35 percent common equity ratio for all Canadian Utilities excepting Gaz Metro. (Exhibit C6-12, AMPC/CEC Evidence, Dr. Booth Evidence, p. 43) In this instance, FBCU had the following concerns with the analysis leading to his recommendation of 35 percent:

- Absent from the comparison was ATCO Gas which was the highest comparator at a 39 percent common equity ratio. FBCU notes that Dr. Booth puts ATCO Gas in the same risk category as FEI and perhaps a little riskier.
- There was no reference to Gaz Metro's deemed preferred shares in his portraying them as having a common equity ratio of 38.5 percent. This effectively understated Gaz Metro's effective deemed common equity ratio.

  (FBCU Final Submission, pp. 77-82)

AMPC/CEC submit that all of the comparators have common equity ratios that are below the current 40 percent common equity ratio of FEI. They also concede that at 38.5 percent, Gaz Metro is at the top of the range. However, they submit that Gaz Metro is in a far more difficult and risky climate than FEI, given FEI's advantage over electricity is 5 times as great as that of Gaz Metro. AMPC/CEC conclude that a common equity that is the same or greater than Gaz Metro's 38.5 percent would be unreasonable on comparative terms. (AMPC/CEC Final Submission, pp. 33-34)

FBCU submit that neither BCSPO nor AMPC/CEC made any attempt to reconcile the inconsistencies in the comparative analysis among Canadian utilities' capital structures. FBCU further submit that Dr. Booth's submission "that ATCO Gas risk was in the same risk bucket or slightly less risky than FEI" is significant because it suggests that the 40 percent common equity ratio for FEI is justified as ATCO has a 39 percent common equity ratio. (FBCU Reply, pp. 24-25)

Commission Determination

The Commission Panel has previously considered this matter in Section 3.2. The Panel has considered the common equity ratio decisions of other Canadian jurisdictions. **However, because each province is different in terms of its levels of regulatory protection and each utility has its own set of unique circumstances which are only minimally covered in the record of this proceeding, the Commission Panel has determined that only limited weight is to be given to the outcomes of proceedings in other Canadian jurisdictions.** Accordingly, evidence related to the equity ratios of other jurisdictions is used as a reference point only in determining whether FEI's is in an appropriate range.

4.7 Capital Structure – Commission Determination

The Commission Panel has determined that a common equity ratio of 38.5 percent is appropriate for FEI effective January 1, 2013.

The Commission Panel has examined the factors contributing to long-term risk in this proceeding and considered the submissions of each of the parties. The Panel has found that reductions are warranted in long-term risk associated with provincial government climate and energy policies as well as the competitive position of natural gas relative to electricity. Both of these risk areas were rated by the FBCU as category 2 risks. To offset these there is not a single area where the Panel has been persuaded the level of long-term risk has been demonstrated to have increased materially since 2009.

The Commission Panel notes that the 2009 Decision put considerable emphasis on the uncertainty created by climate change legislation that did not exist during the previous cost of capital proceeding. In addition, the 2009 Decision acknowledged the change in the competitive position of

natural gas versus electricity but concluded that there were too many variables at play for this to be considered permanent. The Panel's finding that there is lower long-term risk related to both of these factors since 2009 is indicative of a reduction in overall risk to FEI which needs to be reflected in the common equity ratio.

Consideration being given to both long and short-term risk, the Commission Panel determines that a reduction in the common equity ratio of 1.5 percent to 38.5 percent is appropriate.

Considering the discussion of optimal capital structure in Section 4.3, the Commission Panel notes that the reduction in common equity ratio to 38.5 percent is reflective of reduced long-term risk and yet balances this against potential disruption caused by a significant weakening of credit metrics.

With respect to credit ratings and metrics, the Commission Panel notes that considerable concern has been raised concerning FEI's credit metrics. In Section 4.4 we found the evidence supportive of maintaining an "A" category credit rating but not at all costs.

The Commission Panel notes that the 38.5 percent equity ratio awarded FBCU in this proceeding falls within the upper end of a range of comparative utilities in other Canadian jurisdictions and considers it to be reasonable on a comparative basis.

FEI is to file within 30 days of this Decision and the accompanying Order G-75-13 a document setting out how and when it will implement the change to its capital structure.

5.0 RETURN ON EQUITY

5.1 Key Issues

The Commission Panel is of the view that an important consideration in this proceeding is the determination of a return that provides investors with the opportunity cost of their investments. The Brattle Report recognizes and elaborates on this fundamental principle:

> "[The cost of capital is] Defined as *the expected rate of return in capital markets on alternative investments of equivalent risk,* it is the expected rate of return investors require based on the risk-return alternatives available in competitive capital markets. Stated differently, the cost of capital is a type of opportunity cost: . . ." (Exhibit A2-3, pp. 2-3)

However, even if one accepts the concept of the opportunity cost as a foundation of a Return on Equity determination, a remaining challenge is that risk and expected return of the relevant 'alternative investments of equivalent risk' are in the eyes of investors who have access to well functioning capital markets. These expectations are not directly observable to Panel members or to parties in this proceeding who provide evidence for the Panel to consider. Instead, estimates of investors' expectations are based on data that are interpreted through *models* of competitive capital markets. The Panel finds an observation offered in the Brattle Report to be instructive:

> "It is useful to recognize explicitly at the outset that models are imperfect. All are simplifications of reality and this is especially true of financial models. Simplification, however, is also what makes them useful. By filtering out various complexities, a model can illuminate the underlying relationships and structures that are otherwise obscured." (Exhibit A2-3, pp. 3, 5-6)

The evidence presented to the Panel was based on a large variety of specific models that fall into four broad classes: (i) DCF models; (ii) CAPM (iii) ERP models and (iv) CE models. Within these four classes are numerous specific implementations that vary in structure, assumptions, and the data from which they were estimated. For instance, there are multiple DCF models with multiple estimates of the appropriate opportunity cost of an equity investment in the Benchmark Utility FEI. The estimates of the investor's opportunity cost of equity, summarized in Appendix F to this Decision, range from 6.15 percent (Dr. Safir CAPM) to 11.50 percent (Dr. Vander Weide's FRP model.

The models and approaches used by the expert witnesses in this proceeding to estimate the ROE are summarized in Tables included in Appendix F of this Decision.

The key issue then in the determination of the appropriate ROE is assessing how much weight to give to each of these models and their estimates. In turn, the weight given to each estimate depends on a judgment of the validity of the conceptual base of the four broad model classes and a judgment of how reasonable the model inputs are. The Panel has based this judgment, as much as possible, on the objective of determining the opportunity cost of equity.

The Panel finds that the two most compelling frameworks for assessing the cost of equity are the DCF model and the CAPM. These models have well understood theoretical bases and explicitly recognize the opportunity cost of capital. Accordingly, these two models are given equal weight in determining the allowed ROE. As discussed in Sections 5.4 and 5.5, the ERP models (with the exception of Ms. McShane's CAPM based equity risk premium) and comparable earnings model are not based on compelling foundations. Furthermore, model inputs and estimates are largely *ad hoc* and assessments of the validity of these inputs and estimates are based on subjective evaluations with minimal logical guidance. Consequently, both the ERP and CE approaches are given no weight in the Panel's determination of the appropriate ROE for the benchmark utility.

5.2 The Capital Asset Pricing Model

The CAPM is based on consideration of individual investors making portfolio decisions in a well functioning capital market. As such, it is a model of the shareholders who own the shares of the firm. Of all the models used to present evidence to the Panel, we consider that the CAPM provides the underpinnings of investor choice in greatest detail.

The CAPM is based on portfolio theory, a theory that answers the question: If an investor wishes to achieve a particular rate of return and is able to invest in a large set of securities, what investment strategy will deliver the target expected return at lowest possible risk? (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 78) The somewhat surprising answer given by portfolio theory is that all investors will hold a combination of two mutual funds; one made up of all risky securities available, referred to as 'the market portfolio' and the second made up of risk free securities. In contrast to intuition, individual risk aversion will not determine which specific securities to invest in but will

determine how much of an investor's wealth will go in the market portfolio and how much will go into risk-free securities. A more risk-averse individual will hold less of their wealth in the market portfolio and more in treasury bills than a less risk-averse individual.

The result that investors will hold well diversified portfolios instead of individual stocks provides great guidance in elaborating on the seminal Supreme Court of Canada decision of *Northwestern Utilities* that the allowed return on capital is to be comparable to the return that would be earned on "... the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise." (Exhibit A2-3, p. 2) The CAPM tells us that these 'other securities' are not other comparable firms but are instead comparable portfolios that combine the market and the risk free rate.

The Commission Panel notes that the reason investors are better off holding a mutual fund instead of picking individual stocks is diversification. Diversification builds on another bit of intuition: don't put all your eggs in one basket. As The Brattle Report states:

> "…when security returns are positively correlated (i.e., have a tendency to move in the same direction, to some degree), trade in capital markets allows investors to reduce their total risk exposure by holding portfolios, which serve to diversify the risk of the individual securities. Diversification permits investors to obtain lower variance for a given expected return or a higher expected return for a given level of variance, where variance of returns over time is a measure of risk." (Exhibit A2-3, pp. 6-7)

Since diversification is a driving force in investor's decisions, leading them to hold broadly diversified portfolios, when they consider the value of an individual stock they do not consider the total risk of the stock in isolation. They instead consider the amount of risk the stock will add to the risk of the mutual fund, recognizing the effect the stock has on the total diversification achieved. The amount of risk that remains after the benefits of diversification is referred to as non-diversifiable or systematic risk. The measure of the systematic risk is called beta. (Exhibit A2-3, pp. 6-7; Exhibit C4-9, p. 9; Exhibit B1-9-6, Appendix F, p. 88)

The CAPM builds on portfolio theory by providing a risk return relationship that recognizes beta as the risk measure. The theoretical foundation and the formulation of the CAPM is discussed in the evidence of Dr. Safir (Exhibit C4-9, pp. 8-11) and in the Brattle Report, which states:

> "The presence of a market underlies the "opportunity cost" interpretation of cost of capital – by investing in a security A, an investor foregoes (some) investment in an alternative, "comparable risk," investment B obtainable through the market." (Exhibit A2-3, p. 6)

The opportunity cost of an investment is based on the return on a risk free investment, which is the risk free rate. To this is added a 'risk premium'. In turn there are two parts to the risk premium. The first is the extra return that would be earned by holding the market portfolio on its own instead of the risk free security. The expected return on the market is denoted r_m and the risk premium over the risk free return, r_f, is denoted by (r_m - r_f). This is referred to as the 'the market price of risk' or the 'market risk premium'. The second component of the risk adjustment is beta which adjusts the market risk premium to account for the degree to which the individual stock contributes to the market risk; low beta stocks contribute less than average and earn less than the market rate, high beta stocks earn more.

The advantage of the CAPM is that it distils the complex interactions among risk averse investors trading with each other to a simple equation with three parts:

$$r_e = r_f + (r_m - r_f)\beta$$

where r_e is the opportunity cost of equity.

So, to estimate the investor's opportunity cost requires an estimate of the risk free return, the market risk premium and the beta. In spite of the CAPM's strong theoretical underpinnings, the estimation of these model inputs presents challenges as outlined in the Brattle Report (Exhibit A2-6, pp. 16-25) and in the evidence of Ms. McShane. (Exhibit B1-9-6, Appendix F, pp. 67-70) The challenges include the role to be played by the US data in the analysis.

The Panel recognizes the growing importance of US and indeed global securities in the portfolios of Canadian investors as pointed out in the evidence of Mr. Engen and of Ms. McShane. (Exhibit B1-9-6, Appendix E, pp. 11, 43-50; Appendix F, pp. A-14, A-15) The Panel also recognizes that none of the evidence was based on data related to global portfolios held by investors; for instance, market portfolios were defined as either the Canadian or US market separately and none of the evidence dealt with an integrated global portfolio. Furthermore, currency risk was not considered nor was the magnitude of foreign ownership of FEI. The evidence presented includes CAPM estimates on either US or Canadian data. In light of these concerns with respect to the lack of a complete global

perspective and the potential for risk (including currency risk), the Panel concludes that the more appropriate of these two perspectives is that of the Canadian based CAPM. Therefore, the Panel places greater weight on Canadian based CAPM estimates.

The Panel received a great deal of evidence on various estimates of the following three inputs.

(1) The Risk Free Rate, r_f

Evidence submitted to the Panel indicates that, at the time of filing, returns available to Canadian investors on long-term Government of Canada default free bonds were in the 2.6 to 3 percent range. (Exhibit B1-9-6, Appendix F, p. 77; Exhibit C6-12, pp. 53-71) Although this return was available to investors and therefore seems to meet the requirement of an opportunity cost, all of the experts submit that the appropriate opportunity cost is better measured by the *forecasted* yield on a long-term risk free instrument and that in some cases even this estimate should be adjusted.

Estimates of the risk free return available to investors, based on forecasted long-term Government of Canada Bond Yields, range from a low of 2.95 percent estimated by Dr. Vander Weide (Exhibit B1-9-6, Vander Weide Evidence Appendix G, p. 35) to a high of 4.0 percent by Ms. McShane and Dr. Safir. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 77; Exhibit C4-11, BCUC 1.4.1) Dr. Booth submitted that 3.0 percent was the forecasted yield on long-term Government of Canada Bonds but he considers forecast long Canada bond yields of 3.0 percent to be "well below any 'equilibrium' yield since they are only 1% above the forecast inflation rate and mean locking in a negative real yield for a typical taxable investor." (Exhibit C6-12, p. 60) Dr. Booth testified in cross-examination that:

> "…we do have foreign official flows of money coming into Canada because we are a triple A rate country and they are basically buying Canadian government bonds, pushing up prices, pushing down yields, and pushing them down to a value that I do not think reflects the proper trade-off between risk and return by "an ordinary private investor" making these decisions." (T8:1516)

Accordingly, Dr. Booth adds 0.8 percent to the 3 percent to recognize the alternative, and to arrive at his "Base adjusted LTC forecast" of 3.8 percent. (Exhibit C6-12, pp. 84-85, 93; Exhibit C6-15, BCUC 1.30.3)

In summary, the evidence presented seems consistent in stating that the current rates available on risk free government securities is between 2.6 percent and 3 percent. However, the Panel also agrees with the experts that current monetary policy is historically unusual and subsequently results in the possibility of a higher effective risk free rate. **Therefore, the Panel determines that the estimate of 3.8 percent for the risk free rate is reasonable, corresponds to Dr. Booth's estimate, and is within the relatively narrow range of estimates presented by all experts.**

(2) Market Risk Premium (r_m - r_f)

Estimates of the market risk premium range from 5 percent to 6 percent according to Dr. Booth (Exhibit C6-12, Appendix B, p. 16) to a high of 7.5 percent submitted by Ms. McShane. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 98) The basic estimation methodologies used by all experts were similar in that they were based on historical data on market returns and returns on risk free securities. They differ in some important details.

Ms. McShane bases her estimate on the average return on an investment in the market and shows, in Table 10, page 80 of her evidence that the average return on equities in Canada over the 1924-2011 period is 11.4 percent. From this number, Ms. McShane subtracts the *current* forecasted long-term Government of Canada Bond yield of 4 percent to arrive at her 7.5 percent estimate of the risk premium. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 87) The Commission Panel understands that it is typical to base the risk premium on the average historical difference between the return on the market and the risk free rate. It is our understanding that this approach is to deal with, among other things, the fact that historical market returns and historical bond yields reflect historical inflation while current returns reflect current inflationary expectations. This is an especially important consideration in the current environment where inflationary expectations are at a historically low level. (T3:483-485; T5:713-715)

To illustrate our concern with the approach used by Ms. McShane, the Commission Panel notes that there are times in the last 30 years where this approach would have yielded a very small or even negative risk premium. For instance, Schedule 2 of Ms. McShane's evidence reports that the yield on Long-term Canadian Government bonds in 1990 was 10.69 percent. If this was subtracted from the average market return it would have yielded an unreasonably low market premium. (Exhibit B1-9-6, McShane Evidence, Appendix F, Schedule 2, p. 1; T8:716-717)

Ms. McShane was asked if she could provide a single reference to a textbook or Journal article that advocated using her approach. Her response was that she 'probably could not' (T5:717-718). Accordingly, the Panel gives no weight to the risk premium estimate of 7.5 percent provided by Ms. McShane.

Dr. Booth provides evidence that the historical risk premium is between 5 percent and 6 percent. He adjusts this range for 'Operation Twist' to obtain a risk premium estimate of 5.8 percent to 6.8 percent with a midpoint of 6.3 percent. (Exhibit C6-12, p. 93) Operation Twist refers to monetary policy intended to influence returns at various maturities including long maturities.

Dr. Booth provides two tests of the robustness of his estimate. One robustness test is to compare his estimate of the market risk premium with expectations used by FEI in assessing its defined benefit pension liability. Dr. Booth takes the expectation of market return of 7 percent, provided by FEI's consultants, and converts this geometric return to an arithmetic return. From this, Dr. Booth infers that FEI has, for purposes of valuing its pension liability, accepted an expected market return of 9 percent. Based on this he concludes, on page 93 of his evidence, that "[a]s a result, FEI's data seems consistent with a market risk premium of about 6.2%." In their Final Submission, FBCU submit that the Panel should not rely on data used in assessing pension liabilities. FBCU assert that, since actuaries provided the data, they naturally reflect a conservative bias. FBCU cited its witness Ms. McShane, who stated that pension fund managers and actuaries "... have absolutely no incentive to be anything but very conservative because they have a lot on the line. A pension fund needs to be able to assure that it has funds available to pay its retirees." (FBCU Final Submission, p. 151)

The Panel does not accept the assertion that the actuarial expectations are conservatively biased and should be rejected. Actuaries are charged with fairly assessing pension plan liabilities. The Panel finds, therefore, that this robustness test is indeed helpful in assessing the risk premium.

In a second robustness test, Dr. Booth uses the DCF model to estimate an expected return on the entire market. The resulting estimate is 9.3 percent and Dr. Booth notes that this is very close to the expectation held by FEI's own actuaries. (Exhibit C6-12, Booth Evidence, p. 86) This is a forward looking estimate of the market return so that a forward looking risk free investment can be used to compute the risk premium. Since Dr. Booth concludes in his first robustness test that a 9 percent

market return implies a 6.2 percent risk premium, his estimates of 9.3 percent for the market suggests a market risk premium of about 6.5 percent.

FBCU argue that the DCF cannot be used to assess the market as a whole. (FBCU Reply, pp. 29-30) The Panel disagrees with this assertion. Although the model is typically illustrated and applied to a single company, the logic of investors setting prices based on expected cash flows applies equally to a mutual fund or portfolio of shares. The Panel, therefore, does not agree that this approach cannot be taken to estimate the expected return on the market. The Panel therefore finds the DCF based estimate of forward-looking market returns to be helpful as a check.

Other estimates of the risk premium were also in the range of 5.96 percent (Dr. Safir's Canadian estimate, Exhibit C4-9, p. 12, Table 1) to 6.6 percent. (Dr. Vander Weide's estimate, Exhibit B1-9-6, Appendix G, p. 38) **Given the preceding discussion, the Commission Panel accepts a market risk premium of 6.4 percent as it is within reasonable forecasts presented.**

(3) Betas

Evidence on the beta estimates is largely based on a standard approach of regressing returns from comparable firms on market returns. Since FEI does not have traded equity, estimates of beta must be based on comparable firms. In the evidence submitted, the set of comparable firms include Canadian firms as well as, in some cases, US-based firms.

Dr. Vander Weide submits a beta estimate of 0.92 based on the historical ratio of the average utility risk premium to the S&P risk premium. (Exhibit B1-9-6, Vander Weide Evidence, Appendix G, p. 42) Aside from the fact that this is a beta estimate for US Utilities (T6:1092), the method differs significantly from the more commonly accepted method(s) of calculating a beta estimate as set out in the Brattle Report (Exhibit A2-3, pp. 15-16), and as calculated by the other witnesses in the proceeding. Accordingly, the Panel places no weight on this beta estimate.

The other beta estimates submitted range from a low of .36 by Dr. Safir for his Canadian CAPM estimate (Exhibit C4-9, pp. 12, 15), to a high of 0.65-0.70 by Ms. McShane. (Exhibit B1-9-6, pp. 97-98) Dr. Booth provides an intermediate estimate of 0.45-0.55. (Exhibit C6-12, Appendix C, p. 14) All

estimates begin with a regression of returns of the comparator firm on market returns with the 'raw beta' being the slope coefficient of the regression.

The differences among estimates largely result from adjustments that are made to the raw betas. Empirical evidence indicates that the regression based beta estimates seem to understate the betas of low risk firms and overstate the betas of high risk firms. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 96; Appendix A to Ms. McShane's Evidence, pp. A-21-26; Exhibit B1-9-6, Appendix G, p. 41) Since, by construction, the beta of the market is one, the adjustments are intended to bring the estimated beta's closer to one. To accomplish this, Ms. McShane contends that it is appropriate to adjust utility betas towards the market average of 1.0. (Exhibit B-19-6, McShane Evidence, Appendix F, p. 96) Both Dr. Booth and Dr. Safir, on the other hand, contend that the adjustment should be to the utility average beta that is in the range of 0.5 - 0.6. (Exhibit C6-12, Booth Evidence, p. 71; Exhibit C4-9, Safir Evidence, p. 15)

None of the evidence presented revealed the actual bias in beta estimates; instead the experts assert a particular adjustment. In cross-examination Ms. McShane acknowledges that utility betas may indeed not trend towards one.

Mr. HOBBS: And because regulation protects companies, isn't it also true that you would not expect betas for utilities to ever trend towards 1?

Ms. McSHANE: To trend towards 1. I guess I don't disagree with that. I never said that they would. (T4:549)

Similarly, in cross-examination at T6:1073, Dr. Vander Weide says*:*

DR. VANDER WEIDE: Yes. And I readily recognize that betas for utilities don't adjust toward 1.0.

In their Reply, FBCU argued:

> "Ms. McShane's relative risk adjustment of 0.65-0.70 for a benchmark utility, based partly on adjusted betas, recognizes the past relationship between utility returns, both in Canada and the U.S., and the returns on the equity market as a whole. Over the longer-term, utility investors have achieved risk premiums that have been significantly higher than 45% to 55% of the risk premiums achieved on the equity market portfolio. That experience is consistent with the empirical evidence that lower (higher) beta stocks generally have achieved higher (lower)

> returns than the CAPM and beta would have predicted. It is not logical to conclude that, based on that experience, utility investors now only expect to achieve an equity risk premium that is 45% to 55% of the equity market risk premium (or Dr. Safir's lower 36%) simply because utility share price movements have not exhibited a high degree of correlation with price movements in the overall equity market." (FBCU Reply, p. 35)

An adjustment of beta to the market average of one seems inconsistent with the lower risk in the industry, while realized return seems to indicate a beta that exceeds the industry average. The Panel finds that none of the positions fully explain the beta value and therefore accepts an intermediate beta estimate of 0.6 representing the range of reasonable estimates presented.

5.2.1 Adjustments to the CAPM

A number of experts raised concerns about the validity of the simple 'single factor' CAPM. The term single factor refers to the reliance of the prediction of the model on only the market portfolio, the factor implied by the theory. Ms. Ahern introduced in evidence a summary article that shows how other factors such as firm market capitalization (size) and market-to-book ratios can provide added explanatory power to the single factor CAPM. (Exhibit B2-7, Evidence of Ms. Ahern, pp. 13-14; Exhibit B2-7, Attachment PMA-1, Exhibit PMA-9)

The CAPM is by far the most widely studied asset-pricing model and it is not surprising that more is known about its empirical performance than other asset pricing models. This evidence also implies that improved performance can be achieved by including these well-studied extensions of the model. The Panel notes, however, that none of the experts relied on the extensions as found in the literature findings in dealing with the shortcomings of the single factor CAPM. (Ms. McShane, T5:720-722); Dr. Vander Weide, T6:1102-1108; Dr. Safir, T7:1259-1262; Ms. Ahern, T7:1355-1357; Dr. Booth, T8:1658-1663) Instead, the evidence presented by different experts responded to the relatively poor empirical performance of the CAPM in a number of *ad hoc* ways.

Dr. Vander Weide's response to the weak empirical performance of the CAPM is to place no weight on CAPM estimates even though he provides estimates himself. In cross-examination, however, Dr. Vander Weide testified that he did not attempt any standard adjustments to the CAPM that might improve performance. For instance, he did not adjust for the importance of international markets to Canadians, he did not adjust for changes in capital structure and he did not study the ability of a

multi factor model to capture returns. (T6:1108-1111) As a result, the Panel does not accept Dr. Vander Weide's response to the relatively poor performance of the CAPM and continues to place weight on the model.

Ms. McShane and Dr. Booth both attempt to improve the performance of the CAPM by adding empirical analysis in order to augment the basic model. Dr. Booth is clearest in his objective when he states: "I regard this sort of adjustment as converting the CAPM into a conditional CAPM where the CAPM holds conditional upon the state of the financial markets." (Exhibit C6-12, p. 81)
Dr. Booth testified that an academic literature exists that supports the analysis of a conditional risk premium and his credit spread adjustment is consistent with that literature. (T8:1659)
Ms. McShane does not provide the same link to the academic literature and acknowledged, in cross-examination, that her work is along the lines of a multi factor CAPM. (T5:718-720)

The Commission Panel appreciates the efforts of the experts to recognize and deal with the shortcoming of the single factor CAPM. The evidence suggests there are two main thrusts to this effort: i) improving the estimate of the risk premium by conditioning on the current state of the capital markets; and ii) improving estimates of the risk return relationship by adding the factors to the single factor CAPM. Notwithstanding the efforts, the Commission Panel finds that we are not able to assess the validity of the extensions to the single factor CAPM that were presented as there is insufficient evidence involving the use of multi-factor models in this proceeding. The experts expressed reluctance to include other potential extensions to the CAPM that they thought were too complex. This is further addressed in Section 8.

In this regard, the Panel agrees more generally with the specific concern of ICG who argues that in Ms. McShane's CAPM based ERP, she "…makes an adjustment to the market risk premium of approximately 100-150 basis points because in her opinion market risk premium are in fact correlated with the risk free rate." ICG cites Dr. Safir as characterizing the adjustment as arbitrary and not in keeping with the CAPM model. ICG submits that before the Commission Panel accepts this adjustment there must be very strong evidence to support it. In the absence of such strong evidence, the CAPM specifications should not be changed. ICG goes on to say that: "The evidence regarding the correlation (inverse relationship) between the market risk premium and the risk free rate is in fact just that, it is a subjective judgement, with at best, very limited evidence in support of Ms. McShane's proposed departure from the CAPM model." (ICG Final Submission, p. 19)

In support of its argument that there is limited evidence in support of Ms. McShane's adjustment ICG submits that her evidence in support of a relationship between the market risk premium and the risk free rate is presented on a cumulative basis. It argues that when the same data is provided on a non-cumulative basis the US risk premiums do not follow income returns in the manner she suggests (Exhibit B1-53, Undertaking No. 14) and in some instances the data support the opposite conclusion to that observed by Ms. McShane.

Rather than relate the models presented in this hearing to the academic literature, as presented by Ms. Ahern for instance, the extensions seem to be somewhat *ad hoc* leading to the sort of concerns raised by ICG. There is no evidence, therefore that the models present were not the result of a "fishing expedition." That is, the Panel does not know if other adjustments or specifications would produce different results and we cannot assess whether other non-reported specifications should logically be ignored. In the absence of persuasive evidence that these are of value, the Panel is content to consider simple single factor models. At this time the Panel is not persuaded that the specific model extensions that are presented are valid and hence places no weight on them. However, the Panel recommends that in the future improvements in the model can also be brought into evidence, but the evidence should then include both the model extensions as well as a basis on which to judge the validity of the extensions.

5.2.2 CAPM Based Estimate of ROE

Summarizing the discussion above, the Commission Panel has applied the required judgment and accepts the CAPM estimate at 7.64 percent. This reflects a risk free rate of 3.8 percent, a risk premium of 6.4 percent, and a beta of 0.6.

5.3 Discounted Cash Flow Approach

The basis of the DCF approach is the principle that in a competitive market investors who purchase securities are essentially bidding for expected future cash flows that the security entitles them to. Competition implies that investors search for 'good deals', ones that offer the lowest price for a particular cash flow of a particular risk. The higher the price paid, the lower the expected return, so, in an attempt to improve their lot, investors search for securities that trade at a low price generating a high expected return. In their quest for high returns, they are willing to pay a price up to a level

that would make the purchase at least as good as the next best alternative, i.e. equal to their opportunity cost. Of course, in a competitive market, other investors are also looking for good deals and, as a result, competition ensures that observed prices generate returns equal to the opportunity cost.

The theory implies that if one can observe prices and expected cash flows one can infer the investor's opportunity cost. The DCF model applies this logic to equity investment in order to infer the opportunity cost of equity. It is assumed that cash flows to investors consist of dividends and that stock prices reflect investors' expected dividends and the opportunity cost of the investment. If we observe prices of equity and estimate all future dividends that the equity gives title to, then one can infer the opportunity cost of equity. (Exhibit A2-3, pp. 26-29; Exhibit B1-9-6, McShane Evidence, Appendix F, Appendix C, p. C-1)

An attractive feature of the DCF model is that it assumes, unlike the CAPM, that investors hold realistic investment horizons; both short and long-term investors estimate all dividends that the firm will provide over its lifetime. As with the CAPM, a significant disadvantage to the Commission is that for FEI none of the inputs, for example, price, dividends, or opportunity cost, are directly observable. The equity of the benchmark utility is held by Fortis Inc. and not actively traded. Therefore, future dividends are in the eye of the beholder as is the opportunity cost of capital. As a result, the opportunity cost estimate rests entirely on inferences that are commonly based on comparable firms. Not only should these firms be comparable, they should also have actively traded equity, and a source for estimating expected dividends.

Simplifying assumptions make the task of estimating dividends easier and the evidence submitted was all based on one of two simplifications or models. The 'Perpetual Constant Growth' model assumes that investors estimate the next dividend to be paid by the company and a single rate at which dividends will grow in perpetuity. The validity of the constant growth model is reduced when the estimated growth rate comes close to the opportunity cost (as this implies an extremely large stock price) and the model is invalid if the expected growth rate is greater than or equal to the opportunity cost of equity. The second model, 'the multi-stage growth' model, also requires an estimate of the next dividend to be paid but then allows investors to see multiple stages of constant growth; for example, the investor might expect growth of 4 percent for the next five years, 3 percent for the 5 years after that, followed by a constant perpetual growth rate of 2 percent starting

11 years hence. Although the long-term perpetual growth stage must meet the same growth restrictions as the constant growth model, the earlier stages are not restricted in this way. Therefore, multi stage growth models allow considerable more flexibility in dealing with growth forecasts. The Commission Panel has considered DCF-based ROE estimates presented by Ms. McShane, Dr. Vander Weide, and Dr. Safir.[6] Dr. Booth's DCF estimate for the market as a whole was used as a check on his CAPM estimate and is discussed with that estimate previously in Section 5.2.

1) Ms. McShane's estimates

Ms. McShane provides five different estimates with ROE estimates based on the DCF model. The estimates range from 8.6 percent to 11 percent. The estimates were variously based on 12 US Utilities or 5 Canadian utilities. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 113) FBCU submit that: "The application of both constant growth and three-stage models to the two samples supports a DCF cost of equity of approximately 9.1% to 9.8% (mid-point of approximately 9.4%)." (FBCU Final Submission, pp. 105-107) The FBCU also point out that Ms. McShane relied primarily on the consensus (mean) of analysts' earnings growth rate forecasts as the proxy for investors' long-term growth expectations, minimizing the need to superimpose on the analysis her own subjective view of growth expectations. (FBCU Final Submission, p. 106) Ms. McShane recognizes, however, that the forecast period for analysts' long-range earnings and dividend forecasts is typically three to five years over a business cycle (Exhibit B1-9-6, Appendix F, Appendix C, p. C-4), and that extending these forecasts into perpetuity in the constant growth model can overstate expected return. (T4:664-665)

2) Dr. Vander Weide's estimates

Dr. Vander Weide only presents evidence based on a constant growth DCF and only for a sample of US Firms. He relies on I/B/E/S Thomson Reuters Mean Growth forecasts to estimate dividend growth. Dr. Vander Weide's application of the DCF model to his comprehensive group of utilities produced a result of 10.3 percent, and to his smaller group of utilities, 10.0 percent, including 0.50 percent for flotation costs. (Exhibit B1-9-6, Vander Weide Evidence, Appendix G, pp. 27-31; Exhibits

[6] Dr. Booth employed a Constant Growth model but only to estimate the market wide expected return. This was used as a check on his CAPM estimate and so is not included in this discussion.

6 and 7 of his evidence) The FBCU submit that "…Dr. Vander Weide's DCF estimates are reasonable and should be given significant weight." (FBCU Final Submission, p. 108)

3) Dr. Safir's estimates

Dr. Safir uses a two stage DCF model to develop two estimates; one of 8.99 percent based on 5 Canadian firms and one of 8.86 percent based on a sample of 18 US utilities, before adding flotation costs amounting to 5 percent of the initial ROE estimates. (Exhibit C4-9, pp. 24-26, and Schedules 3 and 4)

Commission Panel Discussion

The Brattle Report observes: "The DCF approach is conceptually sound if its assumptions are met, but can run into difficulty in practice because those assumptions are so strong, and hence unlikely to correspond to reality." Elsewhere the report is more specific: "The major source of debate for the DCF model is determining the dividend growth rate, particularly for the long-term. There is generally no publicly available data on forecast growth rates for periods longer than 5 years." (Exhibit A2-3, p. 30)

The FBCU urges the Panel to give the DCF considerable weight, while the AMPC/CEC submits that "a DCF analysis can provide a helpful "check" on CAPM estimates, but the Commission should be cautious not to rely too heavily on it." (FBCU Final Submission, p. 89; AMPC/CEC Final Submission, p. 41)

The Commission Panel is of the view that, notwithstanding the concerns expressed about the approach, considerable weight should be given to the DCF but also accepts that caution should be used in assessing the growth estimates presented. A number of specific concerns arise with respect to the evidence presented:

a) **Reliance on analysts' short-term forecasts as the long run forecasts in constant growth formulas**:

This reliance appears in the single stage models presented by Ms. McShane and Dr. Vander Weide. For instance, Ms. McShane's estimate based on Canadian comparable firms assumes perpetual dividend growth of 7.5 percent. Since this is larger than her estimate for long run GDP growth of 4.3 percent, Ms. McShane seems to imply that FEI will grow to be an increasingly larger segment of the economy. This is inconsistent with the evidence presented in Appendix F of her testimony where she enumerates many reasons why consumers, both residential and commercial, will migrate from natural gas to other sources. Similarly, Dr. Vander Weide's estimates of the cost of capital use short-term analysts' forecasts to estimate the constant growth model. Similar to Ms. McShane, the resulting implication is that FEI will become a larger component of the economy over time, a conclusion that seems inconsistent with FEI's submissions regarding a shrinking market share and falling customer capture rates. (FBCU Final Submission, p. 53) We also note that Dr. Vander Weide included firms whose growth rate exceeded his estimate of the cost of equity in his comparable firms. As noted above, such a growth rate is inconsistent with the DCF constant growth model yet were included in his sample without adjustment. This calls into question the DCF estimates presented by Dr. Vander Weide.

The Panel finds that the use of analysts' forecasts is more consistent with the multi-stage models where the analyst forecasts can inform the early stage and longer term forecasts, such as of GDP growth, can inform later stages.

b) **Reliance on comparable firms operating in the US**:

The AMPC/CEC submits that the use of US based comparable firms renders DCF estimates of limited value. In their submission, AMPC/CEC cites Dr. Booth as follows:

> "[In the past] we had lots of pure play utilities in Canada, where you could do a DCF. In particular, all the local telephone companies were still regulated by the CRTC on a rate of return rate based method, and we had Island Telephone traded, Maritime Tel traded, NewTel traded, Bruncor Traded, Bell Canada traded, B.C. Tel traded. So we had a lot of traded rate of return regulated utilities that we could actually do DCF tests on. Unfortunately, they don't exist anymore." (T8:1493-1494)

While the Commission Panel concurs with the concern about comparability of US based firms, it also agrees with the argument of FBCU that, given the paucity of comparable Canadian firms, also recognized by Dr. Booth, augmenting Canadian data with US firms is appropriate. (FBCU Final Submission, p. 94) The Panel also recognizes the need for careful informed judgment in adjusting the US based estimates to reflect differences in the respective environments.

c) **Analysts' forecast bias**:

Given the heavy reliance on the forecasts of equity analysts, the AMPC/CEC submit that analyst bias may inflate DCF ROE estimates. (AMPC/CEC Final Submission, p. 59) FBCU argues that analysts' forecasts for utilities are not biased. (FBCU Final Submission, p. 111) The Brattle Report notes that studies have shown that analysts' forecasts are likely to be more accurate in utilities than in other sectors and bias is likely to be less in utilities than other sectors. (Exhibit A2-3, pp. 28-29)

The Panel finds that there is reason to be cautious of potential analyst bias in the utility sector. The expert testimony at this time does not, however, convince the Panel that an adjustment for analyst bias should be made. The Panel expects that future hearings will be informed of the latest research on bias in the analyst's reports on the utility sector.

Overall Assessment

The Commission Panel finds that the constant growth DCF models presented have growth assumptions that render the estimates questionable given the discussion above. Therefore, we place little weight on the submitted estimates that are based on the constant growth DCF. The estimates that the Panel found most helpful are Ms. McShane's multi-stage estimates in the range of 8.6 percent to 9.2 percent and Dr. Safir's estimates of 8.86 percent to 8.99 percent (two-stage). (Appendix F) Applying the appropriate judgment required, **the Commission Panel accepts an 8.9 percent DCF based estimate of the opportunity cost of equity.**

5.4 Equity Risk Premium Models

5.4.1 Introduction

FBCU's witnesses Ms. McShane and Dr. Vander Weide each provided results from various models, classified as equity risk premium models. Ms. McShane provided the results of three different 'types' of ERP models, comprising numerous estimates. Dr. Vander Weide used two types of ERP models, which he termed "Ex-Ante" and "Ex-Post" risk premium tests, and used two different samples for each of the two types of tests. None of the other witnesses relied on the ERP.

The Brattle Report summarizes the form and some of the issues concerning ERP models. According to the report, the ERP is frequently implemented using either a historical estimate of the risk premium or a forward-looking or expected risk premium. It notes that the historical risk premium is commonly estimated as the historical spread between equity and debt returns, so the primary choices for the analyst become which equity returns and debt instrument to use as well as the sample period over which the estimate of the spread (i.e., the risk premium) is to be based. The Brattle Report states that it is important that the analysis is consistent in its choice of a debt instrument to determine the cost of debt and that used to determine the risk premium. It also notes that the realized risk premium is highly dependent on the time period over which it is estimated, so that choice is also important. (Exhibit A2-3, p. 31)

The Brattle Report states that the forward-looking model requires that the analyst determine a proper measure of the cost of debt and how to estimate the expected risk premium. It says that because the yield to maturity of an investment grade bond serves as a proxy for the expected return, yield to maturity measures are natural candidates for the expected bond cost. However, determining the expected equity return is more difficult and requires the reliance on an estimation technique. It notes that it is common to rely on DCF models to determine the risk premium in the forward-looking version of the model. (Exhibit A2-3, pp. 31-32)

5.4.2 Discussion of the ERP Method and Results

The Brattle Report states that the risk premium model is a derivative of the CAPM so the comments that apply to the CAPM also apply to the Risk Premium Model, but that "…the Risk Premium Model

does not have the same level of theoretical support. The tie between theory and implementation is weakened because the interest rate in the Risk Premium Model is not necessarily equal to the risk-free rate and the risk premium is not explicitly based upon the product of the investment's beta and the MRP." (Exhibit A2-3, p. 33) Moreover, there is a concern that the historical risk premium approach to the ERP assumes that a historically realized risk premium is an appropriate measure for expected returns, but that over any given period, especially short periods, realized returns can differ substantially from expected returns. (Exhibit A2-3, p. 31)

A strength of the model identified in the Brattle Report is that the information on which the model relies is auditable. However, it notes that because inflation and other factors that are not directly related to the cost of equity capital may affect bond yields, the model will not necessarily produce like results for like conditions. It further states that the implementation of the model largely determines its ability to capture the systematic risk of companies, noting that, unless a forecasted return for relevant companies is used, the model will be unable to estimate reliably the cost of capital across different economic conditions. (Exhibit A2-3, pp. 34)

Commission Determination

The purpose of a rate of return model is to provide structure to the discussion of 'what a fair rate of return is.' Models used to assess this question provide structure and clarity and, in turn, a basis for the data to consider the appropriate interpretation to give it and the estimates.

The lack of a strong theoretical footing for ERP, as noted in the Brattle Report, may explain the large number of ERP estimates submitted to the Panel and the potentially intractable discussion of the merits of the models. There is simply little to help focus the analysis and as a result many models can be submitted as 'true' even though there is little on which to judge the validity of the submission.

The large number of estimates along with the absence of a compelling framework raises the following reservations about the estimates and indeed about the entire approach:

1. The models combine elements of the CAPM and the DCF with other ad hoc adjustments. Since evidence was presented on both the CAPM and DCF, it is not clear what is added by looking at these alternatives.

2. While it is not clear what is gained through these ERP models, it is clear that clarity is lost. In particular, the assumptions used in various estimates are difficult to evaluate. Ms. McShane, for instance, uses return estimates based on a sample of US firms with the 30-year Canada Bond rate in some estimates of the risk premium but in others uses 30-year A-rated utility/government bond yield spreads. (Exhibit B1-9-6, Appendix F, p. 99) Similar ad hoc assumptions are also found in Dr. Vander Weide's analysis. For instance, AMPC/CEC point to Exhibit C6-21 to demonstrate that if bond returns rather than bond yields were used in the analysis, the average Ex-Post risk premium for utilities would be approximately 4.47 percent or 2.3 percent less than Dr. Vander Wiede's estimate. Consequently, the AMPC/CEC argues that the Ex-Post estimates of Dr. Vander Weide must be ignored or if not ignored, then reduced by 2.3 percent. However, FBCU state that it is appropriate to use bond yields as the true risk-free rate. It is not clear, however, why the risk free rate is not estimated using a risk free return.

   Again, while judgment is always needed to evaluate estimates, without a theoretical base, there is no consistent way in which these differences of opinion can be assessed.

3. Since the model variations are ad-hoc they are subject to the concern that they may be subject to a "fishing' expedition" criticism. In contrast, while we can obtain various results from the CAPM or DCF models by changing parameters such as the risk premium in the CAPM or the growth rate in the DCF, the reasonableness of the selected parameter can be questioned.

Given these concerns along with the fact that there is ample evidence on both CAPM and DCF based estimates, the Panel places no weight on the ERP estimates submitted.

5.5 Comparable Earnings Approach

The Brattle Report states notes that the CE method is one of the traditional approaches to the cost of capital estimation, but that it does not have a financial economics foundation or strong theoretical basis. The report states that the legal decision, *Federal Power Commission et al v. Hope Natural Gas Co.,*[7] which stated that the return to the equity owner should be commensurate with returns on investment in other enterprises having corresponding risks, is often cited in the use of comparable earnings, but that neither the Canadian nor the US Supreme Courts has identified any specific methodology to determine a "fair return." (Exhibit A2-3, pp. 11, 36) The Commission Panel observes that much has been learned about financial economics since 1944. In particular, the notion of a comparable investment has been carefully cast in terms of investments in portfolios of

[7] 320 U.S. 591 (1944); 64 S. Ct. 281; 88 L.Ed. 333 (1944) U.S. Lexis 1204

comparable risk since portfolios are more efficient in achieving any expected return than is a single security.

The CE method requires the use of a sample of unregulated companies as comparators, since the use of regulated companies to estimate the comparable cost of capital would be circular. The Brattle Report notes that because the comparable companies are unregulated entities, it is necessary to adjust for any risk differences between the sample companies and the target company, and because the estimates from the model do not come from regulated companies or activities, the method does not recognize the regulatory context in which the cost of capital is being applied. (Exhibit A2-3, pp. 35, 38)

The Brattle Report states that a major issue with the comparable earnings method is whether realized book returns are a good proxy for the return that investors expect going forward and notes that it is a backward looking measure with no consideration of current market conditions. (Exhibit A2-3, pp. 36-37)

Ms. McShane submits that the fair return standard "…is only satisfied if the utility can attract capital on reasonable terms and conditions, its financial integrity can be maintained ***and*** the return allowed is comparable to the returns of enterprises of similar risk. The BCUC has recognized that the comparable return requirement is distinct from the capital attraction standard…." (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 8) [emphasis in the original] In her view, the comparable earnings test is an implementation of the comparable returns standard, as distinguished from the cost of attracting capital standard and it is critical that the regulator recognize the comparable returns standard when setting a fair return. (Exhibit B1-9-6, Mc Shane Evidence, Appendix F, p. 114)

Ms. McShane submits that the comparable earnings test, which measures returns in relation to book value, is the only test that can be directly applied to the equity component of an original cost rate base without an adjustment to correct for the discrepancy between book values and current market values.

Ms. McShane arrived at her comparable earnings estimates based on the earnings on book-value of 21 unregulated Canadian companies from 2004-2011. (Exhibit B1-9-6, Appendix F, pp. 113-116) She arrives at the following result: "To recognize the unregulated companies' higher risk, a

downward adjustment of 125 to 150 bps to their returns on equity was made, resulting in a comparable earnings result in the range of 11.0% to 12.0%." (Exhibit B1-9-6, Appendix F, p. 116)

To complete her comparable earnings estimate, she assesses the need for a market/book adjustment to the comparable earnings results. She submits that "[t]he similar to lower average market/book ratios of the Canadian sample of unregulated companies relative to both the Canadian and U.S. equity market composites indicate no evidence of market power. Thus there is no rationale for making an additional downward adjustment to the unregulated Canadian companies' returns on equity due to their market/book ratios." (Exhibit B1-9-6, pp. 116-17)

Dr. Booth submits that the average ROE increases when one starts adding low-risk firms to a comparable earnings sample and then progressively decreases as more risky firms are added, particularly after the lowest risk firms are added. He argues that: "…to get a high ROE from a sample of comparable earnings firms simply means coming up with "reasonable" screens to narrow down the sample and exclude those firms with significant losses. (Exhibit C6-12, p. 6)

He used book-value based estimates for Corporate Canada as a whole, using Statistics Canada reported earnings for the period 1987 to 2011 and the TSX composite for the same time period. He arrived at a CE estimate for the Canadian market of 9.3 percent, and says that "Like the overall stock market return this then needs to be lowered for the lower risk attached to regulated utilities." (Exhibit C6-12, Appendix E, pp. 3, 7, Schedule 2)

Dr. Booth submits that CE "…is totally unreliable unless a market to book adjustment is made which is rarely the case." (Exhibit C6-15, BCUC 1.39.0) He also submits that a "…market to book adjustment is needed since low risk firms usually have market power which is reflected in higher ROEs. It is incorrect to then allocate to a utility an ROE from a sample of firms that reflects market power when regulation is designed to remove this market power." (Exhibit C6-15, BCUC 1.67.1)

Dr. Booth also says that a problem with looking at past ROEs is that they are earned on historic accounting book equity that does not reflect what can be earned on investments today. (Exhibit C6-12, Appendix E, p. 5)

The AMPC/CEC argues that the Commission should place little or no weight on the comparable earnings test. (AMPC/CEC Final Submission, pp. 38, 60)

Dr. Safir used two market-value based estimates: one for the same Canadian sample of 21 companies used by Ms. McShane; the other based on a sample of 31 US companies in the consumer goods, industrial goods or service sectors using the same sample selection criteria as Ms. McShane used for her Canadian sample. (Exhibit C4-9, pp. 28-29)

Dr. Safir calculated his comparable earnings estimates "…using net income and market value of equity…." He submits that because his comparable earnings estimates were calculated using market-based values instead of book value, they more accurately capture the conditions in the current capital markets in which the benchmark firm would be competing for capital. He goes on to say that his method accounts for factors such as inflation, since both the net income and the stock prices will reflect the level of inflation occurring at the time these numbers were reported and that "[b]ook value-based calculations of comparable earnings will not account for inflation." (Exhibit C4-9, p. 30) Using his market-value based method of calculating CE Dr. Safir arrived at estimates of 6.85 percent for his Canadian sample and 5.81 percent for his US sample. He submits that the Canadian estimate should be given twice the weight of his US estimate and arrives at a weighted average estimate of 6.50 percent. (Exhibit C4-9, p. 33)

Dr. Vander Weide did not provide a CE estimate.

Commission Determination

The fundamental issue regarding the CE test is its lack of a basis in financial economics. The approach requires a sample of unregulated companies of similar risk, but creating a sample of unregulated companies that are, and can be shown to be, of similar risk is difficult without a theoretical basis such as the CAPM or the DCF. Dr. Booth has pointed out the issues that arise when even 'reasonable' screens are used to eliminate companies from the entire universe of companies to create a sample. Moreover, the CE method is retrospective, whereas the ROE to be established for the benchmark utility is prospective.

In her evidence, Ms. McShane submits that: "The economic principle guiding the fair return is the opportunity cost principle." She also submits that one of the requirements of the FRS is that the return allowed is comparable to the returns of enterprises of similar risk and that it is critical that the regulator recognize the comparable returns standard when setting a fair return. She also states that the CE test is an implementation of the comparable returns standard and is to be distinguished from the cost of attracting capital standard. (Exhibit B1-9-6, McShane Evidence, Appendix F, pp. 2, 8, 114)

During cross-examination a discussion on whether the comparable earnings test reflects an investor's opportunity cost concluded with the exchange below:

COMMISSIONER GIAMMARINO: But you would agree that in terms of an opportunity cost, it doesn't match up that closely to what we would consider the exact opportunity cost to the investor.

Ms. McSHANE: A: No, it is not an opportunity cost in the same sense that you were talking about. (T5:732-35)

The Commission Panel addressed the FRS in Section 2 and recognized that a fair or reasonable overall return on capital should be comparable to the return available from the application of the invested capital to other investments of like risk (comparable investment requirement). However, the Commission does not accept that this requirement means that it must use the comparable earnings method as a means of determining what return is required to meet the FRS. Modern finance theory has clearly established that comparable risk is assessed relative to a *portfolio* rather than a single stock. This is indeed the basis of the CAPM and other extensions of risk return modules. Searching for individual firms of comparable risk is consistent with this only if the comparison recognizes non-diversifiable risk as the relevant characteristic. This is exactly what is done when CAPM comparators are sought. But this is ignored when companies are considered comparable on dimensions other than systematic risk.

The preceding discussion highlights some of the serious problems the comparable earnings method contains as a means of determining the return required to meet the FRS. **Consequently, the Commission Panel places no weight on the comparable earnings results.**

5.6 Allowance for Financing Flexibility

Ms. McShane described financing flexibility allowance as intended to cover three distinct aspects: (1) flotation costs comprising financing and market pressure costs arising at the time of the sale of new equity; (2) a margin, or cushion, for unanticipated capital market conditions; and (3) a recognition of the "fairness" principle (Exhibit B1-9-6, McShane Evidence, Appendix F, p. F-1). Flotation costs and financing flexibility adjustments are typically applied to the market-based cost of equity estimates, i.e., the CAPM and the DCF models.

Ms. McShane provided an allowance of 50 basis points for each of her market based tests in order to maintain the market value at a small premium to the book value. In the alternative, should the Commission rely only on the market-based tests, Ms. McShane proposed an allowance for financing flexibility at 1.0 percent. (Exhibit B1-20, BCUC 75.2.1)

Dr. Vander Weide provided an allowance of 50 basis points for flotation and financing flexibility. (Exhibit B1-9-6, Vander Weide Evidence, Appendix G, p. 35)

Dr. Booth provided an allowance of 50 basis points, stating that the market opportunity cost should be adjusted upwards to include issuing costs or a financial flexibility adjustment to make sure that shares can always be sold to net out the original cost included in the rate base, which is all that earns the fair ROE. He also noted that most regulators in Canada have allowed 50 basis points for these new issue costs (Exhibit C6-12, p. 8).

Dr. Safir referred to a survey of flotation costs, which determined them to be approximately 4.5 percent of the recommended rate of return. Based on the 4.5 percent, Dr. Safir applied 5 percent of the rate of return, an equivalent of around 32 to 40 basis points for his CAPM models and 47 bps for his DCF model, to reflect the marginally higher costs that would be faced by Canadian issuers either crossing the border to utilize the US market or in issuing in the smaller Canadian capital market. (Exhibit C4-9, pp. 16-18)

Commission Determination

The Commission Panel accepts the allowance for financial flexibility of 50 bps added to the CAPM and DCF tests in determining the fair ROE. As indicated in Section 5.5, the two market-based tests, CAPM and DCF are given equal weight in the determination of the allowed ROE for the benchmark utility.

With reference to Ms. McShane's proposed additional 50 bps if the CE test is not accepted, the Commission Panel is of the view that each test to estimate the fair return is applied separately to provide a different perspective and each test's results are not contingent upon the results of other tests. Therefore, the Commission Panel does not accept the conditional 50 bps in Ms McShane's alternative proposal.

5.7 Fair Return on Equity – Commission Determination

The Panel finds that the DCF and CAPM should be given equal weight in determining the ROE. Moreover, the Panel finds that CE and other ERP models have insufficient merit to be accorded any weight in the determination of the fair ROE. Considering the CAPM based estimate of 7.64 percent and the DCF estimate of 8.9 percent, the Panel concludes that the ROE, before adjustment for financing flexibility, of 8.25 percent is an appropriate base as it falls in the midpoint range of the two estimates. When an allowance for financial flexibility of 0.5 percent is added, the resulting ROE is 8.75 percent, to be effective January 1, 2013, provided for by Order G-47-12 and confirmed in Order G-187-12. **The ROE will be effective until December 31, 2015, subject to variation commencing January 1, 2014, by the Automatic Adjustment Mechanism formula discussed and adopted in Section 6.**

FEI is to file within 30 days of this Decision and accompanying Order G-75-13 amended rate schedules in accordance with paragraphs 1 and 2 of Order G-75-13 as well as a proposal on the treatment of the refundable portion of the rates collected since January 1, 2013. FEI shall inform all affected customers of the final rates by way of customers notice.

6.0 AUTOMATIC ADJUSTMENT MECHANISM

6.1 Introduction

In 1994, the Commission determined that the Benchmark ROE was to be estimated annually by an Automatic Adjustment Mechanism (AAM).[8] This AAM was eliminated by Order G-158-09 issued concurrently with the 2009 Decision. In eliminating the AAM the Commission stated that: "... in its present configuration, the AAM will not provide an ROE for TGI for 2010 that meets the fair return standard." (2009 ROE Decision, p. 72)

One of the stated purposes of this proceeding was to review the possible return to an AAM for setting an ROE of the benchmark utility and examine potential AAM models. In this Section, the Commission determines that:

- Reinstituting an AAM formula for annually setting the ROE for a benchmark utility between proceedings is appropriate.
- A two-variable model AAM is to be instituted to set the benchmark ROE on an annual basis commencing in the 2014 calendar year for a period of two years.
- Implementation of the model will be subject to the actual long Canada bond yield meeting or exceeding 3.8 percent.
- The new formula will initially utilize the ROE of 8.75 percent as determined in Section 5.7.

6.2 Should the Commission Re-institute an AAM?

In considering re-instituting an AAM, the Commission Panel reviewed proposed AAMs to determine whether they would meet the Fair Return Standard or whether, as FBCU submit: "The Fair Return Standard is best met in intervening years until the next comprehensive cost of capital reviews by holding the ROE constant." (FBCU Final Submission, p. 153) In addition, the Panel examined the status of AAMs in other Canadian regulatory jurisdictions.

[8] In the Matter of Return on Common Equity – BC Gas Utility Ltd., Pacific Northern Gas Ltd., West Kootenay Power Ltd., -- Decision and Order G-35-94, June 10, 1994.

6.2.1 Status of AAMs in Other Canadian Jurisdictions

The Brattle Report surveyed the cost of capital practices in Canada including the formulas used to set the ROEs in Ontario and Quebec. (Exhibit A2-3, pp. 64, 72)

In the 2009 Decision, FBCU was directed to complete a study of AAM alternative formulas and report to the Commission. In compliance, FBCU filed the 2010 report, "A Review of Automatic Adjustment Mechanisms for Cost of Capital" prepared by Concentric Economic Advisers (Concentric). The 2010 Report provided an examination of the use of AAM formulas in other jurisdictions, contrasted these with alternatives and considered the merits of various approaches. While not recommending that a formula be adopted, Concentric identified attributes that should be considered if an AAM is adopted in the future. (Exhibit B1-9-6, Appendix I) In this proceeding, FBCU again engaged Concentric to provide an update of its analysis, which examined the use of ROE formulas in other jurisdictions. The update included the following observations with regard to Canadian jurisdictions:

- The Ontario Energy Board (OEB) continues to rely on its AAM which it modified in 2009. The modified formula is based on 50 percent of the change in forecast long-term Canada bond yields and 50 percent of the change in observed A-rated utility bond index over the 30-year Canada Bond yield.
- In Quebec the Régie de l'énergie (Régie) modified its previous formula in 2012 to incorporate 50 percent of the change in utility bond spreads in addition to the existing formula's 75 percent of change in government bond yields.
- In its December 2011 Decision, the AUC determined that the credit market remained volatile and therefore decided not to employ an AAM for 2012. The AUC indicated that it was not prepared to preclude a return to some form of formula-based AAM in future once the capital markets had stabilized.
- The Newfoundland and Labrador Board of Commissioners of Public Utilities, in June 2012, approved an 8.8 percent ROE (which was not set by formula) for Newfoundland Power stating that this was within a range of reasonable values. The Board did not disavow or abandon the formulaic approach for future rate proceedings.

Concentric has not changed its position on AAMs and stated that: "periodic rate hearings remain the only reliable method for the determination of utility ROE's." However, Concentric noted that Canadian regulators have recognized that a sole reliance on simple relationships to government bonds cannot be relied upon to estimate ROE. Concentric points out that both Ontario and Quebec have incorporated utility bond spreads in their formulas and notes that this mitigates one fatal

weakness of past AAMs. Concentric views the two variable methodology utilized by Ontario as an improvement with a remaining concern being the lack of a specific link to the cost of equity , other than that conveyed by bond yields. (Exhibit B1-9-6, Appendix I, Concentric Update Report, pp. 1-4, 11)

The Commission Panel notes that both the OEB and the Régie formulas are variations of the model proposed by Dr. Booth and are discussed further in Section 6.2.2 below.

It appears that there is some acceptance by utility regulators in Canada of an AAM formula based on a two-variable model that uses the long-term Canada bond rate as a proxy for a risk free rate and a change in utility bond spreads as a proxy for credit risk. There is, however, reluctance in some jurisdictions to institute an AAM given the volatility of Canadian capital markets in recent years.

6.2.2 Submissions by Parties

AMPC/CEC

AMPC/CEC submit that the Commission abandoned the AAM in 2009 because it did not provide a fair return citing the following passage from the 2009 Decision: "the recent flight to quality has driven down the yield on long-term Canada bond yields, while the cost of risk has been priced upwards." Therefore, AMPC/CEC submit that the question for the Commission is, "what formula will allow it to return to an AAM, while ensuring that the results are fair in light of the current financial conditions and the conditions FEI might encounter going forward." (AMPC/CEC Final Submission, p. 62)

AMPC/CEC support a return to an AAM based on its contribution to regulatory efficiency because an AAM reduces the frequency of periodic ROE reviews. They note that FBCU have suggested that 3-5 years is a reasonable gap between comprehensive ROE reviews. AMPC/CEC points out that if the Commission agrees with this, an AAM would likely allow the reviews to be closer to five years rather than three, resulting in considerable efficiency benefits. (AMPC/CEC Final Submission, pp. 62-63)

Dr. Booth states that "The key problem with 'old' ROE adjustment models was that they *only* linked the ROE to the forecast long Canada yield. As a result, during the financial crisis the ROE formula

indicated declining ROEs while at the same time the utility cost of debt was increasing. An enhanced ROE formula has to deal with this, which can be done by incorporating the credit market adjustment I have used in my direct ROE estimates." (Exhibit C6-12, pp. 97, 100)

Dr. Booth recommends "an ROE adjustment model where ROE adjusts by 75% of the forecast change in long Canada bond yields and 50% of the change in the credit spread. This would be subject to a minimum forecast long Canada bond yield of 3.80% … Similar models are in use by the Régie and OEB." (Exhibit C6-12, p. 3) Dr. Booth selects 3.80 percent as the "floor" stating that this "is the lowest rate consistent with a normal cyclical low." (Exhibit C6-12, pp. 97, 100)
AMPC/CEC argue that Dr. Booth's enhanced two variable ROE formula addresses the concern with the old ROE formula that during periods of financial crisis the allowed ROE and utility borrowing costs move in opposite directions. They argue that Dr. Booth's formula obviates FBCU's concern that the AAM won't work because of the current unusual business cycle. The proposed 3.8 percent floor acts like a fixed rate ROE until the long Canada bond yields return to normal, and it provides an adjustment mechanism for periods when conditions are more typical. (AMPC/CEC Final Submission, p. 64)

ICG

Dr. Safir believes that an AAM for a limited number of years is appropriate because "It is simply not economically efficient to revisit the entire ROE setting mechanism annually" and also states that "the AAM is administratively efficient, resulting in significant savings by avoiding costly, annual rate hearings." In Dr. Safir's view, AAMs that reference long-term bond rates, such as the one previously used by the BCUC, are good ways to account for near term influences that affect a fair ROE. (Exhibit C4-9, pp. 36-37)

ICG observes that during the interim years between periodic cost of capital proceedings an AAM formula is more likely to result in an ROE that meets the FRS than no formula. It submits that the Commission should establish an AAM similar to the one discontinued by the Commission in 2009 that referenced long-term bond rates with a three year effective period. It would differ from the previous Commission AAM in that it would use a five year average for the forecast long-term Canada bond yield. (Exhibit C4-9, pp. 36-38; ICG Final Submission, p. 32; T7:1187)

ICG concedes that a multiple factor model may be more likely to meet the FRS than a single factor model, but given that the single factor model has been tested over a long period, it has been recommended to the Commission. (ICG Final Submission, pp. 32-33)

BCPSO

BCPSO submits that an AAM is beneficial because it ensures that the benchmark utility will not operate for more than a brief period of time with a higher than required ROE and therefore supports reinstatement of an AAM. (BCPSO Final Submission, pp. 19-20)

FBCU

FBCU does not support the return to an AAM. FBCU's main concern with the AAM is that the basis upon which the annual ROE adjustments are being made may be suspect. They submit that an AAM relies on a formula with a limited number of inputs that could never capture the complex factors affecting ROE, and that an AAM likely relies on long Canada bond yields and corporate spreads, which are still affected by atypical market conditions. In addition, any formula relies on imperfect proxies. In their view, the application of the FRS requires a significant degree of analysis, market information, and judgment that evolve over time. Formula parameters are static and based on historic relationships and fundamental relationships may shift, leaving the formula out of touch with current market conditions. FBCU take the position that there is no formulaic way to assign a value or weighting to specific risk factors or utility/utility sector characteristics that would apply across multiple utilities and generate the appropriate cost of capital for each one. This is supported by Ms. McShane who submits that the Commission should continue to address the appropriate cost [of capital] on a case-by-case basis: "There is no 'one size fits all' cost that should be determined by means of an interest automatic adjustment mechanism." (FBCU Final Submission, p. 153-156; Exhibit B1-9-6, p. 33; Exhibit B1-9-6, McShane Evidence, Appendix F, p. 7)

FBCU prefer to have the allowed ROE and capital structure set through a traditional process and remain constant between the periodic (three to five year) formal reviews, subject to events occurring that bring the results out of alignment with the FRS, which could result in an unscheduled full review process. This is preferable to having updates made on a basis that the FBCU believe is suspect. (Exhibit B1-20, BCUC 2.113.1)

FBCU argue that there is no efficiency gain associated with implementing the AAM, if there are to be periodic reviews. FBCU further argue that the regulatory burden associated with periodic cost of capital reviews is the same as that associated with periodic reviews with annual formula-driven ROE changes in the interim. FBCU also argue the FRS is best met in the intervening years until the next comprehensive cost of capital reviews by holding the ROE constant. (FBCU Final Submission, pp. 153-156)

FBCU further submit that "The rationale for why the Commission discontinued the AAM remains valid today. Meeting the Fair Return Standard is not optional." FBCU state that "All of the experts agree that we are still experiencing unusually low interest rates, and the ability of any AAM to produce fair results is far from certain [when such conditions exist]." (FBCU Final Submission, p. 153)

With respect to the positions taken by Dr. Safir and Dr. Booth, FBCU make the following submissions:

1. FBCU submit that Dr. Safir is proposing to return to an AAM that has already been rejected by the Commission, with the only difference being the starting point for measurement of changes in the forecasted long Canada bond yields (i.e., the use of the five-year average forecast). They cite Ms. McShane's statement that there is an inverse relationship between long-term government bond yields and the utility risk premium. FBCU also argue that Dr. Safir's use of a five-year average forecast Canada bond yield as the base line in the formula is problematic because it suppresses ROEs despite increases in long Canada bond yields. FBCU submit that while this five year average is intended to compensate for present unusually low interest rates, it would be better to postpone consideration of a formula, rather than implement a "quick fix" that artificially suppresses the ROE. (FBCU Final Submission, pp. 159-160)

2. FBCU submit that the AAM proposed by Dr. Booth is biased downwards. FBCU notes that the current long Canada bond yield is well below the 3.8 percent that Dr. Booth employs as the floor, and points out that while he expects rates to increase, he does not expect the forecast to rise above the 3.8 percent for at least three years. FBCU submit that the combination of rock-bottom forecast yields and a slow rise in interest rates has two implications. First, rock-bottom interest rates means that further declines are not likely. Second, any increase in the forecast long Canada bond rate will not result in an increased ROE. In addition, FBCU submit that the cross-examination of Dr. Booth indicates that he expects credit spreads to fall while the long term Canada bond yield remains below 3.8

percent, an expectation shared by Mr. Coyne. FBCU propose that the result of this will be a progressively lower benchmark ROE after 2013 if Dr. Booth's formula is employed. (FBCU Final Submission, pp. 160-161)

FBCU's position is that if the Commission requires an ROE AAM, it should seek to rectify the problems of the old formula. A new formula would address changes in the equity risk premium, and not solely changes in long Canada bond yields. Any adjustment factor would need to reflect sensitivity to change in bond yields to ROE. (Exhibit B1-9-6, pp. 27-29)

Corix

Corix submits that there is a continued flight to quality and a still increasing cost of risk, so an updated AAM is not appropriate at this time. (Exhibit B2-9, BCUC 1.2.1, p. 3)

6.3 Commission Determinations

6.3.1 Re-instituting an AAM

The Commission Panel does not take issue with FBCU's argument that an AAM formula with limited inputs cannot capture all of the complex factors affecting ROE and therefore, relies on imperfect proxies. However, at the same time, the Panel is of the opinion that the issue is whether the adoption of an AAM formula is better than the alternative, which is to do nothing as suggested by FBCU and Corix. In other words, while implementing an AAM formula may not be perfect, the question is whether it better satisfies the FRS than leaving the ROE static for a period of time or conducting frequent costly and time consuming ROE proceedings. The difficulty with leaving the ROE static over a three year or longer period is that financial markets continue to change and investors' needs continue to evolve. Therefore, in the view of the Commission Panel, implementing a mechanism to capture the impact of some of these changes is far superior to the alternative of doing nothing. Furthermore, as the AMPC/CEC submits, "if there are reasonable grounds to believe the mechanism is not producing fair results, the benchmark utility always has the option of asking for a review." (AMPC/CEC Final Submission, p. 64)

The Commission Panel does not disagree with FBCU's argument that the regulatory burden associated with periodic cost of capital reviews with or without an AAM is similar. However, we are

of the view that the likelihood of a requirement for more frequent ROE proceedings is reduced by having in place an AAM formula. Thus, the Panel is persuaded that the application of the AAM has the potential to contribute to regulatory efficiency.

Therefore, the Commission Panel determines that re-instituting an AAM formula for annually setting the ROE of the benchmark utility between ROE proceedings is appropriate. Additionally, the Commission Panel finds the FRS is adequately met because implementing an AAM formula better meets the standard than taking no consideration of changes in the market over a three year period as suggested by FBCU. The AAM formula to be adopted and the timing of its use is addressed in Section 6.3.2.

6.3.2 Optional AAMs to be Considered

The Commission Panel acknowledges that interest rates have been atypical in recent years and have remained at historical lows. The historical AAM used by the Commission prior to 2009 relied exclusively on a single variable formula based on the long-term Canada bond yields as a proxy for risk free rates. This model was less than fully effective for utilities because the flight to quality kept interest rates abnormally low while the risk had been priced upwards. It could not assure that the FRS could be met in extended times of low interest rates.

As noted previously, Dr. Booth proposed a two-variable model that incorporates the traditional concept of tying the benchmark utility's ROE to the "risk free" long-term Canada bond yield, and also incorporates a credit market adjustment to reflect the relationship of ROE and credit risk within the utility sector. His model also utilizes a "floor" long-term Canada bond rate of 3.8 percent as the risk free proxy until such time as long-term Canada bond yields return to a more common level.

Concentric submits that any new AAM formula should address changes in the utility risk premium and not be based solely on changes to the long Canada bond yields. While it does not recommend a formulaic approach, it does provide several potential formulaic methodologies that could be used in British Columbia (Exhibit B1-9-6, Appendix I, 2010 Report, pp. 39-45)

In summary, possible options for re-instituting an AAM include:

- The single variable model used by the Commission prior to 2009 that was based on long Canada bond yields;
- The variety of approaches offered by Concentric (Exhibit B1-9-6, Appendix I, p. 11);
- Dr. Booth's two-variable model or a variation incorporating the long Canada bond yield, a floor level of long Canada bond yield to address the atypical low interest rates, and a metric to address credit spreads.

The Commission Panel recognizes the shortcoming of the single variable model used by the Commission prior to 2009 in that it fails to satisfy the FRS when interest rates continue at abnormally low levels. Accordingly, this model will not be considered.

While Concentric has explored a number of alternative formulas that could be used in British Columbia, the Commission Panel notes that none of these have been recommended by Concentric nor have they provided evidence as to their use and effectiveness in other jurisdictions. In addition, none of the interveners has expressed support for any of these. Given this lack of support and the lack of evidence to support their efficacy and relevance to British Columbia, the Commission Panel does not endorse any of the possible alternative AAMs explored by Concentric.

During cross-examination, Commission counsel asked Mr. Coyne of Concentric what advice he would give the Commission in terms of adjustments if the Commission were adopt an AAM similar to that of the OEB and the Régie. Mr. Coyne testified that a coefficient of 0.5 was a more accurate reflection of the historic relationship to long-term Canada bonds than 0.75. (T5:827)

Dr. Booth testified that he recommended 75 bps but that he could live with 50 bps and he did not believe that there would be a big impact. (T8:1622)

The Commission Panel is persuaded that a two-variable model similar to that proposed by Dr. Booth and currently utilized in Ontario is appropriate for application to the benchmark utility within British Columbia. (Exhibit C6-15, BCUC 1.44.5 attachment)

By utilizing the 50 percent adjustment of the change in the long-term Canada bond yield as a proxy

for risk free rates, it recognizes the relationship between ROE and risk while moderating the level of change resulting from any volatility in the long-term Canada bond rate. In addition, by utilizing the 50 percent adjustment in the change in the utility bond spreads, it recognizes the relationship between credit risk and ROE in the utility sector and moderates volatility in utility bond spreads. And finally, by utilizing a 3.8 percent floor for the long Canada bond yield, it recognizes the atypical relationship between ROE and cost of risk in periods of unusually low interest rates. Further, the application of similar models within both Ontario and Quebec supports it usefulness and acceptance within other Canadian regulatory jurisdictions.

Given the advantages, the Commission Panel adopts a two variable model AAM to determine the benchmark ROE on an annual basis commencing in the 2014 calendar year. The AAM formula will operate until December 31, 2015. The implementation of the model is subject to conditions outlined in Section 6.3.3. The formula will initially utilize the 8.75 percent ROE as determined in Section 5.7 as the base ROE.

The formula to be used and the basic method to determine the changes in long Canada bond forecast and the changes in utility bond spread are provided as follows:

$$ROE_1 = \text{Base ROE (8.75\%)} + 0.50 \times (LCBF_t - \text{BaseLCBF}) + 0.50 \times (\text{UtilBondSpread}_t - \text{BaseUtilBondSpread})$$

Where:

$LCBF_t$ is the Long Canada Bond Forecast for the test year, with a floor of 3.8 percent. The Base LCBF is 3.8%.

UtilBondSpread_t is the average spread of 30 year A-rated Canadian Utility bond yields over 30 year Government of Canada bond yields and BaseUtilBondSpread will be determined.

6.3.3 Impact of a 3.8 percent Floor

FBCU has argued that the AAM proposed by Dr. Booth is biased downwards. The Commission Panel agrees that the potential for a downward bias does exist.

Dr. Booth has recommended that any change in the ROE be subject to a minimum forecast bond

yield of 3.8 percent as this is the lowest rate which is consistent with a normal cyclical low. The Commission Panel accepts this as reasonable since it is the risk free rate for the CAPM ROE as determined in Section 5.2.

With respect to the two-variable AAM formula, Dr. Booth has acknowledged that as long as the long-term Canada bond yields are below 3.8 percent, the only variable that can affect ROE is the corporate utility bond spreads. FBCU submit that if the credit spread drops or tightens before long Canada bond rates are above 3.8 percent, the ROE will drop further from whatever the starting point is under his formula. Further, Concentric states that "a troubling aspect of Dr. Booth's proposed formula is that it sets a minimum floor LTC yield of 3.8 %, which will be applied for purposes of measuring year over year changes in the formula, but does not specify an objective bond forecast to reference for the starting point." (Exhibit B1-32, Concentric Rebuttal Evidence, Concentric Response to Interveners, p.4) The Panel notes that all parties seem to agree that long-term Canada bond yields are well below what would be considered a cyclical low and have been influenced by monetary policy. Therefore, it is reasonable to assume that the likelihood of an increase in the yields of long Canada bond is much more likely than a decrease. If this were to occur with no corresponding change in utility bond rates, the result would be a decrease in the credit spread and, consequentially, the ROE. Given that a rise in the long Canada bonds yields may be driven by monetary policy and not a change in market conditions, and there is no evidence to suggest there would be a corresponding change in utility bond rates, the Commission Panel accepts that a potential for downward bias exists. **To deal with this the Commission Panel directs that any change in ROE resulting from the AAM formula be subject to an actual long Canada bond yield of 3.8 percent being met or exceeded. Accordingly, the AAM formula will not be operative as long as the long Canada bond yield is below 3.8 percent.**

The Commission Panel has considered Concentric's submission that Dr. Booth did not specify an objective bond forecast to reference as a starting point. We are of the view that the potential for downward bias will continue if attention is not paid to setting appropriate base rates for the formula. Therefore, the Commission will seek submissions from the parties with respect to determining appropriate base levels and developing an effective methodology for deriving the inputs to the formula.

The Commission Panel understands that the conditions placed upon the implementation of the AAM

formula may well result in the 8.75 percent ROE being in place for the term of this Decision ending December 31, 2015. However, in consideration of the FRS, the Panel is of the view that this is appropriate.

FEI is directed to file an application for the review of the common equity component and the ROE approved in Order G-75-13 by no later than November 30, 2015.

7.0 COST OF CAPITAL – SMALL UTILITIES

7.1 Introduction

When the Commission initiated the GCOC Proceeding, it identified the Affected Utilities, which included FEI and other FortisBC gas and electric utilities, PNG and Corix. These utilities were expected to take a lead role in filing evidence for cost of capital matters that may impact them. In addition, the Commission identified Other Utilities that "may wish to participate in the GCOC Proceeding." This list included among others:

- Big White Gas Utility Ltd. and Sun Peaks Utilities Co. Ltd.;
- Central Heat Distribution Ltd.;
- Dockside Green Energy LLP;
- Hemlock Valley Electrical Services Limited; and
- River District Energy Limited (River District).

The recent emergence of thermal energy services (TES) in British Columbia has resulted in the creation, over the last few years, of a number of new on-site thermal energy systems and district energy systems, which are subject to the Commission oversight. For instance, FortisBC Alternative Energy Service Inc. (FAES), an affiliate of FEI and a wholly-owned subsidiary of FortisBC Holdings Inc. (FHI), now owns and operates or is proposing to develop the following regulated TES projects:

- Delta School District Number 37;
- Tsawwassen Springs Development;
- PCI Marine Gateway;
- TELUS Garden Thermal Energy System; and
- Kelowna District Energy System.

Key purposes identified by the Commission Panel in its Final Scoping Document were to establish:

(i) a method to determine the appropriate cost of capital for a benchmark low-risk utility in BC and how the Benchmark ROE will be reviewed and/or adjusted;

(ii) a generic methodology or process for determining each Affected Utility's cost of capital in relation to the benchmark utility's cost of capital; and

(iii) a framework for determining the appropriate cost of capital for other smaller utilities in the province.

Related to this framework, the scope of the proceeding included the following key activities:

(i) establish a generic methodology or process for each utility to determine its unique cost of capital in reference to the benchmark low-risk utility;

(ii) in certain circumstances, develop a methodology to establish a deemed capital structure and deemed cost of debt, particularly for those small utilities without third-party debt, which would involve setting a methodology on how to calculate a deemed interest rate.

(Exhibit A-3, Appendix B to Order G-47-12)

The Commission Panel also requested submissions regarding Stage 1 and Stage 2 review. The FBCU submitted it would be most efficient to break the process down into three groups which would be handled separately: one for the FBCU, a second for the PNG and a third for micro utilities including Corix and FAES and others. (Exhibit B1-22, pp. 10-11) By Order G-148-12, the Commission Panel directed that a Stage 2 will be added to this GCOC proceeding with the schedule to be determined prior to the end of Stage 1. (Exhibit A-21)

Transition to Stage 2

The purpose of the Stage 2 proceeding is to assess the differences in short and long-term risk faced by the Affected and Other Utilities as compared to the benchmark utility FEI. Based on this assessment the Panel will then determine how the risk differentials will impact the capital structures and the allowed ROE for these utilities.

The Panel acknowledges the FBCU submission that it may be efficient, given the small size of thermal energy systems, to have a single process to address cost of capital issues for TES systems, irrespective of the provider. This would include FEI and FAES's Thermal Energy Services, and similar systems to be operated by developers or providers like Corix. (Exhibit B1-9, p. 34) The Panel also notes the previously mentioned FBCU suggestion about dividing the Stage 2 process into three groups.

In anticipation of Stage 2, this section addresses issues related to the framework for determining the cost of capital for the smaller utilities, including all new small TES utilities. The appropriate method to determine interest rates for deemed debt will also be addressed. In this Decision, the definitions of "small utilities" and "micro utilities" are used interchangeably.

7.2 Framework for Establishing an Appropriate Cost of Capital – Equity Risk Premium

7.2.1 Is Size a Risk Factor in ROE and Capital Structure Determination?

Ms. Ahern, the expert witness for Corix states "it is conventional wisdom, supported by actual returns over time, that smaller companies tend to be more risky, causing investors to expect greater returns as compensation for that risk." Ms. Ahern further explains that smaller companies, for instance, face more risk exposure to business cycles and economic conditions, both nationally and locally. Similarly, the loss of revenues from a few larger customers would have a greater effect on a small company than on a much larger company with a larger, more diverse customer base. Moreover, smaller companies are generally less diverse in their operations as well as experiencing less financial flexibility. (Exhibit B2-7, pp. 6-7)

Ms. McShane, the expert witness for FBCU states that in the assessment of investment risk, size has two dimensions that should be considered in determining a utilities common equity ratio and ROE:

1. A small utility does not have the opportunities to diversify its risks to the same extent as a larger utility. For example, assets are typically more concentrated in a limited geographic area, which limits operational flexibility.
2. Smaller utilities have fewer financing options, less institutional interest in acquiring their debt securities, issued debt would be relatively illiquid, and, if issued to third-parties would likely require stricter covenants than debt issued by large utilities.

Ms. McShane also points out that debt rating agencies often take size into account when rating companies and their debt issues. The impact of smaller size for rated utilities is frequently exhibited in lower debt ratings for these companies even in cases where their financial parameters are stronger than their larger peers. (Exhibit B1-9, Appendix F, p. 134)

PNG submits "there was little to no evidence submitted that suggested or countered that size was not a significant factor." While precedents and empirical studies exhibit a broad range of explicit company size adjustments (150-436 bps), which introduces a degree of subjectivity, PNG further submits that "Stage 1 evidence concerning size as an independent factor was relatively uncontested." (PNG Final Submission, p. 13)

7.2.2 Stand-Alone Principle

Both Ms. Ahern and Ms. McShane reaffirm the importance of the stand-alone principle, which is "a cornerstone of Canadian utility regulation with a history dating to at least 1978." (Exhibit B1-9, Appendix F, p. 10, B2-9, BCUC 1.4.7) Therefore, even if a small utility is owned by a larger parent company, there should be no impact on the determination of the small size utility ROE and capital structure. Each utility within the Commission's jurisdiction should be evaluated on a stand-alone basis.

Ms. Ahern further states there is ample academic evidence that investors demand greater returns to compensate for the lack of marketability and liquidity of the securities of smaller firms. She submits "it is the use of funds invested and not the source of those funds which gives rise to the risk of any investment." She refers to the text of Brealey and Myers, which notes "Each project should be evaluated at its own opportunity cost of capital; the true cost of capital depends on the use to which the capital is put." (Exhibit B2-7, p. 7)

7.2.3 Academic Evidence of the Size Effect in Literature

In her filed evidence, Ms. Ahern provides additional examples of the academic literature, where the risk effects of a company's size on the investor required return is addressed:

Eugene F. Brigham, *Fundamentals of Financial Management:*

> A number of researchers have observed that portfolios of small-firms have earned consistently higher average returns than those of large-firms stocks; this is called "small-firm effect." On the surface, it would seem to be advantageous to the small firms to provide average returns in a stock market that are higher than those of larger firms. In reality, it is bad news for the small firm; what the small-

> firm effect means is that the capital market demands higher returns on stocks of small firms than on otherwise similar stocks of large firms.
>
> (Exhibit B2-7, PMA-3, p. 4)

Giacchino and Lesser, *Principles of Utility Corporate Finance:*

> In general, smaller firms face greater financial risk than do large firms... Generally, firm size is measured in terms of total capitalization (i.e., the market value of a firm's equity). Empirical studies have typically found that small firms typically have higher returns over the long run than larger firms. (Exhibit B2-7, PMA-4, p. 3)

Fama and French, in *"The Capital Asset Pricing Model: Theory and Evidence,"* Journal of Economic Perspectives, note that size is a risk factor which must be reflected when estimating the ROE:

> ...the higher average returns on small stocks and high book-to-market stocks reflect unidentified state variables that produce undiversifiable risks (covariances) in returns not captured in the market returns and are priced separately from market betas. (Exhibit B2-7, PMA-5, p. 14)

Based upon this evidence, Fama and French proposed their three-factor model which includes a size variable in recognition of the effect of size on the rate of return on common equity.

Marc Reinganum, *"A Possible Explanation of the Small Firm Effect,"* The Journal of Finance:

> While the OLS estimates seem to understate the betas of small firms, the excess returns not explained by the misestimation could easily exceed twenty percent per year on average. Thus, one can conclude with confidence that the small firm effect is still a significant economic and empirical anomaly. (Exhibit B2-6, PMA-6, p. 9)

From her academic research, Ms. Ahern concludes that:

- The specific, unique risks of the investment (e.g. utility) must be reflected in the rate of return; and
- The size of an investment (e.g. size of the utility) is one of those unique risk factors for which investors must be compensated. (Exhibit B2-7, pp. 10-11)

7.2.4 Empirical Evidence for the Risk Effects of a Company's Size on the Investor's Required Rate of Return

Studies on small size and returns have quantified the impact of a firm's small size on the required return based on an analysis of the relationship between betas and historical returns for companies of different sizes. Ms. McShane and Ms. Ahern state the analyses indicate that small companies tend to exhibit higher betas than larger companies. Two empirical studies reviewed by Ms. Ahern are:

Morningstar/Ibbotson Size Premium Study (Firm Size and Return)
Ibbotson SBBI – 2012 Valuation Yearbook

This study constructs decile (10) portfolios of the companies contained in the NYSE, AMEX and NASDAQ. Ms. Ahern suggests that the study can be used to determine the approximate risk premium due to size for a specific utility over the benchmark utility return. This is done by comparing the size premium appropriate for the decile in which the benchmark utility would fall based on the estimated market capitalization with the size premium appropriate for the decile in which the specific utility would fall based on market capitalization.

	Decile	**Market Capitalization ($Millions)**	**Size Premium (%)**
Benchmark Utility	5	2,246 (average)	1.74
Micro-Cap	10	92	6.10
Size Premium			**4.36%**

(Exhibit B2-6, PMA-8, Table 7-1 and 7-5)

Duff & Phelps Size Study and Risk Study

The Size Study analyzes the relationship between equity returns and company size in a similar manner as the Morningstar Study. It could also be used to determine the magnitude of any necessary risk premium due to the size of a specific utility relative to the benchmark. In addition to presenting risk premia and size premia for 25 size-ranked portfolios using the traditional market

capitalization measure, this study also considers seven other measures of company size, including book value of equity, 5-year average net income, market value of invested capital, total assets, 5-year average EBITDA, sales and number of employees. (Exhibit B2-7, PMA-9, p. 30)

The Risk Study is an extension of the Size Study. The main difference is that while the Size Study analyzes the relationship between size and return, the Risk Study analyzes the relationship between fundamental risk measures (based on accounting data) and return. These are called "fundamental" measures of a company risk to distinguish these risk measures from a stock market-based measure of equity risk such as betas. (Exhibit B2-7, PMA-9, p. 65)

Corix provided a calculation of the size risk premium for micro utilities over the benchmark based on the Duff & Phelps Study. This resulted in a 3.89 percent risk premium as opposed to the 4.36 percent size premium based on the Morningstar Study. (Exhibit B2-8, Attachment to BCPSO 1.1)

7.2.5 Regulatory Support for Size Premium

Ms. Ahern provided only one example of a jurisdiction which has adopted the size premium concept. She cites the Florida Public Service Commission (FL PUC), which adds for small water utilities a bond yield differential, a 50 bps private placement premium and a 50 bps small utility risk premium to the ROE based upon the index of natural gas utilities. Regardless, Ms. Ahern recommends that the size risk of each utility be measured in accordance with the Morningstar/Ibbotson and the Duff & Phelps studies. Specifically, Ms. Ahern states "all of these risk premium spreads should then be averaged and through the exercise of informed expert judgement, a determination of the appropriate risk premium to be added to the benchmark utility return on equity to reflect the size risk of the utility/project relative to the benchmark utility." (Exhibit B2-9, BCUC 1.12.1; Exhibit B2-8, BCPSO 1.2.1)

In responses to IRs and during cross-examination, Ms. Ahern made it clear that she is not recommending any particular amount of a size premium to be adopted by the BCUC but is simply providing testimony for the purpose of establishing a framework. (T6:1128) Similarly, Ms. Ahern states the 4.36 percent risk premium shown in the example would only represent the upper limit of a size premium above the allowed benchmark ROE due to small size. Where in the 10th decile, Corix or any of its projects fall needs to be evaluated to determine the exact risk premium it would

propose. Corix stated it has not yet undertaken a comprehensive study of the appropriate size risk premium above the benchmark for each of its projects and indicated that such a study will be conducted in the next phase of the GCOC proceeding. (Exhibit B2-9, BCUC 1.13.2)

Ms. Ahern acknowledged that based on her experience the regulatory support for a specific size premium has been minimal and that ultimately any risk premium, whether it is linked to business risk in general or size specifically, is a matter of informed expert judgment. (T7:1278-1284) Further, Ms. Ahern could provide only seven cases out of over 200 regulatory proceedings where she has been involved that resulted in an allowed size adjustment. Yet, in a response to an undertaking, it appears that only two of those seven cases *specifically* reference "size" in the determination of the overall ROE and only one case granted a specific size premium. (Exhibit B2-14) Furthermore, the Panel notes that Ms. Ahern had recommended only modest size adjustments in the range of 25-50 bps in all those seven cases.

Ms. McShane concludes the empirical study findings indicate that small size is a factor that both debt and equity investors are concerned with, and which should be taken into account when evaluating ROEs and capital structures of individual utilities in British Columbia. (Exhibit B1-9, Appendix F, p. 136)

Commission Determination

Stand-Alone Principle

The Panel reaffirms the long history and importance of the stand-alone principle in Canadian utility regulation. The determinations on the benchmark ROE and capital structure in this Decision are based on this principle. Therefore, there is no reason to deviate from this principle even in the case of small utilities or projects whether or not they are part of a larger utility. These projects can represent either a "new" utility with a greenfield operation and no historical performance data or an existing facility being developed into a TES project. Each project needs to be considered individually and independently.

The Size Premium

The Panel has considered the evidence on record regarding the academic literature on the size effect as well as the empirical evidence for the risk effects of a company's size on the required rate of return. Noteworthy is the lack of regulatory support for the recognition of a small size risk premium. Finally, the Panel notes the requirement for on-going exercise of informed judgment by both the Commission and experts retained by the utilities, which was acknowledged by Ms. Ahern.

As a result, the Panel recognizes the academic literature and empirical studies seem to support the importance of size in explaining returns. At the same time, however, the evidence presented does not indicate how adjustment for size should be implemented.

Accordingly, the Panel determines that the small size factor should be further considered in the Stage 2 proceeding, but only as one of the many business and financial risks small utilities or projects are exposed to. Utilities are encouraged to use other methodologies or approaches to justify their risk differential in relation to the benchmark. The Panel has not been sufficiently persuaded to put any weight to the empirical studies reviewed to date.

The Panel notes that the Commission developed a risk matrix that has been used in various small TES utilities proceedings to evaluate overall risk of a given project. The "size" factor is one of the risk factors included in the matrix. **The Panel recommends that the small utilities use this risk matrix attached as Appendix B to Order C-1-13 of the TELUS Garden Decision[9] in the Stage 2 proceeding and for future projects to justify their case for the appropriate capital structure and risk premium over and above the benchmark ROE**. For convenience, the risk matrix is attached in Appendix E of this decision. Small utilities, other than TES, can modify this matrix to facilitate a similar comparison of their own short and long-term risks to those of FEI.

The Panel is cognizant of the on-going Phase 2 of the Alternative Energy Solutions (AES) Inquiry,[10] which involves development of a regulatory framework for dealing with small TES utilities. This evolving process will further influence the nature and content of future TES applications.

---

[9] Certificate of Public Convenience and Necessity Order C-1-13 and Reasons for Decision dated February 5, 2013, regarding FAES Telus Garden Thermal Energy Services

[10] In the Matter of FortisBC Energy Inc. Inquiry into the Offering of Products and Services in Alternative Solutions and Other New Initiatives

7.3 Guiding Principles for Setting Deemed Capital Structure and Deemed Debt

7.3.1 Determination of Deemed Capital Structure

The Commission deems an appropriate common equity ratio for the utility. The resultant debt ratio is simply the residual between 100 percent and the deemed equity ratio. However, the deemed component typically incorporates actual debt issues where rates can be objectively observed and determined. In some cases, the utility manages its actual financing to mirror the deemed debt/equity ratio.

Ms. McShane explains the actual debt issues may consist of issues that have been made directly into public markets; they may be private placement to third party institutions such as bank or insurance companies, or they may be non-arms length issues between a utility and affiliated company. In the latter case, there is a contract between the utility issuer (a legal entity) and the affiliated company, which specifies the terms and conditions of the loan, with rates that are based on market conditions. When the parent company issues debt, the subsidiary can enter into an arrangement with the parent for a specific portion of that debt issue, with the same terms as the third-party issue. Alternatively, the utility may enter into an arrangement with its parent for a debt issue that reflects the utility issuer's risk profile, funding requirements and market conditions at the time the issue is made, but is not tied to a specific third-party issue made by the parent. (Exhibit B-1-9-6, McShane Evidence, Appendix F, p. 121)

7.3.2 Criteria for Setting the Deemed Capital Structure

Ms. Ahern, the Corix expert, states that an appropriate deemed capital structure should:

- be reasonable relative to or consistent with the average capital structure of the particular utility industry;
- reflect the specific utility's unique risks, including its relative size;
- be consistent with bond rating agency metrics; and
- provide the opportunity for the utility to earn a reasonable and fair rate of return, given its unique risks, e.g., size etc.

(Exhibit B2-7, p. 19)

Ms. McShane provides general principles that should be observed when setting the ROE and common equity ratio for utilities, regardless of size:

- The combination of ROE and common equity ratio awarded to each utility in relation to the overall return adopted for the benchmark utility should reflect the level of that utility's business risk relative to that of the benchmark utility;
- The overall return awarded to each utility should be comparable, on a risk adjusted basis, to the overall return awarded to the benchmark utility;
- The capital structure, in conjunction with the ROE, should be adequate to permit the utility, on a stand-alone basis, to achieve investment grade debt ratings, with the caveat that some utilities many not actually have a credit rating; and
- There is a trade-off between equity ratio and ROE. For example, if a utility is not fully compensated for higher business risk than that of the benchmark utility through its common equity ratio, its ROE needs to be higher than the ROE granted to the benchmark utility. (Exhibit B1-9-6, p. 129)

7.3.3 When Is Deemed Debt Appropriate?

The FBCU state the deemed debt is appropriate for small utilities in cases where raising debt is inefficient. For example, a separate division or class of service within a larger regulated utility can contain a stand-alone project. Similarly, a regulated utility subsidiary/affiliate within a larger corporate organization can face circumstances where either:

(i) The high cost of debt issuance relative to the size of the issue makes the effective debt cost higher than it would be otherwise; or

(ii) The size of the utility precludes it from accessing appropriate debt terms.

The FBCU further state that the assessment as to whether deemed debt is appropriate and efficient should involve some judgment to ensure that the use of deemed debt is limited to circumstances where it is efficient to do so. Finally, FBCU state "it is reasonably clear that deemed debt would be appropriate for FEW (a separate legal entity), the Fort Nelson Division of FEI, and FAES." (FBCU Final Submission, p. 163; Exhibit B1-20, BCUC 1.140.1, 1.140.2)

7.3.4 Setting the Appropriate Deemed Debt Rate and Term

The FBCU state that deemed debt rates and duration should reflect the particular circumstances of each utility. Utilities for which a deemed cost of debt might be appropriate may have differing profiles; FEW, for instance, is not the same as one of FAES's TES projects or Corix's UniverCity project. The appropriate term of debt may also vary even among projects with a broadly similar risk profile. (FBCU Final Submission, p. 163; Exhibit B1-20, BCUC 1.140.2)

Ms. McShane submits as a general proposition that the term should reflect the long-term nature of the assets and offers the following additional considerations:

1. If the specific utility operations are backed by contractual arrangements, the length of the contract would be a relevant consideration in the determination of the term for the debt.
2. The higher the risk of the specific operation, the less their ability would be to obtain "real" debt on a long-term basis; i.e., on terms longer than 10 years. The term of the debt should reasonably reflect the limitations of what would reasonably be available to operations with a similar risk profile.
3. The appropriate term for the deemed debt also depends on the state of the capital markets.

Ms. McShane concludes that the individual utilities' circumstances may differ in terms of risk, the funding requirements and appropriate terms of debt. Accordingly, she recommends that the Commission continue to address the cost of deemed debt for each utility separately, on a case-by-case basis. In her view, there is no "one size fits all" cost mechanism. (Exhibit B1-9-6, pp. 123-124)

Commission Determination

Before addressing the issue of short-term and long-term debt in the deemed capital structure and the methodology for determining a deemed interest rate, the Commission Panel wishes to reaffirm certain principles for the Stage 2 GCOC proceeding framework.

(i) The general principles and criteria outlined by the Corix and FBCU experts for setting the capital structure for any utility in general and the deemed capital structure specifically for the small utilities are accepted as they are consistent with the principles adopted for setting the benchmark ROE;

(ii) Deemed debt is appropriate for small utilities in cases where raising debt is inefficient;

(iii) Deemed debt rates and duration should reflect the particular circumstances of each utility. Accordingly, the Commission should continue to address the cost of deemed debt for each utility separately on a case-by-case basis; and

(iv) Risk assessment of small utilities, especially the TES projects, must include consideration of rate setting mechanisms, deferral account treatment, length of term and the overall risk/reward equation.

Related to the issue of deemed capital structure and deemed debt are two key questions that the Stage 2 GCOC proceeding must address more comprehensively:

1. Can the combination of the deemed debt/equity ratio and the allowed ROE sufficiently compensate for the unique risks of a particular small utility or project?
2. How important is it to maintain consistency between the risk premium determination and assigning a deemed credit rating for a small utility without third party debt? For instance, would it be reasonable to allow no risk premium over FEI for a TES project while setting the debt rate based on a BBB bond rating?

7.4 Appropriate Portions of Short-Term and Long-Term Debt in the Deemed Capital Structure

In British Columbia, in some of the more recent TES Decisions, the Commission has considered deeming a portion of overall debt to short-term debt. To date no determination has been made to put this into effect. However, the Panel notes that the OEB has officially deemed a standard four percent proportion of short-term debt component for utilities under its jurisdiction for reasons that it outlined in its 2006 Decision:

(i) All utilities actually use some short-term debt;

(ii) Short-term debt is generally less expensive than long-term debt and provides greater financing flexibility; and

(iii) While actual short-term debt percentages may seem to be a more accurate approach, it is administratively challenging given the number of distributors regulated by the OEB.[11]

[11] OEB, Report of the Board on Cost of Capital and 2nd Generation incentive Regulation for Ontario's Electricity Distributors, December 20, 2006, pp. 9-10

In 2009, the OEB reaffirmed this practice for natural gas distributors as well. It also updated its methodology to estimate the deemed short-term debt rate. (Exhibit A2-21, Report of the Board on the Cost of Capital for Ontario Regulated Utilities, EB-2009-0084)

Ms. McShane states there is no single right answer to the question of what proportion of a deemed capital structure should be designated as short-term debt. She notes that annual fluctuations for individual utilities will reflect, among other things, the fact that utilities frequently use short-term debt as a bridge between long-term debt issues. Based on her filed evidence she further states that the average proportion of short-term debt to total capital for rated Canadian utilities has been approximately 1 percent to 2 percent. Her review of 2010 data for Ontario electricity distributors indicated that the average and median actual short-term debt ratios were at 2.9 percent and 0.4 percent respectively. (Exhibit B1-9-6, pp. 125-127)

Ms. Ahern states that conceptually the maturity of the debt capital should match the life of the assets being financed. But when the inclusion of short-term debt is optional, its inclusion should be based upon several criteria:

- If its use is sporadic and hence, volatile, it should not be included in the capital structure. However, if its use is consistent and especially at a significantly high level, it is likely financing rate base and possibly should be included;
- If its use is seasonal and self-liquidating, e.g., financing short-term inventories of natural gas in anticipation of heating season, it probably should not be included;
- If short-term debt is financing working capital, it should be included;
- If it is used as bridge financing until permanent financing can be put in place it should be included at the expected cost rates of that permanent financing; and
- If the short-term debt financing construction projects and if the Construction Work In Progress (CWIP) are included in rate base the short-term debt should be included. (Exhibit B2-7, pp. 23-24)

The FBCU provided information showing actual percentages of short-debt for FEI, FEI – Fort Nelson, FEVI, FEW, and FortisBC Inc. for the 2002-2012 period. While there has been significant fluctuation over the years, the average percentages for the period as a share of capital structure amounted to

5.28 percent, 8.58 percent, 10.77 percent, 13.10 percent and 5.27 percent for each respective utility. (Exhibit B1-24, BCUC 2.189.1, 2.189.2)

Commission Determination

The Commission Panel finds it as an accepted fact that all utilities use some short-term debt financing. The FBCU IR responses clearly support this. While there are varying reasons for its use, the evidence demonstrates that, on average, utilities always carry a small portion of short-term debt in their capital structure. The construction work in progress, due to its nature, is often financed by short-term debt.

Accordingly, the Commission Panel finds it reasonable and prudent to include a deemed component of short-term debt in the capital structure for all small utilities without third-party debt to reflect reality. To establish the percentage of short-term debt to be deemed, the Panel has considered testimony of Ms. McShane, FBCU IR responses and the OEB established practice in Ontario. **While acknowledging that there is no correct amount, the Panel concludes that a four percent component for deemed short-term debt provides a reasonable proxy as it is the midpoint of the range of actual short-term borrowing.**

7.5 Setting the Deemed Interest Rates

7.5.1 Deemed Interest Rate for Long-Term Debt

Parties acknowledge that there are at least three reasonable options for determining the deemed interest rate applicable to a small utility without third-party debt. These options are summarized below.

FBCU Option 1:

Step 1: Assign a credit rating on a stand-alone basis, and then obtain indicative quotes from investment dealers or banks based on the credit rating of a comparable proxy issuer. Using proxy companies that are engaged in the power sector or energy infrastructure can help to minimize subjectivity. The FBCU submit this approach is consistent with the stand-alone principle, and is how FEW has financed the debt component of its capital structure. (Exhibit B1-9, pp. 29-30; Exhibit

B1-20, BCUC 1.141.1, 1.141.5, 1.144.2) A reasonable deemed stand-alone rating for a small regulated utility appears to be in the range of BBB to BBB (low), with the deemed debt cost set on this basis. (Exhibit B1-9-6, McShane Evidence, Appendix F, p. 123; Exhibit B1-20, BCUC 1.147.1)

Step 2: Determine a Government of Canada (GoC) bond yield reflecting the proposed term of debt that could be either the 10-year or 30-year bond as the benchmark, or an interpolation of the two. The selected benchmark should reflect the long-term nature of utility assets, contractual terms and available debt terms. (Exhibit B1-9, p. 30)

Step 3: Determine the credit spread of a comparable corporate proxy issuer in similar industries or lines of business (e.g., regulated utility, power generation, energy infrastructure) at the same term to maturity as that selected as the benchmark GoC bond. (Exhibit B1-9, p. 30; Exhibit B1-24, BCUC 1.141.5.2; Exhibit B1-24, BCUC 2.188.2, 2188.3)

FBCU Option 2:

Ms. McShane identified an alternative approach to use the embedded cost of debt of the issuing entity as the deemed interest rate and allocate the deemed debt and interest rate based on an approved capital structure. Currently, FEI-Fort Nelson debt is deemed and the rate is the embedded cost of debt. (Exhibit B1-20, BCUC 1.141.1, 1.141.6) The FBCU submit that this is an administratively efficient way to allocate debt issued by a single regulated entity, allows the benefits of issuing all debt centrally to be shared, and provides a reasonable degree of assurance that the regulated entity raising the debt will be able to recover its actual incurred cost of debt. (Exhibit B1-20, BCUC 1.148.8)

Corix Option:

Corix supports FBCU's recommendation to apply one benchmark credit spread for small utilities to provide regulatory efficiency. To align with the proposed method, the benchmark credit spread would reflect the spread for BBB and BBB (low) rated debt relative to the underlying 10 year GoC bond yield and would reflect incremental risk of small utilities. Corix states that with the benchmark set for small projects, project stakeholders and interveners can then justify any variances from the benchmark depending on the risk exposure. (Exhibit B2-9, BCUC 1.26.3, 1.27.1, 1.46.5, 1.46.7, 1.46.11)

Commission Staff Option:

This option was raised in order to account for the scarcity of BBB-rated utilities in Canada that can be used as proxy, and for the possibility that utility ratings can be changed.

