As discussed we request that you conduct a complete depreciation study for the Yukon Electrical Company to be included in our 2008 general rate application. I will forward our data files to you early in the new year.

Have a great Christmas season!!

Doug Baer

YECL has 5 accounts with an estimated average service life longer than YEC by at least 10
YECL has 11 accounts with an estimated average service life shorter than YEC by at least 10
The average service life estimate is within 10 in 8 accounts

**YEC-YECL-18**

**Reference:** Automated Meter Reading

**Requests:**

(a) Please provide the business case for conversion to AMR system, including any cost-benefit analysis undertaken.

(b) Please provide all internally generated documents including reports done for or by senior management to justify this capital project.

**Response:**

(a&b) Please refer to YUB-YECL-15(c) Attachment 1.

## YEC-YECL-19

**Reference:** New Customer Care and Billing System

**Requests:**

(a) Please provide the business case for the new customer care and billing system conversion including any cost-benefit analysis undertaken.

(b) Please provide all internally generated documents including reports done for or by senior management to justify this capital project.

(c) Please provide the amortization periods for the legacy systems that are being replaced with the new customer care and billing system.

**Response:**

(a) Please refer to YUB-YECL-16(b) Attachment 1.

(b) Please refer to YUB-YECL-16(b) Attachment 1.

(c) There is no amortization period for the legacy billing system as Yukon Electrical does not have any assets or accumulated amortization associated with the legacy system.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

## YEC-YECL-20

**Reference:** Johnson's Crossing

**Requests:**

(a) Please confirm the rate proposed to be charged for Johnson's Crossing.

(b) Please provide justification for rate and explain why it is fair and reasonable.

**Response:**

(a) As per Schedule 2.1 lines 32-37, there is no new rate proposed for Yukon Electrical's wholesale sales to Yukon Energy at Johnson's Crossing and the Marsh Lake Control Structure. Similar to retail rates, the wholesale rates of 20 cents per kWh and 6.84 cents a kWh will continue until such time as a Phase II Application is completed and new rates are approved by the Board. Yukon Electrical notes the Riders R and G were not proposed to be applicable to the wholesale rate charged by Yukon Electrical to Yukon Energy.

(b) Yukon Electrical and Yukon Energy jointly filed their 1996 1997 GRA that incorporated the Johnson's Crossing rate into their respective wholesale sales and purchased power revenue requirements. Both companies were effectively held whole. Since that point in time, Yukon Energy as part of its 2005 Required Revenues and Related Matters Application updated its purchased power forecast based on the above noted rates. (Please refer to Schedule 12, line 18 of Yukon Energy's 2005 Application where 38,000 was forecast for purchased power.) Until such time as a formal cost of service is completed for the wholesale as well as retail rates as part of a Phase II Application, the current approach of Yukon Electrical and Yukon Energy forecasting their respective revenues and expenses at the existing rates is fair and reasonable.

## YEC-YECL-21

**Reference:** Additions to Rate Base

**Requests:**

(a) With reference to any existing and applicable policy on capital expenditures, please provide a brief description and justification of all capital projects over 500,000 undertaken from 1996 to 2006 that will continue to have costs in rate base during 2008 or 2009, and indicate the amount of such costs in forecast rate base in 2008 and 2009.

(b) For each of the capital projects in (a) please provide the business case and all internally generated documents including reports done for or by senior management to justify this capital project.

(c) Please provide a continuity schedule for gross plant in service showing capital additions and disposals for each year (1996-2009).

(d) Please provide a continuity schedule for accumulated amortization, opening balance and fixed asset amortization.

**Response:**

(a&b) Please refer to YEC-YECL-25(a) Attachment 1 for summary of capital additions greater than 100,000.

(c&d) Please refer to YEC-YECL-21(c) Attachment 1.

## YEC-YECL-22

**Reference:** Contributions in Aid of Construction Requests**:**

**Requests:**

(a) Please provide a continuity schedule for YECL of Contributions in Aid of Construction for the years 1996 to 2009 segregating additions and amortizations.

(b) Please provide contributions from customers since 1996 (gross balance as of December 31, 2007).

(c) By component please confirm which component of the company's investment policy with regard to maximum utility investment was used to determine YECL's investment in each project.

(d) If the company's investment policy was not followed please provide a detailed explanation as to how YECL derived its investment.

**Response:**

(a&b) Please refer to YEC-YECL-22(a) Attachment 1.

(c) Yukon Electrical follows the current Electric Service Regulations (ESR), Schedule B Page 25, effective October 18, 2005. Prior to 2005 the Yukon Electrical followed the ESA effective March 19, 1996. Please refer to Attachment YEC-YECL-22(c) Attachment 1 and Attachment YEC-YECL-22(c) Attachment 2.

(d) Yukon Electrical follows the investment policy that has been approved by the Board.

## SCHEDULE B
## MAXIMUM COMPANY INVESTMENT

**1.** **(a)** **"Cost"** means the estimated cost of materials, labour, equipment, expenses, and any other direct costs incurred by the Company in extending Service to a Point of Delivery.

**(b)** **"Annual Cost"** means the estimated cost of generating and transmitting electric energy to the Customer, operating and maintaining the facilities constructed to serve the Customer and the fixed charges, including return, income tax and depreciation, on the cost of facilities constructed to serve the Customers.

**2.** Subject to the provisions of paragraph 3 of this Schedule B, the maximum **cost** which the Company will incur to extend service to a point of delivery (herein referred to as the "Maximum Company Investment") shall be determined as follows:

**(a)** **Residential Service:**
900 per single family dwelling; and
450 per Multiple Dwelling Unit

**(b)** **General Service:**
400 per kilowatt of estimated billing demand, which shall not be less than five kilowatts, provided that if the estimated life is less than 25 years or seasonal the Company investment will be reduced proportionally, then the Maximum Company Investment shall be determined in the manner described in paragraph 3;

**c)** **Municipal Street Lighting:**
700 per light

**d)** **General Service Secondary:**
One half of one year of forecast retail sales revenues.

At the end of one year of service the Company will re-assess whether the customer's estimates of their consumption were accurate and will collect from the customer (or refund) any contributions, based on the Maximum Company Investment rules then in place in paragraph 2 or paragraph 3, that are required if the loads are significantly different than originally estimated.

**3.** The Maximum Company Investment for an extension of service not specified in paragraph 2, and the Maximum Company Investment in any extension of service, whether or not specified in paragraph 2, the Load characteristics of which are expected to vary materially from the average for that type of service, shall be determined on the basis of a detailed analysis of the **Annual Cost** of such extension and the revenue expected to be derived therefrom. If the **Annual Cost** of serving a customer is higher than the revenue expected to be received from such service, then the Maximum Company Investment shall be the **Cost** of the extension less the present value of the annual amounts over the expected life of the service by which the **Annual Cost** is expected to exceed the revenue.

## SCHEDULE B
## MAXIMUM COMPANY INVESTMENT

**1.** **(a)** **"Cost"** means the estimated cost of materials, labour, equipment, expenses, and any other direct costs incurred by the Utility in extending Service to a Point of Delivery.

**(b)** **"Annual Cost"** means the estimated cost of generating and transmitting electric energy to the Customer, operating and maintaining the facilities constructed to serve the Customer and the fixed charges, including return, income tax and depreciation, on the cost of facilities constructed to serve the Customers.

**2.** Subject to the provisions of paragraph 3 of this Schedule B, the maximum **cost** which the Company will incur to extend service to a point of delivery (herein referred to as the "Maximum Company Investment") shall be determined as follows:

**(a)** **Residential Service:**
900 per single family dwelling; and
450 per Multiple Dwelling Unit

**(b)** **General Service:**
180 per kilowatt of estimated billing demand, which shall not be less than five kilowatts, provided that if the estimated life is less than 25 years or seasonal the Company investment will be reduced proportionally, then the maximum Company investment shall be determined in the manner described in paragraph 3;

**c)** **Municipal Street Lighting:**
700 per light.

**3.** The maximum Company investment for an extension of service not specified in paragraph 2, and the maximum Company investment in any extension of service, whether or not specified in paragraph 2, the Load characteristics of which are expected to vary materially from the average for that type of service, shall be determined on the basis of a detailed analysis of the **Annual Cost** of such extension and the revenue expected to be derived therefrom. If the **Annual Cost** of serving a customer is higher than the revenue expected to be received from such service, then

the maximum Company investment shall be the **Cost** of the extension less the present value of the annual amounts over the expected life of the service by which the **Annual Cost** is expected to exceed the revenue.

**YEC-YECL-23**

**Reference: Capital Plans**

**Requests:**

(a) Describe the system planning criteria used to develop YECL's capital plans.

(b) How far into the future does YECL prepare capital plans? What are these capital plans based on? Please provide a schedule showing YECL's capital plans by project for the next 5 years.

(c) Please describe how YECL's capital projects are prioritized.

(d) Please describe the age and condition assessments which lead to YECL's conclusion that lines need to be upgraded. What are the reliability statistics for these lines and how do these statistics compare to other lines on the system and the system average.

(e) Has a condition assessment study or other report documenting condition assessment been undertaken? If so, please provide copies of all relevant documents.

(f) Please provide YECL's multi year plan to upgrade and extend the life of major components.

**Response:**

(a) System Planning is driven primarily by load growth, existing infrastructure capacity, age, condition, access and operability, safety issues, other system risks and changes to standards and operating practices. Other components are coincidental load readings at substations and at specific breakers. One of the last key factors in this process is the development or redevelopment of the community or areas within the community. Factors influencing community development are the local economy, demand for and availability of residential, commercial and industrial property.

(b) Yukon Electrical develops a 3 year capital plan which it updates annually. Capital plans are based on a review of the overall system requirements as determined by the operations team utilizing information as provided below in (d) and (e). Yukon Electrical's two year forecast is provided in its application for the test years 2008 and 2009; with 2010 still under development.

(c) Once capital projects have been identified priorities are determined based on some of the following considerations:

- Customer needs- providing service to customers who wish to receive electrical service including a review of in service dates
- Safety benefits requirements- projects that will improve safety and or address unsafe situations
- Improves Reliability- the project improves reliability or addresses a reliability concern.
- Enhances customer service- projects that provide service benefits to customers.
- Age and obsolescence- projects that are required to support system integrity.
- Cost benefits- projects that provide a financial benefit to customers
- Replacement of infrastructure and equipment projects that are necessary to deliver service to customers.
- Meet legislative or legal requirements- projects that are required to address changes to codes, regulations or laws. Potential liability must also be taken into account.
- Environmental projects that will provide environmental benefits or that are required to meet environmental standards.

Projects are assessed against the considerations and completed based on facts, prudence, experience and professional judgement

(d) Age alone is not the deciding factor. The climbability of a pole, the ability to receive support or parts for a piece of equipment, accessibility to facilities and many other factors including those identified in (a) above are taken into account when evaluating an asset for rebuild or replacement.

Yukon Electrical does not track specifically its reliability statistics on a line or feeder basis but rather it tracks reliability on the system as a whole. Weekly Yukon Electrical's operations group meets with engineering to discuss the past weeks system performance. Of priority at these weekly meetings are all unplanned distribution outages or events which cause supply disruptions to customers. Events are recorded and trends are identified, ie: reoccurring failures of specific feeders, transformers or services. Trends are then investigated by researching the causes. Supporting information may be available by reviewing service interruption reports. Depending on the cause of the outages a determination is made to either immediately make corrections to the equipment or if the asset repairs can be put into the capital business planning cycle.

(e) On a regular basis Yukon Electrical completes assessments on its system. This is recorded in a number of reports, including: monthly substation reports annual line patrols, ground rod report forms, electrical equipment reports, hydro inspection reports, diesel plant inspection reports, safety audit reports, environmental audit reports, fleet inspection reports. All of these types of reports assist Yukon Electrical in determining the condition of its power system and equipment and provides information necessary to assist with Capital and O&M planning requirements. This information is too voluminous to provide as it would take up several file cabinets. Third party assessments have only been completed on specific components of the distributions system. Such as a Dam Safety Audit on the Fish Lake water way or the Fish Lake turbines inspections. YECL from time to time consults with other groups to assist with its capital planning and business planning needs.

(f) Yukon Electrical's multi year plan for Capital expenditures is provided in Section 9 of the Application. Final determination for 2010 capital expenditures is still under review and not available at this time.

**YEC-YECL-24**

**Reference:** Generation Plants

**Requests:**

(a) With reference to pages 9-5 and 9-6, Plant fuel systems required updating to current Canadian mandatory standards and codes. Please provide detailed information regarding which Canadian mandatory standards and codes are being complied with.

i. Please provide a list of the current Canadian mandatory standards and codes applicable to these projects. Please provide specific sections of Canadian mandatory standards and codes applicable to projects.

ii. Please provide an explanation regarding how the system improvements undertaken meet and comply with the Canadian mandatory standards and codes.

iii. Are any system improvements being undertaken which are not required to comply with mandatory standards and codes? If so, please provide list of such improvements and their justification.

.

**Response:**

(a) .

i. Attached are some of the generation standards relating to generation plants referenced by Yukon Electrical in it application (YEC-YECL-24 attachment 1).

ii. The system improvements undertaken by Yukon Electrical, regarding fuels systems, are driven by a variety of codes and standards as referenced in (i) above. Generally our system improvements are designed to minimize the risk of fire and fuel releases. Therefore alarm systems were installed, fuel

containment was upgraded, and automatic shut of valves were installed to name a few.

iii. Yes, system improvements are undertaken for a variety of reasons including age and obsolescence, environmental compliance, safety, improved reliability, and if required added capacity.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

**5YEC-YECL-25**

**Reference:** Distribution Projects Undertaken Between 1996 and 2005

**Requests:**

(a) For projects greater than 100,000 and in a manner consistent with 1996 97 GRA question YUB-YEC YECL-1-35, please complete a table that details (1) project name and total expense capitalized, (2) project description, (3) rationale justification and (4) cost benefit for all distribution projects between January 1, 1996 and 2007. On an annual basis, please ensure that table provides the sum of all projects not included in this analysis that reconciles to the total distribution capitalized for a given year.

(b) For 1996 and 1997 please explain any discrepancies regarding forecast capital projects and actual results.

**Response:**

(a) Please refer to Yukon Electrical's summary of projects over 100k for years 1996 - 2009 in YEC-YECL-25(a) Attachment 1.

(b) Yukon Electrical's total capital forecast included in its 1996 1997 GRA was 9.774M for the test years 1996 97. The actual total capital expenditures for the 1996 and 1997 test years were 9.729M.

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| C02534<br>( $115,000)<br>2004 ~ 2005 | Ray Street 2004 underground rebuild | Install the electrical portion of the underground system in previously installed raceway. | Poles were aging. Some have no treatment or only treatment at the butts. Other issues due to shell rot or repeated climbing result in poles not being safe to work off of or add new services to. Reconstruction of a new overhead system would not be possible due to code restriction. Therefore YECL has to convert the overhead lines to an underground system. | A subsurface power system designed to new standards. Less potential of human interference or contact. Improved operability and maintenances due to new equipment and access. |
| C01988<br>( $118,000)<br>2001 ~ 2003 | YECL line relocate Alaska Hwy/ Laberge Rd | Rebuild existing powerline to accommodate road upgrade | Structures are old and conductor is small and has been damaged and repaired over the years due to trees and elements. | Increased ground clearance, increased capacity of main line out of LaBerge substation. Reduce long term brushing requirements. Reduce the difficulty of access to the line when performing routine line patrols and troubleshooting. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| C02487 – Y10001 ($225,000) 2004 | YECL Jubilee Mountain Cable Replacement | Build new single phase overhead line to replace 1950's existing 3 phase cable that was laying on the ground. Convert the 3 phase generator for one of the customers to a single phase system to avoid the need for a three phase line. | The existing three phase ground cable had numerous temporary splices causing reliability issues and had caused wildlife issues. The ground cable was also a health and safety hazard to staff and public. | Reliability, safety and replacement of deteriorating facilities. Standard contingency material for repair and restoration. |
| Y10004 ($ 157,000) 2004 | Gray Mountain Line Rebuild<br><br>Middle Section Near Gun Range | Change poles and associated hardware. Rebuild on the opposite side of the road to allow pre build and minimize the outages to the key customers served at the top of Grey Mountain. | This line feeds key communication towers such as radio and hospital pagers as well as infrastructure critical to EMO activities. Furthermore, the line is subject to extreme weather conditions. Poles are aging. Some have no treatment or only treatment at the butts. Other poles, due to shell rot or repeated climbing are not safe to work off of or add services to | Increased reliability to essential service communication sites. Replace deteriorating facilities |
| C02496 ($190,000) 2004 | Grey Mountain Line Rebuild – Bottom section | Change poles and associated hardware. Rebuild on the opposite side of the road to allow pre build and minimize the outages to the key customers served at the top of Grey Mountain. | This line feeds key communication towers such as radio and hospital pagers as well as infrastructure critical to EMO activities. Furthermore, the line is subject to extreme weather conditions. Poles are | Increased reliability to essential service communication sites. Replace deteriorating facilities. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | aging. Some have no treatment or only treatment at the butts. Other poles, due to shell rot or repeated climbing are not safe to work off of or add services to. | |
| C02311 ($224,000) 2003 | 3rd Avenue U/G Conversion<br><br>Boston Pizza to Ray Street. | Install the high voltage cables and ducts into this area and remove aging and deteriorating overhead infrastructure Tie into existing underground facilities on the north side of 2nd Avenue. | Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add new services to. A new overhead system would not be able to meet code in the area that is zoned commercial and could be zero lot line. High voltage lines and transformers would be too close to roof, window and vents. | A subsurface power system designed to new standards. Less potential of human interference or contact. Improved operability and maintenances due to new equipment and access. Replace deteriorated facilities. Eliminate hazards. Comply with code |
| C02113 ($232,000) 2002 | Destruction Bay Alaska Highway Reroute | Move power line to maintain minimum clearances to driving surfaces and allow for Alaska Highway reconstruction. | The existing power line is on the highway Right of Way (ROW) and was in conflict with new highway reconstruction. | Accessible power line Right of Way. Comply with legislation (maintain minimum clearance to driving surface) Replace deteriorated facilities. |
| C02077 ($520,000) 2002 | Shipyard tie in completion | Build new underground lines/feeders and salvage obsolete overhead lines. | New feeders are required to connect distribution system to the new substation. | Strengthens 12 kV loop in downtown Whitehorse core allowing for improved operability and |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | | growth. |
| C02080 ($143,000) 2002 | Services Substation Tie | Tie in new 34KV feeders to connect Shipyard and Services substations. | To provide alternate feed between substations for continuity of service. | Allows us to serve existing customers from our new substation and connects substations for loop and alternate feed capabilities. |
| C02505 ($ 103,000) 2004 | Shipyard substation | Salvaged existing overhead substation and tie into system | Existing sub is on leased land (YTG) and the lease will not be renewed. City plan for area development requires its removal and the lines in the future development area to be removed | Allows us to serve existing customers from our new substation and connects substations for loop and alternate feed capabilities. |
| C02339 – Y10019 ($270,000) 2003-2004 | Powerline reroute Porter creek | Rebuild existing double circuit 34.5kV and 12.5 kv line that is aged and deteriorated and on unsecured Right of Way. | Replace aged and deteriorating facilities that are on unsecured Right of Way. | Security of supply to serve customers in Porter Creek area. Replaced aged and deteriorated main feeder facilities. |
| C02272 ($220,000) 2003-2004 | Distribution drawing upgrade | Digitize and update our manually drafted distribution maps, | Our maps consist of old manually drafted maps that were not easily updatable. Other maps are digitally drawn and updated in a program that only the draftsperson can access. By digitizing our old manual maps and getting key users a program to access the files they can then print the maps they need on a daily | Standardizes drafting process, map updates can be completed in less time. Enables the development of a layered map design, facility information in one format. Allows us to move toward a “data base” of easements, licenses, brushing plans, land base information and ultimately improves service to our customers. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | basis. | |
| C02158 ($180,000) 2003 | Keno City Distribution rebuild | Change poles and associated hardware / conductor. | Poles were aging (1950's vintage). Some have no treatment or only treatment at the butts. Other issues due to shell rot or repeated climbing result in poles not being safe to work off of or add new services to. | Reliability and safety. Replaced aged and deteriorated infrastructure in a remote community. |
| C01908 ($291,000) 2001 | 1st Avenue back alley from Elliott Street through to City Hall. | Install padmount transformers, underground primary cables and ducts into this area. Convert the customers' overhead secondary services to underground services. | Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. In high traffic areas such as in the downtown area, poles and structure are often damaged by vehicular movement. Reconstruction of a new overhead system would be difficult and expensive in order to comply with code due to the high voltage lines and transformers being too close to roof, window, and vents. Therefore YECL has to convert the overhead lines to an underground system. | A subsurface power system designed to new standards. A safer system that has less potential of human interference or contact. Improved operability and maintenances due to new equipment and access. |
| C01843 | Haines Junction airport | String in 1/0 ACSR wire and | An ice storm in 1999 | Line rebuilt to heavy loading |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| ($124,000) 2000 | feeder reconductor | rebuild as required the line between the Airport and the Haines Junction substation. Remove old conductor | diminished the integrity of the #6 wire. The line in question was a double circuit YEC/YECL line between the airport and the Haines Junction substation. | standards. Restored line integrity and provided for future increased load. Addressed a safety concern. |
| C01821 ($631,000) 2000/2001 | YECL shipyards substation rebuild | Material required to construct Subsurface substation to replace existing overhead substation. | Original substation is an aged facility sitting on the riverbank on leased land that will not be renewed. | A subsurface power system designed to new standards. Less potential of human interference or contact. Improved operability and maintenances due to new equipment and access and addresses potential environmental concerns. |
| C01779 ($116,000) 2000 | Alley rebuild between Main Street and Elliott. | Install padmount transformers, underground primary cables and ducts into this area. Convert the customers' overhead secondary services to underground services | Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. In high traffic areas such as in the downtown area, poles and structure are often damaged by vehicular movement. Reconstruction of a new overhead system would be difficult and expensive in order to comply with code due to the high voltage lines and transformers being too close to roof, window, and vents. | A subsurface power system designed to new standards. A safer system that has less potential of human interference or contact. Improved operability and maintenances due to new equipment and access. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | Therefore YECL has to convert the overhead lines to an underground system. | |
| C01754 ($152,000) 2000 | Old Crow distribution line rebuild | Install taller poles in locations where ground clearance is not to the minimum standards and in locations where the poles are aged and deteriorated. | Much of the older system is built with 35 ft poles. Ground clearance has diminished due to a variety of factors. (e.g. road surfaces changing) resulting in safety concerns. Balance load on the system. There are also aged and deteriorating infrastructure that requires replacement. | Meet minimum clearance requirements. Less stress on the generators due to improved load balancing, Improved reliability of our line and remove some risks of pole failure. |
| C01743 ($564,000) 2000-2001 | 34 kV / 12 kV line rebuild at north end of downtown underground feeders to tie into new Shipyards substation. | Install high voltage 750 and 500 MCM underground cables and ducts to connect new Shipyards substation to the system. | Required to link new Shipyards substation with Services substation. Fourth feeder from Shipyards to accommodate new growth.. | Fully linked and looped downtown substations infrastructure that removed aged and deteriorating lines from waterfront. Better accommodates load growth in the area. |
| C01612 ($105,000) 2000 | Haines Junction 2nd feeder | Add a second feeder breaker to the system to allow Yukon Electrical to split the town load for restoration purposes. | The diesel plant had trouble picking up the town's load during cold load pickup. A second feeder allows Yukon Electrical to pick up part of the town, stabilize the generator and then add the rest of the town's load. | Reliability and allows the plant to do what it was intended to do during restoration. |
| C01603 | Services substation to Two | Rebuild an aging and | This double circuit 34 kV and | Upgrade of a critical City of |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| ($132,000) 2001 | Mile Hill rebuild | deteriorating portion of the main double circuit 34 kV / 12 kV line between Service Substation and Two Mile Hill. Upgrade the wire size to 266 ACSR for both circuits. | 12 kV line has wire that is undersized for the amount of load that Yukon Electrical is required to serve in the area. | Whitehorse feeder. Meet load growth requirements in the area. |
| C01571 ($107,000) 1999 | Line rebuild for Carcross substation | Tie new Carcross substation to existing system with two new 25 kV lines. | The Carcross substation was required to be rebuilt and relocated. This work was necessary to tie the new substation to the existing system that feeds Carcross and Tagish. | Connects customers to new substation. |
| C01535 ($128,000) 1999-2001 | Alaska Highway / Carcross Corner OCRs upgrade and relocation | Upgrade and relocate the protective devices and their structures that are on the lines serving Carcross and Teslin. | Standardize structures. Upgrade protective equipment to current standards. Improved the operational capabilities of the devices. Address safety issues. | Provides improved operation of the system. Addresses safety concerns. Protective devices can now accommodate automation. Upgraded substandard equipment. |
| C01513 ($259,000) 1999-2000 | New Carcross substation | Replace an aged and obsolete substation that feed Carcross and Tagish with a new substation. | The existing substation has old and deteriorated poles and old timbers. Upgraded infrastructure required to accommodate load growth in the area. | Security of supply for Carcross and Tagish areas. Reliability and safety. Replace aging infrastructure. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| C01483 ($256,000) 1999 | YECL downtown underground rebuild CBC/NWTEL alley | Install padmount transformers, underground primary cables and ducts into this area. Convert the customers' overhead secondary services to underground services | Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. In high traffic areas such as in the downtown area, poles and structure are often damaged by vehicular movement. Reconstruction of a new overhead system would be difficult and expensive in order to comply with code due to the high voltage lines and transformers being too close to roof, window, and vents. Therefore YECL has to convert the overhead lines to an underground system. | A subsurface power system designed to new standards. A safer system that has less potential of human interference or contact. Improved operability and maintenances due to new equipment and access. |
| C01331 ($210,000) 1998 | Nisutlin River Crossing | Build and install a cable tray with cables on the Nisutlin River Bridge in Teslin. Salvage old submarine cable. | The existing submarine cable that was put in by the US Army is old and deteriorating. Contingency in the event of failure was challenging due the type of cable and location (in the river). One of three phases had faulted restricting capacity and reliability. | Improved security of supply to customers on the other side of the bridge. Feed is now standard cable in proper raceway on bridge that can be repaired or replaced with greater ease. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| C01281 ($280,000) 1998 | YECL stage 1 downtown Whitehorse Underground | Install the transformers high voltage cables and ducts into this area. Convert the customers overhead secondary services to underground services. | Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. In high traffic areas such as in the downtown area, poles and structure are often damaged by vehicular movement. Reconstruction of a new overhead system would be difficult and expensive in order to comply with code due to the high voltage lines and transformers being too close to roof, window, and vents. | A power system that we can operate and maintain. Eliminates a deteriorated system and meets current codes and regulations. A subsurface power system designed to new standards. Less potential of human interference or contact. Improved operability and maintenances due to new equipment and access |
| C01245 ($111,000) 1997 | Watson Lake airport U/G cable replacement | Replace old underground feed with a new underground feed on airport feeder. | Underground cable is old, deteriorated and direct buried. Failures have been frequent in the past. Original cable had been installed by US Army in 1940's | Improved reliability to a critical part of Watson Lake's infrastructure. Upgrades aged facilities. |
| C01124 (124,000) 1998 | Riverdale FH Collins School area voltage conversion. | Salvage the 2400V sub and convert the customer and lines to 12.5kV. | The schools, warm water wells, fish hatchery fed from a 2400v substation. This substation is surrounded by a 12.5kV system. By converting the customer transformers to 12.5kv we can salvage this old | Remove old substation equipment from the system. Provide uniform distribution voltage in the area. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | substation and its transformers. This would remove double circuit lines and simplify the system for operation and construction purposes. | |
| C01021 ($105,000) 1997 | Tagish line rebuild | Change poles, conductor and associated hardware on a portion of the Tagish line. | Poles are aging. Some have no treatment or only treatment at the butts. Other due to shell rot or repeated climbing are not safe to work off of or add services to. | Reliability and safety and replacement of aged and deteriorating infrastructure. |
| C00885 ($238,000) 1996 | McIntyre 34kv second feeder | Extend the 34kv line toward McIntyre subdivision to replace part of the loop underground system to the subdivisions in the area.. | One of the McIntyre subdivision's feeders has had multiple failures. The Logan substation has a 34 kV line in the area of McIntyre. We would build a line towards the Logan substation and replace the existing feeder into McIntyre with a more reliable feeder. | Reliability to the area. Replace failing infrastructure. Provide a loop or alternate feed to the residents in this area. |
| C00860 ($120,000) 1996-1997 | Tagish Bridge crossing reroute | Construct a raceway on the Tagish bridge to accommodate primary cable installation. | The existing overhead line was old and deteriorating, Restoration of the overhead river crossings are very challenging due the nature of their design. The area is also a known flyway for waterfowl | Security of supply to customers on the east side of the bridge. Feeder is now ducted standard raceway. Cable that can be repaired or replaced with greater certainty. Electrical hazard to waterfowl has been eliminated. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | and the overhead conductor is a proven hazard as Trumpeter Swans migrate through the area. | |
| C00780 ($146,000) 1996 | McCrae substation rebuild | Replace an aged and obsolete substation that feeds the McCrae / Country residential area south of Whitehorse. | The existing substation has old and deteriorated poles and old timbers. Upgraded infrastructure required to accommodate load growth in the area. | Security of supply for customers in the McCrae and country residential areas south of Whitehorse. Reliability and safety. Replace aging infrastructure. |

| Y10423 ($111,000) 2005 | #2 Penstock Partial Replacement Unit #2 Fish Lake Hydro | Replace a section of the #2 wood stave penstock with steel. | The #2 wood stave penstock was installed in the 1950s and began to shift and break apart in 2004 due to ground erosion. This drove this partial replacement project. | More secure water source for unit #2. Catastrophic failure of penstock avoided. Mitigated environmental risk. |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| C02068/C02406 ($210,000) 2003-2005 | Stewart Crossing Interconnect conversion | Change the controls and programs for the plant to run as a standby plant after the interconnection to the Mayo Dawson grid. Control and communicate with the remote OSS to serve the community either from the grid or the plant. Upgrade the service and install heaters in the plant. | Automatic start up and synchronization of the plant to the distribution system in Steward Crossing if the transmission line fails. Consistent standard throughout Yukon Electrical's service territory. Take advantage of hydro benefits for the community. | Minimized outage time for the customers of Steward Crossing and reduces cost of responding to manually start and put the plant on line. Reduces dependency on diesel fuel and associated costs. |
| Y10033 – C02465 ($708,000) 2004 | Old Crow Fuel System | See generic business case for fuel system upgrades | | |
| C02380 ($100,000) 2003 | Fuel system upgrade Swift River | See generic business case for fuel system upgrades | | |
| C02375 ($118,000) 2003 | Fuel system upgrade Beaver Creek | See generic business case for fuel system upgrades | | |
| C01485 ($668,000) 1999 | Replace diesel engines 1 & 6 in Watson Lake | Replace existing units 1 & 6. with two new units. | Units have reached the end of their life (near 100,000hrs), and must be replaced to provide service to the community. | Reduced risk of failure. |
| C01355 ($106,000) 1998-1999 | 225KW mobile generator | Purchase mobile unit | Purchase unit to work in and around Whitehorse to minimize outages and help | Mobile generation will help with small isolated plant outages and with local small outages that would be |

| PROJECT NUMBER | PROJECT NAME | DESCRIPTION | JUSTIFICATION | BENEFIT |
|---|---|---|---|---|
| | | | with construction projects | too long for customers. |
| C01268 ($373,000) 1998 | Replacement Unit 3 Old Crow | Replace the smallest unit (1981 vintage), 220kW with a 500kW unit | Generator loading has grown to the point where Yukon Electrical has less than 110% capacity with the largest unit out of service. | Provide adequate generation in the community with the largest unit out of service. |
| C01197 ($542,000) 1997 | Mobile unit Haines Junction | Install a 1.5MW generator and a 480V-14.4kV/25kV step up bank. | Extended outages, lengthy restoration time. | Contingency supply for Haines Junction |
| C01016 ($194,000) 1997/98 | Diesel installation Watson Lake | Install used Detroit Diesel Series 60 generator set with an out-sourced used alternator. All modification and new equipment purchased are included. | Old unit failed | Need 500kw unit to handle peak loads and still have a good heat rate. |
| C01009 ($362,000) 1997/98 | Construct new plant in Swift River | Build new 2 unit plant complete with new building and controls and fuel tank. Install in Swift River and connect to the system. | Old plant and units are old (installed by the Army) 1950's. Had 3 old units in a very old building, poor fuel efficiency. Environmental issues with tank. Plant is not automated and to automate such old equipment, in an old building, in Swift was not prudent. Plant built off site and installed in Swift. | Reliable plant in an isolated community with no alternative power. Upgraded to code. |
| C00892 ($205,000) 1997 | Pelly Crossing | Replace Engine in Pelly Crossing isolated generation plant. | Engine had reached the end of it's service life, increased maintenance cost. | Reduce operation and maintenance. Provide adequate generation in the community with the largest unit out |

|---|---|---|---|---|
| | | | | of service. |
| C00773 ($232,000) 1997/98 | Pelly PLC and 2nd feeder | Add a second feeder breaker to the system and split the load just outside the plant yard. | Diesel plant has trouble picking up the load during the peak load season (winter). In the past extended outages have occurred. A second feeder would allow pick up of the town, and stabilize the generator before adding the remaining community load. | Reliability; allows the plant to do what it was intended to do during peak load (critical) times. |
| C00572 ($227,000) 1996 | Watson Lake Generator control | Install General Electric Fanuc Programmable Logic Control system. (PLC) | Engine and generator PLC's have evolved. Standards and technique of installing and operating this equipment have progressed as well. This equipment has more capabilities and functionality. | Increased reliability, operability, and trouble shooting capability. More advanced and sensitive generator / load monitoring and control. |

# ROW widening various locations

**Summary:** The previous standard of 3 m or 5m on either side of a power line has caused Yukon Electrical problems in the past and often does not allow the company proper access to its facilities. The new standard of 6.1m for single phase and 7.5m for three phase line has proven much better in other areas as well as Yukon. Wildfires, public safety, right of way access for maintenance vehicles and trouble shooting and reliability are the main drivers.

**Project Description:** Widen selected existing right of ways (ROW) to allow for access, wildfire reduction, and reliability.

**Costs Schedule:** Approximately 10,000 to 20,000 per km depending on several factors such as access, size of trees, density of trees, hand slash or mechanical, method of disposal, time of year, and location of work.

**Benefits:** Reliability, wildfire mitigation, accessibility for maintenance and emergency.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Experience with the wider right of ways in the Yukon has trended to fewer tree related outages.

**Business and Technology drivers:** Fewer tree related outages.

**Risks of proceeding:** None

**Risks of not proceeding:** Outages, public contacts or wildfire if tree falls on the line. Access and ability to trouble shoot create unsafe conditions to operate our system.

**Alternatives:** Status quo, narrow right of ways
Tree free right of ways not cost effective (for distribution power lines) or desired by communities.

**Recommendations:** Continue normal practice of widening ROW to improved standard.

**Priority:** Type A Eliminate Safety Hazards

**Summary**: These projects bring our diesel plant fuel system to compliance with current mandatory codes for Canada.

**Project Description:** This project consists standardizing all of Yukon Electrical's diesel plants with double wall tanks, berms and sumps (if required), fluid containment within plants and alarmed automatic shutoff valves.

**Costs Schedule:** Smaller plants (Beaver Creek, Destruction Bay, Haines Junction, Pelly Crossing, Stewart Crossing, Ross River, Carmacks, Teslin), Watson Lake and Old Crow.

**Benefits:** Mitigate the potential of fire and fuel spills comply with current code.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Code

**Business and Technology drivers:** New code, increased expectation on business to be responsible steward of environment.

**Risks of proceeding:** Cost overruns manage projects effectively

**Risks of not proceeding:** Increased costs of spills, increased number of spills, non-compliance with new code, environmental damage.

**Alternatives**

- For isolated diesel generation sites, no alternatives were identified.
- For grid diesel generation standby plants, remove plants.

**Recommendations:** Bring plant fuel containment and fuel systems up to the new code.

**Priority:** Type A Comply with new code.

# C02132 Y10011

**Summary:** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add attachments too. When this occurs, the poles are changed.

This area is inaccessible. Many people have extended their yards. Brushing is difficult or impossible to do in this area. For these reasons and the fact that a trail exists in the area, Yukon Electrical has designed an underground primary and overhead secondary design. The trail gives us access and a ROW for our underground system.

**Project Description:** Build an underground primary system and salvage the overhead primary. Rebuild the overhead secondary system (Hybrid).

**Costs Schedule:** 201,000

**Benefits:** Reliability, safety of linemen and public; reduced long term brushing costs.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older. Access is very difficult and in some cases impossible. It can be very challenging to obtain permission brush to current standards.

**Business and Technology drivers:** Reliability and safety. Poles have deteriorated.

**Risks of proceeding:** Cost over runs effectively manage projects

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives:**
Over head relocation and rebuild to front lot configuration.
Total underground system conversion.

**Recommendations:** In this location underground primary is recommended and overhead secondary is recommended as the most cost effective solution.

**Priority:** Type A Avoid immediate effect of security of supply. Replace deteriorating facilities.

# Y10006

**Summary:** Phase imbalance is an issue in Pelly Crossing. Load balancing is critical is an isolated community with limited load and generation. 3 phase is to be extended into the community to allow for more flexibility. Also two step up banks will be salvaged and replaced with a 3 phase step up bank.

**Project Description:** Build a new 2400 delta 12.5 7.2kV step up bank. Extend three-phase into Jon Ra subdivision and extend three-phase into the 2400V section of town.

**Costs Schedule** 134,000.

**Benefits** Better loading (balanced loading) on our generation.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Load increases are in certain areas where only one phase is available.

**Business and Technology drivers:** Load increase.

**Risks of proceeding:** Cost overruns manage costs effectively

**Risks of not proceeding:** Shorter life on generators, less efficient generator operation

**Alternatives:** Convert entire town to 12.5 7.2kV system more costly. Install larger generators.

**Recommendations:** Extend phase wires into the community to allow for transferring of load now and in the future to ensure load is balanced.

**Priority:** Type A

# Y10254

**Summary:** Voltage lower than what we can serve our customers is being supplied by our Marsh Lake single phase sub. Our protective devices (OCRs) are not coordinating so they require upgrading.

The three phase 1950's regulator on the 34.5kv system does not regulate automatically.

**Project Description:** Install regulation on the Marsh Lake 14.4kv system and upgrade the OCR devices to coordinate better with the downstream devices. Build a platform for new 34.5kv regulator and salvage the old three phase regulator.

**Costs Schedule:** 202,000

**Benefits:** Serve customers on Marsh Lake distribution and customers on the 34.5kv distribution line with voltage within established parameters as well as improved line coordination.

**Resources and Funding Annual:** System improvement budget

**What has changed?** Loading has increased the voltage drop and caused coordination cold load pickup issues on the Marsh Lake system.

**Business and Technology drivers:** Increased load on system.

**Risks of proceeding**: Cost overruns manage costs effectively

**Risks of not proceeding:** Meeting minimum voltage requirements as established.

**Alternatives:** Adding regulators on individual feeder however to costly.

**Recommendations:** Add regulators on the 34kV main distribution. Upgrade protection to avoid coordination cold load pickup issues.

**Priority:** Type A Comply with legislation (minimum voltage levels) Replace deteriorating facilities.

**2002-2005**

# C02055 Y10008 Y10323

**Summary:** A transmission source is available to supply Stewart Crossing with hydro electricity as opposed to supplying the community with diesel generation. Continue to supply the community with three phase power via a new three phase interconnection with the transmission system and tie into the existing plant's town's 2400V delta system.

**Project Description:** Construct a three-phase 25kV grounded wye line from the transmission substation to the plant and then convert it to 3-phase 2400V delta. Upgrade interconnection line to current standards. Remotely control the interconnection point of the Stewart Crossing system to the transmission system. Contribute to a three phase substation being constructed by Yukon Energy.

| | | |
|---|---|---|
| **Costs Schedule:** | Distribution interconnection and system upgrade | 421,000 |
| | Three-phase substation contribution to Yukon Energy | 464,000 |

**Benefits:** Convert Stewart Crossing from a diesel generation community to a hydro electric supplied community while maintaining existing three phase availability.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Hydro electric grid source available from Yukon Energy.

**Business and Technology drivers:** Availability of hydro electricity.

**Risks of proceeding:**
Cost overruns manage costs effectively

**Risks of not proceeding**: Fuel price risk and the continuation of an operating plant as compared to a stand-by plant.

**Alternatives:** A single phase interconnection as opposed to a three phase interconnection. Incremental costs associated with a three phase substation offset by lower distribution system modifications as well as lower three-phase standby plant modification costs. Decision to proceed with a single phase solution would result in three phase power no longer being available to the community.

**Recommendations:** Maintain status quo with respect to three phase power availability in the community via a three-phase interconnection to the grid.

**Priority:** Type A Interconnect generation.

# C02486 Y10035 Y10504

**Summary** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. When this occurs, the poles are changed. Historically this has been a high load growth feeder. Generally these poles were installed prior to 1969.

This is a main line supplied by a radial feeder. Yukon Electrical is also taking this opportunity to upgrade the wire to increase capacity.

**Project Description:** Change pole and associated hardware

**Costs Schedule:** 120,000 2005; 104,000 2006

**Benefits:** Reliability, safety.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older, load growth

**Business and Technology drivers:** Reliability and safety. Poles have deteriorated.

**Risks of proceeding:** Cost over runs effectively manage projects

**Risks of not proceeding Outages:** public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives**
Underground much more expensive
Concrete pole more expensive; would require many bucket trucks to work on poles
Composite poles new unproven technology; more expensive; would require many bucket trucks to work on poles
Steel poles - more expensive; would require many bucket trucks to work on poles

**Recommendations:** Continue normal utility practice of changing out pole when required.

**Priority:** Type A Avoid immediate effect of security of supply (old poles). Replace deteriorating facilities.

# Y10625

**Summary:** Infrastructure is aging. New developments in this area are zero lot lines.

**Project Description:** Change the overhead primary to underground primary. Leave the overhead secondary in place.

**Costs Schedule**: 100,000

**Benefits:** Reliability and safety.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older. A new condo on 4th and Hawkins required 3 phase power. .

**Business and Technology drivers:** Increased area power requirements; reliability and safety due to older poles; zoning regulation changes.

**Risks of proceeding**
Cost overruns manage project effectively

**Risks of not proceeding**
Outages, public contacts fire if pole fails; unsafe conditions to operate our system.

**Alternatives** Continue normal utility practice of changing out poles when required.

**Recommendations** Upgrade to underground due to restrictions in the alley.

**Priority** Type A Replace deteriorating facilities); comply with legislation (can't build and not create a code violation)

# Y10660

**Summary:** The Existing single phase line is across country, making it challenging to maintain and patrol when trouble shooting. The customer has requested a conversion from single phase to three phase. This conversion and construction is an opportunity to share costs in relocating the line to road side to improve access. It will also provide better load balancing at the substation and reduces the number of overhead road crossings on the Alaskan highway.

**Project Description:** Replace and relocate existing cross country line along road side.

**Costs Schedule:** 85,000

**Benefits:** Increased reliability and improved access. Three phase configuration has the ability to better balance the loading of the system and potential future growth in the area. Road side construction vs. cross country requires less future brushing.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Cadet Camps request for three phase power.

**Business and Technology drivers:** Present line is quite inaccessible for routine patrols, maintenance and trouble shooting.

**Risks of proceeding:** Cost over runs manage costs effectively

**Risks of not proceeding:** Missed opportunity to relocate cross country to roadside.

**Alternatives:** Convert the existing cross country line from single phase to three phase. Similar results but still inaccessible extra road crossing, balancing capability reduced, maintenance brushing is not decreased due to road side construction.

**Recommendations:** Proceed with project as planned.

**Priority:** Type A - Avoid immediate effect of security of supply (old poles). Replace deteriorating facilities.

# Y10647

**Summary:** Street light davits are rusted and are in need of replacement. Some have been damaged by vehicle contacts. Many have direct buried wires which have not been reliable in the past. Steel davits would be replaced with galvanized davits. Underground cables would be replaced with wire in conduit to ensure better protection of the wire and easier replacement if a failure should occur.

Take the opportunity to update to current lighting standards as appropriate.

**Project Description:** Replace davits and install new wires in duct.

**Costs Schedule:** 107,287

**Benefits:** Structurally sound light davits, designed to proper lighting levels in a busy downtown. Replaces aged and deteriorated infrastructure.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Lights have gotten older. Aged lights have rusted due to exposure to salt and water. Cables feeding the lights are failing due to age, frost, dig-ins, water ingress.

**Business and Technology drivers:** New lights will be galvanized, design to RTAC standard.

**Risks of proceeding:** Cost over runs manage project effectively.

**Risks of not proceeding:** Increased risk to a failure of a davit in a busy public area.

**Alternatives:** Status quo not an option due to safety concerns.

**Recommendations:** Replace aged davits with new galvanized davit and replace direct buried wires with wires in duct.

**Priority:** Type A Eliminate hazards (rusted out davits). Replace deteriorated facilities.

# Y10253

**Summary:** Poles are old and some are anchored to trees. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. When this occurs the poles are changed.

**Project Description:** Change pole and associated hardware. Rebuilding on the opposite side of the road will allow us to pre build the job and minimize the outages to the customers.

**Costs Schedule:** 190,000.

**Benefits:** Reliability, safety. Reposition the line from cross county to road side. Improved access when patrolling, maintaining or troubleshooting the line.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older, Tagish road has been realigned several times reducing the access to the line.

**Business and Technology drivers:** Reliability and safety. Poles have deteriorated. New design will remove frost issues by building to heavy loading standards.

**Risks of proceeding:**
Cost overruns manage costs effectively.

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system due to pole condition. Limited access to the line.

**Alternatives:** Underground much more expensive

**Recommendations:** Continue normal utility practice of changing out pole when required. Rebuild on opposite side of road to allow for safer construction and minimize outages.

**Priority:** Type A
.

# Y10315

**Summary:** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. When this occurs the poles are changed. Step down transformer was eliminated.

.**Project Description:** Change pole and associated hardware. Convert primary voltage from 2400V to 14400 V.

**Costs Schedule:** 105,000

**Benefits:** Reliability, safety, standard distribution voltage.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older

**Business and Technology drivers:** Voltage conversion.

**Risks of proceeding:** Cost over runs effectively manage projects

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives**
Underground significantly more expensive
Concrete pole more expensive; would require many bucket trucks to work on poles
Composite poles new unproven technology; more expensive; would require many bucket trucks to work on poles
Steel poles - more expensive; would require many bucket trucks to work on poles
Delay Conversion. Both practical and cost effective to coordinate conversion with other required work.

**Recommendations:** Continue normal utility practice of changing out pole when required. Convert from 2400V to 14400V.

**Priority:** Type A Avoid immediate effect of security of supply (old poles). Replace deteriorating facilities.)

# Y10820

**Summary:** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. All these poles are climbed by both the power and communication utilities and are at the point where climbing them is a safety hazard. Rebuilding on the opposite side allows Yukon Electrical to replace the line with minimal outage to customers.

**Project Description:** Change pole and associated hardware

**Costs Schedule:** 136,000

**Benefits:** Reliability, safety.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older

**Business and Technology Drivers:** Reliability and safety. Poles have deteriorated.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives:**
Underground much more expensive

**Recommendations:** Continue normal utility practice of changing out pole when required.

**Priority:** Type A Avoid immediate effect of security of supply. Replace deteriorating facilities

**Business Case: 4 Avenue Klondike Inn to Ogilvie St. - 2007**

# Y10330

**Summary**: Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add attachments too.

City of Whitehorse will widen driving surface and add new bike lanes between Ogilvie St and 2nd Ave intersection. As well, it's likely they will extend their storm sewer system on a proposed shared easement with YECL on the Westmark Klondike property.

YECL will have to remove all poles within the project area as they will conflict with new alignments. System (including street lighting) will have to be rebuilt.

**Considerations:**

- There are 2 old and substandard padmount transformers within the project area; one old live front at the Westmark and the other is a radial only unit feeding McDonalds.
- Poles are in poor shape. Some have been changed out due to rot and at least 1 is dry rotted and stubbed. Structures and assets in the downtown core are subject to more vehicular traffic and tend to be damaged often, in some cases to the point of unplanned replacement.
- Line conductor undersized and of various sizes.
- Line is built about 1.5 meter offset from buried water and sanitary lines and in close proximity of NWTel ducted system, excavation is therefore challenging for both utilities.

**Project Description:** Convert overhead line on 4th Ave. from Klondike Inn to Ogilvie St. to underground. Provide loop feed to McDonalds and remove live front transformer at Klondike Inn. Reestablish alignment as per standard with other utilities.

**Costs Schedule:** 650,000

**Benefits:** Continuity of service, upgrade capacity, remove hazards (poles and live front transformers).

**Resources and Funding:** Annual system improvement budget

**What has changed?** Poles have gotten older development in area requires changes, live-front transformers and their associated equipment are getting older and are safety risk to employees.

**Business and Technology drivers:** Poles have gotten older. Facilities require rebuilding.

- There does not appear to be a viable overhead corridor available on either side of the street, we have a drawing supporting this conclusion.
- As the street is presently lit with lights on existing wood poles, the project would have to include all new lighting. Lighting calcs, due to new road width, calls for 12 meter Gal standards staggered on both sides of the street supplied via U G feeds.(RTAC Guidelines)
- A rebuild at this time enables us to partner with the City on the construction site, civil excavations specifically.

**Risks of proceeding:** Cost over runs manage project effectively

## Business Case: 4th Avenue Klondike Inn to Ogilvie St. - 2007

**Risks of not proceeding:** Opportune time to install underground with City's road works

**Alternatives:**

a) **Leave as is:**
Not possible as alignments conflict.

b) **Move line out into the street:**
Not possible for obvious reasons

c) **Move line closer to property lines:**
Not possible as NWTel duct bank, buried water line and buried sanitary line right next to it leaves no overhead line corridor.

d) **Move overhead line across the street :**
At 4.5 M offset PL (standard) poles from MSB to Dollar Store would be set touching back of curb, way too close to driving area. Poles from Dollar Store to Spook Crk would be on the driving surface.

e) **Rebuild to underground on same side as existing overhead line:**
Recommended, alignment must be 3 M off set water line per City Engineer.

f) **Rebuild to underground on opposite side of the street:**
Would be more expensive as distances are longer and we wouldn't be able to take advantage of existing conduit crossings on Second Avenue and Ray Street.

**Recommendations:** The recommendation is to rebuild to full underground standard on the same side of the road

**Priority:** Type A Replace deteriorating facilities; eliminate hazards

**Generic Business case - 2007**

# Overall Justification

**Summary:** Poles are aging; some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add service to. When this occurs the poles are changed. Generally these poles were installed around 1969. In sections that are cross country, access is extremely challenging especially during wind, ice and snow storms. This has been a trouble area in the past.

**Project Description:** Change poles and take opportunity to move the line to road side to reduce ongoing brushing requirements and increase access and visibility for planned maintenance and outage restoration.

**Costs Schedule:** 150,000 in budget for 3 years for 2 large sections and 2 smaller sections

**Benefits:** Reliability, accessibility, maintainability, reduced ongoing brushing, road side construction requires 7.5m R W vs. 15m cross country.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older and line requires replacing, access to the line has diminished.

**Business and Technology drivers:** Reliability and maintainability.

**Risks of proceeding:** Cost over run manage project effectively

**Risks of not proceeding:** Outages or wild fire if pole fails; unsafe conditions to operate our system. Poor accessibility and visibility when trouble shooting during unplanned outages.

**Alternatives:** Underground much more expensive
Rebuild line in the same place difficult to trouble shoot during emergency restoration and very poor access for operation and maintenance, continue to maintain 15m R W for vegetation.

**Recommendations:** Continue normal utility practice of changing out poles when required. Take the opportunity to move the line to road side for visibility and maintainability.

**Priority:** Type A Avoid immediate effect of security of supply (old poles); eliminate safety hazards

# Y10637

**Summary**: Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. When this occurs the poles are changed. Generally these poles were installed around 1969. This section is cross country and challenging to accessible during wind, ice and snow storms. .

**Project Description:** Change poles and take the opportunity to move the line to road side to reduce brushing and increase access for maintenance and trouble shooting.

**Costs Schedule**: 150,000

**Benefits:** Reliability, maintainability reduces future brushing.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older

**Business and Technology drivers:** Reliability and maintainability. Poles have deteriorated.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Outages, or wild fire if pole fails; unsafe conditions to operate our system. Poor accessibility and visibility to find problems when trouble shooting and restoring power.

**Alternatives**
Underground much more expensive
Rebuild line in the same place tough to find problems and very poor access for operation and maintenance.

**Recommendations:** Continue normal utility practice of changing out poles when required. Take the opportunity to move the line to road side for visibility during emergency restoration and maintainability.

**Priority:** Type A Avoid immediate effect of security of supply (old poles). Replace deteriorating facilities.

# Y10904 &Y10888

**Summary**: The foundations supporting the plant and fuel system are unstable and allow shifting due to changes in ground conditions. There is a safety concern (flash hazard) with unit breaker located inside the plant. There is a code violation with the existing step up transformer bank (less than 2.7m from live parts to ground level)

**Project Description:** Redesign and build plant and fuel tank foundations. Relocate unit breaker to outside of the plant and replace existing step up bank with a pad mount transformer. This will call for fence and grounding modifications. Build to new fuel containment standards.

**Costs Schedule:** 116,600 2007, Unit Breaker, Plant & Transformer 91,500 forecast for 2008

**Benefits:** Code compliance and improved reliability of this plant.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Tank and plant foundation are becoming more unstable, new safety procedures in regard to flash hazards.

**Business and Technology drivers:** National Fire Code, Canadian Council of Ministers on the Environment PN1326 requirements, physical stability of our standby plant, safety concerns for employees, risk of fuel spills.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Fuel spill due to no automated fuel spill detection or due to shifting tank and plant. Safety risks due to arc flash.

**Alternatives:** Remove generation and fuel system from substation and community.

**Recommendations:** Build two concrete pads for the unit and the tank. Replace platform transformer bank with a padmount unit. Replace unit breaker with an outdoor breaker on the 25kv system.

**Priority:** Type A Eliminate hazards comply with legislation (fuel containment)

# Y11125

**Summary:** Underground cable is old and direct buried. The risers and stress cones are tape type. Transformers are radial fed live-front transformers. This cable is unjacketed cable.

**Project Description:** Rebuild old underground system to current standards.

**Costs Schedule:** 175,000 in business plan

**Benefits:** Reliability and safety, contingency spare for new standards (Replacement of Live fronts with dead front transformers)

**Resources and Funding:** Annual system improvement budget

**What has changed?** Aged infrastructure; lack of availability of live front transformers; safety and operating standards.

**Business and Technology drivers:** Risk of failure is high due to type of cables and stress cones. Safety concerns on operating old live front transformers increase constantly.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Unplanned failure to infrastructure, potential for extended outages. (cable splices and elbow installation during outage)

**Alternatives:** Leave as is and accept the risk.

**Recommendations:** Replace old infrastructure with safe reliable facilities, current standards.

**Priority:** Type A Eliminate safety hazards; replace deteriorating facilities, avoid immediate effect of security of supply.

# Y11126

**Summary:** Brushing is difficult or impossible to do in this area. For this reason we have designed an underground primary that leave the overhead secondary configuration in place. This allows us to not change the customer's service drops and entrances. In this specific area, the overhead utilities are located on the property line adjacent to the street.

**Project Description:** Build an underground primary system and salvage the primary on the existing line.

**Costs Schedule:** 140,000 in business plan

**Benefits:** Reliability, Reduced bushing costs, and requirements

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older. Brushing is challenging and costly, at times impossible. Changes from country residential to residential lots have created conflicts between residence's trees and power lines.

**Business and Technology drivers:** Reliability and safety

**Risks of proceeding: Cost** over runs manage project effectively

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system, on going trim costs when attempting to brush.

**Alternatives:** Over head with new wood poles Building new line near road could cause conflicts with driveways and existing deep utilities. We would have a main line near the road and very likely service poles into each house (double the amount of poles.)

**Recommendations:** Relocating the primary over head underground.

**Priority:** Type A Avoid immediate effect of security of supply. Replace deteriorating facilities.

# Y11123

**Summary:** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add attachments too. When this occurs the poles are changed. This line feeds critical communication infrastructure for the phone company, the hospital and radio stations.

**Project Description:** Rebuild the line.

**Costs Schedule:** 200,000

**Benefits:** Reliability and safety.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older. Added customers at the end of the line, (Mountain top communications site)

**Business and Technology drivers:** Reliability and safety. Poles have deteriorated.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives:** Underground much more expensive

**Recommendations:** Continue normal utility practice of changing out pole when required.

**Priority** Type A Avoid immediate effect of security of supply (old poles). Replace Deteriorating facilities.

**Summary**: This existing 266 ACSR line is a main tie between two different substations that feed a large part of downtown. The age of poles and Yukon Electrical being unable to replace overhead lines with overhead lines in this area require the company to replace it with underground cables. Due to the criticality of this line, and to ensure optimal operating flexibility, we will replace the line with a 600 Amp tie line. Recent zero lot line condominium development in the area has accelerated the project.

**Project Description:** Replace the overhead line between 2nd and 6th avenue with an underground line under Strickland Street.

**Costs Schedule:** 400,000

**Benefits:** Maintain critical tie line

**Resources and Funding:** Annual system improvement budget

**What has changed?** Customer development in the area.

**Business and Technology drivers:** Reliability and safety.

**Risks of proceeding:**
Cost overruns manage project effectively

**Risks of not proceeding:** Outages, public contacts or fire if pole fails; unsafe conditions to operate our system. Clearance conflicts with customer development.

**Alternatives:** N A

**Recommendations:** Convert line to underground

**Priority:** Type A

**Summary:** Poles are old and some are anchored to trees. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add services to. When this occurs the poles are changed.

**Project Description:** Change pole and associated hardware. Rebuilding on the opposite side of the road will allow us to pre build the job and minimize the outages to the customers.

**Costs Schedule:** 180,000 estimate subject to a field check

**Benefits:** Reliability, safety. Reposition the line from cross county to road side. Improved access when patrolling, maintaining or trouble shooting the line.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older, Tagish road has been realigned several times reducing the access to the line.