Step 1: Obtain the yield on an appropriate GoC bond as the benchmark.

Step 2: Assign a credit rating to the stand-alone utility/project based on an assessment of financial and business risk (e.g., BBB, other)

Step 3: Obtain the bond yield (credit) spread between GoC bond and a high grade utility (A or A low) and add it to the rate in Step 1.

Step 4 Add a premium, if required, to the credit spread in Step 3. This premium will be calculated as the credit spread between high grade utility bonds (A or A low) and utility bonds of the credit rating estimated in Step 2. The use of historical data (e.g., two most recent years) to have more data points could be considered. (Exhibit A2-43; Exhibit B1-20, BCUC 1.141.9; Exhibit B1-24, 2.188.6; Exhibit B2-9, BCUC 1.26.6)

The FBCU submits it is generally supportive of the Staff option but raised one concern. Ms. McShane cautioned that for any method involving the use of credit rating proxy companies, care should be taken to employ reasonable credit ratings. She re-emphasized that an appropriate credit for small utilities would be BBB to BBB (low), as the inherent risk of small size would preclude them from achieving higher ratings:. "As it is much more likely that the small utility would be BBB on a standalone basis, it makes sense to use a BBB yield as the benchmark to begin with rather than using A-rated proxies." (FBCU Final Submission, pp. 164-165; T5: 680-681)

Commission Determination

The evidence and Final Submissions suggest that setting the deemed interest rate is not a very controversial issue. However, each option reviewed has advantages and disadvantages. The Panel also notes that similar approaches have been adopted in number of recent TES Decisions. For example, BBB-rated proxies were used for the Delta School District Number 37 and Tsawwassen Springs projects.

The Commission Panel has already found that the cost of deemed long-term debt (rate and term) for each utility should be addressed separately on a case-by-case basis. Based on this the Panel recommends that on a go-forward basis the FBCU's Option 1 be used as a guideline for setting the deemed debt rate. The Panel is cognizant of the refinement proposed by Commission Staff to account for the scarcity of BBB-rated utilities in Canada that can be used as a proxy. Should this become a major issue in the future, the Commission can consider switching to use the Commission Staff Option as the guideline.

Because the deemed long-term debt by definition is set for a fixed term, the Panel finds that adjustments will not be necessary during the term of the loan. The only reason for a re-opener would be the situation where a small utility actually issues new debt. The impact of the rate change could be considered a subsequent revenue requirement review.

However, to allow some flexibility, the utilities will have an option to apply for a rate adjustment in accordance with the following reopener-criteria:

- **A measurable change in market conditions**
- **A measurable change in actual debt costs**

The Commission will consider each application for a rate adjustment on a case-by-case basis.

7.5.2 Deemed Interest Rate for Short-Term Debt

The FBCU state the basis for determining the deemed interest rate for short-term debt would be similar to that of long-term interest rate determination. It would be based on indicative credit spread quotes from investment dealers or banks using comparable proxy issuers plus a short-term benchmark yield. A common benchmark yield in Canada is the Canadian Dealer Offered Rate (CDOR). CDOR is the quoted benchmark that is used when a company issues short-term Bankers' Acceptances (BAs), which reflect the short-term benchmark rate plus the company's applicable credit spread. (Exhibit B1-9, p. 31) In response to IRs, the FBCU clarified that quotes from banks would be obtained based on indicated credit rating, not by individual proxy issuer. (Exhibit B-20, BCUC 1.44.2, 1.44.3)

Ms. McShane states that three-month BAs are also a common benchmark for establishing the cost of short-term debt for utilities. (Exhibit B1-9-6, McShane Evidence, Appendix F, pp. 127-128) In response to IRs the FBCU confirm that either the 3-month CDOR or 3-month BA rate is reasonable for setting the short-term rate. Regarding the indicative credit spread quotes, the FBCU state the following approach used by the OEB is reasonable: the OEB obtains up to six quotes from banks. If it obtains six quotes, it discards the highest and the lowest and uses the average of the remaining four. If less than four are obtained, it uses the average of all the quotes obtained. (Exhibit B1-20, BCUC 1.144.4) The FBCU submit that the OEB formulaic approach is an efficient and transparent way of estimating a deemed short-term debt rate. However, the FBCU stress that the OEB methodology is premised on a single debt rating, a short-term debt rating of R1-low, which generally corresponds to long-term credit ratings in the A category; i.e., higher than would be applicable to the small utilities. To overcome this problem, the FBCU suggest using a more reasonable short-term credit rating, one that would correspond to a BBB/BBB (low) on the long-term rating scale. (Exhibit B1-20, BCUC 1.144.5, 1.144.5.1)

Commission Determination

The Commission Panel recommends that small utilities use either the 3-month CDOR or 3-month BA rate as a basis and obtain 3-4 quotes to establish the credit spread for the purpose of setting the deemed short-term interest rate. Because it is highly unlikely that small utilities, especially the TES utilities/projects, will have frequent revenue requirement reviews, the Panel finds that there is no requirement for an annual adjustment mechanism. **The short-term rates are to be reset at the time of the revenue requirement review only.**

8.0 OTHER MATTERS

8.1 Reliance on Less Complex Financial Methodology

Expert witnesses in this proceeding expressed reluctance to use more complex models that could improve understanding and/or estimating the cost of equity. For instance, Ms. McShane states: "I think it's reasonable to try to capture these other factors. I know that it's been difficult to have regulators accept the Fama/French type models ..." (T5:721)

In response to a question from Commissioner Giammarino, Dr. Vander Weide expressed similar concerns:

> **COMMISSIONER GIAMMARINO:** "And [Fama/French] suggest that maybe the future is in an inter-tempo CAPM, that has multi factors. And that would allow for changes in the opportunities – the investments that are available to investors. Did you consider that as an alternative?" (T6:1103)
>
> **DR. VANDER WEIDE:** "That would certainly be an alternative, but from my years in testifying on the cost of capital, I have realized that there are two qualities that make a model present reasonable evidence. One is that it's -- you can estimate the inputs to the model reasonably well, and two, it has to be reasonably easy to understand. So that one can judge the model in the context where everyone doesn't have Ph.D.s in finance or economics. And once you get into dynamic capital asset pricing models, to me that's getting into a level that's too complicated for discussion in a public forum." (T6:1103)

Although Dr. Booth added a credit spread adjustment to his CAPM analysis, he also expressed a similar sentiment about adding further factors to his CAPM, as shown by the following exchange:

> **COMMISSIONER GIAMMARINO**: …there is sort of a well-established set of suspects. You've looked at one.
>
> **DR. BOOTH:** Correct.
>
> **COMMISSIONER GIAMMARINO:** So why not look at all?
>
> **DR. BOOTH:** Two reasons. First of all, with all due respect to the Commission, it's a question of getting things to the Commission in an understandable way through cross-examination. And KISS works. That a simple way of looking at these things, I think, makes sense. The only time,

for example, I saw a company put forward the Fama French model was before the Gaz Métro. And the witness had a real tough time with the more complicated model. And the Régie was very reluctant to adopt a more complicated model.

COMMISSIONER GIAMMARINO: Right.

DR. BOOTH: So when you get down to conditioning, you're absolutely correct. You think about Chandrell and Ross, and you think about economic factors affecting security returns, you can go to more measures. Does the addition of more measures make the testimony more saleable to a Commission? And the answer to that is generally no. It may make it more saleable in an academic seminar but it's easier, I think, to pick on one thing that people can relate to – credit spreads – that was picked up in most of the hearings in 2009, which seems to make sense, and seems to be consistent with the academic literature, than to go through a more complicated model with term structure, yield parameters, dividend yields or other conditioning variables. So, I pick one, the credit spread. (T8:1658-59)

The Commission Panel accepts that evidence should meet some basic criteria. For example, expert witnesses must have confidence in their estimates; and the evidence must be understandable to the Panel, ideally for all parties involved. The Panel is, however, concerned that experts pay undue attention to prior assessments of the limits of what the Commission will understand and/or accept. While evidence put forward should be as helpful as possible to a Panel dealing with the difficult task of determining the appropriate rate of return and capital structure, it should reflect the expert's best judgment about the state-of–the-art methodology, which should in turn be presented in an understandable way.

It is the Commission Panel's opinion that the purpose of a cost of equity model is to provide structure to the discussion of 'what is a fair rate of return.' Models used to fulfill this purpose provide structure and clarity, and in turn provide a basis for determining the truth of any particular assessment. Models are abstractions and, by definition, imperfect representations. As a result, it is up to the Panel to decide how much confidence it should put in various models that have unrealistic assumptions and do not explain returns perfectly. The Panel must also understand where judgment needs to be applied to the output delivered by these models.

Specifically, in Section 5.2.1, the Panel identified some of the weaknesses related to the adjustments to the CAPM. In particular, the experts expressed reluctance to include additional potential extensions to the CAPM because they were perhaps "too complex" to the Panel. This in turn leaves

open what results other extensions could imply. Similarly, in the beginning of Section 5.2 the Panel identified the lack of global perspective in assessing the investor's portfolio. A more clear set of principles, including a definition of FEI's investors' portfolios (i.e., Global, North American, Canadian) would have been valuable. Accordingly, the Panel invites more comprehensive evidence on these topics in the future.

The Commission Panel believes that one of the roles of the expert is to guide the regulator in evaluating the trade-off between the complexities of the structures needed to evaluate arguments versus the reliability of the structures. This trade-off is at the heart of cost of capital hearings. As this trade-off evolves constantly, the testimony should evolve with it.

8.2 FEI - The Benchmark Utility

Based on the evidence related to long and short-term risk before the Commission Panel we are in agreement with describing FEI as the "benchmark utility" rather than a "low-risk benchmark utility." While the Panel has determined that the level of risk is somewhat less in a number of areas than those which existed at the time of the 2009 Decision, there has been little change in many areas. Therefore, we are of the view that describing FEI as low-risk would not be appropriate. Accordingly, for the purposes of Stage 2 of the GCOC, FEI will be referred to as the benchmark utility. **The common equity component and the approved ROE in this Decision will serve as the benchmark cost of capital for any other utility in British Columbia that uses the benchmark utility to set rates.**

The issue as to whether FEI is a pure-play gas distribution received little direct attention beyond the October 4, 2012 procedural conference. However, the Commission Panel has considered the issue in the context of the level of throughput related to alternative energy initiatives. It appears that FEI's forecasted throughput related to alternative energy initiatives is relatively small. Under cross-examination, FBCU witness, Mr. Stout with reference to natural gas transportation initiatives stated:

> "...we forecast two and a half to three petajoules in 2017. I think even if you go to some volume that's in the 10 to 15 petajoule range, it's still less than 10 percent of the throughput of the system, say 5 to 10 percent of the total throughput". (T3:317)

Based on Mr. Stout's testimony, the Commission Panel accepts that FEI at this point in time is primarily a pure-play gas distribution utility.

While Stage 1 of the GCOC proceeding has been mainly concerned with determining an appropriate cost of capital for the benchmark utility, Stage 2 will be primarily concerned with business risk assessment relative to the benchmark. More specifically, public utilities will be called upon to provide evidence as to how they differ from FEI with respect to business risk. The Commission Panel considers that it is feasible that a stand-alone public utility may face overall business risks that are either higher, lower or the same as the benchmark utility.

The primary factors that have influenced FEI's long-term risk have been identified and addressed in Section 4.2. In addition, we have further identified and made determinations upon FEI's short-term risk. In Stage 2 of the GCOC, the public utilities, where appropriate, will be required to describe how they differ from the benchmark utility on these and any other risk factor as it relates to them. In addition, in Section 7.2.5 the Commission Panel has described a risk matrix (included in Appendix E) as a tool for the small utilities (especially the TES utilities) to further assist in justifying their case for an appropriate capital structure and risk premium.

IN THE MATTER OF
the Utilities Commission Act, R.S.B.C. 1996, Chapter 473

and

Generic Cost of Capital Proceeding

BEFORE: D.A. Cote, Commissioner/Panel Chair
M.R. Harle, Commissioner
L.A. O'Hara, Commissioner
R. Giammarino, Commissioner

May 10, 2013

O R D E R

WHEREAS:

A. By Order G-20-12 dated February 28, 2012, the British Columbia Utilities Commission (Commission) established a Generic Cost of Capital (GCOC) proceeding to review: (a) the setting of the appropriate cost of capital for a benchmark low-risk utility; (b) the possible return to a Return on Equity Automatic Adjustment Mechanism (ROE AAM) for setting an ROE for the benchmark low-risk utility; and (c) the establishment of a deemed capital structure and deemed cost of capital methodology, particularly for those utilities without third party debt;

B. Appendix C to Order G-20-12 divided public utilities into two categories for the purpose of the proceeding: "Affected Utilities" and "Other Utilities;"

C. FortisBC Energy Inc. (FEI), FortisBC Energy (Vancouver Island) Inc., FortisBC Energy (Whistler) Inc. and FortisBC Inc. (FortisBC)[collectively (FBCU)]; Corix Multi-Utility Services Inc. (Corix); and Pacific Northern Gas Ltd. and Pacific Northern Gas (N.E.) Ltd. (PNG) registered as Affected Utilities. The British Columbia Hydro and Power Authority (BC Hydro) and the River District Energy (RDE) registered as Other Utilities;

D. Among the Interveners who registered for the proceeding, the Association of Major Consumers of BC (AMPC), British Columbia Pensioners' and Seniors' Organization (BCPSO), Commercial Energy Consumers (CEC) [collectively B.C. Utility Customers], and the Industrial Customers Group of FortisBC Inc. (ICG) actively participated;

E. By Order G-47-12 dated April 18, 2012, the Commission issued the Final Scoping Document for the proceeding. The Scoping Document sets out the purpose and the scope of the proceeding. Matters within the scope of the proceeding included, among others, the appropriate cost of capital and its effective date for a benchmark low-risk utility, the establishment of a benchmark ROE, the consideration of an automatic adjustment mechanism, and the deemed capital structure and deemed cost of capital for small utilities without third-party debt;

F. By Order G-50-12 dated April 19, 2012, the Commission, among other matters, set out the further procedural matters to be addressed in the proceeding and a Preliminary Minimum Filing Requirements (MFR) for Affected Utilities document. Parties were invited to make submissions on the Preliminary MFR for Affected Utilities by May 3, 2012, and on the allocation of Participant Assistance/Cost Awards (PACA), PACA eligibility, and/or the Draft Preliminary Regulatory Timetable by May 9, 2012;

G. By Order G-72-12 dated June 1, 2012, the Commission, among other matters, issued the Final Minimum Filing Requirements for Affected Utilities and the Preliminary Regulatory Timetable for the proceeding;

H. On June 8, 2012, the Commission released "A Survey of Cost of Capital Practices in Canada" prepared by The Brattle Group for the Commission (Brattle Report). Utilities and Interveners were provided with the opportunity to ask Information Requests on the Brattle Report;

I. By Order G-84-12 dated June 20, 2012, the Commission amended the Preliminary Regulatory Timetable, establishing, among other things, a Procedural Conference for October 2, 2012 and the commencement date for an oral hearing, if required, on December 12, 2012. The Procedural Conference was subsequently rescheduled to October 4, 2012;

J. At the Procedural Conference the Commission received, among others, submissions on the following items: (1) the appropriate benchmark utility for the determination of the generic cost of capital; (2) whether a Stage 2 for the purpose of determining an appropriate cost of capital for Affected and Other Utilities to immediately follow Stage 1 was desirable; (3) whether an oral phase was required and (4) the proposed timetable going forward;

K. By Order G-148-12 dated October 11, 2012, the Commission determined that : (1) FEI in its present pre-amalgamation state, would serve as the benchmark for the proceeding and whether FEI in 2012 is a pure play gas distribution utility would be determined following the hearing of further evidence; (2) a Stage 2 would be added to the proceeding with the schedule to be determined prior to the end of Stage 1; and (3) the review of the proceeding would continue by way of an oral hearing commencing on December 12, 2012;

L. By Order G-187-12 dated December 10, 2012, the Commission ordered that: (1) the current ROE and capital structure for FEI, the designated benchmark utility, and all regulated entities in B.C. that rely on the benchmark utility, except British Columbia Hydro and Power Authority, are to be maintained and made interim, effective January 1, 2013; and (2) any determinations of the premiums on the benchmark ROE and capital structure of regulated utilities that depend on the benchmark utility for rate setting will be made following the decision in Stage 2; M. The oral public hearing took place over a period of seven days between December 12, 2012 and December 21, 2012. A total of eight witness panels from FBCU and Interveners gave evidence;

N. FBCU, PNG, Corix, AMPC/CEC, ICG and BCPSO filed Final Submissions. FBCU filed a Reply Submission; and

O. The Commission has considered the evidence and the submissions of the Parties all as set forth in the Decision issued concurrently with this Order.

BRITISH COLUMBIA UTILITIES COMMISSION

ORDER NUMBER G-75-13

NOW THEREFORE, the Commission orders as follows:

1. The common equity component appropriate for the benchmark utility, FEI, effective January 1, 2013 is 38.5 percent.

2. A Return on Equity (ROE) for the benchmark utility, FEI, is established at 8.75 percent effective January 1, 2013.

3. An Automatic Adjustment Mechanism (AAM) formula for annually setting the ROE of the benchmark utility between ROE proceedings is adopted commencing January 1, 2014. The AAM formula will operate until December 31, 2015. The implementation of the model will be subject to conditions outlined in the Decision.

4. FEI is directed to file an application for the review of the common equity component and the ROE approved in Paragraphs 1 and 2 of this Order by no later than November 30, 2015.

5. The common equity component and the ROE approved in Paragraphs 1 and 2 of this Order will continue to serve as the Benchmark cost of capital for any other utility in British Columbia that uses a Benchmark Utility to set rates.

6. Within 30 days of the date of this Order, FEI is to file:

   (a) a document setting out how and when it will implement the change to its capital structure;

   (b) amended rate schedules in accordance with paragraphs 1 and 2 of this Order as well as a proposal on the treatment of the refundable portion of the rates collected since January 1, 2013.

7. Small utilities without third-party debt are to include a deemed component of short-term debt of 4 percent.

DATED at the City of Vancouver, in the Province of British Columbia, this 10th day of May 2013.

LIST OF PROCEDURAL ORDERS

Exhibit Number	Commission Order (Date)	Determinations
A-1	G-20-12 (Feb 28, 2012)	• Stated purpose in establishing the GCOC proceeding • All regulated utilities determined to be applicants in this proceeding. Utilities are divided into "Affected Utilities" and "Other Utilities." • Issued initial regulatory timetable for registration of Utilities and Interveners and written submissions on the Preliminary Scoping Document
A-3	G-47-12 (April 18, 2012)	• Issued Final Scoping Document
A-5	G-50-12 (April 19, 2012)	• Issued preliminary Minimum Filing Requirements (MFR) • Issued preliminary regulatory timetable for written submissions on the MFR and the cost allocation of Participant Assistance/Cost Awards (PACA) and PACA eligibility
A-6	G-72-12 (June 1, 2012)	• Issued Final MFR • Determined the principles in the allocation of PACA costs and PACA cost eligibility • Considered expansion of the current proceeding by conducting the GCOC proceeding in two stages • Issued preliminary regulatory timetable for a Procedural Conference and Stage 1 of the GCOC proceeding. • Put on the record the terms of reference for the survey Report carried out by The Brattle Group
A-9	Order G-84-12 (June 20, 2012)	• Issued amended preliminary regulatory timetable

LIST OF PROCEDURAL ORDERS

Exhibit Number	Commission Order (Date)	Determinations
A-16 and A-17	Letter L-52-12 (September 13, 2012)	• Established the amended date and agenda for the Procedural Conference
A-22	G-148-12 (October 11, 2012)	• Determined that FEI in 2012 in its pre-amalgamation state, will serve as the benchmark utility for the GCOC proceeding • Determined that a Stage 2 will be added to the proceeding • Determined that review will take place by an oral hearing commencing on December 12, 2012
A-30	G-187-12 (December 10, 2012)	• Issued Interim Order establishing current ROE and capital structure for the benchmark utility and all regulated entities in B.C. that rely on the benchmark utility as interim, effective January 1, 2013

INTERESTED PARTY DOCUMENTS

D-1	**AT BUSINESS CONSULTING (ATB)** Online Registration dated May 9, 2012 – Request for Interested Party Status by Anastasios Tsalamandris

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
	Capital structure (debt/equity ratio)	60/40 (actual)	60/40 (actual)	60/40 (actual; proposed)		60/40 (actual)	Deemed 60/40	Deemed 60/40	Deemed 60/40
	Equity Risk Premium	N/A	0 bps (approved)	50 bps (proposed)		50 bps (approved)	50 bps (approved)	100 bps (approved)	50 bps (approved)
1	Technology risk/system performance risk associated with chosen technologies	Natural Gas: proven technology	Geo-exchange loop field system and heat recovery with high efficiency natural gas boilers equipment	Recovered waste heat from TELUS Data Centre with peaking and redundant backup heat supplied by Centre Heat Distribution Ltd.: low risk	Slightly higher for PCI / TG than FEI NG	High efficiency condensing boilers: proven technology; Ground source heat pumps; less established technology	Natural gas boilers proven technology	Biomass Gasification innovative technology; Natural Gas boilers; proven technology (while DGE not yet on biomass, the Commission approved the technology)	Natural Gas: boiler: proven technology

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
2	Fuel Risk cost and availability	Natural gas: Low-medium	Low risk: free energy from ground and heat recovery, but cost risk for electricity used to operate heat pumps and TES equipment, and for natural gas for supplementary heat and peaking	Data Centre that supplies waste heat is assumed to be available throughout the 20 year term of the analysis: low risk Data Centre ceases operation	Lower for PCI / TG than FEI NG	Natural gas and electricity: Low-medium; Heat from ground: low (some energy cost risk in electricity costs to operate GSHPs)	Natural gas fuelled energy centre: low medium Alternative renewable energy source: not approved yet and thus not relevant	Biomass: medium-high; natural gas; low-medium	Natural gas fuelled energy centre: low medium Alternative renewable energy source: not approved yet and thus not relevant
3	Customer Base (e.g., diversity, certainty, growing, declining)	Established and diverse customer base but very slow growth	Greenfield utility four types of customers	Not large customer base or significant diversity: low risk	Higher for PCI / TG than FEI NG (NG has much greater diversity)	Established customer: low risk	Greenfield utility: uncertainty related to timing of full build out	Greenfield utility: uncertainty related to timing of full build out	Greenfield utility: uncertainty related to timing of full build out
4	Default risk of customer	Minimal	Minimal	Minimal	Similar for PCI / TG as for FEI NG	Minimal as SD has budget constraints as well	Minimal	Minimal	Minimal

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
5	Property development risk	Medium to high: there are competing energy options	Low risk: all customers bound by agreement	Majority of tenants committed but customers can still leave: low risk	Lower for PCI / TG than FEI NG	None, as not a new development	Low: phased approach to capital deployment	High: build first approach to capital deployment	Low: phased approach to capital deployment
6	Developer / customer connection risk	Medium to high: due to building stock changes and competitive energy sources	Low Risk: customers will connect on occupancy	Low Risk: customers will connect on occupancy	Lower for PCI / TG than FEI NG	Low, as one known customer with existing sites	Low: mandatory connection	Low: mandatory connection	Low: mandatory connection
7	Load Forecast Uncertainty	Minimal in the short term, as mature utility with deferral account; somewhat higher in the long term	Inherent uncertainty in load forecast	FAES proposes to take forecast risk on actual energy throughput versus forecast for 5 year period: Low-medium	Higher for PCI / TG than FEI NG	Low, as established energy load	Inherent uncertainty in load forecast	Inherent uncertainty in load forecast	Inherent uncertainty in load forecast

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
8	Utility size	Large and mature utility	Project is carried out by a separate corporate entity, Small development specific utility.	Project is carried out by separate corporate entity, Small development specific utility.	Higher for PCI / TG than FEI NG	Project is carried out by separate corporate entity	Small development specific utility	Small development specific utility	Small development specific utility
9	Initial construction cost risk	Depends on the nature of the individual project	Depends on nature of the individual project	Depends on nature of the individual project	Similar for PCI / TG as for FEI NG	Depends on the nature of the individual project	Depends on the nature of the individual project	Depends on the nature of the individual project	Depends on the nature of the individual project
10	Future Construction cost risk	Depends on the nature of the individual project	Depends on nature of the individual project	Depends on nature of the individual project	Similar for PCI / TG as for FEI NG	Depends on the nature of the individual project	Depends on the nature of the individual project	Depends on the nature of the individual project	Depends on the nature of the individual project
11	Operating cost risk	Minimal as revenue requirement application to recover costs	Minimal as mechanism in place to recover costs	Low-medium risk: as deferral accounts do not cover all O&M variances between forecast and actual	Higher for TG, similar for PCI relative to FEI NG	Minimal as mechanism in place to recover costs	Minimal as a mechanism in place to recover costs	Minimal as a mechanism in place to recover costs	Minimal as a mechanism in place to recover costs

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
12	Public Acceptance Risk	Medium as natural gas is an established and widely used technology but public perceives it as less than clean	Low as seen as green alternative	Low	Lower for PCI / TG than FEI NG	Low as seen as green alternative	Low as seen as a green alternative	Low as gasification technology part of approval process for the development and already selected at the time of the CPCN application	low as seen as a green alternative
13	Fixed/Variable rate design	15% fixed/85% variable	~~100% variable~~ Rate Design Not Approved	100% variable (volume rate)	Higher for TG, relative to FEI NG PCI Rate Design not Approved	100% variable	60% fixed/40% variable	50% fixed/50% variable	66% fixed / 34% variable

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
14	Levelized approach to rates	No	~~Only in first three years then transition to cost of service~~ Rate Design not Approved	The rates charged for the first five years have been mutually agreed upon using a benchmark based on BC Hydro RIB Step 1 and Step 2	Slightly higher for TG, relative to FEI NG PCI Rate Design Not Approved	No, transitional market rate and deferral account	Yes	Yes	Yes
15	Financial risk	Low-medium: appropriate standalone financing structure for capital markets	Medium (similar to DSD)	Forecast risk and rates fixed for first five years (other than one-time adjustment for GCOC changes) impacts financial risk: medium risk justifies 50 bps on FEI utility benchmark	Higher for PCI / TG than FEI NG	Medium	Low-medium: subsidiary of parent utility	Low-medium: subsidiary of parent utility	Low-medium: subsidiary of parent utility

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
16	Competitive challenges	Competitive with electricity and competition from alternative energy providers	Other TES providers and electricity	Other TES providers and electricity	Lower for PCI / TG than FEI NG	Other TES providers and electricity	Other utilities and electricity	Other utilities and electricity	Other utilities and electricity
17	Provincial climate change and energy policies	Encourage reduction of fossil fuels usage to reduce GHG emissions and lower energy use.	Favourable government policies	Favourable government policies	Lower for PCI / TG than FEI NG	Favorable govt. policies	Favourable govt. policies	Favourable govt. policies	Favourable govt. policies
18	Regulatory uncertainty	Low to medium: uncertainty exists for service offerings within the natural gas class of service.	Medium risk: New, uncertainty, scrutiny and not streamlined Rate Design Denied as Applied	Medium risk: New, uncertainty, scrutiny and not streamlined	Higher for PCI / TG than FEI NG	Medium risk: new, uncertainty, scrutiny and not streamlined	Medium risk: New, uncertainty, scrutiny, alternative energy centre not yet approved	Medium risk: New, uncertainty, scrutiny	Medium risk: New, uncertainty, scrutiny

ORDER C-1-13
ATTACHMENT B

	Risk Factor	FEI Natural Gas Class of Service (1)	FAES PCI Marine Gateway Project (2)	Telus Garden (3)	PCI Marine / Telus Garden Vs. FEI NG Class of Service (4)	FEI Delta School District (5)	Corix UniverCity (6)	Dockside Green Energy (7)	River District Energy (8)
19	Business Development Risk	Minimal	Low – deferring business development costs increases risk of non-recovery. (PCI BCUC IR 1.41.1.) [Shareholder ultimately at risk for the TESDA]	FAES has agreed to purchase the TGTES from the Partnership upon commissioning for actual construction cost of $7.9 million up to a maximum of 30% above the $7.9 million estimate.	Higher for PCI / TG than FEI NG	Low: deferring business development costs increases risk of non-recovery. (PCI BCUC IR 1.41.1) (Shareholder ultimately at risk for the TESDA)	High as part of overhead cots	High as part of overhead cots	High as part of overhead cots

YEC-YECL-14

Reference: Section 8 – Return on Rate Base – Common Equity Ratio

Request:

(a) Please confirm that forecast common equity ratio is 43.61% for 2013, 43.66% for 2014 and 43.70% for 2015.

(b) Please explain the reason for increase in common equity ratio from 40.65% in 2012 to 43.61% in 2013.

(c) Please confirm that based on Schedule 8.1 the mid-year balance of common equity forecast to increase from $25.740 million in 2012 actual to $42.860 million in 2015, i.e. increase of $17.120 million over three years. Please provide forecast sources for this additional equity amount (parent company equity injections, retained earnings or other).

(d) Please update Schedule 8.1 by using 40% equity ratio and discuss impacts to the YECL to provide services to its customers.

(e) Please outline and explain in detail any changes in YECL's risk profile since the 2008/2009 GRA that would warrant an increase in equity ratio from 40%.

(f) Please explain the impact that the number of deferral accounts (Whitehorse Copper Tailings Sales Uncertainty, Purchased Power Flow Through, Depreciation Parameters, ROE and Defined Benefit Pension Plan proposed in the current application would have on YECL's risk profile.

Response:

(a) Yukon Electrical can confirm that the forecast common equity ratio is 43.61% for 2013, 43.66% for 2014 and 43.70% for 2015. However, when no cost capital is excluded, the forecast common equity ratio is 44.0% for 2013-2015. Please refer to YEC-YECL-14(a) Attachment 1 for a copy of Schedule 8.1 showing the equity ratio not including no cost capital.

(b) Yukon Electrical has requested an increase in equity ratio from 40% to 44% as part of its 2013-2015 GRA. Since 2008, BCUC's benchmark utility common equity ratio has increased from 35.01% to 38.5%, Northland Utilities (Yellowknife)'s common equity ratio has increased from 39.57% to 43.5%, and Northland Utilities (NWT)'s common equity ratio has increased from 40% to 44%. These changes in common equity ratios reflect increases of 3.49%, 3.93% and 4.00%, respectively. Yukon Electrical's requested 4% increase to its common equity ratio is consistent with the approved increases to its affiliates in the Northwest Territories, with which Yukon Electrical shares similar business risks, and is supported by the increase to the BCUC's benchmark utility. Please also refer to YUB-YECL-33(b) for the common equity ratios requested by the British Columbia non-benchmark utilities involved with Stage 2 of the BCUC GCOC process.

(c) Confirmed. The source of the additional equity amount will be parent company equity injections and retained earnings.

(d) Please refer to YEC-YECL-14(d) Attachment 1 for Schedule 8.1 updated for a 40% equity ratio. The requested 44% common equity ratio, based in part on a respect of the stand-alone principle, is required for Yukon Electrical to contribute its fair share towards the maintenance of CU Inc.'s A credit rating. As Yukon Electrical's debt mirrors the debt of CU Inc., Yukon Electrical's customers benefit from the low interest rates obtained by the A rated CU Inc.

(e) Please refer to YUB-YECL-31 addressing changes to Yukon Electrical's risk profile since the 2008/2009 GRA. Further, the increase in common equity ratio is based on the following increases in common equity ratios since Decision 2009-02:

BCUC's benchmark utility common equity ratio increased from 35.01% to 38.5%;

Northland Utilities (Yellowknife)'s common equity ratio increased from 39.57% to 43.5%; and

Northland Utilities (NWT)'s common equity ratio increased from 40% to 44%.

As noted in part (b) of this response, these changes in common equity ratios reflect increases of 3.49%, 3.93% and 4.00%, respectively. Yukon Electrical's requested 4% increase to its common equity ratio is consistent with the approved increases to its affiliates in the Northwest Territories, with which Yukon Electrical shares similar business risks, and is supported by the increase to the BCUC's benchmark utility.

(f) As detailed below, there is no material change to Yukon Electrical's risk profile as a result of the deferral accounts requested as part of this 2013-2015 GRA Application as compared to the risk profile reviewed as part of the 2008/2009 GRA.

Whitehorse Copper Tailings – No industrial customers were forecast as part of Yukon Electrical's 2008/2009 GRA. The requested deferral therefore results in Yukon Electrical's risk profile remaining constant.

Purchased Power Flow Through – There is no change requested in this Application from the previously YUB approved deferral.

Depreciation Parameters – As detailed in Section 7 of its Application, the intension of Yukon Electrical's requested deferral is, to the extent possible, permit Yukon Electrical to harmonize IFRS and regulatory accounting and avoid the administrative burden of keeping two sets of financial records. As such, the purpose of deferral is not to address Yukon Electrical's risk profile.

ROE - The proposed AAM and ROE deferral does not reduce Yukon Electrical's risk profile. BCUC is re-instituting an AAM as it has the potential to contribute to regulatory efficiency, and did not note in its decision any impact the AAM formula has on the risk profile of the benchmark utility.

Defined Benefit Pension Plan – In its 2008/2009 GRA, Yukon Electrical did not request a Defined Benefit Pension Plan deferral as its funding requirements for the test period were known based on the December 31, 2006 Actuarial Valuation. For purposes of this Application, the funding requirements for 2013, 2014 and 2015 are not known. The requested deferral therefore results in Yukon Electrical's risk profile remaining constant.

YEC-YECL-15

Reference: Section 9 – Capital Additions – Capital Additions General

Request:

(a) Describe the system planning criteria (i.e. decision making process for diesel plant replacement, distribution upgrades and other projects included in this GRA) used to develop YECL's capital plans.

(b) Please describe the age and condition assessments which lead to YECL's conclusion that distributions assets need to be upgraded.

(c) Please provide a copy of YECL's capitalization policy.

(d) Please confirm that under International Financial Reporting Standards (IFRS) entities are not permitted to charge projects for equity returns and use debt only rate for AFUDC. If this is confirmed please explain why YECL is proposing to use both an equity and debt components for AFUDC rate.

(e) Does YECL have deferred cost or deferral account accounting policies? If so please provide copies of the policies. Please explain how the deferred accounting policy works, including:

  (i) which type of cost to be deferred;

  (ii) who has the authority for decision to defer, close and amortize YECL deferred costs

  (iii) how the amortization period is determined

(f) Please provide a continuity schedule for each category of deferred cost for YECL for the years 2010 to 2015 showing additions, close-outs, work in progress and amortizations.

(g) Identify which capital projects included in GRA application, both actual and forecast, are improving reliability and provide an explanation for how they improve reliability.

(h) Please provide a continuity schedule for YECL of Contributions in Aid of Construction or customer contributions for the years 2010 to 2015 by project segregating additions, amortizations and other adjustments.

Response:

(a) Distribution projects are identified based on deficiencies; issues and needs are brought forward as a result of inspections, system monitoring and reviews of the generation and distribution system. Planning criteria for generators also includes a review of operating hours. These issues and needs are reviewed at regular meetings involving the Operations and Engineering departments. The projects are then approved or not pending further information or alternatives. Once the project is approved they are prioritized as "A" or "B" projects and are scheduled into Yukon Electrical's capital plans.

(b) The Distribution system is inspected on an annual basis through the system inspection program. Any components that are deficient or requiring corrective action are recorded and tracked to completion. Condition assessments are also recorded and tracked to completion through our test and treat program, ground rod testing, clearance checks, brushing and hazard tree patrols, infrared scanning, daily interaction with the distribution system and as a result of unplanned outages and the causation analysis. Generation components are also inspected. The generating units and associated equipment is monitored to ensure the operating hours are accurately tracked. A combination of equipment condition assessments, performance and recommended operating hours will dictate the replacement of the generation equipment.

(c) Please refer to YEC-YECL-15(c) Attachment 1 for a copy of ATCO Electric's capitalization policy which is also used by Yukon Electrical.

(d) Confirmed. Consistent with past practice and consistent with its parent, ATCO Electric, as well as the Northland companies in the NWT, Yukon Electrical has maintained the existing Board-approved methodology for calculating AFUDC that includes both equity and debt components for the AFUDC rate. For the purpose of preparing its financial statements in accordance with IFRS, Yukon Electrical capitalizes borrowing costs using a debt-only rate.

(e) Yukon Electrical does not have a deferred cost or deferral account accounting policy as, under IFRS, deferred costs such as study costs and expenses related to a deferral account are required to be expensed in the year incurred.

For regulatory purposes, where Yukon Electrical believes that there is value to customers over a period greater than one year, such is the case with the

deferred study costs related to the Watson Lake Bi-Fuel project, Yukon Electrical requests the Board's approval to recover such costs over a period of time that corresponds to the period of time over which the benefits occur.

(f) Please refer to Schedule 8.8 of the Application for a continuity schedule of each deferred charge for the period of 2008 through 2015.

(g) All capital work that is either replacing like for like, upgrading or adding to the system will inherently improve reliability, since it will be newer equipment and built to today's standards. Certain projects have been justified primarily on reliability, while others have been justified by other drivers such as safety. Yukon Electrical conducted a review of its forecast improvement projects for the period 2013 to 2015 and determined that all projects improved reliability in some way or another. The explanations provided in Yukon Electrical's Application, Section 9, provide information on why a project is to be undertaken and outlines reliability benefits on a project by project basis.

(h) Please refer to YEC-YECL-15(h) Attachment 1.

ATCO ELECTRIC LIMITED ACCOUNTING POLICY MANUAL	***Capitalization***
	Date: December 2010 **Number:** D.1.a
PREPARED BY: K. Trunzo	**APPROVED BY:** D. Freedman

This policy is intended to describe the accounting treatment involved in the capitalization of fixed assets. Immediately following this policy, additional policies can be found which cover more specific topics.

Note that transition to International Reporting Standards (IFRS) on January 1, 2010 resulted in significant changes to revenue recognition and treatment of rate-regulated assets and liabilities. As a result, ATCO Electric now applies certain accounting policies to its publicly released financial statements for IFRS reporting and in some cases another policy for regulatory reporting and rate-making purposes. Where accounting treatment differs between the two measures, these are identified below.

Fixed Asset

A unit of property which can be physically identified and has a useful life in excess of one year. The value of the assets should include any non-recurring costs which are relative to its creation. Included in the cost of a fixed asset would be materials, direct and indirect labour, expenses, fringe benefits and an appropriate proportion of administrative overhead. For IFRS reporting purposes, the value of the asset will include interest capitalized during construction; whereas for Regulatory purposes the value of the asset will include an allowance for funds used during construction. The total cost of the asset is significant, relative to the total capital cost of the particular asset. In the case of new assets, the cost must exceed $300. There are numerous items (e.g. office furniture, loose tools, etc.) that are too small to capture in individual projects therefore blanket projects are utilized to capture these costs.

Capital versus O&M Expenditures

1) Capital

An expenditure is capital in nature if it involves: constructing or purchasing a new asset or upgrading it, rehabilitating or replacing an existing asset.

a. Constructing or purchasing a new asset

i. Outright purchase of fixed assets, such as land, a building, a vehicle, machinery, standby equipment, office furniture, etc.

ii. The entire cost of constructing new additions to physical assets such as transmission lines, distribution facilities, substations, etc.

iii. All startup and commissioning costs

b. Upgrade existing assets

i. An enlargement of existing structures or facilities

ii. To increase the capacity of an existing asset

iii. A substantial improvement in the facility affecting quality of output or reduces operating costs

c. Rehabilitate existing assets

i. As a general guideline, to determine if a cost falls into this category, one must consider if the expenditures were planned to be incurred at the time if purchasing the asset.

1. If the expenditures were planned at the time of purchase to occur in the future, they will be expensed to O&M when they are incurred.
2. When extraordinary, material unplanned items are incurred in the future, they will be considered capital.

ii. To insure achievement of life of an asset
iii. To extend the life of an asset beyond its normal service life

d. Replace existing assets
i. The substitution of new for existing facilities that are worn out, irreparably damaged, or have become inadequate in service.
ii. The substitution having substantially no greater capacity than the facility for which it is substituted.

2) Operation and Maintenance

a. Operational Expense
i. The cost of labour, expense and consumable materials used to start up or turn on a system and monitor its operations.
b. Maintenance Expense
i. The cost of labour, materials and expense to keep all parts of the system in a safe operating condition.

Specific Accounting Treatment

Following is the accounting treatment of some of the more common capitalization questions which are encountered.

1) Transformers – Capital/O&M
All transformers 50 KVA and under will be purchased under inventory and charged to fixed assets when installed and if replaced, returned to inventory and credited to fixed assets. Transformers greater than 50 KVA are charged directly to fixed assets. For policy on burnouts, planned and unplanned increases and shop repairs see D.1.a.10 in this manual.

2) Refurbishing & Installing Vehicle Service Bodies – Capital
This expenditure is eligible because it extends the service life of an asset.

3) First Time Painting of Street Lights – Capital
Considered a cost of installing a street light.

4) Switch Number Plates & Installation – Capital
Required for the safe operation of transmission facilities.

5) 5 kV Underground Replacement – Capital
Considered as a distribution rebuild.

6) Brushing – Capital
Capitalize if brushing at time of construction, first time spraying to kill remaining root system, line widening (i.e. the removal of entire trees) along right of ways for trees not previously cleared at time of construction or hazard tree removal for trees either on an existing right of way which has not been previously cleared or those trees outside the existing right of way.

7) **Brushing – O&M**
Mowing the regrowth of trees which were previously cleared and also the second and subsequent sprayings are O&M.

8) **Moving Expense – Capital/O&M**
The individual's moving expenses should be allocated to capital or O&M, or a combination of both, based on the type of work the individual is doing.

9) **Underground Splice Replacements – O&M**
There is no increase in capacity or life extension of the primary asset.

10) **Loose Tools and Office Furniture – Capital/O&M**
The key determinant is the $300 minimum cost which will decide if an item should be capitalized or expensed.

11) **Ground Rod Testing and Replacement – Capital / O&M**
Testing would be charged to O&M unless it leads to immediate major site specific replacement which would qualify the costs as a major capital item. Replacement costs would be capitalized if the work order is for a major replacement done at a specific site.

12) **Pole Inspection or Testing – O&M**
The work involved in inspecting or testing a pole to see if treatment is required.

13) **Pole Treating – Capital/O&M**
Any major pole treating program involving 50 poles or more would be considered capital. Programs of less than 50 poles will be charged to O&M.

14) **Temporary Generation – Capital/O&M**
The cost of renting a temporary generating station to supply load in an isolated fashion to allow a line to be rebuilt would be expensed for IFRS reporting purposes. For Regulatory purposes this cost would be capitalized.

15) **Gang Switch Maintenance – O&M**
Since the refurbishing of gang switches involves only the replacement of insulators in the gang switch assembly, this item should be charged to O&M. The intent is to keep the switch in operating condition.

16) **Substation Regravelling – O&M**
The costs should be charged to O&M as the substation life is not extended, nor is the asset value increased.

17) **URD Elbow & Insert Replacement – O&M**
Costs should go to O&M as essentially the underground system is being maintained in operating condition.

18) **Pedestal Replacement – Capital**
The associated costs should be capitalized and the pedestal being replaced, retired.

19) **Accreditation Manuals – Capital/O&M**
The costs to initially set up the manuals should be capitalized. However a revision to the manual should be expensed.

20) **Panel Upgrades – Capital**
Due to capacity increases, these costs would be eligible for capital.

21) Pole Replacement – Capital/O&M

All poles replaced on a pre-planned basis due to decay should be charged to capital and the old pole and labour to install them should be retired. Poles replaced on an emergency basis due to mechanical damage by vehicles or during storms should be expensed whether or not there is some evidence of wood decay.

22) Pole Stubbing – Capital/O&M

Stubbing of transmission lines on a pre-planned basis should be charged to capital as the intent to increase the service life of the poles. Unplanned pole stubbing would be expensed.

23) Conductor Replacement – Capital/O&M

Replacement of a conductor on a transmission or sub transmission line would be charged to capital if the length of the line is one mile or greater (three miles for a 3 phase line) regardless of the size of the conductor being replaced. Replacement of conductors on distribution lines will be charged to capital if the new conductor is of a larger size or insulation rating compared to the one being replaced. This applies to underground, aerial spaced and overhead conductors.

24) System Spares – Capital/Inventory

The cost of spares that are designated to support specific fixed assets are initially capitalized and depreciated. If the spare part turns over on a regular basis, consideration would be given to setting it up in inventory.

25) Leasehold Improvements – Capital

Leasehold improvements are capitalized where a lease agreement is in place. It is amortized using the straight-line method over the life of the lease plus one renewal period.

26) Postponed Projects – WIP

Costs incurred to date would remain in work-in-progress and reviewed periodically for appropriateness.

27) Properties Removed From Service (i.e. not disposed of)

Original cost would remain with assets in service and depreciated until disposed of.

28) Leases – Capital

Will be capitalized depending on the terms and conditions of the lease, particularly the issue of transfer of ownership at the conclusion of the lease. The lease obligation is included with long-term debt and the original cost is included in fixed assets.

YEC-YECL-16

Reference: Section 9 – Capital Additions – Fish Lake

Request:

(a) Please provide a table that shows capital expenditures for each unit of Fish Lake hydro-electric generating plant for actual and forecast years included in GRA application.

(b) Please explain expenditures with the amount more than $0.5 million.

(c) Please provide a continuity schedule for Fish Lake hydro-electric generating plant for 2010-2015 years by showing the following:

(i) Total plant year-end cost

(ii) Total plant capital additions for the year

(iii) Total plant amortization expense for the year

(iv) Total plant year-end accumulated amortization

(v) Total plant year-end net-book-value

(vi) Total plant net cost mid-year balance (based on iv above)

(vii) Total hydro generation for the year

(d) For c) above please combine all Fish Lake hydro-electric generating related costs.

Response:

(a) Please refer to YEC-YECL-16(a) Attachment 1.

(b) Please refer to YEC-YECL-16(c) Attachment 1.

(c) Please refer to YEC-YECL-16(c) Attachment 1.

(d) Please refer to YEC-YECL-16(c) Attachment 1.

The Yukon Electrical Company Limited
Fish Lake Hydro System Capital Expenditures By Year

Project Description	Reference	2008	2009	2010	2011	2012	2013	2014	2015	Total
Fish Lake Unit #1 Turbine and Building Replacement	Bus Case # 2, Pg 9-26, 9-34, 9-44				717,000	1,024,000	2,167,000			**3,908,000**
Fish Lake Water Licence Renewal	Bus Case # 28, Pg 9-33, 9-42, 9-51				491,000	688,000	650,000			**1,829,000**
Fish Lake Dyke Upgrade	Bus Case # 7, Pg 9-44, 9-54						300,000	1,420,000		**1,720,000**
Fish Lake Ditch # 3 Diversion Structure Replacement	Bus Case # 9, Pg 9-54							1,640,000		**1,640,000**
Fish Lake Unit # 2 Penstock Replacement	Bus Case # 1, Pg 9-18, 9-26			486,000	70,000					**556,000**
Fish Lake Unit #2 New Wheel, Shaft and Bearing Pedestal	Pg 9-12, 9-18, 9-26		153,000	294,000	18,000					**465,000**
Fish Lake Unit #1 Generator EOL Rebuild	Pg 9-5	463,000								**463,000**
Fish Lake Unit #1 Spillway	Pg 9-18, 9-26, 9-45, 9-55			212,000	26,000		20,000	100,000		**358,000**
Fish Lake Unit # 1 Tailrace Reconstruction	Pg 9-26				173,000					**173,000**
Fish Lake Unit # 2 Step-Up Transformer	Pg 9-34					172,000				**172,000**
Fish Lake Unit # 2 Turbine Inlet Valve (TIV) Replacement	Pg 9-34					171,000				**171,000**
Fish Lake Unit # 1 Replacement Wheel	Pg 9-12, 9-19		80,000	45,000						**125,000**
Fish Lake Ditch # 3 Drop Box Concrete Upgrade	Pg 9-19, 9-26			32,000	57,000					**89,000**
Fish Lake Incremental Purchase Power	Pg 9-12		69,000							**69,000**
Louise Lake Control Structure Gate Replacement	Pg 9-26				68,000					**68,000**
Fish Lake Head Pond # 2 Spillway Upgrade	Pg 9-45, 9-55						30,000	30,000		**60,000**

YEC-YECL-17

Reference: Section 9 – Capital Additions – Fish Lake Unit #1 Turbine and Building Replacement

Request:

(a) Please provide details of the failure of Fish Lake Unit #1, including details of insurance proceeds received or expected to be received related to this failure.

(b) Please confirm the proposed date Fish Lake Unit #1 in-service date after rebuilding.

(c) Fish Lake Unit #1 Turbine and Building Replacement Business Case notes the following (page 6 of 8) as the reason for replacing the existing unit with modern equipment:

(i) Modern hydro turbine will be more efficient.

(ii) Modern hydro turbine will have lower operating costs.

(iii) Economic analysis indicates incremental cost of new equipment will be paid back in a reasonable time frame.

Please provide details of impact of each above reasons to Yukon Ratepayers (does the current GRA includes any benefits from increased efficiency, lower operating cost, etc.)

(d) What is the new updated average generation output from Fish Lake Unit #1?

(e) What is the annual average hydro generation for each unit? Does YECL propose to update the average Fish Lake generation from 8.73 GW.h as approved in YUB Order 2009-02 to reflect increased efficiency? If yes, please provide updated average generation forecast for each unit; if not, please provide reasons.

(f) Please provide rationale for separating Fish Lake Dike Upgrade (Business Case #7) and Fish Lake Ditch #3 Diversion Structure (Business Case #9) from Fish Lake Unit #1 Turbine and Building Replacement projects.

(g) The economic case is based on replacing the unit and building only. As evidenced by capital expenditures related to this facility and renewing its water license, considerable additional capital and operating expenditures were and are required during the test years in order to continue to operate this facility as well as Unit #2. Please provide an updated business case considering the life cycle cost analysis of the total expenditures over the future expected life of the facility (capital and future operating expenditures)

(h) Please provide a copy of 2012 Dam Safety Report (Fish Lake Ditch #3 Diversion Structure - Business Case #9, page 2 of 3).

Response:

(a) The turbine-generator failure occurred in March 2010. The shaft tying the turbine and generator became decoupled and consequently, the runner and shaft were ejected through the turbine casing, causing collateral damage to the structure and other equipment in the powerhouse. The lost integrity of the turbine casing allowed a significant volume of water to fountain in the powerhouse for approximately 90 minutes until the intake valve was closed.

Insurance proceeds were received based on the estimated refurbishment cost to return the same unit to service using like-for-like parts where available (and new parts replacing parts that are obsolete.) Facility cleanup charges and installation of a pressure-reducing valve system were also covered by the insurance claim.

Based on the above, the net claim received is broken down as follows ($000s):

Property Damage Claim	956
Less: Deductible (recorded in the Reserve for Injuries and Damages)	(100)
Proceeds Received	856

(b) The forecast in-service date is December 2013.

(c) As detailed in Business Case 2, Yukon Electrical expects an approximately 13% increase in output, approximately $22,000 in lower operating costs, and expects the incremental cost of the unit to be paid back by the incremental output in a reasonable time frame.

(d) There is no average generation output because the unit is not in service yet. Expected annual generation is 5.6GWh.

(e) For the annual average hydro generation please refer to YUB-YECL-37 Attachment 1, tab YUB-YECL-37(d). Yukon Electrical is not proposing to update the average Fish Lake generation based on historical annual averages consistently less than the approved 8.73GWh.

(f) The business cases were separated as they relate to different projects at different locations and at different times that are anticipated to be completed independently.

(g) Yukon Electrical has completed a lifecycle analysis for the Fish Lake hydro generating system for the period from 2008 to 2052. Please refer to YEC-YECL-17 Attachment 1 for the analysis and details.

The analysis takes into account future operating and maintenance costs from 2015 at an escalation rate of 2%.

Future capital expenditures beyond 2015 are forecast starting with $250,000 (in 2013 dollars) every five years, beginning in 2019.

The resulting LCOE is 12.1¢/kWh.

Please note that if this analysis is carried back further in time there would be an associated decrease in the LCOE as significant capital expenditures were not required in previous decades.

(h) Please refer to CW-YECL-17(a) Attachment 2.

Reference: Section 9 – Capital Additions – Fish Lake Unit #2 Penstock Replacement

Request:

(a) Explain why (with numerical support) the life cycle cost of this life extension work is economically preferable to abandonment of the facility (i.e. replace with purchase of wholesale power).

Response:

(a) Please refer to YUB-YECL-37(a).

YEC-YECL-19

Reference: Section 9 – Capital Additions – 500kW Mobile Generator

Request:

(a) Please provide list of YECL diesel units with unit size and expected retirement dates as of December 31, 2012 and as of December 31, 2015 by community.

(b) Please identify location of mobile units and communities they serve.

Response:

(a) Please see the following table for a list of diesel units with unit size and expected retirement dates. Yukon Electrical does not foresee a change in expected retirement dates as listed below from December 31, 2012 to December 31, 2015.

CUL #	Location	Unit #	Rating (kW)	Expected Retirement Date
303	Beaver Creek	1	250	2014 *
378	Beaver Creek	2	360	2013
354	Beaver Creek	3	400	>10 Years
467	Destruction Bay	1	600	>10 Years
372	Destruction Bay	2	300	2015 *
230	Destruction Bay	3	220	2014
414	Old Crow	1	600	>10 Years
355	Old Crow	2	400	2016
384	Old Crow	3	170	2015
422	Watson Lake	1	800	2022

352	Watson Lake	3	1000	2021
258	Watson Lake	4	1500	2013
466	Watson Lake	5	750	>10 Years
423	Watson Lake	6	800	2019
460	Swift River	1	90	2020
413	Swift River	2	80	2013
375	Pelly Crossing	1	275	>10 Years
470	Pelly Crossing	2	600	>10 Years
405	Pelly Crossing	3	300	>10 Years
310	Carmacks	1	1600	>10 Years
265	Ross River	1	1000	>10 Years
416	Haines Junction	1	1750	>10 Years
376	Teslin	1	1500	>10 Years
186	Stewart Crossing	3	150	>10 Years

***** During the interrogatory response process, it has come to Yukon Electrical's attention that it mistakenly identified the replacement of Beaver Creek #1 and Destruction Bay #2 as years 2015 and 2014, respectively. The correct years should have been 2014 and 2015. As the forecast costs for the two replacements are each $600,000, there is no impact to Yukon Electrical's overall capital forecast for 2014 or 2015.

(b) Yukon Electrical currently has three mobile units available for operation. Two are low voltage units (120/240 volt) sized at 225kW and 250kW. These units are used to provide backup to the communities of Keno, Swift River and Deep Creek. They also assist Yukon Electrical to provide power to small sections of the distribution system in the case of system improvements or long duration outages.

The third unit, a 350kW generator, provides 2400 volt backup to the communities of Beaver Creek, Destruction Bay, Old Crow and Watson Lake.

These units are stationed in Whitehorse and are dispatched as required.

YEC-YECL-20

Reference: Section 9 – Capital Additions – Carcross 2MVA Standby Diesel Unit

Request:

(a) Please compare Carcross 2MVA Standby Diesel Unit cost to the cost of Carcross new 1.5 MW Power Plant as proposed in YECL's 2008/09 GRA. Please explain any differences.

(b) Project business case does not include capital cost and/or operating cost estimates for alternatives. This will not allow assess the economic benefit to ratepayers. Please provide business case for the projects with an economic analysis, including rate impacts.

(c) Please explain and provide rationale for YECL's "...threshold minimum load of 1.0 MWHs and 300 customers to enact the N-1 planning criteria."

Response:

(a) In Yukon Electrical's 2008/09 GRA, the estimated cost for the 1.5 MW standby diesel unit was $2.0M.

The estimated cost to implement the project in 2015 for a 2 MW unit is $3.0M, which is comprised of the following:

· 2,000kW Self-contained generator (sized for cold load pickup)	$2,500,000
· Engineering, Design	100,000
· Transformer, cables, vault, cable tray	100,000
· OSS (grid inter-tie/synchronization)	75,000
· Substation bus extension	50,000
· Civil – genset pad, fuel tank pad	50,000
· Fuel tank, piping, utilidor	50,000
· SCADA and PLC	35,000

· Ground grid	20,000
· Fence	20,000
	$3,000,000

The increased cost is due to the installation of a larger capacity generating unit and associated equipment as well as implementing the project seven years later.

(b) There are no significant incremental capital or operating costs associated with the status quo alternative. Yukon Electrical would continue its brushing program to reduce incident outages caused by trees on the line. However, the inherent risk from being on a long radial feed would remain.

The option to close the loop back to the Whitehorse line by including a new substation and line would address issues related to the vulnerability of the radial feed portion to Carcross and Tagish, but does not address the radial supply line out of Whitehorse. The approximate cost of this option is $3.5M comprised of $1.5M for a new substation and $2.0M for new line.

There is no direct economic benefit related to the addition of this unit, as the generating unit is for standby duty. The 2015 rate impact of the recommended alternative is $229,000.

(c) The rationale for a threshold minimum load of 1.0 MWHs to enact a N-1 planning criteria is based on the January 2006 Yukon Energy Corporation 20 Year Resource Plan section 3.4 Summary: Revised Capacity Planning Criteria on pages 88-89:

> 2. **Emergency (or "N-1") WAF and MD system capacity planning criteria:** Each grid system (WAF and MD) will be planned to be able to carry the forecast peak winter loads (excluding major industrial loads) under the largest single contingency (known as "N-1"). The N-1 criterion determines system capacity assuming the loss of the system's single largest generating or transmission-related generation source.
>
> 3. **WAF and MD "community" criteria:** For communities on the WAF or MD grids, any location with a load large enough to justify a diesel unit of about 1 MW or more will be considered as a preferred location for new diesel units if that community does not already

have back-up from another source (e.g., having an existing diesel unit). The new diesel units would provide grid support, and in times of line failures would provide local generation for the communities where they are located.

The selection of 300 customers is recommended as a minimum community size for locations with sufficient load to benefit a reasonable number of customers.

YEC-YECL-21

Reference: Section 9 – Capital Additions – Whistle Bend

Request:

(a) Please provide a summary table that combines costs by year for the business cases 16, 17, 19, 20 and 26.

(b) Please include forecast customer contributions to the summary table in a) above.

(c) Please provide number of customers forecast to be included in test years, including forecast additional electricity required to supply energy to the subdivision.

(d) Please provide source of electricity to the Whistle Bend subdivision.

Response:

(a) Please refer to YEC-YECL-21(a) Attachment 1 for a table of the capital expenditures for Whistle Bend.

(b) Please refer to YEC-YECL-21(a) Attachment 1 for a table of actual and forecast customer contributions for Whistle Bend.

- The customer paid 100% of subdivision costs.
- Yukon Electrical invested as per the T&Cs for the street lights.
- Yukon Electrical built the substation to off load existing overloaded lines and overloaded substation in the area. The 34.5kV lines were added to loop an existing substation that feeds about 5MW of power to customers that Yukon Electrical was not able to take out of service for any operation or maintenance. These system improvements were fully invested by Yukon Electrical, with the exception of the cost of two breakers to feed the Whistle Bend subdivision which were 100% contributed by the customer.

(c) Please refer to YEC-YECL-3(a) Attachment 1 for the number of customers forecast for Whistle Bend. Yukon Electrical has designed and built the Whistle Bend substation to accommodate the load expected of a subdivision that will be

expected to have a population of 8,000 residents with a mix of single family, multiple family and commercial lots. Estimates for the electricity demand of the fully realized subdivision is 15 – 20 MW.

(d) The source of electricity for Whistle Bend subdivision is the Whitehorse grid. Yukon Electrical does not control the supply of power to the Whitehorse grid, except Fish Lake Hydro, though the main source is usually a combination of the Aishihik and Whitehorse Hydro stations. To supply the Whistle Bend subdivision with adequate electrical service, Yukon Electrical had to build a new Whistle Bend substation and connect it in to the Whitehorse distribution system as the existing substations in the area were unable to supply the significant additional load of the Whistle Bend subdivision.

The Yukon Electrical Company Limited
Summary of Whistle Bend Capital Projects

	Business Case #	2010	2011	2012	2013	2014	Sum of Total

YUB-YECL-1

Reference: Deferral Accounts, YECL Application, Page 1-5

The deferral accounts for which Yukon Electrical is seeking approval meet the standard criteria for the establishment of a deferral account:

Request:

(a) Please cite the regulatory body, regulation or rules which provide or state the criteria for a deferral account.

(b) For the seven deferral accounts listed on page 1-6, please state which criteria applies, and if the second criteria applies, please provide the analysis that determined that "an error in forecasting could produce a loss or a gain of a substantial magnitude".

(c) How did YECL manage these costs prior to the proposal of deferral accounts?

Response:

(a) Paragraph 12 of Board Order 2009-2 regarding Yukon Electrical's 2008/2009 GRA states the following, which is consistent with the criteria used by Yukon Electrical to determine which items warrant deferral treatment for 2013-2015:

> With respect to the proposed Pelly Crossing deferral account, the Board notes that the typical criteria used in determining whether to approve the use of a deferral account are the level of uncertainty regarding the accuracy of the forecast and the utility's ability to control the factors influencing the forecast.

Additionally, the two criteria for a deferral account outlined on pages 1-5 and 1-6 of the Application have been specifically tested, reviewed and approved in recent ATCO Electric applications to the AUC.

(b) For the seven deferral accounts for which Yukon Electrical is seeking approval, all are considered to be outside the control of the company and are not reasonably forecastable.

(c) Whitehorse Copper Tailings – This is a new industrial customer that is uncertain as to the exact timing of its start-up as well as its ultimate load. This area was not an issue for Yukon Electrical in its most recent GRAs as it was not forecasting industrial customers.

Purchased Power Flow Through – Yukon Electrical is requesting a continuation of the existing deferral account with no proposed changes.

Diesel Contingency Fund – Yukon Electrical is requesting a continuation of the existing deferral account with no proposed changes.

Fuel Price Flow Through – While Yukon Electrical is requesting a continuation of the existing deferral account, the request includes approval to change the methodology for calculating the deferral to include liquefied natural gas (LNG) as well as diesel fuel in Watson Lake. The purpose of this deferral continues to be to protect both customers and Yukon Electrical's shareowner from changes in fuel price as compared to forecast.

Depreciation Parameters – The intention of Yukon Electrical's requested deferral is, to the extent possible, permit Yukon Electrical to harmonize IFRS and regulatory accounting and avoid the administrative burden of keeping two sets of financial records. As such, the purpose of deferral is not to address risk. This deferral addresses the advent of IFRS since Yukon Electrical's 2008-2009 GRA.

Rate of Return on Common Equity – In Board Order 2009-02, Yukon Electrical was directed for 2008 and 2009 to tie its ROE to the BCUC benchmark return on equity (ROE) for each respective year. As a result, the ROE for 2008 was set at 9.08% (BCUC benchmark ROE + 0.46% risk premium) and the ROE for 2009 was a placeholder, to be set at 46 basis points above the BCUC 2009 benchmark ROE (which ended up being 8.47%). As the 2009 BCUC benchmark ROE was known by the time Yukon Electrical completed its compliance filing, no deferral or true-up was required as it was incorporated in base rates.

Using the same methodology as it was directed to use in 2008 and 2009, Yukon Electrical has requested approval to set its ROE at the BCUC benchmark ROE + 0.46% for 2013-2015. As the BCUC has set the benchmark ROE at 8.75% with no AAM for 2013, Yukon Electrical has not requested a deferral for 2013. For 2014 and 2015, as there is an AAM that may impact the BCUC benchmark ROE for those years and because such a change may not be known at the time of Yukon Electrical's compliance filing related to this proceeding,

Yukon Electrical is requesting a deferral to flow the impact from the AAM, if any, through to customers for the years 2014 and 2015.

Defined Benefit Pension Plan – When Yukon Electrical filed its last GRA in 2008, Federal pension regulations in place required updated actuarial valuations to be completed for defined benefit ("DB") pension plans at least once every three years. An actuarial valuation for the DB plan that Yukon Electrical participates in was completed as at December 31, 2006 to determine the required funding for the years 2007-2009. As a result, the level of the required contributions to the plan was known for the three year period 2007-2009 and, more specifically, for the test period of 2008-2009. Since 2009, Yukon Electrical has contributed to its DB plan based on the results of the actuarial valuations that were prepared during this period. As part of this 2013 – 2014 Application, Yukon Electrical is requesting a deferral account that maintains risk at a status quo level as compared to the 2008-2009 test period.

YUB-YECL-2

Reference: Deferral Accounts, YECL Application, Page 1-6

Request:

Please explain how depreciation parameters, rate of return on common equity and the defined benefit pension plan are not under the control of the company.

Response:

Depreciation Parameters

Events which could potentially lead to a change in life depreciation parameters include: functional obsolescence or inadequacy, technological change, changing requirements of customers and market forces, customer growth, and legal and regulatory requirements. Net salvage can be affected by changes in technology in the removal of property, inflation (which can significantly affect removal costs), and changes in market demand and market prices which can affect salvage values. None of these events are under the control of the company.

Rate of Return on Common Equity

The BCUC benchmark return on equity for 2014 and 2015 is subject to an automatic adjustment mechanism (AAM) that will become operative if a long term Canadian bond yield of 3.8% is met or exceeded. Yukon Electrical does not have any control over the calculation of the AAM or long term Canadian bond yields and, consequently, does not have any control over the benchmark return on equity for 2014 and 2015.

Defined Benefit Pension Plan

Federal pension regulations require the defined benefit pension plan in which Yukon Electrical participates to file an actuarial valuation which sets out funding requirements. The valuation report is prepared by Mercer (Canada) Limited in accordance with applicable pension legislation and actuarial standards of practice in Canada. The results of the valuation and, consequently, the funding requirements are impacted by actuarial assumptions such as investment returns, inflation rates and demographic and societal factors, which are not under the control of Yukon Electrical.

YUB-YECL-3

Reference: Flow-through costs, YECL Application, Page 1-6

Yukon Electrical also seeks the ability to flow-through (dollar for dollar) to the tariff any costs related to Board Orders or legislative provisions resulting in changes to the rules or parameters that Yukon Electrical operates under, or that bear on the nature and extent of Yukon Electrical's obligations as a regulated utility and which impact its 2013-2015 revenues or revenue requirement.

YECL's request appears open-ended.

Request:

(a) Does YECL view the flow-through of the above as something that can be invoked without Board approval?

(b) What has changed in YECL's environment that requires YECL to now make such a request?

Response:

(a) No. Similar to other approved deferral accounts, Yukon Electrical expects that any amount recorded by Yukon Electrical would be brought forward for Board approval as part of a future application.

(b) This deferral has been requested by Yukon Electrical in order to maintain consistency with a similar deferral that was approved as part of the 2011-2013 GRAs of each of Northland Utilities (Yellowknife) Limited and Northland Utilities (NWT) Limited in Decisions 13-2011 and 17-2011, respectively. In those decisions, the approved wording of the deferral account was as follows:

> …a deferral account which would be used to record amounts associated with any Board decisions that result in changes to the rules or parameters that Northland operates under, including such areas as the billing system, collection practices or the frequency of meter reading, or statutory or legislative provisions or changes that

bear on the nature and extent of Northland's regulated utility obligations or operations and which impact Northland's 2011-2013 Revenues and/or Revenue Requirements. For clarity, no such recorded amounts would be approved by the Board as part of this Negotiated Settlement. Rather, the balance(s) would be brought forward by Northland for consideration in Northland's next General Rate Application.

YUB-YECL-4

Reference: IFRS, YECL Application Section 1, Attachment 2

Request:

Of the 24 boxes listed in Attachment 2, 21 list the change to IFRS as having either no change or the proposed treatment has no impact. Please comment on how this may affect accounting and administrative costs for YECL.

Response:

Of the 24 boxes listed in Attachment 2, 21 are described as having no impact on this Application. That is, for the purpose of this regulatory filing, Yukon Electrical has continued to treat the items the same as would have been the case under Canadian GAAP and, accordingly, there is no impact to Yukon Electrical's revenue requirement as a result of the transition to IFRS. For the 3 remaining items that were not specifically identified as not being impacted by the change to IFRS (Regulatory Assets and Liabilities: Deferral Accounts, Deferred Charges and Depreciation), there was also no impact to Yukon Electrical's revenue requirement for 2013-2015 as a result of the transition to IFRS.

Further to the above, however, many of the items listed are now required to be treated differently for financial statement purposes under IFRS than they were treated under Canadian GAAP. Some of the more notable differences include:

- Regulatory Assets and Liabilities: Deferral Accounts – deferral accounts must continue to be recorded for regulatory purposes, but IFRS does not permit the recording of deferral accounts on the balance sheet;

- Capitalization/Non-Capitalization of Costs: Borrowing Costs/Equity Allowance for Funds Used During Construction (AFUDC) – calculation of borrowing costs to be capitalized for IFRS (interested during construction) is different than the standard regulatory method of calculating AFUDC;

- Treatment of Insurance Proceeds – insurance proceeds related to the loss of property, plant and equipment are recognized in income under IFRS while they are considered proceeds of disposition for rate-making purposes;

- Depreciation – Canadian GAAP permitted regulatory companies to record depreciation based on the depreciation parameters set by the latest depreciation study, while IFRS requires an annual review of depreciation parameters and the immediate implementation of new parameters if they are found to have changed materially;

- Accounting for Income Taxes – Yukon Electrical records taxes based on the amount actually payable or receivable in the current year for regulatory reporting, but is required to recognize both current and deferred income taxes under IFRS;

- Pension Costs/ Other Employment Benefits – IFRS requires these items to be recorded on the accrual basis while, for regulatory purposes, Yukon Electrical recognizes pension and OPEB costs on the cash basis; and

- Reserve for Injuries and Damages and Rate Case Reserve – costs are expensed in the year incurred under IFRS.

All of these items requiring different treatment for regulatory and financial statements purposes can result or have resulted in Yukon Electrical being required to maintain two sets of financial records. Maintaining two sets of records adds complexity and additional reconciliation requirements to reporting for both regulatory and financial statement purposes. As well, there are now two sets of “rules” that accountants at Yukon Electrical have to understand and consider when recording transactions.

YUB-YECL-5

Reference: Defined Pension Benefit, YECL Application, Page 5-3, YECL Application, Schedule 5-1 and Schedule 5-2

For the purposes of this Application, the 2013 test period assumes the same defined benefit contribution rates as 2012. Since the next defined benefit pension actuarial evaluation will be completed as of December 31, 2012 to determine 2013 required funding, any required change to the 2013 defined benefit pension funding requirements will impact the defined benefit pension expense related to YECL's eligible northern based staff. Beginning in 2013, YECL is requesting a deferral account to flow through the increases or decreases to required cash contributions to the company's defined benefit pension plan as a result of the required annual actuarial evaluations.

The Board seeks clarification in relation to defined benefit pension actuarial evaluation and the forecast pension costs during the test period.

Request:

(a) YECL submitted that the pension valuation will be completed by December 31, 2012. Please explain whether or not YECL is able to provide an update as to what the actual pension cost for 2013. If confirmed, please explain how this will affect YECL's O&M forecasts for 2013, 2014, and 2015.

(b) Please describe whether YECL will complete another defined benefit pension actuarial evaluation during the test period. If YECL is not expecting to complete another actuarial evaluation during the test period, please indicate when YECL expects to complete another one.

(c) Please explain whether YECL shares a pension plan with its ATCO affiliates. If not, please provide more details about the nature of this pension plan.

(d) If YECL shares a pension plan with its ATCO affiliates, describe whether YECL's regulated affiliates in other Canadian jurisdictions have a deferral account for their defined benefit pension plans. If yes, please describe this treatment (e.g. only current service portion, only special payments, or both).

(e) Schedule 5.1 does not provide an account for pension expense. Please provide a table showing the pension expense for 2008, 2009, 2010, 2011, and 2012, and where applicable, indicate the YECL forecasted pension expense YECL and the

actual pension expense for these years. Also break these costs into those attributable to current service payments and those attributable to special payments.

(f) Please describe which accounts in schedule 5.1 are affected by pension expenses and breakout the pension expenses from these accounts (i.e. show the account amounts less expenses attributable to pension benefits).

(g) Please indicate what percentage of YECL employees are under a defined benefit pension plan versus a defined contribution pension plan? Can new employees to YECL be covered under a defined benefit pension plan?

Response:

(a) The pension valuation as at December 31, 2012 was completed in July 2013. Please refer to YUB-YECL-5(a) Attachment 1 for a copy of the valuation.

As a result of this valuation, Yukon Electrical's required DB pension funding for 2013 is as follows:

Current service	$605,000
Special payment	$351,000
Total	$956,000

The impact on forecast O&M for 2013 is a decrease of $203,000 ($1,268,000 – 956,000 = 312,000 x 65% = $203,000).

This valuation does not have an impact on the O&M forecasts for 2014 and 2015 as the required DB pension funding for each of those years is not known at this time. An actuarial valuation as at December 31, 2013 will be completed in the second or third quarter of 2014 to determine the 2014 funding requirements and a valuation as at December 31, 2014 will be completed in the second or third quarter of 2015 to determine the 2015 funding requirements.

(b) Yes, Yukon Electrical will complete a defined benefit pension actuarial evaluation for each year during the test period.

The Pension Benefits Standard Act ("the Act") is the legislation that governs Federally-registered defined benefit pension plans such as the plan Yukon Electrical participates in. Regulations made under the Act set out

minimum funding requirements and conditions for when an updated defined benefit pension actuarial valuation is required to be prepared.

Regulations amending certain regulations made under the Act, which came into force on July 1, 2010, now generally require the filing of an actuarial valuation report on an annual basis. As a result, Yukon Electrical will be required to complete a defined benefit pension actuarial valuation as at December 31, 2013 in the second or third quarter of 2014 to determine the 2014 funding requirements and to complete a valuation as at December 31, 2014 in the second or third quarter of 2015 to determine the 2015 funding requirements.

(c) Yukon Electrical does share a pension plan with its ATCO affiliates. Canadian Utilities Ltd. (CU) sponsors two pension plans: Plan 1 (DB and DC) and Plan 2 (DB only). Yukon Electrical employees who are members of the DC plan participate in Plan 1. Yukon Electrical employees who are members of the DB plan participate in Plan 2 along with employees of other CU subsidiary companies located in the Yukon Territory, Northwest Territories, Nunavut and Ontario, such as Northland Utilities (Yellowknife) Limited and Northland Utilities (NWT) Limited.

(d) Beginning in 2013, both Northland Utilities (Yellowknife) Limited and Northland Utilities (NWT) Limited have deferral accounts approved to flow through all increases or decreases to required non-capitalized related cash contributions to the defined benefit pension plan. This includes both the current service and special payment portions of the contributions.

Both ATCO Electric – Distribution and ATCO Gas are under Performance-Based Regulation ("PBR") beginning in 2013. The existing special payment deferral accounts of both companies covering special payments were discontinued upon the implementation of PBR. However, in the event of a material change in pension obligations (either positively or negatively), a Z factor application would be available to address the change. Similar to a deferral, a Z factor application is a mechanism that allows a utility to account for the impact of material exogenous events for which the company has no other reasonable cost recovery or refund mechanism within the PBR plan period.

For its 2011-2012 GTA, ATCO Electric – Transmission had a deferral account approved to flow through changes in cash contributions for the special payment portion of required defined benefit funding. However, in its 2013-2014 GTA, filed

in June 2012, ATCO Electric – Transmission has requested to change the deferral to include both the current service and special payment portions of the required funding.

For 2011-2012, ATCO Pipelines had a deferral account approved to flow through changes in cash contributions for the special payment portion of required defined benefit funding. However, in its 2013-2014 GRA, filed in December 2012, ATCO Pipelines has requested to change the deferral to include both the current service and special payment portions of the required funding.

(e) Please refer to YUB-YECL-5(e) Attachment 1 for total pension expense included in Schedule 5.1.

(f) Any account on Schedule 5.1 that includes salaries and wages expenses is affected by pension, as benefit expenses are allocated to each account based on salaries and wages. Please refer to YUB-YECL-5(f) Attachment 1 for a revised schedule 5.1 showing the account amounts less expenses attributable to pension benefits.

(g) At December 31, 2012, 36% of active Yukon Electrical employees were members of the defined benefit pension plan while 64% of active employees were members of the defined contribution pension plan.

In general, new employees to Yukon Electrical are not eligible to be covered under the DB pension plan as it has been closed to new entrants since January 1, 1997. However, new employees to Yukon Electrical who transfer from an ATCO affiliate who were already covered under a DB pension plan sponsored by Canadian Utilities Ltd. continue to be part of the DB pension plan.

Note to reader regarding actuarial valuations:

This valuation report may not be relied upon for any purpose other than those explicitly noted in the Introduction, nor may it be relied upon by any party other than the parties noted in the Introduction. Mercer is not responsible for the consequences of any other use. A valuation report is a snapshot of a plan's estimated financial condition at a particular point in time; it does not predict a pension plan's future financial condition or its ability to pay benefits in the future. If maintained indefinitely, a plan's total cost will depend on a number of factors, including the amount of benefits the plan pays, the number of people paid benefits, the amount of plan expenses, and the amount earned on any assets invested to pay the benefits. These amounts and other variables are uncertain and unknowable at the valuation date. The content of the report may not be modified, incorporated into or used in other material, sold or otherwise provided, in whole or in part, to any other person or entity, without Mercer's permission. All parts of this report, including any documents incorporated by reference, are integral to understanding and explaining its contents; no part may be taken out of context, used or relied upon without reference to the report as a whole.

To prepare the results in this report, actuarial assumptions are used to model a single scenario from a range of possibilities for each valuation basis. The results based on that single scenario are included in this report. However, the future is uncertain and the plan's actual experience will differ from those assumptions; these differences may be significant or material. Different assumptions or scenarios within the range of possibilities may also be reasonable, and results based on those assumptions would be different. Furthermore, actuarial assumptions may be changed from one valuation to the next because of changes in regulatory and professional requirements, developments in case law, plan experience, changes in expectations about the future and other factors.

The valuation results shown in this report also illustrate the sensitivity to one of the key actuarial assumptions, the discount rate. We note that the results presented herein rely on many assumptions, all of which are subject to uncertainty, with a broad range of possible outcomes and the results are sensitive to all the assumptions used in the valuation.

Should the plan be wound up, the going concern funded status and solvency financial position, if different from the wind-up financial position, become irrelevant. The hypothetical wind-up financial position estimates the financial position of the plan assuming it is wound up on the valuation date. Emerging experience will affect the wind-up financial position of the plan assuming it is wound up in the future. In fact, even if the plan were wound up on the valuation date, the financial position would continue to fluctuate until the benefits are fully settled.

Decisions about benefit changes, granting new benefits, investment policy, funding policy, benefit security and/or benefit-related issues should not be made solely on the basis of this valuation, but only after careful consideration of alternative economic, financial, demographic and societal factors, including financial scenarios that assume future sustained investment losses.

Funding calculations reflect our understanding of the requirements of the *Pension Benefits Standards Act*, the *Income Tax Act* and related regulations that are effective as of the valuation date. Mercer is not engaged in the practice of law or tax advice. This report does not constitute and is not a substitute for legal advice.

2

Introduction

To The Management Pension Committee of Canadian Utilities Limited

At your request, we have conducted an actuarial valuation of the Retirement Plan for Employees of Canadian Utilities Limited and Participating Companies - Plan 2 (the "Plan"), sponsored by Canadian Utilities Ltd. (the "Company"), as at the valuation date, December 31, 2012. We are pleased to present the results of the valuation.

Purpose

The purpose of this valuation is to determine:

- The funded status of the plan as at December 31, 2012 on going concern, hypothetical wind-up and solvency basis;
- The minimum required funding contributions from 2013, in accordance with the *Pensions Benefits Standards Act, 1985* (the "Act"); and
- The maximum permissible funding contributions from 2013, in accordance with the *Income Tax Act*.

The information contained in this report was prepared for the internal use of the Company and for filing with the Office of the Superintendent of Financial Institutions ("OSFI") and with the Canada Revenue Agency, in connection with our actuarial valuation of the Plan. This report will be filed with the OSFI and with the Canada Revenue Agency. This report is not intended or suitable for any other purpose.

In accordance with pension benefits legislation, the next actuarial valuation of the Plan will be required as at a date not later than December 31, 2013, or as at the date of an earlier amendment to the Plan.

Terms of Engagement

In accordance with our terms of engagement with the Company, our actuarial valuation of the Plan is based on the following material terms:

- It has been prepared in accordance with applicable pension legislation and actuarial standards of practice in Canada.
- As instructed by the Company, we have reflected a margin for adverse deviations in our going concern valuation by reducing the going concern discount rate by 2.1% per year after January 1, 2020.
- We have reflected the Company decisions for determining the solvency funding requirements. Specifically, the same plan wind-up scenario was hypothesized for both hypothetical wind-up and solvency valuations.

See the Valuation Results – Solvency section of the report for more information.

Events since the Last Valuation at December 31, 2011

Pension Plan

There have been no special events since the last valuation date.

This valuation reflects the provisions of the Plan as at December 31, 2012. The Plan has not been amended since the date of the previous valuation, and we are not aware of any pending definitive or virtually definitive amendments coming into effect during the period covered by this report. The Plan provisions are summarized in Appendix F.

Assumptions

We have used the same going concern valuation assumptions and methods as were used for the previous valuation, except for the following:

	Current valuation	**Previous valuation**
Discount rate:	6.10% initially, then 4.00% starting in 2020	6.10% initially, then 3.30% starting in 2020
Indexing rate:	1.85%	2.00%
Pensionable earnings increases:	3.25% plus merit & promotion	3.75% until 2012, 3.25% thereafter, plus merit and promotion
Termination rates:	No termination	100% of Plan experience 1983 through 1985
Asset valuation method:	Market	Smoothed

The hypothetical wind-up and solvency assumptions have been updated to reflect market conditions at the valuation date.

A summary of the going concern methods and assumptions is provided in Appendix C. A summary of the hypothetical wind-up and solvency methods and assumptions is provided in Appendix D.

Regulatory Environment and Actuarial Standards

There have been no changes to the *Pension Benefits Standards Act* (the "Act") or the relevant regulations which impact the funding of the Plan.

Subsequent Events

After checking with representatives of the Company, to the best of our knowledge there have been no events subsequent to the valuation date which, in our opinion, would have a material impact on the results of the valuation. Our valuation reflects the financial position of the Plan as of the valuation date and does not take into account any experience after the valuation date.

Impact of Case Law

This report has been prepared on the assumption that all of the assets in the pension fund are available to meet all of the claims on the Plan. We are not in a position to assess the impact that the Ontario Court of Appeal's decision in *Aegon Canada Inc. and Transamerica Life Canada versus ING Canada Inc.* or similar decisions in other jurisdictions might have on the validity of this assumption.

We have assumed that all the Plan's assets are available to cover the Plan's liabilities presented in this report.

3

Valuation Results – Going Concern

Financial Status

A going concern valuation compares the relationship between the value of Plan assets and the present value of expected future benefit cash flows in respect of accrued service, assuming the Plan will be maintained indefinitely.

The results of the current valuation, compared with those from the previous valuation, are summarized as follows:

	12.31.2012	12.31.2011
Assets		
Market value of assets	$32,958,400	$30,993,600
In-transit amount	($1,114,800)	($1,393,400)
Asset smoothing adjustment	$0	($59,700)
Smoothed value of assets	$31,843,600	$29,540,500
Going concern funding target		
• Active members	$20,288,900	$25,820,900
• Pensioners and survivors	$15,360,800	$11,632,100
• Deferred pensioners	$423,900	$455,900
Total	$36,073,600	$37,908,900
Funding excess (shortfall)	($4,230,000)	($8,368,400)

Reconciliation of Financial Status

Funding excess (shortfall) as at previous valuation		($8,368,400)
Interest on funding excess (funding shortfall) at 6.10% per year		($510,500)
Employer's special payments, with interest		$906,200
Expected funding excess (funding shortfall)		($7,972,700)
Net experience gains (losses)		
• Net Investment return	$595,300	
• Increases in pensionable earnings	($79,500)	
• Increase in YMPE	($4,900)	
• Increase in maximum pension	$12,900	
• Indexation	$107,200	
• Mortality	($11,300)	
• Retirement	$152,100	
• Termination	($69,300)	
• Net inter-plan transfers	($16,100)	
Total experience gains (losses)		$686,400
Impact of changes in assumptions		
• Discount rate	$2,629,100	
• Indexation rate	$763,600	
• Termination decrement	($162,700)	
Total assumption changes impact		$3,230,000
Impact of change in asset valuation method		$175,800
Net impact of other elements of gains and losses		($349,500)
Funding excess (shortfall) as at current valuation		($4,230,000)

Current Service Cost

The current service cost is an estimate of the present value of the additional expected future benefit cash flows in respect of pensionable service that will accrue after the valuation date, assuming the Plan will be maintained indefinitely.

The current service cost during the year following the valuation date compared with the corresponding value determined in the previous valuation, is as follows:

	2013	2012
Total current service cost	$728,100	$886,800
Estimated members' required contributions	($46,000)	($52,000)
Estimated employer's current service cost	$682,100	$834,800
Expense allowance	$60,000	$60,000
Total	$742,100	$894,800
Employee's current service cost expressed as a percentage of members' pensionable earnings.	1.97%	1.91%
Employer's current service cost expressed as a percentage of members' pensionable earnings.	30.31%	32.79%
Total current service cost expressed as a percentage of members' pensionable earnings.	32.28%	34.70%

The key factors that have caused a change in the employer's current service cost since the previous valuation are summarized in the following table:

Employer's current service cost as at previous valuation	32.79%
Demographic changes	1.02%
Assumption changes	(3.50%)
Employer's current service cost as at current valuation	30.31%

Discount Rate Sensitivity

The following table summarizes the effect on the going concern funding target shown in this report of using a discount rate which is 1.00% lower than that used in the valuation:

Scenario	Valuation Basis	Reduce Discount Rate by 1%
Going concern funding target	$36,073,600	$42,456,600
Current service cost		
• Total current service cost	$728,100	$895,700
• Estimated members' required contributions	($46,000)	($46,000)
• Estimated employer's current service cost	$682,100	$849,700
• Expense allowance	$60,000	$60,000
Total	$742,100	$909,700

4

Valuation Results – Hypothetical Wind-up

Financial Position

When conducting a hypothetical wind-up valuation, we determine the relationship between the respective values of the Plan's assets and its liabilities assuming the Plan is wound up and settled on the valuation date, assuming benefits are settled in accordance with the Act and under circumstances producing the maximum wind-up liabilities on the valuation date.

The hypothetical wind-up financial position as of the valuation date, compared with that at the previous valuation, is as follows:

	12.31.2012	12.31.2011
Assets		
Market value of assets	$32,958,400	$30,993,600
In transit amount	($1,114,800)	($1,393,400)
Termination expense provision	($200,000)	($50,000)
Wind-up assets	$31,643,600	$29,550,200
Present value of accrued benefits for:		
• active members	$16,505,000	$19,322,500
• pensioners and survivors	$20,599,300	$13,684,600
• deferred pensioners	$621,200	$564,100
Total wind-up liability	$37,725,500	$33,571,200
Wind-up excess (shortfall)	($6,081,900)	($4,021,000)

Wind-up Incremental Cost to December 31, 2013

The wind-up incremental cost is an estimate of the present value of the projected change in the hypothetical wind-up liabilities from the valuation date until the next scheduled valuation date, adjusted for the benefit payments expected to be made in that period.

The hypothetical wind-up incremental cost determined in this valuation, compared with the corresponding value determined in the previous valuation, is as follows:

	12.31.2012	12.31.2011
Number of years covered by report	1 year	1 year
Total hypothetical wind-up liabilities at the valuation date (A)	$37,725,500	$33,571,200
Present value of projected hypothetical wind-up liability at the next required valuation plus benefit payments until the next required valuation (B)	$39,996,900	$35,823,600
Hypothetical wind-up incremental cost (B – A)	$2,271,400	$2,252,400

The incremental cost is not an appropriate measure of the contributions that would be required to maintain the financial position of the Plan on a hypothetical wind-up basis unchanged from the valuation date and the next required valuation date, if actual experience is exactly in accordance with the going concern valuation assumptions. This is because it does not reflect the fact that the expected return on plan assets (based on the going concern assumptions) is greater than the discount rate used to determine the hypothetical wind-up liabilities.

Discount Rate Sensitivity

The following table summarizes the effect on the hypothetical wind-up liabilities shown in this report of using a discount rate which is 1.00% lower than that used in the valuation:

Scenario	Valuation Basis	Reduce Discount Rate by 1%
Total hypothetical wind-up liability	$37,725,500	$43,794,300

5

Valuation Results – Solvency

Overview

The Act also requires the financial position of the Plan to be determined on a solvency basis. The financial position on a solvency basis is determined in a similar manner to the Hypothetical Wind-up Basis, except for the following:

Exceptions	Reflected in valuation based on the terms of engagement
The circumstance under which the Plan is assumed to be wound up could differ for the solvency and hypothetical wind-up valuations.	The same circumstances were assumed for the solvency valuation as were assumed for the hypothetical wind-up valuation.
The benefit rate increases coming into effect after the valuation date can be reflected in the solvency valuation.	Not applicable.

Under the Federal pension legislation, the minimum funding requirements on a solvency basis are based on an alternative solvency basis under which the solvency deficiency and the resulting solvency special payments are based on an average solvency ratio determined over three years (current year plus the previous two) subject to prescribed adjustments. The determination of the solvency deficiency on that basis is detailed in Appendix A. The unadjusted solvency deficiency at the current valuation is presented below.

Financial Position

The financial position on a solvency basis is the same as the financial position on the Hypothetical Wind-up Basis shown in the previous section. The solvency ratio is 83.9% compared to 88.0% at the previous valuation.

6

Minimum Funding Requirements

The Act prescribes the minimum contributions that Canadian Utilities Ltd. must make to the Plan. The minimum contributions in respect of a defined benefit component of a pension plan are comprised of going concern current service cost and special payments to fund any going concern or solvency shortfalls.

On the basis of the assumptions and methods described in this report, the rule for determining the minimum required employer monthly contributions, as well as an estimate of the employer contributions, from the valuation date until the next required valuation are as follows:

	Employer's contribution rule		Estimated employer's contributions	
Period beginning	Monthly current service cost[2]	Minimum monthly special payments	Monthly current service cost including expense allowance	Total minimum monthly contributions
December 31,2012	30.31%	$39,090	$61,842	$100,932

The estimated contribution amounts above are based on projected members' pensionable earnings. If current service cost contributions are based on a percentage of members' pensionable earnings, then the actual employer's current service cost will be different from the above estimates and, as such, the contribution requirements should be monitored closely to ensure contributions are made in accordance with the Act.

Alternatively, as the Plan is closed to new employees and therefore the active membership is declining, it would be acceptable to contribute the above dollar amount of total minimum monthly contributions to the Plan.

The development of the minimum special payments is summarized in Appendix A.

Other Considerations

Differences between Valuation Basis

There is no provision in the minimum funding requirements to fund the difference between the hypothetical wind-up and solvency shortfalls, if any.

In addition, although minimum funding requirements do include a requirement to fund the going concern current service cost, there is no requirement to fund the expected growth in the

[2] Expressed as a percentage of members' pensionable earnings capped at $150,164 per member.

hypothetical wind-up or solvency liability after the valuation date, which could be greater than the going concern current service cost.

Timing of Contributions

Required contributions must be remitted monthly, not later than 30 days after the end of the period to which they apply.

Retroactive Contributions

The Company must contribute the excess, if any, of the minimum contribution recommended in this report over contributions actually made in respect of the period following the valuation date. This contribution is due immediately following the date this report is filed.

Any over contributions made prior to filing this report may be used to reduce the otherwise required contributions to be made following the filing of this report.

Payment of Benefits

The Act imposes certain restrictions on the payment of lump sums from the Plan when the solvency ratio revealed in an actuarial valuation is less than one. If the solvency ratio shown in this report is less than one, the plan administrator should ensure that the monthly special payments are sufficient to meet the requirements of the Act to allow for the full payment of benefits, and otherwise should take the prescribed actions.

Specifically, based on the Directives of the Superintendent of Financial Institutions pursuant to the Act, transfers out of the Plan may be made in full provided an amount equal to the transfer deficiency has been remitted to the pension fund in addition to the minimum special payments.

However, transfer deficiencies that are less than 5% of the Year's Maximum Pensionable Earnings ("YMPE") under the Canada/Quebec Pension Plan can be paid in full until such time as the sum of all such transfer deficiencies paid since the date of the last actuarial valuation exceed 5% of the market value of the Plan assets at that date, at which time, this exemption no longer applies.

As such, the administrator should monitor the solvency ratio of the Plan and, if necessary, take the prescribed actions.

7

Maximum Eligible Contributions

The *Income Tax Act* (the "ITA") limits the amount of employer contributions that can be remitted to the defined benefit component of a registered pension plan. However, notwithstanding the limit imposed by the ITA, for plans which are not 'Designated' as defined in the ITA, in general, the minimum required contributions under the Act can be remitted.

In accordance with Section 147.2 of the ITA and *Income Tax Regulation* 8516, for a plan which is underfunded on either a going concern or on a hypothetical wind-up basis the maximum permitted contributions are equal to the employer's current service cost, including the explicit expense allowance if applicable, plus the greater of the going concern funding shortfall and hypothetical wind-up shortfall.

For a plan which is fully funded on both going concern and hypothetical wind-up basis, the employer can remit a contribution equal to the employer's current service cost, including the explicit expense allowance if applicable, as long as the surplus in the plan does not exceed a prescribed threshold. Specifically, in accordance with Section 147.2 of the ITA, for a plan which is fully funded on both going concern and hypothetical wind-up basis, the plan may not retain its registered status if the employer makes a contribution while the going concern funding excess exceeds 25% of the going concern funding target.

Schedule of Maximum Contributions

The Company is permitted to fully fund the greater of the going concern and hypothetical wind-up shortfalls; $6,081,900, as well as make current service cost contributions. The portion of this contribution representing the payment of the going concern funding shortfall can be increased with interest at 6.10% per year from the valuation date to the date the payment is made, and must be reduced by the amount of any deficit funding made from the valuation date to the date the payment is made.

Assuming the Company contributes the greater of the going concern and hypothetical wind-up shortfall of $6,081,900 as of the valuation date, the rule for determining the estimated maximum eligible annual contributions, as well as an estimate of the maximum eligible contributions until the next valuation are as follows:

	Employer's contribution rule		Estimated employer's contributions
Year beginning	**Monthly current service cost[3]**	**Deficit Funding**	**Monthly current service cost**
December 31, 2012	30.31%	n/a	$61,842

[3] Expressed as a percentage of members' pensionable earnings capped at $150,164 per member.

The employer's current service cost in the above table was estimated based on projected members' pensionable earnings. The actual employer's current service cost will be different from these estimates and, as such, the contribution requirements should be monitored closely to ensure compliance with the ITA.

8

Actuarial Opinion

In our opinion, for the purposes of the valuations:

- the membership data on which the valuation is based are sufficient and reliable
- the assumptions are appropriate
- the methods employed in the valuation are appropriate

This report has been prepared, and our opinions given, in accordance with accepted actuarial practice in Canada. It has also been prepared in accordance with the funding and solvency standards set by the *Pensions Benefits Standards Act*, 1985.

APPENDIX A

Prescribed Disclosure

Definitions

The Act defines a number of terms as follows:

Defined Term	Description	Result
Going concern excess (deficit)	Amount by which the going concern assets exceed (are below) the going concern liabilities	($4,230,000)
Unfunded liability	The amount by which the going concern deficit of a plan determined at the valuation date exceeds the present value of going concern special payments of the plan established in respect of periods after the valuation date	$0
Going concern special payment	A special payment made in respect of an unfunded liability	$469,100
Solvency Liabilities	Liabilities that relate to defined benefit provisions and which are determined on the basis that the plan is terminated	$37,725,500
Solvency Assets	Market value of the assets that relate to the defined benefit provisions of a plan minus the estimated expense of the winding-up of the plan	$31,643,600
Solvency Ratio	Ratio of the solvency assets to the solvency liabilities, excluding those solvency assets and solvency liabilities that are attributable to benefits that are paid by means of an annuity, other than a revocable annuity, or an insurance contract	0.839
Average Solvency Ratio	Arithmetic average of the solvency ratios at the valuation date, the prior valuation date and the prior second valuation date adjusted as prescribed for special payments, contribution holidays, amendments and transfer of assets	0.984
Adjusted Solvency Asset Amount	Amount determined by multiplying the average solvency ratio by the amount of the solvency liabilities	$37,113,100
Solvency excess (deficiency)	Amount by which the adjusted solvency asset amount exceeds (is below) the solvency liabilities	($612,400)
Solvency special payment	A special payment made in respect of a solvency deficiency	$0

Timing of Next Required Valuation

In accordance with the Act and the Superintendent's Directives, an actuarial report must be prepared annually except where the solvency ratio disclosed in the most recent actuarial report filed under subsection 12(3) of the Act was 1.20 or greater.

Accordingly, the next valuation of the Plan will be required as of December 31, 2013.

Special Payments
Going Concern Basis

The present values, at the current valuation date, of the monthly going concern special payments determined in the previous valuation, are as follows:

Present Value of Going Concern Monthly Special Payments from the Previous Valuation

Type of Deficit	Effective Date	Special Payment	Last Payment	Present Value at the Current Valuation Date
Going concern	December 31, 2006	$9,510	December 31, 2021	$797,200
Going concern	December 31, 2009	$26,430	December 31, 2024	$2,762,800
Going concern	December 31, 2011	$37,200	December 31, 2026	$4,354,200
Total		$73,140		$7,914,200

Since the present value of the going concern special payments, $7,914,200, exceeds the going concern deficit at the valuation date, $4,230,000, the excess shall be used, as per the Act and regulations, to reduce the going concern special payments on a pro rata basis as follows:

Minimum Going Concern Monthly Special Payments

Type of Deficit	Effective Date	Special Payment	Last Payment	Present Value at the Current Valuation Date
Going concern	December 31, 2006	$5,080	December 31, 2021	$426,100
Going concern	December 31, 2009	$14,130	December 31, 2024	$1,476,600
Going concern	December 31, 2011	$19,880	December 31, 2026	$2,327,300
Total		$39,090		$4,230,000

Solvency Basis

In accordance with the Act and regulations, the solvency excess (deficiency) is defined as the amount by which the adjusted solvency asset amount exceeds (is below) the solvency liabilities. For this purpose, the adjusted solvency asset amount is determined by multiplying the average solvency ratio by the amount of the solvency liabilities. The average solvency ratio, adjusted solvency asset amount and solvency excess (deficiency) are determined as follows:

Determination of Average Solvency Ratio

	12.31.2010	12.31.2011	12.31.2012
Solvency assets			
Market value of assets	$29,819,300	$29,600,200	$31,843,600
Termination expense provision	($50,000)	($50,000)	($200,000)
Solvency assets (A)	$29,769,300	$29,550,200	$31,643,600
Present value of special payments made (contribution holiday) (B)			
2011	$421,200	n/a	n/a
2012	$820,400	$862,400	n/a
Solvency assets adjusted for special payments (contribution holiday) (C = A + B)	$31,010,900	$30,412,600	$31,643,600
Solvency liabilities (D)	$25,701,100	$33,571,200	$37,725,500
Adjusted solvency ratio (C / D)	120.7%	90.6%	83.9%
Average solvency ratio (E)			98.4%

Calculation of adjusted solvency asset amount and solvency excess (deficiency)

	12.31.2012
Average solvency ratio (E)	98.4%
Solvency liabilities (F)	$37,725,500
Adjusted solvency asset amount (G = E x F)	$37,113,100
Solvency excess (deficiency) (G – F)	($612,400)

If there is a solvency deficiency, the Act and regulations require that solvency special payments be made in an amount equal to the amount by which the solvency deficiency divided by five exceeds the amount of going concern special payments that are payable during the year.

Minimum Solvency Special Payments

	2013
Solvency deficiency divided by five	$122,500
Going concern special payments	$469,100
Solvency special payments (not below $0)	$0

Total Special Payments

The following minimum monthly special payments must be made to the plan to eliminate any going concern deficit and any solvency deficiency at the valuation date, within the periods prescribed by the Act and regulations.

Minimum Monthly Special Payments

	2013
Going concern special payments	$39,090
Solvency special payments	$0
Minimum monthly special payment	$39,090

APPENDIX B

Plan Assets

The pension fund is held by RBC Investor Services. In preparing this report, we have relied upon fund statements prepared by RBC Investor Services without further audit. Customarily, this information would not be verified by a plan's actuary. We have reviewed the information for internal consistency and we have no reason to doubt its substantial accuracy.

Reconciliation of Market Value of Plan Assets

The pension fund transactions since the last valuation are summarized in the following table:

	2012
January 1	30,993,618
PLUS	
Members' contributions	58,984
Company's contributions	1,805,397
Inter-plan transfers	(1,385,521)
Investment income	1,464,696
Net capital gains (losses)	1,055,203
LESS	
Pensions paid	985,311
Lump-sum refunds	-
Administration fees	48,656
December 31	32,958,410
Gross rate of return[4]	8.20%
Rate of return net of expenses[4]	8.04%

[4] Assuming mid-period cash flows.

The market value of assets shown in the above table is adjusted to reflect in-transit amounts as follows:

	Current Valuation	Previous Valuation
Market value of invested assets	$32,958,410	$30,993,618
In-transit amounts		
• Transfers to Plan 1	($1,114,793)	($1,393,398)
Market value of assets adjusted for in-transit amounts	$31,843,617	$29,600,220

We have tested the pensions paid, the lump-sums paid and the contributions for consistency with the membership data for the Plan members who have received benefits or made contributions. The results of these tests were satisfactory.

Investment Policy

The plan administrator adopted a statement of investment policy and procedures. This policy is intended to provide guidelines for the manager(s) as to the level of risk which is commensurate with the Plan's investment objectives. A significant component of this investment policy is the asset mix.

The plan administrator is solely responsible for selecting the Plan's investment policies, asset allocations and individual investments.

The constraints on the asset mix and the actual asset mix at the valuation date are provided for information purposes:

	Investment Policy Target	Actual Asset Mix as at December 31, 2012
Fixed Income	50.0%	46.3%
Canadian equity	25.0%	27.3%
Global equity	25.0%	25.6%
Cash	0.0%	0.8%
	100.0%	100.0%

APPENDIX C

Methods and Assumptions – Going Concern

Valuation of Assets

For this valuation, we have used the market value of assets.