**Business and Technology drivers:** Reliability and safety. Poles have deteriorated. New design will remove frost issues by building to heavy loading standards.

**Risks of proceeding:**
Cost overruns manage costs effectively.

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system due to pole condition. Limited access to the line.

**Alternatives:** Underground much more expensive

**Recommendations:** Continue normal utility practice of changing out pole when required. Rebuild on opposite side of road to allow for safer construction and minimize outages.

**Priority:** Type A

# Y11080

**Summary:** Connect Pelly Crossing diesel plant to the grid to ensure it can work islanded and in parallel with the grid.

**Project Description:** Install controls, logic and synchronizing to connect Pelly Crossing plant to the grid. Install heat in the plant to ensure units are in hot standby mode.

**Costs Schedule:** 150,000

**Benefits** Pelly plant can run the town if the WAF grid is out. Pelly plant can feed into the grid if additional generation is required.

**Resources and Funding** Annual system improvement budget

**What has changed?** Pelly distribution system will have a grid source

**Business and Technology drivers** Reduce diesel fuel requirement in the community. Keeping the existing plant allows for a contingency supply for this community similar to other communities that have been converted from isolated generation to grid power.

**Risks of proceeding:**
Cost overruns manage costs effectively
None: YEC agrees that this is the correct plan (we have email dated Dec. 17, 2007)

**Risks of not proceeding :** Diesel is used to supply Pelly Crossing rather than use grid hydro.

**Alternatives:** Remove diesel plant from the community and not have a standby plant (alternate source for 400 - 500kw of load.)

**Recommendations:** Connect this community to the grid in a similar manner to others in the Yukon.

**Priority:** Type A interconnect generation, add new customers to clean power. Type B - reduce adverse effects

# Y11098

**Summary:** A transmission source will be available to Pelly Crossing. The source is about 1km west of the existing plant. The transmission substation produces 25kV power. Yukon Electrical plans to bring the power into the community and then tie it into the plant town 2400V delta system or to the 12.5 7.2kv wye system.

**Project Description:** Build a 3 phase 25kV line from the source toward the existing power lines and convert it to 3 phase 2400V delta or 12.5kV 7.2kV wye. Tie control of Hydro-diesel separation point remotely.

**Costs Schedule:** 140,000

**Benefits:** Convert Pelly from a diesel community to a hydro electric supplied community.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Hydro electric power supply is coming to the area

**Business and Technology drivers:** Eliminate reliance of diesel power when economically possible.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Potential load growth is limited unless generators sizes are increased.

**Alternatives:** Do not connect to the grid, remain on diesel generation**.**

**Recommendations:** Tie the community to hydro electric power.

**Priority:** Type A Interconnect generation. Add new customers to clean energy source.

# Y05105

**Summary:** When we have a fault on our power system the ground potential can rise. This high voltage would be put onto NWTel's ground neutral and could cause safety concerns and equipment damage.

**Project Description:** Run a nonconductive fiber from NWTel's wires into our plants.

**Costs Schedule**: 102,000

**Benefits:** Ensure safety to NWTel people and their equipment and bring our system up to standard (Canadian Electrical Code C22.1-06.) Addresses concern from communications company.

**Resources and Funding:** Annual system improvement budget

**What has changed?** NWTel officially notified us of the concern on November 9, 2007.

**Business and Technology drivers:** Safety, adherence to Canadian Electrical Code

**Risks of proceeding:** Cost overruns manage projects effectively

**Risks of not proceeding:** Subject NWTel people and or equipment to high voltages (Electrocution**)**

**Alternatives:** Use Positrons or a similar device to isolate us from NWTel. These are large expensive devices that require maintenance. Fiber and the equipment to convert fiber to copper and copper to fiber are zero maintenance and cheaper.

**Recommendations:** Run non shielded fiber (non conductive) into our plants subs to isolate our ground from NWTel infrastructure.

**Priority:** Type A comply with legislation; eliminate hazards.

# Y11121

**Summary:** This line has reliability concerns due to frost and snow build up. This is due to wires slapping together when one or more wires lose their snow ice buildup. This is occurs in places where the wires are above one another. Therefore vertical corners need to be tightened or removed by straightening the line or replaced with flat corners.

**Project Description:** Remove verticals, change structure and build to heavy loading standards.

**Costs Schedule:** Phase I 180,000 in 2008; Phase 2 180,000 in 2009 (Squanga towards Teslin).

**Benefits:** Improved reliability, reduction of highway crossings.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Customer concerns regarding reliability**.**

**Business and Technology drivers:** Reliability.

**Risks of proceeding:** Cost over run manage project effectively.

**Risks of not proceeding:** Teslin community continues to raise the issues around power quality and the number of outages. Servicemen continue to remove ice off the line in adverse weather conditions.

**Alternatives:** Different over head options were evaluated such as different conductor, longer arms, shorter spans, adjust conductor tension.

**Recommendations:** Construct to heavy loading standard.

**Priority:** Type A Carry existing load with minimum level of reliability, service and voltage. Eliminate safety hazards (for servicemen removing ice). Replace deteriorating facilities.)

# Unassigned project number

**Summary**:
As a requirement of our 2007 Dam Safety Review and as recommended in the water licensing application, a control structure is required. This structure will manage water flow into Franklin Lake.

**Project Description:** Design and build a structure to deal with excess water.

**Costs Schedule**: 150,000 in 2009 and in 2010 capital forecast

**Benefits:** Requirement of Water License.

**Resources and Funding:** Annual system improvement budget

**What has changed?** The requirement to manage water differently as per the Water License renewal and the as identified by the Dam Safety Review.

**Business and Technology drivers:** Water license will not be renewed without it.

**Risks of proceeding:** Cost over run manage project efficiently.

**Risks of not proceeding:** Non compliance with water license.

**Alternatives :** None identified

**Recommendations:** Comply with recommendations and requirements as Water license and Dam Safety Review.

**Priority:** Type A comply with Water Board Dam safety review.

# Y11103

**Summary**: Third party inspections have concluded the generator requires significant maintenance and repair. From this preliminary field based inspection, the assumption is the core is becoming delaminated and the bearing needs to be refurbished at minimum. A more detailed summary of deficiencies and cost repaired can only be provided when the unit is taken out of service and dismantled.

**Project Description:** Remove generator and transport to qualified repair shop. Reinstall unit and commission.

**Costs Schedule:** 125,000 budgeted

**Benefits:** Continue to off load local distribution sub and feeder (S8358). Unit supplies into the WAF grid.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Unit has been in service since the 1950's.

**Business and Technology drivers:** Life Cycle maintenance.

**Risks of proceeding:** Cost overruns manage project effectively

**Risks of not proceeding:** Unit failed and unable to produce energy.

**Alternatives:** Run unit to failure with the risk un- repairable damage.

**Recommendations:** Take it out of service and complete repairs.

**Priority:** Type A - Avoid immediate effect of security of supply. Eliminate safety hazards. Replace deteriorated facilities.

# Y11099

**Summary:** Inspections by third parties have recommended that this unit needs to be replaced due to normal wear and tear. Holes in turbine could lead to catastrophic failure. The unit which runs 24 7 has been doing so since 1950's.

**Project Description**: Remove and replace the turbine and shaft in Unit 2

**Costs Schedule:** 60,000 in 2008, 130,000 in 2009

**Benefits:** Hydro electricity and continue to off load local distribution substation and feeder (S8358).

**Resources and Funding:** Annual system improvement budget

**What has changed?** Wheel is worn out, water license is being renewed.

**Business and Technology drivers:** Life Cycle Replacement

**Risks of proceeding:** None

**Risks of not proceeding:** Catastrophic failure of turbine, unable to supply grid.

**Alternatives:** Run to failure with the risk of major damages and loss generation.

**Recommendations:** Order wheel in 2008, 40 week delivery time, supplier is in Europe.

**Priority:** Type A - Avoid immediate effect of security of supply

**Summary:** Street light davits are rusted and may fail. Some have been damaged by vehicle and road maintenance equipment contacts. Many have direct buried wires which have not been reliable in the past. Steel davits would be replaced with galvanized davits. Underground cables would be replaced in ducting for better protection of the wire and easier replacement if a failure should occur in the future.

**Project Description:** Replace davits and install new wires in duct.

**Costs Schedule**: 230,000 in 2009

**Benefits:** Structurally sound light davits, designed to proper lighting levels in a busy downtown, hwy and residential neighborhoods. Replaces aged and deteriorated infrastructure. Design to RTAC guidelines.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Lights have gotten older. Aged lights have rusted due to exposure to salt and water, some light have been damaged. Cables feeding the lights fail due to age, frost, dig-ins, water ingress.

**Business and Technology drivers:** New standard is galvanized davits and ducted cableing.

**Risks of proceeding:** Cost over runs manage project effectively.

**Risks of not proceeding:** Increased risk to a failure of a davit.

**Alternatives:** Operate to failure; lights would remain in service until they failed. Replace randomly and at a higher cost per structure.

**Recommendations:** Replace aged davits with new galvanized davits and replace direct buried wires with wires in duct.

**Priority:** Type A Eliminate hazards (rusted out davits). Replace deteriorated facilities.

# Project number not assigned at this time

**Summary:** IDEC has discontinued the manufacturing of our existing Programmable Logic Controllers (PLC) FA-2J and FA-3S PLCs.

It is recommended we change out the IDEC PLCs to GE Fanuc 9030 PLC. Parts and technical support are getting difficult to obtain. Many of our existing plants were converted to GE PLCs over 10 years ago and for consistency Yukon Electrical proposes to standardize on this type of PLC.

**Project Description:** Replace 20 year old computer control system and wiring.

**Costs Schedule:** Budget estimate of 77,000

**Benefits:** Able to have parts and support for failures, expansion, changes

**Resources and Funding:** Annual system improvement budget

**What has changed?** Computers have gotten older, devices are not be made anymore

**Business and Technology drivers:** Manufacture has stopped making the product and will soon stop supporting it. It is important for us to continue to remotely operate and interrogate our plants for reliability purposes.

**Risks of proceeding:** GE Fanuc will be replaced with something else eventually.
Cost over runs manage cost effectively

**Risks of not proceeding:** Unable to replace failed component in the plant control system. Unable to change program or add additional components to the control system. Failure of control system that allows us to operate the plants.

**Alternatives:** Attempt to find alternate sources for obsolete system.

**Recommendations:** Continue the PLC change out program we stared over 10 yrs ago.

**Priority:** Type A replace deteriorating facilities. Type B Provide necessary equipment and facilities to operate.

# Project number not assigned
# At this time.

**Summary** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add attachments too. When this occurs the poles are changed. Generally these poles were installed prior to 1969.

**Project Description** Change poles and associated hardware. When we rebuild on the opposite side of the road it allows us to pre build the job and minimize the outages to the customers.

**Costs Schedule:** 75,000 in business plan

**Benefits:** Reliability and safety.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older

**Business and Technology drivers:** Reliability and safety.

**Risks of proceeding :** Cost over runs manage job effectively

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives:**
Underground much more expensive

**Recommendations:** Continue normal utility practice of changing out pole when required and as identified. Rebuild on opposite side of road to allow for safer construction and minimize outages (if required).

**Priority:** Type A Avoid immediate effect of security of supply (old poles), Replace deteriorating facilities.

**Summary:** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add attachments too. When this occurs the poles are changed. Generally these poles were installed prior to 1969.

**Project Description**: Change pole and associated hardware

**Costs Schedule:** 200,000

**Benefits:** Reliability, safety of linemen and public.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older

**Business and Technology drivers:** Reliability and safety. Poles have mostly or totally deteriorated.

**Risks of proceeding:** Cost over runs manage project effectively

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives**
Underground more expensive
Concrete pole more expensive; would require many bucket trucks to work on poles
Composite poles new unproven technology; more expensive; would require many bucket trucks to work on poles
Steel poles - more expensive; would require many bucket trucks to work on poles

**Recommendations:** Continue normal utility practice of changing out pole when required.

**Priority:** Type A Replace deteriorated facilities.

**Summary:** Poles are aging. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add attachments too. When this occurs the poles are changed. Generally these poles were installed prior to 1969.

The routing of this portion of line was constructed along the original access to the area; the access has since been changed. We now have limited or no road side access to portions of the line, structures are also on property annexed by lake front lot owners.

**Project Description;** Change poles and associated hardware and rebuilding the line on the opposite side of the road.

**Costs Schedule:** 200,000

**Benefits:** Safety, Reliability and improved access for maintenance, trouble shooting and restoration.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Infrastructure is in excess of 40 years old and access has become limited.

**Business and Technology drivers:** Reliability and safety.

**Risks of proceeding:** Cost over runs manage project effectively

**Risks of not proceeding:** Outages, public contacts or wild fire if pole fails; unsafe conditions to operate our system.

**Alternatives**
Underground much more expensive

**Recommendations:** Continue normal utility practice of changing out pole when required. Rebuild on opposite side of service road to allow for safer construction and minimize outages and construct in location for easy trouble shooting.

**Priority:** Type A

# Y10754

**Summary:** Old Crow does not have the 110 back up if the largest unit is out of service. The logical replacement size is 500kW and this unit will not fit into the existing building. A modular unit is recommended to replace unit at the end of it life cycle.

**Project Description:** Purchase and install a modular 500kW unit. Cooling system will tie into existing cooling system to keep all units on hot standby.

**Costs Schedule** 100,000 in 2009; 800,000 in 2010

**Benefits:** Reliability of generation in an isolated community.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Load has increased, engine has reached end of life cycle.

**Business and Technology drivers:** Yukon minimum requirement is to have 110 capacity with largest unit out of service.

**Risks of proceeding:** While load could decrease, it is not likely.

**Risks of not proceeding:** Long term outages to isolated community with no road access and risk of not meeting community's electrical needs.

**Alternatives:** Buy larger unit not efficient for the load we have
Buy a smaller unit better heat rate but does not meet long term needs of the community.

**Recommendations:** Buy a 500kW self-contained generator, engine, unit breaker and controls

**Priority:** Type A Avoid immediate effect of security of supply

# Project number has not been assigned.

**Summary:** IDEC has discontinued the manufacturing of our existing Programmable Logic Controllers (PLC) FA-2J and FA-3S PLCs.

It is recommended we change out the IDEC PLCs to GE Fanuc 9030 PLC. Parts and technical support will are getting difficult to obtain. Many of our existing plants were converted to GE PLCs over 10 yrs ago and for consistency Yukon Electrical proposes to standardize on this type of PLC.

**Project Description:** Replace 20 year old computer control system and wiring.

**Costs Schedule:** 77,000

**Benefits:** Able to have parts and support for failures, expansion, changes.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Computers have gotten older, devices are not be made anymore

**Business and Technology drivers:** Manufacture has stopped making the product and will soon stop supporting it. It is important for us to continue to remotely operate and interrogate our plants for reliability purposes.

**Risks of proceeding:** GE Fanuc will be replaced with something else eventually.
Cost over runs manage cost effectively

**Risks of not proceeding:** Unable to replace failed component in the plant control system; Unable to change program or add additional components to the control system.

**Alternatives:** None identified

**Recommendations:** Continue the PLC change out program.

**Priority:** Type Type A replace deteriorating facilities. Type B Provide necessary equipment and facilities to operate.

**2009**

**Summary:** In the YEC 20 yr Resource Plan, it was recommended that all communities over 1MW be equipped with local generation to serve the immediate area during grid or line failure. The Southern Lakes area, including Carcross and Tagish, fits this criteria Yukon Electrical plans to install a generator in near the Carcross substation. This generator would be no less than 1.5MW as this is adequate sizing for the cold load pick up of the area.

**Project Description:** Purchase a 1.5MW generator complete with a step up transformer and double wall fuel tanks on skids. Install generating equipment with auto synchronizing technology in the Carcross substation.

**Costs Schedule:** 2,000,000 in 2009 budget

**Benefits:** 100 generation redundancy for the residents of the communities of Carcross and Tagish during grid or distribution line outages. .

**Resources and Funding:** Annual system improvement budget

**What has changed?** It has been determined in the Yukon that for communities that have loads over 1MW that back up generation should be considered.

**Business and Technology drivers:**

- Back up diesel for community over 1MW.
- N-1 support for 170 line failure (support for Whitehorse area power supply)
- This configuration would result in similar diesel backup as that which exists for other communities served by Yukon Electrical such as Haines Junction, Teslin, Carmacks, Ross River and Stewart Crossing.

**Risks of proceeding:** Availability of a generating unit, delays in delivery.

**Risks of not proceeding:** Potential for an extended outage in the event the grid or distribution line outages.

**Alternatives:**

- Status quo - Communities of Carcross and Tagish remain without an alternate generating source.
- Grid source from Jake's Corner this feed has same source for first 20km of line and is estimated to be a more expensive option.

**Recommendations:** Install 1.5MW (or larger generator) to improve reliability during grid outages to Carcross Tagish area.

**Priority:** Type A Carry existing load with minimum level of reliability, service and voltage
Type B- Reduce adverse affects to customers affected by outages.

# Project number unassigned
# At this time.

**Summary:** Poles are old. Some have no treatment or only treatment at the butts. Others due to shell rot or repeated climbing are not safe to work off of or add service to. A new overhead system would not be able to meet code due to the high voltage lines and transformers being too close to roof, window, and vents. Due to zero lot line zoning, in many areas, no right of way is available for overhead power lines. In addition, there is less impact to animal and tree contacts. Therefore Yukon Electrical is required to convert the overhead lines to an underground system.

**Project Description:** Install the padmount transformers, high voltage cables, and ducts into this area. Convert customers' overhead secondary services to underground services.

**Costs Schedule:** 300,000 business plan

**Benefits:** Eliminates a deteriorated system and meets current codes and regulations.

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older. New code requires more space from buildings.

**Business and Technology drivers:** New code requirements since the line was built. Poles have gotten older. Facilities require rebuilding.

**Risks of proceeding:** Cost over runs manage project effectively

**Risks of not proceeding:** Unable to provide service to the next customer that comes along, system is not able to accommodate load growth.

**Alternatives:** Status quo not acceptable as system need upgrading

**Recommendations:** Build the underground system to ensure existing code violations are dealt with and future loads can be served without concern for public safety.

**Priority:** Type A Avoid immediate effect of security of supply, comply with legislation. Replace deteriorating facilities

# Project Number Unassigned

**Summary**: Poles are aging. Some have no treatment or only treatment at the butts, a number of poles are stubbed. Others due to shell rot or repeated climbing are not safe to work off of or add services to. When this occurs the poles are changed. In a number of locations access is limited. Generally these poles were installed by the Air Force in the 1950's.

This area is fed from the most heavily loaded line and substation (Mountainview - S8358). Moving the feed to the subdivision to another substation will allow us to off load this substation and line and allow us to minimize outages by giving us a second source into the area for the rebuild.

**Project Description**: Change pole and associated hardware, convert 12KV system to 25KV. In some areas the over head will need to be placed underground.

**Costs Schedule:** 250,000 in 2009 Business Plan and 250,000 in 2010 Business Plan

**Benefits:** Reliability and safety

**Resources and Funding:** Annual system improvement budget

**What has changed?** Facilities (poles) have gotten older. Substation loading will shift.

**Business and Technology drivers:** Reliability and safety.

**Risks of proceeding:** Cost over run manage project effectively

**Risks of not proceeding:** Outages, public contacts or fire if pole fails; unsafe conditions to operate our system.

**Alternatives**
Underground much more expensive only do if alignments and narrow road width force us.
Concrete pole more expensive; would require many bucket trucks to work on poles
Composite poles new unproven technology; more expensive; would require many bucket trucks to work on poles
Steel poles - more expensive; would require many bucket trucks to work on poles

**Recommendations:** Continue normal utility practice of rebuilding the infrastructure.

**Priority:** Type A Avoid immediate effect of security of supply (old poles). Replace deteriorating facilities

**YEC-YECL-26**

**Reference:** Distribution New Extensions

**Requests:**

(a) With reference to page 9-1 lines 7-9, please provide more information regarding the discussions undertaken by YECL with regard to developing its new extension capital forecast, i.e., provide a list the communities, developers, engineering firms and customers consulted with, when and how such consultation occurs and provide detailed summaries of discussion or input received and how this information was integrated into or influenced the extension capital forecast.

(b) With reference page 9-1 lines 9-11, please provide policy or standard by which YECL assesses the ability of infrastructure to accommodate proposed growth. Provide examples of the types of customer service requirements that are considered.

(c) With reference page 9-1 lines 11-13, please provide detailed information on how YECL develops its estimate for facilities required for new extensions which are inserted in the forecast.

(d) With reference to page 9-1, lines 12-14, please provide detailed information on the consideration given to historical customer additions. How are these integrated into the forecast?

**Response:**

(a) City of Whitehorse, YTG, First Nation Governments, and developers are consulted. Our employees are involved in the community organizations such as Chamber of Commerce and participate in a number of workshops, planning meetings, and Charrettes where development is the primary topic. In certain situations Yukon

Electrical initiates the dialog and in others the developer or his consultant contact Yukon Electrical. Most developers incorporate the cost of electrical service into their preliminary business plan or before securing financing for a project and as a result contact Yukon Electrical on an ongoing basis. Formal documentation is generally started when the customer requests a firm estimate and the work order package is created.

(b) Yukon Electrical reviews a number of customer service requirements in its system planning. Some of these include, but are not limited to: customer load requirements, voltage flicker due to motor starts, service size, service entrance location, harmonics from customer equipment, service voltage required, existing pole locations, in-service dates, easement requirements etc.

(c) Generally, Yukon Electrical's estimating process is as follows: After an on site meeting with the interested party a detailed preliminary sketch is completed. An engineered design is developed based on engineered standard prints. Yukon Electrical uses a comprehensive proprietary computer program to assist with design and estimating. An estimate is then created with consideration given to the customer requirements listed in (b) above as well as other variables that have an impact on the final costs, such as backhoe for difficult digging conditions, additional travel, accommodation, brushing, surveying, easement, licensing, permitting, supervision and contingency. If applicable, standard investment amounts are calculated as per Schedule B Maximum Company Investment Page 25 of Electrical Service Regulations, October 18 2005.

For longer term forecasts Yukon Electrical conducts high level engineering assessment of the project. It also relies on historical information regarding similar projects that have been undertaken. In some cases Yukon Electric may use an average cost per lot as a reasonable way to develop its new extension forecast. For large or special equipment that may be required for a project, Yukon Electrical may seek estimates from manufacturers suppliers to include in the overall project costs. Yukon Electrical will also consult, in some cases, with other industry

professionals who may have experience with similar types of work to assist in the estimating of the project.

(d) Yukon Electrical recognizes that there will be unidentified new extensions that come forward on an annual basis. Historical trends that have occurred have proven that this is a prudent cost to include in Yukon Electrical's new extension forecast.

## YEC-YECL-27

**Reference:** Distribution Improvements

**Requests:**

(a) With reference to Reference page 9-1 lines 17-19, please provide YECL's definition of an acceptable level of system performance.

(b) With reference to pages 9-1 and 9-2, can the four major categories of distribution improvement projects be categorized by order of necessity or priority? Which distribution improvement projects currently included in the capital plan fall within each of the four major categories. Which are type A and how many are type B?

(c) With reference to Reference page 9-2 lines 11-13, please file the analysis referred to and used in the capital forecast.

(d) How many outages have been attributed to system deficiencies from the period 1996-2007?

(e) Describe the review process undertaken with regard to outages. Please provide any documentation or reporting that is provided.

(f) How many customer complaints regarding power quality concerns have been received from 1996-present? How many are received annually?

(g) With reference page 9-2 lines 16-18, please provide options reviewed for each major distribution improvement forecast for the test period. Please provide summary of engineering input sought and received for each project. Is such input sought prior to determining optimal option or afterwards? What criteria is used to determine the optimal option for system improvements?

(h) Please provide options reviewed for projects over 500,000 that have been undertaken over the period from 1996-2005.

(i) With reference to page 9-12, please provide a detailed description of past problems caused by old standard clearance of 3m to 5m clearance.

(j) Please provide authority for the new standard clearance distance employed. What other jurisdictions use the new standard?

**Response:**

(a) An acceptable level of system performance can have many facets. Some of the ones that Yukon Electrical considers very important are as follows:

- For protection of the system, it is important that coordination between protective devices is provided to minimize the frequency and size of customer outages.
- For voltage, Yukon Electrical monitors the system to ensure that voltage is maintained to the appropriate levels as identified in Yukon Electrical's Construction Standards Manual, print H5 derived from CSA standards CAN 3- C235-83 table 3.
- Other codes, regulations, and standards that apply to the operation of power systems by electric utilities in Canada and the Yukon are complied with
- Outages are minimal or at an acceptable level based on reliability indices used by the company.
- That the system is capable of providing reasonable service to new customers without negatively impacting service to existing customers.
- The system operates in such a way as it does not impose or present hazards to customers or employees.
- Operates and provides service to a customer that is as good as or better than service provided by other utilities taking into account the unique operating characteristics of providing service north of 60.

- That Yukon Electrical's own Construction Standards, Metering Standards, Safety Standards and operating procedures are adhered to as these have been developed as tools to assist in the operation of the power system.

- Customer concerns are minimized and addressed.

(b) It is difficult to list the distribution projects in the order of necessity and priority based on the four major categories of the distribution Improvement projects listed on page 9-1 and 9-2 of Yukon Electrical's application. At any given time a project in one of the four categories can become a priority depending on the circumstances. In addition, a project may have aspects in one or more of the four categories within its scope. Please refer to the business cases in YEC-YECL-25(a) Attachment 1 which identify the reason for the upgrade and the priority of the project.

(c) YEC-YECL-27(c) Attachment 1 is the tool generally used to bring forward operational concerns. These are prioritized and the ones that are most likely to proceed during the period are included in the forecast.

(d) Yukon Electrical understands that virtually all outages may in some way be attributed to system deficiencies. However, Yukon Electrical does use the outage data to identify trends that it uses as one tool for system improvement planning. Deficiencies are defined as inadequacies or incompleteness. The bar graph attached YEC-YECL-27(d) Attachment 1 list some of the more frequent causes of power line outages. Specific action or activities in each of the noted categories has the potential to reduce the number of outages due to that cause. ie Lighting arrestors could bring down lighting caused outages or minimize equipment damages. Enhanced brushing has the potential to reduce outages caused by trees falling on energized power lines. Bird protectors or cones have the potential to reduce outage on some equipment.

(e) Please refer to YEC-YECL-27(c) Attachment 1. Evaluations of the identified projects are then reviewed by Engineering Management and if required additional work and research are undertaken and the project is then included in the capital forecast process.

(f) Prior to 2006, Yukon Electrical used a main frame system that is no longer accessible for tracking customer concerns regarding power quality issues. Since that time a different data base for recording customer concerns regarding power quality is being utilized. In 2006, Yukon Electrical has tracked 13 power quality inquires; in 2007 Yukon Electrical tracked 27 power quality inquires.

(g) Please refer to the business cases provided to see the list of options considered for projects. Yukon Electrical's Supervising Engineer is responsible to review all aspects of the capital budget related to Distribution Improvements. Alternatives are reviewed to determine the optimal solution prior to a final decision on the scope of the project. Options are considered prior to moving forward toward the solution to avoid rework. Cost of options will be evaluated if options are equally effective in dealing with the issue. Considerations when choosing between options can include, but are not limited to: line routing, future growth, access, operability of the system, protection coordination, space in generator buildings, health safety & environment, code or regulatory changes.

(h) Please refer to YEC-YECL-25(a) Attachment 1 for a summary of projects greater than 100,000.

(i) The problems caused by the reduced Right of Way widths (3 or 5m) included more trees falling onto the lines, limited access for men and equipment, brush fires, and visibility for trouble shooting. Since Yukon Electrical has adopted the new brushing standard, tree related outages have been reduced by approximately 50 .

(j) Yukon Electrical's current brushing standards rely upon numerous other rules and regulations from the overhead power and communication industry in North America.

Yukon Electrical attempts to combine the relevant regulations and standards as well as experiences in specific regions of the country with its own practices. For example, the width of a power line right of way might be different in an area that has deep top soil providing root stability or where wind conditions are less severe or where the vegetation simply does not grow tall enough.

Other considerations might be the location of the line. For example, a power line in the back yard of a home where people continually access the area may require

a different vegetation management approach than one in a rural area where public access is less.

A number of regulatory bodies speak to how vegetation is to be managed when in the vicinity of over head power lines and communication facilities. Given the potential risks and consequences of inadvertent contact, tree removal when in the vicinity of lines is required.

Some of the regulatory agencies or bodies that speak to vegetation control are:

CANADIAN STANDARDS ASSOCIATION, over head systems, page 13, 4.1.7.1.

ALBERTA ELECTRICAL UTILITY CODE, which are standards pulled together by approximately 22 organizations working either in the industry or related industries.

OCCUPATIONAL HEALTH AND SAFETY REGULATIONS.

YUKON ELECTRICAL PROTECTION ACT.

The standard used by Yukon Electrical for vegetation management is also used by Northlands Utilities and ATCO Electric.

# DISTRIBUTION SYSTEM PROBLEM FORM

| Originator | Date | Division |
|---|---|---|
| | | |

| ☐ Property No. | ☐ Town | ☐ Co. Rural | ☐ REA |
|---|---|---|---|
| | | | |

| Service Area Name | No. | Short Description |
|---|---|---|
| | | |

| ☐ System Performance (1) | ☐ Life Extension (2) | ☐ System Replacement (3) | ☐ External Forces (4) | ☐ Special Projects (5) |
|---|---|---|---|---|

WHAT IS THE DEFICIENCY PROBLEM?

- Clearly describe what the problem is.
- List the problem or specific hazard to be corrected.

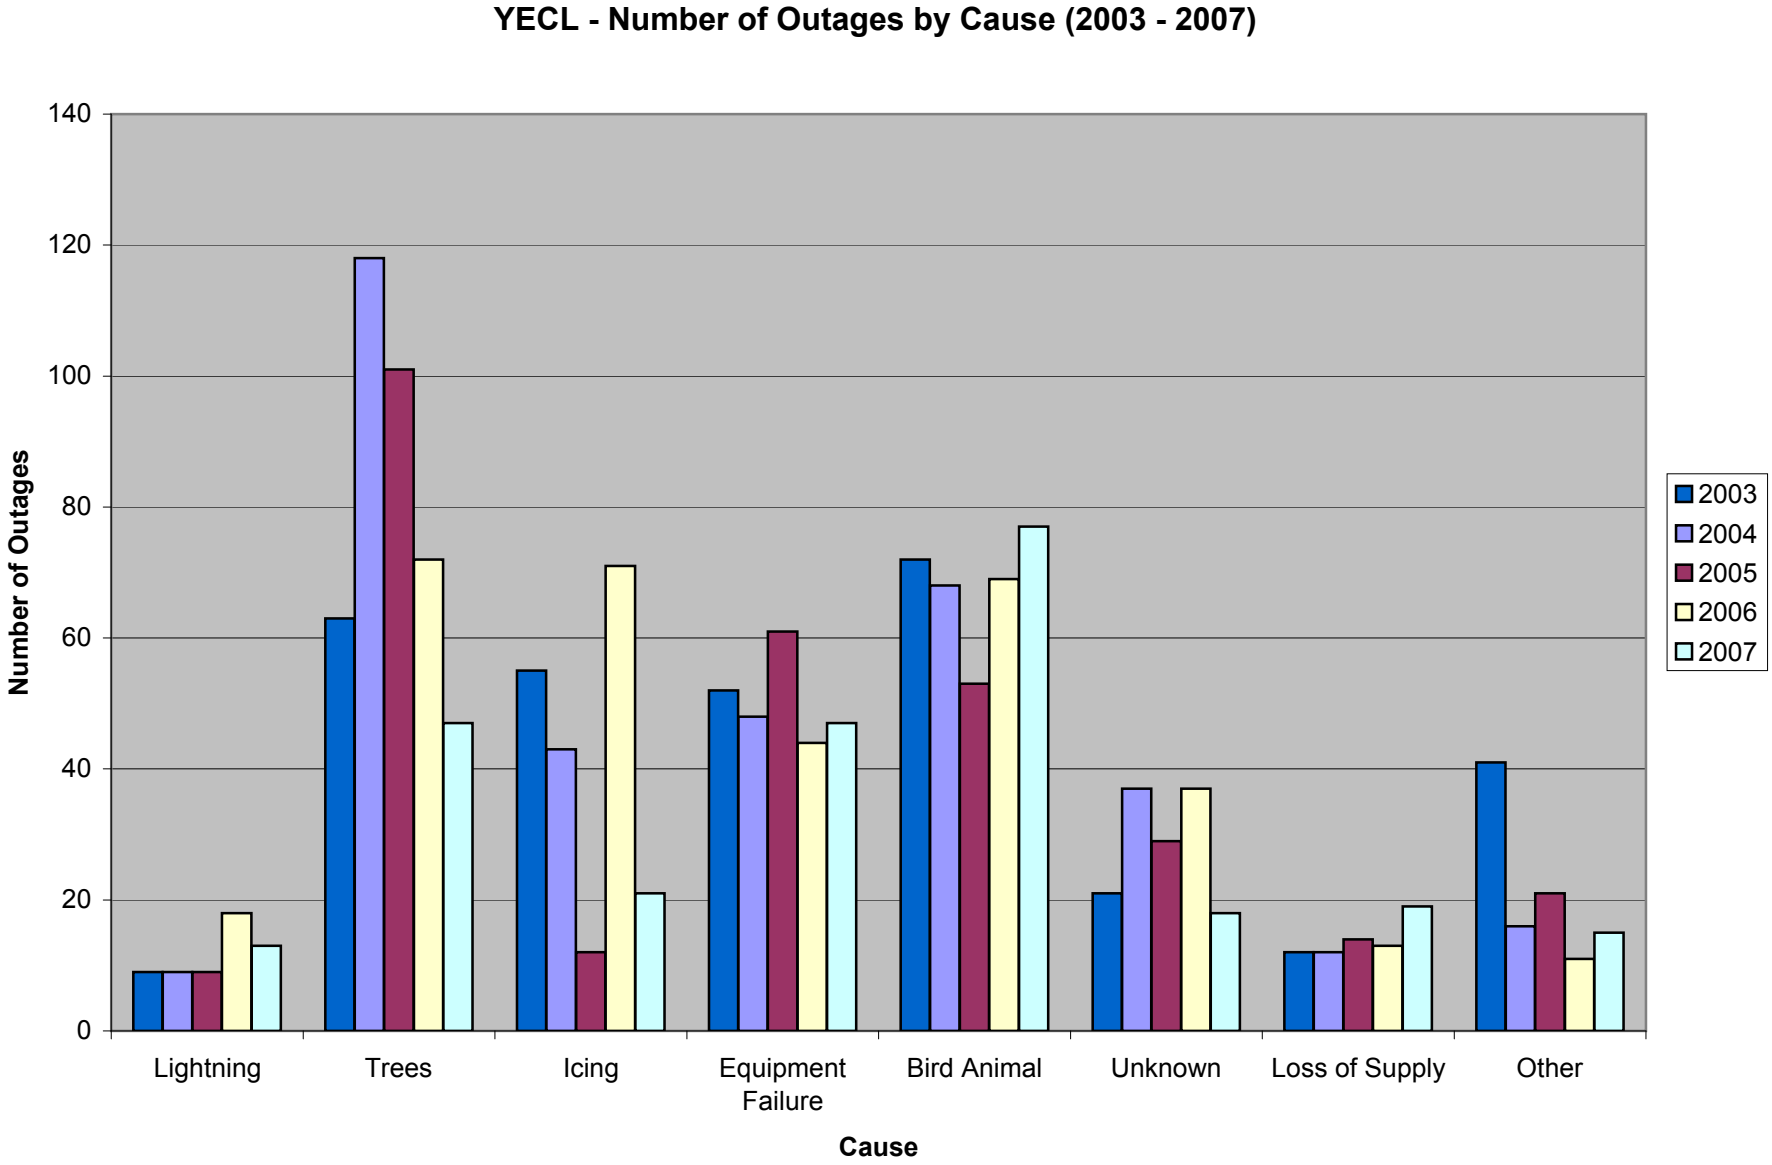
SUPPORTING DATA DOCUMENTATION

| ☐ Number outages past two years | ☐ Attach a copy of outage reports by , date and cause |
|---|---|
| ☐ Number customer complaints? | ☐ Attach list complaints by name, location, date & reason |

| Voltage charts attached? | ☐ Yes ☐ No | Load readings attached? | ☐ Yes ☐ No | Test results attached? | ☐ Yes ☐ No |
|---|---|---|---|---|---|
| Maps, photos, sketches attached? | ☐ Yes ☐ No | | | | |

Suggested solution to resolve the problem and time constraints.

**DISTRIBUTION PRIORITIES**



**Type A are required to**:
- ☐ Eliminate hazards
- ☐ Add new customers
- ☐ Move lines for roads
- ☐ Improve voltage
- ☐ Comply with Legislation

**Type B are to:**
- ☐ Reduce adverse effects
- ☐ Help APL to obtain unallocated areas

**Type C are to:**
- ☐ Increase operating efficiency
- ☐ Function according to standardized operating practices
- ☐ Benefit from long term cost savings
- ☐ Enhance public relations

**YEC-YECL-28**

**Reference:** Conversion of Overhead Systems

**Requests:**

(a) With reference to Reference 9-12 - 4th Avenue Klondike Inn to Ogilvie St., please provide more information regarding how new overhead systems will not meet current electrical codes. Specify which electrical codes are violated and the provisions violated.

(b) The City is a partner is covering the costs to build underground rather than overhead. Please provide more information regarding cost sharing between the City of Whitehorse and YECL for this project.

i. Is this cost sharing undertaken pursuant to YECL utility investment policy? If the company's investment policy was not followed please explain how YECL derived its investment.

ii. By component please confirm which component of the company's investment policy with regard to maximum utility investment was used to determine YECL's investment.

iii. Please provide the total customer contribution, the company investment, the total cost of the project and the estimated demand.

(c) With reference to page 9-8 Yukon Electrical First Avenue Conversion, please provide a detailed rationale for conversion. Was any cost benefit analysis undertaken to support the prudency of conversion of a portion of the overhead system to underground locations?

(d) Was this distribution improvement undertaken as a system performance project a life extension project, a system replacement project or a forced project? Provide justification and rationale.

(e) Was this a type A or type B distribution improvement? Provide rationale.

(f) With reference to U G Rebuild Justice Centre to Whitehorse Star, please provide more information regarding how new overhead systems will not meet current electrical codes. Specify which electrical codes are violated and the provisions violated.

**Response:**

(a) In the case of this particular project, there were no specific electrical code violations. Yukon Electrical used this reference in a generic sense in that it may be one of many reasons why a project may need to be undertaken. For this particular project, relocating the displaced overhead line would violate The City Servicing Standards Manual's guidelines in that the new power line would be on top of existing water and sanitary lines. New lines need to be a minimum of 3 meters away. There was no other choice but to go underground.

(b) i) Please refer to YEC-YECL-25(a) Attachment 1 for the business case associated with this project. This project is a system improvement project that is being undertaken to replace an aged and obsolete portion of the distribution system and as such there are is no cost sharing customer contributions. Given the work is being done at the same time as City of Whitehorse work, Yukon Electrical is able to avoid civil costs that would otherwise be incurred.

ii) Please refer to YEC-YECL-28(b)(i).

iii) The total cost to Yukon Electrical for this distribution project was 650,582 and there was no customer contribution. Note that this is **not** a new extension project but rather a distribution improvement project, and as such there is no estimated demand associated with this project.

(c) Please refer to the business case found in YEC-YECL-25(a) Attachment 1

(d) Please refer to the business case found in YEC-YECL-25(a) Attachment 1

(e) Please refer to the business case found in YEC-YECL-25(a) Attachment 1

(f) For the Justice Center to Whitehorse Star Rebuild, the current electrical code could not be met by replacing the overhead system. The specific areas of concern were as follows:

- A minimum clearance of 3m horizontal or 3m vertical is the latest clearance requirement for overhead power lines. This is outlined in Alberta Electrical Utility Code.

- There is also a requirement for transformers to be 6m from any door, window or vents as per Canadian Electrical Code 26-242.

**YEC-YECL-29**

**Reference: Problem Areas**

**Requests:**

(a) With reference to Grey Mountain Top Cable, how often do failures occur to this system? Typically, how long are such failures?

(b) With reference to Carcross Km 129-131.5 Hwy 2 (south of Annie Lake Rd); please provide more information outlining how this line has been a problem area in the past. What problems have occurred? How often have such problems occurred? What has been the cost of such past problems? How does this cost compare to the cost of moving the line?

(c) Has a cost benefit analysis of been undertaken? If so, please provide summary or any report produced.

**Response:**

(a) With respect to Grey Mountain, historically outages have occurred once or twice per year and have been as long as 24 hrs or more. Generally the outages were caused by heavy snow loading, icing conditions or severe winds. Restoration was dependant on safe access to the area for men and equipment to make the repairs. The customers at this site are of significant importance to the emergency services for the City of Whitehorse and the Yukon Territory. No outages have been recorded to this location due to the above mentioned conditions since the rebuild took place.

It is important to note that these services were rebuilt for a number of reasons including age, obsolescence, access issues, and safety concerns.

(b) Please refer to the business case in YEC-YEC-25(a) Attachment 1. In all capital projects an element of professional judgement and operational experience and expertise is incorporated. Rebuilding and relocating this line from cross county to road side reduces outages and outage duration as well as decreased ongoing

brushing costs. The cost of rebuilding next to the existing line compared to rebuilding next to the road is similar in design, brushing, and digging conditions.

(c) Please refer to the business case in YEC-YEC-25(a) Attachment 1. The cost of rebuilding next to the existing line compared to rebuilding next to the road is similar in design, brushing, and digging conditions. Construction is safer as men are not working in the vicinity of an energized line and outages are reduced to the communities of Carcross & Tagish.

**YEC-YECL-30**

**Reference:** Pole Replacements

**Requests:**

(a) Does YECL have a pole inspection policy or program? If so, please provide.

(b) How often are pole inspections undertaken and by whom? Please provide any inspection reports or record of pole inspections undertaken over the past 10 years.

(c) Are pole replacements capitalized or expensed? Provide rationale.

(d) At what age do poles need to be replaced? How many poles being replaced are currently at this age or older?

(e) Does YECL have in place a plan for pole replacements on an ongoing basis? Please provide.

(f) Please describe pole replacement operations undertaken since the 1996 1997 GRA. Provide the dollar value of pole replacements undertaken from 1996 to 2005.

**Response:**

(a) Yes. Please refer to YEC-YECL-30(a) Attachment 1

(b) This program is new for Yukon Electrical, beginning in 2008. The expected cycle of the program is 9 years.

(c) Pole replacements are capitalized as it is in accordance with Generally Accepted Accounting Principles.

(d) Wooden poles 25 years and older are generally considered for the program. This is when the 9 year testing cycle commences. Age is only one factor that is considered when replacing pole. Please refer to the details provided in the program (YEC-YECL-30(a) Attachment 1).

(e) Please refer to section 9 page 9-18, and 9-25 which outlines the miscellaneous pole changes for the test years. The pole test program being undertaken in 2008 will add further value to Yukon Electrical's pole replacement program.

(f) Yukon Electrical has not tracked the number of poles or costs specifically associated with pole replacements throughout its service territory.

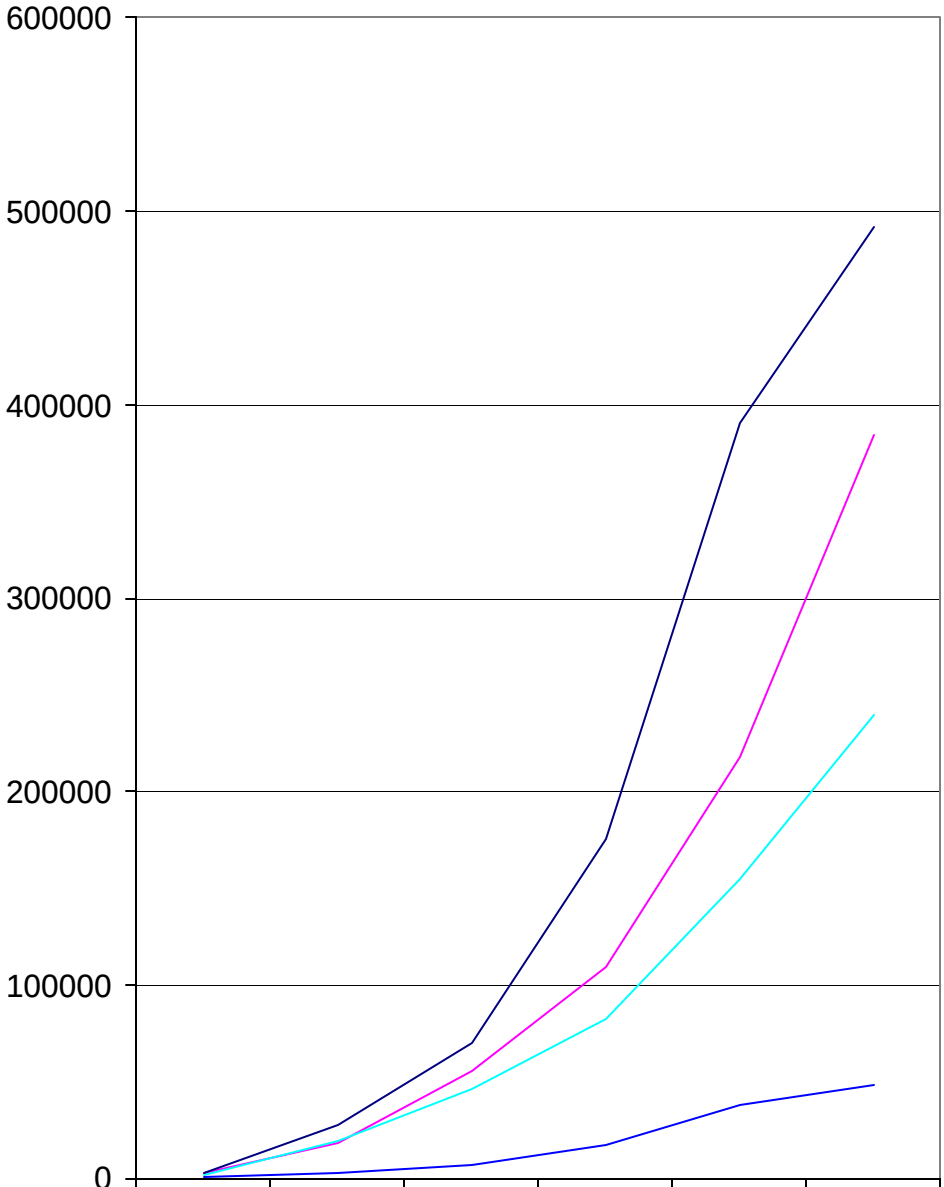
# Part I – Program Outline

## 1.0 Purpose



To provide a safe and economical pole management program that extends the life cycle of the distribution system.

## 2.0 General

The Pole Plant Maintenance Program provides procedures for inspecting and maintaining all wood poles owned by ATCO Electric or R.E.A.L. It is divided into two parts – a program outline that describes the program structure and administration, and a technical detail section to assist inspectors in assessing the condition and strength of all poles in service, including those that may be required to support additional loads.

Industry knowledge about wood pole preservation provided the context for developing the ATCO Electric Pole Plant Maintenance Program, recognizing the limitations of available resources.

**Distribution Asset Base**
**(assets are in constant $)**
**(1949/1959/1969 line lengths are estimates)**

| | 1949 | 1959 | 1969 | 1979 | 1989 | 1999 |
|---|---|---|---|---|---|---|
| Poles And Fixtures: ($ x 000) | 2569 | 18363 | 55444 | 108876 | 218178 | 384374 |
| Overhead Conductor: ($ x 000) | 1949 | 18682 | 45655 | 82523 | 154745 | 239862 |
| Line Length: (km) | 300 | 2618 | 6766 | 16990 | 37880 | 47727 |
| System Pole Estimate: | 3090 | 26965 | 69690 | 174997 | 390164 | 491588 |

## 3.0 Program Objectives

1. To administer the program uniformly company-wide.
2. To ensure results and data are standardized.
3. To determine the safest, most economical plan to test and treat poles.
4. To properly plan for and budget for upcoming work.
5. To provide REAs with a sound and credible program to look after their assets.
6. To implement a timely preventive maintenance program to extend the maximum useful life of poles.
7. To ensure the first time and subsequent testing procedure is well defined.
8. To ensure treating procedures for all poles are well defined.
9. To ensure all poles are maintained in safe condition and will not create any undue hazards to the public and company operating and construction staff.

## 4.0 Schedule

A nine-year schedule is to be developed by each district or O&M Supervisor to ensure systematic inspection and treatment of all poles. Depending on the critical importance of the line, the schedule may be adjusted to test and/or treat poles on a more frequent basis to increase reliability.

1. Divide each district into nine areas (one per year), roughly based on rural boundaries. Try to keep approximately the same number of poles in each area. For numbered lines, it is recommended to complete the entire line as one project. Work from one switching device to another to avoid overlapping outages for pole changes.

2. Establish and publish the pole plant maintenance schedule based on previous test and treat cycles and line patrol findings. Rotation can be adjusted as necessary.

3. Each year, use the pole plant maintenance schedule to prepare maps indicating the lines to be tested, treated and recorded according to specific property numbers and/or line ownership (e.g., R.E.A.L poles, oilfield poles, ‘5L’ distribution line poles, etc.)

4. For the second cycle of the program, use the first cycle schedule with alterations where necessary.

## 5.0 Three-Step Program

The program consists of three key steps.

### 5.1 Patrol

Patrol is necessary only if the targeted block is in its first cycle and no previous records exist, or existing records are inaccurate. If the targeted block is in its second cycle, refer to first cycle records.

Before proceeding, contact R.E.A.L offices through the region CSS to obtain approval to proceed in their areas.

### 5.2 Test And Treat

All poles owned by ATCO Electric or R.E.A.L should be tested and treated, according to schedule requirements. Customer-owned poles are excluded.

Pole species and treatment varies by region and service area, according to the year of construction and available supplies (see Appendix A: Pole Identification). In some areas, distribution poles have been retreated and may have been retreated more than once. Records of this are available.

In general, bandages should be applied to:

- All poles considered suitable during the course of the test and treat program described in detail in Part II, section 4.0;
- All poles that have been partially excavated or reset;
- Butt-treated poles where the ground level has been raised above the commercially treated area and
- Full Length Pressure Treated (F.L.P.T.) poles, which no longer have sufficient preservative to prevent decay.

A reasonable estimate of the remaining service life of F.L.P.T. poles can be attained by analyzing core samples to determine the amount of preservative remaining. In the case of butt treated poles, most of which are over 40 years old, a field examination is adequate.

### 5.2.1 Pole Plant Test and Treat Priority

Based on industry knowledge, the following priority has been established. Detail on each species' acceptance of the original treatment is also provided.

1. **Previously Untreated Poles.**

2. **Butt Treated Poles**

   Various species accepted the original butt treatment to a greater degree than others did. Following are the species and original treatments in order of priority.

   ***Fir and Larch***
   Locating fir poles in your area will likely be a problem. Once located, a permanent record should be kept for future reference.

   Due to density, these species have a very thin shell of originally treated wood. A first time ground line bandage should be installed after poles have been in service 25 years.

   See section 4.1 for detailed test and treat requirements. If Hollow Heart is found, and the pole has adequate shell strength, the poles should be given an internal treatment. Use the Wood Pole Strength Table (Appendix B) to determine the remaining strength if poles have pole top decay and to determine if the pole requires replacement. Fir and Larch should be re-inspected in **Nine (9)** years and given an internal treatment at that time, if justified.

   ***Pine***
   Pine poles generally accepted the original treatment well. A first time ground line bandage should be installed after the poles have been in service 25 years.

   See section 4.1 for detailed test and treat requirements. Pine poles should be tested for Hollow Heart. If strength is adequate, an internal treatment should be administered. If above ground decay has advanced to an unsafe condition, the pole should be replaced. These poles should be re-examined in **Nine (9)** years and re-treated, if justified.

   ***Butt Treated Western Red Cedar***
   Decay in these poles will be greatest at ground line and usually external. If the decay is not too far advanced, a ground line bandage should be installed as cedar readily accepts re-treatment**.** If decay has advanced beyond recommended limits, the pole should be replaced.

See section 4.1 for detailed test and treat requirements. If internal decay is discovered and the pole has adequate strength, an internal treatment should be administered. These poles should be re-examined in **Nine (9)** years.

**3. Full Length Pressure Treated (F.L.P.T.) Poles**

In general, full-length pressure treated poles should provide a service life of 25 years before preservative retention levels drop below toximetric threshold and decay sets in. When poles are relocated, or have their ground line changed, they should be retreated. Random sampling for assays should be carried out by persons who are properly trained in sampling and handling methods. Reports should indicate what subsequent work is required or when further tests should be carried out.

The following program should be adhered to for testing and treating of full-length pressure treated wood poles:

| Species | 1st Test & Treatment | 2nd & Subsequent Tests |
|---|---|---|
| Fir & Larch | 25 Years | Nine Year Plan |
| Pine | 25 Years | Nine Year Plan |
| Cedar | 25 Years | Nine Year Plan |

### 5.2.2 Test and Treat Program Outline

To simplify test and treat, procedures have been based on pole age (in 10-year blocks):

- Pre 1960 butt treated poles: test, record and treat internally
- 1960-1969 F.L.P.T. poles: test, record, internally treat and apply a bandage if not previously bandaged
- 1970-1979 F.L.P.T. poles: randomly test (10 per cent), treat internally, visually inspect, sound test and record the remainder, and apply external bandage to all unless previously bandaged
- 1980-1989 F.L.P.T. poles: randomly test (10 per cent), treat internally, visually inspect, sound test and record the remainder.
- 1990-1999 F.L.P.T. poles: visually inspect, sound test and record
- 2000 –2009 F.L.P.T. poles: visually inspect, sound test and record

Test and treat technical details are provided in Part II of this manual.

## 6.0 Record Keeping

To aid contract inspectors in identifying line ownership, a color-coded map with legend must be prepared prior to the start-up meeting.

- Pole inspectors are to record all poles using the Pole Inspection Report Form (see Appendix C). All inspection data, treatment and recommended actions must be recorded.
- A Construction Inspection Report must also be completed by the drive-up patrol for all pole changes (see Appendix D).
- Inspectors are required to send all completed Pole Inspection Report forms to the ATCO Electric Maintenance Supervisor, both electronically and on hard copy. ATCO Electric will be the sole owner of all records.
- The Pole Inspection Report form will be used to administer the test and treat contract payment.
- The Pole Inspection Report form will define the scope of the pole change and stubbing requirements for the following year. The information can also be used for manpower planning and to define material, equipment and outage requirements.

### 6.1 Invoices

To assist in assigning expenses to the appropriate budget (Operations & Maintenance or Capital), contractor invoices will provide a breakdown of test and treat activities based on pole age. (See Part II, section 3.0 for details).

This distinction is necessary because testing does not increase the life expectancy of poles, and is therefore deemed a maintenance cost. However, treating poles does add life expectancy to the pole plant system and is therefore deemed a capital expense.

## 6.2 T&T INVOICE VERIFICATION PROCESS

6.2.1 Match “miles” indicated on master map with “miles” documented on hardcopy or electronic record.
6.2.2 Verify that number of poles per master map “mile” approximate to the numbers indicated in the records [sequence number].
6.2.3 Verify that poles sequence numbers on urban master maps match sequence numbers in the records.
6.2.4 Verify ownership indicated in record as REA or AE matches color coding on master map.
6.2.5 Match tasks indicated on invoice with tasks indicated in appropriate Pole Admin. Electronic version “Action Count Report”.
6.2.6 Review all information documented per pole for accuracy on a random selection basis [5% / 6% of each plant number] i.e. land location, treatment, etc.
6.2.7 As per 6, check calculation that original circumference – decay deduction =present circumference.
6.2.8 Verify [as per item 6. above] that required circumference is accurate as per wind load chart Appendix B, Table 111 in program.
6.2.9 Remember * O&M tasks are indicated as such on upper left side of invoices, Capital tasks are indicated as such on lower left side of invoices .

# 7.0 Quality Control

## 7.1 Quality Control Audit

A quality control audit is to be completed to make sure contractors hired to carry out test and treat within the distribution system are doing quality work and are completing all requirements, as described in Part II, section 4.0. The audit involves:

- Completing a random (one per cent to two per cent) sampling of the test population to check that proper drilling, plugging and tagging has occurred on poles that are to remain in service.
- Completing a random (one per cent to two per cent) sampling of the population to check that proper drilling, plugging and tagging for internal treatment has occurred.
- Completing a random (one per cent to two per cent) sampling of the population to check that pole bandages were properly applied.

The Test and Treat Audit Form is provided in Appendix E.

## 7.2 Safety

ATCO Electric Supervisor or designee will complete a weekly work site visit and complete the ATCO Electric Job Observation form "Review of Worksite Safe Work Performance" (refer to the AE Intranet, Health & Safety Forms and Reports) and return to appropriate O&M Superintendent.

Alternately on a biweekly basis the Supervisor or designee will complete a Work Activity Audit on Test and Treat Crews and formally document all findings on the appropriate form (Appendix F).

### 7.2.1 ATV/OHV

All contract personnel are to be formally trained in operations and hazards associated with ATV operation and training certificate or letter verifying individuals trained to be provide and filed with ATCO Electric Pre-qualified Supervisor.

When operating an all terrain vehicle or snow vehicle as defined in the off-highway vehicle act, the worker shall wear protective headgear that has been approved by one of the following standard setting organizations for use as protective headwear in motor vehicle applications:

(a) Canadian Standards Assoc. (CSA CAN3-D230-M85)
(b) American National Standards Institute (ANSI)
(c) Snell Memorial Foundation
(d) British Standards Institution

### 7.2.2 Safety Glasses

Approved safety glasses are to be worn by Test and Treat crew personnel while performing all tasks associated with testing and treating of poles.

### 7.2.3 First Aid

Field locations have specified hazards deemed High Risk Hazards and will require the following for each truck in the field:

- One #2 First Aid Kit
- Three Blankets (1 woven, 2 thermal)
- Each crew member is the holder of a standard First Aid Certificate

### 7.2.4 Restricted Sites

All test and treat personnel will be familiar with the procedures (as per ATCO Electric Safe Practices Manual) of working in or around H2S sites.