For the previous valuation, an adjusted market-value method to determine the smoothed value of assets was used. Under this method, 50% of realized and unrealized capital gains (losses) arising during a given year are recognized immediately and the remaining 50% of realized and unrealized capital gains (losses) arising during a given year are spread on a straight-line basis over three years in accordance with the schedule shown in the following table:

Year	Percentage of Gains (Losses) not Recognized
2011:	50% of 2/3
2010:	50% of 1/3
Before 2010	0%

Due to the expectation that the solvency position of the plan will determine the plan's minimum funding requirements in the future, we have discontinued the use of this adjusted market-value method.

Going Concern Funding Target

Over time, the real cost to the employer of a pension plan is the excess of benefits and expenses over member contributions and investment earnings. The actuarial cost method allocates this cost to annual time periods.

For purposes of the going concern valuation, we have continued to use the projected unit credit actuarial cost method. Under this method, we determine the present value of benefit cash flows expected to be paid in respect of service accrued prior to the valuation date, based on projected final average earnings. This is referred to as the funding target.

The funding excess or funding shortfall, as the case may be, is the difference between the market or smoothed value of assets and the funding target. A funding excess on a market value basis indicates that the current market value of assets and expected investment earnings are expected to be sufficient to meet the cash flows in respect of benefits accrued to the valuation date as well as expected expenses – assuming the plan is maintained indefinitely. A funding shortfall on a market value basis indicates the opposite – that the current market value of the assets is not expected to meet the plan's cash flow requirements in respect of accrued benefits and absent additional contributions.

As required under the Act, a funding shortfall will be amortized over no more than 15 years through special payments. A funding excess may, from an actuarial standpoint, be applied immediately to reduce required employer current service contributions unless precluded by the terms of the plan or by legislation.

The actuarial cost method used for the purposes of this valuation produces a reasonable matching of contributions with accruing benefits. Because benefits are recognized as they accrue, the actuarial cost method provides an effective funding target for a plan that is maintained indefinitely.

Current Service Cost

The current service cost is the present value of projected benefits to be paid under the plan with respect to service expected to accrue during the period until the next valuation.

The employer's current service cost is the total current service cost reduced by the members' required contributions.

The employer's current service cost can be expressed as a percentage of the members' pensionable earnings to provide an automatic adjustment in the event of fluctuations in membership and/or pensionable earnings.

Under the projected unit credit actuarial cost method, the current service cost for an individual member will increase each year as the member approaches retirement. As the plan is closed to new members, the current service cost as a percentage of members' pensionable earnings is expected to increase as the average age of the members increases.

Actuarial Assumptions – Going Concern Basis

The present value of future benefit payment cash flows is based on economic and demographic assumptions. At each valuation we determine whether, in our opinion, the actuarial assumptions are still appropriate for the purposes of the valuation, and we revise them, if necessary. Emerging experience will result in gains or losses that will be revealed and considered in future actuarial valuations.

The table below shows the various assumptions used in the current valuation in comparison with those used in the previous valuation.

Assumption	Current valuation	Previous valuation
Discount rate:	6.10% initially, then 4.00% starting in 2020	6.10% initially, then 3.30% starting in 2020
Explicit expenses:	$60,000	$60,000
Inflation:	2.00%	2.00%
ITA limit / YMPE increases:	2.25%	2.25%
Pensionable earnings increases:	3.25% plus merit and promotion	3.75% until 2012, 3.25% thereafter, plus merit and promotion
Post retirement pension increases:	1.85%	2.00%
Retirement rates:	Retirement occurs when age and service sum to 90 years, but not after age 65 or before 55	Retirement occurs when age and service sum to 90 years, but not after age 65 or before 55

Assumption	Current valuation	Previous valuation
Termination rates:	None	100% of Plan experience 1983 through 1985
Mortality rates:	100% of the rates of the 1994 Uninsured Pensioner Mortality Table	100% of the rates of the 1994 Uninsured Pensioner Mortality Table
Mortality improvements:	Fully generational using Scale AA	Fully generational using Scale AA
Disability rates:	None	None
Eligible spouse at retirement:	Based on current marital status	Based on current marital status
Spousal age difference:	Actual age if known (otherwise male 4 years older)	Actual age if known (otherwise male 4 years older)

The assumptions are best estimates with the exception that the discount rate includes a margin for adverse deviations, as described below in the Rationale for Assumptions.

Age Related Tables

Sample rates from the age related tables are summarized in the following table:

Age	Merit and Promotion
20	13.65%
25	6.02%
30	3.08%
35	1.75%
40	1.07%
45	0.70%
50	0.47%
55	0.33%

Pensionable Earnings

The benefits ultimately paid will depend on each member's final average earnings. To calculate the pension benefits payable upon retirement, death or termination of employment, we have taken the member's 2012 earnings and assumed that such pensionable earnings will increase at the assumed rate.

Rationale for Assumptions

A rationale for each of the assumptions used in the current valuation is provided below.

Discount Rate

We have discounted the expected benefit payment cash flows using two different rates. Prior to 2020, the discount rate is based on the expected investment return on the market value of the fund.

The discount rate is comprised of the following:

- Estimated returns for each major asset class consistent with market conditions on the valuation date and the target asset mix specified in the Plan's investment policy.
- A margin for adverse deviations of 2.10% after January 1, 2020.

We have also observed that the defined benefit program is closed to new entrants and therefore the requirements under the Act will eventually become dominated by the solvency considerations, which in turn are dominated by annuity purchase rates. The discount rate after 2020 partially reflects this lower rate, as instructed by the Company.

The discount rate was developed as follows:

	Before 1.1.2020	After 1.1.2020
Assumed investment return	6.10%	6.10%
Margin	(0.00%)	(2.10%)
Net discount rate	6.10%	4.00%

Expenses

The explicit assumption is based on the average amount of investment and administrative expenses over the last 3 years.

Inflation

The inflation assumption is based on the mid-point of the Bank of Canada's inflation target range of between 1% and 3%

Income Tax Act Pension Limit and Year's Maximum Pensionable Earnings

The assumption is based on historical real economic growth and the underlying inflation assumption.

Pensionable Earnings

The assumption is based on our best estimate of future merit and promotional increases over general wage growth considering current economic and financial market conditions. Such merit and promotion increases are assumed to be in accordance with the table developed based on an experience study considering increases over the years 1985 to 1992 and which has continued to be reasonably predictive of merit and promotion increases experienced since that time.

Post Retirement Pension Increases

The assumption is based on the Plan formula and inflation assumption above, considering that the Plan limits pension increases to 3% in the event that inflation exceeds 3%. We have determined the impact of this cap by performing a stochastic analysis based on trials using a mean of 2.0% and a standard deviation of 1.5%.

Retirement Rates

For this valuation we have continued to assume that active members will retire when their age and service sum to 90 years, provided that retirement does not occur after 65 or before 55. Individuals who have already attained this condition are assumed to retire immediately. This assumption is based on the Plan provisions and our experience of similar pension plans.

Retirement earlier than assumed will result in losses to the Plan, while later retirements will result in gains to the Plan. These gains and losses will be revealed in subsequent valuations.

Termination Rates

As the Plan is closed, most active members are now eligible for retirement. The termination decrement assumption no longer has a material impact on the Plan's funding.

Mortality Rates

Due to the size of the Plan, there is no meaningful mortality experience but there is no reason to expect the mortality to differ from the 1994 Uninsured Pensioners mortality table. Furthermore, there is strong evidence of continuing improvement in mortality since 1994 and it has become an industry standard to assume this trend continues into the future. We have used the AA projection scale to allow for improvements in mortality indefinitely in the future.

Based on the assumption used, the life expectancy of a member age 65 at the valuation date is 19.8 years for males and 22.0 years for females.

Emerging information from in-progress mortality experience analysis suggests that mortality has recently improved faster than estimated by projection scale AA. However, no standard tables have been published to replace the 1994 Uninsured Pensioners mortality table and projection scale AA for Canadian pension plan purposes. We expect that the mortality assumption will be changed in the first valuation of the plan prepared following publication of alternative mortality tables and projection scales, based on Canadian experience.

Disability Rates

Use of a different assumption would not have a material impact on the valuation.

Eligible Spouse

The assumption is based on actual membership data, which we believe is the most reliable source.

Spousal Age Difference

Actual spouse age is used where available, otherwise males are assumed to be 4 years older than their spouse.

APPENDIX D

Methods and Assumptions – Hypothetical Wind-up and Solvency

Hypothetical Wind-up Basis

The Canadian Institute of Actuaries requires actuaries to report the financial position of a pension plan on the assumption that the plan is wound up on the effective date of the valuation, with benefits determined on the assumption that the pension plan has neither a surplus nor a deficit. For the purposes of the hypothetical wind-up valuation, the plan wind-up is assumed to occur in circumstances that maximize the actuarial liability.

To determine the actuarial liability on the hypothetical wind-up basis, we have valued those benefits that would have been paid had the Plan been wound up on the valuation date, with all members fully vested in their accrued benefits.

There are no benefits under the Plan contingent upon the circumstances of the plan wind-up or contingent upon other factors. In particular, there are no additional benefits that would be immediately payable if the employer's business were discontinued on the valuation date. Therefore, it was not necessary to postulate a scenario upon which the hypothetical wind-up valuation is made. Therefore, no benefits payable on plan wind-up were excluded from our calculations.

Upon plan wind-up members are given options for the method of settling their benefit entitlements. The options vary by eligibility and by province of employment, but in general, involve either a lump sum transfer or an immediate or deferred pension.

The value of benefits assumed to be settled through a lump sum transfer is based on the assumptions described in Section 3500 – *Pension Commuted Values* of the Canadian Institute of Actuaries Standards of Practice applicable for December 31, 2012.

Benefits provided as an immediate or deferred pension are assumed to be settled through the purchase of annuities based on an estimate of the cost of purchasing annuities.

We have estimated the cost of settlement through purchase of annuities in accordance with the *Canadian Institute of Actuaries Educational Note: Assumptions for Hypothetical Wind-up and Solvency Valuations with Effective Dates Between December 31, 2012 and December 30, 2013.*

However, there is limited data available to provide credible guidance on the cost of a purchase of indexed annuities in Canada. In accordance with the *Canadian Institute of Actuaries Educational Note: Assumptions for Hypothetical Wind-up and Solvency Valuations with Effective Dates Between December 31, 2012 and December 30, 2013*, we have assumed that an appropriate proxy for estimating the cost of such purchase is using the yield on the long-term Government of Canada Real Return bonds.
Interest rate assumptions net of COLA used for lump sum transfers and annuity purchases take into consideration the 3% cap on pension increases provided by the plan provisions. We have

carried out a stochastic analysis in order to determine the additional net interest rate as a result of this 3% cap.

We have not included a provision for adverse deviation in the solvency and hypothetical wind-up valuations.

The assumptions are as follows:

Form of Benefit Settlement Elected by Member	
Lump sum	70% of active members under age 55 and 50% of active members over age 55 elect to receive their benefit entitlement in a lump sum
Annuity purchase	All remaining members are assumed to elect to receive their benefit entitlement in the form of a deferred or immediate pension. These benefits are assumed to be settled through the purchase of deferred or immediate annuities from a life insurance company.
Basis for Benefits Assumed to be Settled through a Lump Sum	
Mortality rates:	UP94 generational
Interest rate:	2.40% per year for 10 years, 3.60% per year thereafter
Interest rate net of COLA:	1.10% per year for 10 years, 1.50% thereafter
Basis for Benefits Assumed to be Settled through the Purchase of an Annuity	
Mortality rates:	UP94 generational
Interest rate:	2.96% per year
Interest rate net of COLA:	0.60% per year
Retirement Age	
Maximum value:	Members are assumed to retire at the age which maximizes the value of their entitlement from the Plan based on the eligibility requirements which have been met at the valuation date
Other Assumptions	
Final average earnings:	Based on actual pensionable earnings over the averaging period
Family composition:	Same as for going concern valuation
Termination expenses:	$200,000

To determine the hypothetical wind-up position of the Plan, a provision has been made for estimated termination expenses payable from the Plan's assets in respect of actuarial and administration expenses that may reasonably be expected to be incurred in terminating the Plan and to be charged to the Plan.

In addition, termination expenses also include a provision for transaction fees related to the liquidation of the Plan's assets and for expenses that may reasonably be expected to be paid by the pension fund under the postulated scenario between the wind-up date and the settlement date.

Expenses associated with the distribution of any surplus assets that might arise on an actual wind-up are not included in the estimated termination expense provisions.

In determining the provision for termination expenses payable from the Plan's assets, we have assumed that the plan sponsor would be solvent on the wind-up date. We have also assumed, without analysis, that the Plan's terms as well as applicable legislation and court decisions would permit the relevant expenses to be paid from the Plan.

Actual fees incurred on an actual plan wind-up may differ materially from the estimates disclosed in this report.

Incremental Cost

In order to determine the incremental cost, we estimate the hypothetical wind-up liabilities at the next valuation date. We have assumed that the cost of settling benefits by way of a lump sum or purchasing annuities remains consistent with the assumptions described above. Since the projected hypothetical wind-up liabilities will depend on the membership in the Plan at the next valuation date, we must make assumptions about how the Plan membership will evolve over the period until the next valuation.

We have assumed that the Plan membership will evolve in a manner consistent with the going concern assumptions as follows:

- Members retire and die consistent with the retirement and mortality rates used for the going concern valuation.
- Pensionable earnings, the *Income Tax Act* pension limit and the Year's Maximum Pensionable Earnings increase in accordance with the related going concern assumptions.
- Active members accrue pensionable service in accordance with the terms of the Plan.
- Cost of living adjustments are consistent with the inflation assumption used for the going concern valuation.

Solvency Basis

In determining the financial position of the Plan on the solvency basis, we have used the same assumptions and methodology as were used for determining the financial position of the Plan on the hypothetical wind-up basis.

The solvency position is determined in accordance with the requirements of the Act.

APPENDIX E

Membership Data

Analysis of Membership Data

The actuarial valuation is based on membership data as at December 31, 2012, provided by Canadian Utilities Ltd.

We have applied tests for internal consistency, as well as for consistency with the data used for the previous valuation. These tests were applied to membership reconciliation, basic information (date of birth, date of hire, date of membership, gender, etc.), pensionable earnings, credited service, contributions accumulated with interest and pensions to retirees and other members entitled to a deferred pension. Contributions, lump sum payments and pensions to retirees were compared with corresponding amounts reported in financial statements. The results of these tests were satisfactory.

If the data supplied are not sufficient and reliable for its intended purpose, the results of our calculation may differ significantly from the results that would be obtained with such data. Although Mercer has reviewed the suitability of the data for its intended use in accordance with accepted actuarial practice in Canada, Mercer has not verified or audited any of the data or information provided.

Plan membership data are summarized below. For comparison, we have also summarized corresponding data from the previous valuation.

	31.12.2012	31.12.2011
Active Members		
Number	28	33
Total pensionable earnings for the following year	$2,915,007	$3,452,193
Average pensionable earnings for the following year	$104,107	$103,794
Average years of pensionable service	24.9	24.7
Average age	54.2	53.9
Deferred Pensioners		
Number	5	5
Total annual pension	$53,017	$53,017
Average annual pension	$10,603	$10,603
Average age	51.9	50.9
Pensioners and Survivors		
Number	39	35
Total annual lifetime pension	$1,077,857	$833,232
Average annual lifetime pension	$27,637	$23,807
Average age	72.7	73.2

The membership movement for all categories of membership since the previous actuarial valuation is as follows:

	Actives	Deferred Vested	Pensioners and Survivors	Total
Total at 31.12.2011	33	5	35	73
Transfers from Plan 1				
Transfers to Plan 1	(1)			(1)
Terminations:				
• Lump sums				
• Deferred pensions				
Deaths			(1)	(1)
Retirements	(4)		4	0
Survivors			1	1
Total at 31.12.2012	28	5	39	72

The distribution of the active members by age and pensionable service as at December 31, 2012 is summarized as follows:

	Years of Pensionable Service									
Age	**1-4**	**5-9**	**10-14**	**15-19**	**20-24**	**25-29**	**30-34**	**35-39**	**40 +**	**Total**
< 25										
25 - 29										
30 - 34										
35 - 39										
40 - 44				1	3					4
45 - 49		1		1	1	1				4
50 - 54					2	1	3			6
55 - 59				1	2	3	2			8
60 - 64					2		1		1	4
65 - 69					1	1				2
70+										
Total	0	1	0	3	12	5	6	0	1	28

The distribution of the inactive members by age as at December 31, 2012 is summarized as follows:

	Deferred Pensioners		Pensioners and Survivors	
Age	**Number**	**Average Pension**	**Number**	**Average Pension**
< 45				
45 – 49	2	$4,440		
50 – 54	1	$26,351	1	$79,562
55 – 59	2	$8,893	2	$49,101
60 – 64			4	$38,841
65 – 69			9	$26,707
70 – 74			8	$25,095
75 – 79			4	$25,985
80 – 84			8	$19,086
85 – 89			3	$15,660
90 – 94				
95 – 99				
100 +				
Total	5	$10,603	39	$27,637

APPENDIX F

Summary of Plan Provisions

Mercer has used and relied on the plan documents, including amendments and interpretations of plan provisions, supplied by Canadian Utilities Ltd.. If any plan provisions supplied are not accurate and complete, the results of any calculation may differ significantly from the results that would be obtained with accurate and complete information. Moreover, plan documents may be susceptible to different interpretations, each of which could be reasonable, and the results of estimates under each of the different interpretations could vary.

This valuation is based on the plan provisions in effect on December 31, 2012. The following is a summary of the main provisions of the Plan in effect on December 31, 2012. This summary is not intended as a complete description of the Plan.

Background	The Predecessor Plan was effective January 2, 1962. On December 31, 1986 the Predecessor Plan was split into three parts, covering employees in the Yukon (Plan 2), the Northwest Territories (Plan 3) and elsewhere (Plan 1). Plan 2A was established effective April 1, 1987 to cover Yukon based employees who had previously been employed by the Northern Canada Power Commission (NCPC). Effective January 1, 1994, Plan 2 was amended to extend coverage to all current and former members of Plan 2A and Plan 3. Service under Plan 2A and Plan 3 were assumed by Plan 2 in exchange for a transfer of assets. Effective December 30, 2003, the Plan was extended to cover employees located in Ontario.
Eligibility for membership	The Plan is closed to new entrants. Some individuals who were employed by NCPC immediately prior to April 1, 1987 elected to have their pension benefit entitlements under the PSSA transferred to the Plan. For these members, pensionable service under the Plan includes service that was pensionable under the PSSA. Service with NCPC counts for determination of vested rights whether or not the individual member elected to transfer his PSSA benefit entitlements to the Plan.
Employee Contributions	Members contribute 2.8% of earnings up to the YMPE and 4.0% of earnings over the YMPE, up to an annual maximum contribution of $2,000. Disabled members and certain executive members are not required to contribute.
Retirement Dates	Normal Retirement Date • The normal retirement date is the first day of the month following the member's 65th birthday. Early Retirement Date • If a member has been in the Plan for at least two years, the member may choose to retire as early as age 55.
Postponed Retirement	A member who remains employed with the company after age 65 may elect to commence receipt of pension or continue to accrue benefits under the Plan up to his actual retirement.

Normal Retirement Pension	2% of annual final average earnings times years of pensionable service between January 2, 1962 and January 2, 1966; PLUS 1.4% of annual final average earnings up to the YMPE, times years of pensionable service after January 2, 1966; PLUS 2.0% of annual final average earnings in excess of the YMPE, times years of pensionable service after January 2, 1966.
Pensionable earnings	Annual final average earnings are calculated over the 60 consecutive months for which earnings are highest. The YMPE is calculated over the same period.
Early Retirement Pension	If a member retires from active service with the consent of the Company, a reduced early retirement benefit is payable, as follows: • if age and service sum to 90 years or more, no reduction applies; • otherwise, the pension payable is equal to the normal retirement pension times a percentage from the following table:

Age at Retirement	Percentage
64	100
63	100
62	100
61	97
60	94
59	88
58	82
57	76
56	70
55	64

If retirement is not from active service, or if Company consent is not obtained, an actuarial reduction applies.

- In addition, female participants employed prior to June 1, 1972 are entitled to a bridge benefit payable only until age 65. The bridge benefit is equal to the expected Canada Pension Plan benefit times the ratio of 36 divided by the number of months from retirement to age 65, provided that the ratio is never more than 1.

Maximum Pension	The Plan provides that the pension payable at the time of commencement must not exceed: • the defined benefit limit prescribed under the Income Tax Act, multiplied by years of pensionable service (with service rendered prior to January 1, 1992 limited to 35 years) Reductions to this maximum apply if retirement occurs before age 60, before completion of 30 years service, and before attainment of age and service summing to 80. The maximum provision automatically reflects any increases to the defined benefit limit that occur in the ITA and Regulations.

Cost of Living Adjustments	The annual adjustment will be as determined by the Company but will not exceed 3% per annum. In calculating the annual adjustment the Company will take into consideration annual percentage changes in the Consumer Price Index for Canada and any previous annual adjustments paid. The annual adjustment is granted to members who retired from active service.
Death Benefits	Pre-retirement: • If a member dies before becoming eligible for retirement, the member's spouse, or the member's beneficiary if there is no surviving spouse, will receive a benefit equal in value to the commuted value of the benefit to which the member would have been entitled had he terminated employment immediately prior to his death, plus any excess of the member's contributions over 50% of that commuted value. • If a member dies after becoming eligible for retirement, the member's spouse will receive the greater of: • a benefit equal in value to the commuted value of the benefit to which the member would have been entitled had he terminated employment immediately prior to his death, plus any excess of the member's contributions over 50% of that commuted value, and • an immediate pension equal to 60% of the pension to which the member would have been entitled had the member retired on their date of death. This pension will also receive future cost of living increases. • If a member dies after becoming eligible for retirement and there is no surviving spouse, the beneficiary will receive the commuted value of the benefit to which the member would have been entitled had he terminated employment immediately prior to his death, plus any excess of the member's contributions over 50% of that commuted value. Post retirement: • The normal form of pension for single employees guarantees a return of the member's own contributions with interest up to retirement date • For employees with an eligible spouse, the normal form of pension provides a continuing survivorship pension to the member's spouse. If retirement occurs prior to July 1, 1987, the spouse's benefit is 50% of the member's benefit. If retirement occurs after July 1, 1987 the spouse's benefit is 60%.
Termination Benefits	A deferred pension commencing at normal retirement date, or alternatively the commuted value thereof may be transferred to the member's locked-in RRSP. If the member's own contributions exceed 50% of the commuted value of the deferred pension, the excess is available as an additional benefit.

APPENDIX G

Employer Certification

With respect to the Report on the Actuarial Valuation for Funding Purposes as at December 31, 2012 of the Retirement Plan For Employees of Canadian Utilities Limited and Participating Companies – Plan 2, I hereby certify that, to the best of my knowledge and belief:

- The valuation reflects the terms of the Canadian Utilities Ltd. engagement with the actuary described in section 2 of this report, particularly the requirement to include a margin of 2.10% after January 1, 2020 in the discount rate used to perform the going concern valuation and the Company's decisions in regards to determining the going concern and solvency funding requirements.
- A copy of the official plan documents and of all amendments made up to December 31, 2012 were provided to the actuary and are reflected appropriately in the summary of plan provisions contained herein.
- The asset information summarised in Appendix B is reflective of the Plan's assets.
- The membership data provided to the actuary included a complete and accurate description of every person who is entitled to benefits under the terms of the Plan for service up to December 31, 2012.
- All events subsequent to December 31, 2012 that may have an impact on the Plan have been communicated to the actuary.

YUB-YECL-6

Reference: Affiliate Costs, YECL Application, page 5-4, YECL Application, Schedule 5-3

Yukon Electrical outsources certain major administrative functions to affiliate companies, such as ATCO Electric, to take advantage of the economies of scale of services available from a larger utility. The cost of these services is detailed in Schedule 5.3 and is based on a fully allocated cost methodology that does not contain any element of profit or return.

The Board wants to better understand the allocated cost methodology used by YECL and its affiliates.

Request:

(a) Please describe the fully allocated cost methodology that YECL and affiliate companies use to determine how costs are allocated.

(b) Please explain whether the cost allocation methodology has changed since 2008.

(c) Please explain the increases in affiliate charges in Account 87500 – Meters and Meter Testing. Are the increases in affiliate charges due to the rate charged or the volume of work? If due to volume, provide an explanation for these volume increases.

(d) What type of metering services does ATCO Electric provides to YECL?

(e) Please explain the increases in affiliate charges in Account 87000 – Supervision. Are these increases due to the rate charged or the volume of work? If due to volume, provide an explanation for these volume increases. In particular, explain why the costs to answer calls after hours will double from 2012 to the test period

(f) What type of meter services does ATCO Gas provide to YECL?

(g) Please explain the increases in affiliate charges in Account 72100 and Account 71300. Are the increases in affiliate charges due to the rate charged or the volume of work? If due to volume, please provide an explanation for these

volume increases. In particular, address the increases related to Rates and Terms & Conditions, Financial Reporting and Regulatory Support, and Payroll, Use of Systems and IT.

(h) With regard to affiliate services provided by ATCO I-Tek, please indicate whether YECL is charged the same rate by ATCO I-Tek as other ATCO affiliates. If the rate is different, explain why it is different. Please provide evidence that the affiliate services received by YECL are at a cost/price that is lower than can be internally provided or at a cost/price that is less than can be obtained locally.

(i) With regard to Account 64600 – Diesel Generation, please describe the services that ATCO Gas provides to YECL in more detail. Can YECL confirm that ATCO Gas is the cheapest provider for these services and by what method has YECL made this determination?

(j) Account 87000 shows $62,000 for After Hours – Call Answering. Please provide details for these costs and explain why these costs have almost doubled from 2012 to 2013.

Response:

(a) Please refer to YUB-YECL-6(a) Attachment 1 for a complete description of the fully allocated cost methodology.

(b) There have been no changes to the cost allocation methodology since 2008.

(c) ATCO Electric provides Yukon Electrical with metering services which include: supplying new and used meters, testing, verifying and re-sealing the meters as well as performing load and loss research studies. Costs increases are due to both volume (with increased customer growth and meters) as well as labour inflation for ATCO Electric.

(d) ATCO Electric is a federally accredited (Measurement Canada) revenue meter testing facility. Through the Revenue Metering department, Yukon Electrical ensures compliance with Measurement Canada with regard to revenue meter testing, quality assurance conformity and audits. The ATCO Electric Metering department maintains Yukon Electrical's meter records system and ensures the records are available for review and inspection by representatives of Measurement Canada. ATCO Electric Meter department also orders, catalogs,

manages and maintains all inventory of revenue metering for Yukon Electrical. Yukon Electrical utilizes the ATCO Electric Meter Standards Manual for installation, testing and use of revenue metering that ensures compliance to all applicable regulations and standards.

(e) While Yukon Electrical has seen modest increases in the amount of calls being covered by AHA, the major reason for the step increase between 2012 and 2013 is due to ATCO Electric completing a detailed usage review of AHA services in 2012. This review determined Yukon Electrical's fair share of costs based on usage needed to be increased to reflect what was actually taking in place. In essence, Yukon Electrical was under charged by ATCO Electric for this service in 2012.

In summary, the reasons for the increase between 2012 and 2013 are as follows:

- Completion of an updated activity based costing methodology;
- An increase in the coverage provided from 5 PM – 8:00 AM weekdays to 4 PM – 8 AM weekdays;
- Increasing volume of after hour calls.

(f) ATCO Gas provides the Data Capture System and the Field Collection System that processes and manages Yukon Electrical's meter reading routes and information. The Field Collection System links the meter readings to ATCO CIS (billing system) and the appropriate customer accounts. The system also produces billing estimates for routes and accounts. ATCO Gas produces reports of meter reads outside set parameters such as high/low read and high/low consumption.

(g) The charges for Rates and Terms & Conditions are for services provided by ATCO Electric staff for supporting rate and rider design, supporting consultations with customers, responding to questions on rate related matters and supporting the development of a sales forecast. The forecast costs are increasing as a result of an increase in the volume of services charged, from approximately 0.1FTE to 0.2FTE, to better reflect the actual as well as forecast time being incurred by staff for Yukon-related issues.

The volume of services for Financial Reporting and Regulatory Support has increased as a result of the addition of the Corporate Accountant and Manager, Financial Reporting & Accounting, North of 60 positions in 2012, as well as the relocation of the Supervisor, Financial Services position from Whitehorse to Edmonton in 2011. As these services are charged based on the actual labour rates paid to the employees providing the services, and employees receive annual increases, the rates charged increase annually based on labour inflation. Please refer to YUB-YECL-22(j) and (k) for further details on the need for these positions.

The charges for Payroll, Use of Systems and IT have increased due to both a change in rate as well as an increased volume of services. The Payroll services are changed based on a flat rate per employee per pay. The rate charged has not changed since 2010 but the volume of services has increased as a result of the increase in the Yukon Electrical complement. The charges for Use of Systems are for the use of software such as Oracle and Hyperion Financials. The volume of services has increased as a result of the increase in the Yukon Electrical complement. As well, it was discovered in late 2011 that Yukon Electrical was not paying a share of all software which it utilizes. This was corrected in late 2011, resulting in an increase in charges for 2012.

The increases for account 71300 in 2013 are due to volume increases as well as costs for various billing system special requests (e.g. modifications to reports, special extracts of data, changes to rider names, etc.) which are typical for a given year based on prior year averages. Rates are not forecast to increase until 2015. Please refer to YUB-YECL-6(g) Attachment 1 for a schedule of Volumes and Rates.

(h) Yukon Electrical is charged the same rate by ATCO I-Tek for information technology (IT) services as is charged to all other ATCO affiliates. Including ATCO Electric, Northland Utilities (Yellowknife) and Northland Utilities (NWT). The rates charged for information technology to the regulated utilities in Alberta are currently under review by the Alberta Utilities Commission to ensure they are charged at fair market value. Given the high degree of IT integration Yukon Electrical has with its parent, it would not be possible to choose a local supplier, even if one was available, for these services. On the question of choosing to providing these services internally on a stand-alone basis and not taking advantage of the economies of scale afforded due its relationship with its

parent and affiliates, Yukon Electrical does not believe it would be able to keep its total "all in" IT costs below the current forecast of under ½ million per year.

With respect to Billing System Services (ITBS), Yukon Electrical is charged the same rate as its Northland affiliates as the services provided are the same. These ITBS costs were reviewed extensively as part of the 2008-2009 GRA proceeding when Yukon Electrical brought forward the forecast costs of a new billing system. The Board accepted the costs for the new billing system as part of Board Order 2009-2. No material changes to the system or costs have occurred since that point in time. There is no local supplier that would be able to provide these services.

(i) Yukon Electrical presently has a provider to supply diesel fuel for use in the Watson Lake Power Plant. Yukon Electrical has the expertise to utilize a new fuel and requires a supply of natural gas at the plant site to implement the bi-fuel project.

This project is the first of its kind and will be proven through demonstration on a single unit before proceeding to conversion of the remaining units while ensuring that a reliable supply of natural gas is available and that the performance of the entire facility is acceptable.

ATCO Gas's services to provide natural gas include liquefied natural gas (LNG) storage and vaporization services along with their expertise related to systems design, purchasing, installation, commissioning, on-going operations support, maintenance, permitting, licensing for the project, regulator support, Health Safety and Environment policies, procedures and work instructions, regulations and safety. The equipment includes an LNG Facility comprised of on-site storage of LNG, LNG vaporizer and controls, natural gas odorizer, metering and facility safety systems.

Yukon Electrical has structured the project to allow flexibility with respect to capital commitments and provision of necessary expertise that allows Yukon Electrical to if necessary, exit the project without having invested the full capital required. This allows Yukon Electrical to evaluate on a go-forward basis the contractual arrangement for equipment and services. The cost of equipment is one part of the lease arrangement. Yukon Electrical has taken the lease approach to secure an inclusive expert provider of natural gas rather than a consortium of consultants, equipment providers and specialized service providers. This bundled approach with ATCO Gas to provide natural gas

includes LNG storage and vaporization services along with their expertise related to systems design, purchasing, installation, commissioning, operations support, maintenance, permitting, regulations and safety. The equipment being utilized is secured utilizing ATCO Gas' competitive procurement process that involves engineering, financial and purchasing professionals. Yukon Electrical is involved in each step of the development of this system to ensure appropriate procurement methods are used and that cost expenditures are prudent.

A competing lease provider was not in the market at the time to meet the needs of the Watson Lake project in 2012. At that time, there were also no regulations, permits or procedures in the Yukon related to this unique project. Yukon Electrical has continued to investigate comparative benchmark pricing related to other service providers that may become available.

(j) Please refer to part (e) of this response regarding after-hours call answering.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

PURPOSE

To provide guidelines for the charging of work performed for or received from affiliates within the ATCO Group.

POLICY

- All transactions with affiliates are governed by the ATCO Group Inter-affiliate Code of Conduct.

For Profit Services

- Services provided to Affiliates on a For Profit Basis shall not be charged at less than the Fair Market Value for those services. Services received from Affiliates on a For Profit Basis shall not be paid for at more than Fair Market Value. Consultation with the Compliance Officer should occur prior to the determination of Fair Market Value for services to be provided or received on a For Profit Basis.

- A prudence review of these services may be required when deemed appropriate by management and / or the Compliance Officer. In demonstrating that Fair Market Value was paid or received pursuant to a For Profit Affiliate Service arrangement, the Utility, subject to any prior or contrary direction by the AUC, may utilize any method to determine Fair Market Value that it believes appropriate in the circumstances. These methods may include, without limitation: competitive tendering, competitive quotes, benchmarking studies, catalogue pricing, replacement cost comparisons or recent market transactions.

- The Utility shall bear the onus of demonstrating that the methodology or methodologies utilized in determining the Fair Market Value of the subject goods or services was appropriate in the circumstances.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

Shared Services

- Shared Services provided to or received from Affiliates on a Cost Recovery Basis are permitted, unless an approved regulated rate exists for the services, in which case the regulated rate will be charged. In the event that the service provided represents a major on-going transaction, or a collection of related minor transactions that are significant in their totality, a review, involving the Compliance Officer, should be performed as to whether the service pricing is appropriate.

- Financial transactions with Affiliates — A Utility shall ensure that any loan, investment, or other financial support provided to a Non-Utility Affiliate is provided on terms no more favorable than what that Non-Utility Affiliate would be able to obtain as a standalone entity from the capital markets.

- Sharing employees — A Utility may share employees on a Cost Recovery Basis with an Affiliate provided that the employees to be shared:
  i) do not have access to Confidential information;
  ii) do not routinely participate in making decisions with respect to the provision of Utility Services or how Utility Services are delivered;
  iii) do not routinely deal with or have direct contact with customers of the Utility; and
  iv) are not routinely involved in operating, planning or managing the business of the Utility (subject to certain exceptions per the Code).

- Transferring of employees — A Utility may transfer employees to or from an Affiliate, provided **any** employee transferred by the Utility who had access to Confidential Information shall execute a confidentiality agreement with respect to such Confidential Information prior to the transfer.

- Sharing of assets - The plant, assets and equipment of a Utility shall be separated in ownership and separated physically from the plant, assets and equipment of other Non-Utility Affiliates. Utility Affiliates may share ownership and may physically share office space, equipment, rights-of-way and other assets on a Cost Recovery Basis.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

- Where operational efficiencies between Utilities that are Affiliates can be obtained through the use of common facilities (such as shared warehousing or field offices). combined purchasing power or through the use of other cost saving procedures, individual assets or groups of assets used in Utility operations (such as equipment, plant inventory, spare parts or similar assets) may be transferred in the ordinary course of business between Utilities on a Cost Recovery Basis.

- Occasional Services: A Utility may receive, or provide, one-off, infrequent or occasional services to or from an Affiliate on a Cost Recovery Basis, without a service agreement. The service(s) must be documented by way of a work order, purchase order or similar instrument.

- Emergency Services: In the event of an emergency, a Utility may share services and resources with an Affiliate without a service agreement on a Cost Recovery Basis. The service(s) must be documented by way of a work order, purchase order or similar instrument.

Master Service Agreement or Contract

- A Master Service Agreement or Master Service Contract (both referred to as MSC for purposes of this policy) must be developed with each affiliate, governing all services with the affiliate, which are not charged on the basis of regulated rates. All services with the affiliate counter party that the MSC applies to can be brought under that MSC by way of a schedule to the MSC. A copy of all agreements with affiliates should be forwarded to the Compliance Officer for record keeping. Note that a service agreement is not required for occasional or emergency services. in the event that these services become material as to value, frequency or use of resources, (as determined by management or the Compliance Officer), a service agreement shall be entered into.

Recoveries

- Recoveries for work performed for affiliates will be recorded as revenue to ATCO Electric, not as a reduction to operating expenses.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

DEFINITIONS

Affiliate: Means with respect to any Utility:

i) an affiliate as defined in the Alberta Business Corporations Act;

ii) a unit or division within the Utility or any Body Corporate referred to in clause (i) above;

iii) a partnership, joint venture, or Person in which the Utility or any Body Corporate referred to in clause (i) above has a controlling interest or that is otherwise subject to the control of the Utility or such Body Corporate;

iv) any partnership, joint venture, or Person deemed by the AUC to be an affiliate of the Utility for the purpose of this Code of Conduct; and

v) an agent or other Person acting on behalf of any Body Corporate, operating division, partnership, joint venture or Person referred to in clauses (i) to (iv) above.

Cost Recovery Basis: Means with respect to:

i) the use by one Affiliate of another Affiliate's personnel, means the fully burdened costs of such personnel for the time period they are used by the Affiliate, including salary, benefits, vacation, materials, disbursements and all applicable overheads;

ii) the use by one Affiliate of another Affiliate's equipment, means an allocated share of capital and operating costs appropriate for the time period utilized by the Affiliate;

iii) the use by a Utility of an Affiliate's services, means the complete costs of providing the service, determined in a manner acceptable to the Utility, acting prudently;

iv) the use by an Affiliate of a Utility's services, means the complete costs of providing the service, determined in a manner acceptable to the Utility, acting prudently; and

v) the transfer of equipment, plant inventory, spare parts or similar assets between Utilities, means the net book value of the transferred assets.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

Direct Labour Costs: The number of hours worked on a project times an employee's hourly wage, or the portion of the annual salary attributable to the services provided.

Direct Costs of Goods and Services: The actual amount paid to the vendor for supplies and services used in the provision of services to an affiliate.

Direct Cost of Material: The unit cost of material used in the provision of services to an affiliate based on the average cost from the Materials Management System.

Direct Cost of Vehicle and Equipment Charges: The charges for vehicles and equipment used in the provision of services to affiliates should be based on the hours used times the hourly charge out rate. The hourly charge out rate will include capital and related costs.

Fair Market Value: The price reached in an open and unrestricted market between informed and prudent parties, acting at arms length and under no compulsion to act.

For Profit Services: Any service that relates to a core business provided on a for-profit bases:

i) by a Utility to a Non-Utility Affiliate, other than a Utility Service; or
ii) by a Non-Utility to a Utility.

Fringe Benefits: The costs incurred by the employer in providing benefits to the employee. These costs include: CPP, Pension, Employment Insurance, Workers' Compensation, Alberta Health Care.

Non-Preset Labour: Employees who are not preset and must submit a daily timesheet in order to distribute their salary to the appropriate accounts.

Preset Labour: Employees whose salaries are distributed on a preset basis to the same accounts.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

Payroll Burden: An incremental charge that is included in an employee's hourly charge out rate to cover payment for statutory holidays and vacation pay.

Overhead: A general loading charge applied to all Labour Costs for the recovery of corporate costs.

PROCEDURE

A. Determination of Cost Recovery Basis.

- Charges for services should be done on an actual cost basis providing it is cost effective and reasonable to track the cost of services provided. In the event cost tracking is not used, the cost allocation methodology used must fairly allocate costs based on reasonable and appropriate criteria. Whether cost tracking is used or not, the following amounts must be incorporated in the determination of fully burdened costs:

  1. Labour Charges — In addition to the Direct Labour Costs, the following amounts should be included:

     - Payroll Burden of 16.3% for employees on timesheets. The payroll system will apply the burden for all Non-Preset Labour. The burden rate is not to be applied when an annual salary is used in the determination of the Direct Labour costs. A separate calculation of burden will be made for Preset Labour charged on an hourly basis.

     - Fringe Benefits — Fringe Benefits are determined by the financial system on a monthly basis.

     - For non-construction projects an Overhead rate of 60% will be applied to labour charges, including payroll burden where applicable as defined above. An additional Overhead rate of 20% will be applied to the labour charges including payroll burden for construction projects.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

- Other charges as discussed below must be included as applicable.

2. Other Charges which may or may not apply, depending on the service performed include:

- Direct cost of Goods and Services.

- Direct Cost of Material — a handling and restocking charge will be applied to the direct cost of materials. Contact Financial Reporting for the current rate to be applied. The MSC should contain a provision that allows for this rate to be varied by ATCO Electric as required.

- Direct Cost of Vehicle and Equipment Operating Costs — Contact Financial Reporting for the current rates to be applied. The MSC should contain a provision that allows for this rate to be varied by ATCO Electric as required.

- Financing, operating costs and depreciation should be recovered if the provision of service to an Affiliate involves the use of ATCO Electric's utility assets. Contact Financial Reporting for assistance in determining these amounts.

- Financing costs associated with a delay in compensation for a material portion of the agreement may be required. Contact Financial Reporting for assistance in determining these amounts.

3. If the agreement involves the disposal of an asset, then fair market value will be exchanged for the asset. If the sale of an asset occurs between regulated affiliates, Fair Market Value will not be less than the Net Book Value of the assets. Statutory requirements for regulatory approval of sales of utility property, other than in the ordinary course of business, will be met.

ATCO ELECTRIC LTD. ACCOUNTING POLICY MANUAL	Provision of Services to or from Affiliates
Original Issue Date: Nov 2, 2001	**Revision Date:** April 10, 2007 **Number:** G.5
PREPARED BY: D. Freedman	**APPROVED BY:** Dennis DeChamplain

B. Finalizing the Agreement

1. The standard MSC is to be used for all agreements with non-regulated affiliates. In the event that a modification to the format of the MSC is required, approval must be obtained from the Compliance Officer.

2. Where an MSC is required, a new MSC must be developed or the existing MSC amended to incorporate new services or changes to pre-existing services. The amendment can be incorporated through the revision to Schedules of the MSC, with appropriate approvals from all parties to the agreement, as well as an approval date.

   The new or amended agreement must clearly indicate an effective date. Contact the Compliance Officer for assistance with respect to this.

3. Discussion with Financial Reporting should occur regarding how the revenue is to be collected, and any new account numbers required for the tracking of revenues and costs associated with the agreement. Generally affiliate revenues should be processed through debit notes which have a standard settlement date. Other collection methods may require a bill to be generated or different procedures to be put in place.

C. Compliance Records

- Records shall be maintained in a manner sufficient to support a third party audit of the state of compliance with the ATCO Group Inter-Affiliate Code of Conduct and retained for a period of at least six years.

YUB-YECL-7

Reference: Discontinuance of Third Party Distribution Line (Property Insurance), YECL Application, page 5-5, YECL Application, Schedule 5-1

Yukon Electrical is proposing to discontinue purchased third party distribution line (property) insurance at the end of the 2013/2014 insurance period, July 1, 2014. On a go forward basis, insurable losses during construction or operations, if and when they occur, would be charged to the Reserve for Injuries and Damages.

The Board requires more details regarding YECL's plan.

Request:

(a) Please describe YECL's current RFID policy.

(b) Please explain how the proposed change will affect YECL's RFID policy and practices (e.g. will appropriations increase?).

Response:

(a) Yukon Electrical seeks to obtain insurance coverage except in cases where the exposure risk is minimal or the cost of the insurance is prohibitively high. In the case of an insured loss, amounts charged to the RFID would include the deductible portion of insured losses as well as any portion of the claim not paid by the insurance company. In the case of an uninsured loss where coverage was not obtained or was not available as a result of very high-risk exposure, the entire amount of the loss would be charged to the RFID. Please also refer to Section 8 Attachment 1 of Yukon Electrical's Application.

(b) The proposed change will not change Yukon Electrical's RFID policy. Yukon Electrical believes that the cost of the third party distribution line insurance, approximately $127,000 per year, is high for the amount of coverage provided, which is a limit of $1.5 million with a $1.0 million deductible. Additionally, there have not been any claims on the third party distribution line (property) insurance policy for the past 20 years.

YUB-YECL-8

Reference: Account 62600 – Hydro Generation, YECL Application, Schedule 5.1, YECL Application, Schedule 5.2

The Board requires more information regarding the cost increases in Account 62600 – Hydro Generation

Request:

(a) Please explain in more detail the specific environmental costs related to the Fish Lake water licensing process which caused the cost increase in 2012.

(b) Please describe in further detail the drivers for the increased inspection and maintenance that resulted in $60,000 of cost in 2013.

(c) Please describe in further detail the specifics of the costs related to the Fish Lake water licensing process that resulted in $106,000 of cost in 2013.

Response:

(a) Please refer to YUB-YECL-8 Attachment 1. The specific environmental costs in O&M relate to various projects performed by contractors as well as increased labour and fringe.

(b) The increased 2013 inspection and maintenance costs are a result of the requirements of the new licence (please refer to YUB-YECL-8 Attachment 1).

(c) Please refer to YUB-YECL-8 Attachment 1 for a description as well as details on the specific costs.

Other	12	16	14	15	15
Schedule 5.1 Line 2	108	154	320	419	454

* The labour for 62600 for 2014 and 2015 includes 100% of the costs related to the Environmental Technician position to be added in 2014. This position will not be exclusively working on environmental monitoring and compliance related to hydro generation but will also be working on diesel generation. As a result, Yukon Electrical proposes to reclassify 50% of the costs related to the Environmental Technician position to account 64600.

YUB-YECL-9

Reference: Account 87400 – Underground Line Maintenance, YECL Application, Schedule 5.1, YECL Application, Schedule 5.2

The Board requires more information regarding the cost increases in Account 87400 – Underground Line Maintenance

Request:

(a) Please describe in further detail the specifics of the "increased overall activity" that resulted in $89,000 of costs.

(b) Please explain why YECL included costs for Arctic Winter Games (AWG) support in this account. How does this cost relate to underground line maintenance?

(c) Please describe in more detail the activities related to the $25,000 cost.

Response:

(a) The increase was a result of higher maintenance costs for unscheduled line restoration, underground line patrols, underground line locates, and general underground line maintenance. The overall increase in activity relates to the increased underground infrastructure. See the following table for a breakdown of 2011 and 2012 costs for account 87400:

	2011	2012
Underground Line Maintenance	11,771	29,742
Underground Line Restoration - Unscheduled	1,505	25,327
Follow-Up Maintenance	5,946	13,941
Immediate Maintenance	2,536	8,818
Underground Line Patrols	3,520	21,698
Underground Line Locates	65,404	81,127
Shipyards Substation Work (completed in the timeframe of the Arctic Winter Games)	-	24,618
	90,681	205,272

(b) This work was not completed for Arctic Winter Games support, it was necessary system work completed for Shipyards substation during the timeframe of the Arctic Winter Games.

(c) During regular substation inspection at Shipyard substation, a critical piece of distribution equipment (the 35kV Vista switch cubicle) was found to be faulty. System switching was completed to minimize the area and number of customers impacted if the equipment was to fail. A high voltage switch modular was modified and upgraded to provide contingency if there was a failure. The critical piece of equipment was taken out of service and repaired at a later date.

YUB-YECL-10

Reference: Account 87700 – Transformer Repair and Replacement, YECL Application, Schedule 5.1, YECL Application, Schedule 5.2

The Board requires more information regarding the cost increases in Account 87700 – Transformer Repair and Replacement

Request:

A cost of $67,000 was incurred in 2012 for repairs required for the Shipyards Park transformer; however, YECL does not explain the cost increases from 2011 to the test period. Please explain why YECL believes these costs will increase to $78,000 in 2013 and continue to increase to $87,000 in 2015.

Response:

In forecasting account 87700 for 2013, 2014 and 2015, additional costs incurred in 2012 for contractors, material and equipment related to the Shipyards Park transformer were excluded.

However, labour costs allocated to 87700 for 2013, 2014 and 2015 were inadvertently based on the 2012 actual allocations, which included a higher than normal amount of labour related to the Shipyards Park transformer. This resulted in a misallocation between this account and other distribution accounts. The total amount of labour allocated to distribution O&M for 2013 to 2015 is correct. Please refer to YUB-YECL-10 Attachment 1 for an overall reconciliation that shows the total distribution labour included in operations and maintenance expenses for the test years is reasonable.

Reference: Account 70200 – General Public Information, YECL Application, Schedule 5.1, YECL Application Schedule 5.2

The Board requires more information regarding the cost increases in Account 70200 – General Public Information

Request:

(a) Please confirm that if the Senior Corporate Communication Advisor joined YECL in mid-2011. If yes, should the full cost of this 0.6 FTE already be reflected in 2012? If confirmed, please explain the increase in Account 70200 from 2012 to 2013.

(b) Please explain whether any of the costs forecasted for the test period would be for marketing or advertising purposes.

Response:

(a) Confirmed. The full costs were reflected in 2012. However, there was an allocation change in 2013 to charge the position all to account 70200. In 2012, there was a $9,000 allocation to account 72100. Thus, for 2013 the cost increase reflects labour inflation of 3.5% plus this allocation increase of $9,000.

(b) The forecast costs include print, web and radio communications to the pubic regarding topics related to safety, outages, electricity conservation and customer billing. There are no costs forecasted for marketing purposes.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

YUB-YECL-12

The Board requires more information regarding the cost increases in Account 72100 – Administrative

Request:

On line 184 and 185 on page 4 of 5 of Schedule 5.2, YECL submitted that it paid higher Head Office Cost of $31,000. How much did YECL previously pay for the head office space before the increase?

Response:

The Head Office Costs referred to on page 4 of 5 on Schedule 5.2 are the various administrative services provided by ATCO Electric and detailed on lines 11 through 16 of Schedule 5.3. These costs do not relate to head office space. The total Head Office Costs increased from $277,000 in 2010 to $309,000 in 2011.

YUB-YECL-13

Reference: Account 72200 – Administration Corporate, YECL Application, Schedule 5.1, YECL Application, Schedule 5.2

The Board requires more information regarding the cost increases in Account 72200 – Administration Corporate

Request:

(a) Costs in this account increased by $22,000 in 2012 over 2011 due to higher banking fees. Explain the additional $42,000 forecast increase in 2013 over 2012 (i.e. $71,000 plus $22,000 is only $93,000 and not $135,000 leaving $42,000 unaccounted for).

(b) Are the banking fees a direct cost or an allocated cost?

Response:

(a) The additional $42,000 is for forecast bank fee increases in 2013 mainly as a result of increased customer credit card usage. There has been significant growth in the number of customers using credit cards to pay their bills each year from 2009 to 2012, and Yukon Electrical expects this trend to continue in 2013.

Please see the table below for more detail on account 72200:

	Actual 2009	Actual 2010	Actual 2011	Actual 2012	Forecast 2013	Forecast 2014	Forecast 2015
Bank Charges	29	42	71	93	135	137	140
Regulatory Expenses	120	142	-	103	-	-	-
	149	184	71	196	135	137	140

(b) Banking fees are a direct cost.

YUB-YECL-14

Reference: Account 72600-Training and Safety, YECL Application, Schedule 5.1, YECL Application, Schedule 5.2

The Board requires more information regarding the cost increases in Account 72600 – Training and Safety

Request:

(a) Costs in this account increased by $69,000 (or 18%) in 2012 due to required safety programs for staff. Please describe this safety program and the components. How many staff members were trained?

(b) Please explain why this cost increase will continue throughout the test period. Does YECL plan to provide this safety program every year going forward?

(c) Please explain why this cost increase did not occur in 2010 or 2011. Was this program not required in 2010 or 2011? What changed in 2012?

Response:

(a) The increase in costs in 2012 was attributable to two training courses for Yukon Electrical's high risk frontline technical employees. A total of 42 employees attended Equipotential Bonding and Grounding as well as Fall Arrest and Pole Top Rescue training.

(b) While not directly related to a similar ongoing level of Equipotential Bonding and Grounding training, the overall level of training will continue throughout the test period due to a number of new initiatives including increased emphasis on driver training as well as project management.

Further to the above, Yukon Electrical has forecast costs throughout the test years based on ongoing training and courses that are required for all employees. Yukon Electrical continues to focus on reducing incidents by ensuring an industry leading safety culture throughout the organization. Ongoing safety training given to the majority of employees includes Zero Incident Culture training, Safety Leadership, First Aid, and WHMIS. Various technical training courses such as Confined Space Entry, Revenue Metering and Advanced Chainsaw are

for Field Service Representatives, Powerline Technicians and Technologists are also provided. Technical courses have certification for 2 or 3 years before recertification training is needed. Technical training costs for apprentices are increasing as Yukon Electrical adds a Power-line Apprentice. As noted above, Yukon Electrical will be providing additional training associated with driver assessments and PACE defensive driving courses for all employees. This is a focused effort and commitment to reduce Yukon Electrical's vehicle incidents. In addition to the increased driver training, Yukon Electrical will also be providing additional Project Management training for staff that will contribute to the success of Yukon Electrical's capital program.

(c) The training programs discussed in (a) were not delivered in 2010 and 2011. They were completed in 2012 due to new work practices and new equipment utilized in the field for these tasks. The high risk frontline technical employees needed to be trained to use the new equipment as designed.

YUB-YECL-15

Reference: Account 72700 – Relocation, YECL Application Schedule 5.1, YECL Application Schedule 5.2

The Board requires more information regarding the cost increases in Account 72700 – Relocation

Request:

(a) Please explain the average cost of relocating an employee or how YECL forecasts how much it will cost to relocate an employee.

(b) Please provide the number of employees YECL forecasts relocating in the test period and how YECL came up with this number.

(c) Please explain whether the costs stem from employees relocating to other ATCO opportunities at the request of ATCO.

Response:

(a) The average cost over the last three years to relocate an employee is $48,600 as shown below:

	2010	2011	2012	Total	Average
Costs - Schedule 5.1, line 44 ($000s)	213	207	66	486	162
Number of relocations	4	4	2	10	3.3
Cost per relocation ($000s)	53	52	33	49	

This includes costs such as house hunting trips, real estate fees on former residence, and moving household goods up to the Yukon.

(b) The forecast number of employee relocations for the test period is 10 (3.3 per year) based on the previous three years, as shown in the table in part (a).

(c) No. Yukon Electrical only pays the moving costs of employees coming to the Yukon.

YUB-YECL-16

Reference: Historical forecast and actuals, YECL Application, Schedule 5.1

The Board requires historical information

Request:

Please update Schedule 5.1 with forecasted, approved, and actual amounts for 2008 and 2009.

Response:

Please refer to YUB-YECL-16 Attachment 1.

YUB-YECL-17

Reference: Inflation forecasts and key assumptions table, YECL Application, pages 1-6 to 1-7

For the 2013 and 2014 test periods, in-scope (subject to a collective agreement) and out-of-scope (not subject to a collective agreement) labour has been escalated by 3.5% and 3.5% respectively. This escalation is based on Yukon Electrical's existing collective agreement that expires on December 31, 2014. For the 2015 test period, in-scope and out-of-scope labour is escalated by 3.5%. This escalation rate reflects Yukon Electrical's forecast of the increase required.

The Board wants to better understand YECL's labour inflation forecast and the methodology YECL used to come up with it

Request:

(a) For the 2013 and 2014 test years the labour inflation rate is subject to a collective agreement that expires on December 31, 2014. Please explain why YECL expects labour inflation to continue to grow at 3.5% in 2015. Please provide any materials/research to support this forecast.

(b) Please provide the date on which YECL negotiated the noted collective agreement and the period to which it applies.

(c) Please provide the inflation forecast for the Yukon (and any other applicable jurisdictions) for the period being negotiated that were available at the time of these negotiations and describe the manner in which YECL and the other negotiating parties arrived at a 3.5% labour inflation rate.

(d) Please explain whether 3.5% is still the most accurate forecast of labour inflation for 2013, 2014, and 2015 given the current economic environment and rates. If not, please provide an updated forecast for 2013, 2014 and 2015.

(e) Would labour inflation be less than what is based on the collective agreement if turnover from more senior to more junior employees is factored in? Please comment.

(f) Please provide statistics on employee turnover for the period from 2008 to 2012.

Response:

(a) A review of collective agreements for other utilities that had already negotiated collective agreements through 2015 was carried out to assess the increases negotiated for 2015. This research provided the following results:

Company	2015 Increase
AltaLink	4.0%
Capital Power	3.5%
EPCOR	3.5%
TransAlta	3.0%

Of the limited amount of data available forward to 2015, these indicators play a role in one of the market areas that Yukon Electrical competes with for skilled labour. Based on these comparatives, Yukon Electrical chose to use 3.5% as its forecast for labour inflation for 2015.

(b) Yukon Electrical negotiated the collective agreement in September of 2012 for the term of January 1, 2013 to December 31, 2014.

(c) Yukon Electrical, with support from the ATCO Electric Human Resources group, establishes an overall compensation strategy based on a combination of factors including internal expertise and experience along with consideration and analysis of a variety of available external market compensation reports. External market data is obtained through various compensation survey organizations, government agencies, professional organizations and applied research organizations, and is analyzed and validated by ATCO Electric's compensation specialists and skilled Human Resource professionals. Some of the data sources referenced by Yukon Electrical in determining the labour inflation rate are as follows:

Conference Board of Canada's Economic Forecast

The Conference Board of Canada's Economic Forecast – Summer 2012 indicates that:

> Labour markets will continue to grow at a good pace as 55,270 jobs are added to the economy (representing growth of 2.6%) in 2013. The unemployment rate will benefit and decline further – to an average of 4.5% in 2013. Tight labour markets will lead to strong wage growth of 3.9 percent in 2012 and 3.4 percent in 2013.

Province of Alberta

The Province of Alberta's Occupational Demand and Supply Outlook 2011-2012 indicates that:

> Over the next ten years, Alberta's labour market is projected to grow by approximately 607,000 workers at an annual average rate of 2.4%. A net increase of 492,000 workers is expected to join the labour force, as occupational supply increases at an annual rate of 1.9%. For the coming decade, Alberta could experience a labour shortage of approximately 114,000 workers.

Conference Board of Canada

The Consumer Price Index (CPI) measures changes in prices, or what is usually referred to as inflation.

Information released July 22, 2011 by *Statistics Canada* indicates that the Yellowknife All-Items Consumer Price Index rose 2.7% from June 2010. By comparison, the annual price increase was 3.1% for Canada, and 3.1% for Whitehorse.

On a year-over-year basis, prices increased in Yellowknife for all major components with the exception of recreation, education and reading.

Comparing June 2011 to June 2010, prices increased by 3.0% in Whitehorse.

Key Economic Indicators

Average Weekly Wage Increase (all employees)

% Change		2009	2010	2011	2012	2013	2014

GDP/CPI - Alberta

% Change		2011	2012	2013	2014
GDP		3.1	4.0	3.9	4.1
CPI		2.0	2.1	1.9	2.1

Source: Conference Board of Canada

Yukon Electrical and its affiliate companies, Northland Utilities (Yellowknife) and Northland Utilities (NWT), use Statistics Canada, the Yukon Bureau of Statistics, the NWT Bureau of Statistics, and the Canadian Mortgage and Housing Corporation (CMHC) as research sources.

Northern Consumer Price Index (CPI) – Monthly

CPI, All Items (2002 = 100)			
	June 2011	**June 2010**	**Annual Rate of Inflation (July 2010 – June 2011)**
Yellowknife	121.6	118.4	2.2%
Whitehorse	118.6	115.1	2.0%
Canada	119.8	116.2	2.5%

Yukon Electrical participates in analysis surveys that provide information of various indices and cost comparatives including labour indices. The participant companies are major northern employers including the privately owner power

companies and Crown corporation power companies, cities, communications companies and governments. The specific results of these surveys are kept confidential and allow the participants to review their relative competitiveness in the market.

External company agreement settlements in the north ranged from 2.25-2.5% increases in 2012 and 2.25-2.75% for 2013 for those where information was available. A few of the companies were in the process of negotiations or in the ratification process and were unable to confirm increase amounts at the time. Those collective agreements anticipated longer term contracts and lower increases for the first few years progressing to larger increase amounts closer to the end of the contract term.

The Alberta market was strong with external company increases ranging from 2-4%, with a majority arriving at 3% or above for 2012. For those where negotiated settlements were available for 2013, increases ranged from 3-4%. Yukon Electrical looked at a rate of 3.5% as being competitive with respect to that market data.

Competing markets for labour such as Alberta have two large transmission projects underway. Both ATCO Electric and AltaLink have a requirement for stable, specialized labour to support these large projects and this is proving to be challenging for them due to a shortage of local labour.

Yukon Electrical also looks at alignment with other internal collective agreements for it's affiliated northern companies Northland Utilities (NWT) Limited and Northland Utilities (Yellowknife) Limited.

Resources can be transferred between Northland Utilities (NWT) Limited, Northland Utilities (Yellowknife) Limited, ATCO Electric and Yukon Electrical, therefore alignment among these operations is important. In addition, the Alberta market is an important feeder pool for resources in ATCO's northern utility companies.

Northland Utilities (Yellowknife) Limited reached a Collective Agreement for a three year period spanning 2012-2014 with increases at 3.5% each year. Northland Utilities (NWT) Limited reached a Collective agreement for a two year period of 2012 and 2013 with increases of 3.5% for both years.

Yukon Electrical's Collective Agreement was negotiated shortly after those two other agreements.

(d) Yukon Electrical considers the forecast labour inflation rate is appropriate for the test period. A Collective Agreement is now in place for the 2013 and 2014 periods that includes a labour inflation rate of 3.5% in both years. Based on the information outlined in response to information request YUB-YECL-17(a), the forecast for 2015 of 3.5% is also considered an appropriate forecast.

(e) No. The same labour inflation rate is applied to all employees regardless of employee seniority.

(f) Please refer to the following list for a summary of employee turnover during the period from 2008 through 2012:

(i) 2008 – 8 employees came & 3 left

(ii) 2009 – 2 employees came & 3 left

(iii) 2010 – 6 employees came & 6 left

(iv) 2011 – 6 employees came & 1 left

(v) 2012 – 5 employees came & 5 left

Some of the positions were filled by transfers from other ATCO affiliates and the remaining from the local labour market. Yukon Electrical has the ability to recruit and transfer technical-based positions from ATCO Electric. Entry level and non-technical positions are typically recruited from the local labour market.

YUB-YECL-18

Reference: Inflation forecasts and key assumptions table, YECL Application, page 1-7

For non-labour costs, an inflation rate of 1.9% has been applied for 2013 based on 50% of forecast Yukon inflation. For 2014 and 2015, no forecast of Yukon inflation was available so inflation rates of 2.0% and 2.1%, respectively, were applied based on 50% of forecast Alberta inflation and 50% of forecast British Columbia inflation.

The Board wants better understand YECL's non-labour inflation forecast and the methodology YECL used to come up with it

Request:

(a) Please provide the raw data that YECL used to determine the non-labour inflation rates used in this application.

(b) Please explain why YECL used a methodology that weights half of the non-labour inflation rate on Alberta inflation.

(c) Please explain why British Columbia inflation is the best proxy for Yukon inflation. Are there no forecasts for any other jurisdictions that are more representative of economic activity in the Yukon than British Columbia? Does YECL have historical evidence that supports using the British Columbia inflation rate?

Response:

(a) Please refer to YUB-YECL-18(a) Attachment 1.

(b) Yukon Electrical is using this methodology because it was the methodology directed to be used by the Board in Board Order 2009-2.

Use of Alberta inflation is reasonable as Yukon Electrical purchases a significant amount of goods and services from Alberta:

- Yukon Electrical's parent company ATCO Electric operates in Alberta and services received by Yukon Electrical by its parent company are therefore Alberta based;

- Yukon Electrical purchases many of its specialty line materials from Alberta; and

- Transportation services typically come from or through Alberta.

(c) Yukon Electrical was directed in Board Order 2009-2 to tie its non-labour inflation rate to two jurisdictions using a 50/50 weighting. As no forecast was available for the Yukon for 2014 or 2015, British Columbia was chosen as it was the closest jurisdiction to the Yukon. Other than British Columbia being a neighbouring jurisdiction to the Yukon with goods and services flowing up into Yukon, Yukon Electrical does not have historical evidence that supports the use the British Columbia rate.

YUB-YECL-19

Reference: Inflation forecasts, YECL Application, page 1-7

A vacancy rate of 3.4% (approximately 2 FTEs) has been applied to all labour expenses for the 2013-2015 test periods. This is based on a five-year historical average which Yukon Electrical believes to be reasonable and is consistent with the methodology approved in Board Order 2009-2.

The Board seeks clarification regarding YECL's vacancy rate calculation.

Request:

(a) Please provide the raw data that YECL used to determine the vacancy rate.

(b) Please provide the calculations/steps YECL used to come up with the 3.4% vacancy rate.

Response:

(a) Please refer to YUB-YECL-19(a) Attachment 1.

(b) Yukon Electrical used the actual data from the previous 5 years of FTEs to determine a forecast vacancy rate. Please refer to YUB-YECL-19(a) Attachment 1 for the calculation used to come up with the 3.4% vacancy rate.

The Yukon Electrical Company Limited
2013-2015 General Rate Application
Calculation of Vacancy Rate

	Full-time Equivalents				
	Actual	**Forecast**	**+/-**	**Vacancies**	**%**

YUB-YECL-20

Reference: Added positions, YECL Application, pages 1-8 to 1-13

Request:

(a) For each of the proposed positions to be added, please indicate which ones will be located in Yukon.

(b) For the senior corporate communications advisor, what is the impact on service quality if the position is not approved by the Board? If there is an effect on service quality, please state the service quality measure and provide an estimate of the impact.

(c) For the environmental technician position, please cite the specific increased regulatory standards, and mandated ongoing ecological and biological studies, and each project requiring an environmental permit.

Response:

(a) Of the 16 positions to be added, 14 positions will be located in the Yukon. The Corporate Accountant (1.0 FTE) and Manager, Financial Reporting and Accounting, North 60 (0.5 FTE) are based in Edmonton.

(b) The Senior Corporate Communications Advisor is tasked to provide timely information and communication to the public regarding safety, outages, electricity conservation and customer billing. Additionally, this position provides internal communication to employees regarding updates and changes within Yukon Electrical. All of these functions are vital to ensure customers and staff have information and access to resources required to understand the services Yukon Electrical provides. This position is also vital in situations when critical public safety situations arise. During these situations, this position provides information and communication to and from the public and acts as a direct link to customers and stakeholders during situations such as public emergencies or unplanned outages.

(c) The new long term licence for the operation of the Fish Lake hydro system includes a number of conditions that impose environmental management and monitoring activities over the course of the licence. Also, the modification of

project infrastructure in the initial years of the licence requires a number of secondary environmental permits to support those operations.

In terms of increased regulatory standards, Yukon Electrical is now required to submit an environmental management and safety plan for the use of heavy equipment adjacent to or in close proximity to water courses and water bodies. This plan will need to be developed for various recurring maintenance activities as well as for the numerous infrastructure upgrades planned for the test period.

Monitoring of nesting shore birds will require coordination with Federal and Territorial environmental managers, all of which Yukon Electrical. Fisheries monitoring activities will require the submission of plans and obtaining secondary permits for sampling fish species. Salvage of stranded fish will require obtaining and reporting upon salvage permits. All of which were not part of the previous long term Water Use Licence.

Construction activities associated with the Fish Lake dyke, the Ditch #3 diversion, and the Ditch #3 drop box will involve development of submissions to the Department of Fisheries and Oceans to obtain and report upon secondary permits such as letters of advice. Plans for use of quarry sources, for traffic restrictions, and for construction waste disposal will also be required from various territorial agencies.

The Environmental Technician will also be the lead for the various permits that Yukon Electrical requires, including air emissions for all 11 Yukon Electrical power plants, special waste storage, Transportation Dangerous Goods air and diesel storage tank permits. This includes applying for amendments and renewals, maintaining compliance and reporting to the regulator as required.

YUB-YECL-21

Reference: Organizational Chart, YECL Application, Section 1, Attachment 1

Request:

(a) Please show the equivalent organization chart for YECL for 2009.

(b) The organization chart shows an allocation of 4.17 people from Head Office. How or by what positions was this work done in YECL's 2008-09 GRA? Where were those costs incurred?

(c) On page 2 of Attachment 1, please explain why there is a need for a supervisor for one person.

Response:

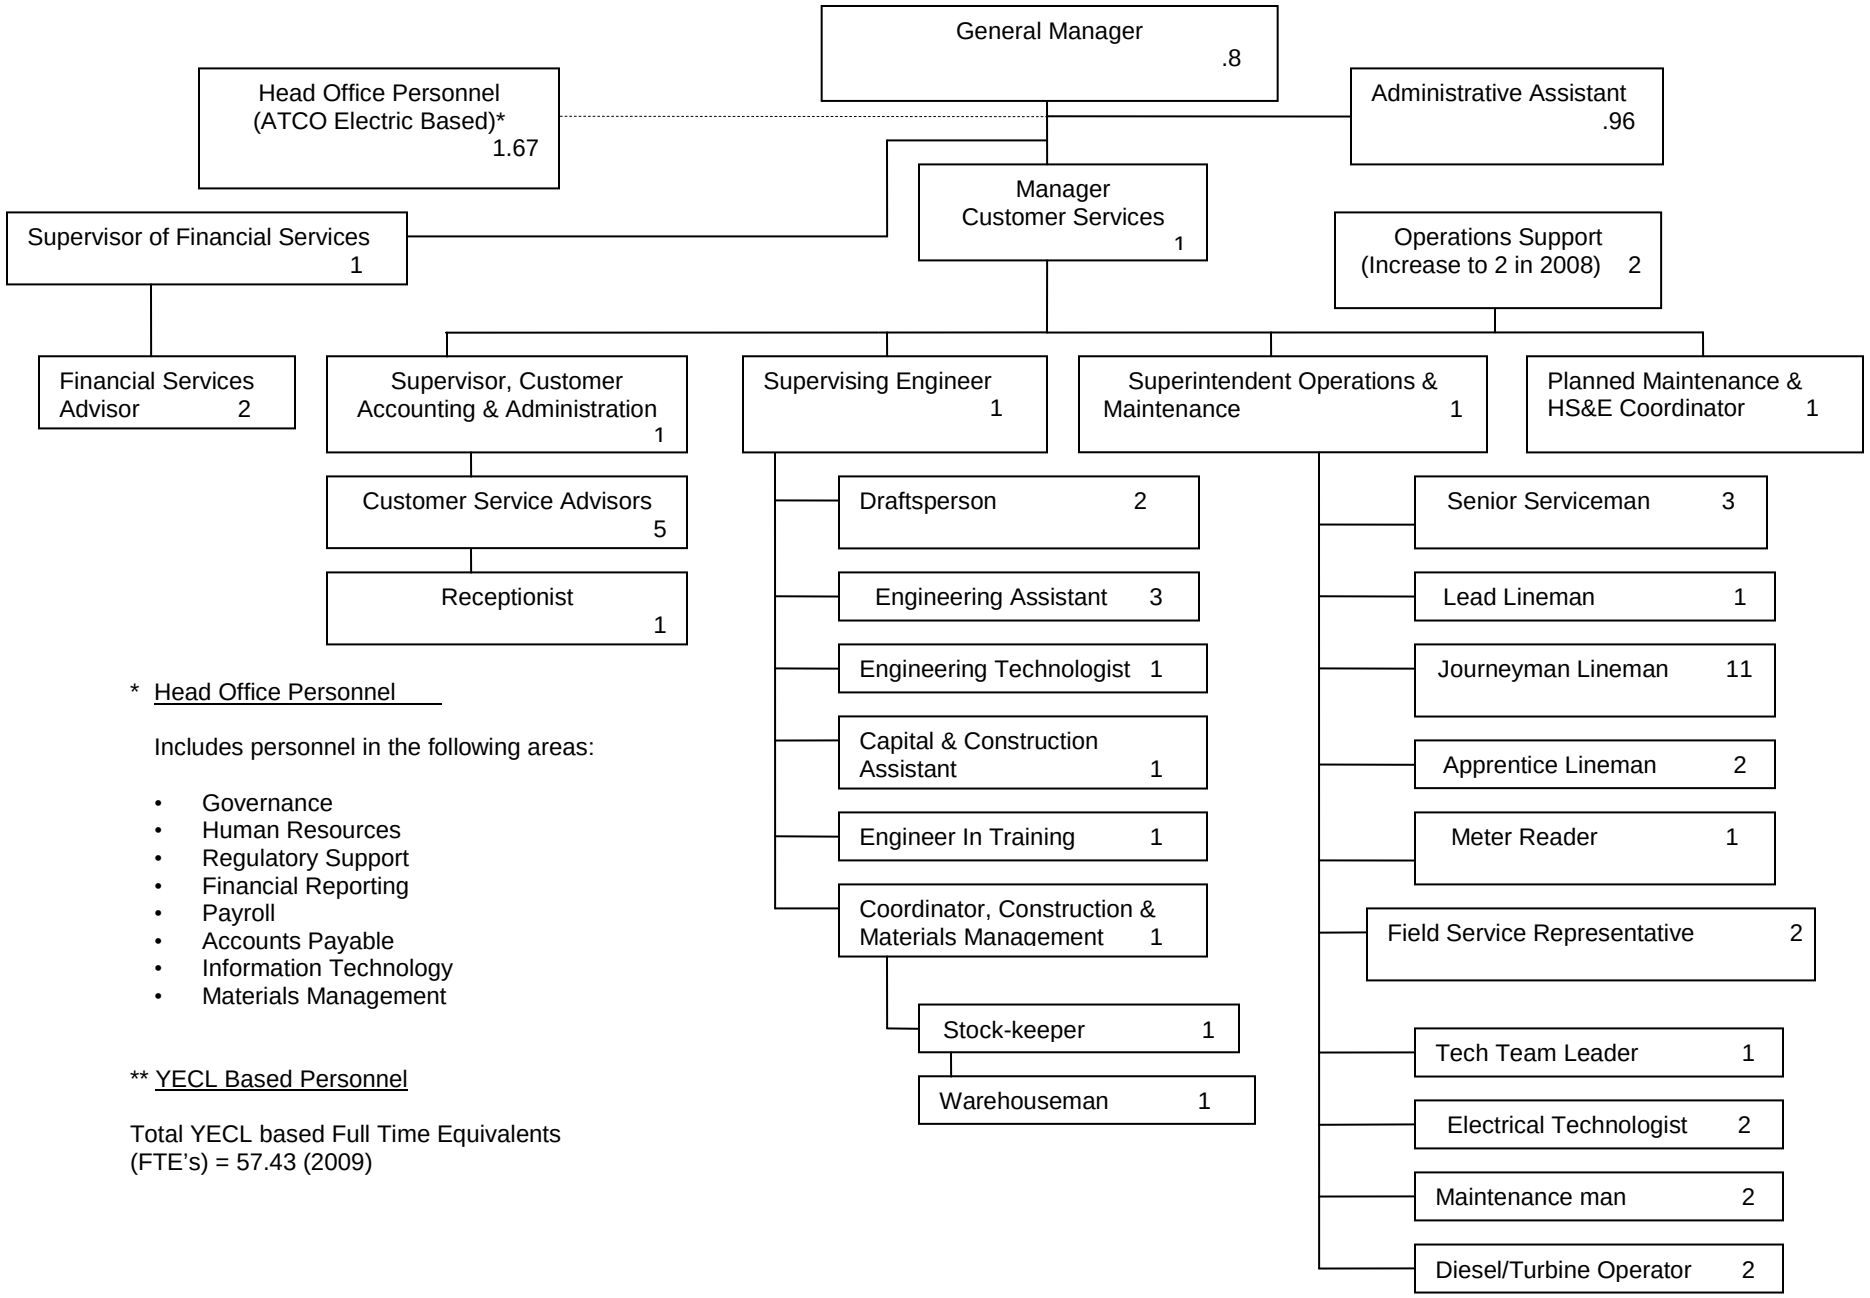
(a) Please refer to YUB-YECL-21(a) Attachment 1.

(b) Both Yukon Electrical's 2008-09 GRA and 2013-15 GRA include an allocation of 1.67 FTEs from Head Office for services related to Governance, Human Resources, Health & Safety, Regulatory Support, Payroll, Accounts Payable, and Materials Management. The allocation has increased to 4.17 since the 2008-09 GRA due to the addition of the Manager, Financial Reporting & Accounting, North of 60 (0.5FTE) and the Corporate Accountant (1.0FTE), which were added in 2012 to address increased workload. As well, the Supervisor, Financial Services (1.0FTE) position was relocated from Whitehorse to Edmonton in late 2011 as a sufficiently experienced and qualified candidate could not be recruited to be based in Whitehorse.

The costs of all of the FTEs allocated from Head Office are included in account 72100 – Administrative on Schedule 5.3 of the Application.

(c) Supervision of a Corporate Accountant is only one of the many duties assigned to the Supervisor, Financial Services. The title of Supervisor was given to the position to be consistent with other positions with a similar level of responsibility in the organization that include both individual contribution as well as supervisory responsibilities.

Organizational Chart
Yukon Electrical Company Limited
2009



* Head Office Personnel

Includes personnel in the following areas:

- Governance
- Human Resources
- Regulatory Support
- Financial Reporting
- Payroll
- Accounts Payable
- Information Technology
- Materials Management

** YECL Based Personnel

Total YECL based Full Time Equivalents (FTE's) = 57.43 (2009)

YUB-YECL-22

Reference: Staff Positions, YECL Application, page 1-7 to page 1-13, YECL Application, Attachment 1, page 1 to page 2

The Board needs more information regarding YECL's staff positions and the operational relationship between YECL and affiliates

Request:

(a) Please confirm that the Supervisor, Financial Services and the Corporate Accountant, who are based out of ATCO Electric's head office, work exclusively on YECL work.

(b) Please confirm that none of the costs associated with the employment of either the Supervisor, Financial Services or the Corporate Accountant are recovered by any other regulated affiliates.

(c) Please confirm that no more than 50% of the cost associated with the employment of the Manager, Financial Reporting and Accounting North of 60, for which YECL is requesting relief, are recovered by any of YECL's other regulated affiliates.

(d) Please explain in further detail the need for the Senior Corporate Communications Advisor. What changed in 2011 that required YECL to establish this position and staff it?

(e) Please provide an estimate of how much of the Senior Corporate Communications Advisor's efforts are spent on advertising campaigns and media relations.

(f) Please explain in further detail the need for the Financial Analyst. What changed in 2011 that necessitated this additional FTE?

(g) Please explain in further detail the need for the Administrative Assistant. What changed in 2011 that necessitated this additional FTE? Who was responsible for YECL's Safe Work Management System before this individual was hired?

(h) Please explain the reasoning for the Engineering Department's reorganization that lead to the creation of the Planning Supervisor position in 2012.

(i) For Meter Readers: Please quantify the increase in customers and further describe "to read meters effectively" (i.e., how was it not effective?).

(j) Once IFRS has been fully implemented, will the Manager, Financial Reporting and Accounting, North of 60 position be removed? If not, why not?

(k) Once IFRS has been fully implemented, will the Corporate Accountant position be removed? If not, why not?

(l) Please explain why YECL has decided to reinstate the Engineer-in-Training position in 2014 after it has been vacant since 2012?

(m) Please explain the need for the Construction Lead position. Before the Construction Lead was hired, who was responsible for overseeing external civil contractors and line crews? What has changed that has necessitated this position?

(n) Please compare the cost of outsourcing the work done by the Engineering Tech 1 Civil and bringing this work in house. If bringing this work in house is costlier than outsourcing to contractors, please provide YECL's justification for doing so. Please describe the offsetting cost savings of bringing this work in house and identify the account in schedule 5.1 that contains the forecast costs for this position.

(o) Please explain in further detail the functions of the Customer Service Advisor. How does this relate to the After-hours – Call Answering service that ATCO Electric provides to YECL? Are these functions redundant?

(p) Please explain the need for the Customer Service Representative. Before the position of Customer Service Representative was established and staffed who was responsible for this position's workload? What has changed that has necessitated this position?

(q) Please explain the need for the Environmental Technician. Before the position of Environmental Technician was established and staffed who was responsible for this position's workload? What has changed that has necessitated this position?

(r) YECL and YEC will jointly be administering the DSM plan and initiatives. Further, YEC is responsible for maintaining the Energy Conservation Office, which was part of its 2012-2013 GRA, and this office has two FTEs. Please explain whether YECL is responsible for any costs originating from the Energy Conservation Office?

(s) If YECL is responsible for any costs originating from the Energy Conservation Office, when were they recovered and is YECL trying to recover any of these costs in its 2013, 2014 or 2015 revenue requirement?

(t) Please confirm that most of the planning and research with regard to the DSM initiative has already been completed by consultants.

(u) Please confirm whether YECL has hired or plans on hiring a DSM Administrator in anticipation of approval of the DSM plan.

(v) Please confirm that the role of the DSM Administrator is to implement the DSM programs. If not, please explain what portion of this FTE is, or will be, dedicated to DSM program implementation. What other responsibilities will this position have?

Response:

(a) Confirmed.

(b) Confirmed.

(c) Confirmed.

(d) Until 2011, the functions of the Senior Corporate Communications Advisor were completed by part-time contractors who could not sufficiently fulfill the requirements or engage fully in the operations of Yukon Electrical. The Senior Corporate Communications Advisor is tasked to provide timely information and communication to the public regarding safety, outages, electricity conservation and customer billing. Additionally, this position provides internal communication to employees regarding updates and changes within Yukon Electrical and engages the service point communities for Yukon Electrical in providing community involvement and communication duties. This position requires

knowledge of the operations of Yukon Electrical to support communication when critical public safety situations arise. This position provides the same services to Yukon Electrical's Northwest Territories Affiliates, Northland Utilities (Yellowknife) Limited and Northland Utilities (NWT) Limited. The responsibilities to the two Northland Utilities companies account for 0.4 FTE of this position. This position requires a senior level of experience in corporate communications to deliver the needs of the companies and to deliver the expected level of communication services by the customers of these companies.

(e) The Senior Corporate Communications Advisor's efforts related to media relations and education campaigns including developing and delivering communications to the public through print, web and radio media along with internal communications for employees accounts for approximately 60% of the role.

(f) In 2011, capital spending increased substantially over prior years. The annual forecast of capital spending for each year from 2012-2015 is similarly higher than Yukon Electrical has historically experienced. As a result of the increase in capital spending, an additional financial resource was required to ensure that all projects are properly forecast, monitored and reported.

(g) The Administrative Assistant provides direct administrative and clerical support to the Manager and the Health, Safety and Environment Coordinator. Prior to this position being implemented, administrative and clerical support for these positions was completed by various other office employees in other departments depending on availability and workload. Increasing workload throughout Yukon Electrical resulted in unavailability of support from other departments. The Safe Work Management System did not have a lead person identified prior to the Administrative Assistant, who now ensures that timely and accurate reporting occurs.

(h) The Engineering department was reorganized in 2012 to address the increased capital program and the workload. The Planning Supervisor assumed the responsibility and tasks to ensure Distribution and Generation System Improvements are identified, designed, scheduled and completed. This responsibility was previously assigned to the Supervisor Engineering, Yukon Electrical's only Professional Engineer on staff. The Supervisor Engineer's workload was too great due to major responsibilities including: complete reviews of system impedance data, fault data or other data throughout Yukon Electrical's service area; ensuring power quality, reliability and electrical

utility standards are designed and met; approving all electrical and system designs; as well as being the lead interface for Yukon Electrical with external standards associations and regulators. The tasks of the Supervising Engineer cannot be outsourced.

(i) The communities that are served directly by the additional Meter Reader position are Whitehorse, Marsh Lake, Tagish, and Carcross and surrounding areas, as well as Deep Creek. At the end of 2012, there were 13,688 meters to read every month for these areas. Increases in the number of meters on a number of routes increased the workload to more than the 8 hour work days for the two Meter Reader positions. This resulted in increased error rates and an increasing trend of vehicle incidents that had inattention or working speed identified as root causes. Yukon Electrical acted on this situation to increase the staffing to an appropriate level. Yukon Electrical has also experienced a high turnover rate for these positions due, in part, to the workload and work speed needed to complete the daily reads. As well, additional support to read meters was covered by Field Service Representatives or Powerline Technicians until the third Meter Reader position was created.

(j) This new 0.5 FTE manager position will not be eliminated once the transition to IFRS is completed. Yukon Electrical fully implemented IFRS at the beginning of 2011. The Manager, Financial Reporting and Accounting, North of 60 position was added in mid-2012. This position was added after the transition to IFRS was completed, once the increased volume of on-going work related to IFRS and project support work as well as forecast regulatory activities was known.

With respect to IFRS, Yukon Electrical is now required to maintain two sets of financial records as a result of the various items which require different treatment for regulatory and financial statements purposes. The transition to IFRS was not simply a one-time project that was completed and then workload returned to pre-IFRS levels. Maintaining two sets of records adds complexity and additional reconciliation requirements to reporting for both regulatory and financial statement purposes. As well, there are now two sets of “rules” that accountants at Yukon Electrical have to understand and consider when recording transactions.

With respect to new project support work, this position is responsible to provide complete financial and business support in the development of all new initiatives, including such projects as LNG, net metering and IPP development.

With respect to regulatory, it is clear to Yukon Electrical that interveners are looking for ever increasing levels of granularity when it comes to the testing of past as well as forecast expenditures. This situation is demonstrated in Yukon Electrical's recent GRAs. For its 2008-2009 GRA, Yukon Electrical submitted an Application that was 372 pages long. For its 2013-2015 GRA, Yukon Electrical submitted an Application that was 1,881 pages long. Even without the 1,221 pages of the Application that contained the Yukon Five Year Demand Side Management Plan, the Application included an additional 288 pages of content or 77% more than the previous Application. Despite the additional information provided in its Application, Yukon Electrical still received 60% more Information Requests (1,128 in the current proceeding versus 707 in the 2008-2009 GRA proceeding). Responding to such a high volume of detailed IRs is a significant undertaking that requires the involvement of this position especially when considering Yukon Electrical does not hire outside consultants when completing the vast majority of this work.

In addition to helping lead and complete Yukon Electrical's 2013-2015 GRA, this position is will also be a key resource in providing support for Yukon Electrical's next Phase II Application, currently forecast to occur in 2014, as well as any Yukon Electrical involvement in future Yukon Energy applications that impact Yukon Electrical and its customers such as: General Rate Applications, new Power Purchase Agreements, or other applications such as the recently directed Diesel Contingency Fund and Rate Schedule 42 process. With the exception of legal, Yukon Electrical does not use outside consultants to complete this work.

(k) As discussed in part (j), Yukon Electrical has already completed its transition to IFRS and the increase in workload, including that resulting from maintaining two sets of books, is on-going. The Corporate Accountant, similar to the Manager, Financial Reporting and Accounting, North of 60, was added in 2012 once it was clear that it was not sustainable to have only one position working on all accounting, financial reporting and regulatory issues. Please also refer to part (j) for comments on the ongoing work needed to be completed for regulatory purposes.

(l) The reinstatement of the Engineer-in-Training position is due mainly to transition and succession planning for our Supervisor Engineering position. Yukon Electrical is able to participate in the ATCO Electric Engineering Program that is focused on the training and development of talent that can provide transition and succession planning. As the Supervising Engineer is a critical

position and is the only Professional Engineer at Yukon Electrical, it is reasonable and prudent to ensure proper succession planning is in place.

(m) The need for the Construction Lead position is due to the increased workload of Yukon Electrical's Construction department. The Coordinator, Construction & Materials Management had the responsibilities previous to the Construction Lead position being created. With the increase in capital work, both system improvements and new customer extensions, the Construction Department was reorganized to match the workload. The responsibility of the Construction Supervisor (formerly Coordinator, Construction & Materials Management), as the head of the Construction Department, includes managing, supervising and providing overall direction to construction planning, resource management, project tendering, materials management and contractor management. Increased workload necessitated the split in responsibilities of directing the in field power line and civil contractors and crew management to the Construction Lead. The Construction Supervisor is able to concentrate on the overall management of the Construction Department.

(n) The comparative rate of contractors Yukon Electrical has used for this work is $60 - $225/hour as indicated in WL-YECL-5(j) Attachment 1. The hourly pay scale for Engineering Tech 1 Civil is $35.51 – $50.10/hour for 2013. The creation of the Engineering Tech Civil 1 was to reduce dependency on external contractors and consultants. This position has the lead responsibility for the Fish Lake Hydro system in estimating, designing, scheduling and managing each infrastructure project to completion. The position also ensures all water management reporting, ongoing monitoring and the necessary reports are completed and given to the proper regulatory body.

This position's time is mainly allocated to capital projects. The 33.6% of the costs of this position charged to operations and maintenance expense in Schedule 5.1 are primarily included in 62600 (Hydro Generation), with small percentages allocated to 87300 (Distribution Maintenance), 72500 (Employee Expenses), 72600 (Training and Safety) and 84600 (Diesel Maintenance).

(o) A Customer Service Advisor works directly with our customers on their account inquiries in person or over the phone. The Customer Service Advisors duties include responding to residential and commercial account service inquiries, complaints and service requests including clarification of billing related questions; following up on billing irregularities; receipt of payments; and updating customer accounts. A Customer Service Advisor responds to customer billing

inquiries by accessing the ATCO Customer Information System (CIS). They arrange for the connection and disconnection of electrical service as requested by the customer. They also follow up on all past due accounts as identified by ATCO-CIS.

This position's responsibilities do not include After Hours call answering, so the position is not redundant. The regular office hours are 8:30 AM to 4:30 PM. The Customer Service Advisors only answer customer inquiries and direct emergency calls during regular office hours. The After Hours call answering service is for all hours outside regular office hours and is for emergencies only as no customer account information is available after regular hours.

(p) The Customer Service Representative position is not established and staffed, it is planned for 2014. This position is being created to provide new customers a single point of contact and clear direction on the development of their project to connect to the Distribution System. Regular feedback from new customers indicates confusion and frustration due to required contact with multiple departments during implementation, design, scheduling and construction of their project to connect to the distribution system. The overall goal is to improve customer service to new customer extensions. The position is responsible for creating the project scope and design in consultation with the customer, ensuring field checks; estimates and project scope are consistent with customer expectations. They monitor the overall project execution across multiple departments and follow up with specific departments to meet their commitment on proposed timeline to customer. They also ensure the Terms and Conditions are applied correctly and that any project issues are followed up to closure with customer. Currently, new customers engage directly with multiple employees in different departments to have their project completed.

(q) The Environmental Technician position is not established and staffed, it is planned for 2014. The Environmental Technician position is needed to ensure various new mandated environmental and regulatory reporting activities are completed. This includes monitoring of environmental protection and regulatory compliance for capital projects, diesel emission permits as well as Fish Lake Hydro system ongoing monitoring and studies. The workload for this position is currently spread across a number of employees including project leads and Engineering Assistants. The reporting was inconsistent as a result. There has been increased monitoring, reporting and applications for regular capital and maintenance activities that have to be submitted for YESAB review.

Also, with the renewal of various permits and licences, the environmental reporting requirements continue to increase.

(r) Yukon Electrical is not responsible for any costs related to YEC's Energy Conservation Office.

(s) Yukon Electrical is not responsible for any costs related to YEC's Energy Conservation Office.

(t) Confirmed.

(u) Confirmed. Yukon Electrical has hired a term DSM Coordinator.

(v) Confirmed. The DSM Coordinator position is fully dedicated to the implementation and delivery of DSM programs.

YUB-YECL-23

Reference: Line item – Display Change to YECL Billing Statements, projected expenditure of $260,000, YECL Application, page 9-51

To provide customers with additional electrical consumption information about their own consumption and to provide additional transparency about the electrical rate structure in the Yukon and how customer consumption translates to their actual electrical costs.

Request:

(a) Please explain in further detail the expected benefit that both the company and consumers will receive from changing the display in the electrical billing statements.

(b) Please provide a cost breakdown of the actions and/or processes required to make the billing statement change (e.g. programming, capital acquisitions, graphic design).

Response:

(a) The energy charge for residential and general service customers is based on a block structure in which each energy block is at a progressively higher cost. This rate structure is currently invisible to the customer, other than on the Yukon Electrical website, and is currently displayed as a combined total on the monthly statement. Most customers are unaware of the current rate block structure.

The monthly billing statement is the primary method used to communicate with customers and presents a unique opportunity to provide customers with information specific to their own consumption.

Displaying the block calculations supports public education goals in the proposed DSM programs and can provide additional information to customers considering electricity conservation measures.

Providing the customer with the calculations in each applicable block will provide additional clarity in understanding the financial impact of using more electricity.

(b) The project will consist of the following steps, which include multiple programming changes, Central Processing Unit time, and extensive testing:

- $62,000 - Configure ATCO-CIS (Customer Information System) company parameters for Yukon Electrical to display energy block calculations on the statement. This requires programming changes to core components of the software.

- $79,250 - Configure the ATCO-CIS Statement display process to present the detailed calculation of the consumption used in each charge period on the customer's monthly bill. ATCO-CIS is currently configured to summarize the total of the energy block calculation as a single "energy charge". This requires changes to statement layout and design as additional space will be required for the block display.

- $54,000 - Configure rates for all customer classes to display blocks for the energy component, the programming changes impact twenty different rates.

- $54,750 - Perform user acceptance testing in the test environment before elevation of program changes to the production environment. This process involves testing various charging scenarios for all twenty rates including:

  - Normal billing period
  - Multiple billing periods
  - Multiple service accounts on a single statement
  - Initial bill
  - Final bill
  - Proration of energy block calculations over a rate change

- $10,000 - Elevation of all changes to production environment.

YUB-YECL-24

Reference: Demand-side management as it relates to revenue requirement, YECL Application, Business Case #30, page 1

Yukon Electrical, in partnership with Yukon Energy (YEC), has developed a five-year plan (2013-2018) to implement and measure demand-side management (DSM) programs for the Yukon that is being filed with this Application.

The Board seeks clarification on forecast costs related to DSM planning and implementation.

Request:

(a) Based on the quote above, please confirm that YECL anticipates implementing the DSM programs in 2013.

(b) On page 6 of Business Case #30, YECL submitted that Project Costs were $204,000, $143,000, $135,000, $522,000, $730,000 in 2011, 2012, 2013, 2014 and 2015 respectively. Please provide an update on how much YECL has actually spent on DSM to date since 2010. What were these costs for? Please delineate these costs.

(c) Have any costs related to DSM been expensed or gone into YECL's revenue requirement? If so, which accounts have been affected and by how much?

(d) Please provide the cost/benefit analysis for this business case.

Response:

(a) Yukon Electrical has been working with Yukon Energy collaboratively since 2011 to build a Demand Side Management plan for the Yukon. As part of the initial preparation for potential programs, a Conservation Potential Review (CPR) was completed. From that document, it was determined there was potential for electricity savings from DSM in the Yukon. The next stage involved developing a Program Portfolio, an Implementation Plan and an Evaluation, Measurement and Verification Plan. The utilities are now in the process of preparing for an anticipated public launch of DSM programs in late Q2 of 2014. This preparation

includes preparing internal systems and processes, engaging market actors, developing branding and marketing materials and developing an interactive customer website. This assumption is based on YUB approval of the programs as filed.

(b) Please refer to the *YECL-DSM Costs 2011-2015* spreadsheet, provided as YUB-YECL-24(b) Attachment 1, for details of Yukon Electrical costs related to DSM.

(c) Yes, costs related to DSM have gone into Yukon's Electrical revenue requirement. The DSM costs as outlined in Business Case #30 are included in capital additions for 2011-2015 and are included as additions to rate base beginning in 2013, on the assumption that the forecast costs will be approved as filed.

It is Yukon Electrical's intention to capitalize all costs associated with the DSM program. However, in preparing the responses to Information Requests, it was discovered that some costs had inadvertently been included in both Operations and Maintenance expenses and Capital. These amounts total $88,000 for 2013, $90,000 for 2014 and $92,000 for 2015. This duplication will be rectified by the removal of costs from O&M and this will be corrected and submitted as part of Yukon Electrical's compliance filing.

(d) The Yukon Electrical Business Case #30 is based on the *Yukon Five Year Demand Side Management Plan*. A cost/benefit analysis of the plan was completed and is based on the four standard cost effectiveness tests described in Appendix F of the *Yukon Five Year Demand Side Management Plan* included in the Application. The analysis of the cost/benefit ratios for each program as well as the total plan can be found in Exhibit 4 on page 15 and Exhibit 5 on page 16 of the *Yukon Five Year Demand Side Management Plan* included in the Application.

The Yukon Electrical Company Limited
Breakdown of DSM Costs - 2015

Expenditure Type		Amount
DSM ADMINISTRATOR	$	93,000.00
STAFF TRAINING AND DEVELOPMENT

YUB-YECL-25

Reference: Electricity consumption in the Yukon, Yukon Five Year Demand Side Management Plan, Page 4

The CPR shows that in 2010, Yukon's residential sector consumed about 146,000 MWh of electricity

The Board requires the most up-to-date information available.

Request:

(a) Do YEC and YECL have an update of how much electricity is consumed in the Yukon for both the residential and commercial classes?

(b) Has the DSM program been implemented yet?

(c) To date, what activities have YEC and YECL conducted with regard to implementation of DSM? What has YECL done?

(d) What elasticity studies has YECL undertaken with respect to the demand for electricity? Please provide the results of those studies.

Response:

(a) The most up-to-date sales numbers as provided by each utility are detailed below:

Yukon Energy	2011 Residential – 12,834,145 kWh
	2011 Commercial – 21,537,664 kWh
	2012 Residential – 13,288,643 kWh
	2012 Commercial – 22,445,877 kWh
Yukon Electrical	2011 Residential – 141,696 MWh
	2011 Commercial – 150,591 MWh
	2011 Lights – 4,179 MWh
	2012 Residential – 150,350 MWh
	2012 Commercial – 159,562 MWh
	2012 Lights – 4,331 MWh

(b) No, DSM programs have not been implemented; however activities to prepare for program implementation have been on-going since 2011. As part of initial preparation for potential programs a Conservation Potential Review (CPR) was completed. From that document it was determined there was potential for electricity savings from DSM in the Yukon. The next stage involved developing a Program Portfolio, an Implementation Plan and an Evaluation, Measurement and Verification Plan. The utilities are now in the process of preparing for an anticipated public launch of DSM programs in late Q2 of 2014. This preparation includes preparing internal systems and processes, engaging market actors, developing branding and marketing materials and developing an interactive customer website. This assumption is based on a YUB approval of the programs as currently submitted.

(c) Yukon Energy and Yukon Electrical have cooperatively developed: the Conservation Potential Review for the Yukon; the Program Portfolio; the Program Implementation Plan; and the Evaluation, Measurement and Verification Plan. These plans are the foundation of public programs to be delivered to residential and commercial customers in order to meet the utilities' goal of 8.5 GWh of sustained electricity savings by the end of the five-year program cycle. Yukon Electrical has partnered with Yukon Energy on all of these initiatives.

(d) Yukon Electrical has not performed an analysis of the elasticity of demand for electricity due to the complexity of the study, lack of appropriate data and extensive amount of time it would take to perform such a study. However, based on a survey of studies reported for some jurisdictions in the U.S. by the Electric Power Research Institute titled, "Price Elasticity of Demand for Electricity: A Primer and Synthesis", dated January 2008, the elasticity of demand for general electricity use is estimated in the range of -0.2% to -0.6% in the short-run (1-5 years), and -0.7% to -1.4% in the long-run for residential customers, and between -0.2% to -0.7% in the short-run, and -0.8% to -1.3% in the long-run for commercial customers. Based on these numbers, for example, a 10% increase in the price of electricity of the residential rate class in the short-run would result in, everything else being constant, a 2% to 6% drop in electricity consumption by residential customers. For commercial customers, the same increase in price in the short-run would result in, everything else being constant, a 2% to 7% drop in electricity consumption. It should be noted that these elasticity estimates were all derived for jurisdictions with enabling technologies that provide for some sort of time-variable pricing (dynamic pricing) such as Time of Use, Critical Peak Pricing, or Real Time Pricing. As such, these customers are more aware and capable to react to price changes, if they choose to do so.

YUB-YECL-26

Reference: Public messaging and programing, Yukon Five Year Demand Side Management Plan, Page 8

The working group will jointly agree to develop: a program delivery process, electricity conservation public messaging, youth education programming, stakeholder consultation, evaluation, measurement, and verification of programs.

The Board wants to further understand how YEC and YECL plan on evaluating, measuring, and verifying program effectiveness

Request:

(a) Please describe how YEC and YECL plan on evaluating, measuring and verifying whether the electricity conservation public messaging is effective.

(b) Please describe how YEC and YECL plan on evaluating, measuring and verifying whether the youth education programming is effective.

(c) Please describe how YEC and YECL plan on evaluating, measuring and verifying whether the stakeholder consultations have been effective.

Response:

(a) The utilities will retain a third-party evaluation, measurement and verification (EM&V) contractor to look over the entire program portfolio and report on its effectiveness to the YUB. The utilities have prepared a set of performance indicators related to conservation public messaging. For example, a number of new market actors being engaged with, number of people attending classroom training, 1-to-10 scale level of satisfaction with the training on average, etc. These examples can be found on pages 32 and 33 of the *DSM Program Evaluation Measurement and Verification Plan*, provided as YUB-YECL-26(a) Attachment 1.

(b) The youth education component of the program is captured in the residential sector engagement, education and communication plan on page 95, section 4.4

of the *Yukon Five Year Demand Side Management Plan* included with the Application. This program is also subject to the EM&V plan.

(c) The utilities do not intend to explicitly ask the independent evaluators to comment on the effectiveness of the stakeholder consultations in a direct manner. It will be left to the independent evaluators to decide if they want to comment on them. As part of the process evaluation, evaluators will be provided with full access to the program documentation including, but not limited to: the Conservation Potential Review report and the market consultation / characterization documentation (reports, interview guides, protocols, consultations notes and so on).

Demand-Side Management (DSM) Program Portfolio for the Yukon

FINAL

Evaluation, Measurement and Verification Plan

1. Introduction

Yukon residents rely on electricity not only to live meaningful, healthy lives but also to support and strengthen the economy. Given the concerns over environmental implications including climate change, and the limited generating capacity in the Yukon, there is growing interest not only in how electricity is generated, transmitted and distributed but also how efficiently it is used at the customer's end. In the Yukon, as well as in a growing number of North American jurisdictions, how electricity is generated and used is being closely analyzed to find innovative ways of meeting individual and corporate energy service needs while minimizing pollution and the creation of greenhouse gases.

In response to these conditions, the Yukon Energy Corporation (YEC), Yukon Electrical Company Limited (YECL) and the Yukon Government collaboratively commissioned a comprehensive study of the opportunities for electricity demand-side management (DSM) within the Yukon. That study, entitled *Conservation and Demand Management Potential for the Yukon 2011*, was completed in January 2012 and revealed a significant cost-effective potential for electricity DSM in the Yukon.

Based on those findings, the YEC and YECL developed a suite of residential and commercial sector program offerings that will enhance the Yukon's electricity DSM program portfolio and provide incremental annual electricity savings of 9.3 GWh/yr by the fifth year of the program. The results of the development work are presented in a report, entitled *Demand-Side Management Program Portfolio for the Yukon* (also known as Program Design Document), which was completed in September 2012.