### 7.2.5 Clothing

Test and treat crews will have available and wear F.R.C clothing when directed by ATCO Electric.

### 7.2.6 Underground Service Risers

No excavations will be attempted by test and treat crew personnel at poles with under ground services attached unless they are Qualified Utility Journeymen. (See 2.3 Excavation for details)

### 7.2.7 WHIMIS/TDG

All lead testers shall have a valid WHIMIS certificate. A valid TDG certificate is required if the crews are handling or shipping any hazardous material.

### 7.2.8 Salvaged Poles

When salvaging reusable or NCV poles from the system refer to the Materials Management and EH&S Policies regarding reuse, disposal or donation of poles.

## 8.0 Field Co-ordinator Responsibilities

- Reviews and assists Project Manager with overall schedule, production estimates and material requirements
- Reviews schedules and working maps with Maintenance supervisor in applicable Region
- Contacts applicable Senior Serviceman and reviews schedule and arranges a start up meeting in each District
- Attends start up meeting with contract crew and applicable O&M Superintendent and assists with competency verification check on new crews
- Arranges for material pickup or delivery with Region Stock keepers and return of any residual material remaining
- Reviews program technical details with Contract Supervisor on an ongoing basis
- Completes weekly status report detailing production and contractor complement
- Identifies future scheduling and completion requirements with contract and O&M Superintendent

- Reports safety and quality discrepancies to contractor supervisor as soon as possible and has authority to "shut down" the crew
- Assists contractor crews with any extra ordinary details regarding specific Districts in their daily tailboards
- Ensures that government legislated and ATCO Electric Safe Work Environmental Practices Procedures are understood and adhered to by contractor.
- Advises the O&M Superintendent of any incidents, personal, vehicle, environmental or customer related
- Follows up on any further requests regarding incident reports
- Ensures contract supervisor is following reporting in requirements of the TDSOP
- Provides emergency call numbers for contact crews
- Ensures contract crews are completing accurate and concise inspection reports and master maps as required by the program details
- Monitors safety of contract workers by completing a documented weekly Supervisor Work site Visit
- Alternately monitors accuracy of work and safety of random crews by completing a biweekly work activity check as per Appendix E Test and Treat Audit Form
- Completes a quality control audit on work completed as per 7.1 of Pole Plant Program
- Reviews program technical details to ensure personnel familiarity on an ongoing basis
- Assists O&M Superintendent with interpretation of records and invoices when required
- Completes biweekly L.T.E invoices for O&M Superintendent
- Carries out other duties as required

## 9.0 Budgeting

# POLE PLANT MAINTENANCE PROGRAM
# Part II – Test and Treat Technical Detail

## 1.0 General

### 1.1 Qualifications

**LEAD INSPECTOR** shall be well trained to recognize decay and other defects, calculate wood pole strength from the tables in the appendices determine the pole species, prepare the field report and organize the work. They shall hold a valid driver's license and be well versed in dealing with property owners.

**ASSISTANT INSPECTOR** shall train under a Lead Inspector until he becomes competent in all aspects of decay and other defect interpretation, wood pole strength determination, pole species identification and other duties the Lead Inspector must be qualified in to perform independently. This period of training will usually be approximately 5000 poles under direct supervision.

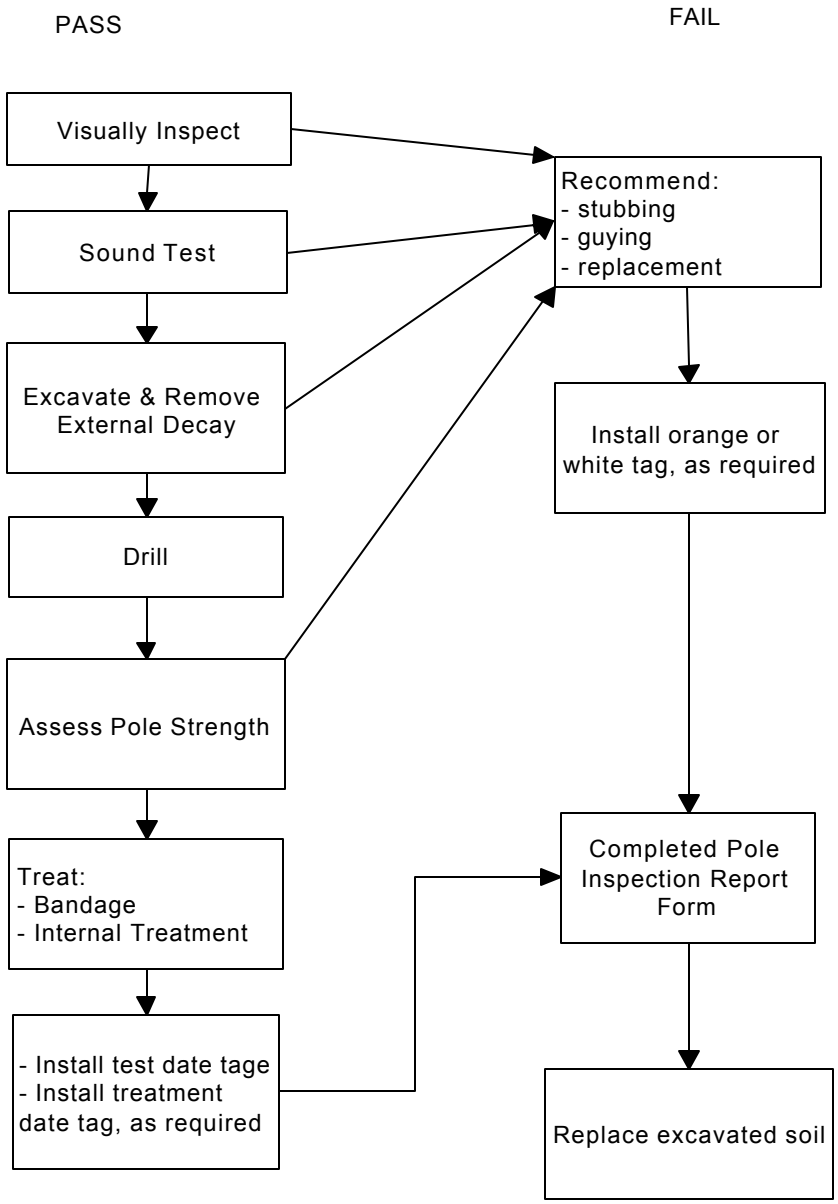
**LABORER** must be physically fit to undertake the rigorous work of excavation and back filling. Will have knowledgeable in product application and job quality. Shall be able to recognize the obvious rejects and exercise caution where called for, such as on poles with underground services.

**CONTRACTOR** to have a current and recognized Safety Program. ATCO Electric and contractor personnel to obtain permission prior to entering private property.

**TESTING** includes visual inspection, sound testing, excavation and drilling to determine if the pole has sufficient strength to support the load it carries. Poles requiring testing include:

- In-service poles scheduled for test and treat.
- Poles which are to bear additional loads.
- Poles in doubtful condition.

**TREATMENT** means the application of a preservative to prevent decay.



Pole testing, treating, stubbing and replacement should be done only by trained and competent personnel.

## 2.0 Process

Each step in the test and treat process is to be conducted consecutively, in the order indicated on the flow chart on the following page. Not all steps may be required – specific requirements based on the age of the poles is provided in section 4.0.

If the pole fails any test during the process, further testing is to be aborted and recommendations made for further action.

**TEST AND TREAT PROCESS FLOW CHART**

## 2.1 Visual Inspection

A thorough above ground inspection is done first to detect defects such as split tops, through checks, lightning damage, shrinkage or discoloration at the top of poles. Defects should be reported on the Pole Inspection Report form so that further investigation can be made by a lineman. Broken poles, including poles with cracks or cross breaks, should be immediately condemned for replacement.

Sawdust in checks or on the ground at base of pole is indicative of the presence of carpenter ants or bees in the upper part of pole. If present, continue with sound testing and drilling to determine the extent of the damage.

## 2.2 Sound Testing

Sound testing is used to detect decay inside the pole. Use a hammer to strike the pole around the sides from the ground line to about eight feet above the ground line. The minimum number of sounding marks per pole required is as follows: Four sounding marks in the first foot of poles starting at ground line (one in each quadrant of the pole). Twelve sounding marks in the remaining height of the pole should be evenly distributed in all four quadrants of the pole, unless a pocket is detected at a particular sounding mark then additional sounding will be required. The hammer blow will usually detect rot immediately below the surface by breaking the thin outer shell of sound wood. Remove this as external decay.

## 2.3 Excavation/External Decay Removal

**** No excavations to be under taken on poles with underground cables attached***

***** No excavations required around poles encased in cement or pavement. The test holes in this case will be drilled at 30° to the pole axis downward from ground level to a depth of 300mm-400mm (depending on the circumference of the pole) toward the center of the pole. Use the multiplying factor of 0.5 to obtain shell thickness.***

Excavate the base of the pole to expose decay below the ground line. Remove the soil around the pole to a minimum of six inches.

Decayed wood on the surface can best be detected by inserting a knife blade about 1/8 inch below the surface and prying a splinter loose. If the splinter pulls along the grain from the wood, the wood is sound. If the wood is broken without forming a splinter, the wood should be considered decayed.

***Probing*** **-** Probing is used to detect decay in checks and exposed pockets. It is done with a piece of steel wire 6 inches long and about 1/8 inch diameter (the reinforcing wire from scrap ACSR is ideal). Jabbing sharpened bars into the surface of a pole is prohibited as this may damage fungus resistant wood and allow decay to start in less resistant areas. The surface of the pole should be probed concentrating on areas near and in deep checks. If the wood is felt to yield under pressure, decay should be suspected.
All external decay, including decay in enclosed pockets and checks, must be removed before taking circumference measurements. If decayed wood is included in these measurements, the strength of the pole will be over-estimated. Also, decayed wood on the surface or in pockets may deprive sound wood of treatment. Suitable tools for removing decay include, scrapers, wire brush, hatchet, and wood chisel.

Take care not to remove sound wood as this will weaken the pole. After removing the decay, form a taper to about 6 inches above the ground line to provide a smooth surface.

## 2.4 Drilling – Hollow Heart Effective Shell Thickness

To detect Hollow Heart, the pole should be drilled at least three times at a minimum depth of 6 inches below ground, angling the bit at 45° and drilling toward the center at the N, SW and SE quadrants. The drill is to be 12.5 mm (1/2"). Depth of bore should be 200-250 mm minimum depending on circumference of pole.

**** No excavations to be under taken on poles with underground cables attached***

***** No excavations required around poles encased in cement or pavement. The test holes in this case will be drilled at 30° to the pole axis downward from ground level to a depth of 300mm-400mm (depending on the circumference of the pole) toward the center of the pole. Use the multiplying factor of 0.5 to obtain shell thickness.***

While drilling, note any change in the rate of the penetration of the drill – the sudden collapse of wood under the drill indicates decay. Powdery borings also indicate decayed wood.

After completing three drillings, measure the length of sound wood in each hole using the Shell Thickness Indicator or another acceptable method. The radial thickness of sound wood in the shell is calculated by multiplying these measurements by 2/3. To find the "Effective Shell Thickness," disregard the largest thickness and take the average of the two smaller thickness.

**For example:**

The lengths of sound wood in each boring have been measured at 7-1/2 inches, 6 inches and 3-3/4 inches.

Thickness of the shell at each boring:

Boring 1: 7 ½" X 2/3 = 5 inches
Boring 2: 6" X 2/3 = 4 inches
Boring 3: 3 ¾ X 2/3 = 2 ½ inches

Disregard the largest reading. Take the average of the two smaller readings:

Average: (4" +2 ½" )/2 = 3 ¼ inches
Refer to Appendix B, Wood Pole Strength Table H-11-4, for Hollow Heart Deductions of Pole Strength. Deductions for shell thickness are provided in ½ inch increments. Find the nearest measurement BELOW the average reading of 3 ¼ inches (3 inches). Deduct the corresponding allowance from the minimum measured circumference to determine the Hollow Heart effective shell thickness.

Poles with an effective shell thickness of less than two inches are to be condemned. If the pole is to be maintained in service, all drilled holes must be plugged with tight treated dowels. If this plugging is not done, decay organisms will have easy access to wood, which may be less decay resistant. A supply of appropriately sized treated dowels, four inches long, is required for plugging the holes.

## 2.5 Pole Strength Assessment

After external decay has been removed and drilling completed, measurements to assess strength are made as follows:

- **Minimum Measured Circumference**

  On poles where there has been no loss of wood, a thin (1/4 inch wide) flexible metal tape should be drawn tightly round the pole at the ground line; this measurement will be the "minimum measured circumference."

  On poles that have been cleared of rot near the ground line, the measurement should be made over the trimmed portion. A series of measurements down the trimmed

portion may be required to determine the smallest measurement. This smallest measurement will be the "minimum measured circumference."

- **Exposed Pockets**

  The width and depth of all exposed pockets should be measured. The length of the pockets along the pole axis is not significant.
  - Measure the width of the pocket at its widest point. If the pocket widens below the surface of the pole, estimate this width.
  - Measure the depth of pocket (the distance across the growth rings toward the center of the pole) by tightly drawing the measuring tape from the surface opening of the pocket to the sound wood inside the pole.

  After each exposed pocket has been measured, deduct pocket allowances from the minimum measured circumference (i.e. pocket or pockets).

- **Effective Circumference & Required Circumference**

  The Effective Circumference of a pole is a measure of its actual strength. It is found by deducting allowances for exposed pockets and Hollow Heart from the minimum measured circumference.

  The Required Circumference is a measure of pole strength necessary to support its conductors and other attachments. Appendix B: Wood Pole Strength Table H-11-4 gives the basis for calculating these requirements.

  When a line is to be inspected, note the factors common to each pole. For example, the line might be constructed on 40-foot poles in a heavy loading area with three-phase 3/0 conductors at 250-foot spans.

  The required circumference for most poles is calculated as follows:

| | |
|---|---|
| **Starting Circumference** | **24.5"** |
| **Load Factors:** | |
| Heavy Load Area | + 3.0" |
| Three-Phase Primary | + 4.0" |
| **Required Circumference** | **31.5"** |

For additional loading, add the allowance to the basic 31.5". For example, adding two secondary conductors will add 2" to the required circumference (1" each), for a total of 33.5".

If the Effective Circumference is equal to or greater than the Required Circumference (that is, the pole is strong enough to support its load), recommend treatment, depending on pole age.

- **Assessing Above Ground Strength**

The procedures outlined above are usually adequate for assessing the strength of a pole. However, there may be circumstances when it becomes necessary to check the strength of the above ground portion of the pole. These circumstances include:

(a) When a line is to be loaded with three phasing or larger conductors, or when heavy banks of transformers are to be installed.

(b) When there has been no ground line deterioration, but sapwood has rotted on the above ground surface of the pole.

(c) When poles appear to have extreme taper, rot or obvious damage such as bird holes.

Assess the required strength halfway up by multiplying the ground line circumference by 0.8. The required strength at the top of the pole can be assessed by multiplying the ground line circumference by 0.6.

If there are decay pockets in these areas, use the Wood Pole Strength Table (Appendix B) to make the necessary deductions.

## 2.6 Treatment

If the pole has sufficient strength, proceed with treatment as per the requirements in section 4.0. Further information on specific treatments is available in Appendix F.

### 2.6.1 External Treatment (Bandage)

External treatment involves the application of a preservative bandage below the ground line to prevent ingress of fungus and insects for eight to 10 years.

**Bandage Requirements:**

1. The bandage shall be 60 cm wide, such that a layer of preservative 50-cm wide is applied to the pole.
2. Active ingredients may include copper, copper naphthanate and borax.
3. Copper naphthanate based greases require a grease thickness of 6.35 mm.

**Bandage Application:**

1. To prepare the pole, excavate to a depth of 22 inches below ground line, remove all external decay and any decay in exposed pockets. If the pole is set in a lawn or pasture, continue the excavation to a depth of 24 inches (2 feet) so that when work is completed, the top of the bandage will be at ground level.

   (If the surrounding area is pavement or concrete or have live underground service cables, apply an internal treatment instead of a bandage.)

2. Measure the circumference of the pole 2 inches above the ground line. Cut the bandage at a separation point that allows for this length plus 2” to 6” for overlap.

3. Gently pry any ground wires away from the pole so that the bandage can be placed directly against the exposed wood. Remove the containment strips from the bandage.

4. Lower the bandage into the excavation and place around the pole, smoothing against the pole surface and using the overlap to draw the bandage tight at the top. Do not apply excessive pressure that might displace the preservative. (It may be helpful to have a coworker assist in this part of the operation.)

5. Staple the top edge of the bandage to the pole, overlapping the ends. Use a hand tacker rather than a hammer as a hammer blow might cause preservative to be splashed.

6. Backfill the excavation, being careful to protect the bandage from large rocks by placing the face of a spade against it.

7. When the application is complete, the top of the bandage should be about 2 inches above ground level except in lawns and pasture, where the top of the bandage should be level with the ground.

8. Attach a product identification tag to the pole at eye level on the roadside face to show the pole group year for future reference [e.g. 1970's] and contractor identification.

*(See Appendix G for diagrams.)*

### 2.6.2 Internal Treatment

Apply to all poles with Hollow Heart resulting from decay or insect infestation. This treatment is effective for eight to ten years.

**Treatment requirements:**

Internal treatment consists of a boron rod or fumigant applied as described below. Active ingredients may include copper, copper naphthanate, anhydrous disodium octaborate, disodium octaborate, tetrahydrate and anhydrous sodium.

**Treatment application:**

**Internal Treatment Application:**

Application efficacy is dependent on initial treatment load rates and the preservative's ability to lock in to the wood cell structure.
Internal pole treatment with a copper/boron, water soluble diffusable co-biocide is a proven system to effectively control and prevent the internal infestation of wooden utility poles by various forms of fungal spores and insects. Using this method, an initial load rate is 6kg./cuM of BAE equivalent copper/boron complex will be adequate to establish an 8-10 year efficacy term.

**Installation instructions:**

Follow the label instruction and insert 1-10 mmX120mm copper/boron rod in each of the three previously drilled inspection holes located 150mm below ground line. Tightly plug with an oversized treated plastic plug. The plug must be removable to permit Q.C. inspection and also to re-access the hole to do subsequent re-treatment without drilling extra holes. If the poles circumference (see chart #1 below) dictates the necessity for more than 3 rods, an additional treatment zone will be developed at the ground line zone.

Drill a second trio of holes starting at ground line using compass points South (S), NE, and NW, to alternate with the holes drilled below. Prior to drilling these holes determine if one rod per hole is sufficient or whether an additional rod per hole will be required to achieve the toxic loading desired. This decision will determine the proper hole drill depth, for either one or two rods per hole, in this second tier of holes.

This drill pattern and hole location will allow the migration of the active ingredients within the pole to dome up to the upper threshold and down to the lower levels (450mm) below ground line. this application procedure is in compliance with label instructions, manufacturers labeling and ATCO Electric Appendix 1.

| **Pole Circumference** | **Treatment** |
|---|---|
| Up to and including 34” | - 3 rods, one per hole |
| 35” to 39” | - 6 rods, one per hole |
| 40” and greater | - 9 rods, two per hole (second tier) |

See Appendix I for the recommended drilling pattern. Drill to be 12.5 mm (1/2")

### 2.6.2.1 Internal Flood

Depending on the results of the test at each applicable pole, a field decision will be made by the tester to internal flood the pole to destroy or inhibit active fungus or insects at or above the ground line area. A minimum of 0.5 liters of liquid Boron (10% in-solution) will be injected into each pole to accomplish this, as follows. Start at the 150mm above ground line level and continue up the pole at 150mm intervals, in a spiral fashion until beyond the infestation area. Under normal conditions a maximum of 3 holes or 450mm above ground line will be sufficient. These holes will be drilled with a 19 mm bit to a depth of 250-300 mm and bore cleaned of all cuttings, filled, then plugged with an oversized treated, removable plug. To ensure each pole receives the required amount of liquid treatment, ensure product is injected slowly and that no air pockets are created to give the false impression that the bore is filled.

### 2.6.3 Other Recommendations

While treatment is to be completed by the pole inspector, decisions on type of stub, guying, or replacement will usually rest with the supervisor.

- **Stubbing**
  Poles considered ideal candidates for stubbing should meet the requirement that the pole shell and heart are in good condition with no shell, heart, or butt rot present, starting from 300mm above ground and proceeding up the poles and from 300mm below ground and down, to provide a solid surface for the stub to align itself to.

  Poles whose effective circumference (measured over the taper) within the 600mm area, is less than the required circumference, but whose original circumference (measured over good wood just above the trimmed part of the pole) is equal to or greater than the required circumference, recommended reinforcing the ground line with a stub. (see Appendix H for diagram)

  ***Stubbing may not be economically justified in all areas.***

- **Guying**
  Where poles are inadequate because of side load due to unsupported services, guying should be recommended. With guying, treatment or stubbing may be adequate to maintain the poles in service.

- **Stubbing vs. Replacement**
  On occasions when decay or insect damage is not discovered in time but the above ground line portion of the pole is sound, stubbing of the pole may be advisable especially when replacement entails considerable transfer work. A stubbed pole must be given a supplementary treatment to kill the nesting insects or prevent the decay from progressing in the above ground section. Metal stub size and proper-banding criteria would be approved by Engineering Standards.

- **Replacement**
  Only poles that cannot be maintained by treatment, stubbing or guying should be recommended for replacement. These include broken poles, poles that have both internal and external decay at the ground line area and poles that have Hollow Heart with effective shell thickness less than two inches. Poles in this condition have deteriorated where they have become unsafe and are not economical to maintain.

## 2.7 Tag Installation

### 2.7.1 Inspected and Treated Poles

- **Inspected Only** – Attach a dated test tag at eye level on the roadside face of the pole.

- **Inspected and Treated** – The dated test tag and pole group year tag is to be attached to the pole at eye level on the roadside face of the pole. If internal treatment was applied, the dated product tag will be installed at eye level on the roadside face of the pole.

- **Stubbed Poles** – The dated test tag is to be attached on the side of the stub facing the road. The date tag should be
located immediately below the upper band. If steel stubs are installed, the date tag is to be located immediately above the stub face of the pole on the roadside.

### 2.7.2 Poles Requiring Additional Attention

Inspected poles requiring additional attention or replacement must be marked with an acceptable **ORANGE** plastic tag stapled to the pole. The tag is to be a minimum of 3 inches square and 1/16 inch thick (minimum) made of solid plastic, and should be place not less than 5 and not more than 7 feet above the ground line.

Emergency poles as defined previously, will also be tagged with a white replacement tag and poles will be changed in the same year as the test.

If any pole poses an immediate hazard (danger pole), the exact location and type of structure must be identified and the pole tagged with a **WHITE** replacement tag minimum of 3 inches square and 1/16 inch thick (minimum) made of solid plastic. The O&M Superintendent is to be notified immediately. When evaluations are completed after normal working hours or on weekends, contact After Hours Assistance (1-800-667-1261) to advise the Region Supervisor On-call or the Edmonton Emergency Centre (780-423-4211).

## 2.8 Pole Inspection Report Form

The Pole Inspection Report form is the primary record of all test and treat activities and the basis for administering payment to contractors.

Specific instructions on completing each section of the form is provided in Appendix C. It is important that the abbreviations and codes provided there be used consistently for ease of budgeting.

- All inspection data, treatment and recommendations are to be included on the Pole Inspection Report form.
- All Pole Inspection Report form numbers are to correspond to numbers indicating the location (miles) on the master map.
- One clean master map to be provided with numbered miles corresponding to the Inspection Report page numbers.
    - One master map for a combination of REA/AE/OF poles in a block.
    - One master map for each town
    - One master map for each '5L' distribution line in block

  Inspection routes and numbering to be in an organized and easy to follow sequence.
- All Pole Inspection Report forms are to indicate line ownership so that plant numbers can be charged with the appropriate capital charges. (To aid contract inspectors in identifying line ownership, a color-coded map with legend will be provided at the start-up meeting.)
- Inspectors are to indicate on a new, clean map all pole replacement locations noted on the Pole Inspection Report form.
- All Pole Inspection Report forms are to be sent both electronically and on hard copy to the ATCO Electric region maintenance supervisor. ATCO Electric will be the sole owner of all records.

## 3.0 Invoicing

Contractor invoices must indicate the number of poles tested, recorded and/or treated according to each pole age block, and assign the cost to the correct budget, as per the following:

| Pole Age Block | Activity | Budget |
|---|---|---|
| 1950s | • Test and record | O&M |
| | • Retreat | Capital |
| 1960s | • Test and record | O&M |
| | • Retreat | Capital |
| 1970s | • Test, record and retreat (10 per cent) | Capital |
| | • Retreat & record (90 per cent) | Capital |
| 1980s | • Test & record (10 per cent) | O&M |
| | • Record (90 per cent) | O&M |
| 1990s | • Record | O&M |

Summary sheet indicating number of poles in each age group and tasks completed to accompany each invoice by Plant Number.

- One for REA
- One for Company Rural Poles
- One for Oilfield Poles
- One for Towns
- One for each '5L' distribution line

## 3.1 Task Codes

A –Test, bandage, record
T –Bandage and record (treat)
I –Test and record (inspect)
V –Visual, sound, and record
B –Install boron rod
L –Internal treat (liquid)

## 4.0 Test and Treat Requirements, by Age Block

Pole identification information is provided in Appendix A.

Before starting excavation on any pole, check that it should be tested. The following categories of poles **DO NOT** require testing:

- **Full Length Pressure Treated Poles (F.L.P.T), depending on age**
  These may only be required to be recorded. See sections 4.2 to 4.6 for details.

- **Broken Poles**
  These poles should be immediately condemned for stubbing or replacement.

- **Severely Decayed Poles**
  Poles so obviously decayed at the ground line or pole top that the minimum required circumference would not be met are usually condemned for stubbing or replacing.

The procedures outlined below are based on the age of the poles, grouped in 10-year blocks. Procedures for stub and burned poles are also provided, in section 4.7.

**Refer to section 2.0 for details on testing, treatment application and tag installation.**

## 4.1 Pre 1960 Butt-Treated Poles

1. Visually inspect, sound test, excavate, drill and assess the strength of each pole according to the instructions provided in sections 2.0 to 2.5. If the pole fails any test, stop testing and go to number 3.
2. If the pole passes all tests:
   - Install a test date tag and remove any previous test date tags.
   - Treat internally for Hollow Heart and/or insects using the approved treatment.
   - Install a treatment date tag.
3. Determine further action required (i.e., stubbing,* guying, replacement) and tag the pole accordingly.
4. Record inspection data, treatment and recommended action (if any) on the Pole Inspection Report form.
5. Replace the excavated soil.

***NOTE: Stubbing may not be economically justified in all areas.***

***NOTE: Do not excavate around poles with underground services attached unless supervised by a qualified utility employee.***

***** NOTE: No excavations required around poles encased in cement or pavement. The test holes in this case will be drilled at 30° to the pole axis downward from ground level to a depth of 300mm-400mm (depending on the circumference of the pole) toward the center of the pole. Use the multiplying factor of 0.5 to obtain shell thickness.***

## 4.2 1960 – 1969 F.L.P.T. Poles

*Note: If any pre-1960 F.L.P.T. poles are found in the test block, test and treat them the same as 1960 – 1969 poles.*

1. Visually inspect, sound test, excavate, drill and assess the strength of each pole according to the instructions provided in sections 2.0 to 2.5. If the pole fails any test, stop testing and go to number 3.
2. If the pole passes all tests:
   - Install a test date tag and remove any previous test date tags.
   - Treat internally for hollow heart and/or insects using the approved treatment.
   - Apply an approved bandage, if not previously bandaged.
   - Install a treatment date tag.
3. Determine further action required (i.e., stubbing,* guying, replacement) and tag the pole accordingly.
4. Record inspection data, treatment and recommended action (if any) on the Pole Inspection Report form.
5. Install a 1960s date tag to simplify age identification in the next cycle.
6. Replace the excavated soil.

****NOTE: Stubbing may not be economically justified in all areas.***

****NOTE: Do not excavate around poles with underground services attached unless supervised by a qualified utility employee.***

***** NOTE: No excavations required around poles encased in cement or pavement. The test holes in this case will be drilled at 30° to the pole axis downward from ground level to a depth of 300mm-400mm (depending on the circumference of the pole) toward the center of the pole. Use the multiplying factor of 0.5 to obtain shell thickness.***

## 4.3 1970 – 1979 F.L.P.T. Poles

1. On 10 per cent of 1970s poles (one pole every kilometer):
   a. Conduct full testing (visual inspection, sound test, excavation, drill and strength assessment). If the pole fails any test, test the rest of the 1970s poles in that kilometer.
   b. Treat internally for Hollow Heart and/or insects, using the approved treatment.
   c. Install test and treatment date tags.
2. On all 1970s poles:
   a. Conduct visual inspection and sound tests.
   b. Apply an approved bandage and treatment date tag unless previously bandaged.
   c. Record inspection data, treatment and other recommended actions on the Pole Inspection Report form.
   d. Install a 1970s date tag to simplify age identification in the next cycle.
   e. Replace the excavated soil.

***NOTE: Do not excavate around poles with underground services attached unless supervised by a qualified utility employee.***

***NOTE: No excavations required around poles encased in cement or pavement. The test holes in this case will be drilled at 30° to the pole axis downward from ground level to a depth of 300mm-400mm (depending on the circumference of the pole) toward the center of the pole. Use the multiplying factor of 0.5 to obtain shell thickness.***

## 4.4 1980 - 1989 F.L.P.T. Poles

1. On 10 per cent of 1980s poles (one pole every kilometer):
   a. Conduct full testing (visual inspection, sound test, excavation, drill and strength assessment). If a pole fails any test, test the rest of the 1980s poles in that kilometer.
   b. Treat internally for Hollow Heart and/or insects, using the approved treatment.
   c. Install test and treatment date tags.
   d. Replace the excavated soil.
2. On all 1980s poles:
   a. Conduct visual inspection and sound tests.
   b. Record inspection data, treatment and other recommended actions on the Pole Inspection Report form.

***NOTE: Do not excavate around poles with underground services attached unless supervised by a qualified utility employee.***

***** NOTE: No excavations required around poles encased in cement or pavement. The test holes in this case will be drilled at 30° to the pole axis downward from ground level to a depth of 300mm-400mm (depending on the circumference of the pole) toward the center of the pole. Use the multiplying factor of 0.5 to obtain shell thickness.***

## 4.5 1990-1999 F.L.P.T. Poles

1. Conduct visual inspection and sound tests on all poles, and install test date tags. No treatment is required unless data indicates (i.e., evidence of insects).
2. Record inspection and treatment data on the Pole Inspection Report Form.

## 4.6 2000 - 2009 F.L.P.T. Poles

1. Conduct visual inspection and sound tests on all poles, and install test date tags. No treatment is required unless data indicates (i.e., evidence of insects).
2. Record inspection and treatment data on the Pole Inspection Report Form.

## 4.7 Other Poles

### 4.7.1 Stub Poles

1. Conduct visual inspection and sound test.
2. Inspect the tightness of the metal bands:
   a. If the bands are loose and there is indication of shell rot, the pole and stub should be replaced.
   b. If the bands are tight, drill near the metal banding area.
      - If the pole passes the drill test, treat for Hollow Heart and/or insects, install test and treatment date tags and record all inspection and treatment data on the Pole Inspection Report form.
      - If the pole fails the drill test, this is an indication of sub-surface rot. Recommend replacement of the pole and stub on the Pole Inspection Report form.

### 4.7.2 Burned Poles

For poles that have been scarred by prairie or forest fire but still have adequate strength to remain in service, install a bandage (if burned at ground line) and apply an internal treatment to deter infestation of insects and ingress of fungus at ground line.

# POLE PLANT MAINTENANCE PROGRAM
# Part III Pole Replacement and Stubbing

## 1.0 Miscellaneous Pole Replacement

Any rotten (shell/hollow heart) undersized (pole circumference) fire/machine damaged or clearance deficient pole to a maximum of two poles per Plant Number identified by field staff. These are to be replaced under the blanket project assigned to each Region. Appropriate form (Appendix L) must be completed and sent to Maintenance Supervisor for approval prior to work being undertaken.

## 2.0 Emergency Pole

Defined as a pole, not meeting specifications defined in Appendix B, but determined by formal test to be of sufficient critical condition to have to be changed in the same year as the formal test. Maximum of two poles per Plant Number can be changed using the emergency/danger project number set up for each Region. A field check form and map will need to be completed to activate the change. Three or more poles will require the set up of a separate project number per plant.

## 3.0 Danger Pole

Defined as a pole, identified by formal test, and found to be in such critical condition as to warrant immediate attention by either temporarily guying, bracing, or replacement within 24 hours. Forward completed form Appendix M to Maintenance Supervisor when job is complete. Use Regional emergency/danger pole project number to track the change.

## 4.0 Pole Replacement/Stubbing

All necessary documentation must be prepared in advance (i.e., inspection report, maps etc.). Complete, in-depth documents and maps will provide the main information for the tendering package.

4.1 Obtain approval from REA's to proceed with work.
(Lightning pole go to Task 87360)

4.2 Obtain appropriate Project number from Maintenance Clerk.

4.3 Pole replacement tags will be marked with sequential numbers that match those on the staking list to avoid conjestion on busy non-urban maps.

- Follow the selected route and document replacements. Keep in mind re-spanning requirements, neutral lowering, re-conductoring if feasible; structure height increases or rerouting. The documentation should also include the

physical conditions of the site (e.g., swamps, crops and farm field operations) and replacement timing.

4.4 Arrange manpower to complete a formal field check, using design criteria summary produced by the Tech. Services Group to aid the field checker in determining pole selection to match conditions found in the field. Document all replacements on maps and pertinent information on the Pole Change Field Check Form (Appendix N). The field check should also determine the most economical and feasible route to aid the replacement crews. Field check can be done by a Journeyman Lineman or Survey.

4.5 Completed field check is returned to Maintenance Supervisor to ensure field check notes, Tool Kit jacket, and requisition are complete. Package is then forwarded to Tech Services to review, estimate, and approve. Maintenance Supervisor to negotiate necessary due dates with Project Leads and document electronically in Asset Sheets.

4.6 When Project package is returned from Engineering, forward to Maintenance Superintendent for approval.

4.7 When Project package is approved, Maintenance Clerk documents the release date and forward to Maint. Supv. to release to the Project Lead for construction scheduling.

4.8 Construction Supv. then assigns Construction Lead and contracts for work either internally or externally by Cost plus, Unit, or Tendering.

4.9 Construction Lead and/or assigned crew design a work plan to carry out the project. When project is complete, the crew foreman completes a commissioning report and sends to the Construction Supv.

4.10 Construction Lead/Supervisor completes a quality check and documents findings as per Appendix D; Construction Inspection Report.

4.11 Five percent of replaced poles are to be cut up and photographed for quality control, to provide program justification and to aid research and development.

4.12 Disposal of all poles changed will follow the Materials management Process for NCV material disposal. A Release and Indemnity Agreement will be completed and filed for selling or donating all treated wood products deemed NCV.

4.13 Construction Lead reconciles WO as per WO Process and returns to Tech Services.

4.14 Project Lead informs Maintenance Supervisor of all applicable dates.

4.15 Transformers on poles being changed during replacement will be re-installed where they are not overloaded. Replace the ones that have oversized breakers or are in a location where we expect they have seen a lot of overload. Small parallel transformers shall be replacement with a single unit. In any case the replaced equipment shall be charged to the blanket transformer equipment work order.

It is important to handle the transformers gently when removing and reinstalling them at the same location.

**YEC-YECL-31**

**Reference:** Danger Tree Removal in ROW

**Requests:**

(a) With reference to page 9-7, is the new standard clearance implemented pursuant to a generally accepted policy or standard? If so, please provide.

(b) Where else has the new standard 6.1 meter clearance distance been implemented?

**Response:**

(a) Yes, the standard clearances are a part of our standard. Please refer to YUB-YECL-11 (a) Attachment 1 , YUB-YECL-11 (a) Attachment 2 and YUB-YECL-11 (a) Attachment 3

(b) Yukon Electrical's current brushing standards are the result of numerous other rules and regulations from the overhead power and communication industry in North America.

Yukon Electrical attempts to combine the regulations and standards with our practices and experiences in specific regions of the country, for example the width of a power line right of way might be different in an area that has deep top soil providing root stability or where wind conditions are less sever or where the vegetation simply does not grow tall enough.

Other considerations might be the location of the line, for example a power line in the back yard of a home where people continually access the area may be securitized more than one in a rural area.

A number of regulatory bodies speak to how vegetation is to be managed when in the vicinity of over head power lines and communication facilities. Given the

potential risks and consequences of inadvertent contact, tree removal when in the vicinity of lines is required.

Some of the regulatory agencies or bodies that speak to vegetation control are:

CANADIAN STANDARDS ASSOCIATION, over head systems, page 13, 4.1.7.1.

ALBERTA ELECTRICAL UTILITY CODE, which are standards pulled together by approximately 22 organizations working either in the industry or related industries.

OCCUPATIONAL HEALTH AND SAFETY REGULATIONS.

YUKON ELECTRICAL PROTECTION ACT

The standard used by Yukon Electrical for vegetation management is also used by Northland Utilities and ATCO Electric.

## YEC-YECL-32

**Reference:** Street and Sentinel Lights

**Requests:**

(a) With reference to page 9-3, please provide description of consultation process undertaken with local communities with regard to streetlight work.

(b) Please provide policy or standards employed with regard to determining whether streetlights require replacement.

(c) Please provide a copy of any report, analysis or study undertaken to determine streetlight replacement requirements.

(d) Who performs streetlight audits? How often are they performed?

(e) Is there an inspection policy? If so, please provide. Who carries out inspections and how often are they undertaken?

(f) With reference to page 9-9, please provide copy of the Rural Urban Transportation Association of Canada guidelines.

(g) Please provide a brief summary of how lighting levels do not meet the above-noted guidelines.

(h) Was the requirement and cost to replace First Avenue Streetlights in the City of Whitehorse factored into any cost benefit analysis undertaken by YECL to determine whether switching from overhead to underground was a prudent decision?

**Response:**

(a) The City of Whitehorse, YTG, First Nation Governments, and developers are consulted with as required. Specifically in regard to new street lighting requests, they are received from the authorities who ultimately will be paying for the lighting such as a municipality. On a broader basis, Yukon Electrical employees are involved in the community organizations such as Chamber of Commerce and participate in a number of workshops, planning meetings, and Charrettes where

development is the primary topic. It is from some of these interactions that Yukon Electrical receives information or is made aware of specific projects that are being planned or undertaken. In some situations Yukon Electrical initiates the dialog with customers and in other circumstances the developer or their consultant contacts Yukon Electrical. Most developers incorporate the cost of electrical service into their preliminary business plan before securing financing for a project and therefore Yukon Electrical is involved in the early stages of a potential project and is able to gather important data as a result.

(b) When a section of direct buried street light wire has failed it is replaced with cable in conduit in order to provide mechanical protection for the cable. The davits are replaced when they are structurally suspect due to severe rusting or damage. For long sections of roads where multiple cable failures and multiple damaged davits have been identified, Yukon Electrical will replace the existing system with new facilities in order to ensure that the lighting standards meet TAC, which is the guideline for new lights and determines how lighting should be provided based on roadway type to maximize safety and security. YEC-YECL-32(b) Attachment 1 is the ATCO Electric Distribution Street Light System Maintenance Program. This document is used as a guideline by Yukon Electrical.

(c) Please refer below to the answer provided in YEC-YECL-32(d) and (e) some of which also pertains to street light replacement planning.

Yukon Electrical does not specifically track its reliability statistics on a line or feeder basis but rather it tracks reliability on the system as a whole. Yukon Electrical's operations group meets weekly with engineering to discuss the past week's system performance. Of priority at these weekly meetings are all unplanned distribution outages or events which cause supply disruptions to customers. Events are recorded and trends are identified, ie: reoccurring failures of specific feeders, transformers or services. Trends are then investigated by researching the causes. Supporting information may be available by reviewing service interruption reports. Depending on the cause of the outages a determination is made to either immediately make corrections to the equipment or if the asset repairs can be put into the capital business planning cycle. Annual patrols flag the key areas of concern.

On a regular basis, Yukon Electrical completes assessments on its system. This is recorded in: monthly substation reports annual line patrols, ground rod report forms, electrical equipment reports, hydro inspection reports, diesel plant

inspection reports, safety audit reports, environmental audit reports, fleet inspection reports, and the list goes on. All of these types of reports assist Yukon Electrical in determining the condition of its power system and equipment and provides information necessary to assist with Capital and O&M planning requirements. This information is too voluminous to provide as it would take up several file cabinets. Third party assessments have only been completed on specific components of the distributions system such as a Dam Safety Audit on the Fish Lake water way or the Fish Lake turbines inspections. Yukon Electrical from time to time consults with other groups to assist with its capital planning and business planning needs.

(d) At a minimum, Yukon Electrical annually inspects its street light plant. These patrols are done by Yukon Electrical Servicemen and Field Service Representatives. During the winter, the asset is also patrolled for light outages.

(e) For Yukon Electrical's inspection policy please refer to YEC-YECL-32 Attachment 1 and (d) above.

(f) Yukon Electrical cannot share this document without permission from the Government of Canada. It is available to whoever wishes to purchase one. Please email publications tac-atc.ca, and ask for 2005 Guide for the design of Roadway Lighting.

(g) Lighting levels do not meet the guidelines when the lights can cause a roadway or an area to be under lit or over lit. Also the uniformity may be such that it leaves black or unlit areas between lights which are not considered safe for drivers. (Uniformity is the difference of light levels directly under the light compared to midway between lights). Different lighting levels are required for different road classes. The guidelines provide information on lighting and lighting design that maximizes safety and security of roadways. It is for these reasons that Yukon Electrical along with many municipalities and other utilities have adopted TAC.

(h) The business case in YEC-YECL-25(a) Attachment 1 for the Yukon Electrical First Avenue Conversion refers to synergies to do the street lights while the city was installing water and sewer systems. Cost savings on trenching and asphalting were realized while doing this work at this time.

|---|---|---|
| | STANDARD Maintenance Management | |
| Primary Process: | **Street Light Maintenance Program** | Number: 1100 |
| Revision Date: | | |
| Document Owner: | Distribution Maintenance Supt. | |

## 1.0 Purpose

To provide an efficient standardized Street Light Maintenance Program that will enhance the efficient operation of the ATCO Electric Distribution System and maintain company ownership of the street lighting system.

## 2.0 Scope

- To maximize street light usage at lowest cost without jeopardizing service or safety.
- To develop and implement the best practices for maintaining in service and spare Distribution Lighting Equipment.
- To develop and implement new street light maintenance standards.
- To efficiently evaluate existing equipment condition.
- To implement CMMS (MAXIMO) as the centralized database for all installed street lighting equipment.
- Develop and assign responsibilities for the Street Light Maintenance Program.
- Standardize inspections, maintenance procedures and reporting.
- Link to system operations/engineering to consistently monitor system/equipment performance.
- Implementation of process for tracking lighting equipment, locations, operations, etc.
- To satisfy core service demands of new franchise agreements.
- To provide the region staff with the data to fulfill the specified sections of the franchise agreement.

## 3.0 Strategy

### 3.1 Implement Reliability Centered Maintenance (RCM) Concepts by using the best value based tools.

- Root Cause Failure Analysis (RCFA), Reliability Centered Maintenance.
- Preventative Maintenance (PM) Total Quality Maintenance (TQM).

### 3.2 Define data management requirements

- Set standards for maintenance management data (what data is required, hierarchy of data, connectivity of data).
- Format software requirements, work order generation, ability to track location and history of street light equipment.
- Determine where data information and upkeep resides most efficiently.

# 4.0 History

## 4.1 *Standards*

Throughout ATCO Electric's existence there have been many and varied types of Street Lighting Facilities installed throughout our franchise areas. They range from incandesent to mercury vapor and now to low and high-pressure sodium lamps. Luminaires have been supplied through a number of different manufacturers and come in all shapes and sizes. The same applies to street light brackets. Standards range from a few meters in length and up and maybe painted, powder coated, galvanized or corten. Styles range from single to double davit and decorative as well as heavy wall pipe that we've inherited throughout history. Street light bases include poured in place concrete, pre-cast concrete and steel bases. Lighting systems may be fed overhead or underground either on wood or steel structures. Supply voltages may be 120V or 240V depending on the engineering criteria of the day. Steel davits may also be joint use, set up on a supporting secondary pedestal. Both wood and steel lighting structures may support festoon lighting (Christmas lights) circuits and attachments, either individually controlled by photocell or group controlled by eye and relay including cascading relay systems.

## 4.2 *Corrosion and Stresses*

Deterioration and weakening of steel street light poles can be greatly accelerated by a number of factors encountered in their (pole) environment.

- Design distance from roadways and base setting depths affects corrosion levels
- Corrosion of anchor bolts (double nutting will provide more thread bonding strength)
- Stray ground current caused by close proximity to cathodic protection or unbalanced three phase lines causes metal perforation in steel bases and partially buried street light poles
- Corrosion occurring inside the steel poles if there is poor or no drainage of water or condensation build-up internally. (proper setting depth)
- Surfaces facing the sun see more corrosion due to the wet heating/cooling cycle
- Wind loading from attachments such as flower pots and banners (see 15.2 – attachment restrictions)
- Leaning steel light poles cause more stress at ground line especially if they lean in the direction of the sweep
- Plow winds –winds of varying speeds
- Rusting on two opposite sides –especially if one corroded side faces the prevailing wind
- Welding process itself causes metal fatigue due to metal crystallization just above the weld area

## 5.0 Present Standards

ATCO Electric's present day standard is to install HPS lighting on powder coated 9m davits in residential areas and HPS lighting on galvanized 12m davits along main hi-ways and arterial roads. The preferred lighting system is to have all lights individually controlled by photoelectric cell except where festoon lighting is associated with the street lighting circuit. The present day base for steel davit is a prefab screw in steel base. Luminaires mounted on wood structures use a forty-one inch by two-inch aluminum pipe style bracket.

Floodlights still incorporate the use of either 400 or 1000-watt MV lamps with external ballasts.

## 6.0 Street Light Inventory

ATCO Electric throughout its system currently owns approximately 39,000 lights. Of this the total population a portion is on the non-investment rate and the remainder lights are on the company investment rate.

**6.1 During the planning stage check if the facility is on the investment or non-investment rate. When it is determined that the pole in question is on the non-invested rate, have the District Manger or CSR contact the appropriate Franchise authority to communicate the findings and financial responsibilities.**

**Investment rate** - these lights are on the investment rate 61B. These are defined as being installed, owned and maintained by ATCO Electric.

- Co. owns and operates the lights
- Co. makes investment in new lights (as per our current approved investment levels in T&C Schedule B)
- Co. does all maintenance on lights (paint davits, repair cables, replace conductor, change heads & bulbs, etc.)
- At end-of-life, Co. will replace the lights, like-for-like using the current material standards (i.e. replace poured-in-place bases with screw-in bases, etc.) Replacements are treated as a reinvestment in facilities and the customer is not charged for like-for-like replacement
- If the design changes and new lights are required, the added lights are treated as new installs and we invest in them as per approved levels
- Rate change at the end-of-life, the old system is salvaged and a new system is installed. The Co. can then invest in the new system (up to the levels allowed in our approved T&C's)

**Non-investment rate** - these lights are on the non-investment rate 61D and E. These are defined as owned by ATCO Electric. ATCO Electric performs only maintenance and the customer is responsible for the cost of replacement.

- Co. owns and operates the lights
- Customer pays total installation costs (NO Company investment)
- Co. does all maintenance on the lights (paint davits, repair cables, change heads & bulbs, etc.)
- At end-of-life, Customer is responsible for the cost to replace the pole (wood or steel) conductor replacement, luminary if it requires upgrade with the pole change and any equipment installed solely to support the lighting system.

- Effectively all capital costs are paid by the Customer. Therefore, monthly charges are less than they are for the "investment-rate"
- Rate change before the end-of-life, the Co. can make a pro-rated investment in the existing lights. The investment would be reduced to reflect the age of the lights (i.e. if the lights are half way through their expected life, our investment would also be reduced by half). This is the option that had been formalized in our new franchise agreements. Once converted to the "investment rate" the monthly charges increase and the Co. becomes responsible for the end-of-life replacement costs.

## 7.0 Definitions

***Construct*** – means and includes establish, construct, re-construct, upgrade or extend any part of the existing Distribution System or proposed Distribution System.

***Core Services*** – means all those services set forth in Schedule "A" of the new franchise template.

***Distribution System*** – means any facilities owned by the company used to provide Distribution Access Service within the boundaries of the Municipality and shall include Street and Decorative Lighting including poles, fixtures, Luminaires, conductors, cables, bases and pedestals.

***Extra Services*** – means those services set forth in Schedule "B" of the new franchise agreement template that are requested by the Municipality on behalf of the Consumer and provided by the company.

***Maintain*** – means to keep in good repair or overhaul any part of the Distribution System including Street Lighting.

***Operate*** – means to interrupt or restore any part of the Distribution System in a safe and reliable manner.

## 8.0 Worker Qualification

**8.1** Lights-out patrols may be carried out by any ATCO employee with the proper training in using the applicable form and orientation with applicable sections of the Safety Standards Manual. Work may also be carried out by a contract employee with similar training and orientation.

Normally street light trouble shooting and maintenance can be undertaken by a single Utility Worker qualified to repair the street lighting system. This individual should have a good comprehension of the lighting system and trouble shooting techniques. Being familiar with and reviewing on an ongoing basis the ATCO Electric Street Light Maintenance Training and Development Manual (Module II) will greatly enhance the troubleshooters abilities and increase their productivity.

The Utility Worker performing this type of maintenance must be trained and qualified to perform the work safely.

**8.2** For street light painting tasks the individual performing the task must demonstrate to the company a comprehensive understanding of correct product application, recognition of hazards and public safety protection as well as aerial bucket operating and rescue technique. When overhead circuits are attached to steel poles, painting within limits of approach of live circuits can be done by a non-utility worker, only when supervised directly by a qualified utility worker or the circuit must be isolated and grounded before proceeding.

**8.3** The testing of steel poles requires an individual well vested in the recognition of hazards and public safety protection. The individual must have a good knowledge of metals, the operation and interpretation of the results using the ultra sound tool and the interpretation of the magnetic particle results as well as a full understanding of ATCO Electric pole failure criteria.

In all cases a detailed work plan and hazard identification document must be completed. Individuals working alone must include in their plans, details to include check in procedures at regular intervals.

All personnel must be familiar with limits of approach measurements.

## 9.0 Tools Required

Aerial equipment must meet CSA standards and be mechanically/electrically sound and equipped with holding valves. Tools and equipment used in the maintenance of lifting systems must be in good condition and rated for the work to be undertaken.

Full fall arrest harnesses must be in good and workable condition and worn by personnel with proper and rated attachment points on the equipment being used.
D-Meter; (for measuring steel thickness -calibrated), welders hammer.

## 10.0 Safety Management

Comply with all AE HS&E Standards and any legislated regulations.

Hard hats, safety glasses, safety boots, and FRCs (where applicable) must be worn at all time. Aerial devices must be equipped with fire extinguishers, first aid kits, fall arrest and rescue harnesses and kits.

A supply of traffic cones and work signs must be available on site at all time.

Limits of approach for workers must be maintained at all time as per the Safety Standards Manual.

The Supervisor is required to complete an ATCO Electric Job Observation form, “Review of Worksite Safe Work Performance”. Please reference to the AE Intranet, Health & Safety Forms and Reports.

## 11.0 Data Base

To efficiently track street light inventories for light audit purposes, maintenance, details, billing and history, as well as new franchise agreement reporting details to municipalities, it is recommended that the entire lighting plant be numbered as per details of the ATCO Electric Distribution System Asset Data Process. This will enable ATCO Electric to centrally track all information and generate projects efficiently with clear location identities.

## 12.0 Inspections

See System Inspection Program for detail and specifications.

- An Annual Inspection of the lighting system is required in conjunction with the Distribution System Inspection
- A Maintenance Physical Inspection is required on a 5 year rotation

## 13.0 Operational Inspection

### 13.1 Lights-out Patrols

On a monthly basis, during the eight winter months (Sept 15$^{th}$ to May 15$^{th}$) the company will conduct a "Lights Out" street light patrol to identify lights that are not working. This will include all urban and highway lighting with the exception of rural and remote communities that have no ATCO personnel residing nearby. These locations will reply on normal customer reporting channels and maintenance performed in the most expedient manner. For a non-numbered structure, identify lights-out location by address and physically marking the site. Formal lights-out patrols will not be conducted during the summer months but will be identified through normal customer reporting channels and maintained as per criteria outlined below.

## 14.0 Repairs

### 14.1 Lights-out Repairs

The company will replace a burnt out light identified in its formal patrol or those reported by external customers within 10 working days of light out notification. (See Franchise agreement for penalty clause, exception in remote areas).

Standard HPS lamps normally cycle on and off when they start to reach end of the life (16-24000 hours). If the lamp is not replaced, the ballast starter can have its life reduced or it may be destroyed if neglected too long, resulting in unnecessary replacement of the starter. (Some new bulbs do not cycle but stay off at end of life.)

An additional factor to consider is that the starter normally tries to restart the lamp every few seconds until the arc is established. Trying to start a failed lamp will destroy the starter and possibly the ballast if the starter is built into it. While the destruction time varies from a few days to a few weeks, it is possible to damage a ballast just enough so that it starts the replacement bulb too harshly, burning it out in only a few weeks or months.

The company will also use best practical efforts to replace burnt out street lights at critical locations or a complete string of lights are out a soon as possible. The location of the critical street lights will be agreed to by municipality and ATCO Electric to complete trouble shooting tasks, refer to Module II ATCO Electric Street Light Maintenance Manual to aid in completing tasks successfully and safely.

Completed repairs are to be documented and input into the Maximo database using the appropriate form or electronic process.

At this time it is also beneficial to make an evaluation as to the condition of the neutral and hot leads coming up the davit or in the wood pole street light bracket and if justified, replace at this time. Bulbs being replaced shall also be dated by marking off existing data criteria stenciled on bulbs.

### 14.2 Underground Breaks

As a minimum the company will provide a temporary overhead repair within ten working days to an identified or reported lights-out due to failed underground cable. Underground breaks identified during the summer months of April 15th to September 15th will be repaired by October 1st of the current summer construction period. A permanent repair will be made by Oct 1rst of the next year if the outage is identified during the winter months between Sept 15th and April 15th. An assessment needs to be made as to type of conductor existing, its overall condition, terrain etc. as to whether the break in the cable is found and repaired or if a new run of cable should be installed to increase the life and efficiency of the system. (see Appendix F for Repair Criteria)

### 14.3 Davit Painting

Evaluation documented in the Street Light Inspection Report indicating the need for painting davit will also dictate the degree of work required to effectively extend the life of the davit.

a. Corten - Pitted/rusted through or integrity of weld is questionable, replace the davit with new powder cost or galvanized davit depending on the area requirement, 9m for residential, 12m for main artery and hi-ways. Corten Davits can be refurbished if they meet metal thickness standards, by sand blasting and finishing with powder coat painting. They cannot be galvanized.

b. Powder Coat - Pitted/rusted/peeling condition, replace the davit with new powder coat or galvanized depending on the area they are located. Powder coated Davits can be refurbished if they still meet metal thickness standards, by sand blasting and refinishing with powder coat painting or galvanizing. For small touch up jobs on scratches, chips, a matching spray paint can be applied.

c. Galvanized - Pitted/rusting condition, replace the davit with new galvanized. Poles can be refurbished by powder coating over galvanizing.

d. Davit Cleaning - To remove salt and eye visible oil films after the davit has been sanded wire bushed or high-pressure blasted, spray on enzyme paint cleaner. Wait five minutes and rinse off. Beading water on the metal shows the need for a second application.

e. Painted - If body and weld integrity remain the decision to repaint will be based on condition. If paint is worn through and badly faded so as to show primer underneath, then a primer needs to be applied to the first ten feet (approximately) of the cleaned davit and a topcoat of oil based paint or urethane applied. If body has rust areas on it, apply a rust converter/primer to all areas affected and then apply the topcoat (ATCO brown, green, and gray). See attached standards. Painted Davits can be refurbished, if they still meet metal thickness standards, by cleaning and repainting or by sand blasting and galvanizing.

f. Decorative Lighting - if body and weld integrity remain, the decision to repaint will be based on condition. Because of the complexity and design features of the different types of steel poles it may be more efficient to remove alternating poles and have them sand blasted and repainted at a local facility that can do this type of work. Then replace and remove remaining poles.

Street Lights identified for painting will be completed in the following year's construction season. Street lights that are identified as requiring immediate work or mutually agreed to be painted by ATCO Electric and municipality will be re-painted in current construction season.

When replacing davits the current fusing, connector, mounting, grounding and meggaring standards as well as clearances found in the construction standards manual will apply.

Manufacturer’s criteria for focusing, installation and hookup located in or on product shall be carefully followed.

### 14.4 Davit Washing

In areas of high road salt/dirt contamination a program of steel pole pressure washing should be carried out on a yearly basis during late spring and early summer. The benefit to implementing this task is to extend the life of the pole and paint finish by preventing the onset of early steel corrosion.

Locations to consider are high traffic arterial roads in urban centers, highways and intersections in rural areas.

The method used to clean steel poles will be by pressure wash and scrub bristle brush using a solution of environmentally friendly detergent. Rinse off with clean water from ground level to approximately 15 feet.

Other considerations prior to implementing this task are: poles counts and budgeting, use of pre-qualified contractors and the appropriate business licenses for urban centers, as well as any local municipal environment concerns.

### 14.5 Grading Adjustment

Lights identified as below grade will be raised using the corporate specified base extension available through Materials Management.

At time of identification, note the spacing for the bolt pattern and the height of extension required to bring the davit to grade level.

### 14.6 Refurbishing

Light standards that have been damaged by traffic or other external sources are to be removed and returned to asset recovery in Nisku. Here a decision is made to repair or refurbish the standard using the technology developed by local contractor (IRIS). The process may include a mag-particular test to check weld integrity and a metal thickness test to see if the standard wall thickness is still within tolerance limits of manufacturer.