The final step in the DSM planning process involved the development of a program implementation plan (PIP) suitable for submission to the Yukon Utilities Board, together with an evaluation, monitoring and verification (EM&V) plan.

This report presents the recommended evaluation, measurement and verification (EM&V) plan for the Yukon DSM portfolio; it accompanies the PIP, which has been delivered under separate cover.

1.1 Objectives & Scope

The objectives of this EM&V plan are:

- To define an EM&V framework that will enable the Yukon Utility Board (YUB) to protect the interests of the ratepayers and maximize the value of DSM for all stakeholders, while also being compatible with the size of the Yukon market.
- To document the program's original theory and objectives for the evaluators to establish the basis for measuring success.
- To develop a high-level EM&V methodology and work plan to confirm the funding level, foresee data collection needs, and incorporate EM&V considerations into the regular program operations, accounting and management functions.
- To support the selection of program evaluators by providing a high-level description of the tasks and capabilities required.[1]

There are three audience groups for this report:

- The DSM program administration staff and the utility management committee.
- The Yukon Utility Board (YUB), the interveners, and other stakeholders.
- The selected evaluators.

The approach presented in this report is preliminary, and should be considered as a suite of options which, as a whole, represent EM&V best practice. The final evaluation scope will be determined through the stakeholder engagement process.

1.2 Report Presentation

The remainder of this report is organized and presented in the following sections:

- Section 2 introduces the recommended EM&V framework for electricity DSM in Yukon.
- Section 3 provides an overview of the Yukon DSM and defines a high-level approach, key milestones and deliverables, and a schedule for EM&V activities.
- Section 4 presents the description, program theory, management by objective (MBO) framework and methodological implications for each of the program elements within the DSM portfolio.
- Section 5 presents an approach, guidelines and criteria to select impartial and capable evaluators.

[1] The team developing this EM&V plan was also involved in the development of the program portfolio. Evaluators will be selected outside of the development team to avoid any conflict of interest. After being selected, the impartial evaluators will provide their expert opinion on the methodology and work plan, gather comments from relevant stakeholders, edit and finalize the EM&V plan.

2. EM&V Framework for DSM in Yukon

Section 2 sets out the recommended high-level characteristics of the DSM evaluation framework for the Yukon. The discussion is organized into the following sub sections:

- General approach
- Rationale for DSM evaluation
- Targets and performance indicators
- Level of rigor and funding
- Applicable evaluation best practices
- Roles and responsibilities
- Technical reference manual and deemed savings

2.1 General Approach

A sound evaluation framework should lay the ground for superior energy conservation policy planning and program management to increase the value of DSM for the Yukon ratepayers and society. The key is to balance:

- The Program's need for quick program performance feedback and for flexibility to adapt the DSM portfolio to changing market conditions.
- The expectation of the DSM program participants for excellent customer service from the Utilities which in many cases implies swift processing of a minimal amount of paperwork.
- The need of the regulator to ensure ratepayer monies are being used in an effective and efficient manner to achieve energy impacts.
- The need of the Yukon society for a self-improving DSM program portfolio, which monitors market feedback, and applies educated and evidence-based recommendations to improve the portfolio.

The recommended approach for the Yukon is a two-layer portfolio monitoring approach:

- **Internal Tracking and Performance Reporting:** DSM program administration staff will track a set of indicators as defined below. Indicators are monitored by diligently inputting data into a program tracking system (program database) and periodic reports are generated (quarterly, yearly) that compare actual results against targets. This will enable the program administrator, as applicable, to justify results, suggest corrective measures and update targets for the next period.
- **Third-Party Program Evaluation:** The Utilities will employ third-party evaluators that will carry out a set of verification, research and reporting activities as defined in this report. Third-party program evaluation provides a check and balance that is superimposed on internal tracking and performance reporting. The program evaluators will retrieve the program database and documentation; check that program procedures and eligibility criteria were complied with by the administration staff; retrieve additional market data through consultation, surveys and other research methods; use advanced energy analytics to improve the accuracy and precision of the impact estimates; and provide constructive criticism of the DSM portfolio.

This EM&V plan focuses primarily on the second layer: *third-party program evaluation*. The tracking and performance reporting infrastructure and functions were described extensively in the Program Implementation Plan. This EM&V plan will refer to tracking when tracking data is needed for evaluation purposes.

The EM&V plan was built based on a 5-year DSM portfolio planning and operation cycle; thus with a 5-year impact evaluation reporting cycle. A 3- to 5-year cycle is standard practice in the industry because it maximizes the value of evaluation. A 5-year cycle was preferred as a means of constraining the EM&V costs. This recognizes the relatively small size of the Yukon DSM market and, consequently, the relatively small size of the DSM budget.

2.2 Rationale for DSM Evaluation

Evaluation is meant to improve DSM program performance such that it sustainably obtains incremental electricity and demand savings. The high-level objectives of DSM evaluation are:

- **Establishment of DSM as a credible and reliable resource:** DSM evaluation increases the accuracy and precision of the impact estimates (e.g. avoided kWh and kW) thus making DSM impact claims worthy of being compared with supply-side resources. The power system planners need to trust in DSM if they are to postpone or curtail supply-side investments on the basis of the DSM projections; actually postponing and curtailing these investments is key to realizing a large portion of the societal benefits of DSM.
- **Explanation of the performance of the programs:** Evaluation helps DSM administration staff interpret the tracking data, and explains why certain programs have under-performed or over-performed. Evaluators consult with several market actors to obtain insights on the reactions of the market to the DSM programs and to seek solutions.
- **Recommendations to adapt and improve programs:** Evaluators will use the results of their research and consultation in Yukon, as well as their experience with DSM in other jurisdictions, to make educated recommendations to adapt and improve the DSM portfolio. For example, those recommendations can include the identification of: subtle tune-ups of operating practices; promising new tactics; ineffective tactics; new DSM opportunities: exit strategies for specific program elements; and, changes in the delivery approach.
- **Accountability of the DSM program administrator:** Evaluators will have access to all of the program documentation including the CPR report, the market characterization reports, the PIP, the tracking database, communication materials, meeting minutes, performance reports, budget and planning, etc. They will identify issues, if any, with the approach to planning and taking programs to market, record keeping practices, data quality control procedures, the timeliness of the application processing, performance indicators, mid-course portfolio adjustments, and ultimately the DSM management and administration practices.

2.3 Targets and Performance Indicators

The utilities will aim to achieve total net electricity savings that are equal to or greater than the total amounts presented in the DSM portfolio projections, and at a total cost that is equal to or less than the total amount presented in the DSM budget (see the Program Design document). However, the utilities will have the flexibility to move targets and budgets between the DSM program elements to adapt to changing market conditions and early program results. Quarterly budgets will also be flexible as long as annual budgets are complied with.

The performance of the program will be measured through the following three sets of activities:

- The performance will be periodically monitored by the DSM administration staff by comparing *key performance indicators* (KPIs) with pre-established targets – that will include kW and kWh savings, or *impacts*.
- The KPIs will be validated by the evaluators by conducting a desk review of the program database and the program documentation, additional research activities, and advanced energy analytics.
- The evaluators will also establish and monitor additional indicators (*evaluation indicators*) to verify that the DSM portfolio is being delivered effectively and that it generates sustainable positive changes in the market.

The program activities will be tracked and performance will be reviewed according to the report and planning schedule presented the Program Implementation Plan (See Section 4.4).

Tracking – Key Performance Indicators

The program accounting system and internal tracking systems will report on the KPIs for each of the program elements of the DSM portfolio. The most important KPIs are listed below.

1. Number of transactions and number of business days of average processing time
2. Incentive disbursement cost
3. Program cost and administration cost
4. kWh and kW savings (gross)[2]
5. Number of transactions being verified on site (to be determined with the DSM administration staff at the preparation stage and then validated by the EM&V contractor)
6. Direct-engagement indicators (to be determined with the program staff at the preparation stage)
7. Indirect communications indicators (to be determined with the program staff at the preparation stage)

The targets for KPIs (1) to (5) above were set out in the projection tables presented in the Program Design Document. KPIs (6) to (8) will be established during program set up in collaboration with the core program staff.

In addition to the information required to track the KPIs above, the evaluators will designate a limited number of information items to be collected for EM&V purposes.

[2] The tracking system will report on net impact if a stipulated net-to-gross ratio is used.

All KPIs computed by the DSM accounting system and the tracking system(s) will be verified by evaluators. The evaluators will also validate the approach to on-site verification, and the information items being collected through the applications and forms for verification purposes.

Evaluation – Evaluation Indicators

In addition to the KPIs stated above, evaluation indicators will be established and documented through EM&V to test the effectiveness of the DSM portfolio delivery mechanisms.

Both the KPIs and the evaluation indicators and targets will be laid out in detail in a management-by-objective framework (MBO framework). The suggested MBO Framework is presented in Section 4.

2.4 Level of Rigor and Funding

The value of EM&V can also to be maximized through setting realistic expectations for the precision and accuracy of the impact estimates. The cost of evaluation grows exponentially as the level of rigor is set higher, and since the cost of DSM remains lower than supply-side options it is common to tolerate a wider margin of error.

One common approach is to set the level of EM&V funding and then establish what is achievable in terms of evaluation scope as well as accuracy and precision of expectations. This is the approach used in this EM&V plan.

Most industry standards suggest allocating 3 to 10% of total program funds to EM&V, where the higher end of the range is for (1) newer programs and (2) smaller programs. It is expected that the Utilities' new DSM programs will be small programs relative to most other jurisdictions. Thus, the Utilities expect to invest between 5 and 8% of the DSM budget in EM&V. The current EM&V plan reflects this level of funding.

The accuracy and precision are to be recommended by the evaluation contractors when bidding on the evaluation work. The level of rigor is to be differentiated by program element. The evaluators shall seek to allocate more resources to program elements that have yielded the highest impact (based on KPIs).

2.5 Applicable Evaluation Best Practices

The Utilities intend to follow the general principles of the California Evaluation Framework[3] and the California Evaluation Protocols (a.k.a. Evaluators' Protocols)[4] but at a level of rigor that is consistent with the size of the overall program.

The two reference books noted above are suggested for the Yukon because:

- The North-American DSM evaluation industry is familiar with them. Few evaluation references are more used than these two California documents; they are the result of extensive work by dozens of evaluation professionals to collect and consolidate EM&V methods and options that had been used successfully at the time. The selected evaluators will be at ease.

[3] **CPUC**, *California Evaluation Framework*, TechMarket Works, USA, 2004, [ONLINE] As seen on March 25, 2013, URL: http://www.calmac.org/publications/California_Evaluation_Framework_June_2004.pdf
[4] **CPUC**, *California Energy Efficiency Evaluation Protocols: Technical, Methodological, and Reporting Requirements for Evaluation Professionals*, USA, 2006, [ONLINE] As seen on March 25, 2013, URL: http://www.calmac.org/events/EvaluatorsProtocols_Final_AdoptedviaRuling_06-19-2006.pdf

- They are comprehensive reference books with a wealth of methodological options from the most basic to the highest level of rigor, for many types of evaluation, and for a vast array of program designs. They are versatile and flexible.
- Both handbooks refer to the International Performance Measurement and Verification Protocol (IPMVP)[5] for larger projects that justify investing in actual field measurements, as required.
- In addition to project-level M&V, these handbooks accommodate one or many approaches to carrying out impact estimates: billing analysis, sampling and the use of statistics, deemed savings, and advanced engineering methods.

Most of the EM&V methods that will be put forward will need to be defined and/or positioned relative to the recommended approaches suggested in the Evaluation Framework and the Evaluators' Protocols.

Evaluators will be expected to make an educated use of the California handbooks. They will be able to suggest alternate approaches and methodologies, as appropriate.

2.6 Roles and Responsibilities

The Utilities intend to employ one third-party evaluation contractor for both the General Service Program and the Residential Program.[6]

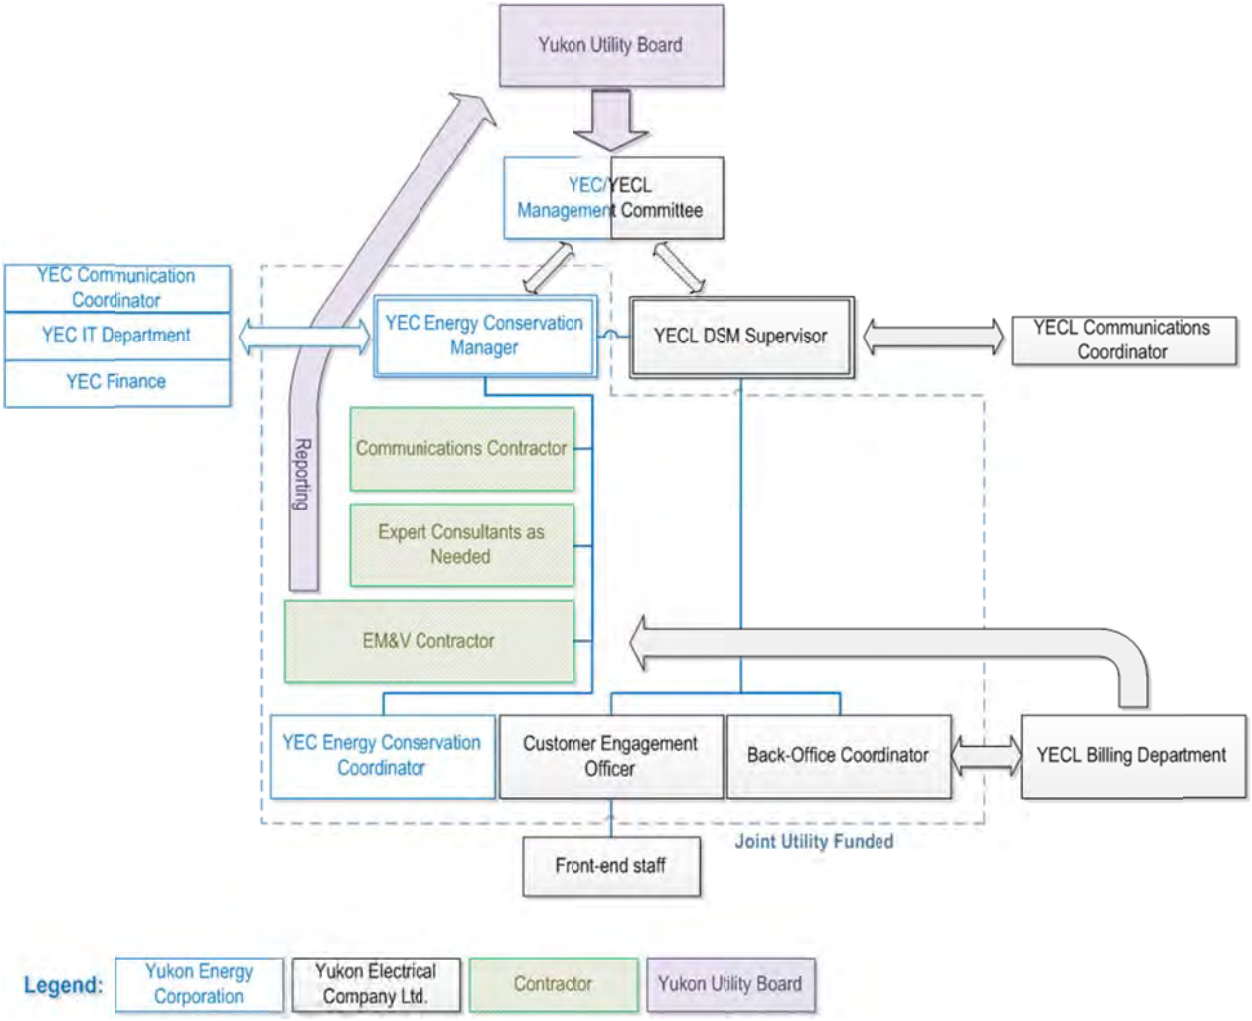
The value of EM&V will be maximized through a practical division of responsibilities between DSM administration staff and the EM&V contractor. For example, certain measurement or site-visit activities can be carried out and documented by the administration staff as part of regular tracking at a much lower cost than if they were to be performed by the EM&V contractor. In this case, the logs and documentation would be reviewed by the contractor.

[5] **EVO**, *International Performance Measurement and Verification Protocol, Volume I, 2012*, USA 2012, [ONLINE] As seen on March 25, 2013, URL: http://www.evo-world.org

[6] It is desirable to retain one EM&V contractor for both the General Service Program and the Residential Program because the total budget envelope for evaluation is relatively small and bundling will allow for economies of scale. In addition, DSM will benefit from the EM&V contractor having flexibility to assign resources among the program elements based on actual impact and/or expenses to date in order to maximize the value of evaluation.

Exhibit 1 outlines the anticipated organization of key roles once the program is fully launched and is in full operation. An explanatory note is presented in tabular format following the chart that presents the tracking and EM&V responsibilities for the key players involved in the operation of the DSM portfolio, and how they relate to the Management Committee and the YUB.

Exhibit 1: Organization Chart during Full Program Operation



Position	Payroll	Role/Responsibility with Regard to EM&V
YEC Energy Conservation Manager	YEC	• Jointly accountable with the YECL DSM Supervisor for deliverables (e.g. schedule, scope, budget, resources) as outlined in the Demand Side Management Program Portfolio. • Jointly report to YEC/YECL Management Committee in coordination with YECL DSM Supervisor. • Jointly develop the budget and the plan for next year and defend it in front of the YEC/YECL Management Committee with YECL DSM Supervisor. • Develop the initial EM&V plan – to be finalized through consultation with the EM&V Contractor, YECL DSM Supervisor, the YEC/YECL Management Committee, and the YUB.

Position	Payroll	Role/Responsibility with Regard to EM&V
		• Prepare reports and documents to be filed with the YUB under the supervision of YEC/YECL Management Committee (most likely made of extracts from the aforementioned reports, budgets and plans). • Procurement of the services of the EM&V contractors, and expert consultants when needed. • Coordination between the positions or resources shown in Exhibit 1. • Update the detailed work plan on a sliding quarterly basis. • Quality control/quality assurance of the EM&V Contractors' deliverables. • Monitor the customer engagement KPIs • Work jointly with the YECL DSM Supervisor to update and approve of the engagement plan updates by the YECL Customer Engagement Officer.
YEC/YECL Management Committee	YEC or YECL	• Review and comment on the reports, budgets and plans drafted by the YEC Energy Conservation Manager and the YECL DSM Supervisor. • Provide directions to the YEC Energy Conservation Manager and the YECL DSM Supervisor on the reports and documents to be filed with the YUB, review and approve these documents and file them. • Work with the YEC Energy Conservation Manager and YECL DSM Supervisor to address comments from the YUB and interveners.
YEC Energy Conservation Coordinator	YEC	• Maintain the tracking system, control the quality of the data inputted into the system. • Extract reports from the accounting system and the tracking system for the YEC Energy Conservation Manager (KPIs, charts, etc.). • Supports the YEC Energy Conservation Manager with the development of quarterly or annual reports. • Support the YEC Energy Conservation Manager with EM&V, with selecting the EM&V Contractor, and with the coordination with the EM&V Contractor. • Support the YEC Energy Conservation Manager with selecting technical experts as needed, and with the coordination with these experts. • Provide technical assistance to all inCharge personnel as needed.
YECL Back-Office Coordinator	YECL	• Handles applications and completion forms. • Feeds the tracking system with transactional information as required in the operation manual. • Proceeds with in-situ verification of a few transactions (spot-check verifications that are going to be selected randomly).
YECL Billing Department	YECL	• Send utility billing data to EM&V Contractor as needed and when needed, directly to the contractor, and under a confidentiality agreement with the contractor.
YEC Finance	YEC	• Support the YEC Energy Conservation Manager with program time and expense tracking based on the work package structure/budget breakdown structure (WPS/BBS).
YEC Information Technology (IT) Department	YEC	• Support the YEC Energy Conservation Coordinator with tracking system maintenance. • Collaborate with the Communication Contractor to monitor traffic on the inCharge website.

Position	Payroll	Role/Responsibility with Regard to EM&V
Communications Contractor	Contractor for YEC	• Record keeping on the engagement and communication activities to be determined during the set-up stage.
YECL DSM Supervisor	YECL	• Jointly accountable with YEC Energy Conservation Manager for deliverables (e.g. schedule, scope, budget, resources) as outlined in the Demand Side Management Program Portfolio. • Jointly report to YEC/YECL Management Committee in coordination with YEC Energy Conservation Manager. • Coordinate with YEC Energy Conservation Manager to ensure business needs are met. • Review and approve the detailed work plan when updated by the YEC Energy Conservation Manager. • QC/QA of all of the communication materials being generated by the YEC Energy Conservation Manager and the Communications Contractor. • Record keeping on the engagement and communication activities to be determined during the set-up stage.
YECL Communications Coordinator	YECL	• Support YECL DSM Supervisor as needed.
Customer Engagement Officer	YECL	• Log the events or actions in order to compute the engagement KPIs. • Log program transactions (for example: program applications) that YECL channels to YECL Back-Office Coordinator with time stamps. • Track incentive reimbursements coming from YEC; and make sure there are no discrepancies between the tracking information of YECL and that of YEC. • Regarding the above, investigate any discrepancy as soon as possible. • Gather data on direct program time and expenses on YECL side and provide to YEC as part of quarterly reporting, present the time and expenses based on the WPS/BBS.
Yukon Utility Board (YUB)	YUB	• Look out for the interests of the rate payers and authorize the use of rate payers' monies on DSM. • As such, the YUB requires DSM to be implemented in a rigorous, cost-effective and optimal manner. All documents filed with them should demonstrate these attributes. • They achieve the above by asking questions and making comments on the reporting and planning documents filed with them; in particular the EM&V reports.
Evaluation, Measurement and Verification (EM&V) Contractor[7]	Contractor for YEC	• Finalize the evaluation, measurement and verification plan. o Review the tracking system and procedures, and recommend changes to maximize the value of EM&V. o Establish key "deemed" values to be used in the tracking system such as deemed savings for certain prescriptive conservation measures, a deemed net-to-gross ratio, and so on (Refer to Section 2.7 for more details). o Collect some additional market baseline information if and as needed.

[7] Refer to Section 4 for more details.

Position	Payroll	Role/Responsibility with Regard to EM&V
		• Carry out a process evaluation study when the DSM portfolio will have had a few quarters of operation (2 to 6). o Do some quality control/quality assurance of the program impacts as computed by the tracking system. • Carry out an impact evaluation study during the last year of operation of the DSM portfolio to validate the program impacts as computed by the tracking system.
Expert Consultants	Contrac-tors for YEC	• Support inCharge staff as required, to update the prescriptive incentive lists (both the incentive level and the eligible products). • Carry out project-level M&V on larger projects (like HE Refrigeration projects, or the residential innovative heating system projects).

Readers can refer to Section 4 of the PIP for additional details about the roles and responsibilities of the above positions in the context of program launch and operation, including their roles and responsibilities beyond EM&V.

2.7 Technical Reference Manual and Deemed Savings

The Utilities envision working with the EM&V contractor to build and verify a technical reference manual (TRM)[8]. The TRM will then be used to track program performance and evaluate program impacts.

A TRM is a repository of all of the project inputs and assumptions (PIAs) used to compute the program impact of *prescriptive conservation measures*. Most of the "smaller" energy conservation measures in the program portfolio will be treated as prescriptive conservation measures (for example the residential LED lamps, automotive heater timer, and ENERGY STAR Computers).

Each PIA usually includes the following items:

- Data to estimate impact and compute cost-effectiveness tests: Annual electricity savings, peak demand savings, measure incremental cost, and measure lifetime.
- Other natural resource savings and interactive effects: for example water and fossil fuels.
- Justification of all of the above including: algorithms, engineering equations and/or engineering model, inputs and assumptions, detailed cost information, and sources.
- Logs of the changes in the PIAs and justifications.
- Estimates of expected program attribution percentage (stipulated net-to-gross-ratio or NTG ratio).

The use of PIAs to estimate program impact is often referred to as the "deemed savings approach". The deemed savings approach will be recommended when the savings and rebate per prescriptive measure will not justify investing in field measurements, when a sampling approach will be cost-prohibitive given the level of funding of evaluation in absolute terms, and when savings cannot be established through utility billing data analysis. For example, this will be the case for residential LED lamps, automotive heater timers, and ENERGY STAR Computers.

[8] Note: A preliminary version *of the TRM was created as part of the CPR and the program design report.*

The creation, verification and continuous update of a TRM is an organized approach to the use of deemed-savings estimates. Every month new evaluation reports are being filed in North America and some of these evaluations are performed in larger jurisdictions with more resources and – in some cases – they include actual field measurements, surveying or sophisticated billing analysis to back the assumptions. The TRM is a tool to ensure continuous improvement of the deem-savings estimates; with time, the DSM staff and evaluators will gather and aggregate better assumptions based on new evaluation results in other North-American jurisdictions, as relevant.

3. Overview of EM&V for the Proposed DSM Portfolio

This section introduces the general approach to evaluation for the proposed DSM portfolio during the next 5-year operation window. This introduction is organized into the following sub sections:

- Evaluation scope
- Main evaluation work packages
- Evaluation schedule

3.1 Evaluation Scope

Evaluation will encompass all of the programs and programs elements that are recommended for the Utilities' initial DSM portfolio. The EM&V contractor will be expected to allocate resources among the elements of the DSM portfolio to maximize the overall value of the evaluation work. Consequently, they will need to be provided with a broad description of the DSM portfolio, projections and budget, as provided below.

DSM Design Principles and Portfolio Structure

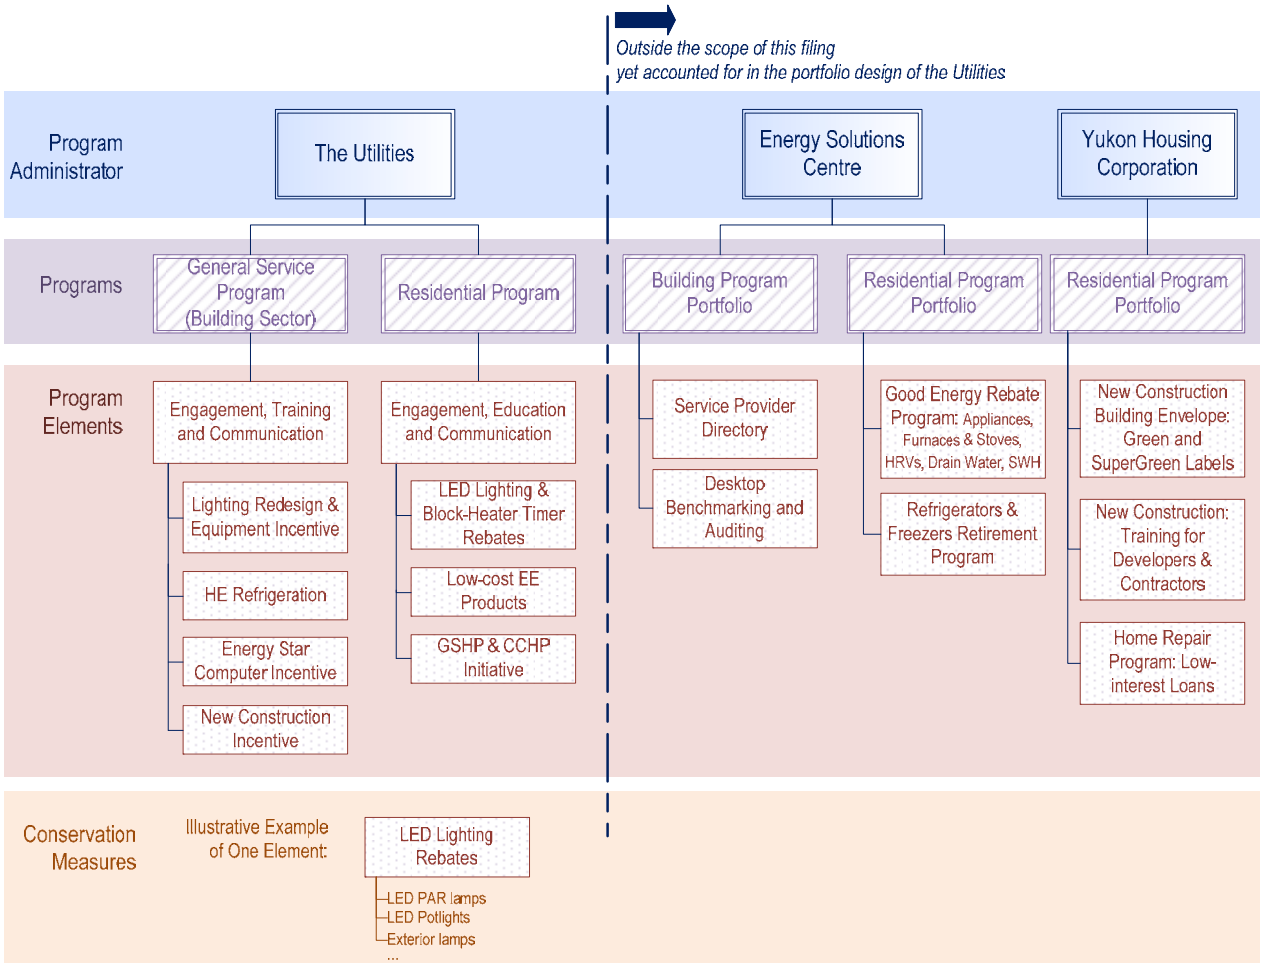
Two broad solutions-based programs are presented, each with multiple program elements: the General Service Program and the Residential Program. The objective was to offer customers a broad suite of options to meet their electricity management needs, rather than forcing customers to sort through a variety of individual programs.

Several specific design guidelines were applied to the programs presented. Those that are relevant to the evaluators are:

- The Utilities should retain design flexibility to enable program implementers to adjust specific designs as dictated by customer response and evaluation results.
- The Utilities should ensure that the program offerings complement existing energy initiatives in the Yukon and minimize duplication or potential customer confusion. To this end, there has been extensive collaboration with local entities such as the Energy Solutions Centre, Yukon Housing, City of Whitehorse and others.

Exhibit 2 presents the proposed overall portfolio of the Utilities' electricity programs. It also shows the current complementary energy programs offered by the Energy Solutions Centre and Yukon Housing.

Exhibit 2: Portfolio Structure



The portfolio in Exhibit 2 is the starting point for the Utilities. It is anticipated that timely adjustments will be made in response to feedback from customers and trade allies as well as the performance of individual programs. These changes will be documented through the internal performance reports, and annual budgeting and planning documentation.

DSM Portfolio Projections and Budget

Exhibit 3 and Exhibit 4 present an overview of the portfolio budget, impact projections, and Benefit/Cost results as anticipated before the preparation and launch stage.

The EM&V contractor should allocate evaluation resources among the program elements in a manner that is commensurate with the expected DSM expenditures and impacts for each. This EM&V plan already accounts for the importance of the program elements relative to each other based on budget and projections; however, the EM&V contractor will be provided with flexibility to further refine the methodology and resource allocation to reflect actual accounting reports, tracking results and KPIs.

The results are presented for the proposed five-year period by individual program element, program, as well as for the portfolio as a whole. The results are also organized within two scenarios:

- **Without Government Buildings:** This assumes that government owned buildings are not eligible to participate in the programs. Government buildings include buildings from all levels of government: federal, territorial, first nation, and municipal.
- **With Government Buildings[9]:** This assumes that all Yukon buildings are eligible to participate in the programs.

In each case, the results presented include:

- **Net Savings – Lifetime MWh:** These are the lifetime electricity savings attributed to (only) the measures implemented in the year shown and are inclusive of transmission and distribution losses.
- **Net Savings – Annual MWh**: These are the electricity savings that would occur in the milestone year shown due to the impacts of the measures implemented to date under the program. They are inclusive of T&D losses.
- **Utility Expenditure**: These show the associated incentive and non-incentive program costs that would be incurred in each milestone year.
- **Benefit/Cost Ratios:** These are the results of the standard benefit-cost tests. The acronyms refer to: the TRC – Total resource cost test; the PAC – Program administrator cost test; the PC – Participant cost test; and the RIM – Rate impact measure test. Seasoned evaluators will be accustomed to them. Explanations on these were provided in the Program Design Document. The definitions that were used are compliant with the 2001 California Standard Practice Manual.[10]

Notes to support the interpretation of Exhibit 3 and Exhibit 4:

- There is no incremental cost to the Participant to purchase an ENERGY STAR computer.
- In case of inconsistencies, the Exhibit in the Program Design Report should prevail.

[9] For example, the DSM plan could include a caveat that some level(s) of government will not participate in DSM programs that are funded from rate-base.

3.2. Main Evaluation Work Packages

Section 3.2 provides a description of the types of evaluation required, summarizes the experimental approach anticipated, and then lists of all the physical deliverables that will be part of the EM&V work.

The approach presented in Section 3.2 is preliminary, and should be considered as a suite of options which, as a whole, represent EM&V best practice.

The general approach is based on four main work packages:

- **Finalization of the EM&V Plan** – to be initiated between the fourth and the sixth quarter after the start of the program operation window (that is: between Y1-Q4 and Y2-Q2).
- **Process Evaluation Study** (EM&V Study #1) – to be initiated two to six quarters after the first DSM incentive transaction (that is: sometime between Y2-Q2 and Y3-Q2 if the first-transaction milestones are passed according to the plan).
- **Impact Evaluation Study** (EM&V Study #2) – to be initiated five to eight quarters before the end of the program window (that is: between Y4-Q1 and Y4-Q4 based on a 5-year operation window).
- **Project-Level M&V Studies** – the evaluators will be convened to perform certain project-level M&V planning, analysis and reporting tasks as needed many times thorough the program operation window.

The four work packages are described below. They are also laid out in a Gantt chart in Section 3.3 Evaluation Schedule.

Finalization of the EM&V Plan

The final evaluation scope will be determined through initial collaboration with the EM&V contractor once selected, and consultation with the YEC/YECL management committee and YUB. It is expected that the contractor will be selected and under a contract between the fourth or sixth quarter of program operation. Finalizing the EM&V plan should take about three months to complete.

Finalizing the EM&V Plan encompasses the following activities:

- Review, edit, and adapt the EM&V plan based on the outcomes of the activities below.
- Collect and review all program documentation so far: the CPR report, market characterization reports, program design document, PIP, early reports from the preparation and launch stage, transactional and operational materials, communication materials and meeting minutes.
- Carry out a few in-depth interviews with YEC and YECL staff, as needed.
- Narrow down the methodological options or suggest other innovative methods to maximize value of EM&V, while in compliance with the California Evaluation Framework.
- Compute the detailed EM&V budget using the actual professional rates of the contractor staff, based on the final recommended approach and based on the rate inflation forecast.
- Identify gaps in the market characterization reports, recommend and carry out some early baseline data collection tasks, as needed.

- Check the logic models for soundness and suggest improvements, based on the result of the activity and above and as needed.
- Review, edit and adapt the TRM based on a desk review of the TRM, on a comparison with other North-American TRMs and on a jurisdictional scan of relevant evaluation reports.
- Establish stipulated net-to-gross ratios for all program elements and measures based on a jurisdictional scan of relevant evaluation reports, and experience.
- Review the transactional and operational materials (application and internal forms), and the tracking system and identify: (i) superfluous information items, and (ii) missing information items that will be required for EM&V purpose. Suggest corrective actions as needed.
- Review and edit the protocols regarding site verification of conservation measures under the responsibility of the administration staff.
- Use the existing program theory and logic models to assess whether the theory is plausible and suggest improvements.

The final EM&V plan should include the following items either in the body of the document or as part of the appendix:

- A verified TRM that will be used to generate KPIs and performance reports for all program elements.
- A revised list of incentive levels for all prescriptive measures.
- Stipulated NTG ratios for all program elements accounting for the above.
- A new version of evaluation indicators and baseline levels (as required) to assess the effectiveness of the delivery mechanism.
- A list of corrective actions on the transactional materials and tracking system, as needed.
- A formal approval of the site-verification protocols and approach to documenting the verifications.

Process Evaluation Study

The following paragraphs provide a description of the type of evaluation required and summarize the experimental approach anticipated, the major deliverables and special methods sought from the evaluation contractor.

The process evaluation study (EM&V Study #1) will be initiated two to six quarters after the first DSM incentive transaction. It should take about six months to complete.

The purpose of a process evaluation is to identify corrective actions to improve the program uptake, impact and cost-effectiveness. The rationale behind carrying out the process evaluation early after the launch of the program is to achieve the benefits of the corrective actions before the end of the current program operation window.

Evaluators will be asked to suggest corrective actions applicable to the incentive levels, communication strategy, transactional infrastructure, tracking and performance reporting, site verifications, delivery approach and institutional framework, and program management practices. Evaluators can go as far as suggesting pulling some program elements out of the market if these elements are deemed ineffective.

Evaluators will suggest corrective actions in light of:

- A consultation with relevant market actors (e.g.: participants, non-participants, supply-side actors and relevant stakeholders) through surveying, interviewing and/or others.
- The desk review of the program database content, accounting reports, communication tactics and materials, performance reports, and site verification documentation.

EM&V Study #1 will also include a few impact-evaluation and cost-effectiveness evaluation components.

- Evaluators will work on updating and tuning the TRM based on any new information that might have come up since the finalization of the EM&V plan – like new relevant evaluation reports from other jurisdictions, new information collected through program tracking, observations made during site verification, or market insights gained during market consultation.
- Evaluators will work on carrying out the ex-post cost-effectiveness tests based on the most recent program data. Evaluators are encouraged to use the same modeling tool used by the administration staff to generate the annual performance report, modify it as required, and validate it to make sure that the reports being filed with the YUB by the administration staff are sound.

Generic Process Evaluation Research Questions: The following are generic research questions that evaluators will be asked to answer as part of the process evaluation study. An answer will be asked for each of the program elements that are laid out in Section 4. Where specific questions or nuances to the generic questions below are needed for each program element, they are laid out in Section 4.

1. Is the program design (theory, strategy, tactics and incentive level) effective at realizing savings (kWh and kW)?
2. Are the program management and operational and transactional infrastructure effective and efficient at delivering the tactics, mitigating risks (fraud and the like), supporting tracking and evaluation, and improving customer satisfaction?
3. Is the program communication strategy effective and efficient at generating uptake in the program element?
4. Is the approach to estimating the impacts as part of program tracking rigorous and effective at establishing DSM as a credible and reliable resource?
5. How much of the impact should be attributed to the program administrator – early estimate for program tracking purposes? (that is: an early stipulated NTG ratios)
6. Is the approach to carrying out the ex-post cost-effectiveness tests sound and effective at supporting DSM planning decisions?

When answering all of the questions above, evaluators will seek to recommend solutions to the issues that might be uncovered and improvements to make the DSM portfolio more effective and efficient.

The main deliverable of EM&V Study #1 will be a Process Evaluation Report at the culmination of the study. The report should include the following items either in the body of the document or as part of the appendix:

- A list of corrective actions, a justification for each, and advice on how to roll these out (who? when? how? how much?).
- A new version of verified TRM.

- A new version of stipulated NTG ratios.
- Verified KPIs for program operation up to a month before the delivery of the report;
- Cost-effectiveness test results based on actual program data for program operation up to a month before the delivery of the report.
- A list of recommendations applicable to EM&V Study #2 and an updated EM&V plan accounting for these recommendations.

Impact Evaluation Study

The impact evaluation study (EM&V Study #2) will mostly consist of impact evaluation research questions. Specific research questions will be laid out for each project element in Section 4. Study #2 will be initiated five to eight quarters before the end of the program window. It is expected that the study will take about twelve months to complete; a first draft should be presented to the YEC/YECL management committee three months before the end of the program operation window (about Y5-Q3) and the final report should be filed with the YUB three months after the end of the program window at the most (about Y6-Q1).

The purpose of impact evaluation is to increase the level of precision and accuracy of the impact estimates filed with the YUB. Evaluators will increase the accuracy and precision of the impact estimates through:

- Additional data collection activities and impact evaluation methods as presented in Section 4.
- Updating and tuning the TRM based on any new information that might have come up since the culmination of EM&V Study #1. The approach will be similar to the one used during Study #1.

Evaluators will generate verified KPIs for program operation up to the end of the program operation window, and then they will carry out the ex-post cost-effectiveness tests based on these KPIs.

Evaluators will observe the changes in the market – whether induced by the DSM portfolio or otherwise – through consultation with relevant market actors through surveying, interviewing and/or other means. It is expected that the same evaluation contractors will have cumulated sufficient relevant market observations to provide an insightful and educated opinion regarding the evolution of the Yukon market and the implications on the current and future DSM portfolio. The evaluators will have accumulated these observations through accessing the market characterization reports as well as research and consultation in Yukon as part of the finalization of the EM&V plan, the process evaluation study, the project-level M&V work, and the impact evaluation study.

Evaluators will be expected to provide an opinion on whether program elements became irrelevant or whether new opportunities have arisen. Program evaluators will be able to make high-level recommendations on the future of DSM in Yukon that will be used to design the next generation of programs.

Generic Impact Evaluation Research Questions: The following are generic research questions that evaluators will be asked to answer as part of the impact evaluation study. Specific questions for each of the program elements are laid out in Section 4.

1. How much of the impact claimed by the program administrator has actually been realized? (i.e. the realization ratio)
2. How much of the impact should be attributed to the program administrator – what is the final estimate? (i.e. the final stipulated NTG)

3. What are the actual ex-post results of the cost-effectiveness tests?
4. Have the program operation standards and procedures been complied with and properly documented?
5. What are the implications of the evolution of the Yukon market on the program design and delivery mechanisms?

When answering all of the questions above, evaluators will seek to make high-level recommendations to make the next generation of Yukon DSM programs more effective and efficient.

The main deliverable of EM&V Study #2 will be an Impact Evaluation Report at the culmination of the study. The report should include the following items either in the body of the document or as part of the appendix:

- A new version of verified TRM.
- A new version of stipulated NTG ratios.
- A realization ratio for each of the program elements.
- Verified KPIs for program operation up to the end of the program operation window based on the above.
- Cost-effectiveness test results based on actual program data for program operation up to the end of the program operation window.
- Evaluation indicators, comparison with baseline levels, comparison with targets and conclusions on the effectiveness of the DSM portfolio at transforming the market.
- Recommendations on the next generation of programs in Yukon including but not limited to: programs that became (or are about to become) irrelevant, ineffective or counter-productive; exit strategies or overhaul of existing program elements; significant changes in the delivery approach; and new DSM opportunities to be investigated.

The evaluators will provide a justification for each of the recommendations they make.

Project-Level M&V Studies

The *Project-Level M&V Studies* work package consist of a series of call ups for the evaluators to perform project-level M&V activities including the planning of project-level M&V, the interpretation and analysis of measurements, and drafting of M&V reports. The outcomes of this work are to be integrated in EM&V Study #2; however the program administrators should be able to trigger these activities independently from the course of Study #1 and #2.

Projects that will need M&V are:

- **General Service high-efficiency refrigeration projects in food retail stores and ice rinks.** These projects are planned to occur in two waves: a first wave is planned to start around Y2-Q2, construction is to end on Y3-Q3, and the post-retrofit measurement period – expected to last for one year – is to end around Y4-Q3. The second wave will start on Y4-Q2 then follow a similar schedule. The completion of the M&V work for that second wave falls outside of the program window.
- **Residential innovative heating projects.** These projects are planned to be implemented between Y1-Q4 and Y3-Q2, and thus the post-retrofit measurement period – expected to last for one year – is to end between Y2-Q4 and Y3-Q3.

The notional schedules presented above depend on the willingness of participants and market stakeholders to carry out these projects and thus the administrator will need flexibility from the evaluators on the timeline.

In addition to impact-evaluation purposes, project-level M&V work has the following objectives:

- Feedback verified information on project savings to the market through case studies and other communication tactics to boost the uptake of the programs. – It is assumed that actual M&V results will reinforce the case studies by making them more credible.
- Validate the viability of technologies in the Yukon, identify risks, and provide insights that will be fed in the planning and decision whether to roll out a full-scale residential innovative heating incentive program.

The approach to M&V will follow an Option-C methodology of the IPMVP; that is: whole-building electricity consumption measurement using the main utility meter. The baseline will be established based on at least 12-months' worth of utility bills prior to construction; and the post-retrofit measurement period is to last for 12 months. The baseline will be adjusted based on one or many relevant independent parameters including at least the heating degree-days.

The specific M&V tasks for each project include:

- Collect pre-retrofit utility bills and information about the project and building.
- Draft a project-specific M&V plan.
- Collect post-retrofit utility-bills, as well as routine and non-routine adjustment parameters.
- Supervise or carry out at least one site visit and document field observations.
- Carry out M&V analysis in accordance with the plan.
- Draft an M&V report.

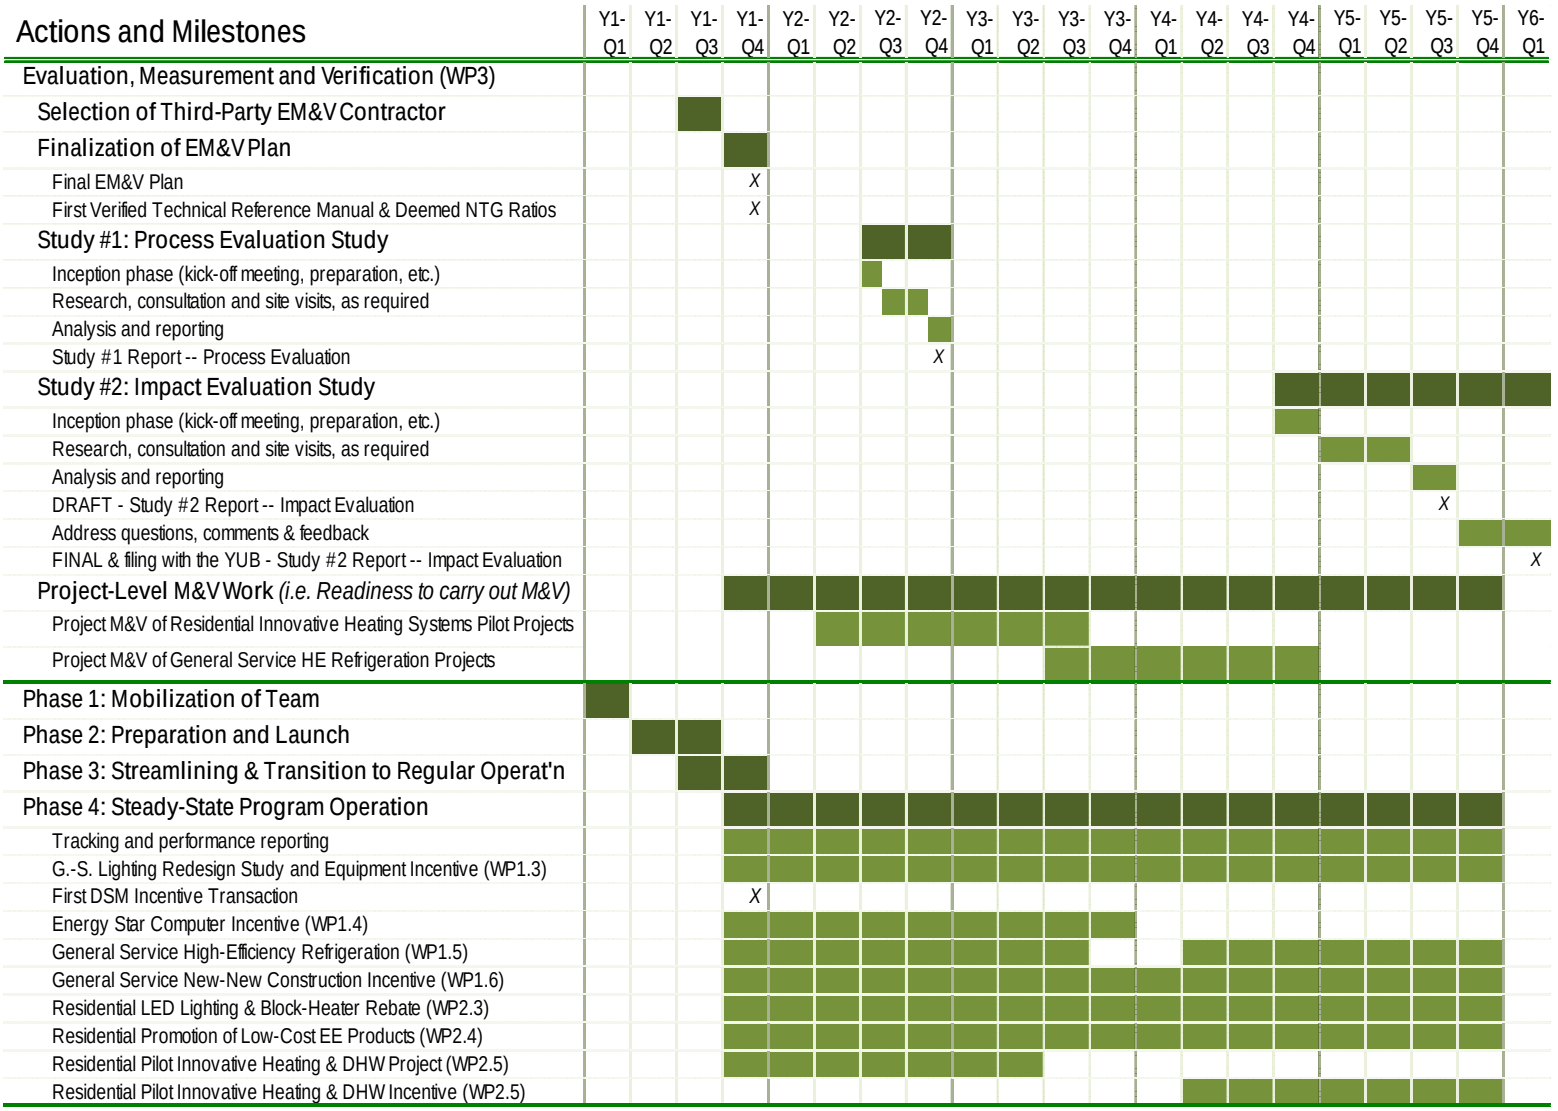
The deliverables for each project include: an M&V plan, and a final M&V report.

Evaluators will be able to suggest other methodological options and approaches they deem relevant, as long as the suggested approaches align with the IPMVP methodological options.

3.3 Evaluation Schedule

Exhibit 5 shows a schedule for EM&V as part of the 5-year program operation window. The EM&V activities, deliverables and milestones are stacked up above a high-level schedule of the program implementation and operations.

Exhibit 5: High-Level Gantt Chart of the Evaluation, Measurement and Verification Work



The schedule for EM&V shown in Exhibit 5 is approximate. The DSM administration will have the flexibility to shuffle the work packages in the 5-year operation window depending on the status of the DSM portfolio; for example the *Finalization of the EM&V Plan* could be postponed by up to two quarters, *Study #1* could be postponed by up to three quarters and/or *Study #2* could be started up to three quarters earlier. However, Y6-Q1 for the filing of the impact evaluation report is a hard deadline.

4. Program-Specific Evaluation Implications

This section provides a description of the specific EM&V requirements for each of the seven program elements that, together, make up the Yukon DSM program portfolio. The discussion is organized and presented by program element, as outlined below.

- General Service Program, which consists of the following four program elements:
  - Lighting Redesign and Equipment Incentive
  - High Efficiency Refrigeration Program
  - Energy Star Computer Incentive
  - New Construction Incentive
- Residential Program, which consists of the following three program elements:
  - LED Lighting and Automotive Heater Timer Rebate
  - Promotion of Low-Cost Energy Efficient Products
  - GSHP and CCHP Initiative

For each program element noted above, the discussion addresses the following areas:

- **Program Description Summary**

  It is standard practice to provide a program description summary as part of EM&V plans. This enables the evaluators to appreciate the program type and the nature of the conservation measures/projects being promoted and, therefore, to more easily establish their evaluation approach. The program theory is also essential to developing indicators that will enable performance-based management and planning.

- **Evaluation Considerations**

  The evaluation considerations are specific to each of the seven program elements. They build on the general approach presented in Section 3. All of the seven program elements will concurrently be subjected to a process evaluation (Study #1), and then an impact evaluation (Study #2). The discussion of evaluation considerations for each program element is further organized into the following areas:
  - Management-by-objective framework
  - Evaluation research questions
  - Suggested evaluation methods and level of rigor

4.1 General Service Lighting Redesign and Equipment Incentive

4.1.1 Program Description Summary

The Utilities will pay an incentive to building owners/managers to have their lighting systems retrofitted. The total incentive will be the sum of three layers:

- Lighting redesign incentive
- Custom lighting incentive
- Prescriptive LED lighting incentive

The Utilities will pay an incentive to building owners/managers to have a lighting redesign conducted in their building. The purpose of the lighting redesign will be to design the optimal lighting system in term of visual comfort, ease of maintenance, and electricity savings considering the existing spaces, windows and fixtures. The incentive for the redesign work will be determined using a dollar-per-square foot rate. The lighting designers will be required to develop designs that meet minimum power density thresholds.

The custom lighting incentive includes a base incentive for the equipment and installation determined using a dollar per kilowatt-hour of annual savings rate. This approach provides flexibility in choice of lighting technologies and also allows contractors and designers to be innovative.

For the prescriptive LED incentive layer, the Utilities will add a flat amount of money per unit for LED products selected from a prescriptive list of eligible products.

Building owners/managers will be able to combine the custom incentive layer, the LED prescriptive incentive layer, and the lighting redesign incentive layer to best suit their needs and to generate a larger incentive for LED technologies: the initial-cost hurdle is higher for the LED technologies and the Utilities have a goal of accelerating market penetration of these products. The prescriptive list of eligible LED products will be consistent with that used in the Residential Program.

Eligible Measures

The proposed incentive levels as well as archetype projects are presented in Exhibit 6 to Exhibit 9.

Exhibit 6: Archetype Lighting Conservation Projects – Custom Incentive Layers for Non-Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive	Size of Archetype Building
ECM91	Lighting Redesign Study	0.00 kWh/ft2	.00000 kW/ft2	110%	$1.20/ft2	16.0 yr	$0.40/ft2	11,759 ft2
ECM80	Typical Lighting Project in	1.99 kWh/ft2	.00060 kW/ft2	95%	$1.40/ft2	15.4 yr	$0.16/ft2	15,000 ft2
ECM81	Typical Lighting Project in Existing Bldg - Food Retail	4.85 kWh/ft2	.00092 kW/ft2	95%	$2.30/ft2	15.4 yr	$0.39/ft2	30,000 ft2
ECM82	Typical Lighting Project in Existing Bldg - Non Food Retail	3.64 kWh/ft2	.00072 kW/ft2	95%	$1.90/ft2	15.4 yr	$0.29/ft2	10,000 ft2
ECM83	Typical Lighting Project in Existing Bldg - Hotel/Motel	1.84 kWh/ft2	.00036 kW/ft2	95%	$2.10/ft2	11.5 yr	$0.15/ft2	20,000 ft2
ECM86	Typical Lighting Project in Existing Bldg - Restaurant	6.65 kWh/ft2	.00140 kW/ft2	95%	$3.10/ft2	13.0 yr	$0.53/ft2	4,000 ft2
ECM87	Typical Lighting Project in Existing Bldg - Recreation	1.79 kWh/ft2	.00043 kW/ft2	95%	$1.90/ft2	15.7 yr	$0.14/ft2	25,000 ft2
ECM88	Typical Lighting Project in Existing Bldg - Warehouse	1.85 kWh/ft2	.00045 kW/ft2	95%	$2.00/ft2	15.7 yr	$0.15/ft2	30,000 ft2

Exhibit 7: Prescriptive LED Incentive Layer for Non-Government Buildings

ID	Measure Short Name	Level of Incentive
ECM92	Commercial 12W LED A19 Bulb	$18.00/unit
ECM93	Commercial 8W LED A19 Bulb	$12.00/unit
ECM94	Commercial LED MR16 Bulbs	$10.00/unit
ECM95	Commercial LED PAR30 Bulbs	$20.00/unit
ECM96	Commercial LED PAR38 Bulbs	$20.00/unit
ECM97	Commercial Spot or task lighting	$10.00/unit

Exhibit 8: Archetype Lighting Conservation Projects – Custom Incentive Layer for Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive	Size of Archetype Building
ECM912	Gov. Lighting Redesign Study	0.00 kWh/ft2	.00000 kW/ft2	100%	$1.20/ft2	20.0 yr	$0.24/ft2	26,209 ft2
ECM802	Gov. Typical Lighting Project in	1.99 kWh/ft2	.00060 kW/ft2	95%	$1.40/ft2	20.0 yr	$0.10/ft2	15,000 ft2
ECM842	Gov. Typical Lighting Project in Existing Bldg - Health	2.45 kWh/ft2	.00035 kW/ft2	95%	$1.40/ft2	20.0 yr	$0.12/ft2	95,000 ft2
ECM852	Gov. Typical Lighting Project in Existing Bldg - Education	1.15 kWh/ft2	.00042 kW/ft2	95%	$1.40/ft2	20.0 yr	$0.06/ft2	33,000 ft2
ECM872	Gov. Typical Lighting Project in Existing Bldg - Recreation	1.79 kWh/ft2	.00043 kW/ft2	95%	$1.90/ft2	20.0 yr	$0.09/ft2	25,000 ft2
ECM882	Gov. Typical Lighting Project in Existing Bldg - Warehouse	1.85 kWh/ft2	.00045 kW/ft2	95%	$2.00/ft2	20.0 yr	$0.09/ft2	30,000 ft2

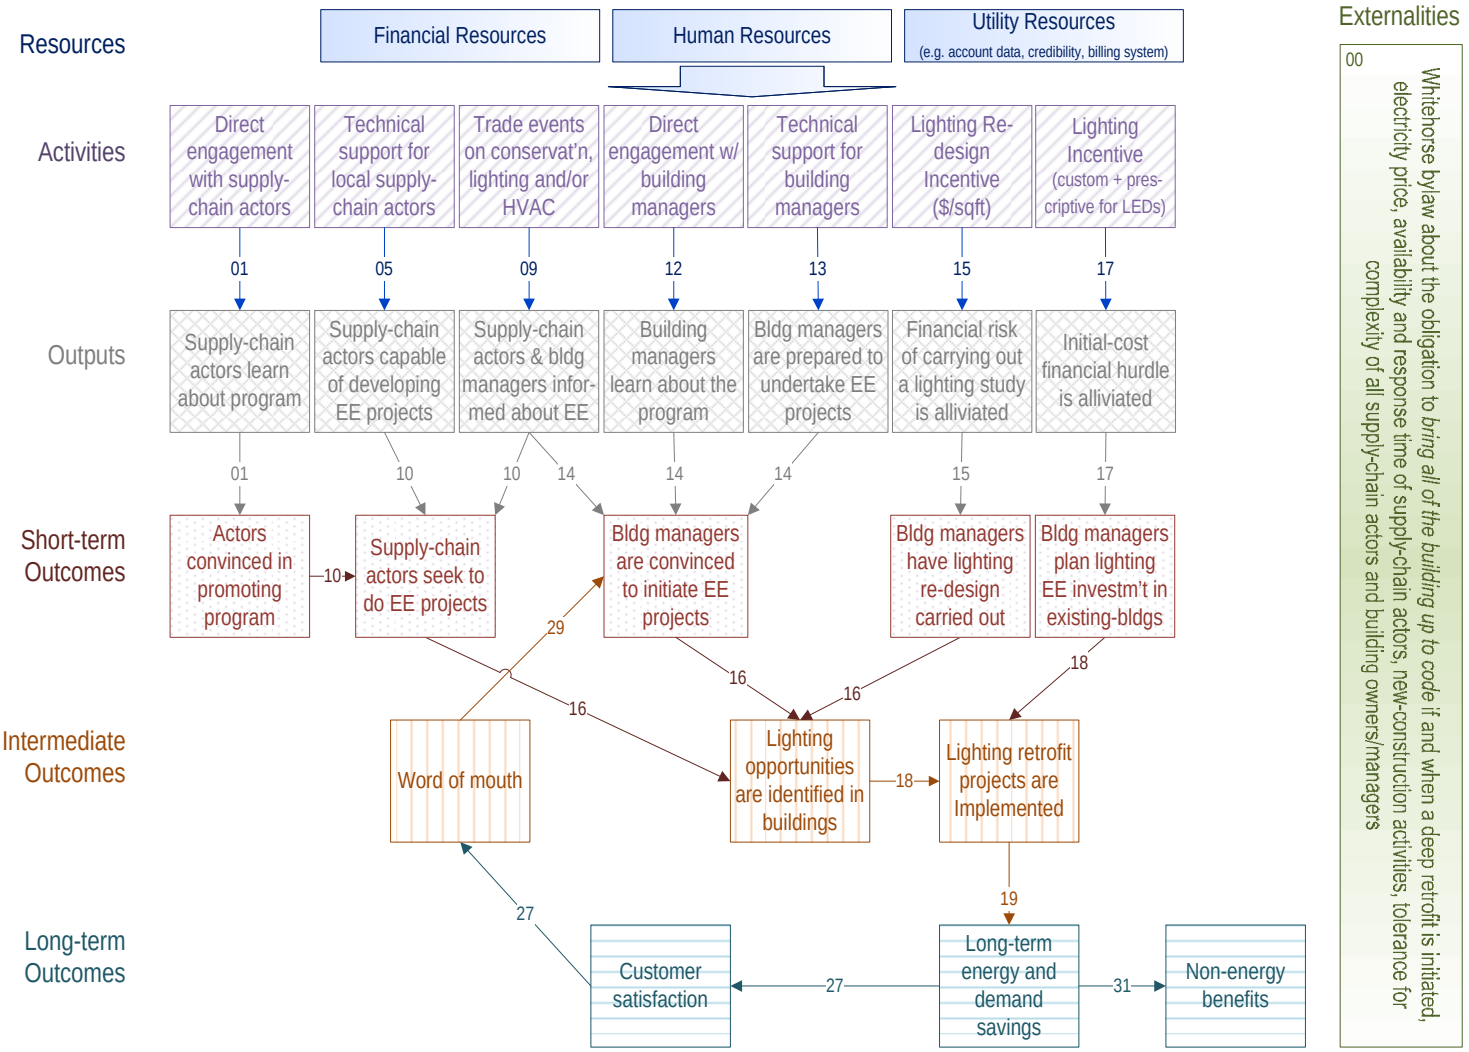
Exhibit 9: Prescriptive LED Incentive Layer for Government Buildings

ID	Measure Short Name	Level of Incentive
ECM922	Gov. Commercial 12W LED A19 Bulb	$10.80/unit
ECM932	Gov. Commercial 8W LED A19 Bulb	$7.20/unit
ECM942	Gov. Commercial LED MR16 Bulbs	$6.00/unit
ECM952	Gov. Commercial LED PAR30 Bulbs	$12.00/unit
ECM962	Gov. Commercial LED PAR38 Bulbs	$12.00/unit
ECM972	Gov. Commercial Spot or task lighting	$6.00/unit

Program Theory

The program element theory is portrayed in the Logic Model below. The offering logic model is annotated from top (resource allocation) to bottom (intended impacts) in the table following the chart.

Exhibit 10: Logic Model for the General Service Lighting Redesign and Equipment Incentive



Link #	Narrative
00	Externalities: The program effectiveness and impact will be influenced by the following externalities: Whitehorse bylaws on the obligation to bring all of the buildings up to code if and when deep retrofits are initiated, the price of electricity, the availability and response time of supply-chain actors, new-construction activities, and tolerance for complexity of all supply-chain actors and building owners/managers. The program administrator should monitor these externalities and adapt the implementation approach as necessary.
01	Direct engagement with supply-chain actors: The Utilities will carry out direct engagement with electrical distributors, lighting designers, electrical contractors, as well as with HVAC contractors, HVAC designers, control designers and architects through emails, phone calls and in-person meetings. The Utilities will present their incentive offerings and engage with supply-chain actors so that they promote them.

Link #	Narrative
05	Technical support for local supply-chain actors: The Utilities will offer technical support to the supply-chain actors in two different forms: (1) hands-on training on the program tools, forms and procedures; on advanced electricity efficiency lighting design; and on the business aspects of electricity efficiency: energy audits, business cases, energy performance contracting, and electricity efficiency financing. (2) The Utilities will act as a broker to procure technical expertise from highly specialized lighting experts recruited throughout North America upon request from the local actors. In addition, the Utilities will disseminate information on recommended lighting equipment (brand-neutral, to the extent possible) in the form of printed brochures, newsletters or web content.
09	Trade events on conservation, lighting and/or HVAC: The Utilities propose to support any form of trade organizations or trade events by sponsoring and attending trade events that gather local building owners/managers and/or supply-chain actors. The Utilities intend to strengthen or create platforms that allow local energy conservation practitioners to present their success stories, and share their lessons learned.
10	Supply-side actors will actively seek to develop projects because they were engaged with by the Utilities, because they were trained and are capable of offering electricity-efficiency services, and because they were provided with networking opportunities with potential clients (building owners/managers) at trade events.
12	Direct engagement with building managers: The Utilities will carry out direct engagement with building owners/managers through emails, phone calls and in-person meetings; and through public relations activities like media advisories sent to the local newspapers and radio, web content, and joint events with the Whitehorse Chamber of Commerce. The Utilities will present their incentive offerings and make the owners/managers aware of the benefits so that they participate in the program.
13	Technical support for building managers: The Utilities will offer customized technical support to building owners/managers to help them to initiate projects. The Utilities could include support to plan investment in assets, and to identify in which buildings to develop projects; support to make optimal decisions on implementation and procurement approach, and support before and during the tendering of project design services, particularly if the procurement approach is energy performance contracting (EPC).
14	Building owners/managers agree to initiate electricity efficiency projects because they were informed about the program components by the Utilities, because they were provided with technical support to decide where to start and how to do it, and because they networked with supply-side actors, perhaps at the trade events supported by the Utilities.
15	Lighting redesign incentive: The Utilities will pay an incentive to building owner/managers to have a lighting redesign study conducted in their building. The purpose of the lighting redesign study will be to design an optimized lighting system in term of visual comfort, ease of maintenance, and electricity savings, considering the existing spaces, windows and fixtures. The incentive will reduce the financial risk of investing in a pre-investment study, and will reduce the initial-cost hurdle of doing business with designers. The building managers will have lighting redesign studies carried out.
16	Electricity-efficient lighting opportunities are identified in the building because the supply-chain actors were seeking to develop new lighting projects, because building owners/managers agreed to initiate an electricity efficiency project and because the financial risk of carrying out a redesign study was alleviated.
17	Lighting equipment incentive: The Utilities will pay an incentive to building owners/managers to have their lighting systems retrofitted. This incentive will include a custom incentive layer and a prescriptive LED incentive layer. The custom incentive allows for flexibility in lighting technologies as well as the use of occupancy control, dimming and day lighting, etc. It pushes distributors, contractors and designers to be innovative. The purpose of the prescriptive LED incentive layer is to increase the level of incentive when LED technologies are used because the initial-cost hurdle is higher for LED technologies than for other technologies; and because LED lighting is a technology for which the Utilities would like to accelerate market penetration.
18	Electricity-efficient lighting retrofit projects are implemented because electricity-efficient lighting opportunities were identified and because the equipment and installation initial-cost financial hurdle was alleviated.
19	The electricity-efficient lighting retrofit projects will yield long-term electricity and demand savings.

Link #	Narrative
27	Building owners/managers will be satisfied by the projects that they implemented. They will tell other people in the building industry; perhaps at the trade events supported by the utilities. This will generate word-of-mouth advertisement.
29	With time, word-of-mouth will become an important information channel that will cause building owners/managers and supply-chain actors to implement more projects.
31	It is assumed that owners/managers will perceive new non-energy benefits; and/or the maintenance of benefits they used to have with baseline systems. For example, the Utilities will seek to make sure that participants perceive that their new systems are more comfortable, are less costly to maintain, have higher tenant satisfaction and retention, generate fewer complaints, and have increased property value.

4.1.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 10 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 11. Performance indicators should be reviewed by the EM&V contractor to validate the theory.

Explanatory notes on Exhibit 11 and MBO frameworks in sections 4.2 to 4.7 are provided below:

- **Part A & Part B.** The MBO framework was divided into two parts:
  - Part A is for the key performance indicators (KPIs) that will be monitored by the administration staff through operations, application and incentive processing, and minimal record keeping of communications and engagement work. Then these KPI results are to be validated by the evaluators.
  - Part B is for the evaluation of market performance indicators. These indicators will be established by evaluators through surveying, consultation, research and analysis as part of the two main evaluation studies: process evaluation and impact evaluation.

- **Components of the MBO Framework:**
  - *Link # and Narrative* refers to the Logic Model for the program element. See Exhibit 10.
  - *Performance Indicators* are the metrics used as KPIs, the evaluation indicator.
  - *Sources* will tell the evaluators where the data needed to compute the indicators must come from. In Part A, most of this data is internal to the program administration: it will be contained either in the program documentation, tracking system or logs of communication and engagement activities.
  - Targets for Year 1 to 5: Goals the actual indicators will be compared against. Those presented below are preliminary and will be validated as laid out below.

- **Starting Point and Later Stages.** The MBO framework presented below is a starting point. After the delivery of this EM&V plan, it will go through various stages of validation and transformation: These stages are:
  - During startup, the launch team will review it and adapt it to its preferences and based on the record-keeping standards that are agreed on. This is why, in many cases, performance indicators are referred to as "*Suggested indicators or KPIs*".

- During the finalization of the EM&V plan, the launch team and evaluators will review the MBO framework and goals, and then sign off on it.
- During operation and on an annual basis, the program administration staff will be able to change the MBO framework and targets based on early results, challenges and market conditions. Whenever changes will be made, the administration staff will document the justifications for the evaluators to review.
- With each program evaluation report, the evaluators will present the MBO Framework with actual indicators against the latest targets.

- **Sum of Section 4.1 to 4.7.** Section 4.1 to 4.7 will present a MBO framework for each of the seven program elements in the portfolio. Such a breakdown creates an appearance of redundancies and overlaps on paper when in many cases the indicators will be the same. The selected evaluation contractor will harmonize and streamline these when collapsing the program-specific research topics and methods into one coherent work plan.

Exhibit 11: Management-by-Objective Framework for the Lighting Redesign and Equipment Incentive

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
Part A -- Visited Regularly as Part of Tracking and Performance Reporting – Key Performance Indicators (KPIs)								
00	Externalities	No associated tracked KPIs	-	-	-	-	-	-

Part B -- To Be Visited, Checked and Reported On by Evaluators				Baseline ↓	Process Eval. ↓		Impact Eval. ↓	
00	Externalities	Suggested evaluation indicators: Done/Not-Done – report on externalities on a yearly basis	Program documentation	Done	Done	Done	Done	Done
01	Direct engagement with supply-chain actors	No evaluation indicator	-			-		-
05	Technical support for local supply-chain actors	Suggested evaluation indicators: 1-to-10 scale, level of satisfaction with the training on average.	Supply-chain actors			7/10		n/a
09	Trade events on conservation, lighting and/or HVAC	Suggested evaluation indicators: % of market who can recall having seen inCharge at events	Participants, non-participants and supply-chain actors			60%		80%

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
10	Supply-side actors will actively seek to develop projects	Suggested indicator(s): % supply-chain actors who know the program	Supply-chain actors			90%		100%
		% of supply-chain actors who recommend the program to their customers				60%		80%
		% of relevant supply-side actors mapped out contributed to at least one transaction	Tracking system			30%		60%
		% of building manager who recall their provider telling them about program	Participants & non-participants			40%		
12	Direct engagement with building managers	Suggested indicator(s): % of relevant building managers who have had at least one transaction	Tracking system			40%		60%
		% of building managers who can recall one of the following: bill inserts, web content, or inCharge in the news	Participants & non-participants			70%		
13	Technical support for building managers	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the training on average.	Building managers (participants & non-part.)			7/10		
14	Building owners/managers agree to initiate electricity efficiency projects	Suggested indicator(s): % of participants who agree that utility technical assistance got them to implement project in full of in part	Participants			60%		60%
15	Lighting redesign incentive	Suggested indicator(s): % of participants who agree that the lighting redesign incentive got them to do a more sophisticated retrofit of their lighting system then they would have otherwise	Participants			60%		60%
		% of participating suppliers who confirm the above	Supply-chain actors			60%		60%
16	Electricity-efficient lighting opportunities are identified in the building	No evaluation indicator	-			-		-
17	Lighting equipment incentive	Suggested indicator(s): % of participants who agree that the incentive got them to install the energy efficient equipment in part or in full	Participants			60%		60%
		% of suppliers who agree that the incentive got their client to pursue with the install energy efficient equipment rather than the base in part or in full	Supply-chain actors			60%		60%
18	Electricity-efficient lighting retrofit projects are implemented	No evaluation indicator	-			-		-

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
19	The electricity-efficient lighting retrofit projects will yield long-term electricity and demand savings.	No evaluation indicator KPIs to be verified by evaluators.	-			-		-
27	Building owners/managers will be satisfied by the projects that they implemented	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the overall program	Participants			8/10		8/10
		1-to-10 scale, level of satisfaction with their energy efficient equipment	Participants			7/10		7/10
29	Word-of-mouth will become an important information channel	Suggested indicator(s): % heard of the program positively from other past participants	Participants			30%		60%
		% heard of the program positively from past participants	Non-participants			10%		30%
31	Owners/managers will perceive new non-energy benefits; and/or the maintenance of benefits	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the lighting quality	Participants			9/10		9/10
		1-to-10 scale, level of satisfaction with the operations, ease of maintenance, & life expectancy				8/10		8/10

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the General Service Lighting Redesign and Equipment Incentive. No additional questions are needed.

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *General Service Lighting Redesign and Equipment Incentive* have implications on the evaluation methods being employed:

- No savings are attributed to the redesign incentive; savings will be attributed only when the participants actually implement the projects and file a final incentive claim.
- The projects that will be partially financed by the Utilities through the program elements are “custom” projects. Participants and their service providers will provide an estimate of the savings – based on engineering calculations, no measurement required – this estimate will be verified by the program administrator and input in the tracking system as is. Thus, there will be a specific impact for each project. Deemed savings and the use of a TRM are irrelevant. Impact and incentive cash flow projections were based on “archetype projects”; those are not going to be used as part of ex-post evaluation.
- It is unlikely that the savings per building will be above 10% of the total building electricity consumption; therefore utility billing analysis will not be an option.
- It is expected that the program element will involve or have implications on the following market actors and stakeholders: lighting designers (population≈2), electrical/lighting

distributors (p=2), electrical contractors (p≈26), property managers (p≈8 large, ≈32 small) and the Yukon Energy Solutions Center.

Based on the above, the suggested *process evaluation* methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews, but evaluators will be able to suggest an alternative approach if necessary. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Literature review and jurisdictional scan to establish valid stipulated NTG ratios.
- Review of the forms and tools (job aids) provided to participants and supply-chain actors to estimate the savings for each projects and review of the procedures to validate the savings as part of regular program operations.
- Review and validation of the approach and internal procedures to site visits; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Quality assurance of a sample of projects selected thorough all the transactions during the 5-year program operation window to establish the actual realized savings for each project in the sample, and ultimately establish the realization ratio for all of the population of projects.
    - It is assumed that manufacturer estimates of the demand (W) for each lamp/fixture as provided in the equipment specification sheets will not have to be measured.
    - Evaluators will be asked to spend more effort validating the running time estimates because this is where most of the inaccuracies will reside; either through research and scans of relevant evaluation reports thorough North America, surveying with the participants, or actual running time measurements.
    - The sample size will be established by the evaluators in order to achieve a level of precision on the realization ratio of ±15% with a one-tailed confidence interval of 90%. Evaluators are suggested to stratify the population by project impact and use a differentiated sampling approach for each stratum in order to maximize value of impact evaluation.
- Review of site visit reports generated by the administration staff to estimate installation/removal rates and uncover issues related with persistence of the savings and the alike.
- New, updated and expanded literature review and jurisdictional scan to establish valid stipulated NTG ratio.
- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

4.2 General Service High Efficiency Refrigeration Program

4.2.1 Program Description Summary

The Utilities will pay an incentive to building owners/managers who retrofit their refrigeration systems and/or install refrigeration controls. This will be a custom incentive for equipment and installation, i.e. it will be determined using a dollar per kilowatt-hour rate for each kilowatt-hour

of savings realized annually as compared with the pre-retrofit consumption and demand level. In addition to the incentive, the Utilities will provide extensive refrigeration-specific technical assistance to identify the opportunities, to develop the projects, to manage the construction works, and to measure and monitor the performance of the projects. It is expected that this program element will aim at hockey and curling arenas and grocery stores in particular.

Eligible Measures

The proposed incentive levels and archetype refrigeration projects are presented in Exhibit 12 and Exhibit 13.

Exhibit 12: Archetype High Efficiency Refrigeration Projects – Custom Incentive for Non-Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive	Size of Archetype Building
ECM98	Typical Low-Cost No-Cost Refrigeration Project - Food	6.55 kWh/ft2	.00074 kW/ft2	95%	$1.73/ft2	10.0 yr	$1.31/ft2	30,000 ft2
ECM99	Typical Deep Retrofit Refrigeration Project - Food	13.48 kWh/ft2	.00153 kW/ft2	95%	$5.87/ft2	10.0 yr	$2.70/ft2	30,000 ft2

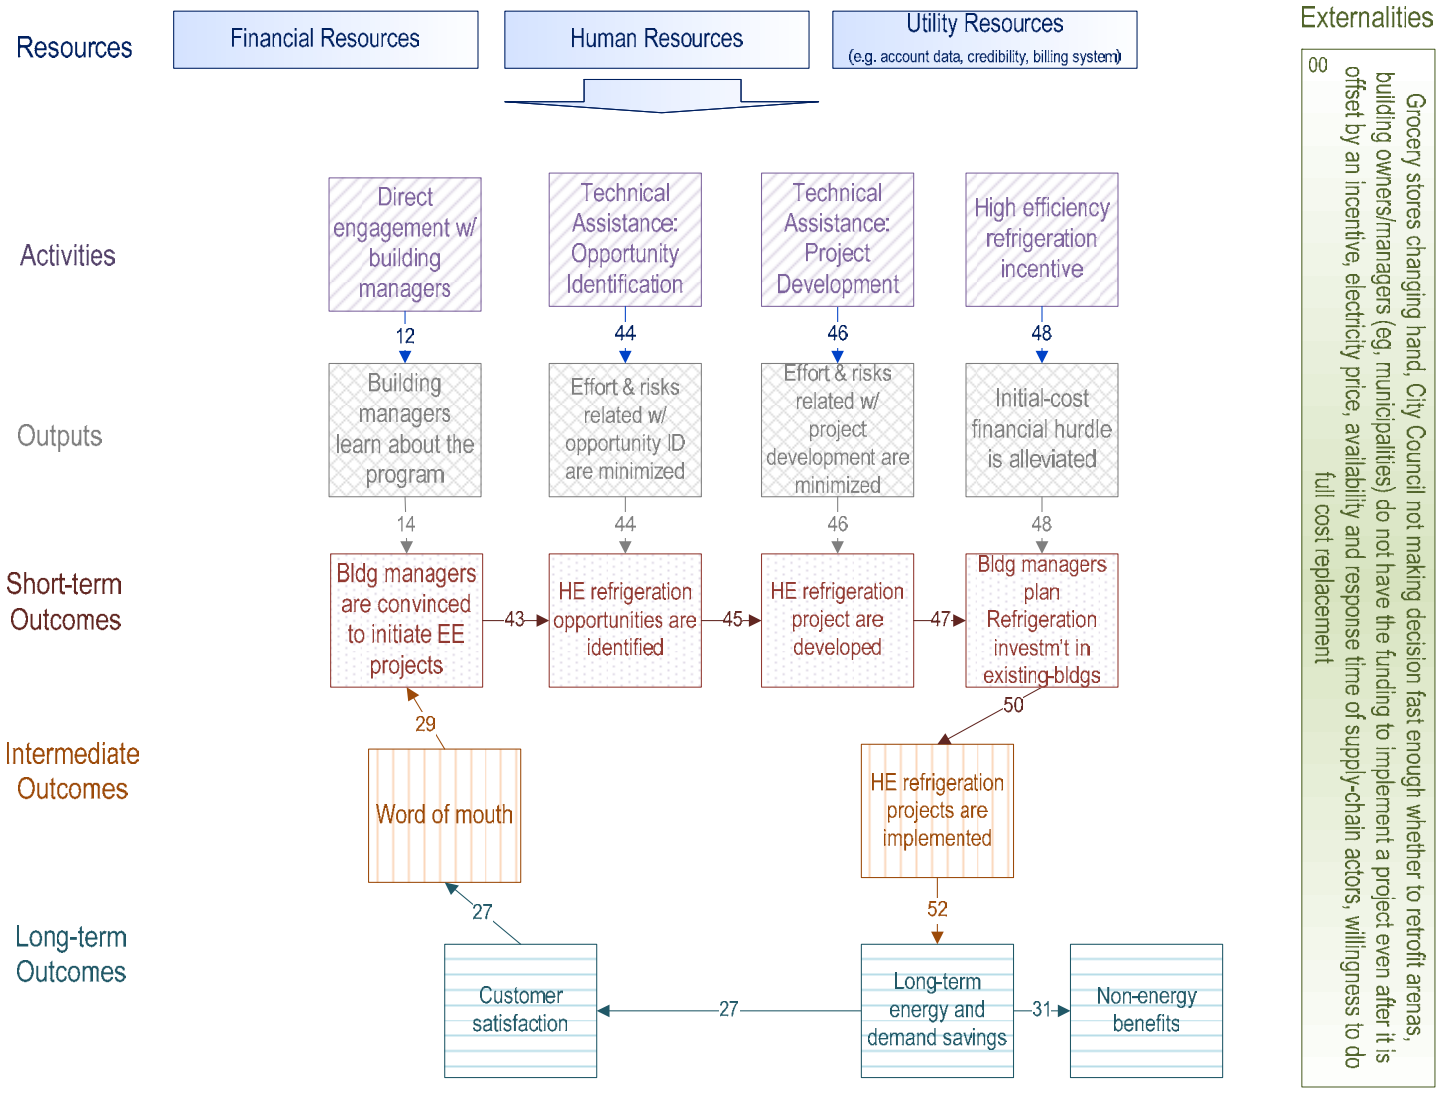
Exhibit 13: Archetype High Efficiency Refrigeration Projects – Custom Incentive for Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive	Size of Archetype Building
ECM1002	Typical Refrigeration Project - Ice Rink	2.49 kWh/ft2	.00034 kW/ft2	95%	$0.72/ft2	20.0 yr	$0.40/ft2	25,000 ft2

Program Theory

The program element theory is portrayed in the Logic Model below.

Exhibit 14: Logic Model for the General Service High Efficiency Refrigeration Element



Link #	Narrative
00	Externalities: The program effectiveness and impact will be influenced by the following externalities: grocery store ownership changes, slow decision-making on the part of City Council regarding whether or not to retrofit arenas, a lack of funding for building owners/managers (e.g., municipalities) to implement a project even after it is offset by an incentive, the price of electricity, the availability and response time of supply-chain actors, and the willingness to do a full cost replacement.
12	Direct engagement with supply-chain actors. The Utilities will carry out direct engagement with building owners/managers through emails, phone calls and in-person meetings, and through public relations activities like press releases sent to the local newspapers and radio stations, web content and joint events with the Whitehorse Chamber of Commerce. The Utilities will present their incentive offerings and make the owners/managers aware of the benefits so that they participate in the program.
14	Building owners/managers agree to initiate electricity efficiency projects because they were informed about the program components by the Utilities.

Link #	Narrative
43	Building owners/managers are offered the free services of energy engineers representing the Utilities to assess their refrigeration system to identify efficiency opportunities. They participate because their risk exposure and level of effort are minimized.
44	The Utilities provide technical assistance to the building owners/managers in the form of an assessment of the refrigeration system to identify energy efficiency opportunities. As a result, high efficiency refrigeration opportunities are identified. It is assumed that the Utilities are offering services NOT being offered for profit by other market actors because the target market niche is too small to be lucrative. It is not displacing or blocking free-market mechanisms (i.e. not blocking an existing mechanism or mechanism in the making).
45	After the high efficiency refrigeration opportunities are identified, the participant is offered more support to develop the project. The participant is asked to make a commitment. If the resulting project is a cost-effective investment, the participant agrees to carry on and implement the project. Otherwise, the participant will have to pay part of the cost of the technical assistance. The participant accepts because the level of risk he/she is asked to take is fair.
46	The Utilities provide technical assistance to develop the high efficiency refrigeration project in the form of a feasibility study and/or an investment-grade audit. If the participant implements the proposed design, the feasibility study will be free of charge.
47	The participants are presented with investment- and implementation-ready high efficiency refrigeration projects.
48	The Utilities will pay an incentive to participants who implement the high efficiency refrigeration projects that are identified. The incentive will alleviate the initial-cost hurdle of the high-efficiency refrigeration retrofit projects.
50	Because high-efficiency projects will have been subsequently identified and then developed by the Utilities, and because the Utilities will alleviate the initial-cost hurdle, high-efficiency refrigeration retrofit projects will be implemented.
52	The high-efficiency refrigeration retrofit projects will yield long-term electricity and demand savings.
27	Building owners/managers will be satisfied by the projects that they implemented. They will tell other people in the building industry, perhaps at the trade events supported by the utilities. This will generate word-of-mouth advertisement.
29	With time, word-of-mouth will become an important information channel that will cause building owners/managers and supply-chain actors to implement more projects.
31	It is assumed that owners/managers will perceive new non-energy benefits and/or maintain the benefits they used to have with baseline systems. For example, the Utilities will seek to ensure that participants perceive that their new systems are more comfortable, are less costly to maintain, have higher tenant satisfaction and retention, generate fewer complaints, and increase property value.

4.2.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 14 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 15. Performance indicators should be reviewed by the EM&V contractor to validate the theory. Explanatory notes on Exhibit 15 are provided in Section 4.1.2.

Exhibit 15: Management-by-Objective Framework for the General Service High Efficiency Refrigeration Incentive

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
Part A -- Visited Regularly as Part of Tracking and Performance Reporting – Key Performance Indicators (KPIs)								
00	Externalities	No associated tracked KPIs	-	-	-	-	-	-

47, 48 & 50	High efficiency refrigeration incentive and thus electricity-efficient refrigeration retrofit projects are implemented[11]	$ of incentive disbursement for HE refrigeration	Program documentation	$0K *w/gov* $0	$0K $0	$122K $132K	$0K $0K	$122K $132K
52	The electricity-efficient refrigeration retrofit projects will yield long-term electricity and demand savings	kWh of avoided electricity consumption kW of avoided coincident electricity demand	Program documentation	Refer to the Program Design Report Exhibits 35 & 36				
27	Building owners/managers will be satisfied by the projects that they implemented	No associated tracked KPIs	-	-	-	-	-	-
29	Word-of-mouth	No associated tracked KPIs	-	-	-	-	-	-
31	Non-energy benefits	No associated tracked KPIs	-	-	-	-	-	-
Part B -- To Be Visited, Checked and Reported On by Evaluators				Baseline ↓	Process Eval. ↓		Impact Eval. ↓	
00	Externalities	Suggested evaluation indicators: Done/Not-Done – report on externalities on a yearly basis	Program documentation	Done	Done	Done	Done	Done
12	Direct engagement with building managers	Suggested indicator(s): % of relevant building managers who have had at least one transaction % of building managers who can recall one of the following: bill inserts, web content, or inCharge in the news	Project documentation Participants & non-participants			40% 70%		60%

[11] Refer to the Program Design Report Exhibits 33 & 34

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
14	Building owners/managers agree to initiate electricity efficiency projects	Suggested indicator(s): % of participants who agree that utility technical assistance got them to implement project in full of in part	Participants			60%		60%
43, 44, 45, & 46	Building owners/managers are offered free energy engineering services to identify opportunities	% of participants who agree that the technical assistance got them to do a more sophisticated retrofit of their refrigeration system then they would have otherwise	Participants			60%		60%
47, 48 & 50	High efficiency refrigeration incentive and thus electricity-efficient refrigeration retrofit projects are implemented	% of participants who agree that the incentive got them to install the energy efficient equipment in part or in full	Participants			60%		60%
52	The electricity-efficient refrigeration retrofit projects will yield long-term electricity and demand savings	No evaluation indicator KPIs to be verified by evaluators.	-	-	-	-	-	-
27	Building owners/managers will be satisfied by the projects that they implemented	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the overall program	Participants			8/10		8/10
		1-to-10 scale, level of satisfaction with their energy efficient equipment	Participants			7/10		7/10
29	Word-of-mouth will become an important information channel	Suggested indicator(s): % heard of the program positively from other past participants	Participants in any GS program elements			30%		60%
		% heard of the program positively from past participants	Non-participants			10%		30%
31	Owners/managers will perceive new non-energy benefits; and/or the maintenance of benefits	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the refrigeration quality	Participants			9/10		9/10
		1-to-10 scale, level of satisfaction with the operations, ease of maintenance, & life expectancy				8/10		8/10

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the General Service High Efficiency Refrigeration Program. In addition, the following question should be explored:

- How effective was the technical assistance at supporting prospective participants in making a decision with regard to energy efficiency projects?

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *General Service High-Efficiency Refrigeration Incentive* have implications on the evaluation methods being employed:

- Relatively few projects are anticipated (5 to 10), therefore transactional infrastructure will be basic and documentation will be on a project-by-project basis.
- No savings are attributed to the technical assistance phases of the project; savings will be attributed only when the participants actually implement the projects.
- An aggregate of the M&V results from the technical assistance phases of each project can be fed into the program-level evaluation.
- Participants and their service providers will provide an estimate of the savings – based on engineering calculations, no measurement required – this estimate will be verified and documented by the program administrator. Thus, there will be a specific impact for each project. Deemed savings and the use of a TRM are irrelevant. Impact and incentive cash flow projections were based on "archetype projects"; those are not going to be used as part of ex-post evaluation.
- These projects are planned to occur in two waves: a first wave is planned to start around Y2-Q2, construction is to end on Y3-Q3, and the post-retrofit measurement period – expected to last for one year – is to end around Y4-Q3. The second wave will start on Y4-Q2 then follow a similar schedule. The completion of the M&V work for that second wave falls outside of the program window.
- It is expected that the program element will involve or have implications on the following market actors and stakeholders: store managers (population≈4); hockey/curling arena operators (p≈9); refrigeration contractors (p≈3); and the high-efficiency refrigeration consultant. Based on the results of the first half of the program period, the second half of the program period may involve: convenience stores, small grocery stores, and restaurants (p≈35).

Based on the above, the suggested *process evaluation* methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews, but evaluators will be able to suggest an alternative approach if necessary. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Literature review and jurisdictional scan to establish valid stipulated NTG ratios.
- Review of the technical assistance reports provided to participants to assess soundness of calculations and the proposed solutions, and effectiveness of the documents produced at supporting prospective participants in making a decision with regard to energy efficiency projects.
- Review and validation of the approach and internal procedures to site visits; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Impact of this program element will be evaluated based on the aggregated results of all of the project-level M&V reports completed as part of technical assistance components of the program. The approach to M&V will follow an Option-C methodology of the IPMVP; that is: whole-building electricity consumption measurement using the main utility meter. The baseline will be established based on at least 12-months' worth of

utility bills prior to construction; and the post-retrofit measurement period is to last for 12 months. The baseline will be adjusted based on one or many relevant independent parameters including at least the heating degree-days. Please refer to Section 3.2 for additional details.

- New, updated and expanded literature review and jurisdictional scan to establish valid stipulated NTG ratio.

- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

4.3 General Service ENERGY STAR Computer Incentive

4.3.1 Program Description Summary

The Utilities will pay an incentive to companies and organizations to have their computer equipment replaced with ENERGY STAR computer equipment.

A prescriptive incentive approach will be as follows: the Utilities will pay a flat amount of money per unit to owners/managers when computers and computer equipment from a prescriptive list of eligible products are purchased.

Equipment eligibility is tracked using a prescriptive list, so a pre-approval step is not necessary. The participation process is therefore very straightforward: the participant will submit a simple application form and provide backup documentation (e.g. invoices) to receive the incentive payment.

Eligible Measures

The proposed incentive level and archetype projects for the ENERGY STAR computer incentive are presented in Exhibit 16 and Exhibit 17.

Exhibit 16: Prescriptive List of ENERGY STAR Computer Conservation Measures for Non-Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM101	ES Desktop Computer and Monitor	148.0 kWh/unit	0.027 kW/unit	95%	$0.00/unit	4.0 yr	$30.00/unit
ECM102	ES Laptop Computer	41.0 kWh/unit	0.007 kW/unit	95%	$0.00/unit	4.0 yr	$10.00/unit

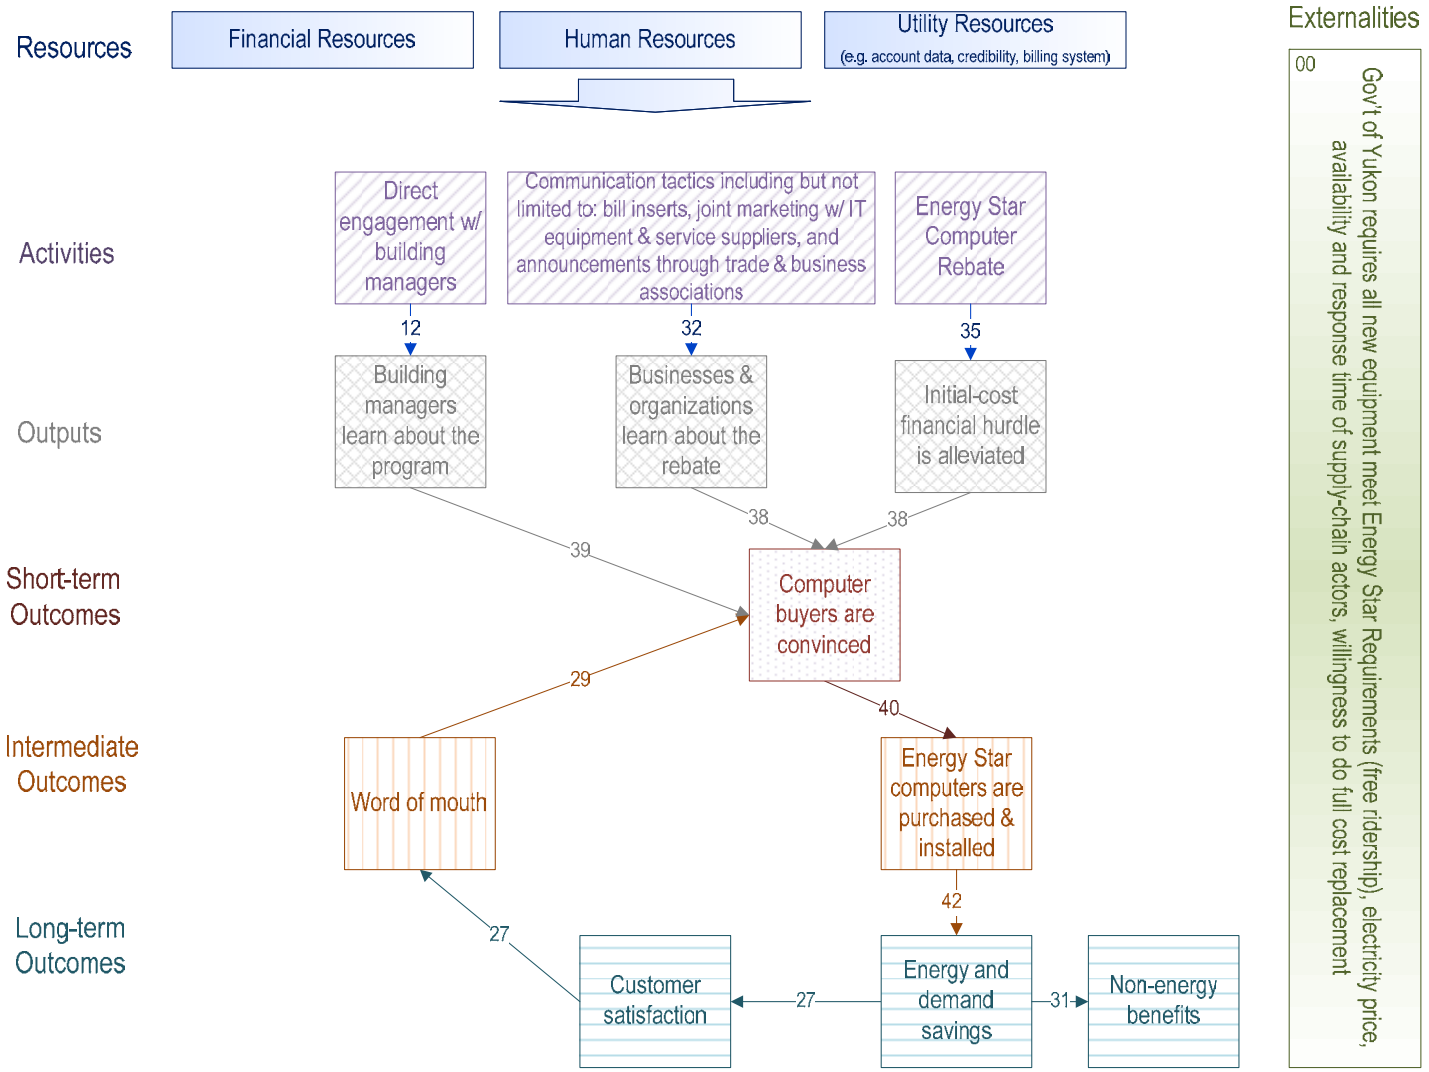
Exhibit 17: Prescriptive List of ENERGY STAR Computer Conservation Measures for Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM1012	Gov. ES Desktop Computer and Monitor	148.0 kWh/unit	0.027 kW/unit	55%	$0.00/unit	4.0 yr	$18.00/unit
ECM1022	Gov. ES Laptop Computer	41.0 kWh/unit	0.007 kW/unit	55%	$0.00/unit	4.0 yr	$6.00/unit

Program Theory

The program element theory is portrayed in the Logic Model below.

Exhibit 18: Logic Model for the General Service ENERGY STAR Computer Element



Link #	Narrative
00	The program effectiveness and impact will be influenced by the following externalities: the Gov't of Yukon's requirement that all new equipment meets ENERGY STAR standards (free ridership), the price of electricity, the availability and response time of supply-chain actors, and the willingness to do full cost replacements.
12	The Utilities will carry out direct engagement with building owners/managers through emails, phone calls and in-person meetings. The Utilities will present their incentive offerings and make the owners/managers aware of the benefits so that they participate in the program. Some building owners/managers also make IT equipment purchase decisions.
32	The Utilities carry out many tactics to inform computer buyers at businesses and organizations based in the Yukon. As a result, the computer buyers will learn about the incentive offering.
35	The Utilities will pay an incentive to computer buyers in exchange for the purchase of an ENERGY STAR Computer. The incentive will alleviate the initial-cost hurdle of the ENERGY STAR Computer and will be a convincing selling point.

Link #	Narrative
38	Because computer buyers will know about the offering and because they are offered a rebate designed to influence them, they will buy ENERGY STAR computers.
40	ENERGY STAR computers are purchased instead of standard computers.
42	The ENERGY STAR computers will yield electricity and demand savings during their 4-year lifetime.
27	Participants will be satisfied with the ENERGY STAR computer that they purchased. They will relay their experiences to other computer buyers in the Yukon, generating word-of-mouth advertisement.
29	With time, word-of-mouth will become an important information channel that will cause computer buyers to buy more ENERGY STAR computers.
31	It is assumed that the staff using ENERGY STAR computers will have the same user-experience as with baseline systems. For example, the Utilities will seek to make sure that participants perceive that their new systems turn on and off as fast as non-ENERGY STAR computers, and that their processors are as fast, etc.

4.3.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 10 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 19. Performance indicators should be reviewed by the EM&V contractor to validate the theory. Explanatory notes on Exhibit 19 are provided in Section 4.1.2.

Exhibit 19: Management-by-Objective Framework for the General Service ENERGY STAR Computer Incentive

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
Part A -- Visited Regularly as Part of Tracking and Performance Reporting – Key Performance Indicators (KPIs)								
00	Externalities	No associated tracked KPIs	-	-	-	-	-	-
12	Direct engagement with building managers	Suggested KPI(s): # of new building managers being engaged with for the 1st time	Direct engagement & communication logs	10	10	5	-	-

00	Externalities	Done/Not-Done – report on externalities on a yearly basis	Program documentation	Done	Done	Done	Done	Done
12	Direct engagement with building managers	Suggested indicator(s): % of relevant building managers who have had at least one transaction	Tracking system			40%		
32	Utilities carry out many communication tactics to inform businesses & organizations about the rebate	Suggested indicator(s): % of building managers who can recall one of the following: bill inserts, web content, or contact from IT suppliers	Participants & non-participants			70%		
35 & 40	Participants receive a rebate	Suggested indicator(s): % of participants who agree that the rebate got them to purchase the energy efficient products	Participants			60%		
38 & 39	ENERGY STAR computers are purchased & installed	No evaluation indicator	-			-		-
42	The ENERGY STAR computer installations will yield electricity and demand savings	No evaluation indicator KPIs to be verified by evaluators.	-			-		-
27	Participants will be satisfied by the products that they bought	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the overall rebate program 1-to-10 scale, level of satisfaction with their energy efficient products	Participants Participants			8/10 7/10		
29	Word-of-mouth	Suggested indicator(s): % heard of the program positively from other past participants % heard of the program positively from past participants	Participants Non-participants			30% 10%		

[13] Refer to the Program Design Report Exhibits 43 & 44 (they do not include the estimated spillover)
[14] This is one way to extrapolate the total number of shoppers influenced by the program (including those that purchased and installed rebate-eligible products without claiming a rebate)

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
31	Non-energy benefits	Suggested indicator(s): % of participants who believe that performance of the ENERGY STAR computer is equal to that of a standard computer % of participants who believe that buying an ENERGY STAR computer will be important or very important to them next time they buy a computer, even in the absence of a rebate program.	Participants			90% 70%		

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the General Service ENERGY STAR Computer Incentive without nuance. No additional questions are needed.

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *General Service ENERGY STAR Computer Incentive* have implications on the evaluation methods employed:

- Participants will receive a flat incentive per unit after they purchase computers and computer equipment from a prescriptive list of eligible products. Deemed savings and the use of a TRM are recommended.
- The ENERGY STAR computer incentive will close in Q4 of Y3.
- It is unlikely that the savings per building will be above 10% of the total building electricity consumption; therefore utility billing analysis or whole-building M&V will not be an option.
- It is expected that the program element will involve or have implications on the following market actors and stakeholders: IT equipment suppliers and retail stores (p≈20), property managers (p≈8 large, ≈32 small) and the Yukon Energy Solutions Centre.

Based on the above, the suggested *process evaluation* methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews, but evaluators will be able to suggest an alternative approach if necessary. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Literature review and jurisdictional scan to establish valid stipulated NTG ratios.
- Review and validation of the approach and internal procedures to issuing rebates; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Primarily, the impact will be computed based on the number of rebate transactions, deemed savings and the content of the TRM. The TRM will be updated at three stages of the evaluation work to ensure the soundness of these estimates and to reduce the evaluation risk: at the EM&V plan finalization stage, at the evaluation process stage and at the final impact evaluation stage.

- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

4.4 General Service New Construction Incentive

4.4.1 Program Description Summary

The Utilities will pay an incentive to building owners/managers for high performance new buildings. The incentive will have two paths: a prescriptive path for small buildings and a custom path for large buildings. The prescriptive incentive will be determined using a dollar-per-square foot rate if the building complies with a certain standard. The custom incentive will be determined using a dollar per kilowatt-hour of annual savings rate for each kilowatt-hour of savings realized above a minimum level. Savings will be determined through building modeling.

Eligible Measures

The proposed incentive level as well as archetype projects are presented in Exhibit 20 and in Exhibit 21.

Exhibit 20: Archetype Electricity-Efficient Non-Government New Construction Projects

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive	Size of Archetype Building
ECM89	Typical High-Performance New Building - 25% Better	5.93 kWh/ft2	.00135 kW/ft2	95%	$2.00/ft2	20.0 yr	$1.50/ft2	11,759 ft2
ECM90	Typical High-Performance New Building - 40% Better	9.49 kWh/ft2	.00217 kW/ft2	95%	$6.00/ft2	20.0 yr	$4.00/ft2	11,759 ft2

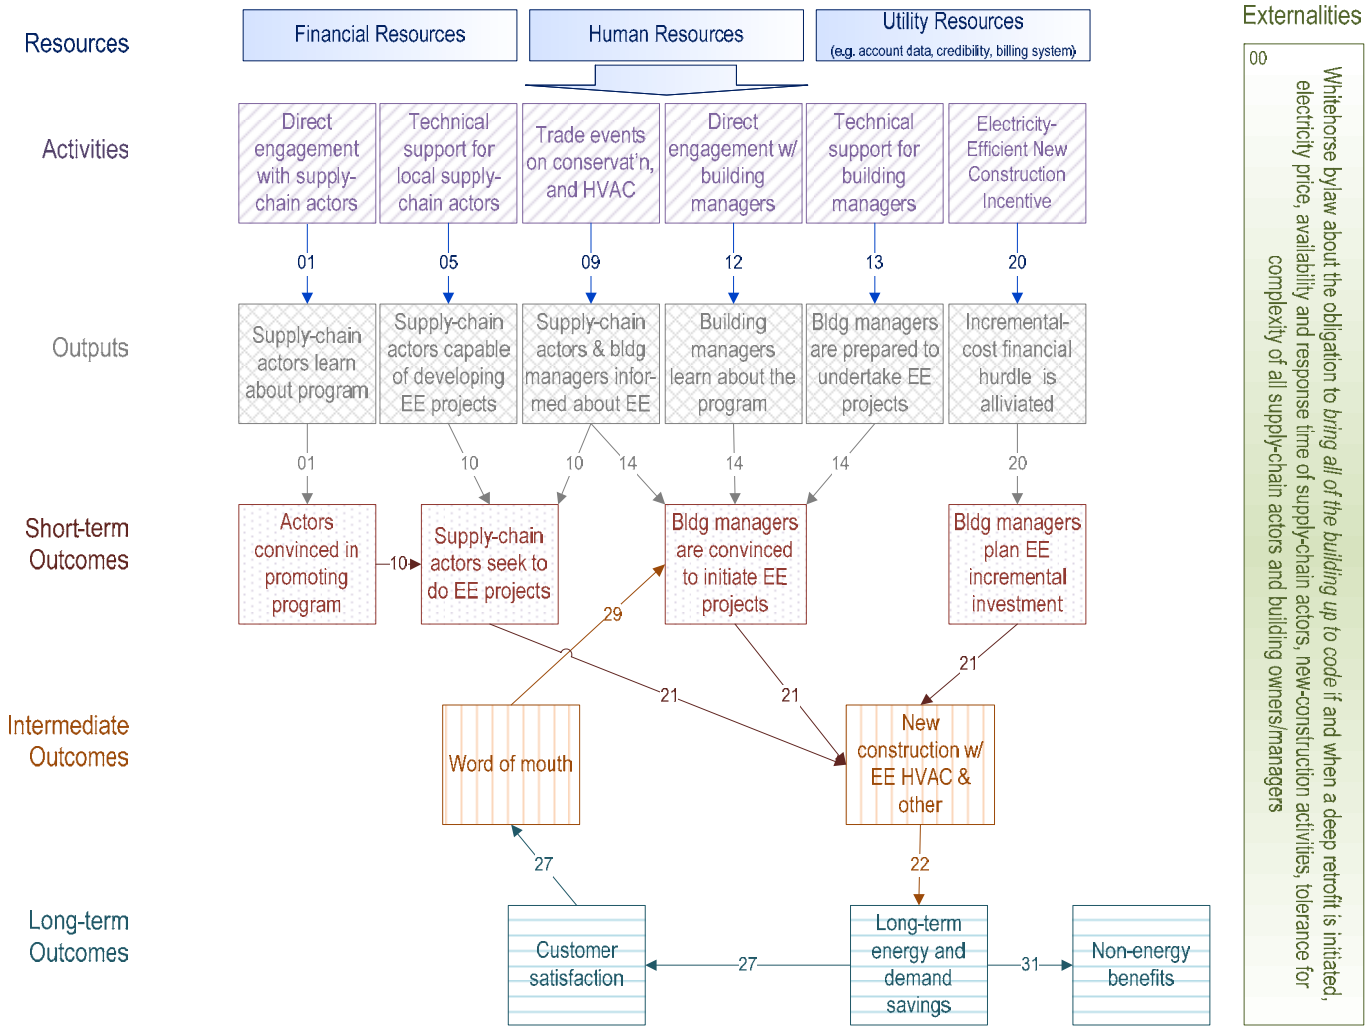
Exhibit 21: Archetype Electricity-Efficient Government New Construction Projects

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive	Size of Archetype Building
ECM892	Gov. Typical High-Performance New Building - 25% Better	5.93 kWh/ft2	.00135 kW/ft2	95%	$2.00/ft2	20.0 yr	$0.90/ft2	26,209 ft2
ECM902	Gov. Typical High-Performance New Building - 40% Better	9.49 kWh/ft2	.00217 kW/ft2	95%	$6.00/ft2	20.0 yr	$2.40/ft2	26,209 ft2

Program Theory

The program element theory is portrayed in the Logic Model below.

Exhibit 22: Logic Model for the General Service New Construction Incentive



Link #	Narrative
00	The program effectiveness and impact will be influenced by the following externalities: Whitehorse bylaws on the obligation to bring all of the buildings up to code if and when deep retrofits are initiated, the price of electricity, the availability and response time of supply-chain actors, new-construction activities, and tolerance for complexity of all supply-chain actors and building owners/managers. The program administrator should monitor these externalities and adapt the implementation approach as necessary.
01	The Utilities will carry out direct engagement with electrical distributors, lighting designers, electrical contractors, as well as with HVAC contractors, HVAC designers, control designers and architects through emails, phone calls and in-person meetings. The Utilities will present their incentive offerings and engage with supply-chain actors so that they promote them.

Link #	Narrative
05	The Utilities will offer technical support to the supply-chain actors in two different forms: (1) hands-on training on the program tools, forms and procedures; on advanced electricity efficiency lighting design; and on the business aspects of electricity efficiency: energy audits, business cases, energy performance contracting, and electricity efficiency financing. (2) The Utilities will act as a broker to procure technical expertise from highly specialized lighting experts recruited throughout North America upon request from the local actors. In addition, the Utilities will disseminate information on recommended lighting equipment (brand-neutral, to the extent possible) in the form of printed brochures, newsletters or web content.
09	The Utilities propose to support any form of trade organizations or trade events by sponsoring and attending trade events that gather local building owners/managers and/or supply-chain actors. The Utilities intend to strengthen or create platforms that allow local energy conservation practitioners to present their success stories, and share their lessons learned.
10	Supply-side actors will actively seek to develop projects because they were engaged with by the Utilities, because they were trained and are capable of offering electricity-efficiency services, and because they were provided with networking opportunities with potential clients (building owners/managers) at trade events.
12	The Utilities will carry out direct engagement with building owners/managers through emails, phone calls and in-person meetings; and through public relations activities like press releases sent to the local newspapers and radio, web content, and joint events with the Whitehorse Chamber of Commerce. The Utilities will present their incentive offerings and make the owners/managers aware of the benefits so that they participate in the program.
13	The Utilities will offer customized technical support to building owners/managers to help them to initiate projects. The Utilities could include support to plan investment in assets, and to identify in which buildings to develop projects; support to make optimal decisions on implementation and procurement approach, and support before and during the tendering of project design services, particularly if the procurement approach is energy performance contracting (EPC).
14	Building owners/managers agree to initiate electricity efficiency projects because they were informed about the program components by the Utilities, because they were provided with technical support to decide where to start and how to do it, and because they networked with supply-side actors, perhaps at the trade events supported by the Utilities.
20	The Utilities will pay an incentive to new building owners/managers for electricity-efficient new buildings construction. The incentive will alleviate the initial-cost hurdle of the construction of electricity-efficient buildings. The incentive will be performance-based and be paid for buildings that are more electricity efficiency than the combination of the 2011 National Energy Code of Canada for Building and the City of Whitehorse's Building and Plumbing Bylaw.
21	Electricity-efficient new buildings constructions are implemented because the supply-chain actors were seeking to work on electricity-efficient new construction projects, and because the initial-cost hurdle of the construction of electricity-efficient buildings was alleviated.
22	The electricity-efficient new buildings will yield long-term electricity and demand savings.
27	Building owners/managers will be satisfied by the projects that they implemented. They will tell other people in the building industry; perhaps at the trade events supported by the utilities. This will generate word-of-mouth advertisement.
29	With time, word-of-mouth will become an important information channel that will cause building owners/managers and supply-chain actors to implement more projects.
31	It is assumed that owners/managers will perceive new non-energy benefits; and/or the maintenance of benefits they used to have with baseline systems. For example, the Utilities will seek to make sure that participants perceive that their new systems are more comfortable, are less costly to maintain, have higher tenant satisfaction and retention, generate fewer complaints, and have increased property value.

4.4.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 22 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 23. Performance indicators should be reviewed by the EM&V contractor to validate the theory. Explanatory notes on Exhibit 23 are provided in Section 4.1.2.

Exhibit 23: Management-by-Objective Framework for the General Service New Construction Incentive

20	New construction incentive	Suggested indicator(s): % of participants who agree that the incentive got them to work on an energy efficient building design in part or in full % of suppliers who agree that the incentive got their client to increase the energy performance of their building	Participants Supply-chain actors			60% 60%		60% 60%
21	Electricity-efficient projects are implemented	No evaluation indicator	-	-	-	-	-	-
22	The electricity-efficient projects will yield long-term electricity and demand savings	No evaluation indicator KPIs to be verified by evaluators.	-	-	-	-	-	-
27	Building owners/managers will be satisfied by the projects that they implemented	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the overall program 1-to-10 scale, level of satisfaction with their energy efficient equipment	Participants Participants			8/10 7/10		8/10 7/10
29	Word-of-mouth will become an important information channel	Suggested indicator(s): % heard of the program positively from other past participants % heard of the program positively from past participants	Participants Non-participants			30% 10%		60% 30%
31	Owners/managers will perceive new non-energy benefits; and/or the maintenance of benefits	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the lighting quality 1-to-10 scale, level of satisfaction with the operations, ease of maintenance, & life expectancy	Participants			9/10 8/10		9/10 8/10

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the General Service New Construction Incentive. In addition, the following questions will be explored:

- Is the baseline building standard for this program sound, and should the baseline be changed mid-course?
- Is the market ready for a more stringent building code?

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *General Service New Construction Incentive* have implications on the evaluation methods employed:

- Under the prescriptive path, the incentive will be determined using a dollar-per-square foot rate if the building complies with a certain standard. The standard will be designed to be slightly more stringent than the Model National Energy Building Code minus 25% (MNEBC -25%) and the City of Whitehorse's Building and Plumbing Bylaw.
- Under the custom-incentive path (or performance path), the custom incentive will be determined using a dollar per kilowatt-hour of annual savings rate for each kilowatt-hour of savings that are realized above a minimum level. Savings will be determined through building energy modeling. The baseline and modeling requirements will be the same as those for the Canada Green Building Council's LEED building certification. Deemed savings and the use of a TRM are irrelevant. Impact and incentive cash flow projections were based on "archetype projects"; those are not going to be used as part of ex-post evaluation.
- The program performance was modeled before the launch using the archetype projects presented in Exhibit 20 and in Exhibit 21Exhibit 21. However, during program implementation, each transaction is treated as a custom project, with a specific level of electricity and demand savings, and a specific total incentive amount.
- This is an incentive for new building constructions, and since there are no "pre-build" utility bills or measurements, whole-building M&V is not applicable (Option C of the IPMVP).
- Calibrated building energy modeling might be practical (that is: Option D according to the IPMVP). The Utilities are working under the assumption that the number of transactions will not be large enough to justify an Option-D methodology; and regular building energy modeling will be sufficient. For the benefit of the readers: under the calibrated building energy modeling approach, building analysts adjust their project-scenario model ex post so that the model reflects early utility bills. Many changes that are uncovered then must also be applied to the base-case scenario. The resulting "calibrated" saving estimate is then considered to be more accurate. It is expected that the program element will involve or have implications on the following market actors and stakeholders: HVAC/control designers and contractors (p≈18), property managers (p≈8 large), architects (p≈3), and the Yukon Energy Solutions Centre.

Based on the above, the suggested process evaluation methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews, but evaluators will be able to suggest an alternative approach if necessary. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Literature review and jurisdictional scan to establish valid stipulated NTG ratios.
- Review of the forms and tools (job aids) provided to participants and supply-chain actors to estimate the savings for each projects and review of the procedures to validate the savings as part of regular program operations.

- Review and validation of the approach and internal procedures to site visits; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Quality assurance of a sample of projects selected thorough all the transactions during the 5-year program operation window to establish the actual realized savings for each project in the sample, and ultimately establish the realization ratio for all of the population of projects.
    - Verification will be based on “as-built” blueprints that shall be collected as part of program operations.
- Stipulated measure lifetime will be assumed to be 20 years and stipulated net-to-gross ratio will be assumed to be 95%. These stipulated values are to be validated by the evaluators during the finalization of the EM&V plan.
- New, updated and expanded literature review and jurisdictional scan to establish valid stipulated NTG ratio.
- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

4.5 Residential LED Lighting & Automotive Heater Timer Rebates

4.5.1 Program Description Summary

The Utilities will provide a flat incentive per unit to shoppers and housing developers after they purchase LED lighting lamps or fixtures or a timer for an automotive heater, car warmer and/or battery blanket selected from a prescriptive list of eligible products.

The Utilities will explore three possible rebate delivery mechanisms: (1) instant rebate at the point of purchase, (2) mail-in rebate, or (3) both. Instant-rebates are generally preferred by participants and will, therefore, be pursued first. However, the Utilities retain the option to complete a mail in rebate if market or regulatory conditions preclude from using instant rebates.

The Utilities retain the right to modulate the rebate though the same fiscal year to be able to react to market conditions and use marketing tactics to drive up the demand. In addition, the Utilities retain the right to update the incentive levels, the list of eligible products and the LED incentive budget on an annual basis.

Automotive heater timers gained a bad reputation in the Yukon because they reportedly failed. In order to address this, the Utilities envision applying the following tactics:

- The Utilities will start by promoting indoor automotive heater timers with the housing developers. Indoor timers are not subjected to cold weather and are therefore more reliable.
- The Utilities know that outdoor automotive heater timers are being promoted by utilities in Alaska. The Utilities intend to research the automotive heater timers that the Alaskan utilities are promoting, to test them in the Yukon. The Utilities will start promoting these automotive heater timers once the reliability issue is resolved.

Eligible Measures

The first list of prescriptive measures will include the items presented in Exhibit 24.

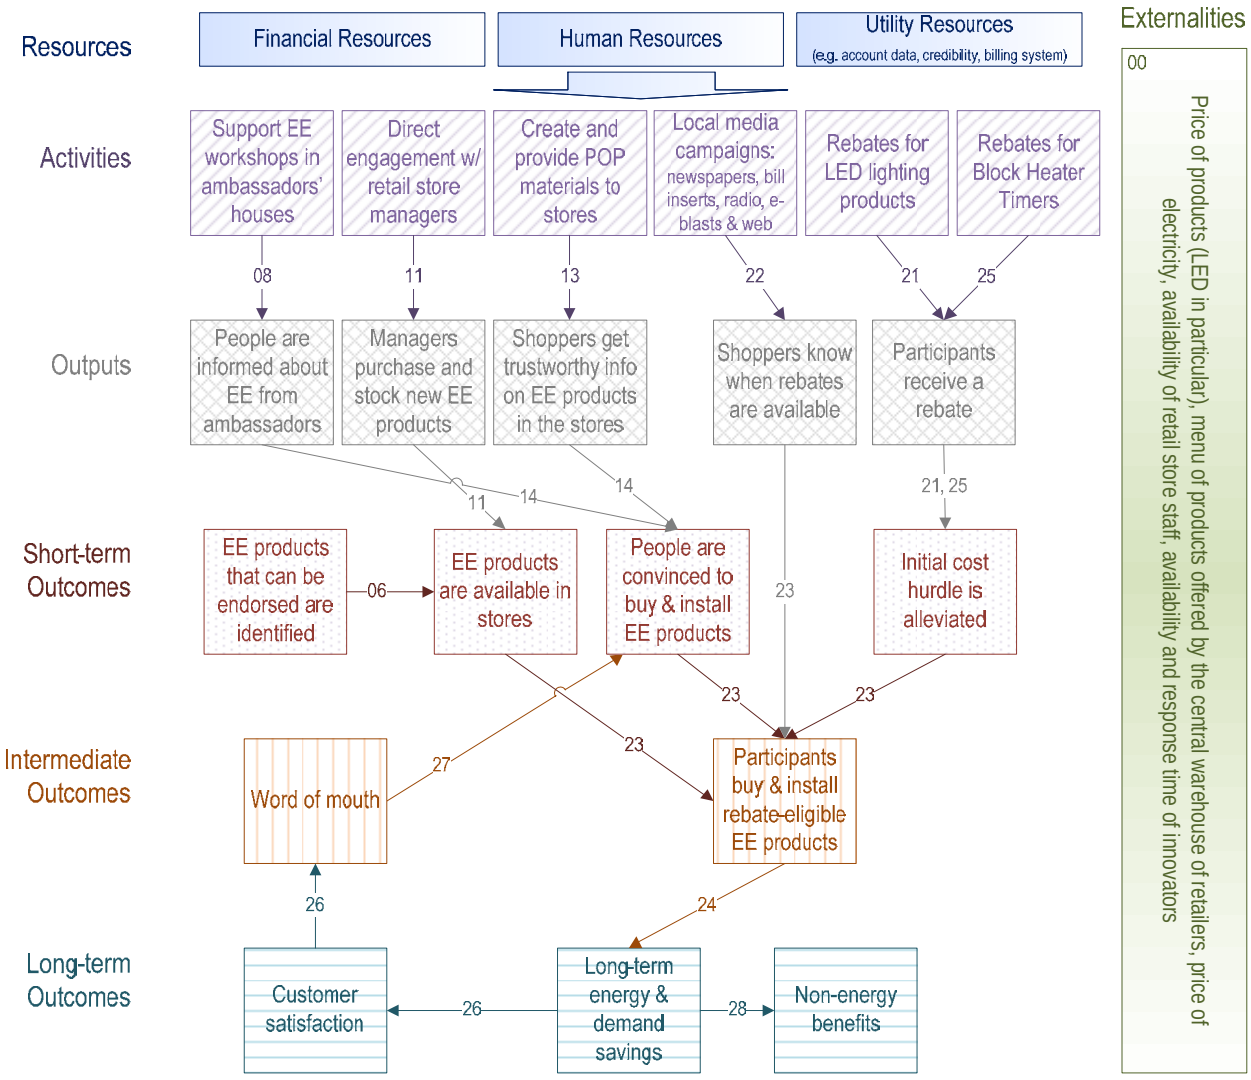
Exhibit 24: Prescriptive List of Residential LED Lighting and Automotive Heater Timer Energy Conservation Measures

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM151	Block Heater Timer	130 kWh/unit	0.046 kW/unit	100%	$37.50/unit	10.0 yr	$20.00/unit
ECM24	12W LED A19 Bulb	48 kWh/unit	0.017 kW/unit	110%	$44.00/unit	20.0 yr	$18.00/unit
ECM60	8W LED A19 Bulb	32.0 kWh/unit	0.011 kW/unit	110%	$30.00/unit	20.0 yr	$12.00/unit
ECM61	LED MR16 Bulbs	15.0 kWh/unit	0.005 kW/unit	110%	$20.00/unit	20.0 yr	$10.00/unit
ECM62	LED PAR30 Bulbs	40.0 kWh/unit	0.014 kW/unit	110%	$51.00/unit	20.0 yr	$20.00/unit
ECM63	LED PAR38 Bulbs	55.0 kWh/unit	0.020 kW/unit	110%	$43.00/unit	20.0 yr	$20.00/unit
ECM44	Spot or Task Lighting	40.0 kWh/unit	0.014 kW/unit	80%	$25.00/unit	10.0 yr	$10.00/unit

Program Theory

The program element theory is portrayed in the Logic Model below.

Exhibit 25: Logic Model for the Residential LED Lighting & Automotive Heater Timer Rebates



Link #	Narrative
00	The program effectiveness and impact will be influenced by the following externalities: price of products (LED technologies, in particular), menu of products offered by the central warehouse of retailers, price of electricity, availability of retail store staff, availability and response time of innovators The program administrator should monitor these externalities and adapt the implementation approach based on them.
06	The consumer responses provided on the scorecards will be aggregated, analyzed and provided to the store managers. The Utilities will be able to endorse certain EE products because customer satisfaction will be good. The results will be presented to the retail store managers, and feed the communication and POP materials. It is expected that store managers will react by stocking more of these products and allocate more shelf space.

Link #	Narrative
08	The Utilities will support EE workshops in the homes of EE community network members or nearby community venues with approximately ten friends and relatives. The Utilities will send facilitator(s), provide communication materials and low-cost EE products to give away, and perhaps provide food and beverages. The Utilities' skilled facilitator(s) will have a few key messages regarding low-cost EE products, LED lighting products, automotive heater timers and innovative heating and DHW systems. The facilitator will encourage the participants to share tips and information on electricity conservation. The facilitator will seek to eliminate potential sources of confusion and false beliefs in the communities by presenting hard facts.
11	The Utilities will establish partnerships with Yukon retail store managers and establish two-way communication. The Utilities will suggest new products to stock; perhaps by providing the results of the low-cost EE product piloting, by revealing in advance what products will be eligible for the LED lighting rebate and automotive heater timer rebate, or by indicating what POP materials will be created and offered to the shops.
13	The Utilities will design and procure educational Point Of Purchase (POP) materials for Yukon retail managers to display in their stores. These materials might include (but not be limited to): brochures, presentation boxes, posters, and displays stands.
14	Yukon shoppers will be informed on EE products through the community direct engagement, and through the POP materials. This will cause them to buy and install these products.
21	The Utilities will provide a flat amount of money per unit to Yukon shoppers after they purchase LED lighting lamps or fixtures selected from a prescriptive list of eligible products. The initial-cost hurdle will be alleviated which will contribute to the items being purchased and installed.
22	The "rebate" period will be extensively advertised through a media campaign starting in June of each year through local radio, local newspapers, co-op advertisement with retailers and in stores, email blast, and electricity bill inserts. Consequently, shoppers will know when the rebates are going to be available. The marketing tactics used will create a sense of urgency and push Yukon shoppers to make the right purchase decision; it is expected to boost overall program uptake as compared a continuously available.
23	Participating Yukon shoppers (i.e. participants) will buy and install LED lighting products or automotive heater timers and receive a rebate because these products will be available in the stores, because they were made aware of the benefits of these products, because they know when the rebate is available, and because the initial cost hurdle was alleviated by the rebate.
24	The LED lighting product installs and automotive heater timer installs will yield long-term electricity and demand savings.
25	The Utilities will provide a flat amount of money per unit to Yukon shoppers for the purchase of automotive heater timers (indoor or outdoor) from selected from a prescriptive list of eligible products. The initial-cost hurdle will be alleviated and/or the rebate will make the purchase of an automotive heater timer much more enticing. This will contribute to the purchase and installation of these items.
26	Shoppers who bought low-cost EE products, LED lighting products or automotive heater timers will be satisfied by the products that they bought. They will tell their friends and relatives. This will generate word-of-mouth advertisement.
27	With time, word-of-mouth will become an important information channel that will cause Yukon residents to buy and install EE products.
28	It is assumed that shoppers will perceive new non-energy benefits; and/or the maintenance of benefits they used to h baseline systems. For example, the Utilities will seek to make sure that participants will perceive that their new LED products last longer, are less sensitive to power quality issues, are more reliable, cast better light (color rendering, intensity, and visual acuity), and easier and less hazardous to dispose of than CFLs. The Utilities will seek to make sure that participants will perceive that automotive heater timers are reliable and that the use of a timer does not have negative impact on their car.

4.5.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 25 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 26. Performance indicators should be reviewed by the EM&V contractor to validate the theory. Explanatory notes on Exhibit 26 are provided in Section 4.1.2.

Exhibit 26: Management-by-Objective Framework for the Residential LED Lighting and Automotive Heater Timer Rebates

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the Residential LED Lighting and Automotive Heater Timer Rebate. In addition, the following questions will be explored:

- How shoppers are influenced by the rebate, but do not ultimately redeem the rebate?
- Has the engagement with the retailers, including sharing the scorecards and the research performed on their behalf, influenced their habits (such as stocking, merchandizing, promotions, and adding new products) to sell more energy efficient products?

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *Residential LED Lighting and Automotive Heater Timer Rebates* have implications on the evaluation methods employed:

- Participants will receive a flat incentive per unit after they purchase LED lighting lamps or fixtures or a timer for an automotive heater timer, car warmer and/or battery blanket from a prescriptive list of eligible products. Deemed savings and the use of a TRM are recommended.
- It is unlikely that the savings per building will be above 10% of the total building electricity consumption; therefore utility billing analysis or whole-building M&V will not be an option.
- Shoppers who are influenced to purchase rebate-eligible products in many cases will not claim the rebate. Hence, the amount of rebate disbursements will not provide a complete indicator of the program impact.
- It is expected that the program element will involve or have implications on the following market actors and stakeholders: retail store managers (p≈20), landlords (p≈50),

shoppers (p≈20,000), housing developers (p≈8), the Yukon Energy Solutions Centre, and the Yukon Housing Corporation.

Based on the above, the suggested *process evaluation* methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews with supply-chain actors, and phone or online surveys with participants and non-participants, but evaluators will be able to suggest an alternative approach if necessary. Mystery shoppers and retail intercepts might also be considered. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Review of the point-of-purchase materials, scorecard feedback, and media campaign material to review their quality and quantity (refer to the KPIs specified in the MBO framework).
- Review and validation of the approach and internal procedures to issuing rebates; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Primarily, the impact will be computed based on the number of rebate transactions, deemed savings and the content of the TRM. The TRM will be updated at three stages of the evaluation work to ensure the soundness of these estimates and to reduce the evaluation risk: at the EM&V plan finalization stage, at the evaluation process stage and at the final impact evaluation stage.
- There is potential for claiming savings over and above the savings realized by those who will redeem the rebates: that is the savings resulting from incremental sales in LED lighting equipment and automotive heater timers from shoppers influenced by the program but who do not ultimately redeem the rebate. Evaluators refer to commonplace occurrence as ‘spillover’. The approach to estimating these savings involve the following:
  - Consult with the store managers during the finalization of the EM&V plan and confirm their commitment to provide sales data for rebate-eligible products during the 5-year DSM operations window. It is recommended to obtain a detailed commitment; agree on how and when the data will be available and what measures are going to be taken to ensure confidentiality.
  - If the evaluators are successful with the above, then the evaluators will lay out the method to estimate the savings based on the expected data in the final EM&V plan.
- For this program element only, because of the above, and if the evaluators are successful at securing the sales data, the evaluators might choose not to use stipulated NTG ratios. Instead, the evaluators will estimate the spillover ratio based on the sales data and use 1 + Spillover as NTG ratio.
- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

4.6 Residential Promotion of Low-Cost Energy Efficient Products

4.6.1 Program Description Summary

The Utilities will prepare and disseminate information on products that generate electricity savings but do not have a perceptible price increment as compared with the baseline equipment. The Utilities will disseminate information through point of purchase displays and brochures in retail stores, and through community engagement. Certain low-cost items will be provided by the Utilities to community volunteers to test and showcase: for example certain LED lamps, low-flow showerheads, faucet aerators, etc. The Utilities will give out a limited number of these items free of charge; volunteers will try them out, fill out a scorecard and send it back. The results will be fed back first to the store managers, and then to the consumers through point of purchase displays and brochures and through community engagement.

Eligible Measures

The preliminary list of low-cost EE products that the Utilities intend to promote includes the items presented in Exhibit 27.

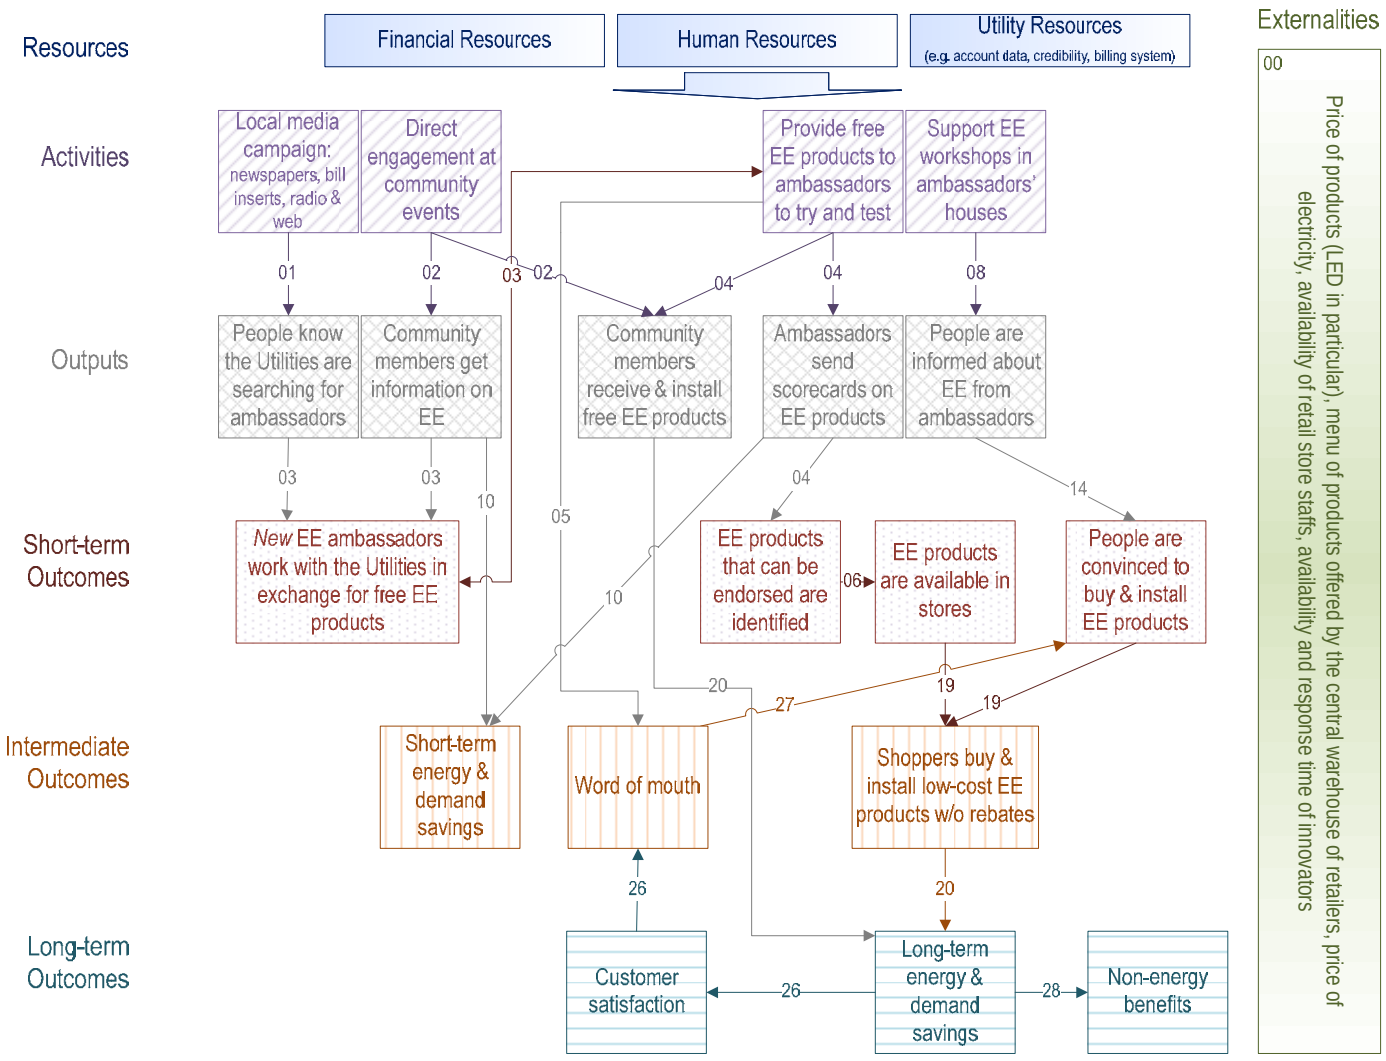
Exhibit 27: List of Energy Conservation Measures Based on Low-cost EE Products

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM242	Pilot 12W LED A19 Bulb	48 kWh/unit	0.017 kW/unit	100%	$44.00/unit	20.0 yr	$44.00/unit
ECM602	Pilot 8W LED A19 Bulb	32 kWh/unit	0.011 kW/unit	100%	$31.00/unit	20.0 yr	$31.00/unit
ECM612	Pilot LED MR16 Bulbs	15.0 kWh/unit	0.005 kW/unit	100%	$25.00/unit	20.0 yr	$25.00/unit
ECM622	Pilot LED PAR30 Bulbs	40.0 kWh/unit	0.014 kW/unit	100%	$64.00/unit	20.0 yr	$64.00/unit
ECM632	Pilot LED PAR38 Bulbs	55.0 kWh/unit	0.020 kW/unit	100%	$53.00/unit	20.0 yr	$53.00/unit
ECM442	Pilot Spot or Task Lighting	40.0 kWh/unit	0.014 kW/unit	100%	$25.00/unit	10.0 yr	$25.00/unit
ECM092	Pilot Ultra Low-flow Showerheads	325.0 kWh/unit	0.116 kW/unit	100%	$16.01/unit	10.0 yr	$16.01/unit
ECM112	Pilot Smart, Surge Protected Power Bars for PCs and TVs	67.8 kWh/unit	0.024 kW/unit	100%	$50.00/unit	10.0 yr	$50.00/unit
ECM182	Pilot DHW Tank Insulation	62.0 kWh/unit	0.022 kW/unit	100%	$37.58/unit	14.0 yr	$37.58/unit
ECM202	Pilot DHW Pipe Insulation	34.0 kWh/unit	0.012 kW/unit	100%	$0.79/unit	15.0 yr	$0.79/unit
ECM482	Pilot Motion Detectors - Indoor and Outdoor	66.0 kWh/unit	0.024 kW/unit	100%	$22.94/unit	10.0 yr	$22.94/unit
ECM152	Pilot Auto Heater Timers	129.8 kWh/unit	0.046 kW/unit	100%	$37.50/unit	10.0 yr	$37.50/unit
ECM142	Pilot Prog. Thermostats (Central)	827.0 kWh/unit	0.295 kW/unit	100%	$62.50/unit	11.0 yr	$62.50/unit
ECM212	Pilot Prog. Thermostats	826.0 kWh/unit	0.295 kW/unit	100%	$285.43/unit	11.0 yr	$285.43/unit
ECM062	Pilot E-Star TVs	69.0 kWh/unit	0.025 kW/unit	100%	$1,125.00/unit	10.0 yr	$1,125.00/unit
ECM082	Pilot ESTAR Printers and Fax	31.7 kWh/unit	0.011 kW/unit	100%	$200.00/unit	6.0 yr	$200/unit
ECM091	Ed. Ultra Low-flow Showerheads	325.0 kWh/unit	0.116 kW/unit	100%	$8.62/unit	10.0 yr	$0/unit
ECM111	Ed. Smart, Surge Protected Power Bars for PCs and TVs	68 kWh/unit	0.024 kW/unit	100%	$25.00/unit	10.0 yr	$0/unit
ECM181	Ed. DHW Tank Insulation	62 kWh/unit	0.022 kW/unit	100%	$37.58/unit	14.0 yr	$0/unit
ECM201	Ed. DHW Pipe Insulation	34.0 kWh/unit	0.012 kW/unit	100%	$0.79/unit	15.0 yr	$0.00/unit

Program Theory

The program element theory is portrayed in the Logic Model below.

Exhibit 28: Logic Model for the Residential Low-Cost Energy Efficient Products



Link #	Narrative
00	The program effectiveness and impact will be influenced by the following externalities: price of products (LED technologies, in particular), menu of products offered by the central warehouse of retailers, price of electricity, availability of retail store staff, availability and response time of innovators The program administrator should monitor these externalities and adapt the implementation approach based on them.
01	The Utilities will advertise their intention of building an EE community network through the local press, and applicable non-profit and community organizations. It is expected that this tactic will ease the development of the network.
02	The Utilities will carry out outreach activities in community events (eg. sport events, cultural events, town hall meetings, etc.), engage with organization and people who have a natural interest in electricity conservation; hook individuals with a continuous stream of free low-cost EE products or contests; do personalized follow-ups; offer to new home buyers to pilot CCHPs, or GSHPs; and promote the idea of supporting an EE workshop at their home or a at local venue.

Link #	Narrative
03	The Utilities will build new relationships and an EE community network that the Utilities will be able to use to extend its communication and community direct engagement footprint.
04	The Utilities will have low-cost EE products tested through volunteers and/or the EE community network. The Utilities will give out a limited number of these items free of charge; the ambassadors will try them out, fill out a simple scorecard and send the scorecard back. The Utilities will collect all of the scorecards, aggregate and analyze the results, and use the results on consumer satisfaction in other program components such as the LED rebate component, the automotive heater timer rebate component and the low-cost EE product education component.
05	It is expected that the volunteers and EE community network members will like the low-cost EE products and will tell their friends and relatives. This will feed the word of mouth feedback loop.
06	The consumer responses provided on the scorecards will be aggregated, analyzed and provided to the store managers. The Utilities will be able to endorse certain EE products because customer satisfaction will be good. The results will be presented to the retail store managers, and feed the communication and POP materials. It is expected that store managers will react by stocking more of these products and allocate more shelf space.
08	The Utilities will support EE workshops in the homes of EE community network members or nearby community venues with approximately ten friends and relatives. The Utilities will send facilitator(s), provide communication materials and low-cost EE products to give away, and perhaps provide food and beverages. The Utilities' skilled facilitator(s) will have a few key messages regarding low-cost EE products, LED lighting products, automotive heater timers and innovative heating systems. The facilitator will encourage the participants to share tips and information on electricity conservation. The facilitator will seek to eliminate potential sources of confusion and false beliefs in the communities by presenting hard facts.
10	The information and tips provided to residents of the Yukon as part of the Utilities direct community engagement activities will influence their behavior and cause them to use less electricity and reduce their peak demand. However, quantifying "behavior-based" electricity and demand savings is challenging and perhaps cost-prohibitive for a small jurisdiction like the Yukon. Moreover, the persistence of "behavior-based" conservation measures is notoriously bad. It is commonly believed to be less than one year by DSM experts. Consequently, the short-term benefits of behavior-based conservation measures will not be quantified. They are considered to be outcomes that are "nice-to-have" yet not necessary to make the program viable.
14	Yukon shoppers will be informed on EE products through the community direct engagement, and through the POP materials. This will cause them to buy and install these products.
19	Yukon shoppers will buy and install low-cost EE products (even in the absence of rebate) because these products will be available in the stores, and because they were made aware of the benefits of these products. The low-cost EE products might have a certain price increment; however it is assumed that the price increment (if any) is too small to constitute the most important purchase barrier.
20	The free and purchased low-cost EE product installs will yield long-term electricity and demand savings.
26	Shoppers who bought low-cost EE products, LED lighting products or automotive heater timers will be satisfied by the products that they bought. They will tell their friends and relatives. This will generate word-of-mouth advertisement.
27	With time, word-of-mouth will become an important information channel that will cause Yukon residents to buy and install EE products.
28	It is assumed that shoppers will perceive new non-energy benefits; and/or the maintenance of benefits they used to h baseline systems. For example, the Utilities will seek to make sure that participants will perceive that their new LED products last longer, are less sensitive to power quality issues, are more reliable, cast better light (color rendering, intensity, and visual acuity), and easier and less hazardous to dispose of than CFLs. The Utilities will seek to make sure that participants will perceive that automotive heater timers are reliable and that the use of a timer does not have negative impact on their car.

4.6.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 28 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 29. Performance indicators should be reviewed by the EM&V contractor to validate the theory. Explanatory notes on Exhibit 29 are provided in Section 4.1.2.

Exhibit 29: Management-by-Objective Framework for the Residential Promotion of Low-Cost Energy Efficient Products

Link #	Narrative	Performance Indicator	Sources	Target Year 1	Target Year 2	Target Year 3	Target Year 4	Target Year 5
Part A -- Visited Regularly as Part of Tracking and Performance Reporting – Key Performance Indicators (KPIs)								
00	Externalities	No associated tracked KPIs	-	-	-	-	-	-

28	Non-energy benefits	Suggested indicator(s): 1-to-10 scale, level of satisfaction with the low cost EE product quality	Participants			9/10		9/10

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the Residential Promotion of Low-Cost Energy Efficient Products. In addition, the following question will be explored:

- How effective are rebates, POP material, direct engagement at community events, and through the EE community network at increasing the sales of the low-cost EE products?
- How willing/able are retail store managers to share sales data to monitor the impact of the program?

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *Residential Promotion of Low-cost Energy Efficient Products* have implications on the evaluation methods employed:

- The Utilities will distribute many EE products free of charge (e.g. low-flow showerhead, faucet aerators, DHW tank insulation, DHW pipe insulation, etc.); and these alone will generate savings.
- This program element will promote the increase of market penetration and sales of low-cost energy efficient products as compare with “base” products. These incremental sales will generate significant impacts, much larger than that for the giveaways alone.
- None of the products will realize savings per building of over 10% of the total building electricity consumption, therefore utility billing analysis or whole-building M&V will not be an option.
- Site visit or field measurement campaign will not be practical for a jurisdiction of the size of Yukon. Hence it is recommended to follow a deemed savings approach and to use a TRM.
- Primarily, the impact will be computed based on the number of free low-cost EE products distributed. But the impact is not expected to be bound to the giveaways only. The evaluators will have to establish how the marketing, education, communication and the giveaways influenced the sales and increased the penetration of the targeted electricity efficient products.

- In addition, the education provided to Yukon residents as part of the direct community engagement activities will influence their behavior and may cause them to reduce their peak demand and electricity use. However, quantifying behavior-based electricity and demand savings is will not be estimated.
- It is expected that the program element will involve or have implications on the following market actors and stakeholders: retail store managers (p≈20), landlords (p≈50), shoppers (p≈20,000), housing developers (p≈8), the Yukon Energy Solutions Centre, and the Yukon Housing Corporation.

Based on the above, the suggested *process evaluation* methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews with retail store managers, EE ambassadors, and phone or online surveys with participants and non-participants, but evaluators will be able to suggest an alternative approach if necessary. Mystery shoppers and retail intercepts might also be considered. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Review of the community event booth materials, scorecard feedback, and media campaign material to review their quality and quantity (refer to the KPIs specified in the MBO framework).
- Review and validation of the approach and internal procedures to issuing rebates; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Impact evaluation for this program element needs to be carried out by monitoring the sales of low-cost electricity efficient products and their respective base cases. Therefore, it is critical to:
    - Consult with the store managers during the finalization of the EM&V plan and confirm their commitment to provide sales data for identified low-cost EE products during the 5-year DSM operations window. It is recommended to obtain a detailed commitment; agree on how and when the data will be available and what measures are going to be taken to ensure confidentiality.
    - If the evaluators are successful with the above, then the evaluators will lay out the method to estimate the savings based on the expected data in the final EM&V plan.
- Evaluators will estimate the incremental sales of EE products; then turn these figures and the number of giveaways in savings estimates using the program portfolio TRM.
- The TRM will be updated at three stages of the evaluation work to ensure the soundness of these estimates and to reduce the evaluation risk: at the EM&V plan finalization stage, at the evaluation process stage and at the final impact evaluation stage.
- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

4.7 Residential GSHP & CCHP Initiative

4.7.1 Program Description Summary

The Utilities will pilot cold climate heat pumps (CCHPs) and ground-source heat pumps (GSHPs). The pilot systems will be subsidized, not provided free of charge, and the results will be disseminated through different channels, such as HVAC contractors, electrical contractors, housing developers and municipalities.

After the completion of these pilot projects, the Utilities will provide a flat amount of money to buyers of new houses or condominium units if they buy a home with a cold climate heat pump (CCHP) or a ground-source heat pump (GSHP) system, or to owners of homes with electric central air heating systems to retrofit their home with a CCHP or a GSHP.

Eligible Measures

The preliminary list of technologies that the Utilities intend to promote includes the items presented in Exhibit 30.

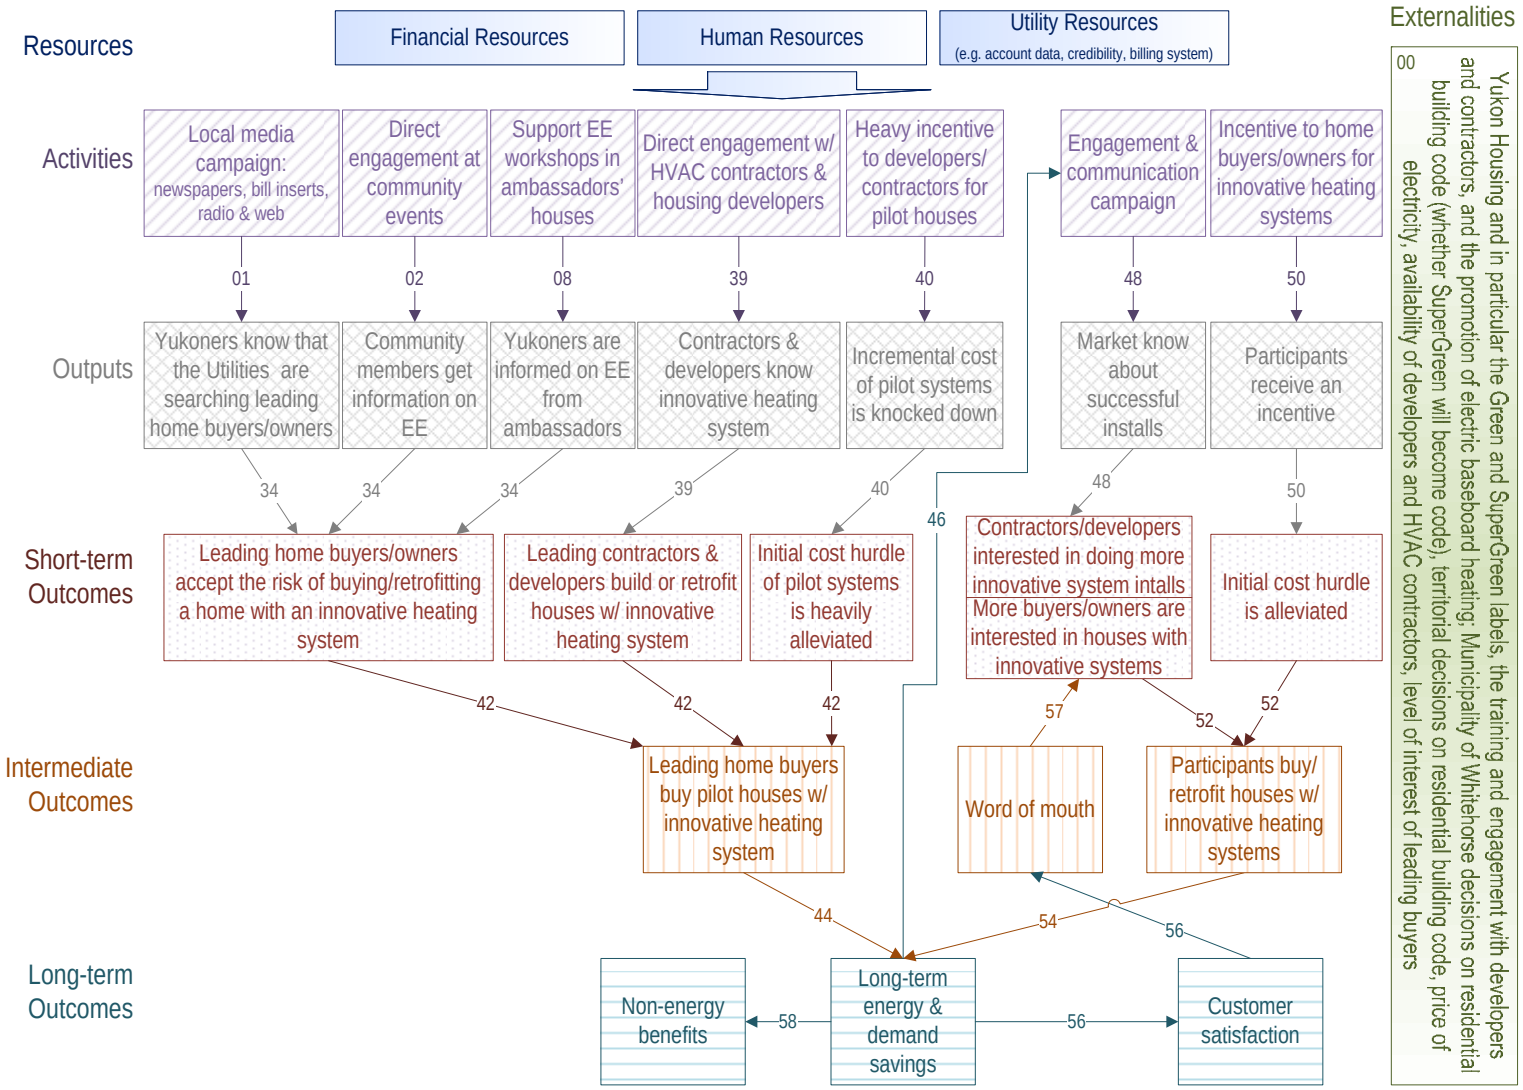
Exhibit 30: Inputs and Assumptions of Residential New-Construction GSHP and CCHP Initiative

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM032	Pilot Cold Temp Heat Pumps	6,780 kWh/unit	2.421 kW/unit	100%	$8,498.44/unit	20.0 yr	$5,000.00/unit
ECM372	Pilot Ground Heat Pumps - Closed	8,605 kWh/unit	3.070 kW/unit	100%	$34,245.24/unit	20.0 yr	$9,000.00/unit
ECM03	Cold Temp Heat Pumps	6,780.0 kWh/unit	2.421 kW/unit	100%	$8,498.44/unit	20.0 yr	$2,500.00/unit
ECM37	Ground Heat Pumps - Closed	8,605.0 kWh/unit	3.070 kW/unit	100%	$34,245.24/unit	20.0 yr	$3,500.00/unit

Program Theory

The program element theory is portrayed in the Logic Model below.

Exhibit 31: Logic Model for the Residential GSHP and CCHP Initiative



Link #	Narrative
00	The program effectiveness and impact will be influenced by the following externalities: Yukon Housing, in particular the Green and SuperGreen labels, the training and engagement with developers and contractors, and the promotion of electric baseboard heating; Municipality of Whitehorse decisions on residential building code (whether SuperGreen will become code); territorial decisions on residential building code; price of electricity; availability of developers and HVAC contractors and level of interest of leading buyers. The program administrator should monitor these externalities and adapt the implementation approach accordingly.
01	The Utilities will advertise their intention to build an EE community network through the local press and applicable non-profit and community organizations. It is expected that this tactic will ease the development of the network.

Link #	Narrative
02	The Utilities will carry out outreach activities in community events (e.g., sport events, cultural events, town hall meetings, etc.), engage with organization and people who have a natural interest in electricity conservation; hook individuals with a continuous stream of free low-cost EE products or contests; do personalized follow-ups; offer to new home buyers to pilot CCHPs or GSHPs; and promote the idea of supporting a EE workshop at their home or a at local venue.
08	The Utilities will support EE workshops in the homes of EE community network members or nearby community venues with approximately ten friends and relatives. The Utilities will send facilitator(s), provide communication materials and low-cost EE products to give away, and perhaps provide food and beverages. The Utilities' skilled facilitator(s) will have a few key messages regarding low-cost EE products, LED lighting products, and innovative heating systems. The facilitator will encourage the participants to share tips and information on electricity conservation. The facilitator will seek to eliminate potential sources of confusion and false beliefs in the communities by presenting hard facts.
34	Through community direct engagement tactics as detailed in links #01, #02 & #03, the Utilities will find leading home buyers or leading home owners who will accept the risk of buying a home with an innovative heating system.
39	The Utilities will engage directly with all of the HVAC contractors and housing developers in the Yukon. Because there only a few, it is realistic to speak with all of them. The Utilities will find leading developers and HVAC contractors who are willing take on the risk of building houses with innovative heating systems; or to retrofit existing homes with CCHP and GSHP systems. Their risk exposure will be reduced because the Utilities will help them find clients.
40	The Utilities will provide an incentive to the developers and contractors that will significantly reduce the total incremental cost of the technologies: not only the cost of the heat pump and the bore wells, but also the cost of the central air ductwork. The initial-cost hurdle of pilot houses will be heavily alleviated.
42	Developers will build pilot houses with innovative heating systems; and new home buyers will buy them because the Utilities will have found the buyers, matched them with the developers/contractors, and heavily subsidized the projects to address the initial-cost hurdle. Alternatively, innovative contractors will retrofit existing homes with innovative heating systems. The home owners will be willing to have their house pilot the system because the Utilities will have found leading home owners, matched them with innovative contractors, and heavily subsidized the projects to address the initial-cost hurdle.
44	The pilot houses with innovative heating systems will yield long-term electricity and demand savings. This electricity and demand savings will be verified and documented through state-of-the art project performance measurement and verification (M&V) activities.
46	The results of the pilot projects and of the M&V activities will feed the program planning; and will feed the engagement and communication campaign of the CCHP and GSHP incentive program component.
48	The Utilities deliver an engagement and communication campaign primarily through already-established channels: community direct engagement; and HVAC contractors and developers engagement. In addition, the Utilities will launch a local media campaign through local newspapers, local radios, brochures to be passed to prospective buyers by developers and contractors, email blasts, bill inserts and web content development. The Utilities will publicize the results of the pilot projects so that the market knows that the installations were successful and that CCHP and GSHP are viable technologies in the Yukon. As a result, developers and contractors will be interested in doing more CCHP and GSHP system installations, more home buyers will be interested in houses with these heating systems; and more home owners will be interested in retrofitting their houses with CCHP and GSHP systems.
50	The Utilities will provide a flat amount of money adjusted based on the capacity of the CCHP or the GSHP (per tons of refrigeration) installed and attributed to buyers of new houses or condominium units heated with a CCHP or a GSHP system; or to home owners willing to retrofit their houses with a CCHP or a GSHP system. The incentive level of CCHP and GSHP will differ. The incentive will alleviate the initial cost hurdle of CCHP and GSHP systems.
52	Because the supply and the demand will be stimulated, and because the initial-cost hurdle is alleviated, the participating home buyers or home owners (the participants) will buy houses with CCHP or GSHP systems.

Link #	Narrative
54	The houses of participants in the CCHP and GSHP incentive program component will yield long-term electricity and demand savings.
56	Participants will be satisfied by the products that they bought. They will tell their friends and relatives. This will generate word-of-mouth advertisement.
57	With time, word-of-mouth will become an important information channel that will cause Yukon residents to buy new houses with CCHP or GSHP systems; or to retrofit their houses with CCHP or GSHP systems.
58	It is assumed that the participants (pilot projects and incentive) will perceive new non-energy benefits; and/or the maintenance of benefits they used to have with baseline systems. The Utilities will seek to see the participants perceive that the comfort provided by CCHPs, and GSHPs is equivalent to what would be provided by baseboards heating.

4.7.2 Evaluation Considerations

Management-by-Objective Framework

Each connecting line in Exhibit 31 is associated with one or more performance indicators in the management by objective (MBO) framework shown in Exhibit 32. Performance indicators should be reviewed by the EM&V contractor to validate the theory. Explanatory notes on Exhibit 32 are provided in Section 4.1.2.

Exhibit 32: Management-by-Objective Framework for the Residential GSHP & CCHP Initiative

Program-Specific Research Questions

Evaluators will be asked to conduct a review of program data and documents, market research, stakeholder consultation, literature review and analysis in order to answer research questions. Many questions will find partial answers through monitoring the performance indicators in the MBO Framework above, but evaluators will research additional issues to make sure their answers are exhaustive, useful and well substantiated.

The generic research questions presented in Section 3.2 are applicable to the Residential CCHP and GSHP Initiative. In addition, the following question will be explored:

- Based on the pilot projects, should the Utilities proceed with a full-fledged incentive program for CCHP and/or GSHP?

Suggested Evaluation Methods and Level of Rigor

The following key observations and characteristics of the *Residential GSHP & CCHP Initiative* have implications on the evaluation methods employed:

- Relatively few projects are anticipated (4 pilot projects and 14 incentive projects), therefore transactional infrastructure will be rudimentary and documentation will be on a project-by-project basis.
- An aggregate of the project-level M&V results of each of the pilot projects can be fed into the program-level evaluation.
- The later incentive-eligible projects will be few (14 projects are estimated). Thus, it is recommended to have the inCharge staff (for example: the YEC Energy Conservation Coordinator) use the same M&V method as were used for the pilot projects.
- The pilot projects are planned to be implemented between Y1-Q4 and Y3-Q2, and thus the post-retrofit measurement period – expected to last for one year – is to end between Y2-Q4 and Y3-Q3.
- It is expected that the program element will involve or have implications on the following market actors and stakeholders: HVAC/control designers and contractors (p≈18), property managers (p≈8 large), housing developers (p≈8), the Yukon Energy Solutions Centre, and the Yukon Housing Corporation.

Based on the above, the suggested *process evaluation* methods are:

- Consult with the relevant market actors listed above. The evaluators are to suggest sample sizes. The most likely approach to consultation will be directed in-depth interviews, but evaluators will be able to suggest an alternative approach if necessary. Evaluators should have a fair level of confidence in the representativeness of the answers based on their expertise and experience.
- Review of the technical assistance reports provided to participants to assess soundness of calculations and the proposed solutions.
- Review and validation of the approach and internal procedures to site visits; review of the documentation to date.

Also based on the observations above, the suggested *impact evaluation* methods are:

- Impact of this program element will be evaluated based on the aggregated results of all of the project-level M&V reports completed for each of the pilot projects and for each of the later projects. The approach to M&V will follow an Option-C methodology of the IPMVP; that is: whole-building electricity consumption measurement using the main utility meter. The baseline will be established based on at least 12-months' worth of

utility bills prior to construction; and the post-retrofit measurement period is to last for 12 months. The baseline will be adjusted based on one or many relevant independent parameters including at least the heating degree-days. Please refer to Section 3.2 for additional details.

- Since the M&V estimates for the later projects are going to be made by inCharge staff, the evaluators are to carry out a desk review of these calculations.
- GSHP & CCHP systems are very new in Yukon, thus there will be very few distortion effects. Consequently it is recommended to use a stipulated NTG ratio of 1.
- Consultation (2nd consultation) with relevant market actors and stakeholders to revisit a few relevant evaluation indicators as laid out in the MBO framework.

5. Procurement of Third-Party Evaluation Services

The Utilities intend to select one independent EM&V contractor through a competitive tendering process who will evaluate both the General Service Program and the Residential Program. A committee of staff from both Utilities will select the contractor. The following observations are provided for consideration by the Utilities in this procurement process.

- Potential bidders can be identified through the International Energy Program Evaluation Conference (IEPEC) as most active North-American evaluators participate in this bi-annual conference. Their names will appear among the sponsors and in the conference proceedings.
- DSM evaluation contractors are usually multi-disciplinary teams with capabilities in social science research, marketing, energy policy, economics, statistics, energy analytics, energy engineering and project-level M&V. It is good for an evaluation contractor to have Certified Measurement and Verification Professionals (CMVP) among the team.
- Some Utilities employ a two-step procurement process. The first step is to submit a Request for Qualifications (RFQ). Qualifying firms would be placed on a short list of two to five bidders. Creating a short-list of bidders has the following benefits:
  - Reduces the level of effort required by the selection committee.
  - Limits the dissemination of information about the program – some that might be confidential – to fewer companies.
  - Tends to increase the response rate and overall proposal quality as the respondents know that they are bidding against a smaller, select number of competitors.
- It is standard practice to share program information with the evaluation bidders. If desirable, the information can be shared on a confidential basis. Increasing the information that is shared before the bid will allow the evaluators to prepare proposals with a greater level of detail.
- This EM&V plan can also serve as an information package for the bidders. If it is not possible to share the EM&V plan with the bidders, then it is suggested that the Utilities include the following items in their request for proposals:
  - The scale of the program in terms of impact and budget. This will allow bidders to estimate the level of effort, to decide on the preferable level of rigor, and to get a general feel for the total evaluation budget.
  - The applicable evaluation best practices (See section 2.5). This would help standardize the terminology among proposals.
  - The program documentation that will be available to them early after signing the EM&V contract. Knowing what pieces of documentation and information exist will make bidders appreciate the professionalism of the approach. This should reduce their perception of risk and in turn increase the number of serious contenders.[29]

[29] The Utilities could inform bidders about the availability of the following information: an EM&V plan; a CPR report; market characterization reports; program design document; PIP and Year-1 program startup progress reports; program theory, logic models, KPIs and targets; program tracking system and program database; the deemed-savings estimates, an ex-ante cost-effectiveness model, and a draft technical reference manual; and, draft with site verifications protocols for use by DSM staff on a routine basis.

- Bidders should be allowed to propose methods that are different from those in the current EM&V plan, if they deem it appropriate. This approach will allow the Yukon stakeholders to tap into the creativity of a larger pool of methodologists.
- The bidders should be asked to present a list of data that they plan to collect, either as part of the proposal or during the inception of the EM&V work. Typically, these data are presented as a table of researchable issues.

YUB-YECL-27

Reference: Allocation of promotional and educational costs, Yukon Five Year Demand Side Management Plan, page 14

Benefit/Cost results are not calculated for program elements that are promotional or educational in nature; however, their associated costs are captured and distributed among those program elements that do create electricity savings.

The Board wants to better understand how these promotional or educational costs will be allocated among the different programs.

Request:

Please describe the methodology that YEC and YECL used to decide how much of the promotional or educational costs are allocated to each program.

Response:

In the model used to design the programs, these costs are allocated to the residential or the general service segment using bottom-up budgetary estimates. These costs are not allocated to the direct-impact program elements. Program administration costs are accounted for in the non-incentive level costs per measure and can be found in the *DSM Program Incentive Level Justification*, provided as YUB-YECL-27 Attachment 1.

Appendix D Incentive Level Justification

Energy Conservation Measure - Justification of the Incentive Level

The purpose of this worksheet is to explain the metholodogy used to calculate the incentive levels for measures in the General Service Program requiring an alternative approach compared to the the one used for the other measures in the Program portfolio.

Redesign Measures

ECM91	Lighting Resdeign Study
ECM912	Gov. Lighting Redesign Study

The incentive levels for the resdesign measures were computed using a trial and error method. Because there are no savings associated with these measures, the cost effectiveness results were computed at the program level instead of at the individual measure level.

Lighting Measures

ECM80	Typical Lighting Project in Existing Bldg - Office
ECM82	Typical Lighting Project in Existing Bldg - Non Food Retail
ECM83	Typical Lighting Project in Existing Bldg - Hotel/Motel

ECM842	Gov. Typical Lighting Project in Existing Bldg - Health
ECM852	Gov. Typical Lighting Project in Existing Bldg - Education
ECM872	Gov. Typical Lighting Project in Existing Bldg - Recreation
ECM882	Gov. Typical Lighting Project in Existing Bldg - Warehouse
ECM922	Gov. Commercial 12W LED A19 Bulb
ECM932	Gov. Commercial 8W LED A19 Bulb
ECM942	Gov. Commercial LED MR16 Bulbs
ECM952	Gov. Commercial LED PAR30 Bulbs
ECM962	Gov. Commercial LED PAR38 Bulbs
ECM972	Gov. Commercial Spot or task lighting

The total lighting incentive is made up of a custom portion and a prescriptive portion. The custom incentive provides flexibility in the choice of lighting technologies and also encourages contractors and designers to be innovative. The custom incentive was calculated using a dollar value per annual kilowatt hour of savings. This value was established using a trial and error procedure and evaluation of the cost-effectiveness results on the program-element level. The purpose of the prescriptive incentive is to increase the incentive total if LED lamps are used, since the initial-cost hurdle is higher for LED technologies than for other technoclogies. The prescriptive incentive also aims to accelerate the market penetration of LEDs. The prescriptive lighting incentive levels in the General Service Program are idential to those in the Residential Program.

Due to limitations of the model, it was not possible to compute the cost-effectiveness test results for the lighting measures on a measure by measure basis. However, the model did allow for the accurate calculation of the cost-effectiveness test results for these measures on the program level.

Discounted Cumulative Net Energy Savings for 20 years	104,227 kWh	104,227 kWh
PAC - Present Value of Benefits	$25,410.06	$25,410.06
PAC - Present Value of Costs	$10,347 50	$3,500.00
PAC - Benefit/Cost Ratio	2.5	7 3
PAC - Net Present Value	$15,062.57	$21,910.06
PAC - Levelized Cost	$0.0993/kWh	$0.0336/kWh

YUB-YECL-28

Reference: General, Yukon Five Year Demand Side Management Plan

The Board wants to better understand some of the programs in the DSM plan

Request:

(a) Why do YEC and YECL have a scenario where government buildings are excluded?

(b) Please describe whether non-incentive costs for these programs are fixed costs (i.e. if no participants, then will the costs be the same?).

(c) Please describe whether the incentive costs for these programs are purely variable costs (i.e., if no participants, then will the costs will be zero?).

(d) For the programs involving rebates or some sort of cash incentive, what will happen to total costs if the participation rate is much higher than YEC and YECL anticipated? Do YEC and YECL have a cap on how much can be spent on these programs or how many participants will be accepted each year?

(e) What if the participation rate of these programs is much lower than YEC and YECL anticipated?

(f) For programs that involve providing the participant with a rebate or some sort of cash incentive, why do YEC and YECL have to provide such a rebate or incentive if the programs pass the "Participant Costs" test. If they are rational profit maximizing agents, will the participants/owners/managers not be willing to take on these activities independent of any incentive from YEC and YECL?

Response:

(a) During consultation, stakeholders provided input as to whether government accounts should be included or excluded from the DSM programs. The utilities analyzed both scenarios and determined there is a marginal increase in costs to deliver programs to government accounts. However, by providing programs to government accounts, a substantial electricity savings could be achieved. It

should be noted that government accounts include municipal, community, territorial, federal and First Nation governments. The utilities felt that due to the divide in stakeholder opinions, the decision as to whether government accounts should or should not be included in programs was best determined by the YUB.

Based on the marginal cost increase versus the substantial electricity savings, it is the utilities' opinion that government accounts should be allowed to participate in the DSM program. Each individual government account holder can choose how they then participate. The utilities request that the YUB select one scenario for implementation, with or without government accounts.

(b) Generally speaking, non-incentive costs related to the launch of the programs are fixed. Promotional or educational costs are notionally fixed, although they can be slowly ramped up or down to maximize cost-effectiveness. After the launch stage a large portion of non-incentive direct costs are marginal, i.e. if no participants, these costs will go down for the period as a result.

In addition, DSM staff costs are fixed as the utilities will not instantly hire and fire DSM staff in reaction to demand. However, based on early uptake numbers and market feedback, the utilities will be able to make medium- to long-term adjustments to the DSM staff to match a less- or more-than-expected number of transactions, ramping up or down the cost accordingly to maximize cost-effectiveness.

(c) Incentive costs are variable with the number of participants in that particular program, i.e. should there be zero participants, zero dollars will be spent on incentives.

(d) In the Program Portfolio *(*Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application*),* an estimated number of participants is forecast for each program. The estimate of participants was factored into the costs of each program. It is anticipated that during the implementation of the programs, the utilities would not exceed these participant numbers. However, the utilities require the ability to be flexible with programs. The utilities reserve the right to adjust the data inputs as necessary in accordance with market conditions. While program budgets are flexible, annual budgets will be respected. This process of program evaluation is outlined in the *DSM Program Evaluation Measurement and Verification Plan*, provided in YUB-YECL-26(a) Attachment 1*.*

(e) The utilities have developed an Evaluation, Measurement and Verification Plan to allow for the flexibility to adjust programs as results are achieved. Please refer to the *DSM Program Evaluation Measurement and Verification Plan*, provided in YUB-YECL-26(a) Attachment 1, for more details.

(f) It should be noted that the Participant Cost Test is used to assess the cost effectiveness from the perspective of the participant after the application of the incentive, not before. Hurdles, barriers and program rationales are laid out in detail in the Evaluation, Measurement and Verification plans. Please refer to the *DSM Program Evaluation Measurement and Verification Plan*, provided in YUB-YECL-26(a) Attachment 1, for more details.

The question in 28(f) would be correct if markets and consumers were behaving in a perfectly rational manner from a financial standpoint, and if energy-efficiency innovations were adopted instantaneously as soon as they became economically viable. On both counts, this is not the case. Market failures, barriers and hurdles slow down the adoption of emerging cost-effective technologies and practices. Moreover, accelerating the penetration of cost-effective technologies and practices as compared to normal market adoption generates wealth for all ratepayers as illustrated by the positive TRC test by avoiding primary energy costs, and differing investments in generation, transmission and/or distribution capacity.

Many consumers do not purchase or invest in the most energy efficient option on their own because, for example:

- of the incremental initial cost of the conservation measure;
- the products don't have as much in-store visibility as base-case products;
- the sales people do not push these products as much because they are not familiar with them;
- consumers aren't provided with the information in a timely manner to make a choice;
- consumers don't invest the time to look into the new options;

- consumers don't trust the information that is being provided to them by the vendors; or

- consumers make decisions based on habits rather than a careful comparison between options.

Rebates/incentives are effective at generating incremental savings because, for example:

- Notionally, rebates/incentives get results by offsetting the initial cost hurdle, and/or lowering the simple payback or knocking down the risk of "trying" the technology;

- Even without an actual significant initial cost hurdle, rebates have an influence on purchase habits – to illustrate the point, rebates are tactics that are used frequently by marketers to influence consumers, get them to know new products and change their habits;

- In other jurisdictions, consumers like to rely on incentive programs to identify the most energy efficient option(s). Many consumers will trust the utility more than they would trust the vendors, and tend to integrate program eligibility criteria in their purchase/investment decision criteria; and

- Incentive programs increase the visibility and effectiveness of energy performance labeling program (informational program) like the Energy Star.

YUB-YECL-29

Reference: Residential Programs, Yukon Five Year Demand Side Management Plan

The Board wants to better understand the Residential programs proposed in the Five Year Demand Side Management Plan.

Request:

(a) With regard to the LED Lighting and Automotive Heater Timer Rebates, how much of the total costs of purchase will the rebates cover?

(b) With regard to the Low-cost Energy Efficient Products, please provide more details regarding what costs are included in the non-incentive and incentive costs? Please confirm whether or not rebates will be a part of this program. If confirmed, how much will rebates account for the total costs of these products?

(c) With regard to the Low-cost Energy Efficient Products, please confirm that YEC and YECL plan on promoting certain energy-efficient products in stores. Please describe whether YEC and YECL have started this initiative, and if so, identify in which stores.

(d) With regard to the CCHP and GSHP Initiative, please describe how much money YEC and YECL plan on giving to purchasers of a new home with a CCHP or GSHP system, or to owners of homes with electric central air heating systems to retrofit their home with CCHP or GSHP. For how much of the total costs will this incentive account?

(e) The Public Engagement, Education and Communication program appears to have a number of overlapping areas and activities with that of the Low-cost Energy Efficient Products program. Please confirm and explain the reasons for the overlaps.

(f) On page 20 of the Yukon Five Year Demand Side Management Plan, YEC and YECL noted that “many of the engagement initiatives carried out by the Utilities will also be used to disseminate information about the Yukon Housing conservation programs and the ESC energy conservation programs to increase value for the audience and create synergy between stakeholders.” Please

describe whether YEC and YECL will recover any of the costs attributable to these activities from these stakeholders. If not, how much money can be attributable to these activities?

Response:

(a) The incentive levels for this program are in the table below (taken from pages 72 and 76 of Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application):

Exhibit 67: Prescriptive List of Residential LED Lighting and Block-Heater Timer Energy Conservation Measures

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM151	Block Heater Timer	130 kWh/unit	0.046 kW/unit	100%	$37.50/unit	10.0 yr	$20.00/unit
ECM24	12W LED A19 Bulb	48 kWh/unit	0.017 kW/unit	110%	$44.00/unit	20.0 yr	$18.00/unit
ECM60	8W LED A19 Bulb	32.0 kWh/unit	0.011 kW/unit	110%	$30.00/unit	20.0 yr	$12.00/unit
ECM61	LED MR16 Bulbs	15.0 kWh/unit	0.005 kW/unit	110%	$20.00/unit	20.0 yr	$10.00/unit
ECM62	LED PAR30 Bulbs	40.0 kWh/unit	0.014 kW/unit	110%	$51.00/unit	20.0 yr	$20.00/unit
ECM63	LED PAR38 Bulbs	55.0 kWh/unit	0.020 kW/unit	110%	$43.00/unit	20.0 yr	$20.00/unit
ECM44	Spot or Task Lighting	40.0 kWh/unit	0.014 kW/unit	80%	$25.00/unit	10.0 yr	$10.00/unit

Exhibit 1: Participation Projections – LED Lighting and Block-Heater Timer Rebates

ID	Measure Short Name	Year 1	Year 2	Year 3	Year 4	Year 5	Total
ECM151	Block Heater Timer	0 units	68 units	109 units	109 units	109 units	395 units

ECM60	8W LED A19 Bulb	349 units	1,455 units	1,455 units	1,455 units	1,455 units	6,167 units
ECM61	LED MR16 Bulbs	55 units	259 units	259 units	259 units	259 units	1,089 units
ECM62	LED PAR30 Bulbs	14 units	79 units	79 units	79 units	79 units	328 units
ECM63	LED PAR38 Bulbs	10 units	59 units	59 units	59 units	59 units	246 units
ECM44	Spot or Task Lighting	9 units	41 units	41 units	41 units	41 units	172 units

(b) The plan is to have low-cost products being given away for free. This is one of the tactics for this program element. Rebate costs represent the full cost of the products (not the incremental cost).

Other tactics include educational materials, in-store events, sales people training, point-of-purchase materials. Therefore, the non-incentive costs include:

- Initial Set-up and Preparation of the distribution (Time);
- Procurement and Inventory Management (Time);
- Scorecard Crunching, Analysis & Reporting (Time);

- Expense Budget: Shipping (Mostly direct cost, perhaps some time);
- Point-of-Purchase Materials, and educational brochures - Early Support & Training, Research and Creation, In-store Events, Supervision (time); and
- Expense Budget Related with Materials (mostly direct costs).

This information is also provided in the detailed budget. Please refer to the *DSM Program Detailed Budgets*, provided as YUB-YECL-29(b) Attachment 1, for details.

(c) Yukon Energy and Yukon Electrical are planning on working with local retailers to implement this program; however, this program initiative has not started. Upon launch of the DSM programs, in-store promotion is identified as one of the communication strategies.

(d) As the CCHP and the GSHP programs are pilot programs, please refer to the incentive level chart and participant level projections as listed below (taken from pages 90 and 94 of the Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application):

Exhibit 81: Inputs and Assumptions of Residential New-Construction CCHP and GSHP Initiative

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM032	Pilot Cold Temp Heat Pumps	6,780 kWh/unit	2.421 kW/unit	100%	$8,498.44/unit	20.0 yr	$5,000.00/unit
ECM372	Pilot Ground Heat Pumps - Closed	8,605 kWh/unit	3.070 kW/unit	100%	$34,245.24/unit	20.0 yr	$9,000.00/unit
ECM03	Cold Temp Heat Pumps	6,780.0 kWh/unit	2.421 kW/unit	100%	$8,498.44/unit	20.0 yr	$2,500.00/unit
ECM37	Ground Heat Pumps - Closed	8,605.0 kWh/unit	3.070 kW/unit	100%	$34,245.24/unit	20.0 yr	$3,500.00/unit

Exhibit 84: Participation Projections – CCHP and GSHP Initiatives

ID	Measure Short Name	Year 1	Year 2	Year 3	Year 4	Year 5	Total
ECM032	Pilot Cold Temp Heat Pumps	1 units	0 units	0 units	1 units	0 units	2 units
ECM372	Pilot Ground Heat Pumps - Closed	0 units	1 units	1 units	0 units	0 units	2 units
ECM03	Cold Temp Heat Pumps	0 units	0 units	0 units	6 units	6 units	12 units
ECM37	Ground Heat Pumps - Closed	0 units	0 units	0 units	1 units	1 units	2 units

(e) It is standard practice to have elements of a DSM portfolio to complement each other and for their respective theory to be overlapping; together the program elements make a more effective portfolio. The division of the actual activities between one element or another, in this case, is arbitrary and is mostly based on the premise that the utilities are claiming a direct impact for the Low-cost Energy Efficient Products element and not for the Public Engagement, Education and Communication. However, the costs are not overlapping and there is no cost double-counting.

- Low-cost Energy Efficient Products element: was intended to induce change in purchase habits in retail stores therefore generating a direct impact which will be measureable through the monitoring of sales data. Please find details in the *DSM Program Evaluation Measurement and Verification Plan*, provided in YUB-YECL-26(a) Attachment 1.

- Public Engagement, Education and Communication is a set of enabling tactics designed to boost uptake of all program elements (including the Low-Cost EE Products Elements) and to create a culture of energy efficiency. The utilities do not intend to claim a direct impact for this.

(f) Yukon Electrical and Yukon Energy have a cooperative relationship with Energy Solutions Centre (ESC) and Yukon Housing and will, through DSM public communication, assist in distributing additional energy efficiency materials that

are produced by these agencies. As these public communication activities are already part of the utility DSM programs there are no incremental costs associated with the distribution of additional ESC and Yukon Housing information. The benefit is purely an added convenience to the residential and commercial customer. Additionally as the utilities are mindful of the programming presented by ESC and Yukon Housing, there is an added benefit of uptake of the ESC and Yukon Housing programs.

YUB-YECL-30

Reference: General Service Programs, Yukon Five Year Demand Side Management Plan, page 20

The Board wants to better understand the General Service programs proposed in the Five Year Demand Side Management Plan.

Request:

(a) With regard to the Lighting Redesign and Equipment Incentive, how much of the total costs of these retrofits will the rebates cover?

(b) With regard to the High Efficiency Refrigeration Incentive, how much of the total costs of these retrofits will the rebates cover?

(c) On page 22 of the DSM plan, YEC and YECL noted that they "will provide extensive refrigeration-specific technical assistance to identify the opportunities, to develop the projects, to manage the construction works, and to measure and monitor the performance of the projects." Please explain how or when YEC and YECL developed the technical expertise in refrigeration specifics.

(d) With regard to the Energy Star Computer Incentive, how much of the total costs of these products will the rebates cover? Are any Yukon-based companies or organizations eligible for this program?

(e) With regard to the New Construction Incentive, how much of the total costs of these buildings will the rebates cover? Are any Yukon-based companies or organizations eligible for this program?

Response:

(a) The Lighting Redesign and Equipment Program is based on an incentive level for a dollar per square foot with a cap. This program also includes an added prescriptive incentive for the installation of LED fixtures and lights, which is also based on a dollar amount per unit and is consistent with the residential LED program. The total incentive amount for this program are as follows (taken from page 33 of Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application):

Exhibit 20: Budget – Lighting Redesign and Equipment Incentive excluding Government Buildings

	$1,000s					
	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Incentive:	$4	$96	$213	$239	$222	$773
Non-Incentive:	$72	$56	$46	$50	$91	$314
Total:	$76	$152	$259	$289	$312	$1,087

Exhibit 11: Budget – Lighting Redesign and Equipment Incentive including Government Buildings

	$1,000s					
	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Incentive:	$6	$135	$294	$327	$299	$1,062
Non-Incentive:	$81	$77	$66	$72	$127	$425
Total:	$88	$213	$360	$400	$427	$1,487

(b) The High Efficiency Refrigeration Program is based on an incentive level for a dollar per kilowatt hour rate, based on annual savings. The total incentive amount for this program are as follows taken *(*from page 42 of Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application):

Exhibit 23: Budget – High Efficiency Refrigeration Incentive excluding Government Buildings

	$1,000s					
	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Incentive:	$0	$0	$122	$0	$122	$243
Non-Incentive:	$34	$69	$17	$55	$43	$218
Total:	$34	$69	$139	$55	$165	$461

Exhibit 34: Budget – High Efficiency Refrigeration Incentive including Government Buildings

$1,000s						
	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Incentive:	$0	$0	$132	$0	$132	$263
Non-Incentive:	$36	$100	$19	$86	$49	$290
Total:	$36	$100	$151	$86	$180	$553

(c) Given the relatively small number of potential participants, energy engineers will be engaged by the utilities to build tailor-made technical assistance packages for each participant. These packages may include an initial walk-through audit, an investment grade audit, procurement support, project management and/or project performance measurement and verification. The technical assistance budget will be commensurate with the estimated savings.

(d) All Yukon Electrical and Yukon Energy general service account holders will be eligible for the Energy Star Computer incentive. Eligibility for government general service accounts will be determined based on the YUB decision on the inclusion of government accounts. The incentive level is fixed, the product cost is variable. This allows for participants to choose the most appropriate product for their application (taken from page 45 of Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application):

Exhibit 39: Prescriptive List of ENERGY STAR Computer Conservation Measures for Non-Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM101	ES Desktop Computer and Monitor	148.0 kWh/unit	0.027 kW/unit	95%	$0.00/unit	4.0 yr	$30.00/unit
ECM102	ES Laptop Computer	41.0 kWh/unit	0.007 kW/unit	95%	$0.00/unit	4.0 yr	$10.00/unit

Exhibit 40: Prescriptive List of ENERGY STAR Computer Conservation Measures for Government Buildings

ID	Measure Short Name	Gross Annual Consumption Savings	Gross Coincident Peak Savings	Net-to-Gross Ratio	Measure Cost	Measure Lifetime	Level of Incentive
ECM1012	Gov. ES Desktop Computer and Monitor	148.0 kWh/unit	0.027 kW/unit	55%	$0.00/unit	4.0 yr	$18.00/unit
ECM1022	Gov. ES Laptop Computer	41.0 kWh/unit	0.007 kW/unit	55%	$0.00/unit	4.0 yr	$6.00/unit

(e) All Yukon Energy and Yukon Electrical general service account holders will be eligible for the New Construction Incentive. Eligibility for government general service accounts will be determined based on the YUB decision on the inclusion of government accounts. The incentive will be determined using a dollar per square foot rate if the building complies with a certain standard. The standard will be designed to be slightly more stringent than model national energy building code minus 25 percent and the City of Whitehorse's building and plumbing bylaw. The total incentive amount for this program are as follows (taken from page 57 of Appendix E of the *Yukon Five Year Demand Side Management Plan* included in the Application):

Exhibit 58: Budget – Electricity-Efficient New Construction Incentive excluding Government Buildings

	$1,000s					
	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Incentive:	$0	$4	$19	$30	$34	$87
Non-Incentive:	$27	$7	$5	$31	$13	$83
Total:	$27	$12	$24	$61	$47	$170

Exhibit 59: Budget – Electricity-Efficient New Construction Incentive including Government Buildings

Incentive:	$0	$6	$25	$39	$45	$115
Non-Incentive:	$28	$9	$6	$33	$16	$93
Total:	$28	$15	$32	$72	$61	$208

YUB-YECL-31

Reference: Business risk, YECL Application, Section 8-Return on Rate Base, Page 8-4, Lines 13-15

Consistent with the various business risk factors identified in its 2008-2009 GRA, Yukon Electrical's ongoing business risks encompass market demand, operational costs, physical hazards and regulation."

The Board wants to understand how the business risks identified in the quote have changed since the 2008-2009 GRA

Request:

(a) Is it the position of YECL that it faces greater business risks than it did in the 2008-09 GRA? If yes, explain why.

(b) Please discuss how the following risks have changed since the 2008-09 GRA:

i. Market demand

ii. Operational costs

iii. Physical hazards

iv. Regulation

(c) For each of the above risk factors, please quantify the impact of the change in risk.

Response:

(a - c) At the outset, it should be noted that Yukon Electrical's request for an increased common equity ratio arises primarily from the recognition in other jurisdictions that similar increases have been approved for other utilities which has Yukon Electrical has been compared or benchmarked against. Since 2008, BCUC's benchmark utility common equity ratio has increased from 35.01% to 38.5%, Northland Utilities (Yellowknife)'s common equity ratio has increased

from 39.57% to 43.5%, and Northland Utilities (NWT)'s common equity ratio has increased from 40% to 44%. These changes in common equity ratios reflect increases of 3.49%, 3.93% and 4.00%, respectively. Even in the absence of increased business risk, Yukon Electrical's requested 4% increase to its common equity ratio is consistent with the approved increases to its affiliates in the Northwest Territories, with which Yukon Electrical shares similar business risks, and is supported by the increase to the BCUC's benchmark utility. Please also refer to YUB-YECL-33(b) for the common equity ratios requested by the British Columbia non-benchmark utilities involved with Stage 2 of the BCUC GCOC process.

Further to the above, it is Yukon Electrical's position its business risks for this Application remain largely consistent with those assessed in 2008 as part of its 2008-2009 GRA. At that point in time, Yukon Electrical's expert witness concluded that Yukon Electrical's business risks were higher than those of the typical Canadian electricity distribution utility and higher than average within the spectrum of Canadian utilities. Further to this position, however, Yukon Electrical notes the following areas where its business risks have increased modestly since 2008.

Market Demand:

Market demand risk relates to those factors that can lead to annual volatility in electricity sales and loss of customers. Between 2008 and 2012, Whitehorse residential annual use per customer has increased from 10,489 kWh in 2008 to 11,128 kWh (Normalized 2012 Actual). This increase appears to be, in large part, due to a resurgence of electric space heating in the Whitehorse area. While Yukon Electrical has incorporated this increase into its 2013-2015 sales forecast, there is now added risk of this space heating electrical load shifting to home heating fuel, propane or wood. Homes that are supplementing fuel heating with portable electric space heaters can choose to not do so. For purposes of quantification, this 639 kWh change in UPC impacted Yukon Electrical's 2013 sales revenue forecast by approximately $850,000 (639 X 10,792 X .1237).

Since 2008, approximately 2,500,000 kWh of secondary sales electric load (related to heating and processing) has been converted into primary load. This new primary load has been incorporated into Yukon Electrical's primary sales forecast for 2013-2015 and annually represents approximately $400,000 of Yukon Electrical's commercial sales revenue forecast. Given that this load is

convertible to a fossil fuel solution, there is now increased risk to Yukon Electrical of decreased primary sales due to fuel switching.

As part of this GRA, Yukon Electrical and Yukon Energy are jointly proposing a Demand Side Management (DSM) program. This program, which was not in place in 2008, will increase emphasis on energy efficiency and conservation. While Yukon Electrical has incorporated the forecast impact of the program into its forecast (please refer to WL-YECL-8(a)), overall sales forecast risk has increased as a result of the introduction of the program. Should the program be more successful than anticipated, it will reduce Yukon Electrical's actual sales as compared to forecast.

In its 2008-2009 GRA, Yukon Electrical did not forecast any sales to industrial customers. In this Application, Yukon Electrical is forecasting industrial sales to one customer, Whitehorse Copper Tailing (WHCT). As it continues to be unclear as to whether or not and when this customer may connect and what the ultimate amount of load will be, Yukon Electrical has requested a deferral account that will address any additional earnings or decreases in earnings as a result of the actual load being higher or lower than forecast. Assuming this deferral is approved by the Board, there is no change in market demand risk related to industrial sales in this Application as compared to the 2008-2009 GRA.

Operational Costs:

As detailed in the following table, Yukon Electrical is forecasts a shift in the mix of its assets towards generation during the test period. The presence of generation assets in rate base generally increases the Yukon Electrical's business risk relative to a pure distribution utility, as the operational risks associated with generation exceed those of distribution "wires" operations.

	Actual		GRA		
	2008	**2012**	**2013**	**2014**	**2015**
Generation	14%	13%	16%	18%	19%
Distribution	79%	81%	77%	75%	74%
Other	7%	6%	7%	7%	7%
Total	100%	100%	100%	100%	100%

Since the 2008-2009 GRA, Yukon Electrical has obtained a 25-year water licence for operation of the Fish Lake Hydro System which stipulates additional monitoring, reporting and operational requirements as compared to the previous licence. Please refer to YUB-YECL-53 (to be filed August 29) for an overview of the new requirements associated with this licence. This change has increased Yukon Electrical's operational risk with respect to hydro generation at the Fish Lake hydro plant.

Yukon Electrical, as part of this Application, is also proposing its Watson Lake Bi-Fuel Project whereby it will be possible to fuel the generators in Watson Lake with both diesel fuel and natural gas. This project is subject to new permitting and oil and gas regulations that Yukon Electrical must follow in order to provide service to its customers. The project offers customers benefits related to emissions reduction, fuel cost savings and diversity. The project is, however, a first of its kind project in the north and the steps necessary to achieve approvals are significant and contain a level of uncertainty. The Watson Lake Bi-Fuel Project will increase Yukon Electrical's operational risk as compared to 2008.

YUB-YECL-32

Reference: Return on equity, YECL Application, Schedule 8.1

The Board wants to confirm the return on equity for 2008 to 2012.

Request:

(a) Please confirm the following returns from Schedule 8.1:

(i) 2008: 7.03%
(ii) 2009: 11.35%
(iii) 2010: 10.54%
(iv) 2011: 10.74%
(v) 2012: 10.18%

(b) Please confirm that the average ROE for the years 2008 to 2012 was 9.968%.

(c) Please discuss the need for an increase in approved ROE to 9.21%, given that YECL has been earning an average of 9.68% when the approved ROEs in the past five years were lower than the requested ROE.

Response:

(a) Confirmed.

(b) Yukon Electrical confirms its average ROE for the years 2008 to 2012 was 9.968%. The BCUC GCOC Benchmark average for the same period, including the awarded 0.46% risk premium, was 9.68%[1].

(c) As detailed throughout this Application, Yukon Electrical is experiencing significant cost pressures and capital requirements that require it to come forward to the Board to ensure that it has an opportunity to continue to provide safe and reliable service to its customers while affording the company an opportunity to earn a fair return for the test period 2013-2015.

[1] Average BCUC Benchmark for the period 2008-2012 was 9.22%: 2008 (8.62%); 2009 (8.99% (8.47% + 9.50% (effective July 1, 2009)); 2010 (9.50%); 2011 (9.50%); 2012 (9.50%).

The requested ROE of 9.21% is linked to the recently approved BCUC GCOC benchmark rate of 8.75% plus a risk premium of 0.46%. As stated in Decision 2009-2, the Board accepts that when using the BCUC generic cost of capital, a risk premium is required for Yukon utilities.

YUB-YECL-33

Reference: Common equity ratio, YECL Application, Section 8 – Return on Rate Base, page 8-6

Yukon Electrical is requesting to increase its common equity ratio from the current level of 40% to 44% for each of 2013, 2014 and 2015.

Although the BCUC increased its common equity ratio for its benchmark utility after 2008, it also lowered the common equity ratio effective January 1, 2013.

Request:

(a) Please confirm that the BCUC reduced the common equity ratio for its benchmark utility from 40% to 38.5% in Order G-75-13.

(b) Given that the BCUC has determined that a lower common equity ratio is appropriate from 2013, please discuss the differences for YECL which make an increase of 4% to its common equity ratio more reasonable than the benchmark utility for BCUC.

Response:

(a) Yukon Electrical confirms the following changes with respect to the BCUC common equity ratio for its benchmark utility have taken place since the Yukon Utilities Board Decision 2009-2 (February 12, 2009):

Common equity ratio as of February 12, 2009:	35.0%[1]
Common equity ratio effective January 1, 2010:	40.0%[2]
Common equity ratio effective January 1, 2013:	38.5%[3]

(b) Yukon Electrical's request for a 9.21% ROE and a common equity ratio of 44% is based on the expert evidence it filed in its 2008-2009 GRA that concluded Yukon Electrical's business risks are: (1) higher than those of the typical

[1] Per BCUC Order G-14-06 dated March 2, 2006, that stated the appropriate common equity component allowed in the capital structure for the benchmark utility, Terasen Gas Inc. (TGI) is 35%. This Order also addressed the appropriate common equity component allowed in the capital structure of Terasen Gas (Vancouver Island) (TGVI) which was set at 40%.
[2] Per BCUC Order G-158-09 dated December 16, 2009.
[3] Per BCUC Order G-75-13 dated May 10, 2013.

Canadian distribution utility; (2) higher than average within the spectrum of Canadian utilities; and (3) that the capital structure for Yukon Electrical should respect the stand-alone principle. Please refer to YUB-YECL-33(b) Attachment 1 for a copy of the expert evidence filed in the 2008-2009 GRA. As detailed in YUB-YECL-31, it is Yukon Electrical's position that its business risk has increased modestly since 2008.

Regardless of Yukon Electrical's assessment that its business risk has increased modestly since 2008, regulatory decisions and processes in British Columbia and the Northwest Territories have occurred since 2008 that support Yukon Electrical's requests in this Application.

Firstly, in British Columbia, the BCUC has reaffirmed the long history and importance of the stand-alone principle in Canadian utility regulation as part of its BCUC Generic Cost of Capital Proceeding (Stage 1) Decision May 10, 2013 (page 100). As detailed in this Application, Stage 1 of this proceeding has now concluded with Order G-75-13 stating the benchmark utility, FortisBC Energy Inc. (FEI), is to have an ROE of 8.75% and a common equity ratio of 38.5% for the years 2013-2015 subject to any adjustments in 2014 or 2015 as a result of the Automatic Adjustment Mechanism (AAM).

Now that Stage 1 has been completed in British Columbia, Stage 2, dealing with business risks of non-benchmark utilities, has begun. A summary of the requested ROEs and common equity ratios in that proceeding is as follows:

	ROE	Equity Ratio
FortisBC Inc. (Electricity)	9.25%-9.50%	40%
FortisBC Energy (Vancouver Island)	9.25%	43.50%
FortisBC Energy (Whistler)	9.50%	45%
Pacific Northern Gas Ltd.	9.75%	50%
Pacific Northern Gas (N.E.) Ltd.	9.50%	45%

Further to the situation in British Columbia, the Northwest Territories Public Utilities Board approved common equity ratios for Northland Utilities (Yellowknife) and Northland Utilities (NWT) of 43.5% and 44%, respectively, for the test years 2008-2010 as well as 2011-2013. As stated in Yukon Electrical's 2008-2009 expert evidence, Yukon Electrical shares similar business risks with Northland Utilities (Yellowknife).

For purposes of this Application, it is Yukon Electrical's position that its ROE and capital structure should be based on its evidence that (i) its business risks are higher than the typical distribution utility; and (ii) applicability of the stand-alone principle in the Yukon.

In order to provide perspective on the various companies that are involved in the Stage 2 process in British Columbia as well as the Northland companies that share similar risks to Yukon Electrical, please refer to the following table that is based on information obtained from the BCUC Stage 2 process as well as Northland's 2012 statistics:

	FortisBC Energy Inc. (BCUC Benchmark)	Yukon Electrical	FortisBC Inc.	FortisBC Energy (Vancouver Island)	FortisBC Energy (Whistler)	Pacific Northern Gas Ltd.	Pacific Northern Gas (N.E.) Ltd.	Northland Utilities (Yellowknife)	Northland Utilities (NWT)
Type of Utility	Gas Distribution Company	Electric Distribution & Generation Company	Electric Generation, Transmission and Distribution	Gas Distribution Company	Gas Distribution Company	Gas Transmision & Distribution Company	Gas Distribution Company	Electric Distribution Company	Electric Generation, Transmission & Distribution Company
Service Area	Lower Mainland, Inland, Columbia and Revelstoke (propane)	Whitehorse and area, Watson Lake and area, Tagish, Teslin, Haines Junction, Carmacks, Stewart Crossing, Pelly Crossing, Carcross, Keno, Ross River, Old Crow, Beaver Creek, Destruction Bay, Burwash Landing and Swift River	South Central Interior of British Columbia	Vancouver Island, Sunshine Coast, and Powell River	Whistler	West Central portion of British Columbia from Summit River to west coast	Northwest British Columbia Fort St. John / Dawson Creek areas	Yellowknife and N'Dilo	Hay River, Trout Lake, Wekweeti, Kakisa, Dory Point, Fort Providence and the Katio'odeeche First Nation
Common Equity Ratio for 2013 - (1) Approved or (2) Applied For	38.5% (1)	44% (2)	40% (2)	43.5% (2)	45% (2)	50% (2)	45% (2)	43.5% (1)	44% (1)
ROE for 2013 (1) Approved or (2) Applied For	8.75% (1)	9.21% (2)	9.25%-9.50% (2)	9.25% (2)	9.5% (2)	9.75% (2)	9.5% (2)	9.3%(1)	9.3% (1)
2012 Rate Base ($ millions)	$2,692.8	$60.0	$1,088.5	$778.7	$41.7	$127.9	$45.0	$40.7	$15.2
2012 Sales/Transportation Volumes	178,735 TJs	316 GWh	3,144 GWh	38,083 TJs	686 TJs	4,053 Tjs	5,422 Tjs	159 GWh	35 GWh
2012 Number of Customers	893,040	16,702	113,915	101,098	2,612	20,496	19,379	8,140	2,718

It is Yukon Electrical's position, based on its previously filed business risk expert evidence in 2008-2009 GRA and as updated by Yukon Electrical management in in YUB-YECL-31, its overall business risk is more aligned with the referenced smaller distribution utilities in British Columbia and the Northwest Territories as opposed to the British Columbia gas and electric utilities with billion dollar rate bases. For these reasons, as well as reference to the stand-alone principle, the requested 9.21% ROE and common equity ratio of 44% are reasonable for purposes of this Application.

I. INTRODUCTION AND SUMMARY OF CONCLUSIONS

My name is Kathleen C. McShane and my business address is 4550 Montgomery Avenue, Suite 350N, Bethesda, Maryland 20814. I am President of, and a senior consultant with, Foster Associates, Inc., an economic consulting firm. I hold a Masters in Business Administration with a concentration in Finance from the University of Florida (1980) and the Chartered Financial Analyst designation (1989).

I have testified on issues related to cost of capital and various ratemaking issues on behalf of electric utilities, local gas distribution utilities, oil and gas pipelines, and telephone companies in more than 190 proceedings in Canada and the U.S. My professional experience is provided in Appendix A.

Yukon Electrical Company Limited ("Yukon Electrical") has requested an expert opinion on fair return, comprised of both an appropriate capital structure and a return on equity (ROE) for the Company's 2008 and 2009 test years, using, for the express purpose of these two test years, the benchmark return on equity established by the Alberta Energy and Utilities Board (EUB)[1] as a point of departure.

In that context, I have estimated the capital structure that would fully reflect the business risks of Yukon Electrical. Based on my analysis, the common equity ratio that would fully compensate for the business risks of Yukon Electrical lies at the upper end of a range of 47.5% to 52.5%.

At a common equity ratio of 52.5%, the allowed return on equity for Yukon Electrical should be equal to that applicable to an average risk Canadian utility, that is, a benchmark return on equity. For the express purpose of this proceeding, I recommend adopting the benchmark return on equity derived in the EUB's Generic Cost of Capital Decision 2004-052 (July 2, 2004), as adjusted for changes in interest rates. The benchmark return on

[1] Now the Alberta Utilities Commission or "AUC".

equity adopted by the EUB under its generic cost of capital automatic adjustment mechanism for 2008 was 8.75%, based on a long-term Canada bond yield of 4.55%.

With respect to the benchmark return on equity for test years 2008-2009, I recommend that the Yukon Utilities Board ("the Board"):

1. Adopt a single return on equity for both test years, based on the forecast average long-term Government of Canada bond yield of 4.5%; and,

2. Apply the EUB's automatic adjustment formula to arrive at a benchmark ROE for 2008-2009.

Since the forecast average long-term Government of Canada bond yield for 2008-2009, at 4.5%, is virtually identical to the forecast relied on by the EUB to determine the allowed ROE for 2008, the application of the automatic adjustment formula produces a benchmark return on equity of approximately 8.75% for 2008-2009. The indicated benchmark return on equity of 8.75% would be applicable to Yukon Electrical at a common equity ratio of 52.5%.

However, the benchmark ROE is viewed as below the level consistent with a fair and reasonable return. Thus, requiring shareholders to commit additional equity to achieve a 52.5% equity ratio to have the opportunity to earn a benchmark equity return regarded as too low is fundamentally incongruous. As a result, I recommend that the actual common equity ratio of Yukon Electrical be raised to 47.5% and to allow an incremental equity risk premium of 0.50% above the benchmark return on equity. The 0.50% incremental equity risk premium compensates for the difference in financial risk between the proposed 47.5% equity ratio and the 52.5% common equity ratio that would fully compensate for the business risks of Yukon Electrical. At a common equity ratio of 47.5%, the allowed ROE for Yukon Electrical should be set at 9.25%.

II. ANALYTICAL FRAMEWORK

A. RELATIONSHIP BETWEEN COST OF CAPITAL AND CAPITAL STRUCTURE

The cost of capital is largely a function of business risk, that is, the risks arising from the operations/assets of a firm. The cost of capital, however, is also a function of financial risk, i.e., additional risk borne by the common equity shareholder because the firm is using fixed obligation securities (e.g., long-term debt) to finance a portion of its assets. Therefore, the capital structure, comprised of fixed obligation securities and common equity, can be viewed as a summary measure of the financial risk of the firm.

The use of debt creates a class of investors whose claims on the resources of the firm take precedence over those of the equity holder. Since the issuance of debt carries fixed costs which must be paid before the equity shareholder receives any return, the addition of debt to the capital structure increases the potential variability of the equity shareholder's return. Thus, as the debt ratio rises, the cost of equity rises. In the absence of the deductibility of interest expense for tax purposes and costs associated with the use of excessive debt, the increase in the cost of equity offsets the increase in the debt ratio, so the overall cost of capital to a firm would not change materially if the firm were to change its capital structure.

The existence of corporate income taxes and the deductibility of interest for income tax purposes, in conjunction with the costs associated with potential bankruptcy or loss of financial flexibility, alter the conclusion that the cost of capital is constant across all capital structures. The deductibility of interest expense for income tax purposes means that there is a cash flow advantage to equity holders from the assumption of debt. When interest expense is deductible for income tax purposes, the after-tax cost of capital is reduced when debt is used.