### 14.7 Street Light Pole and Base Testing

Steel light poles shall be tested for wall thickness and weld integrity on a five year schedule initially. The schedule may be modified to complete testing on a 5 year rotation for highways and high traffic areas and 10 year rotation for residential as results of the first cycle of testing may dictate.

The cycle will consist of two levels:

a. Year One Cycle:
Complete a documented Physical Street Light Inspection on all steel light poles using the Street Light Inspection Form (Appendix H).

A visual examination is completed from bottom to top to note blistering, corrosion and other defects such as holes and dents. Also at this time, it is necessary to complete a thorough visual inspection on any lights sitting on break-away bases.

Old style solid aluminum break-aways need to be accessed through the inspection cover to visually inspect the anchor bolts and condition of the aluminum base for signs of corrosion and cracks. On newer types of break-away bases, the inspector needs to remove the metal shroud, check its condition to ensure it can still deter public access to energized conductors, visually check the break-away couplers and anchor bolts for mechanical integrity, then replace or reattach the protective shroud. Document any findings on the physical inspection report.

A Sound test using a welder's hammer will be performed on all lights concentrating on the areas of worst corrosion and most importantly at the

base just above the weld. This test will identify weak spots in the metal or possibly determine that the pole has failed. It will also identify suspect poles requiring Ultra Sound or magnetic particle testing in year one. Testing at the base is most critical as this is the location where wind load stress is the highest. The criteria used to determine a failed pole are if there is more than 10% metal loss in an area, there are holes through the pole greater in diameter than 50mm, there are three or more creased corners to an octagonal pole or more than 1/3 of the surface on a round pole is dented.

Physical Maintenance inspection maps will be color coded by the Physical inspection to ease in the sorting process as follows:

Blue – indicate to replace a standard
Green – indicate to raise or extend the base
Yellow – indicate to paint a standard
Red – wash a standard

All maintenance items identified by the Inspector will be completed by service point staff in year one with the exception of those identified to be performed by the Inspector and those capital items identified for year II.

A dry magnetic particle test will be performed on those poles identified by the physical inspection on the weld portion attaching the base to the davit. This will reveal any failures/cracks to the original weld and determine future action requirements.

An ultra sound test will be completed on those steel light poles identified by the physical inspection to determine wall thickness under areas of heaviest corrosion. The surface is prepared by brushing and scraping the areas necessary to obtain this minimum thickness reading. Do not test over paint.

Steel bases identified as requiring an ultra sound test will be excavated to the needed depth where possible to attach the test probes in areas of corrosion. An alternative to the ultra sound test on steel bases is to complete a magnet strictive sensor test on below ground steel as per 2.0 Corrosion Detection Methods found in the Ground Test Program.

Minimum wall thickness on steel light poles shall meet or exceed 0.115 inches. Minimum wall thickness on steel bases shall meet or exceed a reduction of 10% metal loss except in the corners, beyond the anchor bolts, away from the shaft, at the outside top edge where it can be up to 20%metal loss on the top surface.

If any pole poses and immediate hazard (danger pole) the exact location and type of structure must be identified using its asset structure number as reference. The O&M superintendent is to be notified immediately. When evaluations are completed after normal working hours or on weekends, contact after Hours Assistance (1-800-667-1261) top advise the region Supervisor on call or the Edmonton Emergency Centre (780-423-4211)

Danger pole is defined as a steel pole, identified by formal test, and found to be in such critical condition as to warrant immediate attention by temporally guying, bracing, removal, or replacement within 24 hours. Forward completed form Danger Pole replacement to maintenance Supervisor when job is complete. Use Regional Danger pole project number to track the change.

Steel light poles deemed to be failures because of excessive dents or creases and noted on the Level II inspection from, can be repaired on site. This can be accomplished by using an approved two piece collar for the appropriate height needed and welding the seams and the base and top of the collar directly to the Davit, then primed and painted. Steel light poles should have no discernible bend between top and bottom sections (outside the dent area) for aesthetic purposes.

In summary, tasks identified and to be completed in year one of the program cycle will include magnetic and ultra sound testing where necessary, emergency pole replacements, as well as the physical maintenance inspection.

b. Year Two Cycle:
Tasks identified and to be completed in year two of the program cycle will include steel light pole and base replacement, grading adjustment, davit painting, steel light pole repairs and davit washing.

All tasks shall be performed by a contractor pre-qualified through the ATCO Electric Process.

## 14.8 Quality Control

The Region will provide Quality Control Inspections for the year one cycle tasks prior to year two tasks being undertaken.

A random 10% population will be inspected to ensure items identified by the original inspector are consistent and accurate.

The primary focus will be on those steel poles identified as requiring painting in year two, but can also verify the accuracy of the need to have completed the ultra sound test on the random sample.

If the quality control audit indicates accuracy of the original inspectors decisions, then work as identified can proceed to project preparation and ultimately, completion.

## 14.9 Report to Municipality

The new franchise agreement with municipalities has a clause within that requires a “report card” on street light maintenance upon request by the municipality. The report required may include standards painted each year, temporary o/h service replaced; number of lights fixed and time frame between reported and fixed so as to avoid monthly penalty as well as u/g cable replacement undertaken.

## 15.0 Replacement

### 15.1 Davit Base Replacement

Using documented details of steel light pole and base condition found in the annual Inspection the five year Physical street light inspection report and the test/repair criteria as per 14.7, a decision can be made to replace, repair, or repaint deteriorated light poles and bases.

A decision at this time needs to be made to replace the base. The new 12m galvanized davit will not fit the bolt pattern of most of the poured in place or pre-cast concrete bases. Condition of base is critical at this time as well.

Davits deemed to be able to be refurbished will be sent upon consultation with investment recovery supervisor to Nisku for refurbishing and reuse.

### 15.2 Attachment Restrictions

Municipalities will approach AE for approvals to attach banners, signs or flower pots to existing steel light poles. Wind loading now becomes a primary concern for the integrity of the davits. Steel street light poles can not be drilled, welded, or otherwise weakened during this process. To determine acceptable sign, banner, and/or flower pot sizes and weights, the Regional engineer shall be contacted to match conditions with pole sizes and locations.

The municipality then becomes responsible for the installation, maintenance, and liability of any of the attachments.

### 15.3 Group Lamp Replacement

Scope: To increase the value of the Street Light System using a planned maintenance technique, by completing the group replacement of the street lighting system.

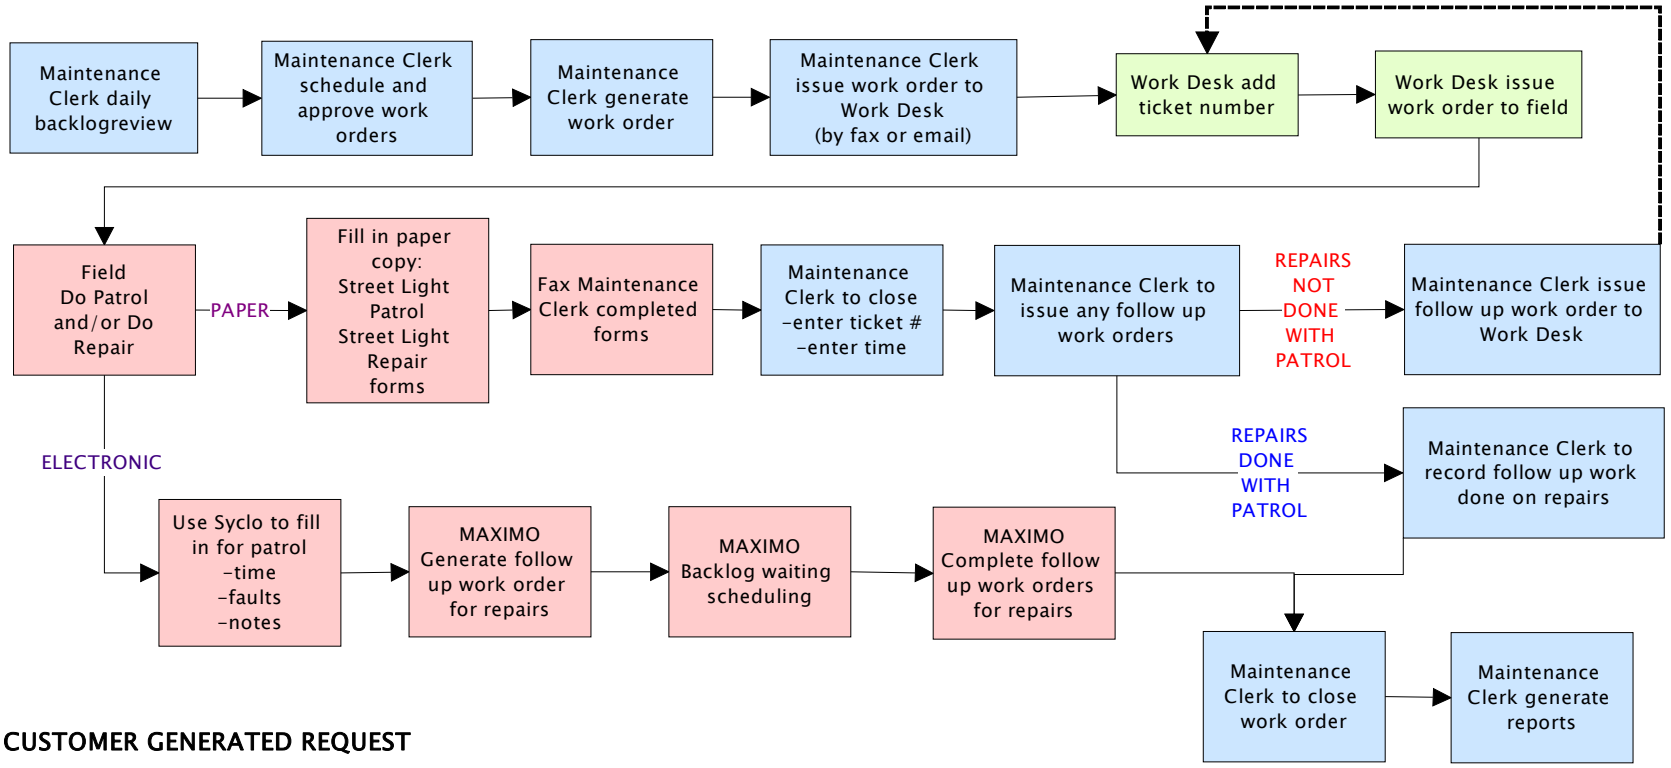
Group Replacement is implemented to replace unplanned failures, improve reliability, reduce customer complaints and decrease the overall lighting system maintenance costs.

Mid -life HPS bulbs (Life Cycle 30,000 hours)

Studies have indicated Group Replacement should be completed at 70 to 80 % of life for maximum efficiency.

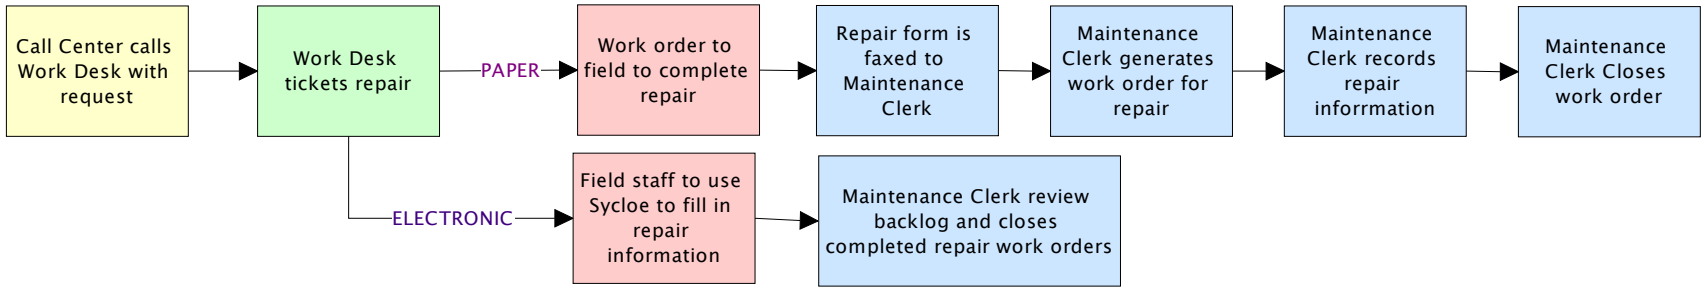
Average life 30,000 hours x 80% of life = 24,000 hours/4745 hours per year = 5.0 years or 5 year group replacement program

The estimated cost of a 5 year group replacement program would be the total # of lights, 39,000 lights/5 year rotation = number per year x /light = annual capital cost.



There would also be a small number that would fail premature and would require unplanned replacement.
# of lights x 3% premature failures = # of bulbs x  per light to repair =  annual O&M cost for repair

The Total Annual cost for this program is:  the annual Group Replacement + the unplanned repair cost = total cost



A 5 year cycle of group bulb replacement shall be initiated under three Regional Projects to record & document the group bulb replacement program.

To evaluate new products, test plots may be implemented at specified locations.  i.e. Dual Arc bulb performance

## 16 Maximo Work Order Implementation Flow Chart

### CUSTOMER GENERATED REQUEST

## 17 Funding

Funds will be identified in the Distribution Maintenance capital budget to accommodate the replacement of temporary o/h service with underground cable. The average cost for LTE & material is $20/meter.

Allocation example:

- If the cable is spliced/repaired charges are directed to the appropriate Service Point O&M account.
- If the span of cable is replaced charges are allocated to the Distribution Maintenance capital budget.

The cost of painting metal standards is a capital expenditure.

The cost to replace a metal standard with base costs is approximately $2000/location. (capital)

Lights-out patrols based on a group sampling of service points indicates approximately 15 hour per month for 8 months as defined in the New Franchise Agreement and funded by the Service Point O&M account

Street light steel pole washing will be charged to Service Point O&M account

One Project Number per Region will be generated to complete the Level II inspections as per the five year schedule. (Dist. Maint. O&M)

Appropriate number of D-series projects will be generated to collect capital costs for work required as required as per each Plant number affected.

When replacing non-invested stand-alone street lighting poles, whether they are wood or steel, use the following process:

- Complete all of the work on the capital project assigned
- Determine what lights the municipality is responsible for total replacement cost
- Calculate the average cost of replacement
- District to invoice the municipality for these costs
- Tech. Services to credit the capital project with the funds from the municipality

## 18 Storage

All steel standards shall be stored horizontal on raised soft surfaced bunks to avoid ground contact, corrosion, and damage to paint, powder coat and galvanizing from sharp or hard objects.

Luminaires and lamps are to be stored indoors in proper bin locations with easy access.

## 19 Recycling

All damaged/failed Luminaires and lamps shall be returned to the local warehouse and placed in the proper storage bins made available for recycling. Recycling is to be in accordance with procedures outlined in the Waste Minimization Program 9-1 of the EH&S Management System.

Recycle containers will be shipped through normal channels to Nisku Investment Recovery (contact supervisor).
Concrete bases will be disposed of through field warehousing directions.

Steel poles will either be recycled or disposed of through the Investment Recovery Supervisor.

## YEC-YECL-33

**Reference:** Generation Projects Undertaken from 1996 to 2005

**Requests:**

(a) For projects greater than 100,000 and in a manner consistent with 1996 97 GRA question YUB-YEC YECL-1-35, please complete a table that details (1) project name and total expense capitalized, (2) project description, (3) rationale justification, and (4) cost benefit for all distribution projects between January 1, 1996 and 2007. On an annual basis, please ensure that table provides the sum of all projects not included in this analysis that reconciles to the total distribution capitalized for a given year.

(b) For 1996 and 1997 please explain any discrepancies regard forecast projects and actual results.

**Response:**

(a) Please refer to YEC-YECL-25(a) Attachment 1.

(b) Please refer to response to YEC-YECL-25(b).

**YEC-YECL-34**

**Reference:** Fish Lake Generator Rebuild

**Requests:**

(a) With reference to page 9-16, Third party inspections recommended that this unit needs to be cleaned and that an electrical arcing noise be addressed.

i. Who performed the third party inspections? When? Were these mandatory inspections or were such inspections undertaken voluntarily by YECL?

ii. Were such inspections undertaken pursuant to a regular inspection program or other assessment process? If so, please describe.

iii. Please provide complete recommendations and reports issued by third party inspectors.

iv. Were such third party inspections carried out on Fish Lake specifically or were they undertaken for all generation plants? If other third party inspections were undertaken please provide other recommendations or reports issued.

**Response:**

i. The third party inspections were performed by Geatano Grubisa Lorne Bowes in 2007. Yukon Electrical sanctioned these inspections based on noted operating information.

ii. Daily visual audible and temperature inspections are done at Fish Lake. These inspections noted changes in the equipment; concerns were brought forward for follow up and as a result a more detailed assessment was undertaken.

iii. For reports please refer to attachments YUB-YECL-5 attachment 2, YUB-YECL-5 attachment 3.

iv. The attached reports were undertaken specifically for the Fish Lake Hydro System. No other third party inspections were done on these Hydro units.

## YEC-YECL-35

**Reference:** Haines Junction Diesel Plant Upgrade

**Requests:**

(a) With reference to page 9-16, were any studies or assessments undertaken by YECL or third parties prior to determining the need for this project? If so, please provide a copy of study or report justifying project.

(b) If project was undertaken pursuant to third party inspection please provide any recommendations provided.

(c) Were other options available or considered? Please provide brief description and summary regarding why such options were not considered optimal. Please provide all internally generated documents discussing options.

**Response:**

(a) No third party assessments were done or required as this project is consistent with and works toward stronger environmental stewardship and meeting of current codes similar to other generating locations owned and operated by Yukon Electrical.

(b) N A.

(c) Please refer to the business case in YEC-YECL-25(a) Attachment 1.

**YEC-YECL-36**

**Reference:** Fish Lake Weir in Ditch 3 or Gate

**Requests:**

(a) Please provide YECL's 2007 Dam Safety Review.

(b) Were third parties contracted to review this project and provide options and recommendations? If so provide recommendations and report or study provided to YECL.

(c) Were other options considered? If not, why not? If so, why was this considered the optimal option? Please provide all internally generated documents discussing options.

**Response:**

(a) Please refer to YUB-YECL-9(b) Attachment 1.

(b) Two third party consultants assisted Yukon Electrical in developing the plan to upgrade the weir in Ditch 3 on the Fish Lake Hydro system. It has also been reviewed and approved by the technical authority of the Yukon Water Board.

(c) The option selected was most effective to manage the situation. No other options were recommended. The Dam Safety Review is based on the Fish Lake Dam Control Structure being fully opened once the reservoir reached the FSL of 30.0 m (112.39m elevation). It was understood that this discharge may exceed the capacity of Ditch 3, but it was assumed that the safety of the dam would take precedence over that of the downstream structures. (See 5.2 of Dam Safety Review dated November 28, 2008) Based on the assumption that maximum discharge from Fish Lake combined with unrestricted inflow from Bonus Creek would jeopardize the structural integrity of Ditch 3, options to divert some of the water flow prior to it entering Ditch 3 were reviewed. The only apparent location to divert the flow without crossing First Nation Land and requiring major earth work is the existing lease for the diversion to Franklin Lake. For these reasons, Ditch 3 Diversion was considered to be the optimal option.

## YEC-YECL-37

**Reference:** Fish Lake Unit 2 New Wheel, Shaft and Bearing Pedestal

**Requests:**

(a) Please provide more information regarding the third party inspections and recommendations provided.

i. Who performed third party inspections? Were these mandatory inspections or were such inspections undertaken voluntarily by YECL?

ii. Were such inspections undertaken pursuant to a regular inspection program or other assessment process? If so, please describe.

iii. Please provide complete recommendations or report issued by third party inspectors.

iv. Were such third party inspections carried out on Fish Lake specifically or were they undertaken for all generation plants? If other third party inspections were undertaken please provide other recommendations or reports issued.

**Response:**

(a) i. Grubisa Millwright Services Ltd. out of Edmonton did the inspections. The inspections were conducted at the request of Yukon Electrical.

ii. Yes. Please refer to YEC-YECL-34.

iii. Please refer to YUB-YECL-5 Attachment 2 and 3.

iv. Third party inspections were undertaken only on the Fish Lake Hydro generators.

**YEC-YECL-38**

**Reference:** Carcross New 1.5 MW Power Plant

**Requests:**

(a) Please provide copies of all documents including any documents setting out YECL's franchise rights which deal in any way with the issue of why YECL believes diesel backup at Carcross is YECL's responsibility.

(b) Please provide basis for statement at page 9-23 that this project is per Yukon Energy's Resource Plan ? Provide quotes of any relevant portions of Yukon Energy's Resource Plan. Identify and summarize any and all YECL discussions with YEC leading to YECL's proposal of this project in this GRA.

(c) Prior to determining the need for a diesel unit at Carcross what assessment or analysis of the justification, need for and alternatives to the proposed project was undertaken?

(d) Please provide any analysis undertaken by third parties or YECL to justify the need for this unit at this time. Please provide all internally generated documents including reports done for or by senior management to justify this project.

(e) Were other contingency options considered and assessed? If so, please provide any analysis or study undertaken and rationale underlying selection of a new Carcross unit as the preferred option. If not, why not?

(f) Were other interested parties consulted with regard to the need or justification for a new unit at Carcross for contingency purposes? If so, please provide a summary of other views obtained. If not, why not?

**Response:**

(a) Yukon Electrical relies on the Public Utilities Act and Regulations there under for its rights and obligations to serve Carcross.

(b) Please refer to response to YUB-YECL-49(a) below:

It is Yukon Electrical's understanding that the YUB provided recommendations to the Justice Minister regarding the 20 Year Resource Plan put forward by Yukon Energy (YEC). The report of the YUB was submitted to the Minister January 15, 2007.

In YEC's 2007 annual report in the President's message it states Yukon Energy's primary focus this year was to proceed with some of the major initiatives laid out in our 20- year resource plan. The plan addresses our major electrical generation and transmission needs from 2006 until 2025 and was **approved last year by the Yukon Utilities Board (YUB).**

In the report filed with the minister by the YUB on page 11 of 55 and page 12 of 55 it stated

> *"YEC's criterion respecting communities to the WAF or MD grids, which states that any location with a load large enough to justify a diesel of about 1MW or more should be considered as a preferred location for new diesel units, is a criterion for deciding where to locate new units rather than a planning criterion to decide if new units are needed or not. Therefore, the Board has no concerns with YEC adopting this criterion."*

Although Yukon Electrical works closely with YEC on operational aspects of the power system, Yukon Electrical does not believe it has any obligation to seek advice from YEC on how Yukon Electrical chooses to provide reliable and safe service to its customers in Carcross or elsewhere.

(c) Carcross Tagish is the only community of Yukon Electrical that meets the above mentioned criterion and Yukon Electrical believes that adding the generator will enhance reliability for customers on the Carcross and Tagish grids.

Below is the information showing the peak demand on the Carcross Tagish system since 2003:

Carcross Substation

| | |
|---|---|
| 2003 | 748 KW |
| 2004 | 835 KW |
| 2005 | 864 KW |
| 2006 | 921 KW |

2007 864 KW
2008 1025 KW

Loads have increased such that they are expected to peak consistently over 1MW on a go forward basis.

The criteria relied upon by Yukon Electrical, including a need to enhance reliability and reduce outages, have already been vetted through past public processes and provide a valid basis for undertaking system improvement projects. However, Yukon Electrical did look at the outage statistics for the area. The option of installing a substation at Jake's Corner to give the area a second feed was also evaluated at a high level. The cost was higher than the backup generator option providing very little benefit due to the fact that the line to Carcross and the line to Teslin are one in the same for the first 20 km.

(d) Yukon Electrical did not engage a third party in its review of this project. Please refer to business case attached in YEC-YECL-25(a) Attachment 1. In addition please refer to (c) above.

(e) Please refer to (c) and (d) above

(f) Yukon Electrical did have discussions with customers in the Carcross and Tagish area. Concerns were expressed over duration of outages, reliability and emergency response. Meetings were held with community members, associations and politicians. One of the options considered to address these concerns was the addition of a standby diesel plant. Yukon Electrical also believes that its rate application is another way to engage interested parties in discussions regarding this option.

**YEC-YECL-39**

**Reference:** Return on Equity

**Requests:**

(a) Please provide a copy of the engagement letter and terms of reference between YECL and Foster Associates, Inc. for the preparation of the cost of capital evidence in this proceeding.

(b) Please provide the ROE allowed by the BCUC for benchmark low risk utilities for the past 10 years and provide appropriate references.

(c) Please provide the actual regulated ROE by year for YECL for that same period.

(d) Please confirm that YECL is protected from fuel price risk for diesel generation by Rider F. If not, why not.

(e) Please explain why, in Ms. McShane's view, it is reasonable to use one average long-term Canada bond yield for the two test years as the basis for the proposed ROE instead of using different ROEs for each test year.

(f) Please provide the data relied on by Ms. McShane to support the statements that the quarterly consensus forecasts for U.S. 10-year Treasury bond yields can be used to approximate the forecast for the 10-year Government of Canada bond yield, as the available consensus forecasts show that the Canadian and U.S. rates are expected to track closely, with the 10-year Canada bond slightly higher (10 basis points) than the 10-year Treasury by 2010 (pages 10 and 11 of the Foster Associates Inc evidence).

(g) Please provide the actual long-term Canada bond yield at June 30, 2008 and the average long-term Canada bond yield for the first six months of 2008.

(h) Please indicate the generic return on equity that would be calculated using the Alberta EUB method if:

i. The actual June 30, 2008 long-term Canada bond yield were used as the basis for the return on equity calculation for 2008.

ii. The average long-term Canada bond yield for the first six months of 2008 was used as the basis for the return on equity calculation for 2008.

(i) Please provide a copy of schedule 1.1 for YECL under each of the following assumptions as to rate of return on common equity: 9 , 8.5 , 8 and 7.5 .

**Response:**

(a) Please refer to YEC-YECL-39(a) Attachment 1 for a copy of the Requisition Enhancement form and YEC-YECL-39(a) Attachment 2 for a copy of a Blanket Purchase Order for Foster Associates Inc.

(b) The BCUC has identified Terasen Gas Inc. as the benchmark utility. The requested returns are shown on Schedule 5, page 2 of 3.

(c) The actual YECL regulated return is as follows:

| Year | Actual |
|---|---|
| 1998 | 9.65 |
| 1999 | 9.75 |
| 2000 | 10.09 |
| 2001 | 10.67 |
| 2002 | 10.98 |
| 2003 | 10.55 |
| 2004 | 10.20 |
| 2005 | 9.04 |
| 2006 | 10.69 |
| 2007 | 10.70 |

(d) Confirmed.

(e) There is no compelling theoretical rationale for setting two separate ROEs for the test period. Setting a single ROE for the test period, rather than separate ROEs for each of the two test years, recognizes that the cost of equity is a longer-term concept that, at any point in time, is a single value, incorporating both current and forecast interest rates (among other factors).

(f) A copy of the May 1, 2008 Blue Chip *Financial Forecasts* is attached as YEC-YECL-39(f) Attachment 1 - Blue Chip. As stated at page 10 of the Foster Associates Inc. evidence, commencing at line 277, due to the absence of a consensus 2009 forecast for the 10-year Canada yield, the 2009 forecast was based on the quarterly consensus forecasts for the U.S. 10-year Treasury bond. The Blue Chip *Financial Forecasts* (May 1, 2008) anticipated 10-year Treasury bond yields of:

| | |
|---|---|
| **1st Quarter 2009** | 4.0 |
| **2nd Quarter 2009** | 4.1 |
| **3rd Quarter 2009** | 4.3 |

With a further 0.1 increase in the 4th quarter, the 4th quarter 10-year yield would be 4.4 for an annual average of 4.2 .

The 10-year Canada bond yield was estimated to be approximately the same as the forecast 10-year U.S yields, given that, as noted at lines 283-285, the available consensus forecasts show that the Canadian and U.S. rates are expected to track closely with the 10-year Canada bond slightly higher (10 basis points) than the 10-year Treasury by 2010 as per the April 2008 Consensus Economics Consensus Forecasts. The relevant pages of the forecast are attached as YEC-YECL-39(f) Attachment 2 - Consensus Economics April 2008 extract.

(g) The long-term Canada bond yield was 4.08 on June 30, 2008, equivalent to the average for the first six months of the year.

(h) As the yield is the same, the resulting ROE would be 8.40 in both cases.

(i) This information is not being provided as any number of combinations have been or could have been requested and the information is readily available through the spreadsheets provided in the application.

Standard Purchase Order
Terms & Conditions

P01 ACCEPTANCE
Any work, shipment or acknowledgment by Supplier in response to this purchase order shall constitute complete acceptance by Supplier of entire purchase order including all terms and conditions contained or referenced herein and no contrary terms and conditions shall apply.

P02 ALTERATION AND CANCELLATION
Purchaser reserves the right to change any and all quantities and descriptions for items on this purchase order at Purchaser's absolute discretion. Purchaser shall confirm such change in writing to Supplier. Provided Supplier is in compliance with all terms, conditions and specifications of purchase order at time of change, Supplier shall be entitled to fair and reasonable compensation from Purchaser for material previously received by Purchaser, out-of-pocket costs to Supplier for work-in-progress prior to change, and expenses incurred by Supplier to meet such change.