However, as the proportion of debt in the capital structure increases, the cost of capital tends to increase due to the loss of financial flexibility and increased potential for bankruptcy, partially offsetting the tax advantage. In addition, although interest expense is tax deductible at the corporate level, it is taxable to investors at a higher rate than equity, offsetting some of the net after-tax advantage of increasing the debt component of the capital structure. Further, in the specific case of regulated companies, the benefits from the tax deductibility of interest flow through to customers.

While it is impossible to state with precision whether, within a reasonable range of capital structures, raising the debt ratio decreases the overall cost of capital or leaves it unchanged, in either case the costs of the components of the capital structure do change. An increase in financial risk will accompany an increase in the cost of equity.

B. APPROACHES TO DETERMINING THE FAIR RETURN

Recognizing the relationship between the cost of capital and capital structure, there are effectively two approaches that can be used to determine the fair return. The first is to assess the specific regulated company's business risks then establish a capital structure that is compatible with its business risks and permits the application of the cost of equity determined by reference to proxies to the specific regulated company without any adjustment to the proxy companies' cost of equity.

The second approach entails acceptance of the specific regulated company's actual capital structure for regulatory purposes, or deeming a capital structure that adequately protects bondholders but does not necessarily equate the total (business and financial) risk of the regulated company to those of the proxies or benchmark. The actual or deemed capital structure then becomes the key measure of the utility's financial risks. The utility's level of total risk (business plus financial) is compared to that faced by the proxy companies used to estimate the equity return requirement. If the total risk of the proxy companies is higher or lower than that of the specific regulated company utility, an

adjustment to the proxies' cost of equity would be required when setting the specific regulated company's allowed return on equity.

The National Energy Board (NEB) employed the first approach when it established its automatic adjustment mechanism for a number of oil and gas pipelines in 1995. The individual pipelines were deemed capital structure ratios that were intended to compensate for their different levels of business risks, so that a single benchmark return on equity could be applied across all of the pipelines.[2] It is also the approach that was adopted by the EUB in its Generic Cost of Capital Decision. In that decision, the EUB set different capital structures for eleven electric and gas distribution and transmission entities, based on their different business risk profiles, and then established a common return on equity to be applied to each of the utilities under its jurisdiction.

This second approach, that is varying both capital structures and risk premiums, is equally as valid as the NEB/EUB approach as long as the combination of actual/allowed capital structure and equity risk premium for a particular utility reasonably compensates for its business risk relative to that of its peers. The British Columbia Utilities Commission (BCUC) has allowed for both different capital structures and different equity risk premiums among the various utilities it regulates. However, it explicitly designates a low risk benchmark utility (Terasen Gas) and a low risk benchmark return on equity. The combination of capital structures and equity risk premiums has also been used in Ontario and Québec.

For purposes of this proceeding, I have utilized the first approach and estimated the capital structure that is intended to fully reflect the business risks of Yukon Electrical. In other words, I have estimated a capital structure for Yukon Electrical, based on the principles set out in Section III that would be compatible with the application of a benchmark return on equity to Yukon Electrical. If, however, the common equity ratio

[2] In the years since the multi-pipeline return on equity was adopted, the NEB has changed the allowed capital structure, rather than the allowed return, to recognize changes in business risk. Thus, TransCanada PipeLine's allowed common equity ratio has risen from 30% in 1995 to 33% in 2002, 36% in 2005 and 40% in 2007.

adopted for ratemaking purposes is lower than that which would fully compensate for Yukon Electrical's business risks, then an upward adjustment will need to be made to the benchmark ROE for Yukon Electrical's higher financial risks.

C. BENCHMARK RETURN ON EQUITY

1. Conceptual Considerations

Both approaches to determining a fair return outlined in Section II.B rely on the measurement of the equity return that would be applicable to a benchmark utility or average risk Canadian utility. That return will be referred to as a benchmark return on equity. A capital structure for Yukon Electrical would then be determined that (a) is compatible with its business risks; (b) would permit it to achieve a stand-alone debt rating similar to that of proxy companies used to establish the benchmark return on equity; and (c) would equate the level of total (business and financial) risk faced by Yukon Electrical to that of the proxies used to estimate the benchmark cost of equity. Under this approach, the benchmark return on equity is "fixed" and the common equity ratio for Yukon Electrical is established so that no adjustment to the benchmark return on equity is required.[3]

The term benchmark utility is a hypothetical construct, because it does not refer to a specific utility and hence reflects no specific business or financial risks. Since the estimate of the cost of equity is derived from market data for utilities across industries (electric, gas distribution and gas pipeline), the benchmark utility reflects, in effect, the composite of the business and financial risks faced by the utilities used to establish the benchmark return. However, one objective measure of what constitutes a benchmark utility would be its ability, on a stand-alone basis, to achieve a particular debt rating,

[3] In this regard, Standard & Poor's notes that the business and financial risk components are inextricable. "For example, a utility with a strong business profile could have less financial protection than one with a weaker business profile, yet they could still achieve the same rating. Conversely, a utility with a weak business profile could require a more robust financial profile than one with a stronger business profile in order to get the same rating." (Standard & Poor's, *Research: Rating Methodology for Global Power Utilities*, August 30, 1999)

typically an A rating. The typical, average risk Canadian utility is rated in the A category by both of the major debt rating agencies, DBRS and Standard & Poor's (S&P).

Designation of a debt rating as an indicator of relative risk recognizes that (a) debt ratings reflect both business and financial risk, and (b) the equity return requirement is a function of both business and financial risk. Thus, the benchmark return on equity would be one that is applicable to a specific utility whose capital structure is adequate to achieve, on a stand-alone basis, debt ratings in the A category.

The applicability of the benchmark return on equity to a specific utility thus is dependent on the business risks and capital structure allowed for that utility. Since different utilities face different levels of business risk, utilities with lower (higher) business risk would require lower (higher) common equity ratios. If the lower (higher) business risk of specific utilities is completely compensated for through a lower (higher) common equity ratio, their total (or investment) risk will be approximately the same. If the allowed common equity ratio is sufficient to result in a level of total risk equivalent to the benchmark, the benchmark return on equity can be directly applied to that utility, with no adjustment to the level of the benchmark return on equity.

For specific purposes of this proceeding, I recommend adopting as the benchmark return on equity, the generic return on equity applicable to the Alberta utilities as adjusted for any forecast changes in interest rates. The return on equity adopted by the EUB for 2008 was 8.75%, based on a forecast long-term Canada bond yield of 4.55%.[4]

2. Benchmark Return on Equity for Test Years 2008-2009

Expert testimony on the fair return is typically technical and lengthy, and often quite similar from year to year. Preparation of testimony, responses to information requests and cross-examination of witnesses entail a considerable amount of money, time and effort. As a result, the cost impact on a utility the size of Yukon Electrical can be

[4] Order 2007-0347, November 30, 2007.

significant. Yukon Electrical is proposing that for the specific purposes of this proceeding, the Alberta generic return on equity be used as a point of departure for establishing its allowed return on equity for the 2008-2009 test years, as adjusted for changes in interest rates. The generic return on equity established by the EUB in Decision 2004-052 and adjusted automatically each year in subsequent Orders is virtually identical to "benchmark" ROEs adopted by other Canadian regulators, including the National Energy Board and, implicitly, by the Public Utilities Board of the Northwest Territories when it established the allowed ROE for Northwest Territories Power Corporation in Decision 13-2007 (August 29, 2007). Using the EUB's generic return on equity as a point of departure, the costs associated with the determination of the allowed return on equity for Yukon Electrical should be greatly reduced. The cost of capital testimony can then focus on the issue of the capital structure that is required to fully compensate for the utility's business risks and, if necessary, given the specific financing considerations of the utility, any incremental equity risk premium relative to the benchmark return on equity that is required.

Given these considerations, I accept, for the express purposes of this proceeding, that the return on equity determined by the EUB in Decision 2004-052, as adjusted for changes in interest rates since the decision was issued, will be used as the basis for establishing the allowed return on equity for Yukon Electrical.[5] That return on equity, however, can only be applied to a common equity ratio that fully compensates for Yukon Electrical's business risks.

Decision 2004-052 established an automatic adjustment mechanism for determining a utility's allowed return on equity in response to a change in interest rates. Automatic adjustment mechanisms for determining a utility's allowed return on equity are relied

[5] In my opinion, as well as that of Yukon Electrical, the EUB benchmark return on equity is below the level commensurate with the comparable returns standard. The EUB as well as the NEB have initiated proceedings to determine whether their automatic adjustment mechanisms continue to produce a fair return. In the ATCO Utilities' view (with which I concur), as filed with the AUC on April 4, 2008, the automatic adjustment mechanism does not produce a fair return. Nevertheless, until such time as the issue has been reviewed by the AUC, Yukon Electrical is prepared to accept the EUB "benchmark" as a point of departure for establishing its allowed ROE for 2008 and 2009.

upon in six regulatory jurisdictions in Canada. The various mechanisms are all quite similar. The point of departure for the implementation of each of the automatic adjustment mechanisms was the determination of a base, or initial, return on equity and its two component parts, the risk-free rate and the equity risk premium. The adjustment mechanism itself specifies how changes from the base allowed return on equity are to be calculated for subsequent years. The two major components of the adjustment mechanism are the measurement of the risk-free rate and the formula, or adjustment factor, to be used to adjust the allowed return on equity from one year to the next. The forecast yield on the long-term Government of Canada bond is used as the proxy for the risk-free rate.

Application of an adjustment mechanism like those used in most Canadian jurisdictions requires the following steps:

Step 1: Establish the forecast long-term Canada bond yield for the test year(s),

Step 2: Apply the adjustment factor to the difference between the test year forecast(s) of the long-term Canada bond yield and the bond yield underlying the base allowed return on equity, and

Step 3: Adjust the base allowed return on equity by the amount(s) determined in Step 2.

In five of the six Canadian jurisdictions that currently use an automatic adjustment mechanism,[6] the adjustment factor is set at 0.75, i.e., the change in allowed return on equity equals 75% of the change in the forecast long-term Government of Canada bond yield. The 75 basis point change in allowed return on equity for every one percentage point in the forecast long term Government of Canada bond yield reflects some

[6] The five regulatory boards that use automatic adjustment mechanisms with a 0.75 adjustment factor are the EUB, the British Columbia Utilities Commission, the Ontario Energy Board, the National Energy Board, and the Régie de l'Energie de Québec. In Newfoundland and Labrador, the adjustment factor is 0.80.

recognition that the return on equity does not move in tandem (one for one) with changes in the yield on long-term government bonds.[7]

As indicated in Section II.C.1 above, the 2008 Alberta generic return on equity is 8.75% (at a long-term Canada bond yield of 4.55%). Yukon Electrical is proposing rates for a two-year test period, 2008-2009. I recommend that the PUB adopt a single benchmark return on equity for both test years, based on the average forecast long-term Government of Canada bond yield during the test years.

The most recent Consensus Economics, *Consensus Forecasts* (April 2008) indicates that the 10-year Government of Canada bond yield will be 3.6% in July 2008 and 3.9% by April 2009. During the first four months of 2008, the 10-year Government of Canada bond yield averaged approximately 3.7% (and the 30-year Government of Canada bond yield averaged 4.1%). Based on the actual yields to date and the *Consensus* for July 2008 and April 2009, the 10-year Government of Canada bond yield is forecast at approximately 3.7%. During April 2008, the spread between 10 and 30 year Canada bond yields averaged approximately 50 basis points. The addition of 50 basis points to the forecast 10-year bond yield produces a forecast 30-year Canada bond yield of 4.2% for 2008.

There is no consensus forecast for all of 2009. However, the long-term forecast for 10-year Government of Canada bond yields contained in the April 2008 Consensus Economics, *Consensus Forecasts* anticipates that the 10-year Government of Canada bond yield will be 5.0% in 2010. In the absence of a 2009 consensus forecast for Canada, the quarterly consensus forecasts for U.S. 10-year Treasury bond yields can be used to approximate the forecast for the 10-year Government of Canada bond yield, as the available consensus forecasts show that the Canadian and U.S. rates are expected to track

[7] While the 0.75 adjustment factor recognizes to some extent the inverse relationship between equity risk premiums and equity returns, it overstates the extent to which they move together. Nevertheless, to the extent that the automatic adjustment formula has reduced allowed ROEs since the inception of such formulas, it is reasonable for the formula to increase allowed ROEs by a similar amount until such time as a benchmark return is recalibrated and, if warranted, a new formula established.

closely, with the 10-year Canada bond slightly higher (10 basis points) than the 10-year Treasury by 2010. The Blue Chip *Financial Forecasts* (May 1, 2008) anticipates that the 10-year U.S. Treasury yield will increase quarterly by 0.10% during 2009. The resulting 10-year 2009 Government of Canada bond yield would be approximately 4.2%. Based on these forecasts and a continuation of the current 50 basis point spread between 10- and 30-year Canada bond yields, I anticipate that the 30-year Canada bond yield will average 4.7% in 2009.

The average forecast 30-year yield for the two test years is thus approximately 4.5%, similar to the 4.55% forecast relied on by the EUB to set the Alberta "benchmark" return of 8.75%. While the 2008-2009 average forecast long-term Canada bond yield of 4.5% is somewhat higher than the forecast for 2008 alone, Yukon Electrical is taking the risk that the actual long-term yields in 2009 will be higher than currently anticipated.

Based on a 4.5% long-term Canada bond yield forecast, the benchmark return on equity (ROE) for Yukon Electrical's 2008-2009 test years is approximately 8.75%, the same as the 2008 Alberta generic return on equity.

I recommend, therefore, that a benchmark return on equity of 8.75% be adopted for both test years; the 8.75% would be applicable to the common equity ratio estimated in Sections III to VIII. If, however, the common equity ratio adopted for ratemaking purposes is lower than that which would fully compensate for Yukon Electrical's business risks, then an upward adjustment will need to be made to the benchmark ROE for Yukon Electrical's higher financial risks.

III. PRINCIPLES FOR CAPITAL STRUCTURE

The following principles should be respected when establishing the appropriate capital structure for Yukon Electrical:

A. The Stand-Alone Principle.
B. Compatibility of Capital Structure with Business Risks.
C. Maintenance of Creditworthiness/Financial Integrity.

Each of these principles is defined below.

A. THE STAND-ALONE PRINCIPLE

The stand-alone principle encompasses the notion that the cost of capital incurred by Yukon Electrical should be equivalent to that which would be faced if it was raising capital in the public markets on the strength of its own business and financial parameters; in other words, as if it were operating as an independent entity. The cost of capital for the company should reflect neither subsidies given to, nor taken from, other activities of the firm. Respect for the stand-alone principle is intended to promote efficient allocation of capital resources among the various activities of the firm.

Yukon Electrical is 100% owned by ATCO Electric. ATCO Electric, in turn, is a wholly-owned subsidiary of CU Inc. Yukon Electrical operates as a stand-alone entity (separate from the other electric utility operations of ATCO Electric). CU Inc. raises debt on behalf of Yukon Electrical. CU Inc.'s debt is rated A(high) by DBRS and A by S&P. Debt raised by CU Inc. is mirrored down to the individual ATCO Utilities, including Yukon Electrical, at the cost incurred by CU Inc. Yukon Electrical's customers, therefore, receive the benefits of CU Inc.'s ratings. In turn, Yukon Electrical should contribute its fair share toward the maintenance of the debt ratings through its own capital structure and return on equity. It would be inequitable for customers to receive the

benefits of debt costs that reflect an A(high)/A debt rating while the common equity ratio (or equity thickness) is only adequate, for example, for a (notional) BBB rating.

Based on the indicated spreads for new issues as published by RBC Capital Markets, CU Inc. has been able to raise new 30-year debt on average at approximately 120 basis points over a similar term Government of Canada bond during 2007 and the first quarter of 2008. Over this period, spreads for utilities with one debt rating in the BBB category (split-rated utilities) have ranged from 135 basis points (Union Gas rated A by DBRS and BBB+ by S&P) to 175 basis points (EPCOR Utilities, rated A(low) by DBRS and BBB+ by S&P) and have averaged approximately 140-145 basis points (See Schedule 1).

The 2007-2008Q1 average masks the widening spreads over the period. As investors have become more risk-averse, and the outlook for the economy has deteriorated, credit spreads have widened considerably since the end of 2006. At the end of March 2008, the indicated spread for a new 30-year CU Inc. issue was 157 basis points versus 92 basis points at the end of 2006. Spreads for new split-rated A/BBB issues have increased from approximately 125-130 basis points to 200 basis points over the same period.

Depending on the state of the capital markets, the spread between the cost of a new long-term debt issue for a strong A credit and one for a split A/BBB credit can be much higher than it is currently. As recently as five years ago, the spread has been as high as 100 basis points.

With respect to electric power corporations that are still investment grade but rated in the BBB category by all the debt rating agencies, there is only one conventional equity corporation (i.e., non-income trust) included in the S&P/TSX Utilities Sector, TransAlta Corporation. The average indicated spread for a new 30-year TransAlta Corporation debt issue during 2007-2008Q1 has been 278 basis points; at the end of March 2008, the spread was 390 basis points. (Schedule 1) The recent differential between the TransAlta Corporation cost of long-term debt and the CU Inc. cost of long term debt of approximately 233 basis points provides a perspective on the potential magnitude of the

benefits to ratepayers of Yukon Electrical's affiliation with CU Inc. As a true stand-alone entity, Yukon Electrical would not be able to obtain investment grade debt ratings given its small size. The estimation of an appropriate capital structure for Yukon Electrical should recognize the magnitude of the cost benefits conferred upon ratepayers arising from Yukon Electrical's ability to access debt capital through CU Inc. rather than on its own.

B. COMPATIBILITY OF CAPITAL STRUCTURE WITH BUSINESS RISKS

The capital structure should be consistent with the business risks of the specific entity for which the capital structure is being set. The business risks to which investors in a utility are exposed are those that reflect the basic characteristics of the operating environment and regulatory framework that can lead to the failure to recover a compensatory return on, and/or the return of, the capital investment itself.

C. MAINTENANCE OF CREDITWORTHINESS/FINANCIAL INTEGRITY

For larger utilities like CU Inc. which regularly access the public debt markets, a reasonable capital structure, in conjunction with the returns allowed on the various sources of capital, should provide the basis for stand-alone investment grade debt ratings in the A category. An A debt rating assures that the utility would be able to access the capital markets on reasonable terms and conditions during both robust and difficult or weak capital market conditions.

As noted above, Yukon Electrical is too small to have its own debt ratings (i.e., it would not be investment grade) or to access the public debt markets on its own. If it were to access third-party debt on its own, its options would be limited to banks or insurance companies at a significantly higher cost than is available to CU Inc., and with more stringent covenants. A rigid application of the stand-alone and creditworthiness/financial integrity principles would impute to Yukon Electrical both the actual cost of debt that Yukon Electrical would be able to obtain on its own and the capital structure that would

be required by a potential lender to provide debt capital in the absence of its affiliation with CU Inc.

To my knowledge, the only small (total capital less than $100 million) regulated company that has accessed debt on a true stand-alone basis within the past five years is Natural Resource Gas (NRG), a small Ontario natural gas distributor. NRG was able to obtain five-year bank financing during 2005, a period of easy credit, at a spread over five-year Government of Canada bond yields of approximately 280 basis points. At the same time, the larger gas utilities (with debt ratings in the A/BBB rating categories) were able to issue five-year debt at spreads of 40-45 basis points over five-year Government of Canada bond yields. At the time, TransAlta Corporation was able to raise five-year debt at approximately 70 basis points above a similar term Government of Canada bond yield. While NRG is somewhat smaller (assets of approximately $9 million) than Yukon Electrical, it would be of reasonably similar business risk to Yukon Electrical. Thus NRG's stand-alone cost of debt provides a further indicator of the order of magnitude of the benefit that Yukon Electrical's ratepayers receive as a result of Yukon Electrical's affiliation with CU Inc.

My assessment of the appropriate capital structure for Yukon Electrical balances the stand-alone and creditworthiness and financial integrity principles with a recognition that the impact of small size on lenders' willingness to lend funds and on the stand-alone cost of debt would be, in part, related to the lack of liquidity and institutional interest in small debt issues rather than to fundamental business risk factors. Nevertheless, the appropriate capital structure and return on rate base for Yukon Electrical needs to recognize the cost benefits that Yukon Electrical's ratepayers receive.

IV. BUSINESS RISK

Business risks have both short-term and longer-term aspects. The capital structure and fair return on equity should reflect both short-term and long-term risks. Long-term risks are important because utility assets are long-lived. Moreover, utility stocks are not typically purchased as short-term investments. Since utilities are generally regulated on the basis of annual revenue requirements, there is a tendency to downplay longer-term risks, essentially on the grounds that the regulatory framework provides the regulator an opportunity to compensate the shareholder for the longer-term risks when they are experienced. This premise may not hold. First, customer resistance may forestall higher return rewards when the risk materializes. Second, no regulator can bind his successors and thus guarantee that investors will be compensated for longer-term risks in the event they are incurred in the future.

Business risk encompasses those market demand, supply and regulatory factors that expose the shareholders to the risk of under-recovery of the required return on, and the return of, their capital investment.

Market demand risk relates to those factors that can lead to annual volatility in electricity sales or loss of customers. It includes market size, economic diversity and strength of the service area, growth potential, concentration of sales, competition with alternative energy sources and weather.

Supply and physical (operating) risks faced by an integrated electric utility comprise the risk of under-earning due to the inability to deliver electricity, or the inability to recover costs associated with the acquisition or delivery of electricity. The physical risks of the utility are a function of its geography, mix of generation and ability to access alternative sources of supply.

The regulatory framework in which a utility operates is, next to the basic demand risks, the most significant aspect of risk to which shareholders in a regulated firm are exposed.

The financial community is very conscious of the regulatory environment, as highlighted in reports of both bond rating agencies and investment analysts.

Yukon Electrical is a small integrated electric utility serving 19 communities and approximately 15,000 customers spread throughout the territory. Whitehorse, the largest community, accounts for over 70% of the population of the Yukon. T he largest community served outside of Whitehorse is Watson Lake, with a population of approximately 1,600. T he populations of the other communities served range from approximately 10 to 300. Total sales in 2007 were approximately 300 GW.h. To put this in perspective, the following table compares customers, sales, and rate base of major Canadian investor-owned and government-owned electric utilities with rated debt, i.e., not guaranteed.[8]

Table 1

Company	Customers	Sales (GW.h.)	Rate Base ($ Millions)
Yukon Electrical	15,000	300	43
Electric Utilities with Rated Debt:			
ATCO Electric	216,000	10,300	1,500
EPCOR Utilities	318,000	7,100	500
FortisAlberta	430,000	14,700	800
FortisBC	152,000[1/]	3,100	680
Hydro One	1,300,000	29,300	8,400
Hydro Ottawa	280,000	7,500	500
Maritime Electric	66,000	1,000	200
Newfoundland Power	229,500	5,000	750
Nova Scotia Power	460,000	11,600	2,900

[8] For comparison with other northern electric utilities:

Company	Customers	Sales (MW.h.)	Rate Base ($ Millions)
NTPC[1/]	18,800	310,000	200
NU (YK)	7,900	157,000	20
NU (NWT)	2,600	35,000	12
YEC[1/ 2/]	15,000	302,000	158

[1/] Includes both direct and indirect customers.
[2/] Rate base approximated by 2006 net property, plant and equipment.

[1/] Includes both direct (approximately 100,000) and indirect customers.

As the table above indicates, Yukon Electrical is approximately one-quarter the size of the smallest utility (Maritime Electric) with its own debt ratings. Growth in rate base has been relatively strong over the past 10 years (approximately 3% annually). Future growth is expected to come from growth in new residential and commercial development and the continuing replacement of aerial infrastructure, i.e., exposed distribution lines, with underground lines. While rate base growth is expected to remain relatively strong, Yukon Electrical is expected to remain a very small utility relative to its Canadian peers. From a business risk fundamentals perspective, small size limits a utility's ability to diversify its risks geographically, operationally and among services provided.

Yukon Electrical's customer profile, based on 2007 actual data, is as follows:

Table 2

	Residential	**Commercial and Secondary[1/]**	**Street & Sentinel Lighting**	**Wholesale**
Sales ($000)	$14,088	$20,182	$837	$53
Customers	12,452	2,592	na	1

[1/] The majority of customers (2,570) and sales ($18,728) are commercial.

While Yukon Electrical currently has no industrial customers of its own, the economic base of the Yukon will have secondary impacts on the residential and commercial customer load. The cornerstones of the economy of the Yukon have historically been resource-based industries. The impact of these industries (principally mining) on the economy of the Yukon declined over the past decade following the closure of the Faro Mine in January 1997.[9] Prior to the mine's closure, the mining and oil and gas extraction industries had accounted for approximately 12% of GDP. In 2006, the portion of GDP accounted for the mining/oil and gas industries had fallen by half, to approximately 6%

[9] The mine was operated by Anvil Range Mining at the time of its closure.

(virtually all of which is accounted for by gold mining). The opening of the new Minto Mine in late 2007[10] is expected to have a positive impact on the economy, but will correspondingly increase the potential volatility in the economic performance of the Yukon.

The largest sector of the Yukon economy is public administration (government) contributing approximately 24% of GDP in 2006. This sector has a moderating impact on the territory's economy, because its rate of growth, while exhibiting some variability, is not subject to the wide swings seen in some other sectors, e.g. the resource-based sectors, manufacturing and construction. The importance of government to the economy of the Yukon is reflected in Yukon Electrical's customer profile/sales margin. Of Yukon Electrical's 18 largest customers, 11 are government-related entities, accounting for 17% of gross margin. Despite the moderating effect of government, annual GDP growth rates in the Yukon have been volatile, in part due to the year to year changes in construction activity. Over the 1998-2006 periods, annual GDP growth in the Yukon has been approximately twice as volatile as that of the individual provinces.

The divergent rates of growth in the Yukon over time demonstrate the volatility in the economy and potential impact on Yukon Electrical. Not only do the actual annual rates of growth exhibit considerable volatility, there can be significant differences between rates of growth as initially reported or forecast and the final actual rates of growth once all revisions have been made. For example, in May 2007, the Yukon Government, in its *Yukon Economic Overview and Outlook 2007* reported a 2005 rate of real GDP growth of 5.2%. The actual rate, as indicated above, was only 3.9% when revised in November 2007. The potential variance between forecast and actual rates of growth enhances Yukon Electrical's forecasting risk. On the cost side, forecasting risks are further increased by the tight labour market, particularly for skilled workers, rising wages and rising costs of basic materials.

[10] The mine is expected to connect to Yukon Energy in late 2008 and generate approximately 40 MW.h of sales. The costs associated with extending the transmission line to the mine are being paid by Minto Explorations Inc., the mine operator, and the Territorial Government.

Electric utilities, including Yukon Electrical, are subject to the risk of lost sales arising from the increasing emphasis on energy efficiency, conservation and reducing peak load. Lost load due to energy efficiency and conservation efforts reduces the utility's earnings. The implementation of energy conservation and efficiency initiatives, with the objective of reducing energy costs and environmental impacts raises the risk to earnings.[11] The Yukon Government is actively promoting energy efficiency through its Energy Solutions Center. Moreover, the elimination of Yukon Energy's Rate Stabilization Fund will act as an incentive for conservation.

With respect to supply and physical risks, Yukon Electrical faces a significantly higher level of risk relative to other Canadian electrical utilities. The electric utility network in the Yukon has two main grids: t he Whitehorse/Aishihik/Faro (WAF)[12] and the Mayo/Dawson grid.[13] The WAF grid is fed by Yukon Electrical's Fish Lake hydroelectric facility and Yukon Energy's Aishihik and Whitehorse hydroelectric plants. Yukon Electrical has backup generation to the WAF grid through its diesel standby plants at Carmacks, Ross River, Haines Junction/Canyon Creek and Teslin. Yukon Electrical's diesel plant at Stewart provides backup generation capacity to the Mayo/Dawson Grid. Yukon Electrical also serves a number of isolated communities (not connected to the grid) in the Yukon with diesel generation (Watson Lake, Beaver Creek, Destruction Bay/Burwash Landing, Old Crow, Pelly Crossing and Swift River). P elly Crossing is forecast to be connected to the WAF grid in the 4th quarter of 2008.

Approximately 12% of Yukon Electrical's rate base is comprised of generation assets (approximately 90% of which is diesel). The presence of generation assets in rate base generally increases the business risk of Yukon Electrical relative to a pure distribution utility, as the operational risks associated with generation exceed those of "wires"

[11] A number of regulatory jurisdictions in North America have implemented or are investigating revenue decoupling (decoupling revenues from consumption) to address this issue.
[12] The WAF grid connects Whitehorse with Yukon Electrical's franchise communities of Carcross, Carmacks, Haines Junction/Canyon Creek, Ross River and Teslin.
[13] The Mayo/Dawson grid connects Yukon Electrical's franchise communities of Stewart Crossing and Keno Hill with Yukon Energy's franchise communities of Dawson City, Elsa and Mayo.

554 operations. In the case of Yukon Electrical, the operating risks are exacerbated by the
555 severe climate in which the utility operates, increasing both the risk of outages and the
556 potential unanticipated impacts of repair (in terms of both time and expenditures), and the
557 isolated nature of some of the smaller communities served. While Yukon Electrical has
558 proposed deferral accounts that cover diesel fuel costs, the high cost of diesel fuel creates
559 an additional incentive to conserve energy (thus leading to lower than expected sales).
560 Further, in contrast to hydroelectric generation, diesel generation is exposed to greater
561 risks of complying with increasingly stringent environmental standards. Yukon
562 Electrical has a significant amount aerial infrastructure, i.e., exposed distribution line.
563 Although the exposed lines are being moved underground, the exposed lines, in
564 conjunction with a heavily treed service territory, increases the operating risks of Yukon
565 Electrical.
566
567 With respect to regulatory risk, as independent tribunals, regulators have the power to
568 expose utilities to relatively high risks, by, for example, disallowing costs, approving rate
569 designs that are tilted against recovery of fixed costs, or returns that do not conform to
570 informed investors' perception of risk. Alternatively, regulation can provide an
571 environment characterized by even-handedness, conducive to continued growth
572 consistent with economic allocation of resources, and affording the utility an opportunity
573 to achieve a fair return with a reasonably high probability. This explains why regulation
574 is considered to be a key element of a utility's business risk profile. On balance, the
575 regulatory environment in the Yukon has been even-handed and reasonable in its
576 approach; the Board has granted deferral accounts for costs that are beyond the control of
577 management, including power costs, diesel fuel and generation costs, plant maintenance
578 expense and rate case expense.[14] Nevertheless regulatory decisions can also have a
579 negative impact on utilities.
580
581 Ms. McShane has no reason to conclude that, based on current policies and practice, that
582 Yukon Electrical, similar to other regulated utilities in North America, will not be

[14] The existence of these deferral accounts does not constitute a guarantee that the costs accrued in the account will be recoverable from customers.

provided a reasonable opportunity to recover its capital investment. Nevertheless, the regulator cannot provide a guarantee that the capital investment will be recovered. The regulator can not provide a guarantee that long-term economic conditions will permit the full recovery of the invested capital, it does not make energy policies that can favor the government-owned utility and/or impact on the ability to recover the invested capital, and it cannot bind the decisions of future regulators.

On balance, as a very small utility operating in a service territory with an undiversified economic base and facing significant geographic physical/operating challenges, Yukon Electrical:

- is exposed to a significantly higher degree of business risk than the typical electricity distribution utility in Canada,
- is of higher than average business risk within the spectrum of Canadian utilities and,
- is of similar business risk to its sister utility in the Northwest Territories, Northland Utilities (Yellowknife) Limited.

V. CAPITAL STRUCTURES OF PEERS

The determination of the capital structure that reflects Yukon Electrical's business risks and would be compatible with the application of the benchmark return on equity requires comparisons with the capital structures of other electric utilities for two reasons. First, electric utilities which raise debt in the public markets (and, therefore, have debt ratings) have capital structures that have been "tested" by the capital markets. Thus, their capital structures, in conjunction with other key financial metrics (e.g., coverage ratios), provide an indication of the capital structure required to maintain investment grade debt ratings. Second, the common equity ratios allowed for other electric utilities (whether or not their debt is rated), either through regulatory decisions or settlements, provide a measure of the

level that is warranted for an electric utility to compete for capital with its peers, with due regard to differences in business risk.

Table 3 below sets out the average actual common equity ratios of Canadian electric utilities with rated debt, as well as those of low risk U.S. electric utilities with debt rated in the A category.

Table 3

Electric Utilities with Rated Debt	Ratings DBRS/Moody's/S&P	Common Equity Ratio (2006)
Canadian Electric Utilities:		
All	A/Baa1/A-	43.4%
Transmission & Distribution	A/Baa1/A-	44.5%
Integrated	A(low)/Baa2/BBB+	40.5%
U.S. A-rated Electric Utilities	na/A2/A	49.0%

Source: Schedules 2, 3 and 4.

Table 3 indicates that the average actual common equity ratios for all Canadian electric utilities with rated debt and for Canadian transmission and distribution utilities have averaged close to 43.5% and just below 45% respectively. The corresponding debt ratings by all three debt rating agencies have been, on average, approximately A-/A(low).

Given Yukon Electrical's higher than average business risks, the equity ratios maintained by other Canadian electric utilities indicate that a 45% common equity ratio would be too low to fully compensate for its business risks. Two of the smaller investor-owned primarily electric distribution utilities that would be considered the closest comparators to Yukon Electrical of the Canadian electric utilities with rated debt (Maritime Electric and Newfoundland Power) both have target actual common equity ratios of 45%. While they are the closest comparators, both are significantly larger and face lower business risk than Yukon Electrical. Moreover, their allowed returns on common equity are higher than the returns allowed under the Alberta formula which serves as the benchmark return on

equity for Yukon Electrical.[15] These specific "comparators" strengthen the conclusion that a 45% common equity ratio for Yukon Electrical (at the benchmark return on equity) is too low to fully compensate for Yukon Electrical's business risks. With respect to the recent Northwest Territories Power Corp. (NTPC) decision, for the 2007/08 test year, the Public Utilities Board of the Northwest Territories adopted a common equity ratio of 48.86% and an incremental equity risk premium of 0.50% for NTPC, a higher business risk utility than Yukon Electrical. The corresponding equity ratio for NTPC that would fully compensate for its higher business risks would be approximately 56-57%. Since NTPC faces higher business risk than Yukon Electrical, the fully compensatory equity ratio for Yukon Electrical indicated by the NTPC decision would be lower than 56-57%.

As the capital market has become increasingly global, Canadian utilities increasingly find themselves competing with foreign utilities for financing. The similarities and proximity of the U.S. and Canadian capital markets make comparisons with U.S. electric utilities especially relevant. The major bond rating agencies increasingly draw comparisons between Canadian utilities and their U.S. peers. Thus, the capital structures of U.S. electric utilities of reasonably similar business risk to Yukon Electrical and with debt rated in the A category may provide some guidance.

Since 1999, S&P has assigned to utilities a business risk score in a range of "1" to "10", where "1" indicates the lowest level of business risk, and "10" the highest.[16] As of November 2007, the median business profile score of the U.S. electric utilities with debt rated in the A category was "4".[17] By comparison the average S&P business profile score assigned to Canadian utilities has been "3". Like Yukon Electrical, the majority of these

[15] Maritime Electric, which is not subject to an automatic adjustment formula, was allowed a common equity return of 10.0% for the 2008 test year, approximately 125 basis points higher than the EUB's generic return on equity for the same test year. Newfoundland Power's allowed return on equity at a 4.55% long-term Government of Canada bond yield would be 8.91%.

[16] The key qualitative factors that S&P evaluates in assessing the business risk of regulated electric utilities include regulation, markets, operations, competitiveness and management. S&P considers regulation to be a critical aspect of utilities' creditworthiness.

[17] In November 2007, S&P integrated its utility business/financial risk evaluation methodology into its broader corporate ratings matrix and no longer provides as detailed or transparent a matrix for utilities.

companies are largely "wires" or "pipes" companies.[18] However, as discussed in Section IV, Yukon Electrical would be viewed as facing higher business risks than the typical Canadian utility. On balance, based on its business risk fundamentals, Yukon Electrical would, on a stand-alone basis, be assigned a business profile score within the "4" category, higher than the typical Canadian utility, but the same as the A rated U.S. utilities.

The higher business risk of the U.S. electric utilities relative to the typical Canadian electric utility is reflected in their higher common equity ratios, leading to similar debt ratings. As indicated in Table 3 above, the median 2006 actual common equity ratio of U.S. electric utilities with debt rated in the A category was 49.0%. Given the similarity in the level of business risks between the A rated U.S. electric utilities and Yukon Electrical, in isolation,[19] the 49% median equity ratio is a reasonable benchmark for Yukon Electrical.

With respect to allowed common equity ratios, Table 4 below summarizes the most recently adopted capital structures for major Canadian electric utilities, along with any applicable incremental equity risk premiums. Unlike Yukon Electrical, both NTPC and Yukon Energy are government-owned utilities whose debt is guaranteed by their respective Territorial governments. However, like Yukon Electrical, they are both northern utilities, and they are both largely treated like investor-owned utilities for purposes of establishing capital structure and return on equity.

[18] Newfoundland Power, for example, was assigned a business risk profile score of "3". Newfoundland Power would be considered to face lower business risks than Yukon Electrical, given its size, service area and more comprehensive slate of deferral accounts, including revenue protection against weather variations.

[19] As discussed in more detail in Section VII, the debt ratings of utilities in a particular business risk category are not solely driven by capital structures. They are also driven by other financial parameters, including coverage ratios. Coverage ratios are a function of cash flows, which, in turn, are dependent upon equity returns. The common equity return for the A rated U.S. electric utilities has averaged 11.8% over the past three years (2004-2006), compared to the 8.75% benchmark return. Taking the actual common equity ratios and ROEs of the A rated utilities together, a 50% common equity ratio for Yukon Electrical at the benchmark 8.75% ROE would be too low to equate Yukon Electrical to a benchmark utility.

Table 4

Alberta Taxable Distributors	37.0%
FortisBC	40.0% (plus 0.40% risk premium above BCUC's low risk utility benchmark)
Maritime Electric	42.7% (ROE has been approximately 1.25% higher than Canadian average)
Newfoundland Power	44.5% (risk premium 0.15% higher than benchmark)
Northwest Territories Power	48.6% (plus 0.50% risk premium)
Nova Scotia Power	37.5% (ROE approximately 0.75% higher than Canadian average)
Ontario Electric Distributors	40.0%
Yukon Energy	40.0% (plus 0.52% risk premium above BCUC's low risk utility benchmark) [1/]

[1/] Equal to average of the incremental equity risk premiums of Pacific Northern Gas (65 basis points) and FortisBC (40 basis points); by Order in Council, Yukon Energy's return on equity is then reduced from the "fair return on common equity" by 0.50%.

Source: Schedule 5.

If the capital structure for each of the utilities in Table 4 above were adjusted to eliminate the incremental equity risk premiums, the allowed equity ratios would be approximately 46-47%. On average the companies included in Table 4 are of lower business risk than Yukon Electrical. On this basis, the common equity ratio for Yukon Electrical necessary to compensate for its business risks would be higher than 46-47%.

With respect to U.S. electric utilities, since the beginning of 2005, the average common equity ratio adopted for ratemaking purposes has been 47.9%.[20] The average business profile score of all U.S. electric utilities rated by S&P is "5". Thus, the business risk of the U.S. electric utility industry as a whole is higher than that of Yukon Electrical. However, the average debt rating of all U.S. electric utilities is only BBB. Consequently, it may be inferred that a common equity ratio of 47.5% is not adequate for a "5" business profile score and an A credit rating. Given Yukon Electrical's lower fundamental business risks than the U.S. industry in the aggregate, but higher target debt rating (in the A category), the U.S. electric industry average allowed common equity ratio suggests that

[20] Regulatory Research Associates, *Major Rate Case Decisions, January–March 2008*, April 2, 2008. Allowed returns on equity have averaged 10.4% over the same period.

a 47.5% common equity ratio would constitute a floor for the equity ratio required to equate Yukon Electrical to the benchmark utility.

On balance, the actual and allowed equity ratios of other Canadian electric utilities, and those of U.S. electric utilities (in conjunction with their actual and allowed ROEs) indicate that the common equity ratio required to fully compensate for Yukon Electrical's business risks would be no less than 47.5%.

VI. RATING AGENCY DEBT RATIO GUIDELINES

Of the three bond rating agencies that rate Canadian utility bonds (as well as the debt of utilities globally), S&P has published the most detailed matrix of quantitative guidelines for different debt ratings.[21] For a given business risk score and a particular debt rating, S&P provides a guideline range for debt ratios, Funds From Operations (FFO)[22] Interest Coverage, and FFO to Total Debt (discussed in Section VII). S&P does not apply their guidelines mechanistically; however, the guidelines do represent one objective basis for evaluating an appropriate stand-alone capital structure for Yukon Electrical.

S&P's debt ratio guidelines for an A debt rating and a business risk score of "4", the notional business risk score attributed to Yukon Electrical, are as follows:

Table 5

Total Debt/Total Capital	45.0-52.0%

Source: Standard & Poor's, *Key Credit Factors: Assessing U.S. Vertically Integrated Utilities' Business Risk Drivers*", September 14, 2006.

The guidelines for a business risk profile score of "4" indicate that a common equity ratio in the range of 48% to 55% (mid-range of 50.0-52.0%) is warranted for an A rating.

[21] DBRS has published guidelines, but the guidelines have not distinguished by either business risk or investment grade rating category.
[22] FFO means Funds from Operations, which equal net income plus non-cash items, including depreciation, deferred taxes and other non-cash expenses, e.g., amortization of regulatory assets.

Moody's also has published quantitative guidelines. As with S&P, other factors may outweigh the mechanistic application of the guidelines in determining a rating. However, the guidelines provide "broad guidance on the ratio ranges that may generally be seen at different rating levels".[23] While neither Yukon Electrical nor CU Inc. has a Moody's rating, there are a large number of Canadian electric, gas and pipeline companies that are rated by Moody's. Thus Moody's guidelines are applicable to those companies and, in turn, will play a role in the formation of target capital structures among Canadian utilities, with the objective of maintaining investment grade debt ratios.

Canadian distribution utilities are typically considered to be operating in a "low business risk" environment by Moody's due to the high degree of regulation and a supportive regulatory system. However, due to its specific business risk fundamentals and small size, Yukon Electrical would likely be classified within the "medium business risk" category. Moody's debt ratio guidelines for an A rating for a regulated company of "medium risk" are:

Table 6

Debt/Capital	40.0-60.0%

Source: Moody's, *Moody's Rating Methodology: Global Regulated Electric Utilities*, March 2005.

Based on Moody's debt ratio guidelines, a reasonable common equity ratio for Yukon Electrical compatible with a stand-alone A rating would be in the middle of the range, i.e., approximately 45%-55%.

The S&P and Moody's debt ratio guidelines, taken together, support a common equity ratio of approximately 45%-55% (mid-point of 50%).

[23] Moody's, *Moody's Rating Methodology: Global Regulated Electric Utilities*, March 2005, page 8.

VII. RATING AGENCY GUIDELINES OTHER THAN DEBT RATIO

Based on the actual and allowed equity ratios for other Canadian and low risk U.S. electric utilities (Section V), the rating agency debt ratio guidelines (Section VI) and consideration of Yukon Electrical's relative business risk (Section IV), a common equity ratio range of 47.5%-52.5% (mid-point of 50%) would be required to equate Yukon Electrical to the benchmark utility (i.e., one with a credit rating of A).

However, the common equity component alone does not determine the debt rating. Other financial metrics, along with qualitative factors, are also taken into account by debt rating agencies. Both S&P and Moody's consider cash flow coverage ratios to be key quantitative financial metrics, specifically FFO Interest Coverage and FFO/Total Debt. If a utility is able to achieve adequate cash flow coverage ratios, despite a debt ratio that is higher than indicated by guidelines (as a result of the combination of return on equity, cost of debt and cash flows from depreciation), it still may be able to achieve an A rating. Consequently, S&P's and Moody's guideline ranges for the debt ratio, while an important indicator of an appropriate capital structure, should be referenced with regard to other financial metrics.

Table 7

	S&P	**Moody's**
	"4"	"Medium Risk"
FFO Interest Coverage	3.5-4.2X	3.5-6.0X
FFO/Average Total Debt	20.0-28.0%	22.0-30.0%

Source: Standard & Poor's, *Key Credit Factors: Assessing U.S. Vertically Integrated Utilities' Business Risk Drivers*", September 14, 2006 and Moody's, *Moody's Rating Methodology: Global Regulated Electric Utilities*, March 2005.

I have estimated the FFO Interest Coverage and FFO/Total Debt ratios for Yukon Electrical based on common equity ratios of 47.5% and 52.5%. Specifically, I estimated the ratios using capital structures containing 47.5% and 52.5% equity, each in conjunction with a benchmark return on equity of 8.75%, Yukon Electrical's forecast

embedded cost of debt of 6.83% and forecast depreciation expense for 2009. In interpreting the results, it is important to recognize, as noted earlier, that the guidelines are not applied mechanistically.

Yukon Electrical's indicated FFO Interest Coverage ratios are 4.2X and 4.7X at 47.5% equity and 52.5% equity respectively. The indicated ratios are at the upper end of S&P's guideline range at a 47.5% common equity ratio and above the upper end of the range at a 52.5% common equity ratio. In each case, the calculated FFO coverage ratio is below the mid-point (4.75X) of Moody's guideline range. The estimated FFO/Total Debt ratios (22% and 25% at common equity ratios of 47.5% and 52.5% respectively) are within both S&P's and Moody's guideline ranges. Table 8 (below) indicates that an FFO Interest Coverage ratio for Yukon Electrical in the range of 4.2X to 4.7X would be higher than the achieved ratios of other Canadian transmission and distribution utilities (3.8X), which would be reasonable given Yukon Electrical's higher business risk. However, at a 52.5% equity ratio, the ratio would be similar to, but still lower than, the average FFO coverage ratios achieved by the low risk (A rated) U.S. electric utilities (4.9X).

As shown in Table 8, an FFO/Total Debt ratio for Yukon Electrical of 22% to 25% would be higher than the average achieved FFO/Total Debt ratios of other Canadian electric utilities (17.5%), but, at a 47.5% equity ratio, similar to the average of the low risk (A rated) U.S. electric utilities (22.3%).

Table 8

Electric Utilities with Rated Debt	Ratings DBRS/Moody's/S&P	FFO Interest Coverage (2004-2006)	FFO to Total Debt (2004-2006)
Canadian Electric Utilities:			
All	A/Baa1/A-	3.5X	17.5%
Transmission & Distribution	A/Baa1/A-	3.8X	17.5%
Integrated	A(low)/Baa2/BBB+	3.3X	14.2%
U.S. A-rated Electric	na/A2/A	4.9X	22.3%

Source: Schedules 2 and 3.

Although S&P no longer publishes a guideline range for pre-tax (or EBIT)[24] interest coverage ratios,[25] it is still considered an important quantitative financial ratio by all three debt rating agencies (S&P, DBRS and Moody's). It has also been a key ratio considered by regulators (e.g., EUB and BCUC) in assessing capital structures. Moreover, in contrast to the FFO coverages, which are driven in part by depreciation expense, EBIT coverage is more a function of capital structure and return on equity.

S&P's most recent EBIT interest coverage guideline range for an A rating at a "4" business profile score was 3.3X to 4.0X.[26] At common equity ratios of 47.5% and 52.5%, the benchmark return on equity of 8.75%, Yukon Electrical's embedded debt cost of 6.83%, and an income tax rate of 34%,[27] Yukon Electrical's EBIT interest coverage would be in the range of approximately 2.8 to 3.2X. Table 9 below demonstrates the calculation of the EBIT interest coverage at a 50% common equity ratio.

Table 9

	Cost Rate	**Percentage**	**Weighted Component**
	(1)	(2)	(3)=(1) x (2)
Debt	6.83%	50.00%	3.42%
Common Equity	8.75%	50.00%	4.375%
Tax Rate (t)	34%		
Income Tax = 4.38 x (t/(1-t))			2.25%
Pre-Tax Return			10.04%
EBIT Interest Coverage[1/]			2.94X

[1/] EBIT Interest Coverage = Pre-Tax Return ÷ Weighted Debt Component.

The indicated EBIT interest coverage ratios of 2.8X to 3.2X at common equity ratio of 47.5-52.5% are below the bottom end of S&P's guideline range for an A rating.

[24] Earnings before Interest and Taxes.
[25] Moody's has not, to my knowledge, ever published an EBIT interest coverage guideline.
[26] S&P, *Utilities and Perspectives*, June 1999. The EBIT interest coverage guideline ranges were excluded from the quantitative guidelines after June 2004, but the actual EBIT interest coverage ratios continue to be provided in the annual utilities' *CreditStats* published by S&P.
[27] Statutory combined Federal (19%) and Yukon Territory (15%) rate as of 2009.

Table 10 below indicates that an EBIT interest coverage ratio in the range of 2.8X to 3.2X would be somewhat higher than the average for the other Canadian electric utilities. Over the period 2004-2006, the average EBIT coverage ratios for all major Canadian electric utilities and transmission and distribution utilities with rated debt were 2.7X and 2.5X respectively. In light of Yukon Electrical's higher than average business risk, an EBIT interest coverage ratio higher than the Canadian electric utility industry average should be expected. A ratio of 3.2X, however, would still be lower than the 3.6X average EBIT interest coverage ratio achieved by low risk (A rated) U.S. electric utilities, which, is partly attributable to the low risk U.S. utilities' higher achieved returns on equity (11.8%, see Schedule 2) relative to the 8.75% benchmark return on equity.

Table 10

Electric Utilities with Rated Debt	Ratings DBRS/Moody's/S&P	EBIT Interest Coverage (2004-2006)
Canadian Electric Utilities:		
All	A/Baa1/A-	2.7X
Transmission & Distribution	A/Baa1/A-	2.5X
Integrated	A(low)/Baa2/BBB+	2.6X
U.S. A-rated Electric	na/A2/A	3.6X

Source: Schedules 2 and 3.

In summary, my estimates of the various financial metrics for Yukon Electrical, with emphasis on EBIT coverage, in conjunction with the guideline ranges and the comparative ratios for other electric utilities, indicate that the common equity ratio for Yukon Electrical should be focused on the upper end of the 47.5% to 52.5% range (i.e. at 52.5%).

VIII. DEBT RATING AGENCY COMMENTARY

As indicated in Sections VI and VII above, debt rating agencies and debt investors look at a variety of quantitative financial measures in assessing the financial strength of a utility. For a regulated utility, the ability to achieve strong financial metrics arises not only from the equity base on which it is allowed to earn, but also the allowed return on equity and the rate of depreciation. Both DBRS and S&P have consistently commented on the highly levered nature of Canadian utilities and the low allowed common equity returns relative to their global peers, particularly those in the U.S. The investment community has also indicated to the National Energy Board that it believes the financial parameters adopted for regulated companies are too low.[28]

DBRS

DBRS has commented generally on the relatively low common equity ratios and returns that are being allowed in Canada. In a May 2003 commentary, *The Rating Process and the Cost of Capital for Utilities: Five Reasons Why Canadian Utilities have Lower Ratios and Five Changes to Regulation Which Should be Introduced in Canada*, DBRS noted that it would like to see both the deemed common equity ratios increased as well as increases in allowed returns to levels more consistent with U.S. returns.

In December 2004, subsequent to the EUB's Generic Cost of Capital Decision (2004-052, dated July 2004), DBRS referred to the low deemed equity ratios and equity returns as a "challenge" for the ATCO Utilities. The DBRS report for ATCO Ltd. stated,

> While ATCO's diversified operations, coupled with the Company's prudent management approach, provide a level of earnings stability, additional challenges over the medium term include the relatively low approved returns on equity (return on equity) and deemed equity for the regulated businesses, continuing regulatory risk and lag and ATCO's merchant power exposure in Alberta.

[28] National Energy Board, *Canadian Hydrocarbon Transportation System*, August 2005, June 2006 and July 2007.

In DBRS' *Year in Review and Outlook for 2007* (January 2007), the company cited two challenges faced by Canadian regulated utilities in 2006 that were expected to continue to put pressure on the sectors' credit metrics in the coming year. The first challenge was the historically low level of allowed rates of return which put downward pressure on earnings and cash flow. For 2007, DBRS expected that, in some cases, the low rates of return would be offset by higher equity ratios.[29] The second challenge was the need to finance increased capital expenditures to replace aging infrastructure and to meet increased demand due to growth in business.[30]

Standard and Poor's

With respect to S&P, in early March 2003, the debt rating agency announced that it was reevaluating its prior justification of the strong investment grade ratings of Canadian utilities (i.e., the nature of Canadian regulation).

S&P noted that Canadian utilities are among the most highly levered utilities in their global ratings universe, and that the highly leveraged financial profiles generally stem from regulatory directives. Subsequent to that announcement, S&P has commented on the low equity ratios and allowed returns of specific Canadian utilities.

Like DBRS, S&P has made references to the low deemed equity ratios and equity returns allowed in the EUB's Generic Cost of Capital decision for Alberta utilities. For example, S&P commented on the thin equity layers (and the low returns) allowed the ATCO group of utilities after the EUB decision, stating,

[29] In its July 24, 2007 report on Toronto Hydro, DBRS stated "The return on equity of 9.0% in 2007 (also 9% in 2006) is an 88 basis point decline from 9.88% in 2005. However, the lower return on equity is expected to be somewhat offset as the equity component of the capital structure increases from 35% in 2007 to 40% in 2009."

[30] Other DBRS reports have referenced the low approved returns on equity as a "challenge" for Canadian utilities, i.e., ATCO Ltd. (January 2007), CU Inc. (January 2007), Union Gas (March 2007) and FortisAlberta (May 2007).

> The regulatory regime, although comparable with other provinces in Canada, typically approves less generous returns on thinner equity layers than those approved for ATCO's global peers. Approved returns for ATCO's regulated businesses are 9.6% on equity layers varying from 33%-43% of total capital. (S&P, *Research Update: ATCO Group of Companies 'A' Ratings Affirmed; Outlook Stable*, November 9, 2004)

In a more recent report for Yukon Electrical's parent, CU Inc. (rated A), S&P stated in reference to the company's businesses in Alberta,

> Rates of return and deemed equity layers are somewhat low compared with those of global peers, but are similar to those of other Canadian utilities (S&P, *CU Inc.*, October 26, 2007)

In general, S&P considers that Canadian utility financial polices tend to be aggressive with leverage, and regulators parsimonious with returns.[31] As indicated above, the "aggressive leverage" is largely a result of regulatory directives.

In sum, the debt rating agencies consider the allowed common equity ratios for Canadian utilities to be relatively thin and the allowed ROEs to be relatively low. (Actual equity ratios will generally track allowed equity ratios, as utilities have no incentive to maintain higher equity ratios than allowed by the regulator for ratemaking purposes.)

Based on the views of the debt rating agencies, in the aggregate, the allowed and actual common equity ratios of other Canadian electric utilities would be on the low side as a point of departure for estimating a reasonable capital structure for Yukon Electrical. In that context, the upper end of a 47.5%-52.5% common equity range would be reasonable for Yukon Electrical and allow the benchmark return on equity to be applied without an incremental equity risk premium.

[31] Standard & Poor's, *Industry Report Card: Regulatory Rulings, M&A, and Fuel Cost Recovery Dominate Global Utilities Credit Environment*, November 21, 2006.

IX. CHOICE OF CAPITAL STRUCTURE AND RISK PREMIUM

As previously discussed, I have estimated the common equity ratio that would fully compensate for Yukon Electrical's business risk, i.e., the upper end of a range of 47.5% to 52.5%. A common equity ratio of 52.5% represents a material departure from the actual common equity ratio of approximately 40% that has been historically maintained. To reach an actual common equity ratio of 52.5%, there would need to be a material equity infusion would be required to bring the actual equity ratio up to 52.5%.[32]

There is a critical concern, however, with this approach. While the shareholders may be willing to accept the Alberta benchmark return on equity as a point of departure for setting the allowed return on equity for Yukon Electrical, the benchmark return on equity is viewed as relatively low. The very fact that shareholders in Yukon Electrical (as well as shareholders in other Canadian utilities with similar allowed returns) consider the allowed returns for Canadian utilities to be to low to be compatible with the fair return standard begs the question of why utility investors would want to invest additional equity in order to have the opportunity to earn an inadequate return. In this regard, Canadian utility returns compare unfavourably to the returns that are being allowed for U.S. utilities. The average return on equity that has been allowed by state regulators for U.S. electric and gas utilities over the period 2005-2008Q1 has been approximately 10.4%, approximately 1.5 percentage points higher than the corresponding allowed returns for Canadian utilities. The returns allowed by the Federal Energy Regulatory Commission for (lower risk) transmission operations have been in the approximate range of 10.75-13.8%.[33]

[32] In principle, the common equity ratio could be simply deemed to be 52.5% irrespective of Yukon Electrical's actual common equity ratio. This is not without precedent. For example, the Ontario Energy Board has deemed common equity ratios of 40% for all of the electricity distributors under its jurisdiction. The actual equity ratios of the distributors at the end of the 2006 ranged from negative to 100%. However, Canadian regulators generally have been reluctant to adopt deemed common equity ratios that are materially higher than the actual equity ratios that are maintained by the utilities.

[33] The Conference Board of Canada, in reference to allowed returns for U.S. electricity transmission, underscored the importance of competitive returns for transmission in Canada. In its May 2004 Briefing entitled Electricity Restructuring: Opening Power Markets, the Conference Board stated,

This consideration leads me to recommend that Yukon Electrical move to an equity ratio of 47.5%, with the difference between a 47.5% equity ratio and the 52.5% ratio that would fully compensate for Yukon Electrical's business risks reflected in an incremental equity risk premium. The estimate of the risk premium recognizes that within the five percentage point range of equity ratios (from 47.5% to 52.5%), the overall cost of capital would be relatively constant. In other words, as the equity ratio moves from 52.5% to 47.5%, the overall cost of capital would not change; the decrease in the equity ratio would be offset by an increase in the common equity return. As demonstrated in Table 11 below, a decrease in the common equity ratio from 52.5% to 47.5% increases the equity return from the 8.75% benchmark return on equity to approximately 9.25%.[34]

Table 11

	Proportion	Cost	Weighted Component
Debt	47.50%	6.15%	2.92%
Equity	52.50%	8.75%	4.59%
			7.52%
		Tax Allowance at 34%	2.37%
		Pre-Tax Cost of Capital	9.88%
Move Equity Proportion to 47.5%			
Pre-Tax Cost of Capital Remains Unchanged at:			9.88%
Less: Weighted Interest Component (6.15% x 52.5%)			3.23%
Pre-Tax Weighted Equity Component			6.65%
Less: Tax at 34%			2.26%
After-Tax Weighted Equity Component			4.39%
ROE at 47.5% Equity			
(After-Tax Weighted Equity Component / 47.5%)			**9.24%**

Investors are discouraged by limitations on the regulated cost recovery for transmission upgrading. Transmission companies are simply not seeing favourable risk/return ratios on their investments, and know that they can realize better returns in the United States, where regulated rates of return are much higher. Rates of return to Canadian firms for transmission projects are around 9 to 10 per cent, well below the 13 to 14 per cent available to U.S. companies. These lower rates discourage investment in Canadian utilities. Moreover, investors are additionally deterred by the fact that existing cost-of-service rates do not reflect the economic value of the transmission grid.

The same conclusions are relevant to distribution and generation.

[34] Based on a cost of debt equal to the 4.55% forecast 30-year Long Canada yield plus the November 30, 2007 indicated spread for a new 30-year CU Inc. debt issue of 130 basis points, and the 2009 statutory corporate income tax rate of 34%.

The indicated required increase in the common equity return due to the lower equity ratio, and thus the required incremental equity risk premium for Yukon Electrical at a 47.5% ratio, is approximately 0.50%. A 0.50% incremental equity risk premium results in a recommended ROE for Yukon Electrical of 9.25%.

X. CONCLUSIONS

- I have relied on the approach adopted by the EUB and NEB with respect to capital structure, that is, I have estimated the capital structure that fully reflects the business risk of Yukon Electrical.

- The return on equity that would be applied to the capital structure that fully compensates for Yukon Electrical's business risk is the EUB's benchmark return on equity established in Decision 2004-052, as adjusted for changes in the forecast long-term Canada bond yield.

- I recommend that the YUB adopt a single benchmark return on equity for both test years, 2008-2009, of 8.75%, based on the average forecast of long-term Canada bond yields over the period of 4.5%.

- The capital structure for Yukon Electrical should:
  - Respect the stand-alone principle;
  - Be compatible with Yukon Electrical's business risks; and,
  - Maintain Yukon Electrical's creditworthiness and financial integrity.

- Yukon Electrical's business risks are higher than those of the typical Canadian electricity distribution utility and higher than average within the spectrum of Canadian utilities.

- The actual and allowed capital structures of Yukon Electrical's peers, both Canadian and U.S., indicate that, in isolation, the common equity ratio that would equate Yukon Electrical to a benchmark utility would be no less than 50%; taking explicit account of U.S. utilities' considerably higher ROEs relative to the benchmark ROE of 8.75% supports an equity ratio in excess of 47.5%.

- Debt rating agency guidelines for the debt ratio compatible with Yukon Electrical's level of business risk support a common equity ratio in the range of 45-55%.

- Estimates of the various financial metrics for Yukon Electrical, with emphasis on EBIT coverage, in conjunction with the guideline ranges and the comparative ratios for other electric utilities, indicate that the common equity ratio for Yukon Electrical should be focused on the upper end of a 47.5% to 52.5% range (i.e. at 52.5%).

- The concerns expressed by the debt rating agencies, as well as other capital market participants, that the common equity ratios of Canadian utilities are too thin (and the ROEs are too low) further support the focus on the upper end of common equity ratio range for Yukon Electrical of 47.5% to 52.5%.

- In sum, the upper end of a 47.5-52.5% common equity range would be reasonable for Yukon Electrical and would allow a benchmark return on equity to be applied without an incremental equity risk premium.

- One critical factor militates against increasing the actual common equity ratio of Yukon Electrical to 52.5%: To require shareholders to commit additional equity capital to have the opportunity to earn an equity return perceived as too low is fundamentally incongruous.

- To address this factors, I recommend increasing the actual common equity ratio of Yukon Electrical to 47.5% and allowing an incremental equity risk premium of 0.50% above the benchmark return on equity to compensate for the difference between a 47.5% equity ratio and the 52.5% common equity ratio that would fully compensate for the business risks of Yukon Electrical. At a 47.5% common equity ratio, the allowed ROE for Yukon Electrical should be set at 9.25% for the 2008 and 2009 test years.

APPENDIX A
QUALIFICATIONS OF KATHLEEN C. McSHANE

Kathleen McShane is President and senior consultant with Foster Associates, Inc., where she has been employed since 1981. She holds an M.B.A. degree in Finance from the University of Florida, and M.A. and B.A. degrees from the University of Rhode Island. She has been a CFA charterholder since 1989.

Ms. McShane worked for the University of Florida and its Public Utility Research Center, functioning as a research and teaching assistant, before joining Foster Associates. She taught both undergraduate and graduate classes in financial management and assisted in the preparation of a financial management textbook.

At Foster Associates, Ms. McShane has worked in the areas of financial analysis, energy economics and cost allocation. Ms. McShane has presented testimony in more than 190 proceedings on rate of return and capital structure before federal, state, provincial and territorial regulatory boards, on behalf of U.S. and Canadian telephone companies, gas pipelines and distributors, and electric utilities. These testimonies include the assessment of the impact of business risk factors (e.g., competition, rate design, contractual arrangements) on capital structure and equity return requirements. She has also testified on various ratemaking issues, including deferral accounts, rate stabilization mechanisms, excess earnings accounts, cash working capital, and rate base issues. Ms. McShane has provided consulting services for numerous U.S. and Canadian companies on financial and regulatory issues, including financing, dividend policy, corporate structure, cost of capital, automatic adjustments for return on equity, form of regulation (including performance-based regulation), unbundling, corporate separations, stand-alone cost of debt, regulatory climate, income tax allowance for partnerships, change in fiscal year end, treatment of inter-corporate financial transactions, and the impact of weather normalization on risk.

Ms. McShane was principal author of a study on the applicability of alternative incentive regulation proposals to Canadian gas pipelines. She was instrumental in the design and preparation of a study of the profitability of 25 major U.S. gas pipelines, in which she developed estimates of rate base, capital structure, profit margins, unit costs of providing services, and various measures of return on investment. Other studies performed by Ms. McShane include a comparison of municipal and privately owned gas utilities, an analysis of the appropriate capitalization and financing for a new gas pipeline, risk/return analyses of proposed water and gas distribution companies and an independent power project, pros and cons of performance-based regulation, and a study on pricing of a competitive product for the U.S. Postal Service. She has also conducted seminars on cost of capital for regulated utilities, with focus on the Canadian regulatory arena.

Publications, Papers and Presentations

- *Utility Cost of Capital: Canada vs. U.S.,* presented at the CAMPUT Conference, May 2003.
- *The Effects of Unbundling on a Utility's Risk Profile and Rate of Return*, (co-authored with Owen Edmondson, Vice President of ATCO Electric), presented at the Unbundling Rates Conference, New Orleans, Louisiana sponsored by Infocast, January 2000.
- *Atlanta Gas Light's Unbundling Proposal: More Unbundling Required?* presented at the 24th Annual Rate Symposium, Kansas City, Missouri, sponsored by several commissions and universities, April 1998.
- *Incentive Regulation: An Alternative to Assessing LDC Performance*, (co-authored with Dr. William G. Foster), presented at the Natural Gas Conference, Chicago, Illinois sponsored by the Center for Regulatory Studies, May 1993.
- *Alternative Regulatory Incentive Mechanisms*, (co-authored with Stephen F. Sherwin), prepared for the National Energy Board, Incentive Regulation Workshop, October 1992.

1/ The settlement agreement specifying ROE and capital structure was approved by the PUB.

2/ A negotiated settlement to be filed with the UARB would implement a fuel adjustment clause and reduce the return on equity to 9.35% if approved.

3/ The capital structure of NTPC includes no cost capital (-.85%).

4/ The 8.57% ROE is for rates to be in effect as of May 2008. As per the 12/06 Report of the Board, the ROE is to be based on the January 2008 *Consensus Forecasts* and the January 2008 spread.

5/ The YUB set YEC's risk premium at the mid-point of the FortisBC risk premium (40bp) and that of PNG (65bp) as established by BCUC G-55-07. By Order in Council, YEC's ROE is then reduced from the "fair return on common equity" by 0.50%.

YUB-YECL-34

Reference: Forecast income taxes, YECL Application, pages 1-5 - 1-6, Section 10 – Income Tax, page 10-1

The deferral accounts for which Yukon Electrical is seeking approval meet the standard criteria for the establishment of a deferral account:

(a) Costs are not under the control of the company and are not reasonably forecastable; or
(b) An error in forecasting could produce a loss or gain of a substantial magnitude.

The Board wants to better understand the request for a deferral account for income taxes.

Request:

(a) Please confirm the following calculations derived from the table on page 10-1

	Amount	Increase	Percentage Increase
2013	$248,000	$555,000	n/a
2014	$704,000	$456,000	184%
2015	$828,000	$124,000	18%

(b) YECL has forecast substantial increases in income taxes for the test period. Please discuss the factors that would lead to the increases noted above.

(c) Please provide additional detail on the position of YECL that income taxes require the use of deferral accounts.

Response:

(a) Confirmed.

(b) Yukon Electrical's utility earnings before tax are increasing for the test period primarily as a result of growth in rate base as well as amount of rate base being

financed by the shareholder. Depreciation expense, which is added back to utility earnings before tax for the purpose of calculating taxable income, is also significantly higher for the test period primarily as the result of the reinstatement of the provision for future removal and site restoration in depreciation rates.

(c) Yukon Electrical has not requested a deferral account for income taxes in this Application and does not believe such a deferral account is required.

YUB-YECL-35

Reference: Increases in forecast property, YECL Application, Section 6 – Taxes Other than Income, page 6-1

The increases forecast during the test period are primarily due to planned capital work on the downtown office building in Whitehorse and the Fish Lake Unit #1 building, as well as inflation.

The Board seeks additional detail regarding the forecast increases in property taxes.

Request:

Please provide a schedule that details the forecast increases in property taxes between increases due to capital work and increases due to inflation.

Response:

Please see table below showing the increases to the base level of taxes for 2012 due to inflation and new capital.

	Actual	Test Period		
	2012	2013	2014	2015
Base	250	250	250	250
Inflation		5	5	5
Increases Due to Capital		2	10	18
Schedule 1.1, line 11	250	257	265	273

YUB-YECL-36

Reference: Fish Lake Unit #2 Penstock Replacement, YECL Application, Business Case #1, page 2

Replacement of the current above ground wood stave penstock with a new penstock. The new penstock will be installed in the same general area as the existing penstock. Civil works will be completed for the new penstock as an 'in ground' installation. Water in this section of the Fish Lake hydro system will be passed through the overflow spillway at Headpond #2 to maintain water flow through the system to McIntyre Creek until the project is complete.

YECL has included demand side management costs of $204,000, $143,000, $135,000, $522,000, and $730,000, respectively for 2011, 2012, 2013, 2014, and 2015.

Request:

(a) The current above ground wood stave penstock is to be replaced with an *in ground* installation. Please provide an explanation as to what is meant by an *in ground* installation.

(b) Please provided a comparison of costs between *in ground* and *above ground* installations.

(c) Does the decision to go with the in ground installation preclude or render any other associated apparatus inappropriate or require additions to Fish lake hydro system? Please explain.

Response:

(a) In ground means below ground or buried. An in ground installation was chosen to eliminate the vandalism Yukon Electrical has experienced with the above ground penstock.

(b) A consultant completed preliminary estimates of both options. An in ground steel penstock installation would cost approximately $530,000. A steel penstock supported above ground on concrete piers and steel saddles would cost approximately $560,000.

(c) No changes to the Fish Lake Hydro system were required due to the in ground installation.

YUB-YECL-37

Reference: Business Cases #1 2, 7, 9 and 28; Fish Lake-related projects, Yukon Electrical Application, Business Case 2, page 3

In March 2010, a catastrophic failure of Fish Lake Unit #1 plant occurred, irreparably damaging the facility. In consideration of Yukon Electrical's ongoing water management responsibilities, existing hydro system infrastructure, the continued operation of Fish Lake Unit #2 as well as the ongoing declarations of diesel being on-the-margin; returning Fish Lake Unit #1 to operation has been determined to be the best option available.

Request:

(a) For each of the business cases listed above, please provide an economic analysis similar to what was provided in business case #2, the Fish Lake Unit #1 turbine and building replacement.

(b) Please provide a economic analysis similar to what was provided in business case #2, which considers all Fish Lake-related business cases in total, i.e. $9,653 million:

i. Business case #1 - $556,000,
ii. Business case #2 - $3,908,000,
iii. Business case #7 - $1,720,000,
iv. Business case #9 - $1,640,000, and
v. Business case #28 - $1,829,000.

(c) Please confirm whether there are additional expenses related to the Fish Lake hydro system that have arisen since Yukon Electrical filed its application.

(d) Once all the work has been completed and the Fish Lake infrastructure has been updated with current engineered standards and equipped with more efficient apparatus please explain why the forecast Fish Lake hydro generation in the test period should not be greater than the base hydro generation for Fish Lake, which was approved in Board Order 2009-2.

Response:

(a) Please refer to attachment YUB-YECL-37 Attachment 1 for Levelized Cost of Energy (LCOE) calculations. The tabs are:

- **YUB-YECL-37(a) BC1** for Penstock 2 replacement;
- **YUB-YECL-37(a) BC2** for Unit 1 replacement;
- **YUB-YECL-37(a) BC7** for Fish Lake Dike Upgrade;
- **YUB-YECL-37(a) BC9** for Ditch #3 Diversion Structure; and
- **YUB-YECL-37(a) BC27** for Water License Renewal.

The summarized results are as follows:

Business Case	LCOE (Real) (¢/kWh)
1 Penstock Replacement	1.1
2 Unit 1 Replacement	5.1
7 Fish Lake Dike Upgrade	1.2
9 Ditch #3 Diversion Structure	1.2
27 Water License Renewal	2.6

(b) Please refer to attachment YUB-YECL-37 Attachment 1, tab YUB-YECL-37(b) - LCOE for the LCOE calculation. The LCOE when all business case costs are considered at the Fish Lake facility is 11.5¢/kWh.

Yukon Electrical considers an LCOE of 11.5¢/kWh to be a good indicator of these projects' economic viability and compares favorably with other small hydro projects referenced by Yukon Energy in its 20-Year Resource Plan[1].

[1] Reproduced from YEC's 20-Year Resource Plan: 2011-2030, Table 7-1: Summary of Potential Hydro Sites:

Small Hydro Projects (<10MW)		Installed Capacity (MW)	Annual Energy (GWh)	Capital Cost (Million $2009)	Levelized Cost (¢/kWh)
20-23 ¢/kWh	Moon Lake	5.8	32.9	126.8	19.9
	Tutshi River	4.2	30.3	135.5	23.1
	Tutshi (Windy Arm)	5.9	39.4	164.9	21.6
	Pine Creek at Atlin	3.5-8	23-52	NA	NA

Given forecast Yukon load growth is expected to be met with a generation mix of hydro and diesel, Yukon Electrical has also performed a Net Present Value analysis of offset diesel expense for all Business Case-related costs.

Table 4.1-2 from Yukon Energy's most recent GRA Compliance Filing provides a forecast Yukon Integrated System generation mix at different grid loads. By keeping Fish Lake in service, a portion (58%-78%) of Fish Lake's output will offset the forecast diesel expense.

Please refer to YUB-YECL-37 Attachment 1, tab YUB-YECL-37(b) – NPV. The Net Present Value of diesel savings is $23.8M over the life of the asset. Also, the Cumulative Present Value (graph) shows that diesel savings will surpass the project expenses in the eighth year.

(c) Confirmed. The costs for the Fish Lake Water License have increased since Yukon Electrical filed its Application. Please refer to YUB-YECL-53(a) Attachment 1 for details. There are no other additional expenses forecast for the Fish Lake Hydro system in addition to those included in the Application.

(d) The forecast Fish Lake hydro generation should not be greater than 8.73GWh approved in Board Order 2009-02.

Please refer to YUB-YECL-37 Attachment 1, tab YUB-YECL-37(d) for historical output of Fish Lake, from 1960 to 2012. Included in this attachment are two additional tables: (1) 10-year averages for each decade up to 2009, and (2) multi-decade historical averages for decreasing periods up to 2009.

The observations that can be made from this information are as follows:

1. The 50-year historical average is 8.48GWh;

2. Only two time periods (the 1960s and 1970s) exceed the 8.73GWh approved by the Board in Order 2009-02; and

3. There is a high variability in output with the lowest average 10-year output of 7.42GWh occurring in the 2000 – 2009 time period.

These observations clearly show the 8.73GWh is higher than what should be forecast based on the use of historical averages.

Yukon Electrical does not have any actual experience with the new equipment. It is not yet clear what the efficiency gain will be and is subject to operational flows. Yukon Electrical believes the best forecast available for purposes of this Application is to remain at the Board-approved output of 8.73GWh rather than decreasing the expected output at the facility to better match the historical average and then offsetting it with potential efficiency gains.

YUB-YECL-38

Reference: Watson Lake Unit #4 Replacement, YECL Application, Business Case #3, pages 2 and 4

Yukon Electrical is planning to replace Unit #4 (CUL 258), which is at the end of its life, with a new diesel generator. Based on forecast load growth and Yukon Electrical's planning criteria, the new unit is planned to have similar generating capacity in comparison to the existing unit.

*End of Life Condition: CUL 258 [1,500 KW] was manufactured in 1985 and currently has **140,226** operational hours… [emphasis added]*

…

- *Available plant floor space in the existing unit position is not sufficient to allow for a larger unit;*
- *Maintaining the same output capacity allows Yukon Electrical to continue use of existing electrical equipment;*

Request:

(a) Are any of the other units in the Watson Lake plant approaching their end of life? What are the ages and operating hours (end-of-life conditions) of the other units in the Watson Lake generating plant?

(b) Given that Watson Lake Unit #4 is planned to be replaced, is there still a requirement to replace the muffler, heat exchanger and radiator as the replacement unit is the same size as the existing unit? Please explain.

Response:

(a) Yes. Based on forecast running hours, Watson Lake Unit #2 (CUL 257) is approaching the end of its life and is scheduled for replacement in 2015. The replacement of this unit is included in the 2015 capital expenditures in the Application (page 9-61 and Business Case #13).

The ages and operating hours of the units in the Watson Lake generating plant are as follows:

Unit #	Engine Year of Manufacture	Engine Hours (December 2012)	Expected Retirement Year
1	1998	57,579	2022
2	1985	84,524	2015
3	1991	70,868	2021
4	1985	140,226	2013
5	1993	8,339	2023+
6	1998	64,820	2019

(b) Yes, there is a requirement to replace the associated equipment as the existing muffler, heat exchanger, and radiator are the same vintage as the generator unit (1985) and they are specific to the operation of a 900 RPM 3606 Caterpillar engine (existing unit). The new unit is a 1200 RPM 3516 Caterpillar. The cost of this associated equipment has been included in the total forecast project cost of $1,474,000 included in Business Case #3.

YUB-YECL-39

Reference: Business Case #13, Watson Lake Unit #2 Replacement, YECL Application, Business Case #13, Pages 2 and 4

Yukon Electrical is scheduled to replace Unit #2 (CUL 257) [800 kW], which is at the end of its life, with a new diesel generator. Primary drivers for this replacement are: unit age (1985), poor condition of the alternating current (AC) generator, total operating hours and community loading. ***The replacement unit is to have a larger generating capacity in comparison to the existing unit to handle load growth and contingency concerns.*** *[emphasis added]*

…

End of Life Condition: The AC generator on the engine is 1974 vintage and was installed on CUL 257 with 51,404 operational hours from a previous unit in Watson Lake (CUL 192). As of January 1, 2013, CUL 257) [800 kW] had 84,524 operational hours which would put the total hours on the AC generator at ***135,928*** *hours. This generator failed in 2011 and was sent out for repair. [emphasis added]*

…

Alternative #3: Replace ***CUL 258*** *with a new larger size unit. This option addresses the end of life replacement of CUL 257 and the need for additional capacity in the Watson Lake facility. [emphasis added]*

Recommendation:
Proceed with replacement ***of CUL 257 with a unit of similar size and generating capacity to continue to meet the community's load and avoid further costs in respect of this unit, which will be at the end of its life****. [emphasis added]*

Request:

(a) With respect to the Watson Lake Unit #4 replacement, YECL submitted that "in 2012 a peak of 3,126kW was recorded". However, with regard to this business case, YECL submits that the "Watson Lake plant had a recent peak of 3,205kW recorded for the community." Please explain the reasons for ascribing the community of Watson Lake with the different peak loads.

(b) Please provide information as to how often and when major and minor overhauls are performed on units such as CUL 257.

(c) When YECL states that CUL 257 is to be replaced with a similarly sized unit or a larger sized unit, is YECL referring to the unit's generating capacity or physical size?

(d) With respect to replacing the unit, alternative #3 speaks of replacing CUL 258 with a new larger sized unit to address the end-of-life replacement of CUL 257. Should CUL 258 read CUL 257? Please explain.

(e) This business case recommends the replacement of a unit to meet the need for additional capacity in the Watson Lake facility. However, the recommendation is to proceed with the replacement of unit CUL 257 with a unit of similar size and generating capacity to continue to meet the community's load. Please clarify what size of unit is to replace CUL 257.

(f) Please provide a listing by unit of unit capacity, operating hours and utilization factor for 2011 and 2012. Please provide this information for all plant locations.

(g) Will the replacement of the Watson Lake Unit #2 be by a diesel or natural gas unit?

Response:

(a) The recorded values correspond with annual recorded peaks loads. In 2012, a peak of 3,126kW was recorded; in 2011 a peak of 3,205 kW was recorded.

(b) Major and minor overhauls are carried out as per the manufacturer's recommendation. For 1200 RPM 3500 series Caterpillar engines, minor overhauls are completed at 12,000, 36,000, 60,000 and 84,000 hours. Major overhauls are completed at 24,000, 48,000 and 72,000 hours.

(c) Yukon Electrical is referring to generating capacity.

(d) Correct. Alternative #3 should be worded as replace CUL 257.

(e) The estimate of the project cost is based on replacing with a similar sized unit of 800kW. Yukon Electrical will evaluate the load of the community, both peak and annual load duration curves, and select the most suitably sized unit to provide efficient power to the community. If load continues to grow, a larger unit will be evaluated.

(f)

CUL #	Location	Unit #	Rating (kW)	Hours In 2011	Utilization Factor	Hours In 2012	Utilization Factor
303	Beaver Creek	1	250	3927	44.8%	3918	44.7%

186	Stewart Crossing	3	150	94.7	1.1%	57	0.7%

(g) The forecasted replacement will be a diesel unit. If the Watson Lake LNG pilot project is successful, the unit will have bi-fuel capabilities.

YUB-YECL-40

Reference: 500 kW Mobile Generator, YECL Application, Business Case #4, page 2

Purchase a 500kW 2400V mobile generator to provide contingency power to isolated generation communities. The load in these communities has increased, resulting in the **existing 350kW** mobile generator not being large enough to provide full contingency power in the event of a planned or unplanned plant shutdown. As a result, a larger mobile unit is required. [emphasis added]

……..

The existing 350kW unit is unable to meet the current peak loads of the communities it serves. In 2011, a system peak of 359kW was recorded for Beaver Creek and Destruction Bay had a system peak of 389kW. In 2012, a system peak of 355kW was recorded for Beaver Creek and Destruction Bay had a system peak of 415kW. The mobile units will continue to provide emergency backup as well as system supply for planned regular maintenance and plant shutdowns.

Request:

Please explain what YECL intends to do with respect to the existing 350kW unit.

Response:

The existing 350kW unit is in good working condition and able to supply adequate contingency power to the communities of Beaver Creek and Destruction Bay during the summer months. The unit has less than $50,000 of net book value as of the end of 2012 so it provides additional contingency with negligible additional cost to ratepayers. As such, Yukon Electrical plans to keep the unit in service.

YUB-YECL-41

Reference: Beaver Creek Unit #2 Replacement, YECL Application, Business Case #5, page 2

Purchase new diesel generator unit complete with manufacturer-supplied and specified radiator, exhaust, and heat exchanger. Remove existing unit, install new unit and supplied devices, integrate unit into electrical supply and control systems and connect unit into waste heat and fuel systems.

Request:

With respect to the Beaver Creek generating plant unit, what is the generating capacity of Unit #2 and what is the generating size of the replacement unit?

Response:

The existing unit capacity is 360kW; the new unit capacity is 365kW.

YUB-YECL-42

Reference: Watson Lake Bi-fuel Project, YECL Application, Business Case #6, Page 2

Phase 1 of the project (2013) involves the modification of Watson Lake power plant generation Unit #5 to a bi-fuel system which allows the unit to run on a combination of diesel and natural gas (NG). The purpose of this phase is to verify that NG injection into the engine provides reliable electricity generation for a utility power system along with the environmental benefit to reduce emissions. Phase 2 of the project (2014) will convert the remaining 5 units at the Watson Lake power plant to bi-fuel operation.

…

This project will reduce the dependency of Watson Lake on a single fuel (diesel). In addition to the environmental benefits of this project to reduce emissions of particulate matter, sulfur oxides, nitrogen oxides and carbon dioxide, this initiative will assist in determining the operational and financial benefits of the use of LNG as an alternate fuel for electricity generation.

The Board notes that Unit #5 was to be bi-fuel operational in 2012

Request:

(a) Please provide an economic analysis for this project that supports YECL's decision to make Watson Lake Unit #5 bi-fuel operational.

(b) Is Unit #5 operational as a bi-fuel (LNG/diesel) unit?

  (i) If so, have emissions testing been performed? If so, please provide the results.

  (ii) If not, when does YECL expect that Unit #5 will be bi-fuel operational?

(c) Does YECL wish to update its project costs to convert all units in the Watson Lake facility to possess bi-fuel operational capabilities?

(d) YECL submits that the "natural gas will be trucked to Watson Lake from a production facility near Delta, British Columbia in a specialized, low pressure, double-walled, well-insulated or vacuum jacketed vessel." Please provide information regarding:

(i) a competitive supply market for LNG, as well as

(ii) a competitive transportation market for LNG.

(e) Please provide information regarding the component technologies that have been successfully used in on-grid applications — e.g. providing continuous power to a community like Watson Lake rather than smaller end-users such as localized generation for commercial buildings, oil and gas companies.

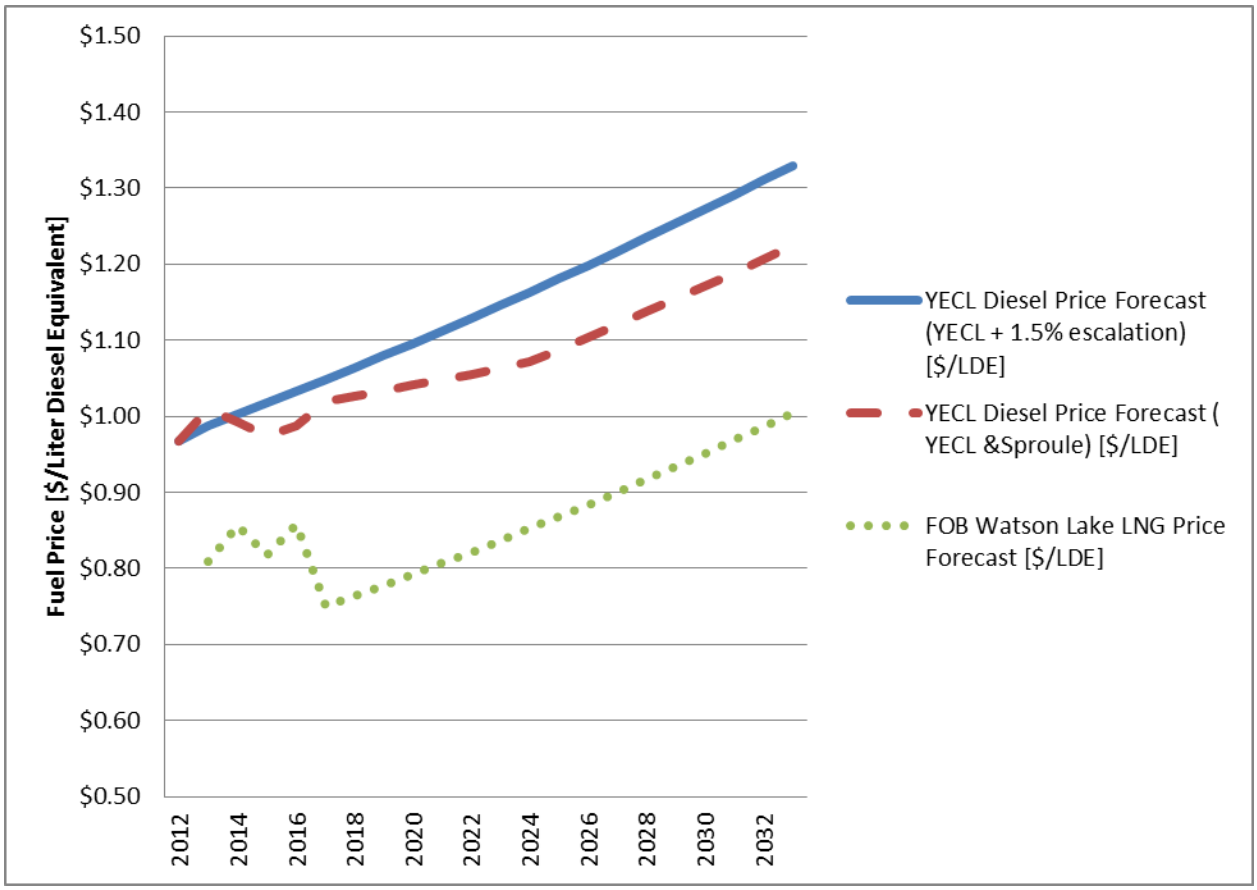
(f) For the proposed replacement of Watson Lake Unit #2, what are the differences in emissions between a new diesel-only unit and a natural-gas-only unit? Please quantify in terms of kilograms of emissions per kW.h for each case.

Response:

(a) The primary driver for the Watson Lake Bi-Fuel project is to provide local emissions reductions. It is predicted that there will be a reduction in particulate matter (PM) emissions, important to people with compromised lung function, and NOx and SOx, contributing to smog and acid rain.

The economic driver for Yukon Electrical to undertake this pilot project is fuel savings. A comparison between the price of diesel to liquefied natural gas (LNG) delivered to the Watson Lake Power Plant is found in Figure YUB-YECL-42A below.

Figure YUB-YECL-42A: Forecast Fuel Costs for Diesel and Liquefied Natural Gas (LNG) at Watson Lake Power Plant Gate



There is a predicted cost savings in fuel between LNG and diesel, even when compared to a more conservative estimate for diesel, shown as the dashed line in the figure above. The LNG forecast, shown as the dotted line, is based on contract prices for LNG as well as industry intelligence on a northern B.C. supply point in the near future. Diesel is forecast using actual delivered diesel prices at Watson Lake and a Sproule forecast for oil in the dashed line and a 1.5% escalation in the solid line (where 1.5% escalation is a commonly used rate by the industry, including Sproule http://www.sproule.com/forecasts).

When the lease cost of $22,000 per month is included in the project operations and maintenance costs, cumulative fuel savings begin in 2017. The cumulative fuel savings is one of the financial indicators used to evaluate the project and is illustrated in YUB-YECL-42(a) Attachment 1. Note that the cost of a diesel fuel tank and associated facilities are not included in this comparison and would act to increase the rate of total fuel savings for the project.

Total capital costs for the Watson Lake Bi-Fuel Project were included in Business Case #6 in the Application. These capital costs are included in Figure YUB-YECL-42B below.

Other than fuel prices, which are forecast as shown in Figure YUB-YECL-42A above, it is assumed that operations and maintenance costs escalate at 2% per year. There are no additional internal labour resources required and, therefore, labour loading does not apply; any additional project labour is carried out through contractor services and assumed to escalate at 2% per year. There are no other costs forecast for this project, other than those illustrated in YUB-YECL-42(a) Attachment 1 and Figure YUB-YECL-42B below.

When comparing the project capital costs to the cumulative fuel savings, in, a simple project payback of 9 years is shown. Simple project payback is the second financial indicator used to measure this project. The term of the project is 20 years.

Figure YUB-YECL-42B: Annual and Total Capital Costs for the Watson Lake Bi-Fuel Project

Year-End	**2012**	**2013**	**2014**	**2015**
Phase 1 - Infrastructure Costs [$]	$90,000	$363,000		
Phase 1 – Feasibility engineering in 2012/13 [$]		$222,000		
Phase 2 - Conversion of remaining 5 units to bi-fuel operation [$]			$372,000	
Total Annual Capital Cost [$]	**$90,000**	**$585,000**	**$372,000**	
Total Capital Cost [$]				**$1,047,000**

(b) No, Unit 5 is not yet operational as a bi-fuel unit. It is anticipated that the LNG facility supplying natural gas to the power plant will be licensed and commissioned in late fall of 2013. After this time, it will be possible to operate Unit 5 in bi-fuel mode.

(c) An adjustment to the forecast costs is not required at this time; however the Yukon Territorial Government requirements for testing of emissions have not yet been fully evaluated.

(d) (i) A competitive market supply for LNG does not yet exist. There is only one Western Canadian supply for LNG at this time, with two others expected to be in the market in 2014.

(ii) A competitive bid process was used to select the transport company to be used in this pilot project.

(e) To provide some background information, continuous power generation is typically accomplished by either 100% diesel or 100% natural gas. As the supply chain for liquefied natural gas (LNG) is being tested, Yukon Electrical considers a bi-fuel system to be a secure and cost effective means of supplying electricity. A bi-fuel unit can automatically switch from bi-fuel (blended natural gas with diesel) to 100% diesel operation without loss of power and there is no need to invest in new units with a bi-fuel kit at this time.

Two significant components related to the project are the bi-fuel kit for introduction of natural gas into the existing generating unit as well as the storage and vaporization equipment for receiving LNG and its conversion back into natural gas.

The bi-fuel kit manufacturer chosen by Yukon Electrical has a record of 191 engines with bi-fuel kits successfully being used for prime power generation globally. A detailed list of installation locations and end user classification has not been supplied the manufacturer as of the date of this submission. Yukon Electricals inspection of operating units includes commercial building generating sets and oil and gas installations.

A notable northern LNG facility that utilizes a storage and vaporization process similar to that proposed for Watson Lake is the Fairbanks Natural Gas LLC

facility, which has been in operation since 1998 and continues to expand its capabilities. The facility provides natural gas to residential and commercial customers.

(f) Please refer to the table below for a comparison of emissions differences for a diesel-only unit and a natural-gas-only unit. These results are based on information that can be found at:

YUB-YECL-43

Reference: Old Crow Plant Expansion, YECL Application, Business Case #8, pages 2, 3, 6 and 7

Yukon Electrical is planning to construct a 1,350 square foot additional generating building adjacent to the existing Old Crow plant. Both the existing building and the new building will be sized to house two diesel generators, associated equipment, and provide sufficient working space for regular work to be safely performed.

The additional building is required as the existing plant does not provide enough space to replace the existing units as they reach their end of life, as new units of the same or greater kW rating will not physically fit in the same space as the current units. It also does not provide adequate wall or floor space to facilitate the installation of new control equipment and does not allow for the addition of any more units as are required due to load growth.

…

Waste Heat

Existing waste heat system will be expanded to include the new building and units. The connection between buildings will be accomplished by above ground piping installed within containment.

Electrical Distribution

Electrical connection to both the generation system and distribution lines will be accomplished by a combination of overhead and underground methods.

As contingency, the new building will be able to supply energy to the distribution system through either the existing 2.4kV generation system or, in the case of emergency or planned maintenance, directly onto the distribution feeders.

…

In 2010, a peak of 450kW was recorded and in 2011, 478 kW was recorded.

…

If a situation arises during the winter which removes one of the larger units from operation, the other unit is then enlisted into 24/7 operation. If the situation persists, and the 24/7 running unit is required to be taken offline for a regular service; then a partial outage to the community must occur to reduce the community load to a level that can be handled by the smaller 170kW CUL 384.

Request:

(a) With respect to waste heat, please explain what is done with the waste heat.

(b) Does the existing building have the capability to supply energy to the distribution system through either the 2.4kV generating system or, in the case of emergency or planned maintenance, directly onto the distribution feeders?

(c) For each year (2013 and 2014) please provide the forecast/incurred cost of each of the forecast cost items listed under the Project Cost heading. For each item, please delineate the costs as being either labour-related or other.

(d) Do the forecast costs include any necessary training for a local operator/expertise with respect to operating and or maintaining the isolated plant? Please explain.

(e) Please explain why a full flow rated heat exchanger is required to be installed on Unit #1.

(f) Please provide load duration curves for each year of the period from January 2008 to June 2013.

(g) Over the period from January 2008 to June 2013, please provide the number of times that a partial outage to the community has occurred during the winter, which has reduced the community load to a level that was handled by the smaller CUL 384 unit. Please provide the dates for the outages as well as the reasons underpinning the partial outages.

Response:

(a) Currently, the waste heat is used to heat the offline units, the current Old Crow power plant and staff accommodations.

(b) No, the generating units and distribution feeders are interconnected through the power plant's 2.4kV switchgear. The generating units have no other means to connect to the distribution system.

(c) The costs for each year are noted below ($000):

2013	
$ 100	Design contract
180	On-site contractor services for foundation work
20	Labour
$ 300	
2014	
$ 200	Freight
325	Electrical equipment and materials
1,025	Contractor services (contract to include building material and construction)
100	Labour
$ 1,650	

(d) Yukon Electrical's current operators will remain in place. The forecast training costs are adequate as there is no additional training required.

(e) The current heat exchanger is not sized for full flow from the unit therefore it only sees partial flow which limits the amount of heat transferred to the waste heat system. Situations arise when this partial level of captured heat is insufficient to effectively keep the waste heat system up to temperature.

(f) Please see the following load duration curves for each year from 2008 through 2012. Data up to 2013 up to June is currently not available.

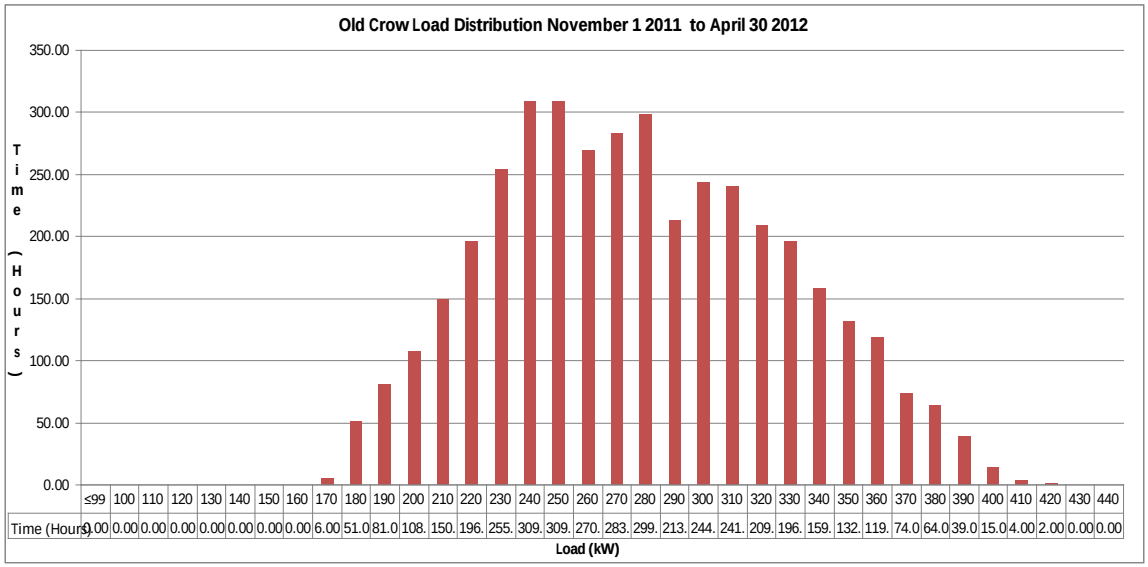
(a) During the requested period, there were no instances where a partial outage to the community in the winter required CUL 384 to provide partial power to the community. This would require the remaining 2 larger units to be unavailable, which did not occur. During the winter months, the community load in Old Crow is greater than CUL 384 can adequately manage. As you can see in the below Old Crow Load Distribution table, there were a total of 6 hours in the period of November 1, 2011 to April 30, 2012 that community load was 170kW (maximum capacity of CUL 384). The remainder of the time, another unit in the plant would have to be utilized to provide power to the entire community.



Load (kW)	≤99	100	110	120	130	140	150	160	170	180	190	200	210	220	230	240	250	260	270	280	290	300	310	320	330	340	350	360	370	380	390	400	410	420	430	440

YUB-YECL-44

Reference: Old Crow Unit #4 Addition, YECL Application, Business Case #10, page 2

*Purchase a new **400kW** unit to be installed in the new Old Crow building (see Business Case #8). This project is required to provide full contingency generation for the isolated community of Old Crow in the event of a scheduled plant shutdown or an unplanned shutdown. [emphasis added]*

Contingency; ability to provide backup generation to the community in the event of loss of existing plant. In an emergency situation for the existing plant, transportation of mobile backup generation to this isolated fly in only community is a lengthy process due to known locations of Hercules aircraft that are out of Territory. This process would result in a long duration outage. The cost to complete this in an emergency situation would be approximately 25% of the cost of this planned project. This unit would also be able to provide full backup for scheduled maintenance shutdowns or upgrades that require a complete outage to the community. There will be a number of scheduled full shutdowns needed in the next three years.

Modernization of existing facility; plant Programmable Logic Controller is obsolete and the control system requires replacement. To complete this work a complete shutdown of the existing plant is needed. Onsite backup generation is required to avoid day long outages for multiple days, this need would be satisfied by the new unit.

Request:

(a) Please explain why the forecast $500,000 for this business case is the same as that for the replacement of Old Crow unit CUL 384 with a 250kW unit, considering that this business case provides for the "[m]odernization of existing facility; plant Programmable Logic Controller is obsolete and the control system requires replacement. To complete this work a complete shutdown of the existing plant is needed. Onsite backup generation is required to avoid day long outages for multiple days, this need would be satisfied by the new unit."

(b) During downtime for repairs on a unit in the old building, is it necessary to have all the units housed in the old building idle? If so, has this always been the case? If not, why is it being addressed now? Please explain.

(c) Please provide the number of times in the last decade that there has been a loss of an existing plant, where flown-in mobile backup generation has been necessary. Provide the dates, the length of time and the cause of each outage.

Response:

(a) The 400kW unit for Old Crow will be purchased and put in to service at the same time as the Old Crow plant expansion in 2014. This coordination will allow for cost savings due to resource utilization and sharing for both projects. Contractors that are needed for electrical, civil and welding work will already be on site. The materials needed for the Old Crow plant expansion will be freighted via large aircraft or the winter road if available, and the 400kW unit will be a small addition to the freight costs.

The 250kW unit will require its own specific shipment and contractors will be traveling to Old Crow specifically for that project in 2015. The material cost for this generating unit is approximately $50,000 less than for the 400kW unit, based on manufacturer estimates, but the higher freight and contractor costs offset the savings in the cost of the actual unit.

(b) It is not necessary to have all units idle in the old building to perform small repairs and top ends on a single unit. However, for major repairs such as major overhauls and control system work, a complete shutdown or isolation of the old building is required to safely complete the work. There are a number of scheduled full shutdowns required in the next three years.

There have been instances where major repairs required all of the units in the old building to be idle, resulting in outages that are short in duration. However, as discussed in Business Case #8, the Programmable Logic Controller (PLC) in the old building used for plant control is obsolete and is no longer supported by the manufacturer. As a result, the control system is planned to be replaced in 2016. Work such as this completed on the PLC system requires a complete shutdown of the power plant for several days which would result in multiple full outages. Flying in backup generation is an option to provide power to the community while the PLC is being worked on, but this option is very expensive and does not address the need for contingency power in the event of an emergency. The addition of Old Crow #4 would allow Yukon Electrical to continue to supply the community with power while major repairs are being completed, as well as addressing the community's requirement for additional

contingency in the event of an unplanned outage. The ability to have a safe and reliable power supply in a remote community north of the Arctic Circle is paramount. This project provides security of supply, and redundant and contingency power for the community in the event of an emergency or the unplanned loss of the current power facility.

(c) There have been no instances like these in the past decade. However, there have been 3 long duration outages (4 to 7 hours in length) in the last year to the entire community that would have been only minutes in length if the new 400kW unit and expanded Old Crow plant were in service.

YUB-YECL-45

Reference: Beaver Creek Unit #1 Replacement, YECL Application, Business Case #11, page 2

Purchase new diesel generator unit complete with manufacturer-supplied and specified radiator, exhaust, and heat exchanger. Remove existing unit, install new unit and supplied devices, integrate unit into electrical supply and control systems, and connect unit into waste heat and fuel systems.

Request:

(a) With respect to the Beaver Creek generating plant unit, what is the generating capacity of Unit #1 and what is the generating size of the replacement unit?

(b) Is the replacement unit identical to what is being proposed in Business Case #5? Please explain.

(c) Are modifications to the electrical supply and control system necessary? Please explain.

Response:

(a) The capacity of the current unit is 250kW; the generating size of the replacement unit upon which the project forecast is based is 300kW. The forecast of the replacement unit is based on the best information available to Yukon Electrical at this time. Once the actual replacement date arrives, Yukon Electrical will select a unit to ensure ideal generator capacity is selected.

(b) This project is identical in scope to that what is being proposed in Business Case #5: design and acquisition of a new generator, exhaust system, controls and labour to complete project. However, the replacement unit forecast in Business Case #5 is similarly sized to the existing Beaver Creek Unit #2, which is 365kW.

(c) Yes, in order for the new unit to operate properly within the existing power plant it will need to be integrated into the power plant control system. The existing unit (1988 Vintage) has controls that differ greatly from modern units which will require modification work to existing systems.

YUB-YECL-46

Reference: Carcross 2 MVA standby project, YECL Application, Business Case #12, page 2

This project includes the purchase and installation of a 2MW self-contained generating unit for contingency in the Carcross substation. The communities of Carcross and Tagish, including the surrounding areas, have peak load demands of 1.5MW in the winter with approximately 712 total customers.

Should a loss of generation on the Yukon Interconnected System or loss of Distribution System capability on the single radial line to the service area occur, customers in Carcross and Tagish would be without electricity. A back up power supply would provide these customers with a backup power supply similar to six other Yukon communities. A power system planning principle, "N-1," is used as a criterion to ensure contingency of supply to meet customer peak loads while a largest generating unit or major distribution/transmission component is out of service. This criterion is used in larger customer centers to provide a high reliability level to customers, however, is not practical on an individual customer basis. Yukon Electrical proposes a threshold minimum load of 1.0MWHs and 300 customers to enact the N-1 planning criteria

Request:

(a) In respect of the N-1 planning criteria, please explain what the minimum threshold load and number of customers is currently necessary to enact the N-1 criteria. Please discuss the reasons why these minimums were chosen. If there are currently no minimum thresholds, please indicate the reason(s).

(b) Please explain what has changed to influence the justification/rationale for proposing the minimum thresholds alluded to in part (a).

(c) Please provide the names of the various communities throughout the Yukon with standby generators that are connected to the Yukon Interconnected System (YIS). Please provide the dates that the generator sets were installed. Also, indicate if any of the communities were initially isolated with local generation and were subsequently connected to the YIS.

(d) With respect to outage statistics, has the line to Carcross and Tagish been identified to be a problem area?

(i) Please provide on an annual basis the number of outages and the relevant statistics for the last decade where the communities of Carcross and Tagish have been isolated from the Yukon.

(ii) Please provide the underlying reasons for the outages — e.g. lightning, trees falling on the line, poles falling, wildlife, etc. — and the costs to mitigate the identified problem areas.

(iii) Please provide the results of any reviews that have been undertaken to analyze and correct any of the problems in parts (i) and (ii).

(iv) Please provide the results of any engineering analyses that have been undertaken to analyze and determine the most effective way to complete the required work that has arisen out of part (iii) reviews.

(e) Please provide the planned and executed staged distribution improvements in the area to mitigate problems alluded to in part (d).

(f) Other than the rationale that the Carcross-Tagish area contains a population that exceeds the population of some of the communities that currently have backup generation capability is there any other rationale to support threshold minimums to enact the N-1 planning criteria?

(g) If the Board were to accept the proposed threshold minimums to enact the N-1 planning criteria, are there other communities for which the planning criteria would be enacted in the short term?

(h) Please provide a detailed cost estimate for the proposed 2MVA standby project — e.g. labour, pad, generator, substation, buildings, etc.

(i) Please discuss what alternatives were considered with respect to this project

Response:

(a) The rationale for a threshold minimum load of 1.0 MWHs to enact an N-1 planning criteria is based on the January 2006 Yukon Energy Corporation 20 Year Resource Plan that addressed a revised planning criteria for communities. An excerpt from Section 3.4 entitled “SUMMARY: REVISED CAPACITY PLANNING CRITERIA” on pages 88-89 provides the following:

2. **Emergency (or "N-1") WAF and MD system capacity planning criteria:** Each grid system (WAF and MD) will be planned to be able to carry the forecast peak winter loads (excluding major industrial loads) under the largest single contingency (known as "N-1"). The N-1 criterion determines system capacity assuming the loss of the system's single largest generating or transmission-related generation source.

3. **WAF and MD "community" criteria:** For communities on the WAF or MD grids, any location with a load large enough to justify a diesel unit of about 1 MW or more will be considered as a preferred location for new diesel units if that community does not already have back-up from another source (e.g., having an existing diesel unit). The new diesel units would provide grid support, and in times of line failures would provide local generation for the communities where they are located.

The selection of 300 customers is recommended as a minimum community size for locations with sufficient load that benefits a reasonably high number of customers.

(b) Yukon Electrical seeks approval for Board direction related to planning and design standards with respect to providing system redundancy.

(c) Please refer to the table below for a list of communities in the Yukon with standby generators that are connected to the Yukon Interconnected System as well as their initial installation date and indication of if they were initially isolated then connected to the YIS.

YUB – YECL – 46(c)

Power Plant Location	Company	In Service Date	Isolated then Connected to YIS
Dawson	YEC	1966	Yes
Faro	YEC	1970	Yes
Mayo	YEC	1974	Yes
Whitehorse	YEC	1968	Yes
Carmacks	YECL	1960	Yes
Haines Junction	YECL	1958	Yes*
Pelly Crossing	YECL	1966	Yes
Ross River	YECL	1966	Yes
Stewart Crossing	YECL	1965	Yes
Teslin	YECL	1962	Yes

* Haines Junction was connected to the grid in the 1970s. It was repowered in 1997 to provide standby capacity.

(d) The line to Carcross and Tagish has not been identified as a particular problem area. It is part of Yukon Electrical's maintenance and on-going improvement programs.

(i) Please refer to YUB-YECL-46 Attachment 1, tab YUB-YECL-46(d)i. for outage statistics from 2003-2012. Company Total statistics are provided as a reference. Haines Junction outage statistics are also provided as a reference for a similarly sized community. Note that the SAIFI is similar in Haines Junction – indicating similar outage frequency to Carcross & Tagish – yet the SAIDI and Index of Reliability is considerably better – indicating that outage durations are shorter in Haines Junction.

(ii) Please refer to YUB-YECL-46 Attachment 1, tab YUB-YECL-46(d)ii. for detailed statistics by CEA Coding. Statistically, the largest contributors to outages are related to a loss of supply from the Yukon Interconnected System and from trees on the distribution lines. Business Case# 12 to install a standby generating unit is proposed to address the supply and radial isolation issue at a cost of $3M. Brushing costs for the Carcross and Tagish areas since 2008 total $190,000.

(iii) Compilation of statistical data and a review of results have determined that along with the on-going brushing and distribution improvements the optimal solution to improve service reliability is a standby generator.

Please refer to YUB-YECL-46 Attachment 1, tab YUB-YECL-46(d)iii. with highlighted outage causes and commentary below:

- **Adverse Weather** – Tagish 2004 – A snowstorm caused an extended outage in 2004 to most of the town.

- **Defective Equipment** – Carcross and Tagish 2011 – Two dead-end insulators failed at Emerald Lake turnoff, causing an outage to Carcross and Tagish. The insulators were replaced.

- **Defective Equipment** – Tagish 2007 – Conductor on double dead-end structure slipped from insulator pin, causing extended outage to all of Tagish.

- **Trees** – Trees are an ongoing concern in Tagish and Carcross and Yukon Electrical's brushing program targets these areas.

(iv) Other options considered included:

- Providing an alternative feed from Jakes Corner from a new 34.5kV – 25kV substation and 15km line to the community of Tagish. This alternative feed provides a looped supply configuration to the communities however is still supplied off of the main radial feed line from Whitehorse.

- Acceleration of the brushing program to reduce incident outages caused by trees on the line. However, the inherent risk from being on a long radial feed remains.

- Hiring a Serviceman to staff the Carcross and Tagish region, similar to Haines Junction. Though not as remote as Haines Junction, this option can more rapidly address localized incidents. This does not assist with the loss of supply issue.

(e) Widening of the right of way has been undertaken. Some sections of line have been rebuilt along the road side right of way in place of cross country routing. This removes the trees entirely from the road side of the power line and speeds up patrolling/trouble shooting times.

(f) Additional rational to enact the N-1 planning criteria based on minimum thresholds for electrical load and population base is related to providing electrical

service for emergency services in the Carcross-Tagish area that include ambulance, fire protection, emergency measures and policing services that require a reliable source of power to function properly. Yukon Electrical strives to ensure reliable service to meet the needs of its customers and communities.

(g) Additional community areas that would meet the planning criteria include the greater Marsh Lake area (New Constabulary, Old Constabulary, Judas Creek, Army Beach, South McClintock) that would meet the thresholds.

Haines Junction is another community that due to load growth in the near future would not have sufficient generating capacity to provide 100% standby capacity. This could be met with a larger sized unit. As such, it would be beneficial for Yukon Electrical to obtain guidance from the Board with respect to ensuring that standby capability for existing communities is maintained.

(h) Detailed cost estimate for the proposed 2MVA standby project:

2,000kW Self-contained generator (sized for cold load pickup)	$2,500,000
Engineering, Design	100,000
Transformer, cables, vault, cable tray	100,000
OSS (grid inter-tie/synchronization)	75,000
Substation bus extension	50,000
Civil – genset pad, fuel tank pad	50,000
Fuel tank, piping, utilidor	50,000
SCADA and PLC	35,000
Ground grid	20,000
Fence	20,000
	$3,000,000

(i) For additional information on options, please also refer to response (d)(iv) above. The community of Carcross is fed from a single 34.5kV line off of the 34.5kV line from Whitehorse to Teslin. The community of Tagish is supplied by a 25kV line from the substation at Carcross. An option to close the loop back to the Whitehorse line by including a new substation and line would address issues related to the vulnerability of the radial feed portion to Carcross and Tagish, but

does not address the radial supply line out of Whitehorse. The approximate cost of this option is $3.5M comprised of $1.5M for a new substation and $2.0M for new line. This alternative feed will also be supplied by the radial line from Whitehorse and, therefore, does not provide the security of supply.

YUB-YECL-47

Reference: Destruction Bay Unit #2 Replacement, YECL Application, Business Case #14, page 2

Replace Unit #2 in Destruction Bay, which is at the end of its life, with a new diesel generator. Based on forecast load growth and Yukon Electrical's planning criteria, the new unit is planned to have similar generating capacity in comparison to the existing unit.

Request:

Please provide the size of the existing Unit #2 and the size of its proposed replacement.

Response:

The capacity of the current unit is 300kW; the proposed replacement, which the project estimate is based on, is also 300kW.

YUB-YECL-48

Reference: Automated Meter Reading – Whitehorse and area, YECL Application; Business Case #27, page 2 and 3

This project is to convert conventional electronic and mechanical meters to Automated Meter Reading (AMR) technology. The project will convert all meters in the Whitehorse area, Marsh Lake, Carcross, Tagish and Teslin communities to AMR technology, which is approximately 80% of all Yukon Electrical meters. The benefits of conversion will be improved customer service, improved safety performance for employees and customers and reduced vehicle emissions, as well as long term cost savings of over $2 million over 25 years as compared to conventional meter reading.

…

… the City [of Whitehorse] … is investigating the utilization of AMR technology to obtain water meter readings … there may be potential benefits to the project in terms of costs if the City chooses to partner with Yukon Electrical on the project.

Request:

(a) Please explain the difference between the terms “automated meter reading” (AMR) and “advanced metering infrastructure” (AMI).

(b) With respect to this AMR business case, please explain the significant changes since YECL’s last GRA that makes the project move viable and beneficial, and at the same addresses the concerns that were raised by interveners in YECL’s previous GRA.

(c) Please list and explain the potential benefits/economies if YECL were to partner with the City of Whitehorse respecting the AMR project — e.g. Does the crossover point shown on the *CPV of AMR Conventional Meters: Cost Comparison* (Business Case #27, Attachment 1, page 1 of 11) move to the left?

(d) Please explain if there are additional capital costs if YECL were to transition to AMI from AMR.

(e) Respecting the AMR meters that YECL is proposing to use, please explain the benefits of having the time-of-use ability built into the meter and the related costs.

i. If in the future the Board were to approve additional costs to enable time-of-use metering, please provide the additional asset-related costs and time that would be required to make the time-of-use metering benefits available to customers.

(j) Are the costs of equipping YECL's proposed Whistle Bend substation with a two-way automatic communication system (TWACS) built into the AMR business case?

(k) Has YECL had discussions or worked with YEC to review and assess the costs and potential benefits of the AMR project? Please provide a detailed explanation.

(l) Please explain what YECL is meaning respecting its submission that "there will be beneficial long-term cost savings." For example, are there any additional costs and time required in order to realize the long-term cost savings? Please explain.

(m) Please provide the cost/benefit analysis for this business case.

(n) Does the proposed AMR project enable YECL to provide time-of-use rates? If so, does YECL intend to apply for time-of-use rates? Have YECL customers requested time-of-use rates?

Response:

(a) Advanced Metering Infrastructure (AMI) are meters and systems that measure, collect, and analyze energy usage, and communicate with other devices within a customer's premise. Automated Meter Reading (AMR) is the communication system and meters that provide a reading of the energy usage at set and infrequent times.

(b) Significant changes since Yukon Electrical's last GRA filing that makes the project more viable and beneficial include:

(i) Reduction of implementation costs. Yukon Electrical has gained knowledge and experience from its affiliate company Northland Utilities (Yellowknife) Limited, which successfully implemented AMR in 2010 in a similar northern climate. NUY's implementation was completed under budget and in the forecast timeline. Yukon Electrical has

used information gathered by NUY during its implementation to better forecast implementation costs for this project.

(ii) Impact of regulation changes. New Measurement Canada regulations, which take effect January 1, 2014, will increase sample and testing work required on the existing mechanical meters. Measurement Canada will also be decreasing the life extensions of mechanical meters from six to four years. In comparison, AMR meters require testing after ten years.

Concerns raised during the previous GRA are addressed as follows:

Evidence of Reduction in Meter Reading Errors

Currently, Yukon Electrical experiences on average 60 questioned reads each month. The cost associated with sending someone to manually re-check these reads is approximately $50,400 per year. With the implementation of AMR, these costs as a result of human error are removed from the process.

In addition, AMR will also replace the need to send field staff to read meters when customers move or transfer accounts. Yukon Electrical averages 431 of these work order types per month. This equates to an annual cost savings of approximately $84,400.

Impact of Cost Overruns on AMR Project

The AMR project cost data has been further supported by the experiences of Northland Utilities (Yellowknife) Limited ("NUY"). NUY implemented the same infrastructure proposed by Yukon Electrical in 2010 and completed the project under budget. Through post-implementation discussions with NUY, Yukon Electrical is confident in its forecast outlined in the business case. Yukon Electrical has also built a contingency of 10% into the business case model. The proposed 9 year cross-over is a conservative estimate.

Work done with other Interveners

Yukon Electrical has engaged in meetings and discussions with both the City of Whitehorse and YEC on the proposed AMR project. Yukon Electrical supplied YEC with a copy of the proposed AMR business in March 2013, prior to submission of this filing. There are a small number

of YEC customers that can benefit from this project; therefore input on the overall project was not received.

(c) If a partnership was entered into with the City of Whitehorse respecting the AMR project, the City would fully contribute for their share of the hardware cost (capital) and billing components (O&M). The crossover point shown on the CPV of AMR Conventional Meters: Cost Comparison would become shorter as a percentage of installation labour would be allocated to any water meters installed.

(d) Yes, there would be significant additions to capital costs depending on the suite of AMI options selected. There are a number of different options within the context of Advanced Metering Infrastructure and each option would have separate costs. The single most significant cost would be the Meter Data Management System (MDMS) or similar technology that would collect, analyze and transfer data from the AMI meters to the ATCO CIS billing system. As ATCO Electric does not utilize AMI, this data system and technology would be fully incurred by Yukon Electrical to acquire and implement a new MDMS.

(e) The time of use (TOU) ability of the AMR meters Yukon Electrical is installing would be utilized to conduct load studies on the system. There is no additional cost for the meter as this is a built in capability of the Two Way Automatic Communication System (TWACS) meters. Currently, this TOU ability of the TWACS meter is not Measurement Canada approved for revenue metering. If the YUB were to enable TOU rates in the future, the costs could be substantial to implement if the TWACS meters were unable to obtain Measurement Canada approval. If Yukon Electrical was to proceed in selecting a different vendor then TWACS technology, we would lose out on our significant advantage that has been gained by adopting ATCO Electric's ("AE") AMR experience. AE has already developed a mature, stable and proven system. Yukon Electrical would need to incur costs to develop our own market technology research and pilot projects. Once a system was selected there would be additional costs associated with design, implementation and interfacing with Yukon Electrical's current billing (and other related) systems.

(j) TWACS is not needed at Whistle Bend Substation.

(k) Yes, Yukon Electrical has engaged in discussions with YEC regarding AMR. Additionally, a copy of the proposed AMR business case was provided to YEC. As the impact of AMR is minimal to YEC customers, further discussions did not arise.

(l) By stating "there will be beneficial long-term cost savings," Yukon Electrical is referring to the savings of more than $2.2 Million over the life of the project as shown in the Application in Business Case #27 – AMR Attachment 1. There are no additional costs and time required in order to realize the long-term cost savings. All costs have been included in the AMR Business Case #27 and supporting model to realize these savings.

(m) Please refer to YUB-YECL-48(m) Attachment 1 for a copy of the cost/benefit analysis for the AMR project which shows that customers will benefit from the implementation of AMR with cost savings in 9 years and cumulative savings of $2.2 million over 25 years.

(n) No, the proposed AMR meters do not currently have Measurement Canada approved revenue metering time of use ("TOU") capability.

Yukon Electrical does not intend on applying for TOU rates. Yukon Electrical examined the current electrical load profile of the area to be converted to AMR, there would be little to no beneficial result of implementing TOU rates.

The core purpose of TOU rates is to encourage consumers to shift electrical demand, rather than to reduce overall consumption. In the Yukon, and the AMR implementation area, the patterns of peak consumption closely align with the patterns of residential customer electrical use. Meaning, the peaks are associated with the residential customers' usage. These times of day are before and after work/school during the week. The peak times occur on the coldest days of the year, usually in December or January, when water flows are low. It can be assumed that, due to the load profile of residential customers influence on the peak, implementation of TOU rates would only shift load to a later hour rather than having an overall consumption reduction effect. Therefore, the consumption and associated peaks would still occur, just at a later hour, as residential heating and cooking would still be required regardless of price signals.

Yukon Electrical participated in a consultation workshop in January 2011 where electricity rates, as a driver for demand-side management (DSM), were discussed. Within the notes of the meeting, which can be found in UCG-YECL-128(a) Attachment 9, the participants had varying views on the benefits of TOU and the ability of a TOU program to be an effective tool for DSM.

The majority of North American jurisdictions which have converted to TOU rates did so through an outside directive. These rates were mandated either by act of provincial or state legislation change or a directive by the authorized regulatory

agency for that jurisdiction. Again, Yukon Electrical sees little benefit in TOU rates for the potential significant cost of implementing and will not be seeking TOU rates unless otherwise directed.

It should be noted that in the five-year DSM plan, coincidental peak savings are achieved through the proposed electricity conservation programs.

Cost Comparison: Yukon Electrical AMR Project

General Assumptions:
1. Analysis is over 25 years
2. AMR Implementation is over 2 years
3. Escalation Rate 2%
4. Analysis is on an incremental basis
5. Sunk capital costs are ignored
6. Future meter replacement costs are included

YUB-YECL-49

Reference: Old Crow Unit #3 Replacement, YECL Application, Business Case #15, page 2

*Purchase and install a new **250kW** unit to replace the existing undersized 170kW unit (CUL 384). Load growth and load duration of Old Crow community have steadily diminished the utilization of the existing unit due to its rated capacity. The new 250kW unit will be installed in the new building in Old Crow (see Business Case #8), as it will not physically fit in the existing building, so the purchase of new switchgear and engine controls components is also required. [emphasis added]*

Request:

(a) Please provide the ages and operating hours of the units in the Old Crow generating plant? Will the units soon be at the end of life?

(b) Please indicate what future plans YECL has in respect of unit CUL 384.

Response:

(a) Unit 2 could be eligible for replacement in 2017 or 2018 if annual operating hours continue on the past 2 year average.

Unit #	Engine Year of Manufacture	Engine Hours (December 2012)	Forecast Retirement Year
1	1998	20,184	2022+
2	1991	57,141	2017
3	1992	28,879	2015

(b) CUL 384 will be removed from service in Old Crow and sold.

YUB-YECL-50

Reference: Hillcrest Subdivision Conversion, YECL Application, Business Case #18, Page 2

The project is to reduce the load on 4L306 by converting a subdivision to 25kV electrical infrastructure and transferring to 5L630. The existing infrastructure is also at end of life condition with poor condition of poles and aged electrical hardware that is degrading.

The Hillcrest subdivision load is to be converted to 25kV and transferred to 5L630.

Request:

Once the conversion is completed and throughout the conversion, what are the contingency plans if there is a fault on either 4L306 or 5L630?

Response:

The will be no change in contingency for 5L630. As Hillcrest is converted and transferred from 4L306 to 5L630, the additional distribution in Hillcrest that is added to 5L630 will be newly constructed infrastructure which inherently has fewer issues.

It is very similar circumstance for 4L306. Currently, Hillcrest is a radial feed at the end of this line. Accordingly, any outage on 4L306 and 5L630 would affect the Hillcrest area as it is at the end of the respective distribution lines. Yukon Electrical emergency crews would have to locate and repair the problem.

YUB-YECL-51

Reference: Crestview to mayo Road Corner Double Circuit, YECL Application, Business Case #21, page 2

Build a new distribution line in double circuit configuration from Crestview area to the Mayo road intersection. The new 34.5 kV top distribution line will be built with 266 ACSR conductors. The bottom circuit, 5L628, will be replacing the existing distribution line. Permitting, easements, brushing and construction will be completed to standard.

Request:

(a) Please provide an itemized list of the costs that make up the forecast $0.6 million total for this project.

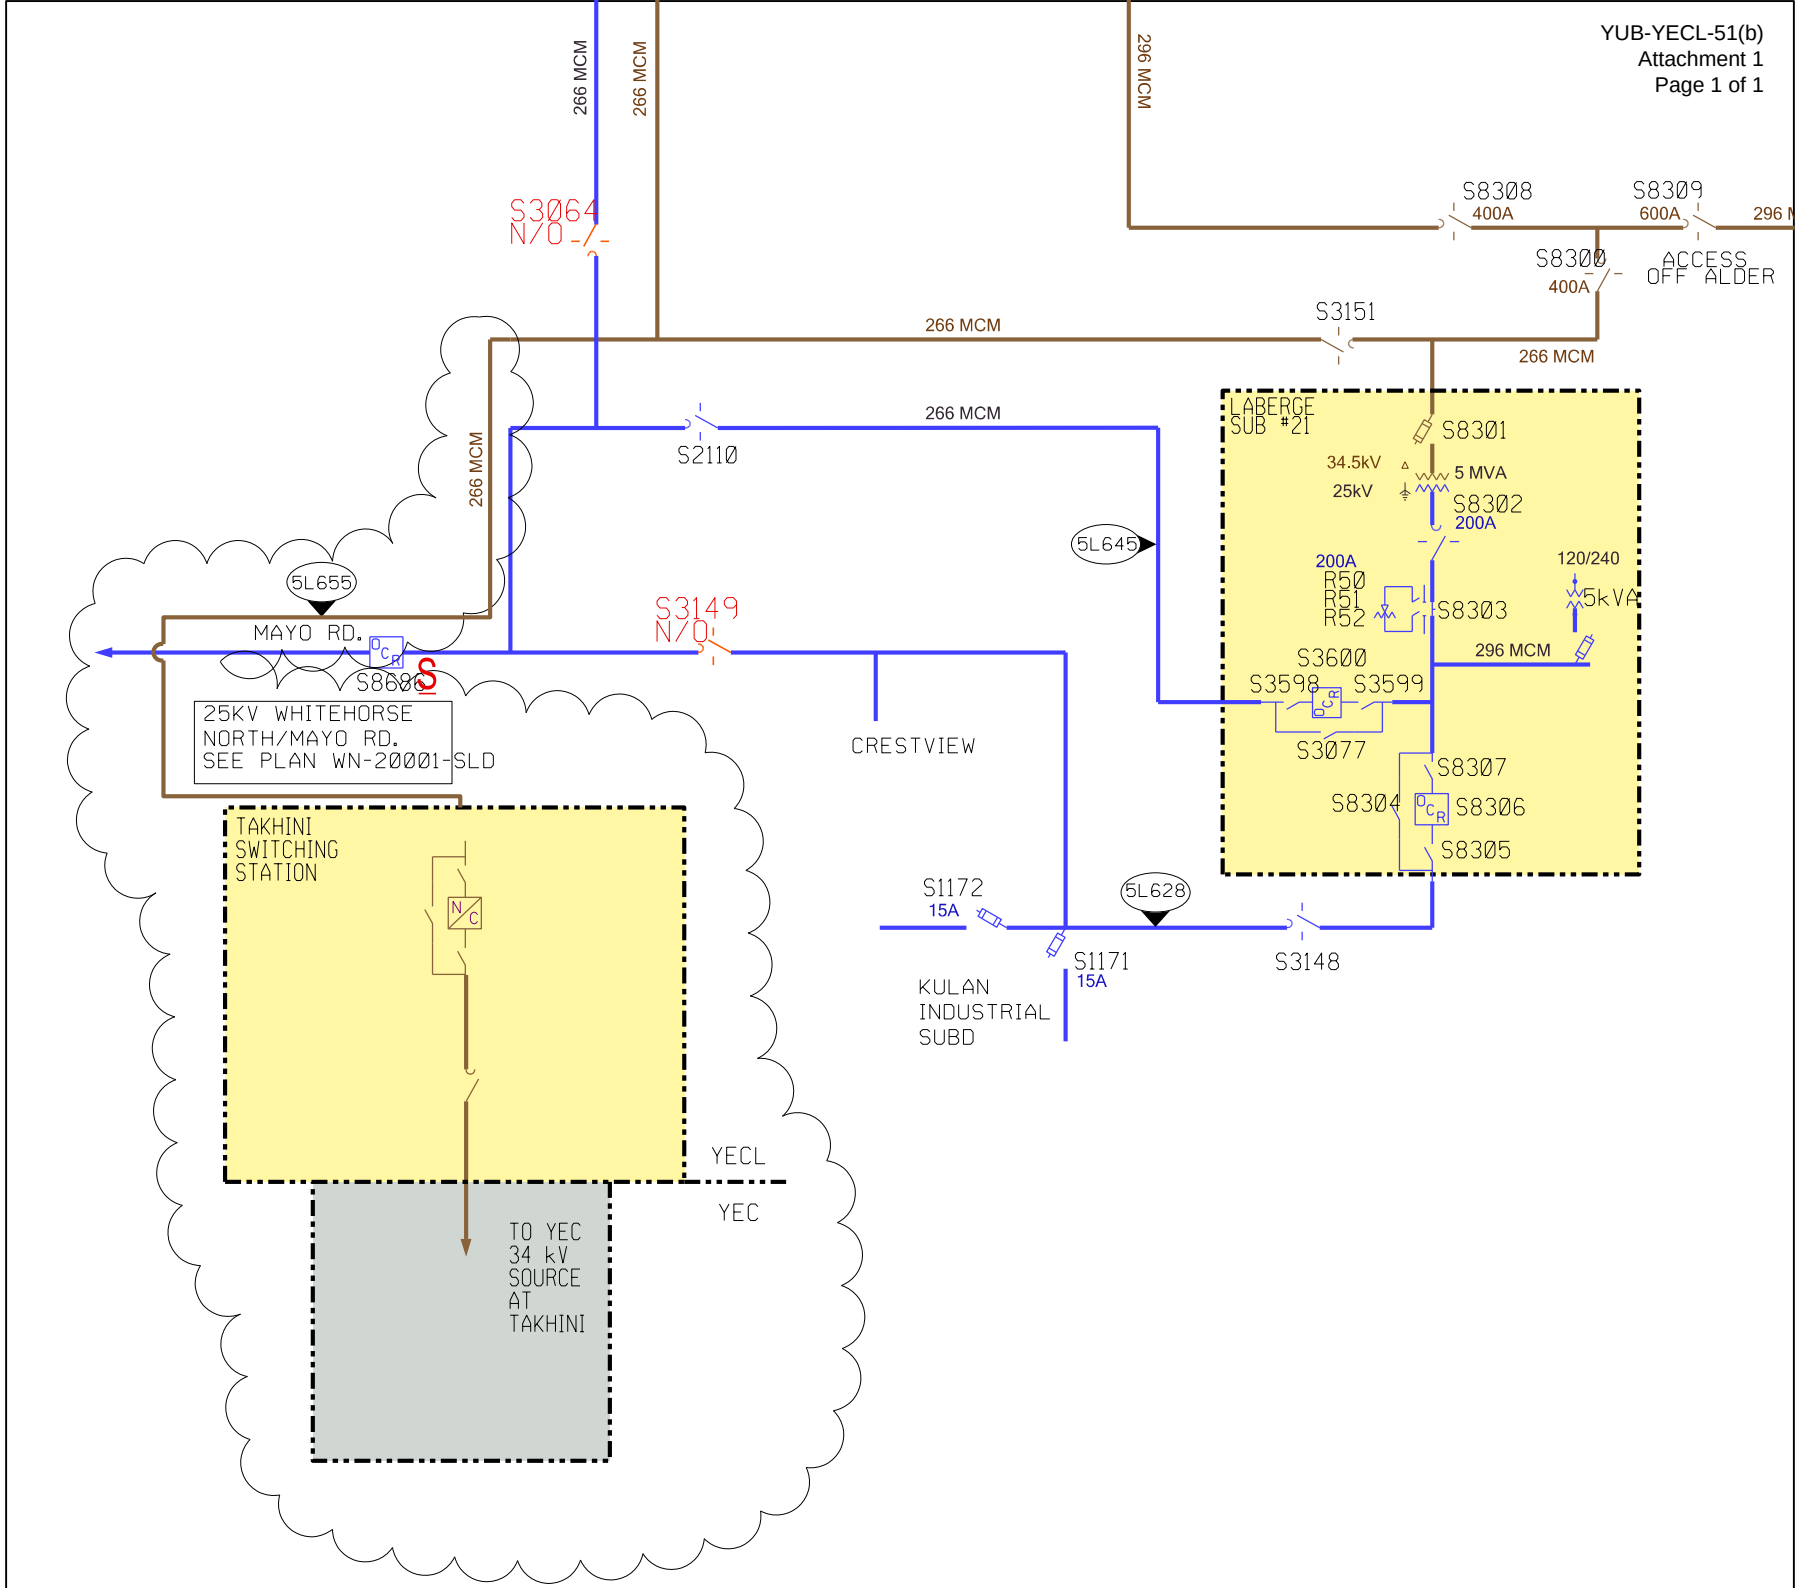
(b) Please provide a single-line diagram showing the proposed 34.5kv line, 5l628 and the new YEC substation for which business cases 21 and 23 apply.

Response:

(a) The costs in 2012 for this project were made up of:

Materials	$218,000
Labour Charges	20,000
Contract Services	389,000
Other	1,000
Total Costs	$628,000

(b) Please refer to YUB-YECL-51(b) Attachment 1.



WH-20001.dgn NTS

YUB-YECL-52

Reference: Whitehorse 5L628 and new 35kV Build, YELCL Application, Business Case #23, page 2

The project is to build a double circuit distribution line on the North Klondike Highway to the Yukon Energy Takhini Switching Station.

The new top circuit will be built to 34.5kV standards with sufficient capacity to safely accommodate the design of the supply source.

The bottom circuit will be a replacement of 5L628 in this area. The existing line in the area serves all customers on the North Klondike Highway (approximately 750). Most poles in the area are unable to accommodate the addition of another circuit. Where possible, existing infrastructure will be utilized to complete the project.

Request:

Please provide an itemized list of the costs that make up the forecast $1.9 million total for this project.

Response:

Forecast costs for this project:

Materials	$1,171,800
Contract Services	661,500
Labour	56,700
Total forecast costs	$1,890,000

YUB-YECL-53

Reference: Fish Lake Water Licence Renewal, YECL Application, Business Case #28

Request:

(a) Please provide a comprehensive list of the activities that make up the expenses incurred in 2011, 2012 and 2013, respectively $491,000, $688,000 and $650,000.

(b) At what stage of renewing the water licence is YECL?

(c) At this point, can YECL confirm that no further modifications to the Fish Lake hydro facility that will arise (a) as a result of acquiring the licence, or (b) out of the licensing requirements?

(d) In addition to part (c), does YECL see any increases related to operating and maintenance activities that may arise out of the new Fish Lake licensing requirements? Please explain.

(e) Have all studies been undertaken that are required with respect to renewing YECL's Fish Lake long-term licence? Please explain.

(f) In addition to the long-term licensing requirements, is it YECL's intent to perform any studies, notwithstanding that said studies may not be related to Fish Lake licensing requirements? Please explain.

Response:

(a) Please refer to YUB-YECL-53(a) Attachment 1.

(b) On May 29, 2013, the Yukon Water Board issued to Yukon Electrical a 25-year Water Use Licence (HY12-065) to operate the Fish Lake hydro system from May 31, 2013 until May 30, 2038. Thus, the licence renewal has been completed.

(c) Yukon Electrical can confirm that all modifications of the Fish Lake hydro system, as directed by Water Use Licence HY12-065, are included in the capital forecast included in the Application and no further additions or modifications will be needed during the test years as a result of the Water Use Licence.

(d) Yukon Electrical has forecast and applied for all increased requirements related to operating and maintaining the Fish Lake Hydro system in its Application.

Yukon Electrical recognizes that these increased management efforts add to the cost of managing the system. For this reason, significant effort was made during the relicensing process to seek as efficient management requirements as possible.

At the public hearing to consider Yukon Electrical's long term licence application, Yukon Electrical specifically raised the issue of ratepayers' interests and the fact that the Yukon Water Board needs to consider those interests in determining the conditions of the requested licence. The following text from Yukon Electrical's opening statement demonstrates that efforts were made to ensure that regulation and requirements were efficient:

> Also it is important for the Board to understand that while we sit here as Yukon Electrical seeking this long term licence, we also represent the interests of Yukon ratepayers who are not otherwise represented before you. As a regulated industry, we have an obligation to our ratepayers for prudent fiscal management of this resource to best meet ratepayers' needs. In that vein we respectfully ask that the Board in its deliberations consider the impact of potential licence conditions on ratepayers. Regulation through a water use licence is of course an appropriate requirement but excessive regulation that does not fundamentally improve or impact operations and its effects will have a direct impact on ratepayers and this should be considered.
>
> It is important to understand that this is a small hydro project, with a limited revenue stream to offset investments and operating expenses which include future studies and monitoring activities. To that end, the term of this licence is important as it allows the substantial investments made today and those we have proposed, to be spread out sustainably for ratepayers. It is also important that the flexibility incorporated into the two decision documents issued for this project be extended into the conditions of water use licence. This is so that the inherent flexibility, included in many of the decision document conditions, to adapt monitoring and studies in consultation with Regulators and KDFN can be realized if they are found to be supported by the results of monitoring in early years of

the new licence. This would ensure that unnecessary activities and arising expenses are not forced upon ratepayers.

We respectfully point out that this legacy project is unlike most undertakings considered by the Board in that there is strong operational evidence to support how the project will work since it has been working for over 60 years. Irrespective of modelling and studies, the past operation speaks for itself and should provide the Board comfort that it can continue to operate in an overall beneficial manner.

(e) All studies required for the renewal of a long term Water Use Licence have been completed. There are on-going requirements for studies as part of the new Water Use Licence. The costs for these studies have been forecast in account 62600 and included in Yukon Electrical's Application. Please refer to YUB-YECL-8 for further details.

(f) It is not Yukon Electrical's intent to perform any non essential studies.

The Yukon Electrical Company Limited
Breakdown of Expenses Incurred Related to Fish Lake Water Licence Renewal

Expenses Incurred:	2011	2012	2013 *
Labour	54,924	62,554	25,382
Contract Services	435,111	507,872	747,737
Other	758	117,975	45,226
Total	**490,793**	**688,401**	**818,345**

* Actual expenses incurred for 2013, which are $168,345 higher than the $650,000 forecast in the Application.

YUB-YECL-54

Reference: Downtown Office Building Envelope Upgrades, YECL Application, Business Case #29, page 2 and 3

This project will replace the exterior building envelope of Yukon Electrical's downtown office. The exterior upgrades are required to improve the energy efficiency of the building and create a more comfortable environment for staff and customers, as well as preventing further water damage and potential mold growth in the future.

A Building Evaluation Report was prepared in Q4 2011 that recommends that upgrades be carried out to the exterior of the building to improve and update the overall integrity of the building. The upgrades will also improve the comfort level of the occupants ***and it is projected that these improvements will result in an annual reduction in energy costs of 20%.*** *[emphasis added]*

….

….

- *The changes to the exterior construction and increase in insulation will also result in cost savings and environmental benefits due to a reduction in both electricity use and furnace fuel consumption.*

Request:

With respect to the projected 20% reduction in energy costs, please provide a cost/benefit analysis that illustrates the project payback based on forecast energy savings.

Response:

Yukon Electrical is not able to demonstrate an economic payback for the project related to energy cost savings. Based on heating oil operating costs for the last three years, the savings are $1,500/year. However, this is only a minor benefit to the project and is not the primary reason why the project must be completed. The building envelope has failed allowing moisture ingress, which presents a health concern for employees and customers, as well as a risk to building integrity, and this is the primary reason why Yukon Electrical plans to update the building envelope. The photographs of the facade included in Business Case #29 show the deteriorated condition of the building exterior.

YUB-YECL-55

Reference:

Yukon Electrical seeks the following approvals from the Board:

…

(2) Approval of the continued use of the deferral accounts listed in detail later in this section during the test period;

…

A new industrial customer, Whitehorse Copper Tailings (WHCT), is forecast to start operations in the fall of 2013. While the customer has acknowledged uncertainty in the exact timing of its start-up as well as its ultimate load, the latest available information results in a 2013 forecast of 1,025 MWh and 4,620 MWh for each of 2014 and 2015.

… As WHCT is a single industrial customer that could contribute materially higher or lower than 1.4% of Yukon Electrical's total forecast sales and the exact timing of its start-up and eventual load are not within the control of Yukon Electrical, Yukon Electrical is requesting a deferral account relating to WHCT sales uncertainty.

Request:

Does YECL envision drafting a purchase power agreement with WHCT, similar to what the Yukon Energy Corporation (YEC) has in place with Minto and Alexco mines, in order to safeguard the utility and its customers? Please provide a detailed explanation.

Response:

Yukon Electrical proposes to apply to the Yukon Utilities Board for approval of a power purchase agreement once the details of the customer requirements are available.

Yukon Electrical proposes to utilize Rate Schedule 39 as being applicable to all major industrial customers engaged in manufacturing, processing or mining with an electric service capacity in excess of 1,000 kW.

The components of the present rate include a demand charge of $15.42/kV.A and an energy charge of 7.81¢/kW.h for all energy used. A fixed charge is applied for monthly Capital Cost Contributions for connection to the Yukon Interconnected System.

YUB-YECL-56

Reference: Yukon economic activity, YECL Application, Section 2, pages 2-3

The latest economic projection from the Yukon Government, however, suggests a sharp slowdown in the pace of economic activity in 2012 and 2013. The Yukon Territory real Gross Domestic Product is estimated to have grown in the range of 2%-3% in 2012 and is expected to grow only 2% in 2013, down sharply from the 2011 growth rate of 6.5%. The Territory's unemployment rate rose to 6.9% in 2012, from 5.4% in 2011, and is projected to rise further, to 7.3%, in 2013. The Yukon Government also expects a slower population growth in 2013, dropping from 2.1% in 2012 to 1.3%. The value of building permits is estimated to have dropped 43% in 2012, compared to 2011. In its latest Northern Housing Report, Canada Mortgage and Housing Corporation forecast a 25% decrease in Whitehorse housing starts in 2012 as compared to 2011.

The projections were based on forecasts from Yukon Economic Review 2012, Yukon Economic Development (February 5, 2013), and Northern Housing Report, Canada Mortgage and Housing Corporation, 2012.

Request:

Please provide the Yukon Government's latest economic projection for 2012 and for each year of the test period.

Response:

Please refer to YUB-YECL-56 Attachment 1. An economic projection for 2014 and 2015 is not available.

Table of Key Economic Indicators 21

- Sources for Table Indicators 22

Highlights for 2011

Current as of May 30, 2012

- Preliminary estimates by Statistics Canada indicate that Yukon's real GDP grew 5.6% to $1.776 billion, from $1.681 billion in 2010. Gains in real GDP in 2011 marked the eighth consecutive year of growth.
- Yukon's average annual population increased by 1.6% in 2011 to 35,391. Increasing population in 2011 marked the eighth consecutive year of growth.
- Yukon's average unemployment rate of 5.4% for 2011 was down from 6.9% in 2010 and well below the national average of 7.5%.
- Mineral exploration expenditures in 2011 are estimated at nearly $307 million, topping the previous record high of $157 million in 2010.
- The value of Yukon mineral production for 2011 is estimated at $402 million, up from $299 million in 2010.
- Over 114,000 quartz claims were staked in Yukon in 2011, 38% higher than the previous record high of 83,161 recorded in 2010.
- In 2011, the Department of Tourism and Culture reported 309,863 visitors (border crossings), down slightly from 311,542 in 2010.
- The value of Yukon building permits in 2011 was a record $176.8 million, 34% higher than the $131.8 million reported for 2010.
- The value of retail sales in Yukon totaled a record $662 million in 2011, up 10.6% from $599 million in 2010.

Forecast for 2012

- Yukon's real GDP is expected to increase by 3% in 2012, with growth related primarily to increased mineral production.
- With labour force growth expected to outpace employment growth in 2012, the unemployment rate is expected to increase to 6.5%-7.0%.
- Yukon's population is forecast to average 36,000 in 2012, marking the ninth straight year of population growth.
- The value of mineral production is expected to total almost $600 million, up from the 2011 estimate of $402 million. Growth in 2012 is expected to stem primarily from higher production from the Wolverine mine, which declared commercial production in March 2012.
- Border crossings are expected to total about 313,000 in 2012, up slightly from approximately 310,000 in 2011.
- The value of building permits in 2012 is expected to be $150 million, down from the record $177 million in 2011, but well above the long-term average.
- Retail sales are expected to continue to benefit from a strong economy and total approximately $690 million in 2012, representing a 4% increase from 2011.

2012 Highlights – February 2013 Update:

- Current expectations are that real GDP growth in 2012 will be in the range of two to three per cent.
- The Yukon population in 2012 is now expected to average slightly less than the May forecast of 36,000.
- Yukon's labour market remained strong in 2012 with employment averaging 18,900 and the labour force averaging 20,400, a new record.
- The rate of growth in Yukon's labour force outpaced the growth of employment in 2012 which saw Yukon's unemployment rate increase to 6.9 per cent, up from 5.4 per cent in 2011.
- Annual average inflation for 2012 was 2.3 per cent, slightly below the May forecast of 2.5 per cent, and below the 3.0 per cent average of 2011.
- While exploration spending in 2012 will fall below the estimated record of over $300 million for 2011, interest in exploration in Yukon remains strong. Current expectations have exploration expenditures in 2012 at about $150 million, the third highest level on record.
- Benefitting primarily from higher production from the Wolverine mine, the value of Yukon's mineral production is expected to have grown for the seventh consecutive year in 2012, and total about $450 million, up from an estimated $402 million in 2011.
- Based on year-to-date border crossing data for 2012 annual tourist visitation is expected to have grown to about 321,000, 3.6 per cent higher than the 309,863 recorded in 2011 and well above the May 2012 forecast of 313,000.
- Building permit value for 2012 is estimated at $100.4 million, a decline of 43 per cent from 2011.
- Given the growth in retail sales posted in the first 11 months of 2012, the 2012 total will fall below the May forecast, but total over $675 million, up by over 2 per cent from $662.2 million in 2011.

Global, U.S. and Canadian Economic Outlook – 2011/2012

It was a year of significant uncertainty for the global economy in 2011. Fears of a second global economic downturn since 2008 persisted and were primarily related to worries about the difficult fiscal situations of some countries in the eurozone and the worry that potential defaults of some countries could have substantial impacts on the European banking system. This has had ramifications for global financial markets including decreased liquidity, the impacts of which have even been felt in Yukon. The performance of the U.S. economy also did little to ease global economic concerns in 2011, which has seen a recovery from the previous economic downturn that has been slower than many analysts expected. In addition, a number of Middle East countries saw internal conflicts, and in some cases changes in leadership that contributed to heightened geopolitical tension and concerns about interruptions in global economic oil supply. All of these events helped keep the price of oil high throughout 2011, likely dampening economic growth in some countries.

The most recent World Economic Outlook, published by the International Monetary Fund (IMF) in April 2012, estimates global economic growth of 3.9% for 2011.[1] Growth in 2011

[1] http://www.imf.org/external/pubs/ft/weo/2012/01/index.htm

was noted as lower than in 2010, where growth was estimated at 5.3%. As has been the case in recent years, growth rates in 'emerging and developing economies' in 2011 are estimated to have exceeded those of 'advanced economies' with overall growth for emerging countries estimated at 6.2%, almost four times the 1.6% growth noted for advanced economies. Leading the way for the emerging economies are China and India, which are estimated to have grown 9.2% and 7.2% respectively in 2011.

The World Economic Outlook (April 2012) includes global economic forecasts of 3.5% for 2012 and 4.1% for 2013, with growth in emerging and developing economies expected to be far more robust than growth in developed economies. Advanced economies are expected to post growth of 1.4% and 2.0% in 2012 and 2013 respectively. Emerging and developing countries are expected to post much higher growth with the IMF forecasting growth of 5.7% for 2012 and 6.0% for 2013. China and India, while expected to experience lower GDP growth than recorded in recent years, is expected to continue to fuel economic growth of emerging and developing countries in both 2012 and 2013. Strong domestic demand in these countries along with continuation of strong demand for oil resources from some of the other emerging and developing countries is expected to contribute to growth in the near-term.

The IMF (April 2012) is estimating economic growth of 1.7% for the United States for 2011, lower than the 3.0% growth estimate for 2010. Growth prospects for the U.S. are looking marginally better going forward with the IMF estimating growth of 2.1% for 2012 and 2.4% for 2013. Improving labour markets, higher consumer and business confidence, fiscal consolidation and generally improving household debt levels are all helping to improve the outlook for the U.S. economy. The conclusion of presidential elections in November should also help provide political certainty for the U.S.

Following estimated growth of 2.5% for 2011 for Canada, the IMF is projecting slightly weaker growth of 2.1% and 2.2% for 2012 and 2013 respectively. Canada's recent economic performance has been stable, with Canada generally outperforming most advanced economies. Canada's stable banking system, abundance of valued natural resources, as well as targeted monetary and fiscal stimulus have all contributed to Canada's continued economic growth. Going forward, the demand for Canadian oil and mineral resources is expected to remain strong, which will continue to contribute to Canada's economic growth prospects.

While global growth prospects have improved since late 2011, downside risks to growth remain. Even with the actions taken to address concerns of fiscal sustainability in some European countries the possibility of continued economic and fiscal troubles in Europe remains. Heightened concerns for defaults for some European countries could see investors move to pull resources out of the euro area which could have serious impacts on European and global growth prospects. Escalated unrest in a number of oil-producing countries could also place pressure on global oil prices, as fear of interruptions of global oil supply increases the risk premium on oil. A prolonged period of high oil prices would likely dampen global economic growth prospects, possibly stalling the recoveries of some advanced economies and placing downward pressure on emerging economies. Global growth prospects could also be impacted negatively if oil prices contribute to losses in consumer and business confidence and possible volatility on financial markets.

From a Canadian perspective, a number of areas could impact near-term growth. The Canadian dollar has had a prolonged period of strength versus the U.S. dollar, but further appreciation could have negative impacts on Canadian exports to the U.S. as a high dollar increases the relative costs of Canadian goods to American customers. Canadian exports could also be negatively impacted by a slowdown in the U.S. economic recovery, or lower demand from some European countries and parts of Asia.

In its most recent interest rate announcement on April 17, 2012, the Bank of Canada signaled that an increase in interest rates may be coming. The Bank, citing improving global economic prospects, noted that some modest withdrawal of monetary stimulus could become appropriate. With warnings from the Bank that many Canadians are carrying higher debt levels, an interest rate increase could have negative impacts on Canadian economic activity, as households face higher debt servicing costs. Ultimately the Bank's decision to raise interest rates will be dependent on a number of factors.

Further increases in oil prices may also impact Canadian households as increasing prices would reduce households' discretionary income, likely resulting in lower spending in certain areas of the economy. Higher oil prices could also impact the cost of manufacturing of a variety of goods, and also increase the costs of certain services, which could also have negative consequences for Canadian growth going forward.

Outlook for Global, U.S. and Canadian Economies

- The IMF's World Economic Outlook (April 2012) includes the following:
  - The global economy to grow by 3.5% in 2012 and 4.1% in 2013.
  - The U.S. economy to grow by 2.1% in 2012 and 2.4% in 2013.
  - The Canadian economy to grow by 2.1% in 2012 and 2.2% in 2013.

Global, U.S. and Canadian Outlook – February 2013 Update: While not insulated from the prevailing weakness in the global economy, strong fundamentals, including a stable banking system and abundant natural resources, has positioned Canada well to deal with the current economic headwinds.

The International Monetary Fund (IMF) reported in its January 2013 update to the *World Economic Outlook* that global economic growth is now expected to be 3.2 per cent for 2012 and 3.5 per cent for 2013. This follows estimated global economic growth of 3.9 per cent in 2011 and represents downward revisions from its October 2012 projections of 3.3 per cent growth for 2012 and 3.6 per cent growth for 2013.

The IMF's January update noted that policy actions have lowered risks in the euro area and the United States, but that the economic recovery in the euro area has been delayed. The IMF has indicated that global growth could exceed projections if "crisis risks do not materialize and financial conditions continue to improve" but that downside risks to the global economy, including setbacks in the euro area and excessive U.S. fiscal consolidation in the short term, remain significant.

For emerging and developing economies, the driver of global economic growth in recent years, growth is expected to be healthy, but below the growth levels recorded in 2010 and 2011. The IMF estimates growth of 5.1 per cent for 2012 and is projecting growth of 5.5 per cent growth for 2013. For China, the primary engine of growth in emerging markets in recent years, the IMF is estimating growth of 7.8 per cent in 2012 and forecasting growth of 8.2 per cent in 2013.

The IMF has revised down its near-term outlook for the euro area, with the euro area now expected to contract 0.2 per cent in 2013, down from the October 2012 forecast of 0.1 per cent growth. A contraction in 2013 would mark the second consecutive year of negative growth in the euro zone, following a 0.4 per cent contraction in 2012. The IMF noted that the euro area continues to pose a significant downside risk to global growth prospects.

The IMF's January 2013 projections for the U.S. have GDP growth of 2.3 per cent and 2.0 per cent for 2012 and 2013 respectively. These projections are broadly unchanged from the October outlook. Recent positive news on the U.S. employment front and signs of improvement in the U.S. housing market indicate that the U.S. economy is improving. A last minute deal to avoid automatic tax increases and mandatory spending cuts on January 1, 2013 was also good news for the U.S., and ultimately the global, economy. Going forward, performance of the U.S. economy will depend very much on the ability of policymakers to develop a plan to address the country's deficit issues and to deal with the issue of raising the federal debt ceiling during the first quarter of 2013. High consumer debt and uncertainty in the financial markets also remain a concern going forward.

The IMF's January update notes growth for Canada at 2.0 per cent and 1.8 per cent for 2012 and 2013, respectively. The current forecasts for Canada exceed the IMF's 2012 and 2013 forecasts for all Advanced Economies.

The Bank of Canada's January *Monetary Policy Report* noted growth of 1.9 per cent for 2012 and a forecast of 2.0 per cent for 2013. The Bank lowered growth estimates for both 2012 and 2013 noting that the slowdown in the second half of 2012 was more pronounced than anticipated. The Bank now expects the pace of economic growth in Canada to pick up through 2013 with the Canadian economy now expected to return to full capacity in the second half of 2014.

Yukon Outlook – Economic Sectors
Mining

Yukon's mining sector is in the midst of a strong period of growth with mining activity currently taking place in all areas of the mining life cycle. Current expectations for 2012 have Yukon's mining sector building on the recent strong performance, with the sector well-positioned to be a significant contributor to Yukon's economy for the foreseeable future.

There were over 100 companies doing exploration work in Yukon in 2011, with over 50 of these companies estimated to have spent in excess of $1 million each on exploration-related work. Natural Resources Canada's (NRCAN) Survey of Mineral Exploration, Deposit Appraisal & Mine Complex Development Expenditures indicates that exploration expenditures in 2011 totaled nearly $307 million, which is the highest value on record, and well above the $157 million estimated for 2010. Early indications are that 2012 mineral exploration spending will fall short of the record level reported for 2011, as concerns related to the global economy are making it difficult for mining companies to raise capital. This results in companies budgeting less for exploration-related activities. Current expectations are that mineral exploration expenditures could fall within $160-$200 million, which would be the second highest total on record, and would be well above the historic average.

Interest in Yukon's mineral potential is also being reflected in staking activity in recent years. In 2011, a record 114,587 new claims were staked, 38% higher than the high of 83,161 recorded in the previous year. Expectations for 2012 are that staking activity in the territory will fall well below the record level of 2011, but remain above the historic average.

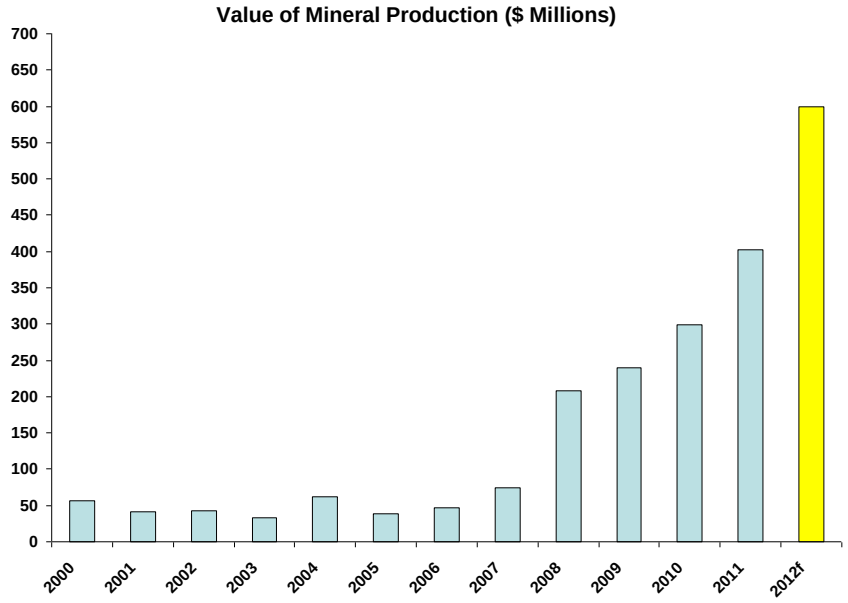
Driving much of the recent exploration activity has been strong growth in gold prices, which have doubled since 2007, and have shown tremendous gains in the last two years. It is estimated that exploration activities related to gold accounted for almost 70% of all mineral expenditures in 2011. With the expectation that gold prices will remain high for the foreseeable future, gold exploration will likely account for a significant portion of Yukon exploration activities going forward.

Following a period of strong development activity that has seen three mines developed and brought into production since 2005, development expenditures in 2012 are expected to fall below recent levels. Due primarily to development work associated with the Wolverine and Bellekeno mines, development expenditures in both 2010 and 2011 were estimated at about $150 million. With the vast majority of the development work associated with these projects now complete, development costs in 2012 will likely decline to less than half of the total seen in the last two years. Contributing to development expenditures in 2012 will be Capstone Mining Corp., which has budgeted over $32 million for capital expenditures on work related to the Minto mine, and Yukon Zinc Corp., which has budgeted $10-$15 million for continued work on the Wolverine project. Further expenditures could be seen on the Bellekeno project and the Victoria Gold project.

With Yukon Zinc Corp. filing Notice of Commencement of Production in March 2012, Yukon now has three commercially producing mines. Production from these mines, along with the production value of placer gold, is forecast to generate about $600 million in

mineral production value in 2012, far exceeding NRCAN's estimates of $402 million for 2011 and $299 million for 2010.[2] The additional mineral production in 2012 will be a significant contributor to Yukon's real GDP growth in 2012.

Placer gold production has been generally stable in recent years. Production in 2011 totaled 46,485 ounces; 9.4% lower than the 51,302 ounces produced in 2010. Current expectations for 2012 are for placer gold production to approach the 2010 level and total about 50,000 ounces.



Source: Natural Resources Canada; Department of Economic Development

Prices for minerals of interest to Yukon have generally been strong in recent years with annual gains in both 2010 and 2011 for gold, silver, copper, zinc and lead. The recent performance of gold and silver price in particular has been very strong. Gold prices in 2011 approached US$1,900 per ounce and averaged about US$1,570 per ounce for the year, 28% higher than the 2010 average of about US$1,225 per ounce. Silver prices in 2011 averaged over US$35 per ounce, up 74% from about US$20 per ounce in 2010.

While copper, zinc and lead prices have not surged like that of the prices for gold and silver, prices for all three of these metals have recorded recent gains.

- Copper prices averaged US$4.00 per pound in 2011, up 17% from US$3.42 per pound in 2010 and 71% from US$2.34 in 2009.
- Zinc prices averaged US$0.99 per pound in 2011, similar to the level recorded in 2010 and from US$0.75 per pound in 2009.
- Lead prices averaged US$1.09 per pound in 2011, up from US$0.97 per pound in 2010 and US$0.78 in 2009.

[2] NRCAN, 2011 Preliminary Estimate of Mineral Production http://mmsd.mms.nrcan.gc.ca/stat-stat/prod-prod/2011-eng.aspx

Continued economic uncertainty, especially in relation to the U.S. and some European countries, is expected to contribute to mixed performance for mineral prices in 2012. Gold and silver prices are expected to continue to perform well, with a number of forecasters expecting gains in price for both of these precious metals. Estimates for 2012 vary by forecaster. At the time of writing TD Economics was forecasting gold at US$1,766 per ounce and silver at US$35.02 per ounce, while BMO Capital Markets was forecasting gold at US$1,675 per ounce and silver at US$34.25 per ounce. Forecasters are less bullish on the prospects for copper, and zinc prices in 2012 with current expectations for prices to be steady, or slightly lower than the levels posted in 2011.

With three producing mines and a number of other projects advancing towards development decisions, the future of Yukon's mining sector looks promising. Currently there are six projects that have gone through permitting or in the process of obtaining the appropriate permits. There are also 10 projects that are doing advanced exploration or are completing feasibility-related work. A number of the project proponents have noted development timelines that could see development and production within five years.

While it is certainly the case that mining activities in Yukon are impacted by what is happening in the global economy and in the global mining sector, Yukon seems to be well-positioned to capitalize on the strong interest in its mineral resources. The expectation going forward is that development of Yukon's mineral sector will continue, with mining-related activity continuing to be an important contributor to Yukon's economy for the foreseeable future.

Outlook for Mining

- Mineral exploration spending in 2012 to fall in the $160-$200 million. This would be the second highest on record.
- With the vast majority of the development work associated with newly producing projects now complete, development costs in 2012 will likely decline to about half of the total seen in the last two years.
- The value of mineral production could total about $600 million in 2012, up from $402 million in 2011. Growth in 2012 is expected to stem primarily from a significant increase in production from the Wolverine mine which declared commercial production in March 2012.

Mining – February 2013 Update: While exploration spending in 2012 will fall below the estimated record of over $300 million for 2011, interest in exploration in Yukon remains strong. Current expectations have exploration expenditures in 2012 at about $150 million, the third highest level on record. In 2012, over 80 exploration projects were active in the territory, with over 30 of these spending at least $1 million.

Exploration for gold continues to account for the majority of recent exploration spending in Yukon. In 2012, exploration for gold accounted for 69 per cent of all exploration expenditures, well ahead of zinc-lead (11 per cent), silver (9 per cent), nickel-platinum (7 per cent) and copper (4 per cent). The price of gold, unlike those of the other commodities noted, recorded gains in 2012 with the price up 6.1 per cent, to almost US$1,670 per ounce.

In terms of staking activity, 2012 was more in line with staking activity seen prior to 2010. Claims staked in 2012 totaled fewer than 12,000, well below the over 114,000 claims staked in 2011.

Current estimates have development expenditures for 2012 near $100 million, down from an estimated $150 million in 2011, but above the May forecast for 2012 of $70 million.

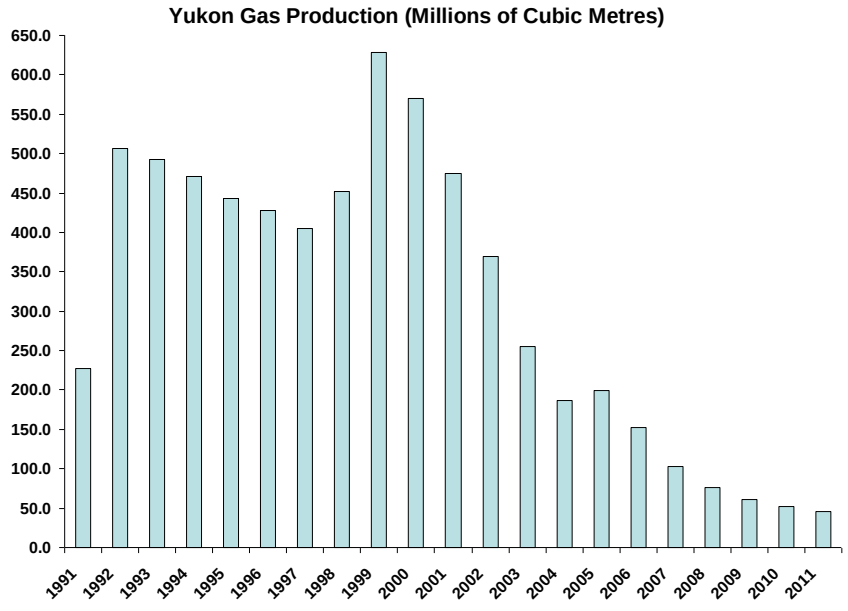
With the announcement of commercial production from the Wolverine mine in March 2012, Yukon now has three commercially producing mines. Benefitting primarily from higher production from the Wolverine mine, the value of Yukon's mineral production is expected to have grown for the seventh consecutive year in 2012, and total about $450 million, up from an estimated $402 million in 2011. While higher than 2011, the 2012 value of mineral production estimate is below the May 2012 forecast of $600 million. The downward revision is due to lower than expected production, as well as lower year-over-year prices for some minerals.

While, Yukon's mining sector has performed relatively well in 2012, the sector is not immune to global economic forces. Concerns of slowing growth in China, a sluggish U.S. recovery and ongoing economic turmoil in Europe has contributed to a volatile stock market and has seen many investors postpone their investment decisions, or decline to invest altogether. This weakened investment climate has contributed to lower exploration expenditures in 2012, as many junior mining companies found it difficult to raise funds to support exploration activities. With junior mining companies estimated to account for over 70 per cent of mining related spending in Yukon in every year for the period 2007 to 2012, current financing issues for junior mining companies is a concern for the local mining sector.

Even with the current global economic uncertainty, growth prospects for Yukon's mining sector are promising with six projects in permitting and a number at an advanced exploration or feasibility stage. For 2013, Alexco Resources has indicated that they are anticipating production from the Onek and Lucky Queen properties in 2013. Production from the Wolverine mine is also expected to increase in 2013 as the project achieves peak production. In terms of development, both Victoria Gold Corp. (Eagle Gold project) and Copper North Mining Corp. (Carmacks Copper project) have publically indicated a desire to begin development activities before the end of 2013.

Oil and Gas

Production at Kotaneelee, Yukon's only producing natural gas field, continued to decline in 2011 with production of 45.1 million cubic metres, down almost 13% from 51.6 million cubic metres in 2010. Kotaneelee has generally been on the decline since 1999, a normal trend for a field that is nearing the end of its productive life.



Source: Yukon Department of Energy, Mines & Resources

The Government of Yukon undertakes a disposition of oil and gas rights twice annually. The Spring 2012 Request for Postings (RFP) closed on January 18, 2012, and saw the Government of Yukon receive 12 RFPs for areas in southern Yukon in the Whitehorse Trough oil and gas basin. It was announced on April 12, 2012 that oil and gas exploration rights would not be issued in any of the 12 areas. This decision was made following the conclusion of a 60-day public review period and a technical review by the Government of Yukon.

For a number of years there has been discussion of the development of two proposed northern natural gas pipeline projects that if developed would have impacts on Yukon. Recent events seem to indicate that the development of either of these projects in the short-term is unlikely.

The Alaska Highway Pipeline Project would offer a source of natural gas to the United States' lower 48 states, with gas to be shipped via a 2,700-kilometre pipeline from Alaska, through Yukon and into Alberta. Recent development of shale gas resources in the United States has lessened the need for Alaskan natural gas and lowered the price of natural gas, and as such, alternative destinations for Alaskan gas are being considered. The project proponent, TransCanada PipeLines Limited, along with ExxonMobil, BP PLC, and ConocoPhillips, have committed to study the possibility of developing an alternative instate pipeline and liquefied natural gas (LNG) export plant. This project would be focused on production of LNG that would be targeted for Asian markets that have a growing demand

for natural gas products. Results of the evaluation of the LNG option for Alaskan gas will be important in determining if the Alaska Highway Pipeline Project will remain an option for development.

Development of the Mackenzie Gas Project in the near-term is uncertain. Abundant U.S. shale gas resources, natural gas prices at 10-year lows and cost escalations in the project itself were all noted as rationale for the recent announcement by the project lead, Imperial Oil, that the project had been put on hold and that budgets and staffing related to the project were being reduced. Beyond Imperial Oil, the partnership group that had been looking to develop the project includes Exxon Mobil Corp., ConnocoPhillips, Royal Dutch Shell PLC and the Aboriginal Pipeline Group. On April 2, 2012 the partnership issued a news release indicating that while the project was currently on hold, the project could be restarted if natural gas prices were to rebound sufficiently so as to improve the viability of the project.

There is optimism being generated about possible oil and natural gas development in Yukon coming out of the efforts of Northern Cross (Yukon) Limited to develop resources in the Eagle Plain area in northern Yukon. Development of natural gas resources would offer an opportunity for Yukon to reduce its dependency on the importation of petroleum products and provide a more cost-effective option to these petroleum products. With a substantial investment from CNOOC (China National Offshore Oil Corporation) International Inc., an affiliate of CNOOC Limited, one of China's largest independent oil and gas companies, Northern Cross has the capital to move forward with exploration work on its Yukon properties. Northern Cross has made a commitment of over $20 million for work on 15 exploration permits in the Eagle Plain area. Northern Cross is preparing a major exploration drilling program that is expected to begin in the summer of 2012, include the drilling of at least five wells and will likely last until the spring of 2013.

Economic growth in Yukon is increasing the demands for energy. Continued development of Yukon's mining sector in particular is placing additional pressure to identify adequate and cost-effective local sources of energy production. In response to these pressures the Department of Energy, Mines & Resources is examining the feasibility of developing Yukon's natural gas resources to meet Yukon's current and future energy demands.

Outlook for Oil and Gas

- Continue to evaluate the possibility of utilizing local gas resources to meet Yukon's current and future energy demands.

Oil & Gas - February 2013 Update: The Government of Yukon received two submissions to its most recent Oil and Gas Disposition Request for Postings which closed on January 16, 2013. Both request for oil and gas rights are for areas in the Eagle Plain basin. These requests are now subject to a 60 day public review period which is scheduled to close on March 28, 2013.

Production from the Kotaneelee gas field totaled 30.1 million cubic metres in 2012, down 33 per cent from 45.1 million cubic metres produced in 2011. In October 2012, EFL Overseas Inc. completed an acquisition of additional rights and interests in the Liard basin gas field and facilities in the Kotaneelee area from Nahanni Energy Inc. With the previous acquisition from Devon Canada EFL Overseas Inc. became the largest interest holder in the Kotaneelee with a general interest of 53.67 per cent and a working interest of 100 per cent in one gas well. EFL Overseas Inc. has indicated plans to pursue the acquisition of additional working interests in the Assets.

Northern Cross (Yukon) Limited continues to explore the development of resources in the Eagle Plain area in northern Yukon. Investment from CNOOC (China National Offshore Oil Corporation) International Inc., an affiliate of CNOOC Limited, one of China's largest independent oil and gas companies, has provided Northern Cross the capital to move forward with exploration work on its Eagle Plain properties. Northern Cross has made a commitment of over $20 million for work on 15 exploration permits and at the time of publication, two drill rigs were operational, with the expectation of 5-7 wells drilled by August 2013.

The Vuntut Gwitchin Development Corporation, on behalf of four northern First Nations, and with assistance from the Canadian Northern Economic Development Agency (CanNor), is also pursuing options to commercialize Eagle Plain gas. The feasibility study portion of the work has been completed and the four First Nations are now moving into the business planning portion of the project.

Yukon Energy Corporation is also assessing the use of natural gas to meet its short term (five year) generation requirements and as a transition fuel as it develops longer term renewable energy projects.

Tourism

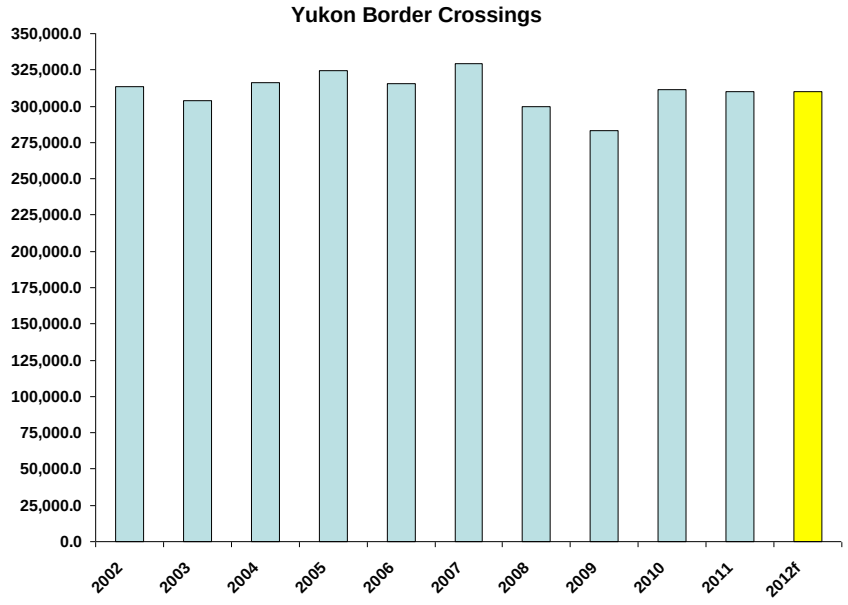
Recent tourism activity in Yukon has been steady, with annual international border crossings totaling about 310,000 in the past two years. Annual international border crossings of 309,863 were recorded in 2011, down slightly from 311,542 in 2010, but still above the almost 283,000 recorded for 2009.

Visitation via motorcoach totaled 122,205 in 2011, up 5.7% from 2010. Countering some of the gains in motorcoach visitation was a decline in visitation via private vehicle, which decreased 4.2% to 187,658. Higher year-over-year prices for fuel likely account for some of the decline in private vehicle traffic in 2011.

Recent shifts in visitation origin are consistent with what is being seen nationally, and is reflective of the current economic reality which is seeing advanced economies post weaker growth rates than those of emerging economies such as China or India.

Data for visitation by place of origin indicates that visitation from the U.S., Yukon's largest tourism market, was down 3.5% compared to the previous year, totaling 206,271 in 2011. While 2011 saw over 7,500 fewer visits from the U.S., visitation from the U.S. still accounted for two-thirds of all border crossings in 2011.

Non-U.S. visitation in 2011 increased to 103,592, up 6.0% from 2010. Increases in non-U.S. visitation were seen in all areas with visitation from other parts of Canada increasing 7.5% to 26,812 and foreign visitation increasing 5.1% to 33,329. Driving the foreign visitation was a strong increase in Asia/Pacific tourists, up 14.5% to 11,892.



Source: Yukon Department of Tourism & Culture; Yukon Department of Economic Development

At the Erik Nielsen Whitehorse International Airport, the total number of passengers arriving and departing increased by 7.7%, or 19,140 for a total of 267,442. The total for 2011 exceeded the previous high recorded in 2010, and it is the third consecutive year of increasing passenger volumes at the airport, potentially indicating a shift in how visitors will travel to the territory in the future.[3]

Given Yukon's well-established and unique tourism product, the outlook for visitation to Yukon remains generally positive. With that said, there are factors that have the potential to negatively impact visitation in the near-term.

The Canadian dollar has experienced a prolonged period of strength which is continuing into 2012. The Canadian dollar has been especially strong against the U.S. dollar, with the Canadian dollar averaging US$0.9997 year-to-date (to May 25, 2012). A strong Canadian

[3] Department of Tourism, Yukon Visitor Statistics, Year-End Report 2011

dollar increases the relative cost of travel to Canadian destinations, which could act as a deterrent to individuals who might travel to Yukon. A strong Canadian dollar could also impact visitation from other parts of Canada, as Canadians look to take advantage of a strong currency and travel to U.S. destinations or other regions where the Canadian dollar has appreciated against the local currency.

Economic and political uncertainty in the U.S. and abroad could also have some negative ramifications for travel to Yukon going forward. It has been a turbulent time for a number of countries with many countries' economies struggling in light of ongoing global economic concerns. Weakness in the economic recoveries of some countries, especially the U.S., could influence the global recovery and could negatively impact tourism. Continued economic and political uncertainty will likely cast a shadow on travel prospects going forward, which could have impacts on visitation to Yukon in the near-term.

Travel in 2012 could also be negatively impacted by high and increasing oil prices. Oil prices to May 25, 2012 averaged US$101.83 per barrel, 2.8% higher than in the same period of 2011. High oil prices are being reflected in higher gasoline prices as well with average year-to-date (to May 22, 2012) gasoline prices in Whitehorse are up 3.1% from the same period in 2011 to almost $1.31 per litre. Higher fuel prices increase the costs of operating a motor vehicle and also the operational costs for airlines. Given that the primary modes of transportation into Yukon are motor vehicles and aircraft, it is possible higher fuel prices and the subsequent higher costs of travel, could impact visitation to Yukon.

While risk factors exist, current expectations have visitation in 2012 being up slightly, with a forecast of 313,000 border crossings in 2012.

Outlook for Tourism

- Border crossings are expected to total about 313,000 in 2012, up slightly from approximately 310,000 in 2011.

Tourism – February 2013 Update: Data provided by the Department of Tourism & Culture has border crossings in the first ten months of 2012 at 315,440, up 3.8 per cent (11,517 visitors), versus the same period in 2011.

By mode of transportation increases in the January to October period were recorded in motorcoach visitation, up 9.9 per cent (12,067 visitors). Visitation via personal vehicle was down 550, representing a slight decline versus the first ten months of 2011.

By country of origin, the largest percentage increase in visitation was recorded from the United States which grew 4.9 per cent (9,881 visitors). Growth was also recorded in visitation from other parts of Canada, up 3.8 per cent (1,018 visitors) and foreign visitation, up 1.8 per cent (601 visitors). Visitation attributed to Yukon residents was on par with the same period of 2011 (up by 17 visitors).

U.S. visitation remains the largest contributor to Yukon visitation, accounting for over 67 per cent of all border crossings in the first ten months of 2012. After a decline of 3.5 per cent in 2011, U.S. visitation has rebounded well so far in 2012. Gains in 2012 may be a reflection of an improved economic situation for many U.S. residents, as the U.S. economy continues to recover from the recent global economic downturn.

The Department of Tourism & Culture has indicated that border crossings are expected to have grown to about 321,000 in 2012, 3.6 per cent higher than the 309,863 recorded in 2011 and well above the May 2012 forecast of 313,000.

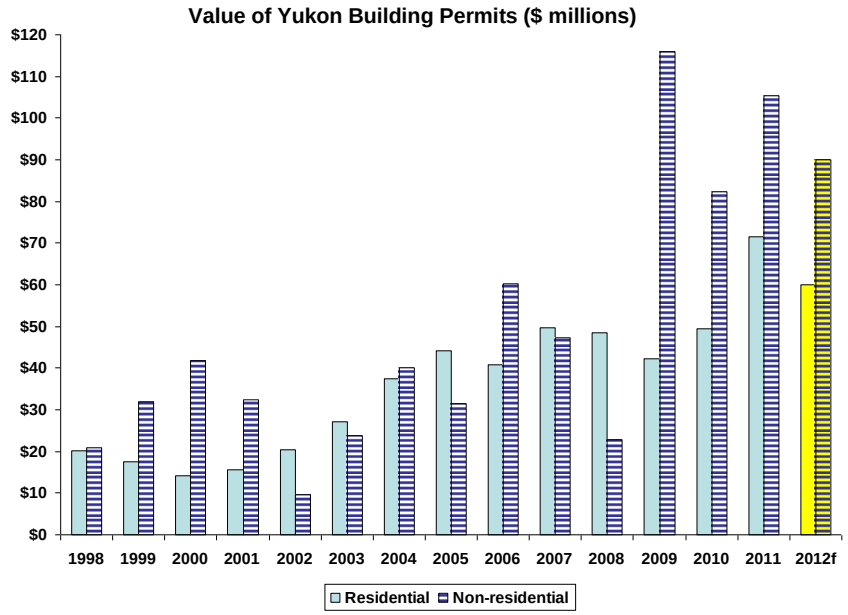
Beyond 2012, current expectations are for Yukon's tourism sector to continue to perform well. Assuming that the U.S. economy continues to recover and that the global economy does not fall into recession, visitation in 2013 is expected to total about 328,000 (Department of Tourism and Culture).

Construction

Reflecting the strong performance of Yukon's economy, a record value of building permits of $176.8 million were recorded in 2011. The 2011 value was over 34% higher than the $131.8 million reported for 2010. Gains in building permit value in 2011 stemmed primarily from growth in the value of residential building permits and institutional building permits.

Residential permit value reached $71.5 million in 2011, up almost 45% from the $49.4 million recorded in 2010. Strong residential construction in Whitehorse was the primary driver of residential permit value in 2011, with Whitehorse accounting for over $52 million in residential building permits.

The value of institutional permits totaled $70.8 million in 2011, up almost 50% from the $47.3 million posted in 2010. Major institutional projects such as the Watson Lake and Dawson City hospitals, development of a new wastewater treatment facility and district heating system in Dawson City, and water treatment facilities in Carcross and Ross River all contributed to strong growth in institutional permit value in 2011.



Source: Yukon Bureau of Statistics; Yukon Department of Economic Development

The expectation for 2012 is for construction activity to remain strong, with residential and institutional construction expected to once again be the primary drivers of permit value.

The most recent Government of Yukon budget included a significant commitment of funding in 2012-2013 to address land availability and housing needs. Of the almost $35 million noted to be directed towards these efforts, about half will be related to development of the Whistle Bend sub-division. Lots from phase one of the six phase project are scheduled to be ready for purchase by the fall of 2012 and will provide 93 single family, eight duplex and nine multi-family lots, along with one commercial and one school site. Upon completion, the Whistle Bend sub-division is expected to include 3,900 housing units and accommodate close to 8,000 people.

Beyond Whistle Bend, residential spending in 2012 will include the development of more Government of Yukon land in the downtown Whitehorse area, work related to the Grizzly Valley sub-division near Whitehorse and development of residential lots in Mayo and Watson Lake.

The Government of Yukon's 2012-2013 budget also included over $51 million in various transportation infrastructure projects. Included among these projects are:

- $15 million under the Shakwak project for the Haines Road and North Alaska Highway and a further $1 million from the Government of Yukon for the North Alaska Highway;
- Over $7 million for reconstruction of the Campbell Highway from km 10 to 190 and a further $1.5 million for surfacing;
- Over $7 million over the next two years to extend water and sewer services to the south commercial area at the Erik Nielson Whitehorse International Airport;

- $6 million for work related to rehabilitation and improvement of the Upper Liard Bridge;
- $2.6 million for reconstruction, Bituminous Surface Treatments and re-vegetation work on the Atlin Road;
- $2 million for reconstruction of the Takhini Hotsprings road;
- Over $1.8 million for improvement projects for the Erik Nielson Whitehorse International Airport including taxiway improvements, rehabilitation and the installation of a second bridge or jet way; and
- Over $1.8 million to address airside deficiencies at Yukon aerodromes outside Whitehorse.

In addition to transportation infrastructure and residential development the 2012-2013 Government of Yukon budget included funding commitments in a variety of other areas:

- $15 million under the Building Canada Plan for the construction of new wells, pump houses and treatment plants to improve the quality of drinking water in Burwash Landing, Carcross, Deep Creek, Dawson City, Haines Junction, Mendenhall, Old Crow, Ross River, Tagish and Teslin;
- Over $12 million under the Building Canada Plan as part of a multi-year program to improve water and wastewater systems in Faro, Haines Junction, Mayo and Watson Lake;
- Over $7 million for a new Emergency Response Centre in Whitehorse that will serve as the city's primary ambulance station;
- $7 million to construct a new recreation centre in Ross River;
- Over $4 million to develop a second-stage housing facility in Whitehorse;
- $3 million under the Canada Strategic Infrastructure Fund to complete the last phase of the Whitehorse Waterfront Development project;
- Over $2.3 million to build the Arrest Processing Unit, which will serve as a replacement for the RCMP detachment cells and offer prisoners access to 24-hour nursing and specially trained correctional staff; and
- Almost $1.3 million for replacement of the F.H. Collins Secondary School in Whitehorse.

The City of Whitehorse's most recent capital budget, released in December 2011, also notes several capital projects which will see notable spending in 2012. Most prominent among the spending included in the capital budget is $6.5 million in 2012 that is allocated for the extension of water and sewer services and associated road work in the Marwell area. New fire hydrants will also be added in some parts of Marwell to enhance fire protection. The city's most recent capital budget also includes 2012 expenditures of $4 million for expansion of the Porter Creek Reservoir and $3.8 million for reconstruction of Black Street, including work on roads, sidewalks and water and sewer lines. The budget also includes a total of $4.1 million to be directed towards the replacement of the Selkirk Pumphouse, a facility that currently handles Whitehorse's entire water supply. Of the $4.1 million, $2 million is planned to be spent in 2012 with the remaining $2.1 million to be spent in 2013.

Activity related to the mining sector should also continue to contribute to construction activity in Yukon. Even with the vast majority of the development work associated with Yukon's three commercially producing mining projects complete, these projects will continue to have expenditures associated with ongoing mine development. Capstone Mining Corp. has budgeted over $32 million for capital expenditures on work related to the Minto mine. Yukon Zinc Corp has also budgeted $10-$15 million for continued work on the Wolverine project. Further expenditures could be seen on the Bellekeno project as well as on the Victoria Gold project if development were to commence in the fourth quarter of 2012.

The current forecast for the value of building permits issued for 2012 is $150 million, which would be down from the record $177 million recorded in 2011, but above the long-term average.

Outlook for Construction

- The value of building permits in 2012 is expected to be $150 million, down from the record $177 million in 2011 but above the long-term average.

Construction - February 2013 Update: The forecast completed in May 2012 was for building permits in 2012 to total $150 million, down 15.2 per cent from the $176.8 million recorded in 2011. The expectation was for residential and institutional construction to be the primary contributors to total permit value in 2012

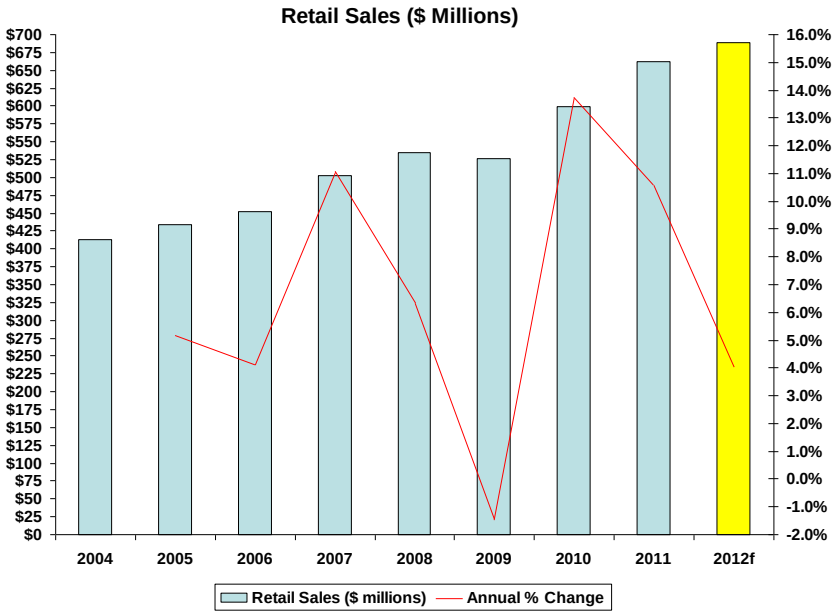
Data for 2012 indicate that building permit value fell well short of the May forecast. Total building permit value totaled $100.4 million in 2012, down 43.2 per cent from the $176.7 million recorded in 2011. While total building permit value was down, residential permit value was strong, totaling $65.7 million in 2012, accounting for over 65 per cent of total building permit value.

Declines in 2012 were noted in all areas of building permits, with lower value of government and institutional building permits accounting for the majority of the difference in total building permit value. After averaging almost $68 million in the three years prior to 2012, government and institutional permits totaled under $21 million in 2012, down 71.5 per cent from the $70.7 million recorded in 2012. Lower government and institutional permits account for 66 per cent of the total decline in total building permits of $76.3 million.

Going forward expenditures related to the reclamation of the Faro mine, further development of existing mines and spending related to new mining startups are expected to contribute to construction activity. Further expenditures related to residential construction, in particular related to the Whistle Bend subdivision in Whitehorse, as well as construction of the F.H. Collins School, is also expected to contribute to construction activity in the near-term.

Trade

The value of retail sales in Yukon totaled a record $662 million in 2011, up 10.6% from $599 million in 2010. Strong economic activity related to mining development, increased employment, higher population and higher year-over-year fuel prices are all considered contributing factors to retail sales growth in 2011.



Source: Yukon Bureau of Statistics; Statistics Canada; Yukon Department of Economic Development

The value of retail sales for 'other retail stores' exceeded $400 million in 2011, up from $378.7 million in 2010. Contributing to the higher value of sales were higher year-over-year fuel prices, which positively impacted the value of sales from gasoline stations.

Increases in sales were also recorded in other retail sale categories in 2011. Sales from 'food and beverage stores' increased 4.4% to $195.7 million in 2011, up from $187.5 million in 2010. Sales from 'clothing and clothing accessories stores' also increased 5.9% to $18.4 million in 2011, up from $17.4 million in 2010.

Strong oil prices are expected to continue to impact fuel prices in 2012 and will likely continue to impact the value of retail sales. Year-to-date (to May 25, 2012) oil prices have averaged almost US$102 per barrel, 2.8% higher than in the same period in 2011. Higher oil prices are contributing to higher fuel prices with year-to-date (to May 22, 2012) gasoline prices in Whitehorse 3.1% higher than the same time in 2010. Fuel prices are expected to post a year-over-year increase in 2012, which could see costs of shipping goods to Whitehorse increase as a result of the higher fuel costs. If passed onto consumers, higher fuel costs could also positively impact retail sales.

Rising fuel prices are not expected to be the only driver of retail sales in 2012. Continued economic growth, stemming primarily from activities related to the mining sector could also positively impact retail sales in 2012. A growing population, increases in the number of people employed and higher household incomes should all contribute to growth in retail sales in 2012.

Overall, it is expected that retail sales will grow to approximately $690 million in 2012.

Outlook for Retail Sales

- Retail sales are expected to continue to benefit from a strong local economy and total approximately $690 million in 2012, representing a 4% increase from 2011.

Trade – February 2013 Update: Retail sales in the first eleven months of 2012 totaled almost $617 million, up 2.5 per cent from $602 million recorded in the same period in 2011.

Food and Beverage Stores, the largest segment of retail sales in Yukon at about 30 per cent of total sales, is reported to have increased by 2.5 per cent in the first eleven months of 2012 when compared to the same period in 2011. Strong growth in sales was recorded by Gasoline Stations; which recorded gains of 10.7 per cent. Sales from Gasoline Stations accounted for over 16 per cent of all sales in the first eleven months of 2012. Growth was also recorded in Food and Beverage Stores (2.5 per cent) and Health and Personal Care Stores (3.0 per cent).

Declines in 2012 were noted in Clothing and Clothing Accessories Stores and Building Material and Garden Equipment and Supplies Dealers which fell 7.0 per cent and 0.9 per cent respectively. Sales from these two categories together accounted for over 10 per cent of total sales in the first eleven months of 2012.

Given year-to-date growth in retail sales, the 2012 total will fall below the May forecast, but total over $675 million, up by over 2 per cent from $662.2 million in 2011.

Looking forward to 2013, expectations for continued economic growth are expected to contribute to further gains in retail activity with sales anticipated to approach $700 million.

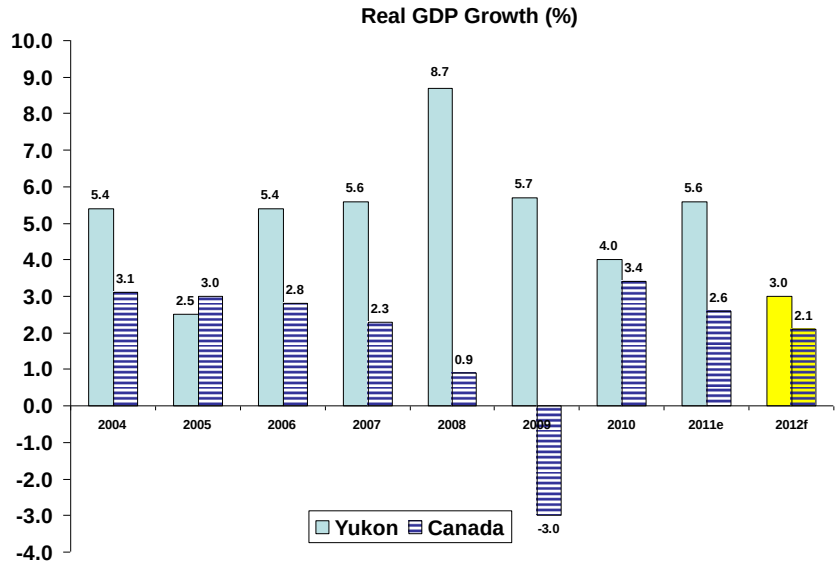
Yukon Outlook – Economic Indicators

Economic Growth (Gross Domestic Product)

On April 27, 2012, Statistics Canada released preliminary 2011 real GDP data by industry for provinces and territories. It is estimated that Yukon's real GDP in 2011 totaled $1.776 billion, up 5.6% from $1.681 billion in 2010. Yukon's estimated growth for 2011 was more than double the national growth rate of 2.6% and ranked second among all Canadian jurisdictions, behind only Nunavut at an estimated growth rate of 7.7%. With estimated growth of 5.2%, Alberta posted the strongest growth among all the provinces.

Statistics Canada attributed Yukon's 2011 real GDP growth primarily to activities related to Yukon's growing mining sector. It was noted that gains in output of support activities to mining and oil and gas extraction, record levels of mineral exploration and higher mineral production due to the opening of the Bellekeno mine were all contributing factors to real GDP growth in 2011. Statistics Canada also highlighted a 21% growth in construction output, a 6.6% growth in retail trade and a 4.7% growth in the finance, insurance and real estate sector as contributing to overall growth in Yukon's 2011 real GDP.

With growth in 2011, Yukon has posted eight consecutive years of real GDP growth, with Yukon's growth rate exceeded the national average in seven of the eight years.



Source: Yukon Bureau of Statistics; Statistics Canada; International Monetary Fund; Yukon Department of Economic Development

The development of Yukon's mining sector has been the primary driver of real GDP growth in recent years, with Yukon's economy benefitting from expenditures related to mineral exploration and development and the addition of mineral production from new mining projects. Significant construction activity in Yukon has also contributed to economic growth in recent years.

The expectation for 2012 is that Yukon will post gains in real GDP for the ninth consecutive year as mining and construction related activities continue to contribute to Yukon's economy. The current forecast for 2012 real GDP is for growth of upwards of 3%. The addition of commercial mineral production from the Wolverine mine, supported by continued construction activity and tourism-related activity, is expected to contribute to real GDP growth in 2012.

The Conference Board of Canada's latest economic forecast for the three Canadian territories was released in March 2012.[4] The current Yukon forecast is for 2.9% Real GDP growth for 2012. The Conference Board of Canada releases economic forecasts for the three territories twice annually and a revision to the March estimate is expected this summer.

Outlook for GDP

- Yukon's real GDP is expected to increase by upwards of 3% in 2012, with growth related primarily to increased mineral production.

[4] *Territorial Outlook, Winter 2012*, Conference Board of Canada, Centre for the North

Gross Domestic Product - February 2013 Update: Statistics Canada's revised estimates for real GDP for the provinces and territories, released on November 19, 2012, indicate that Yukon's real GDP grew 6.5 per cent in 2011 to $2.407 billion*. Yukon's growth estimate for 2011 was more than double the national growth rate of 2.6 per cent and the highest growth rate of any Canadian jurisdiction.

Statistics Canada noted a number of areas that helped contribute to the strong growth in 2011. A 22.0 per cent increase in Yukon exports, more than double the pace of growth in 2010, was a strong contributor to growth in 2011. Due to the strength of outlays on mineral exploration business investment in Yukon rose 6.5 per cent in 2011 which also contributed to real GDP gains. An increase of 4.5 per cent in Consumer spending was the strongest growth in the country, a reflection of higher household spending on services, in particular rents, air transportation and food and non-alcoholic beverage services.

The December 14, 2012 Statistics Canada real GDP by industry release also noted a gain of 6.5 per cent in Yukon's real GDP. Gains in Mining, Quarrying and Oil and Gas Extraction was the primary contributor to total real GDP growth in 2011, accounting for over 80 per cent of all estimated gains in 2011.

In May 2012 the Department of Economic Development forecasted growth upwards of 3 per cent in 2012. Current expectations are that real GDP growth in 2012 will likely be in the range of 2 to 3 per cent.

The Conference Board of Canada's Territorial Outlook Summer 2012 publication includes a forecast of 3.7 per cent for Yukon real GDP for 2011.

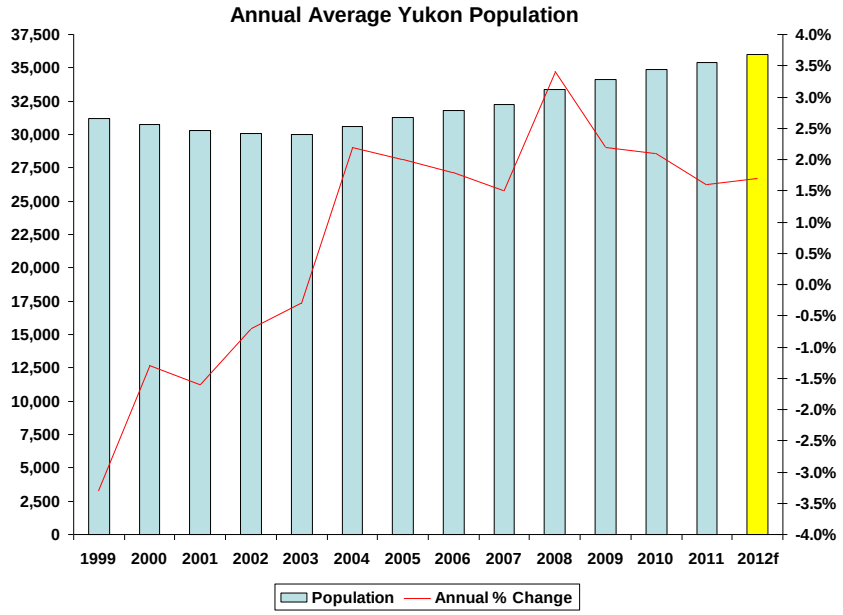
Early expectations for 2013 are for Yukon's real GDP to grow for a tenth consecutive year, but likely below levels recorded in recent years. Uncertainty related to the level of construction activity, mining project development, and exploration expenditures are tempering initial growth expectations for 2013.

*Periodically, the provincial and territorial economic accounts undergo historical revisions, which are much broader in scope than the regular annual revisions. These revisions are reserved for incorporating updated international national accounting standards, as well as conceptual, classification, presentational and major statistical changes. Statistics Canada's November 2012 release included revisions back to 2007, with further revisions back to 1981 to be released in 2013. Real dollar figures are now expressed in 2007 dollars, versus the previous 2002 dollars.

Population

Yukon's annual average population grew by 544 to 35,391 in 2011, representing a 1.6% increase over the previous year. This is the eighth straight year of population growth for Yukon and marks the highest annual average population since the beginning of the Yukon Census.[5]

[5] Accurate population estimates for the gold rush era are not available. However, the first census population estimate for Yukon was conducted in 1901 when the population was recorded at 27,219.



Source: Yukon Bureau of Statistics; Yukon Department of Health & Social Services; Yukon Department of Economic Development

Comparing December 2011 to December 2010, Yukon's population grew 1,133 to 35,800, an increase of 3.3%. Growth was concentrated in Whitehorse where the population increased by 886 (3.4%) to 27,190. The population of Whitehorse accounts for over 75% of Yukon's total population.

Over the same period, population growth was recorded in fourteen communities, with declines only in Watson Lake (-15) and Tagish (-1). The population of Burwash Landing was unchanged. Outside of Whitehorse the largest increases in population were recorded in Dawson City, Marsh Lake and Carmacks, which posted population gains of 78, 42 and 35, respectively.

Yukon's demographic situation is similar to the national story with both the populations of Yukon and Canada generally getting older. The population of mid-to-retirement aged Yukoners, aged 45-64, totaled 11,499 in December 2011, 1.7% higher than the December 2010 total. Accounting for over 32% of Yukon's total population in December 2011, the 45-64 segment of Yukon's population has exceeded 30% of the total population for seven consecutive years.

The number of post-retirement age residents (65 and older) has also been increasing in recent years. As of December 2011, 3,291 Yukon residents were 65 or older, accounting for over 9% of Yukon's total population. Only ten years ago, this segment of the population accounted for only about 6% of the population, with only 1,850 post-retirement age people living in Yukon.

While it is the case that Yukon has an aging population, the number of individuals 19 years of age or younger actually increased to 7,748 in December 2011, up from 7,604 in December

2010. This marked the first such increase since 2004. Optimism related to a strong local economy could account for the increase, as young people and young families may be looking to capitalize on employment and business opportunities in the territory.

Optimism related to a generally healthy economy could also explain the continued growth in Yukon's 'working age' population (15-64). This segment of the population totaled 26,887 in December 2011, up 2.8% from December 2010. More than half (13,261) of the 'working age' population falls within the ages of 20-44, with this segment of the population posting strong growth in the last two years, with annual increases of over 4.5% in both 2011 and 2010. Notable increases in 2011 were also recorded in the 25-29 range (7.6%) and the 30-34 range (6.8%).

On average, the population of Yukon is expected to total 36,000 in 2012, representing a 1.7% increase over 2011 and marking the ninth straight year of population increase.

Outlook for Population

- Yukon's average population is forecast to increase to 36,000 in 2012, marking the ninth straight year of population growth.

Population - February 2013 Update: Revised population estimates by the Yukon Bureau of Statistics show Yukon's average annual population in 2011was 35,246, an increase of 1.1 per cent over 34,847 in 2010. This was a downward revision from the 2011 annual average reported in the May Outlook of 35,391, and down from a preliminary annual average increase of 1.6 per cent.

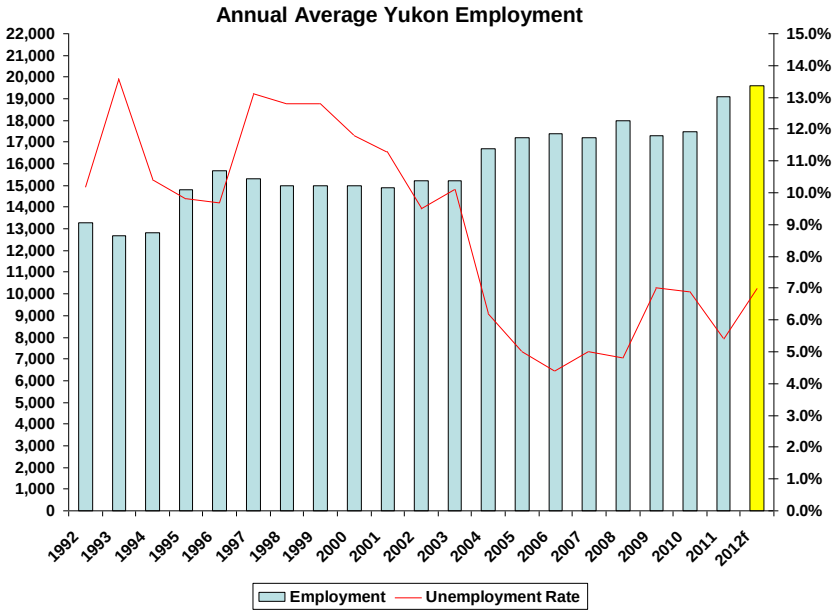
Yukon's average population to June 2012 is estimated at 35,723, an increase of 1.4 per cent over the revised 2011 average. Working age population data from the Yukon Labour Force Survey indicate continued population growth in the second half of the year.

The Yukon population in 2012 is now expected to average just short of the May forecast of 36,000. Early expectations for 2013 are for further gains, with the population expected to grow to an average of approximately 36,500.

Labour Force

The Yukon Labour Force Survey, as conducted by Statistics Canada, reported the average Yukon labour force at 20,200 in 2011, almost 7% higher than the figure reported for 2010. The average number of employed in Yukon was 19,100, up 9.1% from the 2010 average of 17,500. The survey also reported the average number of unemployed in 2011 at 1,100, down over 15% from 2010.

The average Yukon unemployment rate was reported as 5.4% for 2011, down from 6.9% in 2010. The 2011 unemployment rate for Yukon was amongst the lowest in the country and well below the national average of 7.5%.[6]



Source: Yukon Bureau of Statistics; Statistics Canada; Yukon Labour Force Survey

Yukon Labour Force Survey data for the first four months of 2012 notes across-the-board increases for key labour force statistics. From January to April, Yukon's labour force has averaged 20,600, 4.4% higher than in the same period of 2011. The average number of people employed in the first four months of 2012 was 19,150, up 375 from the same period of 2011. Gains have also been noted in the number of people unemployed and the unemployment rate in the first four months of 2012, with the average number of unemployed increasing by 525 to 1,450 and the unemployment rate increasing from an average of 4.7% in the first four months of 2011 to an average of 7% in the first four months of 2012.

The higher unemployment rate in early 2012 appears to be at odds with the recent performance of other key economic indicators, as Yukon continues to experience continued high levels of mining-related activity, retail trade and construction activity. Recent increases in the unemployment rate could be attributable to the relatively small sample size used for the Yukon Labour Force Survey, which can often be subject to volatility. Yukon's labour force has also seen significant recent growth, which is often the case for an economy that is performing well. Recent labour force growth outperforming recent employment gains has also contributed to an increase in the unemployment rate in recent months.

[6] Methodological differences exist between the Labour Force Survey used for the Territories and that of the Labour Force Survey utilized for the Provinces. Sample design, rotation pattern and reliability criteria are different in the three territories from those in the ten provinces.

Generally, Yukon's economic fundamentals appear to be strong and the expectation is that continued economic growth driven by continued high levels of construction and resource sector activity should contribute to lower unemployment rates in the coming months. The forecast for 2012 has Yukon's average labour force increasing from 20,200 to 21,000, an increase of 4%. Yukon employment is also anticipated to post growth in 2012, with the current forecast for an increase of just over 2.5% to 19,600. The number of unemployed is expected to increase to 1,400 in 2012, up from 1,100 in 2011. With labour force growth expected to outpace growth in employment, the average unemployment rate for 2012 is expected to increase to 6.5%-7.0%.

Outlook for Labour Force

- Yukon's labour force is expected to continue to post gains in 2012, with the labour force expected to grow to a record 21,000. The number of people employed is also expected to increase to a record 19,600.
- With labour force growth expected to outpace employment growth in 2012, the unemployment rate is expected to increase to 6.5%-7.0%.
- Opportunities associated with resource development activities and high levels of construction activity will continue to support employment gains in 2012.

Labour Force - February 2013 Update: Following a record average of 19,100 employed in 2011, Yukon's average employment in 2012 fell to 18,900. While down from 2011, Yukon employment in 2012 recorded the second highest level in history. Yukon's labour force averaged a new record in 2012, growing to 20,400, up from the previous record of 20,200 in 2011.

With a growing labour force and a slight decline in average employment, 2012 saw Yukon's unemployment rate increase to an average of 6.9 per cent, up from 5.4 per cent in 2011.

Further economic growth is expected to support gains in both employment and the labour force in 2013. Current expectations have employment growing to 19,100 and the labour force growing to 20,600.

Consumer Prices

The Whitehorse Consumer Price Index (CPI)[7] for 2011 increased by 3.0%, higher than the 0.8% increase recorded in 2010. The 3.0% annual increase in the Whitehorse CPI is the second highest increase since 1992, and followed two years of very low inflation in 2009 and 2010. Looking at national performance, Canada's CPI increased by a similar 2.9% in 2011.

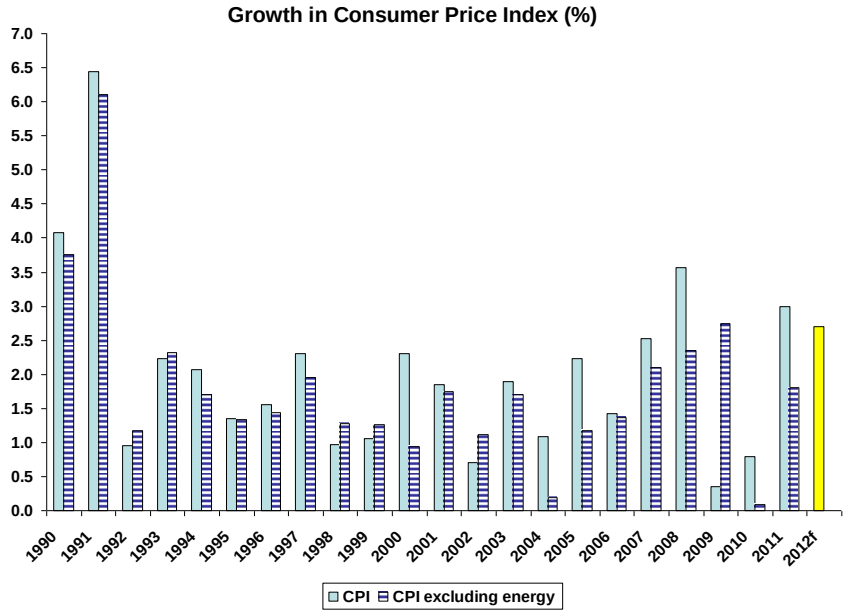
Contributing to Whitehorse's CPI growth in 2011 was the persistence of strong prices for crude oil, which contributed to higher fuel prices at the consumer level. Comparing 2011 to 2010, the price of Home Heating Fuel Oils and other oils is reported to have increased by 21% and the price of Gasoline over the same period is reported to have increased by 15%.

[7] Consumer Price Index data is only available in Yukon for Whitehorse.

The Energy component of Whitehorse CPI increased by over 13% in 2011, partly a reflection of higher crude oil prices.

Looking at the various components of CPI for Whitehorse, only Clothing and Footwear (down 0.9%) did not post an increase in 2011. On a percentage basis, the largest increases were seen in Gasoline (14.7%), Transportation (5.0%) and Shelter (4.4%). All these components were impacted by higher oil and fuel prices, contributing to much of the increases noted for these components in 2011.

Other components of CPI that saw increases in 2011 included Food (2.6%), Alcoholic Beverages & Tobacco Products(2.3%), Household Operations, Furnishings & Equipment (0.9%), Health & Personal Care (0.6%) and Recreation, Education & Reading (0.1%).



Source: Yukon Bureau of Statistics; Statistics Canada; Yukon Department of Economic Development

Expectations for 2012 are that prices will continue to be impacted by high and increasing fuel prices. Year-to-date (to May 25, 2012) oil prices have averaged almost $102 per barrel, almost 3% higher than the $99 per barrel averaged in the same period of 2011. Many forecasters are expecting oil prices to remain high throughout 2012, with BMO Capital Markets Economics forecasting oil to average $100 per barrel and TD Economics calling for oil to average just over $100 per barrel.

The impacts of higher year-over-year prices for fuel have been reflected in Whitehorse's average CPI in the first four months of 2012, which has increased 2.7% versus the same period in 2011. The Gasoline component of Whitehorse's CPI was up 4.7% in the first four months of 2012, while the overall Energy component increased by 5.5%.

The current forecast from the Department of Economic Development is for Whitehorse CPI to increase 2.5% in 2012. This forecast represents the expectation that oil prices will likely continue to be strong throughout 2012, contributing to year-over-year growth in fuel costs. Higher fuel prices could lead to price increases in other areas as increased fuel prices trickle through the economy and increase costs.

Outlook for the Consumer Price Index

- Inflation in Whitehorse in 2012 is expected to average 2.5%, slightly lower than the 3.0% recorded in 2011.

Consumer Prices - February 2013 Update: Consumer inflation averaged 2.3 per cent in Whitehorse in 2012, slightly below the May 2012 forecast of 2.5 per cent and below the 3.0 per cent average observed for all of 2011.

Energy continues to be a key driver of inflation in Whitehorse, with the 2012 average up 3.9 per cent over the 2011 average. Fuel oil has been reported as increasing by 4.5 per cent in this period and electricity has increased by 4.1 per cent.

In addition, the gasoline component of the Consumer Price index is reported to have increased by 3.6 per cent over 2011 figures. Gains in 2012 have also been reported in Shelter and Food which have increased 3.4 per cent and 2.6 per cent respectively.

Looking forward to 2013, national forecasts are predicting a slowing of inflation over the year with a slowing housing market but increases in food prices. It expected that inflation should average 2.0 per cent overall in Whitehorse in 2013, slightly higher than the national average.

YUB-YECL-58

Reference: Line Losses, YECL Application, Section 3, pages 3-2 and 3-3

The energy component of the purchase power cost is determined by applying Yukon Energy's wholesale rate to the total forecast energy (kWh) purchases. Total forecast purchases are determined by 1 applying a forecast line loss percentage to Yukon Electrical's sales load forecast that was discussed in Section 2. Overall, line losses are determined by using a five-year historical average of 6.2%. This is consistent with the approach approved in Board Order 2009-2.

Request:

Please indicate where the Board, in Board Order 2009-2, approved YECL's five-year historical average approach. Provide a specific reference(s).

Response:

Yukon Electrical stated on page 3-2, Lines 18-21 in its 2008-2009 General Rate Application:

> **Forecast Process**
>
> The energy component of the purchase power cost is determined by applying Yukon Energy's wholesale rate to the total forecast energy (KWh) purchases. Total forecast purchases are determined by applying an estimated line loss percentage to Yukon Electrical's sales load forecast that is discussed in Section 2. Overall line losses are determined based on using a five year historical average of 6.2%.

This process was not challenged in IRs or specifically mentioned in the Board Decision 2009-02 Appendix 1 – Reasons for Decision. However, it forms part of the Revenue Requirement ultimately approved in Board Order 2009-02.

YUB-YECL-59

Reference: Capital Additions, YECL Application, Section 9, page 9-4, Schedule 9.1

A listing of the capital expenditures for 2008-2015 is provided in the following pages. For significant projects greater than $100,000, a description of the project is included. Business cases for all major capital projects ($500,000 or greater) are being filed with this Application as directed in Board Order 2009-2.

With respect to capital expenditure totals, YECL has forecast a total of $63.5 million to be spent over the 2013-2015 test period.

Request:

Considering that the $63.5-million forecast expenditures related to capital is almost double the amount of capital expenditures for any prior three-year period and considering the relatively short construction season, please provide a prioritized list of expenditures that make up the $63.5-million test period total shown in Schedule 9.1.

Response:

Yukon Electrical has prioritized all projects in the test years; please refer to YUB-YECL-59 Attachment 1. Priority 'A' projects include projects that reduce or eliminate hazards, forced projects, planned life extensions, new extensions and system performance projects designed to correct unacceptable conditions or imminent hazards. These are projects that Yukon Electrical believes must be completed in order to safely and reliably deliver electricity to customers. Priority 'B' projects include projects that also fit in to those categories, but are less critical, as well as projects that increase operating efficiency and reduce adverse affects on the system. All projects Yukon Electrical has identified are required and necessary for various reasons.

Yukon Electrical is fully cognizant of the short construction season and various other constraints in completing projects throughout its service areas. Yukon Electrical is confident in its capital forecast and its ability to complete the projects as planned for the test years.

Yukon Electrical Capital Projects 2013-2015 By Priority

Priority	Project Name	2013	2014	2015	Total

YUB-YECL-60

Reference: Generation plant replacement, YECL Application

Request:

Please provide a comparative listing of all YECL generator sets on a per plant basis. The listing should include peak plant loading and by unit, the total engine hours and the total annual hourly usage for the period from 2008 to 2012, as well as the total forecast hours for each year of the forecast period.

Response:

Please refer to YUB-YECL-60 Attachment 1 for a listing of all Yukon Electrical generator sets.

Peak plant loading for the period 2008-2012 was:

	Peak Load (kW)				
Location	**2008**	**2009**	**2010**	**2011**	**2012**

* During the interrogatory response process, it has come to Yukon Electrical's attention that it mistakenly identified the replacement of Beaver Creek #1 and Destruction Bay #2 as years 2015 and 2014, respectively. The correct years should have been 2014 and 2015. As the forecast costs for the two replacements are each$ 600,000, there is no impact to Yukon Electrical's overall capital forecast for 2014 or 2015.

YUB-YECL-61

Reference: 2008-2015 capital expenditures, YECL Application

A listing of the capital expenditures for 2008-2015 is provided in the following pages. For significant projects greater than $100,000, a description of the project is included. Business cases for all major capital projects ($500,000 or greater) are being filed with this Application as directed in Board Order 2009-2.

Request:

For each of the capital expenditures for 2008-2015 provided on pages 9-5 to 9-67, please provide a continuity table. Please retain the following headings: Generation Plants, Distribution New Extensions (gross and net of customer contributions), Distribution Improvements, Street and Sentinel lighting, Transformers & Regulators, Meters, General Property & Equipment, CIS Billing System Conversion. Moreover, please ensure that projects that are ongoing from year to year, such as replacement of transportation equipment, replacement of meters and new installations, new underground line extensions, and pole replacement are aligned as one project over the years.

Response:

Please refer to YUB-YECL-61 Attachment 1 for a continuity table of capital expenditures from 2008 to 2015.

Please refer to YUB-YECL-61 Attachment 2 for a breakdown of actual as well as forecast capital projects with a total project cost greater than $100,000 for the period 2008-2015.

Below is a table that presents the information that Yukon Electrical has provided to allow for the testing of the reasonability of its capital forecast.

	2008-2015		2013-2015	
Type	$$	%	$$	%
Business Case/Extended Write-Ups	40,810,000	34.41%	34,236,000	53.90%
Project Description Write-Up	58,033,000	48.93%	25,251,000	39.75%
Listed Projects	15,466,000	13.04%	3,194,000	5.03%
Other Small Projects	4,289,000	3.62%	839,000	1.32%
Total	118,598,000	100.00%	63,520,000	100.00%
Total of Projects detailed in YUB-YECL-61 Attachment 2	104,178,000	87.84%	61,229,000	96.39%

The Other Small Projects of $4,289,000 from 2008-2015 are comprised of approximately 800 projects, each under $25,000. This equates to an average project cost of approximately $5,361 per project. Yukon Electrical has not listed these projects due to their immaterial nature on an individual and consolidated basis.

YUB-YECL-62

Reference: New 250kW Mobile Generator, YECL Application, page 9-45

This generator provides contingency power to smaller communities. Contingency situations include emergency backup and scheduled maintenance shutdowns of power plants. The unit is also used during other system improvement projects to supply temporary power.

YECL presently has a 350kW mobile unit as stated in BC #4 that is unable to meet the current peak loads of the communities it serves.

Request:

(a) Please provide the justification for the purchase of this unit.

(b) How does YECL plan to utilize the 350kW mobile?

Response:

(a) The 250kW mobile generator is a multi-configurable low voltage unit (208/480VAC) used to provide backup to the communities of Keno, Swift River and Deep Creek. The 350kW mobile generator supplies only 2400v and cannot be utilized in these communities. On January 1, 2012, there was an extended outage in Keno due to loss of supply to the community. Emergency crews were dispatched with the existing low voltage mobile generator stationed in Whitehorse to restore power to the community. This outage was over 11 hours in length when the temperature was 30 degrees below zero. A second outage to the community the following day was over 16 hours due to malfunction of the mobile generator. Without a secure supply from the Yukon Interconnected System and with malfunction of the mobile generator, the community was in an emergency situation. As a result of the outage debrief, Yukon Electrical examined the need for a second low voltage mobile generator given that this single unit serves as backup to multiple communities throughout our service area. These low voltage mobile generators also assist Yukon Electrical to provide power to small sections of the distribution system during system improvements or long duration outages.

(b) The existing 350kW unit is in good working condition and able to supply adequate contingency power to the communities of Beaver Creek and Destruction Bay during the summer months. The unit has less than $50,000 of net book value as of the end of 2012 so it provides additional contingency with negligible additional cost to ratepayers. As such, Yukon Electrical plans to keep the unit in service.

YUB-YECL-63

Reference: Line item – Fish Lake Unit #2 SCADA, YECL Application, page 9-45

Request:

Please provide the benefits YECL obtains by installing this SCADA system.

Response:

The benefits of a SCADA system include: real time indication of unit loading and alarms; immediate annunciation to staff of unit shut downs and alarms; and frequent collection of data in terms of unit loading, performance and alarm history as well as automated controls. The automated controls will help to optimize water levels.

YUB-YECL-64

Reference: Line item – Fish Lake Unit #2 Penstock Improvements, YECL Application, page 9-45

Request:

Please provide any details on what the improvements are and how the operation of Fish Lake Unit #2 will benefit.

Response:

Details consist of Penstock #2 access road drainage improvements and slope stabilization to minimize an identified embankment failure risk. The operational benefit is in having a stabilized bank due to better drainage which will allow Yukon Electrical to continue to use this access road to inspect hydro infrastructure. If this project is not completed, there is a risk that the access road will be washed away and Yukon Electrical will lose access to its hydro facilities.

YUB-YECL-65

Reference: Line item – Miscellaneous O/H Services – Various Subdivisions, YECL Application, page 9-46

Capital expenditures required for the connection of new residential and commercial customers in Yukon Electrical's service area in compliance with Terms and Conditions. Any new extension (driven by a customer) that is under $25k is included in this.

Request:

Please provide details to the Board on how this level of expenditure was determined.

Response:

Yukon Electrical has determined its new extension capital forecast, including the Miscellaneous O/S Services, based on the knowledge it has of areas of development within its service areas as well as based on historical customer additions. New extensions are, on average, 75-80% funded by customer contributions. The net investment for the New Extension Category, including Miscellaneous O/S Services, is as follows:

		2011 Actual	2012 Actual	2013 Forecast	2014 Forecast	2015 Forecast
New Extensions	Schedule 9.1, L.10	6,078	4,919	5,149	5,307	5,570
Customer Contributions *		(5,149)	(3,097)	(3,903)	(4,320)	(4,160)
Yukon Electrical Net Investment		929	1,822	1,246	987	1,410

* Total contributions as per Schedule 8.12, L.3, less contributions received for Street Lights.

YUB-YECL-66

Reference: Line item – Miscellaneous Distribution Pole Replacement, YECL Application, page 9-48

Various deficient poles are identified through distribution system inspections, test and treat program and in unplanned situations. System inspections identify ground rot, pest infestation, broken or damaged poles and electrical degradation. The test and treat program identifies internal condition of the pole. Unplanned situations include emergency situations due to failure of the pole and forced projects.

Request:

(a) Please provide an explanation on how the program is tracked and how pole replacement is prioritized.

(b) For this item, what is the forecast O&M expenditure for each of the test years?

Response:

(a) When poles and structures are identified as deficient through any of the programs noted, a needs statement is completed to collect the relevant information. Once completed, the needs statement is submitted by field personnel to the Team Lead and the Superintendent Operations and Maintenance. The project is prioritized, catalogued in a database and tracked to completion.

(b) There are no amounts included in O&M for this item.

YUB-YECL-67

Reference: Line item – PCB Identification and Transformer Change Outs, YECL Application, page 9-48

Identification of Polychlorinated Biphenyl (PCB) content of all oil-filled equipment, in compliance with the Canadian Environmental Protection Act 1999. Oil-filled equipment containing PCBs in a concentration of at least 50 mg/kg but less than 500 mg/kg is being removed from service.

Both YEC and YECL have been working on this issue since the mid-1980s and do not appear to making progress, as costs continue to be incurred. In the GRA, costs have been incurred or allocated for this project between 2011-15.

Request:

(a) What is YECL's estimate of how many of the transformers remaining still contain PCBs?

(b) Please provide the plan and schedule that YECL plans to follow to have all transformers containing PCB's disposed of for each of the test years.

Response:

(a) Yukon Electrical has completed testing and identification of approximately 5,000 transformers throughout all service areas. At this time, it is estimated that there are approximately 1,000 pieces of equipment remaining that will require testing and identification of PCB content. There are 10 transformers that require removal from service and disposal as a result of 2012 identification.

(b) Yukon Electrical plans to test and identify PCB content of approximately 1,000 transformers in 2013. Any transformers identified as having unacceptable PCB content will be removed from service and disposed in 2013 and 2014.

YUB-YECL-68

Reference: Line item – Whitehorse Safety Code Corrections, YECL Application, page 9-49

Request:

Please provide a list of what safety code corrections are included in this expenditure.

Response:

Yukon Electrical completes Safety Code Audits of its distribution system projects to ensure compliance with applicable regulations such as the Canadian Electrical Code and the Alberta Electrical Utility Code. These audits are part of Yukon Electrical's quality control and commissioning program. ATCO Electric, under the Safety Codes Act of Alberta, has established a Quality Management Plan (QMP) that is approved by the Safety Codes Council. This grants ATCO Electric Accredited Corporation status. As a result, ATCO Electric is legally authorized to enforce the Alberta Electrical Utility Code (inspection authority having jurisdiction).for all electrical facilities and systems that are owned by, or under the care and control of, the Accredited Corporation. This includes Yukon Electrical. Please refer to YUB-YECL-68 Attachment 1 for a list of the specific projects that required correction.

Area	Number	Location	Description of Work to Be Completed
Whitehorse North	Y11489	Lot 33 Pilot Mtn	Lower ground moulding /ground rod exposed / transformer grounding
	Y12173	Lot 1066 Alaska hwy	megger reading missing/ground moulding
	Y12009	Grizzley Valley - stage 3	Remove switch tag/install 2nd ground moulding on gangswitch pole
Porter Creek and Beyond	Y10891	MacDonald rd rebuild	loose bonding bolt / loose guy guard / anchor bonding
	Y11097	Crestview	Lower ground moulding / underground warning stickers / megger tag
	Y11260	30 MacDonald rd	Lower ground moulding / preform not in fiber rod / 5/8 pal nuts
	Y12319	Lot 58-2 Dogwood	Ground moulding not buried / pal nuts / outage required
	Y12320	Lot 55 Dogwood	megger reading / inspect down ground / tighen guy wire
Takhini and Marwell	Y12200	Lot 10 Raven's Ridge	Install seal on breaker cabinet/grounding correction
Lobird / Macrae and Beyond	Y10856	Carcross Corner St. Lights	Underground cable warning stickers / asset tags
	Y11516	lot 39 Mt. Sima	transformer grounding / guy preform not seated in anchor eye

YUB-YECL-69

Reference: Line item – Miscellaneous Street Light Replacements, YECL Application, page 9-50

Planned replacement program based on street light inspections and condition assessment of infrastructure. Condition assessment is based on performance of street lights, deficiencies or substandard conditions and the general physical condition. Inspection of the general physical condition includes the base and metal structure for deterioration, rust, broken bolts and damage.

Request:

Please provide more details pertaining to the planned replacement program for each of the test years.

Response:

In 2013, Yukon Electrical plans to replace lights on and near Hickory Street. Yukon Electrical will be replacing 18 street light davits and installing approximately 560m of underground electrical wire.

In 2014, Yukon Electrical plans to replace lights on Pine Street between 12th avenue and Ponderosa Street. This project will include replacement of 28 street light davits and 980m of underground electrical wire.

In 2015, Yukon Electrical plans to replace lights on Alsek Road. This project will include replacement of 30 street light davits and 1,110m of underground electrical wire.

YUB-YECL-70

Reference: Line item – Replacement of Meters and Installing New Meters, Application, page 9-50

The installation of new meters is required to accommodate load growth associated with customer requests for service. These expenditures allow Yukon Electrical to meet its obligation to provide metered service connections. The capital meter additions are planned based on known areas of development and expected connection requests. New meters are also required to replace obsolete or end of life meters as identified by Measurement Canada. The new meters to be installed in 2013 will be AMR compatible in preparation for the conversion to AMR in 2014 and 2015.

Locations include Chestnut, Mulberry and Hickory Street.

Request:

(a) Please explain why an additional $50,000 in 2014-15 is required for replacement meters after expending $600,000 through this project?

(b) Are any AMR meters included in this line item?

Response:

(a) The $50,000 is primarily for meter replacement outside of the area that will have AMR installed. The following communities are not part of the AMR project:

Watson Lake

Lower Post

Upper Liard

Swift River

Ross River

Old Crow

Stewart Crossing

Keno

Pelly Crossing

Carmacks

Beaver Creek

Destruction Bay – Burwash

Haines Junction

(b) No AMR meters are forecast in this line item.

YUB-YECL-71

Reference: Tools, Instruments & Equipment, YECL Application, Schedule 9.1, line 18

Request:

(a) Does YECL have a tool replacement policy? If so, please provide a copy of YECL's tool replacement policy.

(b) What is the impact if any of the tools or equipment expenditures are denied by the Board?

Response:

(a) Yukon Electrical's tool replacement policy is based on its Safety Standards Manual (SSM) Section 300: Equipment Requirements. Please refer to the following attachments:

- YUB-YECL-71 Attachment 1 - SSM Section 300: Equipment Requirements
- YUB-YECL-71 Attachment 2 - SSM Section 900: Working with Powered Tools
- YUB-YECL-71 Attachment 3 – Policy B19: Protective Clothing and Safety Equipment
- YUB-YECL-71 Attachment 4 - SSM Appendix A: Equipment Test and Service Schedule

In general, any equipment or tool found to be defective, excessively worn or in unsuitable condition for its intended purpose is to be removed from service and repaired or replaced as necessary.

(b) Yukon Electrical requires specialized tools and equipment to complete work on the distribution power system and ancillary equipment. Tools and equipment include high voltage insulated tools, rubber gloves, revenue meter test equipment, insulation testers, survey equipment, Arc Flash Protective Clothing, underground locators, mechanical tools for work on diesel generators, and digital recording ammeters. Yukon Electrical would be unable to competently and safely work on and around the distribution power system and other associated equipment without these specialized tools.

SECTION 300: EQUIPMENT REQUIREMENTS

301 Specifications and Certifications

STANDARDS:

1. Where ATCO Electric has approved equipment it must be used.

2. In using the equipment, employees must not exceed the rated capacity or any other limitations described in the manufacturer's specifications or as certified (stamped and signed) by a professional engineer.

3. All equipment must be constructed, installed, operated, maintained, stored, serviced and tested according to the manufacturer's specifications or as certified (stamped and signed) by a professional engineer.

4. No modifications may be made to any equipment that could affect its structural integrity or stability unless it is performed in accordance with the manufacturer's specifications or as certified (stamped and signed) by a professional engineer.

© Safety Standards Manual

APPLYING THE STANDARDS:

For approved equipment, refer to the Tool Catalogue on the intranet or the Standards group.

If manufacturer specifications do not exist, specifications certified (stamped and signed) by a professional engineer may be used.

Do not use equipment that is damaged or worn so that its strength or stability is in question. Remove all damaged equipment from service and report it to your supervisor.

302 Equipment Safeguards

STANDARDS:

1. Whenever possible, employees must use existing safeguards or put safeguards in place to prevent contact with machinery or equipment that may be hazardous.

2. Safeguards must not be tampered with or removed except while performing maintenance, checks, repairs or adjustments to the equipment.

3. If a safeguard must be temporarily removed or made ineffective, the employee must:

    - Lock and tag the equipment to make it inoperable; or

    - Put a temporary alternate protective measure in place that provides an equivalent level of safety; and

    - Replace the safeguard as soon as the task is completed and check that it is functioning properly before leaving.

4. If safeguards are unavailable or impractical, personal protective equipment must be worn or an alternate procedure used to eliminate or control the hazard.

© Safety Standards Manual

5. Loose-fitting clothing is prohibited near moving parts of machinery.

APPLYING THE STANDARDS:

Identify equipment hazards during the job planning process. Equipment hazards that require safeguards include:

- Moving parts of machinery;
- Points of machinery that cut, shape or bore;
- Heated or cold surfaces that could cause skin to freeze, burn or blister;
- Energized electrical equipment;
- Equipment that throws debris; and
- Any other machinery, function or process that may cause injury.

303 Identification of Unsafe Items/Equipment

STANDARDS:

All tools and equipment that are not in safe operating condition must not be used. If the tool or equipment cannot be immediately repaired it must be tagged with a defective equipment tag to warn others.

This standard does not apply where other defective electrical system identification procedures are in place.

APPLYING THE STANDARDS:

Any employee who identifies or discovers a tool or piece of equipment that appears unsafe to use or has an expired re-certification date, must immediately cease operating the tool or equipment. When immediate repair cannot take place, the employee must affix a completed “Defective Equipment” tag to the item where it can be clearly seen.

© Safety Standards Manual

The employee must notify the person responsible for the tool or equipment; or if that person is not known, their supervisor.

Defective equipment tags must not be removed until repairs are complete.

Tags shall be no less than 5" X 3" and contain the following information:

- The warning "DANGER – Defective Equipment"
- The statement "Do not remove this tag"
- Explanation of the defect
- Printed name of the employee that discovered the defect.

Defective equipment tags are available through reprographics (0205-0075-0309)

304 Protective Equipment Requirements

STANDARDS:

All employees must use approved protective equipment to control hazards not previously eliminated through engineering and administrative controls.

All visitors to a location (employees or others) must supply and wear their own appropriate protective equipment or they are not allowed on site.

NOTE: ATCO Electric promotional clothing is not *Arc Flash Protective Clothing*

APPLYING THE STANDARDS:

For all construction, maintenance and warehousing work activities, lateral impact hard hats, safety glasses (with side shields) and CSA green triangle with an orange Ω symbol safety footwear with ankle

© Safety Standards Manual

support must be worn, unless the hazard assessment describes where a different barrier is required. Note: although the CSA safety footwear with the Ω symbol supplies electrical protection it is not to be counted on as a barrier to electric hazards because the condition (e.g. wet, dirty, shunted by spur) will affect it.

For additional and alternate personal protective equipment requirements, refer to Table 304-1.

The only exceptions are:

Hard Hats – not required when driving vehicles or for indoor work where there is no risk of head injury (e.g., working in your office).

Safety Footwear – can be substituted with regular footwear for comfort while driving a vehicle where there is no risk of injury to feet, or to allow the safety footwear to dry and warm up during breaks.

Safety Glasses – not required for office work or when using equipment such as binoculars or survey transits, where glasses may impede the operator's vision, or where greater eye protection is required (e.g., welding mask, full face shield or safety goggles). Refer to specific activities in Table 304-1 for details.

📖 Management Guide Policy B-19: Protective Clothing & Safety Equipment

Table 304-1

Additional/Alternate Protective Equipment Requirements

Welding	See Section *518*
Working with explosive actuated tools	See Section 901
Working with grinders and metal chop saws	See Section 903
Working with vibrating tools	See Section 905
Working with chain saws	See Section 906
Vehicle and equipment operation	See Section 1000
Operating *All-Terrain* off-road vehicles (ATVs, *UTVs*, snowmobiles)	See Section 1005

Arc Flash Protective Clothing

1. Employees issued *an Arc Flash Protective Clothing* system shall wear and keep a supply of garments with them at all times to maintain readiness for all work related hazards.

2. Where there is a risk of arc flash, only workers wearing *Arc Flash Protective Clothing* and appropriate PPE shall be permitted in the established work zone/arc flash boundary.

3. *Arc Flash Protective Clothing* may be layered to increase the level of protection. Clothing worn next to skin under the minimum outer layers in *Table 304-3 shall be Arc Flash Protective Clothing or non-melting natural fibre clothing like cotton or wool(an incidental amount of other material, e.g. elastic for the waist band or plastic bra clasps, are permitted).Metallic articles shall not be worn next to skin.*

4. Clothing systems and Personal Protective Equipment used shall provide a minimum Arc Thermal Protection Value (ATPV) of 8 cal/cm^2 protection.

5. If the use of *Arc Flash Protective Clothing* and Arc Rated PPE introduces additional hazards, the safe work plan must be reviewed and revised to make sure all hazards are reduced to the lowest practical level.

Table 304-3

Typical Work	Outer Layer(s)*
Work on < 100 volts • Test bench work • Protected side of breakers and fuses • Vehicle batteries	1 layer Non-Melting Natural Fibre (cotton wool)
General work near energized facilities within an established work zone. • Visits, audits, observations • Inspections, planning • Tree work	1 layer Non-Melting Natural Fibre (cotton wool)
Generating Plants, Oil & Gas Plant	*Arc Flash Protective* layer
Work on an Isolated & Grounded System	*Arc Flash Protective* Layer
Low voltage (>100 to <750V) • Meter removal/installation • Secondary work • Rubber glove work • Facility battery banks • AC/DC Panels • Work on metal clad switchgear, breaker racked out and shutters closed	*Arc Flash Protective* layer
High voltage (>750V) • Live line work with sticks • All switching • Work near metal-clad switchgear and through the door insertion and removal of metal clad circuit breakers	*Arc Flash Protective* layer
High voltage (>750V) • Rubber glove work • Bare hand work • Opening hinged covers to exposed energized parts Ex. Live front transformers, metal clad switchgear energized bus	2 *Arc Flash Protective* Layers
Work in energized metal-clad switch gear cabinets. • Insertion or removal of breaker • Circuit breaker operation • Removal of bolted covers to expose energized parts • Voltage testing Work in energized PT/CT cabinets >1 kV	3 *Arc Flash Protective* layers & blast hood

© Safety Standards Manual

* The "*Arc Flash Protective* Layers" must be a minimum of 8 cal/cm2 protection. This can mean one Arc Flash Protective layer with 8-cal protection, or multiple layers adding up to 8-cal or greater. (E.g. A 6-cal shirt with a 6-cal jacket overtop is equal to 12-cal protection, and thus meets the minimum.)

Also, note that Multi-layer *Arc Flash Protective Clothing* garments such as winter wear and blast suits are considered 2 FR layers.

Note: Reduce the high temperature hazards associated with protective requirements by:

- Increasing the number and length of breaks;
- Reducing the duration of exposure to high temperatures (plan work for time of day when temperature is lower, Keeping exposure to < 1 hour during highest temperature);
- Providing water for cooling and air conditioning during breaks; and
- Constant observation to detect signs of heat stress.

See Section 507: Working in Hot and Cold Environments.

Care for *Arc Flash Protective Clothing*

- Quality of protective clothing and equipment in possession of a worker must present observable protection and appearance consistent with safe work expectations, requirements of manufacturers, and OH&S Code sections pertaining to PPE.
- *Arc Flash Protective Clothing* garments shall be laundered regularly to maintain hygienic and flame resistant properties.

© Safety Standards Manual

- Tears and holes in *Arc Flash Protective* Clothing garments shall be repaired with *Arc Flash Protective* materials by the supplier contracted to do repairs.

- Never wash with bleach, detergent with bleach or fabric softeners.

- Never dry with fabric softener sheets.

305 Ordering Protective Equipment

STANDARD:

Employees must select the appropriate protective equipment from the *Arc Flash Protective Clothing Catalogue* or Tool Catalogue (as applicable), located on the intranet.

APPLYING THE STANDARD:

Follow established purchase approval procedures, and contact the warehouse for ordering assistance.

For prescription safety glasses, obtain the required form from your supervisor.

306 General Care and Maintenance

STANDARD:

Employees must follow the manufacturers specifications for the care and maintenance of their protective equipment (see Applying the Standards and manufacturer's instructions).

Employees must:

- Maintain their protective equipment;

- Inspect it before each use; and

© Safety Standards Manual

- Remove damaged protective equipment from the work site immediately and identify it to their supervisor.

- DO NOT alter or modify protective equipment in any way.

APPLYING THE STANDARDS:

General inspection and maintenance requirements for common equipment are provided below. Refer to Appendix A for the equipment test and service schedule.

If more information is required, contact the Training Centre or the manufacturer for assistance.

Hard Hats

Inspect the shell for cracks, nicks, gouges, dents, stains, melting, pitting and damage caused by rough treatment, impact, penetration or abrasion. To check the stiffness of the shell, compress it inward from the sides about 2.5 centimeters with both hands, then release the pressure without dropping the shell. The shell should quickly return to its original shape with no deformation or cracking. If any signs of damage are observed, replace the hard hat immediately.

Inspect the suspension for cracks, tears and fraying of the suspensions straps. The suspension should be pliable and show no other signs of wear. All points in the suspension should fit tightly in their respective slots. If any of these sign of damage are observed replace the suspension immediately.

The current manufacturer of ATCO Electric hard hats recommends the shell be replaced after three years of use and the suspension after one year of use.

- Clean the hard hat with mild soap and water.

- Do not store the hard hat in direct sunlight.

- Do not place stickers or decals on hard hats except non-metallic safety orientation stickers, as required by customers.

© Safety Standards Manual

- Non-metallic orientation stickers must be placed at least 12 mm above the brim to maintain the hard hat's dielectric classification.

Hot Sticks and Live Line Tools

Inspect before using for:

- electrical tracking, burn marks or blisters caused by heat;
- cracks, elongation of holes, loose or bent fasteners and fittings; and
- poor operating action.

Remove and tag damaged hot sticks from service immediately and have them repaired and tested.

If a tingling sensation is felt when the tool is in contact with an energized conductor or hardware, the tool must be returned to the test lab for repair and electrical testing.

Clean and wax hot sticks and live line tools with the prescribed manufacturer's products specified in the Insulated Equipment section of the Tool Catalogue.

Before using live line tools, wipe with a silicone-impregnated cloth. DON'T use cloths that have been exposed to detergents or solvents.

When they are not in use, store tools in a bin or a protective bag to keep them dry.

Every three years, a dielectric test is required (see Appendix A). Lab tests can be coordinated through the local warehouse. Hot sticks must not be used after the expiry date.

Rubber Gloves

Inspect and test rubber gloves before first use each day and immediately following any potentially damaging incident.

© Safety Standards Manual

Rubber gloves must be inspected over their entire surface, and rolled and stretched gently between the hands to expose defects and embedded materials. Any glove with a sign of the inside colour showing through must not be used.

Insulating rubber gloves must be given an air test by twirling or rolling the cuffs or using a mechanical inflator. When using the inflator, take care to avoid over-inflation. **No part of the glove should be stretched more than 1.25 times its normal size.** To detect punctures, listen for escaping air and hold the gloves against your cheek to feel for escaping air.

Rubber gloves must be stored with the protector gloves removed and placed in a separate storage compartment. See the Tool Catalogue for double compartment storage bags.

Rubber gloves should not be stored when wet or dirty, except on a temporary basis, after which they should be cleaned and dried with a clean rag.

Rubber gloves should be washed frequently to remove perspiration, dirt and body salts from the interior. Rinse thoroughly to avoid possible irritation from cleaning residue, wipe dry and return (right side out) to dry. DON'T leave rubber gloves inside out, as the distortion will hasten deterioration. Also, never allow rubber gloves to dry in the sun because of the possibility of ozone damage.

If wool or cotton liners are used, these should also be washed regularly to avoid the risk of dermatitis. Use 10-4 Rubber Glove Dust to aid in pulling on and removing the gloves.

All rubber gloves must be laboratory tested every six months. Rubber gloves must not be used past the expiry date (see Appendix A).

Protector Gloves

Inspect protector gloves before first use each day and immediately following any potentially damaging incident.

Protector gloves must not be used if they have holes, tears or other defects that affect their ability to provide mechanical

© Safety Standards Manual

protection to the insulating rubber gloves. Keep them as free as possible from oils, greases, chemicals and other damaging materials. If they become contaminated, they may no longer be used as protector gloves, unless they are thoroughly cleansed of the contaminating substance. Check inside the protector gloves for sharp or pointed objects before fitting them over rubber gloves.

Climbing and Fall Protection Equipment

Conduct a visual inspection of climbing and fall protection equipment before first use each day:

- Check the lineman's body belt / full body harness material and stitching for excessive wear. Inspect the plastic distribution and absorption plate on the full body harness for cracks and wear.

- Check D rings, buckles and locking snaps for broken or damaged parts. Make sure locking snaps operate properly.

- Check the lanyard, fall restricting pole strap and choker strap material and stitching for wear or corrosion and loose or missing rivets and springs.

- Check that retractable lanyards operate properly and are properly attached.

- Check climber pads, straps and stitching for cracks and wear and cracked or worn buckles.

- Check that climber shaft screws are tight and the steel rings are not cracked or showing signs of excessive wear.

- Inspect gaffs for damage and check sharpness (use the plane test).

- Remove from service and re-certify or replace any personal fall arrest system that has arrested a fall.

© Safety Standards Manual

Self Contained Breathing Apparatus (SCBA) & Supplied Air Respirators

SCBA and supplied air respirators must be maintained and stored in a manner that prevents contamination of the equipment (i.e., cleaned, sanitized and then stored in the appropriate carrying case).

All SCBA and supplied air respirators must be inspected monthly and before and after each use to verify the following:

- All component parts are clean and in good working condition (i.e., face piece, helmet, hood, suit, head harness, valves, connecting tubes, harness assemblies, filters, cartridges and cylinders);
- Connections are tight;
- Regulators, alarms and other warning systems are functioning properly;
- End of service-life indicator and shelf-life dates are not expired;
- Pressure gauges of all breathing cylinders indicate "FULL"; and
- Oxygen-generating canisters and CO2 sorbent in closed-circuit apparatus are new and capable of providing full-rated service.

If the SCBA or supplied air respirator does not pass the inspection, it must be removed from service and tagged for repair by an authorized service centre.

In addition, SCBA and supplied air respirators must be tested, both visually and functionally, by an authorized service centre at least every two years.

📖 HSE Practice 402: Inspection

© Safety Standards Manual

SECTION 900: WORKING WITH POWERED TOOLS

901 Working with Explosive Actuated Tools

STANDARDS:

1. Only employees trained in the operation of a particular explosive actuated tool are allowed to use it.

2. If the tool is equipped with protective guards, the protective guards must be used.

3. Employees required to operate explosive actuated tools repeatedly or for prolonged periods must wear hearing protection.

4. Explosive actuated tools must be used only in non-flammable environments.

© Safety Standards Manual

APPLYING THE STANDARDS:

Explosive actuated tools are normally used to connect conductors (ampacts) or fastening devices (e.g., screws or bolts) to materials such as concrete and steel. When planning to use explosive actuated tools, make sure consideration has been given to the proximity of co-workers. Always communicate with others in the vicinity.

Training for explosive actuated tools can be arranged through the Training Centre.

902 Working with Compressed Air Tools

STANDARDS:

1. Use of compressed air tools must be identified as a hazard during the job planning process.

2. Compressed air tools must be operated in accordance with the manufacturer's instructions and only with recommended attachments. DO NOT operate above the manufacturer's rating.

3. Only tools in good condition may be used. Hoses must be regularly checked for cuts, bulges and abrasions, and replaced if defective.

4. Air pressure must be released before connections are broken, unless the equipment has quick acting, self-closing connectors.

5. Air pressure to hoses must be turned off at the end of the working day.

6. Compressed air pressure must NEVER be:

    - Released toward yourself or another person; or

    - Used to clean off your clothing or your body.

7. Employees using portable air compressors must follow the manufacturers speculations and, if applicable, any written work procedures in place for the portable unit.

© Safety Standards Manual

APPLYING THE STANDARDS:

Keep your hands away from the operating switch when changing body or tool positions.

903 Working with Grinders and Metal Chop Saws

STANDARDS:

1. Only grinders equipped with properly adjusted protective shields may be used.

2. *During grinding and buffing operations employees must wear all necessary PPE (including proper hand, eye and face protection,).*

3. Employees using metal chop saws must wear hand, eye and face protection (e.g., safety glasses and a face shield).

4. Employees using grinders or metal chop saws must make sure all guards and shields are in place and follow safe operating procedures.

APPLYING THE STANDARDS:

Safe Operating Procedures

1. Disconnect the power source before adjusting the tool rest or changing the wheel.

2. Adjust the tool rest so that the upper edge is not below the centre line of the abrasive wheel, or more than 2 mm from the cutting surface.

3. Stand to one side of the grinder until the wheel reaches operating speed, and then begin grinding.

4. Each time the wheel *or blade* is changed, check the r.p.m. rating. DO NOT use a wheel *or blade* unless it has an r.p.m. rating that is as fast as the grinder or saw.

5. DO NOT use a wheel that has been dropped on a hard surface.

© Safety Standards Manual

6. DO NOT grind on the sides of an abrasive wheel unless it is designed for that use.

7. DO NOT use wet grinding wheels as they may become unbalanced or create soft spots in the grinding wheel.

8. When using a chop saw for an extended period of time, consider wearing a protective apron.

904 Working with Hydraulic Tools

STANDARDS:

1. Hydraulic tools must be operated in accordance with the manufacturer's instructions and safe operating procedures.

2. All exposed fittings and hoses must be examined before each use to make sure there are no visible defects.

3. Hydraulic pressure must be released before connections are broken unless the equipment has quick acting, self-closing connectors.

4. *Hydraulic tools must not be interchanged between a dielectrically tested and rated aerial unit and an unrated unit.*

© Safety Standards Manual

APPLYING THE STANDARDS:

Safe Operating Procedures

1. Keep your hands away from the operating switch when changing body or tool positions.

2. *Only qualified personnel who fully understands the hazards of hydraulics must check for pin hole leaks.*

    - *Check for pin hole leaks by passing a piece of cardboard or wood over the suspected area.*

    - *DO NOT check for pin hole leaks with your hands, as hydraulic pressure through a pin hole can easily cut through a rag, gloves and the skin underneath.* The pressure could inject the hydraulic fluid stream under your skin. HYDRAULIC FLUID INJECTED UNDER THE SKIN CAN BE FATAL.

905 Working with Vibrating Tools

STANDARDS:

1. Extended use of vibrating tools must be addressed as a hazard in the job planning process.

Employees required to use vibrating tools for an extended period of time must take the following safety precautions:

- Wear properly-fitting vibration-dampening gloves if the tool is not equipped with a vibration dampening feature;

- Keep wrists in the “neutral” position while using the tool; and

- Take a few short breaks every hour and massage hands to maintain circulation.

© Safety Standards Manual

APPLYING THE STANDARDS:

An example of extended use of vibrating tools is jack hammering concrete for more than one hour. Standard 2 does not normally apply when using tampers and ground rod pounders unless use is prolonged.

906 Working with Chain Saws

STANDARDS:

1. All employees required to operate chain saws must receive Chainsaw Basic training through Training and Development prior to operation.

2. Employees designated as first responders (i.e. dealing with trouble trees on lines) are required to receive Chainsaw Advanced training. Training and Development requires employees to complete Chainsaw Basic prior to receiving Chainsaw Advanced.

3. Chain saws must be operated *in accordance with the training received and shall be* adjusted and maintained in accordance with the manufacturer's specifications.

4. All employees using chain saws must wear a face shield, Class A ear muffs, safety boots or chainsaw boots, *and full-length leg protection as identified in the ATCO Electric tool catalogue.*

5. Employees must ensure that they have a #2 first aid kit with them at the location of chainsaw activities

6. All chain saws must be equipped with*: throttle interlock, chain catcher,* chain brake *and if available a low kick back chain must be used.*

7. Hydraulic-powered saws must be equipped *with a low* kick *back* chain *if available*.

8. Chain saws must not be operated from poles *or trees*.

9. Chain saws must not be operated above shoulder level, with the exception of the bucket work identified below.

© Safety Standards Manual

10. When operating a chain saw from a bucket, the operator must wear a protective chain saw jacket *as identified in the ATCO Electric tool catalogue.*

11. Where possible, the bucket shall be positioned so that a chainsaw cut can be made from below shoulder height. If this is not possible, workers cutting from the bucket must take caution to reduce additional risks for injury associated with kickback from cuts above shoulder height.

12. Chain saws must be turned off when ascending to or descending from a work location. The operator may warm up the chainsaw while still on the ground, prior to ascending to the work location.

13. The chain saw operator must not start the engine until in the immediate work area. *Chain brakes are to be applied when moving between locations.*

14. While the chain saw is running, no one is allowed within a 2-metre radius of the chain saw and operator.

15. The operator must hold the chain saw firmly with both hands when cutting. *The saw must not be operated at any time with only one hand.*

APPLYING THE STANDARDS:

- 🕮 Training Course – Chainsaw Basic
- 🕮 Training Course – Chainsaw Advanced
- 🕮 *ATCO Electric Tool Catalogue*

© Safety Standards Manual

Management Guide ATCO Electric	Protective Clothing and Safety Equipment	B19 1 of 3

A. PURPOSE

This Policy outlines responsibilities for employer and employee to obtain protective clothing and safety equipment, and the procurement and distribution of the clothing and equipment.

The protective clothing and safety equipment specified in this Policy is integral to Company safety systems protecting workers from the following potential affects:

- Burns
- Heat attenuation
- Vehicle impact (high visibility)
- Eye injury
- Foot injury
- Head Injury
- Frostbite
- Slips and Trips

Wearing the protective clothing also helps maintain the identifiable and beneficial image ATCO Electric employees have helped build among customers.

B. POLICY

ATCO Electric will provide the necessary protective clothing and safety equipment to the level that the Safety Standards Manual and field level hazard assessment prescribes. ATCO Electric will ensure employees: are aware of procedures for obtaining protective clothing appropriate to their job needs; receive training on the use; and have access to all necessary safety equipment.

Employees shall advise on, select from the Company catalogue, inspect, wear, care for, clean, arrange for repair, account for, and request replacement of protective clothing and safety equipment. Employees shall also report equipment or protective clothing that is in bad condition, may not withstand the necessary function, or has obvious defects.

Employees will pay 40% of the expense for protective footwear. Employees will pay 100% of the expense for 'against-the-skin' undergarments (e.g., boxer shorts, briefs, sport bras) which must be a minimum of 65% natural fibres (e.g., cotton or wool). Regarding repairs of FR clothing or protective footwear, ATCO Electric will pay for 100% of the expense.

C. ACCOUNTABILITIES

1. Employees covered by this policy will always wear protective clothing to ensure their ongoing safety and readiness for work.
2. The Company will maintain a Protective Clothing and Safety Equipment Steering Committee to:
    a. Sustain quality, functional requirements and specifications of protective clothing and safety equipment for entering into the Company's procurement system catalogue;
    b. Provide ongoing support for decisions related to the organizational alignment and application of the policy; and
    c. Maintain a website page on E-net to serve as a reference source and tool for viewing protective clothing and safety equipment materials.
3. Individual operating departments must annually budget for the capital and O&M expenses of adding and repairing protective clothing and safety equipment.
4. Supervisors and in-scope leaders will keep an up-to-date spreadsheet with the amount of protective clothing and safety equipment in possession of each worker assigned to their location.
    a. Employees will account for all clothing and equipment in September and in-scope leaders will forward a copy of this information and comments for review by their Sr. Mgr. and the Steering Committee before September 30 each year. *See Annual Inventory Form on http://enet/Support/HSE/FRC.htm.*
    b. Any employee unable to account for protective clothing and safety equipment recorded in their possession will report the occurrence to their Sr. Mgr. and replace the item(s) at their expense. *See Annual Inventory Form on http://enet/Support/HSE/FRC.htm.*
5. Protective clothing and safety equipment (except footwear, eyewear and 'against-the-skin' undergarments (e.g., boxer shorts, briefs, sport bras)) used by employees in the Company's work are limited to the items specified in the Company's clothing and tool catalogues.
6. Quality of protective clothing and safety equipment in possession of a worker must present observable protection and meet the minimum safety requirements of the manufacturer and ATCO Electric Safety Standards Manual.
7. Employees shall immediately return protective clothing and safety equipment (except footwear and eyewear) to the Company upon:
    a. Request by management
    b. Indications of surplus to requirements
    c. Finding irreparable damage during inspections
    d. Receiving clothing or equipment replacements
    e. Change to job function not requiring the clothing or equipment, or
    f. Termination of employment.

Management Guide ATCO Electric	Protective Clothing and Safety Equipment	B19 3 of 3

D. COMPLIANCE

This policy is pursuant with ATCO Electric's Safety Standards Manual (SSM), Section 300. Non-compliance of the policy risks contravention of the Occupational Health and Safety Act, Chapter 0-2, (Obligations of employers, workers, etc) for which ATCO Electric has the obligation to protect the health and safety of their workers as far as reasonably practicable.

Adherence to this policy is in accordance with Best Practice 001 Safety Leadership Planning, which clearly defines employee accountabilities for safety - in this case, barriers to hazards as identified in employees hazards assessment.

This table specifies protection required, approved items, procurement of items and responsibility for payment of the items. For additional details on protective clothing prescribed for specific positions, refer to ATCO Electric's Safety Standards Manual, Section 300.

YUB-YECL-72

Reference: Line item – Transportation Equipment, YECL Application, page 9-51

- Replacement of Units 161, 163, 372, 674 and 675
- Purchase New Pole Trailer
- Purchase New Service Truck PLT Team Lead
- Purchase Zoom Boom Personnel Lift
- 4 Place Stringing and Pulling Trailer

Request:

(a) Please provide the replacement policy/criteria for vehicle replacement.

(b) Please provide any business cases for the purchase of new vehicles for each of the test years.

Response:

(a) Key considerations for the replacement of transportation equipment include the age, mileage and required costs to repair to acceptable working condition. Service vehicles are mechanically evaluated when they reach 170,000 kilometers and 7 years of age. If the vehicle is in good to fair mechanical condition it will continue to be utilized. For any vehicles that receive a poor mechanical condition rating, an estimate for necessary repairs is completed. The cost of repair, repair history and use of vehicle are reviewed in consideration of replacement.

(b) Please refer to the following for the business cases:

2013

- YUB-YECL-72 Attachment 1 – Diesel Powered Hydraulic Cable/Wire Puller
- YUB-YECL-72 Attachment 2 – New Stringing Trailer
- YUB-YECL-72 Attachment 3 – Unit 674 Replacement
- YUB-YECL-72 Attachment 4 – Unit 675 Replacement

- YUB-YECL-72 Attachment 5 – Unit 161 Replacement
- YUB-YECL-72 Attachment 6 – Unit 163 Replacement
- YUB-YECL-72 Attachment 7 – New Service Truck
- YUB-YECL-72 Attachment 8 – Unit 372 Replacement
- YUB-YECL-72 Attachment 9 – Zoom Boom

2014

- YUB-YECL-72 Attachment 10 – Forklift Replacement
- YUB-YECL-72 Attachment 11 – Unit 777 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Purchase Diesel Powered Hydraulic Cable/Wire Puller

The Yukon Electrical Company Limited
An ATCO Company

Title: **Purchase Diesel Powered Hydraulic Cable/Wire Puller**

Summary:

Yukon Electrical's power system construction and maintenance team requires the use of a specialized puller. In the past, this service was contracted out or one would be rented from a contractor as required. Now this work is largely being performed in house and constant access to the puller for emergency and planned needs is required. In addition the preferred contractor's puller is sent outside the territory when not in use and is increasingly hard to access.

Project Description:

Purchase a used puller to have in house that is able to pull both overhead wires and underground cables

Project Cost:

2013 – $35,000

Business and Technical Drivers

Business Drivers:

Specialized tool now required in house and ability to better control costs associated with renting unit.

Technical Drivers:

Difficulty to access contractor's equipment. Increased requirement for use of specialized puller.

Alternatives:

Alternative # 1: Continue to utilize the services of the contractor. This alternative is difficult due to the limited access to the contractor.

Alternative # 2: Rent a puller and perform the work in house. This option can be costly and is also dependent on the availability of the equipment as there are none in the Yukon for rent.

Alternative # 3: Purchase a used diesel powered hydraulic cable/wire puller suitable to Yukon Electrical's requirements. This is the most cost effective and attractive alternative that gives Yukon Electrical unlimited access to the equipment.

Alternative # 4: Purchase a new diesel powered hydraulic cable/wire puller suitable to Yukon Electrical's requirements. A new puller costs approximately $145,000.

Recommendation:

Purchase a used diesel powered hydraulic cable/wire puller.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Purchase New Stringing Trailer

The Yukon Electrical Company Limited
An ATCO Company

Title: **Purchase New Stringing Trailer**

Summary:	Due to the increased amount of capital work required, a stringing trailer is needed to enable the line crews to perform construction work and increase the productivity of the construction team.
Project Description:	Purchase a trailer suitable to haul wire reels and poles. The dual purpose trailer will provide a more versatile and cost effective piece of equipment.
Project Cost:	2013 – $30,000

Business and Technical Drivers

Business Drivers:	This is a specialized tool required in house and will provide better financial control as this item is dual purpose and expandable to accommodate a tensioner system.
Technical Drivers:	Tool required for crew to perform construction work.
Alternatives:	Alternative # 1: Continue to use wire reel stands temporarily mounted to a trailer. This is not a viable alternative since there are now two line crews that require the use of this equipment to perform construction work. Also with existing equipment Yukon Electrical is not able to complete tension stringing in a live line application. Alternative # 2: Rent a stringing trailer. Currently there are no companies in the Yukon that rent stringing trailers. Alternative #3: Purchase a new stringing trailer.
Recommendation:	Purchase a new stringing trailer to enable the second line crew to perform construction work.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Unit 674 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 674 Replacement**

Summary:	Unit 674 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Yukon Electrical is seeking approval to replace unit 674, a 2006 Dodge ¾ Ton 4X4 Extended Cab, in 2013 with a new vehicle of a similar size that has a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The replacement vehicle will be equipped with service bodies added to the cab and chassis.
Project Cost:	2013 – $70,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and the vehicle 7 years old with 199,620 km. It has been identified as overweight in accordance with NSC. Current unit has encountered reliability issues in the past couple of years.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Vehicle weight has been unloaded to comply with NSC, however it has restricted the use of the vehicle as it is no longer fit for a Powerline Technician. Alternative # 2: Purchase a replacement unit of a similar size.
Recommendation:	Purchase a replacement unit of a similar size.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Unit 675 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 675 Replacement**

Summary:	Unit 675 is in need of replacement since the vehicle was involved in collision and written off by insurance assessment officer.
Project Description:	Approval required to replace unit 675, a Dodge ¾ Ton Extended Cab 4X4 with a ½ Ton 4X4 in 2013. Unit 675 is utilized by a Field Service Representative and is no longer required to be a large service vehicle. The new vehicle will have valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The vehicle was involved in a car accident in 2012 that did significant damage to the vehicle that it was no longer drivable and deemed not repairable. The vehicle is no longer in service.
Project Cost:	2013 – $30,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement since the current unit is not operational. Yukon Electrical requires this unit in order to deliver service to the community.
Technical Drivers:	The vehicle was written off by the insurance adjusters and is currently not in service.
Alternatives:	Alternative #1: The only alternative is to replace the existing unit since it is no longer operational.
Recommendation:	Purchase a replacement unit of a adequate size.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Unit 161 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 161 Replacement**

Summary:	Unit 161 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Approval required to replace unit 161, a 2001 Ford ¼ Ton 4X4, in 2013 with a new vehicle of a similar size that has a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The replacement vehicle will be equipped with service bodies added to the cab and chassis.
Project Cost:	2013 – $30,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and the vehicle 12 years old with 197,010 km and in poor mechanical condition. Current unit has encountered reliability issues in the past couple of years.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Alternative # 2: Purchase a replacement unit of a similar size.
Recommendation:	Purchase a replacement unit of a similar size.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Unit 163 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 163 Replacement**

Summary:	Unit 163 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Approval required to replace unit 163, a 2001 Chevrolet ¾ Ton 4X4, in 2013 with a new vehicle of a similar size that has a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The replacement vehicle will be equipped with service bodies added to the cab and chassis.
Project Cost:	2013 - $70,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit. This vehicle is used in a remote community and reliability is also a concern.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and the vehicle is 12 years old with 218,157 km. The vehicle is also currently not in compliance with NSC. Current unit has encountered reliability issues in the past couple of years.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Unable to remove enough weight to comply with NSC. Alternative # 2: Purchase a replacement unit of a similar size.
Recommendation:	Purchase a replacement unit of a similar size.

Business Case

New Service Truck

The Yukon Electrical Company Limited
An ATCO Company

Title: **New Service Truck**

Summary:	Yukon Electrical is seeking to purchase a new ½ Ton Truck for the Powerline Technician Team Lead of the second line crew to enable them to perform construction work simultaneously with the first line crew.
Project Description:	Yukon Electrical is purchasing a new ½ Ton Truck to enable the Powerline Technician Team Lead to carry out his duties for the second line crew. These duties include carrying tools, materials and the line crew to and from job sites.
Project Cost:	2013 – $30,000

Business and Technical Drivers

Business Drivers:	Increasing Vehicle Fleet size to meet increase in Yukon Electrical's planned capital work. Increase the productivity of the construction team.
Technical Drivers:	A new vehicle is required due to the increase in construction staff associated with the increase in capital work Yukon Electrical will be performing.
Alternatives:	Alternative # 1: Continue to utilize a single truck for both line crews. This alternative is not viable given there are now two construction line crews and they require to work separate and in different locations. Alternative # 2: Purchase a new ½ Ton Truck for the PLT Team Lead of the second line crew.
Recommendation:	Purchase a new ½ Ton Truck for the second line crew.

Unit 372 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 372 Replacement**

Summary:	Unit 372 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Approval required to replace unit 372, a 2003 Dodge 3500 1 Ton 4X4, in 2013 with a new vehicle of a similar size that has a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The replacement vehicle will be equipped with service bodies added to the cab and chassis.
Project Cost:	2013 - $80,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and the vehicle is 9 years old with 238,898 km and in poor overall mechanical condition. Current unit has encountered reliability issues in the past couple of years.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. The Electrical technologists travel to all rural communities in all weather conditions and need a reliable vehicle. Alternative # 2: Purchase a replacement unit of a similar size.
Recommendation:	Purchase a replacement unit of a similar size.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Purchase Zoom Boom

The Yukon Electrical Company Limited
An ATCO Company

Title: **Purchase Zoom Boom**

Summary:	Purchase Zoom Boom for Watson Lake Diesel Plant.
Project Description:	Yukon Electrical requires a Zoom Boom variable reach forklift for its Watson Lake Diesel Plant to allow the plant operators to perform maintenance on the areas of the plant not reachable from the ground. In the past scaffolding was used and was less efficient and also posed a safety concern as the scaffolding cannot reach all areas were work is required. The Zoom Boom will comply with safety regulations and give the staff more flexibility performing their duties.
Project Cost:	2013 – $49,000

Business and Technical Drivers

Business Drivers:	The plant operators are unable to perform various tasks with scaffolding and ladders. The Zoom Boom provides a safer and a more secure way to carry out above ground elevation work. Provides compliance with BP 503-Working at Heights.
Technical Drivers:	Gives the plant operators the ability to lift heavy engine parts when repairing/replacing engines, work on exhaust equipment directly above units and plant lighting that is on 25 ft ceiling.
Alternatives:	Alternative # 1: Rent a Zoom Boom for the work, however currently there is no access to one in Watson Lake. Alternative # 2: Continue using scaffolding and ladders to perform these duties. This is not a viable alternative since there are a number of tasks where scaffolding and ladders are not safe. Alternative # 3: Purchase a Zoom Boom for the Watson Lake plant.
Recommendation:	Purchase a Zoom Boom for the Watson Lake plant.

Business Case

Forklift Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Forklift Replacement**

Summary:	Yukon Electrical Whitehorse Service Complex warehouse requires replacement of existing 1994 Cark 2 wheel drive forklift.
Project Description:	Replacement forklift required to perform loading and unloading of freight and is required to operate outdoors in all weather conditions. The current forklift is near end of its operational life. In addition, Yukon Electrical intends to replace the existing 2 wheel drive forklift with a 4 wheel drive forklift to provide a more stable operation in the Service Complex yard in all weather conditions.
Project Cost:	2014 – $90,000

Business and Technical Drivers

Business Drivers:	Forklift required on an ongoing basis for operational purposes and specific to our material handling requirements.
Technical Drivers:	The new forklift will have 4 wheel drive which is capable of operating safely in all weather conditions as well as operating indoors on pallet racking system. The existing 2 wheel drive forklift is regularly stuck in the Whitehorse Service Complex yard.
Alternatives:	Alternative # 1: Continue to repair and use current 2 wheel drive forklift. This could result in further incidents of machine being stuck in yard during winter and inefficiency due to down time of unit. Alternative # 2: Purchase a new 4 wheel drive forklift for the Whitehorse Service Complex.
Recommendation:	Purchase a new 4 wheel drive forklift for the Whitehorse Service Complex.

Unit 777 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 777 Replacement**

Summary:

Unit 777 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.

Project Description:

Yukon Electrical is seeking approval to replace unit 777, a 2007 Dodge ¾ Ton 4X4, in 2014 with 5500 Quad Cab 4x4 c/w TL38 service body and bucket.

This unit is based in Haines Junction and will be used for regular service trips, repairing streetlights and brushing in Haines Junction, Destruction Bay, Burwash and Beaver Creek.

Project Cost:

2014 – $230,000

Business and Technical Drivers

Business Drivers:

A bucket truck is required on a regular basis to perform maintenance of overhead power systems. Opportunity to decrease maintenance and operating costs related to the old unit.

Technical Drivers:

Routine and emergency work could be completed in a timelier and cost effective manner with this unit. Unit 777 is 7 years old and has approximately 250,000 km. The age of the unit is a primary concern since it is used in remote areas and issues with reliability can be more serious in the harsh winter months.

Alternatives:

Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. The vehicle is used in remote areas, which poses an even greater safety concern. Powerline Technician in Haines Junction will continue to come to Whitehorse to utilize bucket truck for use in Haines Junction, Destruction Bay, Burwash and Beaver Creek.

Alternative # 2: Purchase a replacement 5500 Quad Cab 4x4 c/w TL38 service body and bucket.

Recommendation:

Purchase a replacement 5500 Quad Cab 4x4 c/w TL38 service body and bucket.

Unit 887 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 887 Replacement**

Summary:

Unit 887 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.

Project Description:

Yukon Electrical is seeking approval to replace unit 887 with 5500 Quad Cab 4x4 c/w TL38 service body and bucket.

This unit will be used for regular service trips, repairing streetlights and brushing in Whitehorse, Carcross, Carmacks, Teslin, Marsh Lake, Tagish, Pelly, Stewart, Keno and Ross River.

Project Cost:

2014 – $230,000

Business and Technical Drivers

Business Drivers:

A bucket truck is required on a regular basis to perform maintenance of overhead power systems. Opportunity to decrease maintenance and operating costs related to the old unit.

Technical Drivers:

Routine and emergency work could be completed in a timelier and cost effective manner with this unit. Existing bucket truck in Whitehorse is unable to keep up with demand. Unit 887 will be 7 years old and has approximately 200,000 km.

Alternatives:

Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Continue to provide service to Whitehorse, Carcross, Carmacks, Teslin, Marsh Lake, Tagish, Pelly, Stewart, Keno and Ross River with single bucket truck.

Alternative # 2: Purchase a replacement 5500 Quad Cab 4x4 c/w TL38 service body and bucket.

Recommendation:

Purchase a replacement 5500 Quad Cab 4x4 c/w TL38 service body and bucket.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Unit 780 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 780 Replacement**

Summary:	Unit 780 is a small digger derrick that is in need of replacement because of the age, operational efficiency and high costs of maintenance.
Project Description:	Yukon Electrical will engage ATCO Electric fleet management to design and obtain quotes for replacement of unit 780 – 1993 Digger Derrick. The existing unit is unable to haul a trailer with more than one pole and the GVWR is too light to be a front line digger.
Project Cost:	2014 – $375,000

Business and Technical Drivers

Business Drivers:	A digger derrick is essential piece of utility equipment that is used in the power line construction and maintenance activities such as setting poles, hanging transformers, installing and replacing street lights, and carrying poles.
Technical Drivers:	Unit 780 is a small digger derrick and the vehicle GVWR is too light to haul a trailer with more than one pole. As construction and maintenance requirements have grown, the unit's limited capability has been realized as detrimental to efficient utilization of two Yukon Electrical line crews. The working capability of the unit is too limited. Unit 780 will be 21 years old with approximately 100,000 kms.
Alternatives:	Alternative # 1: Continue to use small digger derrick. This results in narrowed work or projects as it can only complete a few tasks required of a digger derrick. Also, the vehicle is 21 years old and maintenance required to maintain adequate performance will increase. Alternative # 2: Purchase a new replacement digger derrick.
Recommendation:	Purchase a new replacement digger derrick.

The Yukon Electrical Company Limited

Unit 164 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 164 Replacement**

Summary:	Unit 164 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Yukon Electrical is seeking approval to replace unit 164, a 2001 Chevrolet ¾ Ton 4X4 Extra Cab, in 2014 with a vehicle of a similar size that has a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The replacement vehicle will be equipped with service bodies added to the cab and chassis.
Project Cost:	2014 – $70,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit. This vehicle is used in a remote community where the reliability is imperative.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and vehicle will be 13 years old with approximately 220,000 km. Current unit has encountered reliability issues in the past couple of years.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Alternative # 2: Purchase a replacement unit of a similar size.
Recommendation:	Purchase a replacement unit of a similar size.

The Yukon Electrical Company Limited
An ATCO Company

Business Case

Unit 989 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 989 Replacement**

Summary:	Replace unit 989 – Live Line Bucket Truck since the unit is no longer able to perform live line work, its primary purpose, and is nearing end of life.
Project Description:	Yukon Electrical will engage ATCO Electric fleet management to design and obtain quotes for replacement of unit 989 – 1995 Live Line Bucket Truck. The current live line bucket truck is unable to perform live line work due to the age and deterioration of the unit's insulation and boom. A new unit is required to fulfill Yukon Electrical's requirement to perform live line maintenance.
Project Cost:	2015 – $450,000

Business and Technical Drivers

Business Drivers:	Maintain ability to do live line work as an alternative to planned outages. This is a key activity for Yukon Electrical to provide customers in reducing outages and maintaining customer service. Having a planned outage for an entire subdivision or large area of the distribution system to change one pole is avoidable.
Technical Drivers:	Conductivity tests show the insulating is deteriorating, holding valves are failing on a regular basis and require repairs, the boom requires significant maintenance and is starting to fail, and the aerial unit is nearing the end of its operational life. The vehicle unit is a 1995 unit that is also needing regular maintenance and will soon receive a 'poor' mechanical rating if deterioration continues.
Alternatives:	Alternative # 1: Continue to use, maintain and repair unit 989. The mechanical condition of the truck is in moderate to poor condition. The live line boom is tested and rated for required work, but continues to degrade and will soon require significant repair work. The boom repair work would result in the unit being transported down south to a repair shop. This would leave Yukon Electrical without a live line bucket truck for months and the same mechanical issues with the 1995 truck and drive train if the boom was repairable. Alternative # 2: Purchase a new replacement live line bucket truck.
Recommendation:	Purchase a new replacement live line bucket truck.

Unit 747 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 747 Replacement**

Summary:	Unit 747 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Yukon Electrical is seeking approval to replace unit 747, a 1997 Chevrolet ½ Ton 4X4 in 2015. The replacement vehicle will be designed as a 1 Ton 4X4 with a service body. The new vehicle will have a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR) for its purpose. The replacement vehicle will be equipped with service bodies added to the cab and chassis.
Project Cost:	2015 – $100,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and the vehicle will be 18 years old with approximately 270,000 km. Weight restrictions of NSC have required Yukon Electrical to standardize 1 Ton units as the minimum GVWR.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Alternative # 2: Purchase a replacement unit of a adequate size.
Recommendation:	Purchase a replacement unit of a adequate size.

Business Case

Unit 955 Replacement

The Yukon Electrical Company Limited
An ATCO Company

Title: **Unit 955 Replacement**

Summary:	Unit 955 is in need of replacement due to the age and mileage of the vehicle. Purchasing a new unit would also increase safety, abide by the National Safety Codes (NSC) and decrease maintenance cost.
Project Description:	Yukon Electrical is seeking approval to replace unit 955, 2000 Chevrolet ½ Ton 4X4 Extended Cab, in 2015 with a 1 Ton 4X4 new vehicle that has a valid warranty, the most current safety features and adequate gross vehicle weight rating (GVWR). The replacement vehicle will be equipped with a service body added to the cab and chassis.
Project Cost:	2015 – $100,000

Business and Technical Drivers

Business Drivers:	Vehicle/Fleet Replacement. Opportunity to decrease maintenance and operating costs related to the old unit.
Technical Drivers:	Safety is a primary concern of Yukon Electrical and the vehicle will be 15 years old with approximately 240,000 km. Weight restrictions of NSC have required Yukon Electrical to standardize 1 Ton units as the minimum GVWR.
Alternatives:	Alternative # 1: Continue to repair and maintain the vehicle to the Commercial Vehicle Maintenance Standards. The vehicle has no warranty and there is no guarantee that maintenance will provide reliable operation. Alternative # 2: Purchase a replacement unit of adequate size.
Recommendation:	Purchase a replacement unit of adequate size.

YUB-YECL-73

Reference: Line item – Whitehorse Service Complex Pole Storage, YECL Application, page 9-51

Environmental requirement to get the poles off the ground.

Request:

Please provide more detailed information on the projected cost of $150,000.

Response:

Please refer to YUB-YECL-61 Attachment 2 for a breakdown of the project cost of $150,000. The costs for the standard metal pole bunks and hardware are forecast to be $100,000 and the cost for installation is forecast to be $50,000.

YUB-YECL-74

Reference: Line item – Destruction Bay Unit #3 Replacement, YECL Application, page 9-54

Purchase new unit complete with new manufacturer supplied and sized, radiator, exhaust, and heat exchanger. Remove existing unit, install new unit and supplied devices, integrate unit into electrical supply and control systems, connect unit into waste heat and fuel systems.

Request:

Please provide the reasons as to why this unit is being replaced.

Response:

Destruction Bay Unit #3, as of December 2012, has 97,170 hours and is on schedule for a major overhaul at 102,761 hours. Based on yearly operating hours, this unit is forecast for a major overhaul in 2014. Yukon Electrical has determined that life extensions performed on units in excess of 100,000 operational hours are not prudent as the unit may not operate reliably with these excessive operational hours. A generator with these operating hours is at the end of its life.

YUB-YECL-75

Reference: Line item – Destruction Bay Programmable Logic Controller Upgrade, YECL Application, page 9-54

Replacement of circa 1982 IDEC PLC as this control equipment is no longer supported or available from the manufacturer. The software driver is not compatible with the next generation System C and Data Acquisition (SCADA) program. Includes design and procurement of control equipment and panels as well as on-site installation and commissioning of the equipment.

Request:

Have all the other plants replaced their PLC's to work with the new SCADA system?

Response:

Old Crow, Beaver Creek, Destruction Bay, Teslin and Stewart Crossing are the generating facilities that still house IDEC PLCs.

Beaver Creek PLC is scheduled for replacement in 2013. Destruction Bay is scheduled for replacement in 2014. Old Crow is scheduled for replacement in 2016. Teslin and Stewart Crossing will be completed some time after 2016.

YUB-YECL-76

Reference: Line item – Watson Lake Replace ABB 5HK Breakers, YECL Application, page 9-55

Current breakers are at the end of life and obsolete technology. Replace existing breakers with vacuum breakers and install them into existing cells.

If there are five breakers to be replaced at $45,000 each, the projected cost would be $225,000.

Request:

(a) Confirm the number of breakers that need to be replaced.

(b) Are any of the present breakers in immediate danger of failure?

(c) Do the present breakers present a safety hazard to the employees?

Response:

(a) There are eight breakers in total to be replaced: six generator unit breakers and two power plant bus feeder breakers.

(b) No. The Arc Extinguishing Chutes in the breakers were inspected during regular maintenance shutdowns. Dielectric testing has confirmed the insulation is intact, except for small cracks, and is able to continue to operate as designed. However, the Arc Extinguishing Chutes have asbestos-lined material that has cracked and flaking occurs during operation of the breaker. There is no reliable method to predict if and when the breaker will fail.

(c) Yes. The concern is that the flaking asbestos becomes air borne during operation of the breakers. Asbestos is a known carcinogen.

YUB-YECL-77

Reference: Line item – Stewart Crossing Plant Improvements, YECL Application, page 9-55

General improvements including control system upgrades as well as building heating improvements. This will improve reliable operation of the generator and improve the energy efficiency of the building.

This plant is now tied into the grid and is now a standby plant.

Request:

Please explain the control system upgrades required if the Stewart Crossing Plant is now a standby plant. Please provide the current reliability metrics and the forecast improved reliability metrics.

Response:

The control system upgrade will allow Yukon Electrical to synchronize the Stewart Crossing Plant to the grid. Currently the community has a complete outage to transfer from the power supply of the Stewart Crossing Plant to the Yukon Interconnected System. This control system upgrade will reduce the outages to the community by 50% for any outages that resulted in disconnection from the Yukon Interconnected System and operation of the standby plant. Please refer to YUB-YECL-77 Attachment 1 for reliability metrics.

YUB-YECL-78

Reference: Line item – Ross River Replace ABB 5HK Breakers, YECL Application, page 9-55

Request:

(a) Is the present breaker in immediate danger of failure?

(b) Does the present breaker present a safety hazard to the employees?

Response:

(a) No. The Arc Extinguishing Chutes in the breakers were inspected during regular maintenance shutdowns. Dielectric testing has confirmed the insulation is intact, except for small cracks, and is able to continue to operate as designed. However, the Arc Extinguishing Chutes have asbestos-lined material that has cracked and flaking occurs during operation of the breaker. There is no reliable method to predict if and when the breaker will fail.

(b) Yes. The concern is that the flaking asbestos becomes air borne during operation of the breakers. Asbestos is a known carcinogen.

YUB-YECL-79

Reference: Line item – Miscellaneous O/H Services – Various Subdivisions, YECL Application, page 9-56

Capital expenditures required for the connection of new residential and commercial customers in Yukon Electrical's service area in compliance with Terms and Conditions. Any new extension (driven by a customer) that is under $25k is included in this.

Request:

Please provide the details as to how the projected expenditure was determined for each of the test years.

Response:

Yukon Electrical has determined its new extension capital forecast, including the Miscellaneous O/S Services, based on the knowledge it has of areas of development within its service areas as well as based on historical customer additions. New extensions are, on average, 75-80% funded by customer contributions. The net investment for the New Extension Category, including Miscellaneous O/S Services, is as follows:

		2011 Actual	2012 Actual	2013 Forecast	2014 Forecast	2015 Forecast
New Extensions	Schedule 9.1, L.10	6,078	4,919	5,149	5,307	5,570
Customer Contributions *		(5,149)	(3,097)	(3,903)	(4,320)	(4,160)
Yukon Electrical Net Investment		929	1,822	1,246	987	1,410

* Total contributions as per Schedule 8.12, L.3, less contributions received for Street Lights.

YUB-YECL-80

Reference: Depreciation, YECL Application, page 7-1

The depreciation rates used to calculate actual 2008 through 2012 depreciation expense were developed using the Board-approved depreciation parameters form Yukon Electrical's last General Rate Application.

Request:

(a) Please provide the terms of reference and the direction given by YECL to Gannett Fleming Inc. to undertake and the need for the depreciation study.

(b) Why is there a need to change YECL's depreciation study?

Response:

(a) Gannett Fleming was retained by Yukon Electrical in November 2012 to complete a full and comprehensive depreciation study. Gannett Fleming was also asked to research and provide an assessment of the reasonableness of including a request for the re-instatement of net salvage percentages into the depreciation rate calculations. There were no formal contractual documents or terms of reference.

(b) As stated in YUB-YECL-88(a), depreciation studies are typically completed every 3 to 5 years. Yukon Electrical's last depreciation study was submitted in its 2008-2009 GTA and was based upon data as of December 31, 2007. Yukon Electrical's submitted depreciation study is based upon data as of December 31, 2011. As detailed in Yukon Electrical's 2008-2009 GTA, Schedule 8.5, line 2, the 2007 year-end balance was $117M. As detailed in Yukon Electrical's current GTA, Schedule 8.5, line 2, the 2011 year-end balance was $155M with the 2015 year-end balance expected to be $229M. This represents an approximate 32% increase in property, plant and equipment from the 2007 data represented in Yukon Electrical's last depreciation study to the 2011 data represented in Yukon Electrical's current depreciation study. Furthermore, the year-end balance as of 2015 represents approximately a 96% increase from the 2007 year-end balance. In light of this significant amount of capital activity, Yukon Electrical determined that a detailed review and study was necessary to ensure an accurate recovery of its capital assets.

In addition, as detailed in Section 7, page 7-1, lines 10-14, Yukon Electrical is proposing to change the method of depreciation for diesel generation from a mass property approach to a life span approach. This change will allow for more accurate diesel generation depreciation rates.

In addition to the above noted issue driving the need for the depreciation study, Yukon Electrical also believes it is important for all parties to understand the following broader picture changes that have occurred in the Yukon since Board Order 2009-02.

The first issue that has changed since Board Order 2009-02 is that sending the right price signal to customers has taken on added importance as a result of diesel generation once again being on the margin in the Yukon. As the Board is aware, price signals that reflect the full cost to serve customers were discussed as part of the 2010 Yukon Electrical and Yukon Energy Joint Phase II Rate Application. While a large amount of the rate design discussion centered on economy and efficiency principles within the rate design of runoff rates and what exactly was meant by the term "economy and efficiency", Yukon Electrical notes the following statements in Board Order 2010-13 (paragraphs 196-197):

> The Board has considered the views of all the Parties and notes that there clearly is no consensus on this issue. However, it is clear that the Companies agree that in the past, economy and efficiency has been linked to the incremental cost of diesel generation.
>
> In terms of pricing signals, the Board is of the view that the best pricing signals to customers are those prices that reflect the full cost to serve those customers. Arguments on incremental cost of diesel generation, or what portion of the incremental cost of diesel generation should be reflected in the runoff rates should take a distant backseat to the proper alignment of costs to revenues for each rate class. Once rebalancing has occurred for the rate classes, then issues relating to runoff can be examined in greater detail.

While Yukon Electrical recognizes the above statements were in the context of setting runoff rates, it is for this exact reason of prices reflecting the full cost to serve customer that Yukon Electrical is requesting to once again collect negative net salvage as part of its revenue requirement.

A second large change since Board Order 2009-02 has been the development and inclusion in this Application of the Joint Yukon Electrical and Yukon Energy Demand Side Management (DSM) program. This program will promote energy conservation and will result in lower energy consumption. It is Yukon Electrical's position that it is counter intuitive to be investing in this DSM program while, at the same time, not sending the right price signal by not fully charging current customers for the cost to provide electric service; namely the cost associated with net salvage.

A third large change since Board Order 2009-02 has been the cessation of collection of net salvage resulting in Yukon Electrical falling considerably behind in its required recovery of the funds for future removal of assets. In the 3 year period from 2009 through 2011, an increase in the amount of Future Removal and Site Restoration (i.e. FRSR) deficiency transfer from current users of the Yukon Electrical utility assets to future rate-payers of $7.9 million has accrued to a total balance of over $12 million. It is noted that this significant increase in transfer to future rate-payers is caused by two significant forces. Firstly, the retirement costs associated with assets that have retired over the past 3 year period have drawn down the FRSR by over 6.2%[1] of the balance that existed at December 31, 2008. However, this draw down of the FRSR was caused by retirements of only approximately 3% of the plant in service as at December 2008[2]. In other words, the FRSR balance is drawing down at approximately twice the rate of the asset retirement activity of the plant in service balance that existed at December 31, 2008.

The second cause of the significant increase in the accumulated FRSR deficiency is the fact that older vintages of assets are now 3 years closer to expected retirement, providing less time for these vintages to recover the FRSR deficiency. While approximately 3% of the investment in plant in service as of 2008 has retired over the period from 2009 through 2011, this pace of retirements is expected to significantly increase in future years, which will require significantly increased amounts of cost of removal funding. For example, over the past 16 years, 4 diesel generating units have been removed and retired from service. However, over the next 3 year period 7 units will require replacement due to age and condition. As such, the pace of retirements will significantly increase over the next few years.

[1] Calculated by comparing the 2008 FRSR balance of $4,688,112 to the 2012 balance of $4.395,151
[2] Based on2009 through 2012 retirement transactions of $3.3 million compared to the 2008 plant in service balance of $115.7 million

Gannett Fleming has advised that the level of accumulated FRSR deficiency will continue to increase at an increasingly rapid pace in future years, if FRSR funding is not re-instated into the deprecation calculations. As noted above there are two independent forces that are causing increases in the amount of the deficiency, that will cause the deficiency to grow at an exponential rate, as witnessed over the past 3 year period. The inter-generational inequity of the current process as mandated by the Board in Decision 2009-02 has already caused future rate-payers to bear $7.9 million of additional burden, and continuation of this practice will see this burden increase by exponential amounts in future years.

The concept of inclusion of net salvage provisions into the depreciation rate calculations has been a topic of debate in many regulatory jurisdictions across Canada since the issuance of the YUB Board Decision 2009-02. As indicated in the Additional Evidence of Larry Edwin Kennedy filed with the current Yukon Electrical Application, this topic has received considerable attention in the depreciation rate filings in many jurisdictions. However, notwithstanding the significant amount of regulatory debate, the inclusion of net salvage percentages in the depreciation rate calculations continues to be widely accepted throughout Canada and North America. Furthermore, the topic of re-instatement of net salvage into depreciation rate calculations has been specifically discussed in hearings in British Columbia in 2011, in which the BCUC specifically allowed FortisBC Energy Inc. to re-instate collection of net salvage as part of their depreciation rate calculations. As stated by the BCUC in FortisBC Energy's 2012-2013 Revenue Requirements and Rates Decision, dated April 12, 2012, pages 83-84:

> The Commission Panel accepts the FEU's proposed application of the traditional method of providing negative salvage in rates during the test period. Using a "pay as you go system" to recover salvage costs could see ratepayers of tomorrow paying higher prices to retire assets which were used to the benefit of today's ratepayers. Further the Commission Panel also does not believe a phased in approach is appropriate. In our view, such treatment will only further defer costs of today for payment by future ratepayers and, given current fuel prices, such treatment does not appear warranted.

While net negative salvage rates are an estimate, the Commission Panel accepts that the rates are based on the recommendations of an independent expert. The Panel also accepts that net negative salvage is a widely used utility practice in Canada and is within the recommended accounting practices of FERC.

For the above reasons, Yukon Electrical is of the view that the completion of an updated depreciation study was necessary and appropriate.

YUB-YECL-81

Reference: Depreciation, YECL Application, page 7-1

For this depreciation study, Yukon Electrical has incorporated the usage of a life span analysis (similar to hydro generation) for each of its diesel generation locations. This will allow for more accurate depreciation rates for diesel generation facilities.

Request:

(a) Please describe and explain the method used to determine the depreciation expense for diesel generation facilities in prior YECL applications.

(b) Please explain lifespan analysis.

Response:

(a) In prior depreciation studies, the diesel generation facilities were depreciated using group depreciation methods with the use of an average service life estimate combined with an estimated retirement pattern (Iowa curve shape) on an account by account basis. In this manner the assets within each account are depreciated based on the expected average service life based on physical factors such as wear and tear, exposure to the elements, technology, etc. As such, the depreciation rates did not specifically consider economic factors on the facility as a whole that are now considered as part of the life span analysis.

(b) Long life assets such as electric generation plants are restricted not only by physical forces of retirement such as wear and tear and physical deterioration, but also, and to a much greater extent, by economic forces of retirement such as changes in demand and capacity, environmental factors, and alternative sources of generation. Generally, environmental forces of retirement will be the dominate retirement force than physical forces of retirement. In Yukon Electrical's situation, it is expected that economic forces of retirement will be the dominant force of retirement. As such, Gannett Fleming recommends the use of Life Span in the development of depreciation rate for electric generation plant.

The concept referred to with the terms "Life span", "economic life" or "economic planning horizon" or "truncation date" (which have similar meaning within

depreciation literature) is the key parameter used to set appropriate depreciation rates that accurately reflect the annual consumption in service value when nonphysical forces of retirement are probable. Appropriate depreciation rates also help to ensure that both long term generational equity and a reasonable opportunity for the recovery of investment are achievable.

The use of Life span in the calculation of depreciation rates introduces the concept of Terminal or final retirements into the calculation to represent those retirements described by the truncation of the interim survivor curve at the truncation date. The following diagram provides an illustration of the concept of terminal retirement in the calculation of the estimated average service life. In this illustration a life span date of 2025 is used in combination with an R2-70 Iowa curve.

YUB-YECL-82

Reference: Deferral on depreciation parameters, process to determine whether a change in depreciation parameters may be required, YECL Application, pages 7-2 and 7-3

Yukon Electrical is requesting approval for a deferral account to allow it the ability to file future applications, as necessary, to change its depreciation parameters within the 2013-2015 test period, and flow through the impact of any such change to customers within the test period.

If a significant change has occurred, but not only in the current year but over a few years (i.e.2 to 3) that cannot be discounted as being a non-typical transaction and appears to be a valid retirement pressure that is supported by the appropriate engineers and management, than a new depreciation parameter may be warranted.

Request:

(a) Please explain why the above-noted request may not be considered as retroactive ratemaking?

(b) Would the YECL request to potentially change depreciation parameters shift forecast risk for this item form YECL to customers?

(c) The timing required to detect a significant change extends beyond the requested test period. Would it be more efficient then to propose changes to depreciation parameters in a subsequent GRA?

(d) YECL has stated that, “each change in depreciation parameters must be assessed on an individual basis with regard to materiality”. Please provide YECL’s views of what those materiality guidelines should be.

Response:

(a) This deferral account should not be considered retroactive ratemaking as it is simply requesting the opportunity to reflect in rates the impact of updated depreciation parameters potentially more often than what would have been necessary prior to the advent of IFRS. In the past, depreciation studies were filed in regular intervals to update depreciation parameters. These updated

depreciation parameters were filed with regulators, tested, approved and ultimately reflected in both the GAAP and regulatory books of the utility. The only thing that has changed in today's IFRS environment is that IFRS requires depreciation parameters to be reviewed on an annual basis. This means there is now a risk that there will be different depreciation parameters for IFRS and utility purposes if there is not an opportunity to update utility depreciation parameters at the same time as they are changed for IFRS purposes.

(b) As detailed in Section 7 of its Application, the intention of Yukon Electrical's requested deferral is, to the extent possible, to permit Yukon Electrical to harmonize IFRS and regulatory accounting and avoid the administrative burden of keeping two sets of financial records. As such, there is no shifting of forecast risk for this item from Yukon Electrical to customers.

Significant changes in the expected life of assets or gross salvage and costs of retirement of assets can be caused by various events, including a change in technology. Such an event or events could have an immediate impact on the expected life of assets or gross salvage and costs of retirement in the same year in which in which it occurs. Conversely, such event or events could have an impact on the expected life of assets or gross salvage and costs that is not immediate but is only revealed after several years of data and trend information is analyzed. Yukon Electrical would be required to update its depreciation parameters if either type of situation were to occur.

If a material change is warranted upon Yukon Electrical's annual review of depreciation parameters as described on pages 7-2 and 7-3 of the Application, Yukon Electrical would be obligated to adjust its depreciation parameters and the resulting depreciation rates and expense for that year for financial statement purposes in order to obtain a clean audit opinion under IFRS. While the update to the depreciation parameters for regulatory purposes could wait until Yukon Electrical's next GRA is filed, the delay would create a situation where there Yukon Electrical would be managing two separate sets of books for property plant and equipment.

Yukon Electrical would only update its depreciation parameters if the resulting impact on depreciation expense was large enough to require adjustment for financial statement purposes. Such a change would have to be greater than $100,000.

YUB-YECL-83

Reference: Depreciation, YECL Application, Schedules 7-1 to 7-5 inclusive

Request:

(a) Please restate the Section 7 schedules, using the methods and Iowa curves approved in YECL's 2008-09 GRA.

(b) In schedule 7.5, please fully explain the transition from ($382,000) to $71,000 (2012 Actual to 2013 Forecast) for the total amortization of differences.

Response:

(a) Please refer to YUB-YECL-83(a) Attachment 1.

(b) The amortization of differences is developed using the forecast life and net salvage parameters for each fixed asset account. Using the forecast life and net salvage parameters assumes that these parameters have been in existence since day 1 for each fixed asset account and determines a calculated accrued depreciation to the date of the depreciation study. This calculated accrued depreciation is then compared to the actual booked accumulated depreciation. If the booked value is greater than +/- 5% of the calculated value, the difference is amortized over the remaining life of the fixed asset account, as an annual provision for true-up, resulting in an annual depreciation expense decrease. Similarly, if the booked value is less than +/- 5% of the calculated value, the difference is amortized over the remaining life of the fixed asset account resulting in an annual depreciation expense increase. Thus, the difference between the previous depreciation study amount of ($382,000) to the current depreciation study amount of $71,000 reflects depreciation parameter forecast changes.

YUB-YECL-84

Reference: Average life curves, YECL Application, Section 7, Attachment 1, page 31 of 208

In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit … It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group, assuming no contrary relevant factors external to the analysis of historical data.

Request:

(a) What is used to determine which curve gives the best fit? Is a goodness-of-fit test or some other statistical method used to make the determination? Please explain.

(b) If statistics are not the only factor used in determining the best fitting curve, what weighting is given to statistical analysis versus "contrary relevant factors"?

Response:

(a) Gannett Fleming employed a visual fitting process, which includes the following steps:

1. The observed life table as determined in the Retirement rate analysis is plotted in accordance with the procedures as described at pages II-10 through II-23 of the Gannett Fleming report;

2. The areas of the observed life table that the analyst considered to represent data points that are representative of future retirement causes and expectations are determined for each account, giving consideration to:

   i. placing reduced emphasis on the tail portion of the observed life table (generally once plant exposed to retirement is less than 1% of total plant exposed to retirement at age 0);

   ii. placing reduced emphasis on the early portion of the life curve; and

iii. identification of any unusual data points in the observed life table at any age and determination of the reasons for retirement causing the unusual data point;

3. A statistically determined best fit is determined through the calculation of the sum of least squared differences procedure. In this procedure, the variance of each actual data point determined in the retirement rate analysis is compared to the corresponding data point of the smoothed Iowa curve through the calculation of a residual measure in which each variance is squared and the squared differences are summed. The square root of the sum of the squared differences is known as the residual measure of the fit of the smoothed curve to the observed life table; and

4. The statistical best fit (as determined above) for each family of curves is plotted against the observed life table. In addition, a number of smoothed Iowa curves are plotted against the observed life table through the period of most reliance to allow the depreciation analyst to visually inspect the smoothed Iowa curve against the plotted observed life table.

While this process begins with the determination of a best fit curve determined through the calculation of the residual measures, the statistical fitting process does not provide any weighting of the observed life table data points. Therefore, the statistical best fits are only used as a starting point for the remainder of the curve fitting process, in order that the analyst can place appropriate weighting on the various segments of the observed life table.

(b) Please refer to YUB-YECL-84(b) Attachment 1 which is a summary of the relative weighting assigned to each of the factors considered in the average service life analysis for each account.

YUB-YECL-85

Reference: Survivor curve judgments, YECL Application, Section 7, Attachment 1, page 31 of 208

The primary factors were the statistical analysis of data; current policies and outlook as determined during conversations with management personnel and engineering staff, and survivor curve estimates form previous studies of this Company and other electric distribution companies.

Request:

Please explain why any weighting should be given to other distribution companies.

Response:

In the development of average service life estimates, consideration should be given to all forces of retirement that can be reasonably expected to occur. In order to forecast the forces of retirement, a number of estimation "tools" are available, including the review of historic retirement experience, discussions with operations and management representatives, industry experience, upcoming capital programs and experience gained from the review of relevant peer companies. In this manner, the depreciation analyst can form an average service life or net salvage estimate based on a wide variety of input. The weighting provided to each of these inputs is provided in response to information request YUB-YECL-84(b) Attachment 1.

With specific reference to the use of peer information, it should be noted that it provided additional weighting in circumstances where the company has a limited amount of actual retirement experience, and where peer companies have experienced relevant retirement activity. Additionally, Gannett Fleming uses the peer analysis as a benchmark for the determination of the reasonableness of the average service life and net salvage analysis developed from the use of other analysis tools. In this manner, the use of peers is not the primary estimation method, but rather a check of reasonableness. In circumstances where average life or net salvage parameters determined with company specific information are out of the range of the peer analysis, further interview and discussions are held with company representatives to determine the potential reasons that the company retirement history would differ from that of the peers.

YUB-YECL-86

Reference: Asset accounts, YECL Application, Section 7, Attachment 1, pages 31 of 208 to 35 of 208

The estimates of net salvage were based primarily on the professional judgment of Gannett Fleming, in part on historical data for the years 1983 through 2011, and in part through a comparison to peer electric distribution companies.

The net salvage percentages estimated in this study have been determined using the "Traditional Approach" for net salvage estimation.

Request:

(a) For each of the asset accounts listed, please provide a table that shows the Iowa curve previously used and approved by the Board, the Iowa curve recommended in this application, the corresponding depreciation rates previously approved and now recommended, and if there is a change an explanation of the primary factor for that change from what was approved to what is being recommended.

(b) In general, does a change in the Iowa curve from a 50-RX to a 45-RX imply a change in expected service life form 50 years to 45 years?

(c) For Account 475.00 the change from Iowa 50-R4 to Iowa 45-R3 is "to better fit industry retirement trends". What curve best represents YECL's retirement trends for that asset class?

(d) For account 478.10, the Iowa curve has been changed from an Iowa 25-R3 to an Iowa 30-R3 "to better fit industry retirement trends". Please define the industry, the trend, and the location of that industry and how those locations are an appropriate match for a location such as Yukon.

(e) Please explain why the retirement history for Accounts 422.00 through 427.00 were not available. What was used in past studies for YECL?

Response:

(a) Please refer to YUB-YECL-86(a) Attachment 1, which identifies the primary factor for the material change from what was approved in the last depreciation study to what is being recommended for the Iowa curve and depreciation rates in this application.

(b) Confirmed, given the context of the example where the survivor curve shape (i.e. RX) remains constant and the average service life differs.

(c) The curve that best represents Yukon Electrical's retirement trends for the asset class of 475.00 is within the range of the electric distribution systems peer analysis (YUB-YECL-87(a)). The recommended Iowa curve appears to be trending towards a shorter survivor curve shape amongst Yukon Electrical's peers and within the range of Yukon Energy Corporation's approved Iowa curve.

(d) Please refer to the response to information request YUB-YECL-87. The analysis focused on a number of northern Canadian regulated distribution systems including Yukon Energy Corporation.

(e) Given the amount of investment in the hydro generation accounts, and further given the very limited amount of retirement history, in prior studies it was determined that the accounts could be analyzed and depreciated as one group. However, during the early stages of this current study, it was identified that some of the operating components will have an identifiably differing life expectation and replacement of some of the components is now likely in the near term. Therefore, during the preparation of this study, it was determined that the expected consumption of service value for this group of investment is better estimated through the analysis of the accounts individually.

YUB-YECL-87

Reference: Estimation of net salvage, YECL Application, Section 7, Attachment 1, pages 35 to 37 of 208

The estimates of net salvage were based primarily on the professional judgment of Gannett Fleming, in part on historical data for the years 1983 through 2011, and in part through a comparison to peer electric distribution companies.

The net salvage percentages estimated in this study have been determined using the "Traditional Approach" for net salvage estimation.

Request:

(a) Please list the peer distribution companies and the weighting given to each company.

(b) Please confirm whether the "Traditional Approach" conforms with past directions form this Board.

(c) Please provide a table showing for each asset account, the approved net salvage percentages approved in the 2008-09 YECL GRA and the net salvage percentages recommended in the current application.

Response:

(a) Please refer to YUB-YECL-87(a) Attachment 1 for a list of peer distribution companies. Gannett Fleming does not assign any specific weighting to each company in the peer analysis. The peer analysis tool is a guide in formulating the reasonableness of a range in order to test whether the preliminary recommendation falls within the range of currently approved parameters.

(b) Confirmed. In previous applications, the request for net salvage has been prepared using the "traditional approach".

(c) Please refer to YUB-YECL-87(c) Attachment 1 for a table of the net salvage percentages approved in the 2008-09 Yukon Electrical GRA along with the net salvage percentages recommended of this current application.

YUB-YECL-88

Reference: Results of study, YECL Application, Section 7, Attachment 1, page 43 of 208

An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and salvage and for the change of the composition of property in service.

The service life and net salvage estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and consideration of estimates made for other electric utilities.

Request:

(a) For the first quote above, please define "a long period of time". Would consistent accrual rates imply accuracy and a reasonable estimation of average service life for an asset?

(b) Why would any consideration be given to estimates made for other electric utilities?

Response:

(a) Normally depreciation studies are completed every 3 to 5 years for utilities of the size of Yukon Electrical. Gannett Fleming would view that a "long period of time" would be a period of longer than 5 years. Additionally, Gannett Fleming notes that consistent accrual rates that remain unchanged for periods of longer than 5 years do not necessarily imply accuracy and a reasonable estimation of average service life for an asset. In circumstances where accrual rates remain unchanged for long periods of time without any type of review or study, the accrual rate should not be considered as correct. However, accrual rates that remain consistent after having been studied likely represent a reasonable estimation of average service life.

(b) Please refer to the response to information request YUB-YECL-85.

YUB-YECL-89

Reference: Additional evidence, YECL Application, Section 7, Attachment 2

Request:

Was this additional evidence provided at the request of YECL? Please explain.

Response:

During the initial phases of the depreciation study, Yukon Electrical asked Gannett Fleming to provide an indication of whether any events have transpired since the Board's Decision regarding the inclusion of net salvage percentages that may support the reinstatement of net salvage percentages in the current study. In response to this request, Gannett Fleming embarked upon a process to research this issue among Canadian regulatory jurisdictions. Based on this research, it was Gannett Fleming's view that a number of significant events had transpired that support the inclusion of net salvage. Accordingly, Yukon Electrical requested that the Additional Evidence addressing this issue be prepared.

YUB-YECL-90

Reference: Inclusion of net salvage in the depreciation rate calculations, YECL Application, Section 7, Attachment 2

Request:

(a) To clarify, when net salvage is included in depreciation rates, are customers therefore currently paying for a service (salvage) or part thereof, which would occur in the future, and whose final cost is an estimate subject to change?

(b) Do accounting guidelines, MFRs or other rules or regulations delineate the use of depreciation parameters and FRSR policies based on type of ownership (Crown versus private)

(c) If FRSR balances are a current recovery for a future service (salvage), should such balances or contributions earn a return until said services are performed?

(d) If FRSR contributions are based on estimates, who is at risk for any variances between actual and forecast results? Please explain.

Response:

(a) Net salvage is an estimate of the future gross salvage received for property retired minus the future cost of retirement for plant retired, demolished, or removed. Negative net salvage is an estimated cost that will be incurred in the future on facilities that are being used to provide utility service to customers today, and as such, it helps to maintain generational equity, by ensuring that customers are paying for the full cost of receiving service at the time it is being provided. To not do so would result in inter-generational inequity in that future customers would pay for costs associated with facilities that were used to provide service to past customers.

(b) No.

(c) No. Yukon Electrical does not earn a return on FRSR balances prior to said services being performed. As detailed in Schedules 8.5 and 8.6 of its Application, a reinstatement of net negative salvage for Yukon Electrical results

in an increase to the forecast depreciation expense, an increase to the forecast accumulated depreciation and a reduction to the overall forecast rate base. As such, the inclusion of net negative salvage results in a lower rate base as compared to if net negative salvage was not included in Yukon Electrical's revenue requirement.

Please refer to YUB-YECL-90(c) Attachment 1 for Yukon Electrical's forecast rate base and return on rate base for 2013-2015 both including and excluding net negative salvage, which illustrates that the inclusion of net negative salvage results in a lower rate base.

(d) Net salvage parameters are reviewed at each GRA for applicability and accuracy to the future gross salvage and cost of retirement costs. These forecasts are vetted, tested and approved at each GRA. As such, these forecasts are based on the best information available to Yukon Electrical at the time and ensures that customers pay only the cost associated with assets required to provide utility service; no less and no more.

The Yukon Electrical Company Limited
Comparison of Rate Base and Return Including and Excuding Net Salvage

	As Filed Using 2013/2015 Proposed Depreciation Parameters - With Net Salvage	Using 2013/2015 Proposed Depreciation Parameters - No Net Salvage