P03 PRICES
Unless otherwise specified herein prices shown shall be fixed and inclusive of any other charges including but not limited to deposits, packaging and handling.

P04 SHIPMENT AND DELIVERY
Time is of the essence and Supplier shall cause goods or services to be provided to Purchaser upon the specified delivery date. Unless otherwise specified herein, Supplier shall select appropriate mode of shipment, the carrier, and the payment arrangement for shipping charges. Any bills from Supplier to Purchaser for agreed and prepaid carrier charges exceeding fifty Canadian dollars ($50) or its equivalent shall be supported by copy of the carrier billing.

P05 TITLE AND OWNERSHIP
Supplier represents and warrants to be the absolute owner of materials specified herein with good and marketable title thereto free and clear of any lien, charge, encumbrance or right of others whatsoever and is exclusively entitled to possess and sell same. Unless otherwise specified herein, title and risk for goods hereunder shall pass to Purchaser only upon acceptance by Purchaser at the FOB point specified herein. Any design, drawing, sample, pattern, tool or material supplied by, loaned by, or paid for by Purchaser in relation to this purchase order shall remain or become property of Purchaser.

P06 CONFIDENTIALITY
All documents, designs, drawings, specifications, samples and the like furnished by Purchaser to Supplier shall be treated as confidential by Supplier, used by Supplier only in relation to this purchase order and disclosed to Supplier's employees and subcontractors only after appropriate written acknowledgment of confidentiality is obtained from such parties.

P07 USE OF PURCHASER'S NAME
Supplier shall not use Purchaser's name in any form of promotion or advertising without Purchaser's prior written consent.

P08 BILLING AND PAYMENT
Invoices shall specify this purchase order number and provide a breakdown to at least the item level. The time for payment specified herein shall commence upon receipt of suitable invoice or satisfactory receipt of the specified goods and services, whichever shall be the later. Purchaser reserves the right to deduct monies due, or accruing due, from Supplier to Purchaser at time of payment.

P09 GUARANTEE
Supplier warrants all goods and services supplied hereunder to meet requirements of the law, generally accepted industry standards, and any specification provided by Purchaser. Unless otherwise specified herein, Supplier shall repair or replace without charge to Purchaser, any defective or failed goods or workmanship detected within twelve (12) months of first use by Purchaser, provided Purchaser has cared for and used such goods in a reasonable manner. Such repair or replacement shall be without prejudice to any of Purchaser's other rights or remedies.

P10 INDEMNIFICATION
In accepting this purchase order Supplier shall indemnify and save harmless Purchaser from all loss, costs, damages and claims to the extent they are attributable to the performance or purported performance by Supplier in response to this purchase order including without limitation those with respect to patent infringement, injury and death.

P11 INSURANCE
Supplier and Supplier's subcontractors or agents hereunder shall have insurance adequate to cover obligations incurred under this purchase order or to any minimum amount specified herein and to the satisfaction of the Purchaser. At Purchaser's request, Supplier shall provide independent documentary proof of such coverage.

P12 ASSIGNMENT
Supplier shall not assign any obligation or benefit arising from this purchase order without Purchaser's prior written consent.

P13 GOVERNING LAW
This purchase order shall be governed by the laws of the province or territory named as the office of Purchaser in the purchase order and any disputes arising shall be subject to the exclusive jurisdiction of those courts.

# Is The Fed Preparing To Pause?

**Domestic Commentary** Despite some speculation that the Federal Open Market Committee might leave interest rates unchanged when it meets April 29th-30th, financial markets and an overwhelming majority of our panelists foresee a 25 basis point reduction in the target federal funds rate to 2.00%. That would mark the seventh cut in the last eight months and bring to 325 basis points the total reduction in the fed funds target since last September. However, some analysts suspect the statement issued after the meeting will signal a desire on the part of the FOMC to hold interest rates steady for a time as it assesses the impact of the federal tax rebate checks that will begin to go out within weeks, as well as its own previous moves to lower interest rates and pump liquidity into dysfunctional credit markets. A pause in the easing cycle also would likely serve to support the value of the U.S. dollar, knock commodity prices down and buttress the Fed's inflation-fighting credibility. However, it is thought unlikely that the statement would completely rule out additional rate reductions given the still relatively sober outlook for economic growth in the medium term among analysts at the Fed and in the private sector. The Fed tried that gambit in October by noting that weak growth and inflation were of equal concern to policymakers, but had to reverse course within weeks when credit markets went into a tailspin.

Specifically, the results of our April 21st-22nd survey show 86% of our panelists predicting the target federal funds rate will be reduced by a quarter of a percentage point at the late-April meeting. A couple of panelists forecast no change in the Fed's overnight rate at the meeting while seven predicted a 50 basis point cut. A slim majority (51%) say the target fed funds rate will remain at 2.00% following the FOMC's June 24th-25th meeting. Last month, 44% said the funds rate would be at 2.0% following the June meeting. About 42% believe the target fed funds rate will stand at 1.75% after the late-June meeting, one panelist foresees a 1.50% funds rate and two foresee 1.25% or lower target. Overall, the consensus predicts the target fed funds rate will average 1.9% in Q3 and Q4 of this year, 0.1 of a point higher than estimated a month ago. The funds rate will average 2.0% in Q1 2009, 2.2% in Q2 2009 and 2.5% in Q3 of next year, says the consensus, unchanged from last month's forecast.

Reacting to a variety of catalysts, the Treasury market has gotten absolutely crushed over the past several weeks as safe-haven demand dried up. Yields hit their cyclical lows during the week ended March 21st when the Fed engineered the shotgun wedding of Bear Stearns to J.P. Morgan Chase, announced a lending facility for non-bank brokers, broadened the list of collateral it would accept for loans and cut the target funds rate by 75 basis points to 2.25%. These moves eased concern about systemic risk and a deep, prolonged downturn in the economy, thus reducing demand for risk-free Treasuries. More recently, earnings reports from the financial sector apparently have been insufficiently grim enough to worry investors, prompting a considerable tightening of credit spreads and higher stock prices. The ability of financial firms to raise fresh capital in order to shore up balance sheets, even if it is at the expense of diluting existing shareholder equity, also has helped reduce concern among investors. Though hardly robust, better-than-feared news over the past month on retail sales, industrial production and unemployment claims, also seem to have inspired confidence, further decreasing demand for Treasuries in favor of riskier assets. Lastly, Treasuries have suffered as speculation increased that the Fed might cut interest rates little if any more. As a result, yields at the front end of the Treasury curve have shot to their highest level and the curve is at its flattest since late January/early February. Two-year Treasury yields have soared a bit more than 100 basis points above their March 17th lows, the five-year note yield is up 90 basis points and the 10-year yield some 45 basis points higher.

At the same time, we also have witnessed renewed turmoil in the interbank lending market which suggests things may not be as nearly rosy in the banking and broader financial system as investors have come to assume of late. The three-month LIBOR has spike to 2.91%, some 37 basis points higher than on March 18th. That has pushed the 3-month LIBOR/OIS spread (an indirect measure of funds available in the money market) to 89 basis points, a new high for 2008 and close to the high reached last December. Granted, some of this results from an investigation by British authorities into whether banks were inaccurately reporting their funding costs. However, some of the rise likely reflects continued unease among banks about counterparty risk and the hoarding of funds. The jump in LIBOR served to produce a sharp blowout in swap spreads and problems in the Eurodollar futures market that contributed to the upward pressure on Treasury yields. Whatever the cause, the rise in LIBOR is troubling since interest payments on over $600 billion of investment grade debt, about $30 billion of high yield floating corporate debt and $900 billion in subprime mortgages are tied to this rate.

Besides the signals from the interbank lending market, there remain other reasons to suspect increased optimism on the part of investors could be misplaced and that even if it pauses in the near-term the Fed may ultimately decide to cut interest rates further. Real GDP likely grew at a rate of less than 1.0% for a second straight quarter in Q1 2008 and the consensus now assumes an outright contraction in the economy growth during Q2. Although the consensus assumes improved growth of 1.6% in the second half of this year and growth of about 2.25% in the first half of 2009, several analysts worry that collateral damage to the American economy resulting from the housing and financial crisis will instead broaden and continue to grow.

Consumer confidence dropped to a 26-year low in March, according to the University of Michigan and the rise in gasoline prices to a record $3.50 per gallon in late-April likely sent it even lower. Indeed, the average price of gasoline this summer may come close to being a dollar higher than last year, completely offsetting the boost to discretionary consumer spending that was expected to result from the tax rebate program. Reduced hiring and slower wage growth also is likely to weigh on consumer spending. Nonfarm payrolls have contracted at an average monthly rate of 77,000 since the start of this year and even bigger declines may lie ahead. Increased economic uncertainty has also taken its toll on capital spending plans and investment in business structures may swoon following robust growth in 2007. Reduced domestic demand produced a sharp build-up of business inventories during Q1. Although that will add to Q1 rate of real GDP growth, a paring of inventory levels in Q2 is likely to be a major drag on growth. Moreover, there is yet to be seen signs of a bottom in the housing market. Starts and new home sales fell sharply in March and persistently high inventories of unsold homes, coupled with steadily rising delinquency and foreclosure rates continue to exert downward pressure on prices. Recent, sharp increases in loan-loss provisions by banks further suggests more write downs lie ahead on all manner of consumer, corporate and housing debt.

**Consensus Forecast** The consensus says the FOMC will cut interest rates by 25 basis points on April 30th, but the percentage of those expecting additional rates cuts fell over the past month. Partly as a result, a majority of our analysts think the value of the dollar will bottom in Q2 *(see page 2 for U.S. consensus forecasts).*

**Special Questions** A bit more than 34% of our panelists agree with Martin Feldstein that the FOMC should not cut its target federal funds rate below 2.0%. Almost 62% of the panelists think the Treasury market is overvalued. Yet, 72% of the panelists say the U.S. is in, or will enter, a recession this year *(see page 14 for details).*

*Forecasts of individual panel members are on pages 10 and 11. Definitions of variables are as follows: [1]Three month currency interest rates. Government bonds are yields to maturity. Foreign exchange rate forecasts for U.K., Australia and the Euro are currencies per U.S. dollar. For the U.S dollar, forecasts are of the U.S. Federal Reserve Board's Major Currency Index.*

**International Commentary** Confronted by the fastest inflation in 16 years, the European Central Bank (ECB) left its repo rate at 4.0% on April 10th. Analysts worry that high energy costs, tightening credit conditions and the Euro's almost 20% surge versus the U.S. dollar over the past year poses downside risks to growth. Many continue to cut their forecasts of real GDP growth this year and next in the currency zone. To date, however, PMI data for the manufacturing and services sectors indicate that though slowing, growth remains relatively healthy. That's particularly true in the north. In Ireland and southern parts of the Eurozone, however (Spain, Portugal and Italy), the outlook is much grimmer due to bursting bubbles in the housing market. Keeping the ECB from preemptively easing, consumer price inflation rose to 3.6% in March and could jump to 4.0% this summer as food and energy prices continue to rise. The consensus, nonetheless, predicts faltering economic growth and easing inflation will eventually prompt the ECB to cut rates before the year is up.

The Bank of England (BoE) voted 6-3 to cut its base rate by 25 basis points to 5.00% on April 10th, the third reduction since December (one member voted for a bigger cut, while two others voted to leave rates unchanged). Deteriorating credit conditions were highlighted has the primary motivation for the move. Although policymakers acknowledged that inflation may rise a bit more in coming months, they remained confident it would fall back in the medium term. Consumer spending remains tepid and the credit crunch hitting the housing, services and financial sectors has grown worse. Rising mortgage payments, tightening credit and higher inflation are expected to crimp consumer spending while business investment pulls back due to heightened economic uncertainty. Large budget deficits will make it difficult for the government to provide meaningful fiscal stimulus. Real GDP growth this year may be the slowest since 1992. The y/y change in consumer price inflation remains above the BoE's target of 2.0% and may hit 3.0% this summer. Nonetheless, the consensus sees at least two more rate cuts this year.

The Bank of Canada (BoC) reduced its overnight target rate by 50 basis points to 3.0% on April 22nd. That marked the second half-point reduction in as many months and brings the total amount of easing since December to 150 basis points. In announcing its latest cut, the BoC signaled that further easing would likely be required in the medium term, but the easing bias appeared less forceful than in the immediate past. The BoC currently expects real GDP to grow only 1.4% this year, the smallest increase since 1992. Domestic demand remains buoyant but export growth is slowing due to the loonie's strength and weakening imports from America, Canada's largest trading partner. Inflation remains quite tame, with the overall consumer price index up just 1.4% in March on a y/y basis and core inflation up only 1.3%.

Inflation in Australia jumped to a two-year high in Q1, driving the value of its currency versus the U.S. dollar to its highest level since 1984 on speculation the Reserve Bank of Australia will have to maintain a tight policy for longer than expected . The RBA last tightened in March, raising its overnight target rate to 7.25%. The housing sector is beginning to slump and consumer confidence is at its lowest level since 1993. However, extremely low unemployment and fast rising wages threaten to keep inflation high.

The Bank of Japan (BoJ) left interest rates unchanged on April 9th as the bank cut its assessment of the economy amid rising concern about a possible recession. The unemployment rate is up and consumer spending is weakening. That leaves Japan dependent upon exports for sustaining the expansion at a time when its largest trading partner the U.S. may have entered a recession Those worries were reflected in the latest Tankan report that showed confidence among Japan's largest manufacturers has slipped to a 4-year low. Large companies said they plan to cut capital spending by 1.6% in this fiscal year, the worst projection since Japan's economy emerged from recession in 2002 *(see 10 and 11 for individual panel members' forecasts).*

**No Help Wanted**

The economy's problems are intensifying. Payrolls have fallen by nearly a quarter-million since the start of the year, and the losses go well beyond jobs in housing and autos. Employment is falling from retailing and transportation to Wall Street and even professional services. Unemployment is up sharply, rising from 4.4% at its low a year ago to 5.1% this March.

Consumers, nearing panic, are driving the downturn. With employment down, stock and house prices off sharply, and gasoline prices on the rise, consumers are pulling back. Vehicle sales came in at 15.3 million units annualized in the first quarter, compared with 16.1 million units last year, and closer to 17 million units during the first half of this decade. Other retailers, from home improvement centers to high-end department stores, are also seeing weaker sales.

The economy probably began contracting in December—this won't be known precisely until all historical data revisions are done—and it is not expected to stabilize until June. This will make for a seven-month recession, some five months shorter than the average length of the 10 recessions since World War II. This downturn is also expected to be mild. Unemployment is projected to peak at close to 6% early in 2009, up 1.5 percentage points from its low. This compares with an unemployment rise of 2.5 percentage points in a typical recession.

The unprecedented housing downturn, and more specifically the collapse in house prices, is at the center of the recession. According to the national Case-Shiller Home Price Indices, prices fell 10% from their peak in the spring 2006 selling season through the end of last year. Judging by the recent pace of decline, they are now probably down as much as 15%. In California and Florida, prices have fallen closer to 25% from their peak, back to where they were in 2004.

The sharp price declines, following a wave of homebuyers who put little of their own money into their purchases, mean that an estimated 9 million homeowners are underwater. That is, they owe more on their mortgages than their houses are worth. Add in rising job losses and the result is a surge in mortgage defaults. First mortgage loan defaults—the first step in the foreclosure process—are running at a stunning annual pace of 2 million. The housing market is now trapped in a self-reinforcing negative cycle in which price declines ignite foreclosures, which in turn push prices lower as foreclosed homes flood the market.

The surge in foreclosures and resulting mortgage losses have undermined the financial system. The private residential mortgage securities market has completely shut down, and the resulting panic weighs on every corner of the fixed-income market. Bond issuance is down and credit spreads have widened. Credit has become harder to get, and the cost of capital has risen. Households and businesses are the casualties.

The 15% decline in house prices translates into a loss in housing wealth of approximately $3 trillion. When combined with the collapse in mortgage equity withdrawal—homeowners can no longer borrow freely against their houses—consumers have no choice but to rein in their spending. Every $1 decline in housing wealth eventually reduces consumer spending by an estimated 7 cents. This trend will thus reduce consumer spending by 2% this year and cut GDP growth by nearly 1.5 percentage points.

With all that is going wrong, it may be hard to understand how this recession could be short and mild. There are reasons for optimism, however. The global economy continues to perform well. Growth is slowing in Europe, Canada and Japan, but emerging economies continue to shrug off the U.S. downturn. Combined with a low and falling U.S. dollar, chances are strong that a narrowing trade deficit will add about a percentage point to growth this year.

Corporate balance sheets outside of financials and housing-related industries are strong. The interest coverage ratio for nonfinancial corporations—the share of cash flow needed to service corporate debt—is as low as it has been since the 1960s. With so much financial wherewithal, businesses can avoid significant cuts in investment and hiring. In fact, although investment is soft, it is not falling, and the decline in payroll employment is modest for this stage of a recession. By this point in the 2001 cycle, payrolls were falling 150,000 to 200,000 per month.

The reason employment is not falling faster is that firms had been disciplined in their earlier hiring. Before previous recessions, businesses hired ahead of their need. Then when sales turned soft, they came under pressure to shed workers aggressively. This time, payrolls were relatively lean to begin with. There will still be layoffs, but they should be modest. Firms also did a good job of managing their inventories. The ratio of inventories to sales is a bit elevated, but only a bit, and although firms are likely to draw down inventories more, the resulting drag on growth should be smaller.

The most important reason for optimism is that policymakers are fully engaged in stemming the recession. The Federal Reserve has slashed interest rates and is expected to cut its funds rate target again in a few weeks to 2%. The central bank is also using new tools to provide liquidity to various parts of the credit market. If the Federal Reserve follows through on its commitments, it will trade some $400 billion of Treasury bonds on its $900 billion balance sheet for assets ranging from agency mortgage-backed securities to investment grade corporate bonds.

Congress and the Bush administration are also working hard to stimulate growth and stem the housing crisis. A full $100 billion in tax rebate checks will be distributed to consumers from May to July. If households respond as they did to a similar tax rebate in 2001, two-thirds of the money will be spent by year's end. The Federal Housing Administration, Fannie Mae, Freddie Mac, and the Federal Home Loan Bank have also been empowered to provide more mortgage credit. Although this still won't fill the void left by the collapse of the private mortgage securities market, it will help.

Policymakers are also expected to pass a mortgage write-down plan by this summer. The plan would allow homeowners facing foreclosure to significantly cut their mortgage balances, giving them lower monthly mortgage payments. Foreclosures will rise to a record high this year, but this plan would keep them from rising even higher and help cushion the fall in house prices.

Real GDP is forecast to decline during the first half of 2008, but turn positive during the second half. For all of 2008, real GDP is expected to grow by 1.5%. Growth is expected to accelerate in 2009 near 3%.

The risks to this outlook remain decidedly to the downside. Not only is there a significant risk of a more severe recession, but the subsequent recovery may well be less buoyant than we expect. How this plays out will depend on whether the financial system stabilizes soon. And that will depend on whether house-price declines begin to abate, which in turn depends on policymakers. Policymakers must come through with a plan that succeeds in keeping a large number of underwater homeowners in their homes, or the remainder of this decade will be very difficult.

*Mark Zandi, Moody's Economy.com, West Chester, PA*

**After the Repricing**

The recent equity and credit market rally can be justified by three factors. First, the data are consistent with a recession, but not at this point with the deep slump feared by some market participants. Second, the tax rebates will start early next month, and this should give a lift to spending. Third, there have been some large- *(continued on next page)*

large-scale equity infusions into financial institutions. As we noted in scale equity infusions into financial institutions. As we noted in our *Leveraged Losses* paper back in late February, this is indeed a key pre-requisite for resolving the financial crisis

But it would be a mistake to treat the recent moves as the start of a "standard" recovery. In the near term, the main risk is that energy prices remain on a tear and the money markets are under considerable stress. This is not only visible in elevated LIBOR spreads, but also in the commercial paper market where the spread between 30-day AA and A2/P2 rated nonfinancial paper closed at 97 basis points on Friday, which is actually higher than the Monday after the Bear/JPM deal. We don't know how the contrast between equity/credit vs. money markets will resolve itself this time, but it has been a dangerous one to ignore over the past 9 months.

More fundamentally, the economy will only get a temporary boost from the fiscal stimulus. A true recovery is unlikely until house prices have stabilized, which in our forecast does not happen until the second half of 2009. Until then, consumer spending and business investment will be constrained by the housing collapse and the associated credit crunch. In addition, there are a few sectors that have been strong so far but are likely to look much weaker in late 2008 and 2009. Nonresidential private construction has added ½ percentage point to real GDP growth in 2007, but it will likely subtract around ¼ point in 2008 and 2009. Another issue is the deterioration in state and local tax revenues. While the lags between revenues and spending at the state and local level are long, this should eventually lead to a substantial slowdown in spending, probably in 2009.

Given all this, the front end of the US yield curve has become a lot more attractive. The very short end is now approximately fair, as the market has moved to our forecast for a 25-basis-point cut on April 30. Risks around this forecast are evenly distributed in my view -- some chance that the renewed money market turmoil persuades the committee to do 50bp, but also some risk that they stand pat following the two dissents last time and continued headline inflation worries among some committee members.

But beyond the next few meetings, the market looks quite attractive as it now discounts 75-100bp of tightening in 2009. The FOMC is unlikely to tighten policy until they can be reasonably confident that the unemployment rate has peaked and house prices have bottomed, conditions that in our forecast aren't met until late 2009. Consistent with this, I thought it was notable that the March 18 FOMC omitted the phrase suggesting a "rapid reversal" of monetary easing that had appeared in the January 30 minutes. While our baseline forecast remains a 2% funds rate until the end of 2009, there is a decent chance of further rate cuts in late 2008 or early 2009 if the economy weakens anew after the fiscal stimulus has gone through the system. Therefore, long positions in the 1-2 year sector look quite attractive to me, although the chaos in the money markets admittedly makes the implementation of this view trickier than usual.

*Jan Hatzius, Goldman, Sachs & Co., New York, NY*

**Modest Fed Ease In April But Still Weak Fundamentals**

Some easing in market strains, along with growing arguments that monetary policy is sufficiently accommodative, has led market participants to expect little in the way of further Fed rate cuts. While we expect that the FOMC will ease only 25 basis points at its upcoming meeting, we caution that economic fundamentals remain weak, and still look for a 1.5% funds rate target later this year. Tight credit conditions, mounting job losses, soaring energy costs, and falling home values provide an unfavorable backdrop for consumer spending, as recent reports have indicated. Importantly, few signs of housing recovery have yet emerged, and inventory accumulation in Q1 may point to weaker production ahead.

We now expect a 25 basis point ease at the upcoming April 29-30 Fed meeting, but continue to see moderate further easing ahead. Economic conditions remain weak, with below-1% GDP growth likely in the first half of 2008. Aided by accommodative monetary policy and the recently enacted fiscal stimulus package, we do anticipate gradual economic improvement in 2H 2008.

The Fed call has changed for two primary reasons. First, the recent sharp gains in headline inflation, led by sustained energy, food and other commodity price pressures and related in part to lower U.S. interest rates and the weak dollar, are increasingly worrisome to the FOMC. Multiple dissents in March make clear that this issue has already played an important part in Fed deliberations. Secondly, the Fed funds futures market is currently pricing in a 25 basis point cut in the funds rate on April 30th. Unless market and/or economic conditions deteriorate sharply in the coming days, the FOMC is not likely to ease more than Fed funds futures anticipate.

Some recent releases for March confirmed the Fed's Beige Book summary that economic activity has continued to weaken. Ongoing declines in housing were highlighted by the March drop in single-family and multi-family housing starts. Total starts fell a greater-than-expected 11.9% to 947,000 units, and declined at an 34.5% annualized pace in 1Q 2008, suggesting a continued significant housing drag on GDP growth. Building permits, a proxy for future building activity also fell 5.8%. After falling 0.4% in February, retail sales advanced 0.2% in March. However, excluding gasoline store sales, retail sales were flat. The key control group, which is retail sales excluding the automotive, building materials and gasoline categories, advanced at a 0.9% annualized pace in Q1, the smallest quarterly increase since 2002. While industrial production advanced 0.3% in March, it was flat in Q1 and manufacturing output fell for a second straight quarter.

Producer prices soared 1.1% in March as higher energy and food prices drove up the index. Core producer prices posted a moderate 0.2% advance. Core intermediate goods prices jumped 1.1% in March and are up 5.5% over the past year, an additional source of concern. Boosted by a 1.9% increase in energy costs, the consumer price index advanced 0.3% in March. Stripping out the volatile food and energy components, the core CPI increased 0.2% for a second consecutive month. On a year-over-year basis, the core index is up 2.4%. While believe that a slowing economy will ease price pressures in the months ahead, persistent headline inflation remains worrisome.

Despite less favorable trade trade data in February, we now estimate just above 1% GDP growth last quarter. However, domestic demand likely declined in Q1, and we expect it to remain flat this quarter. Somewhat larger (and undesired) inventory accumulation added an estimated one percent to Q1 GDP growth, and likely points to weaker production this quarter. We estimate a slight GDP decline in 2Q 2008, and a soft rebound in the second half of the year. The unemployment rate will continue to drift higher for the balance of the year and into 2009.

*Peter E. Kretzmer, Mickey Levy and Gary Bigg, Bank of America, New York, NY*

# Special Questions:

**1.** Please provide your forecasts of the seasonally-adjusted annualized percent change in the following variables during Q1 2008?

| | Q1 2008 SAAR | |

| 1.75% | 18 | Bottom 10 Average | 1.63% |
| 1.50% | 1 | | |
| 1.25% or less | 2 | | |

**3.** Martin Feldstein recently argued in a *Wall Street Journal* piece that the FOMC should stop cutting interest rates. Do you think the Fed SHOULD cut its target federal funds rate to below 2.0%?

| (Percentage of those responding) | |
|---|---|
| Yes | No |
| 34.1% | 65.9% |

**4.** Given your outlook for economic growth, inflation and Fed policy, do you think the Treasury market is currently overvalued, fairly valued or undervalued?

| (Percentage of those responding) | | |
|---|---|---|
| Overvalued | Fairly Valued | Undervalued |
| 61.9% | 26.2% | 11.9% |

**5.** Through March, the Consumer Price Index excluding food and energy prices (core CPI) was up 2.4% on a y/y basis. What will be the year-over-year percent change in the "core" CPI as of June and December of this year?

| | Year-over-year percent change in core CPI as of: | |
|---|---|---|
| | June 2008 | December 2008 |
| **Consensus** | **2.4%** | **2.3%** |
| Top 10 Average | 2.6% | 2.6% |
| Bottom 10 Average | 2.3% | 2.0% |

**6.** The unemployment rate stood at 5.1% in March. What will be the unemployment rate in June and December of this year?

| | Unemployment Rate in: | |
|---|---|---|
| | June 2008 | December 2008 |
| **Consensus** | **5.3%** | **5.6%** |
| Top 10 Average | 5.5% | 6.0% |
| Bottom 10 Average | 5.2% | 5.3% |

**7.** Do you believe the U.S. economy is in, or will enter, a recession in 2008?

| (Percentage of those responding) | |
|---|---|
| Yes | No |
| 72.1% | 27.9% |

# CONSENSUS FORECASTS

**E-mail Edition: -** **All rights reserved. Under our agreement this publication may not be reproduced (complete or partial), redistributed, stored in a public retrieval system or broadcast to persons other than the email subscriber without the prior written permission of Consensus Economics Inc.**

**Survey Date**
**April 14, 2008**

Every month, Consensus Economics surveys over 240 prominent financial and economic forecasters for their estimates of a range of variables including future growth, inflation, interest rates and exchange rates. More than 20 countries are covered and the reference data, together with analysis and polls on topical issues, is rushed to subscribers by express mail and e-mail.

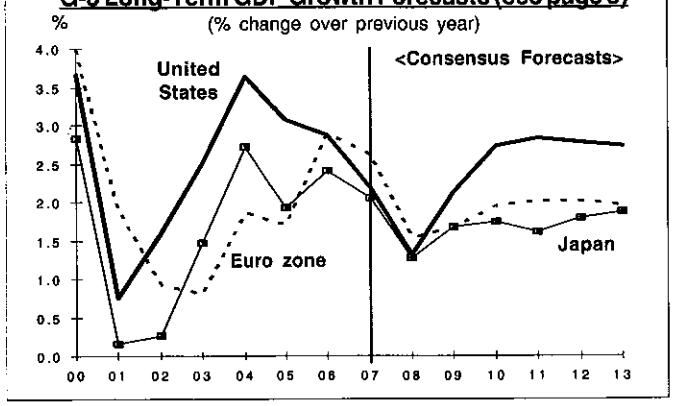
## Survey Highlights

- Forecasts for **consumer price inflation** in many of the countries surveyed have been raised as the global phenomenon of surging food and energy prices intensifies.

- In the **US**, further evidence that the economy is in recession has led to forecasts for a number of key variables being downgraded. Consequently, our panel attaches a high likelihood of a rate cut at the next FOMC meeting (see below):

**Likelihood of a Federal Reserve Interest Rate Change**
Our panel's estimated average probability of a change in the **Fed Funds rate (currently 2.25%) at or before the next FOMC meeting (April 29-30)** was:



| INCREASE | | NO CHANGE | | DECREASE | | |
|---|---|---|---|---|---|---|
| 0.6 | + | 16.2 | + | 83.3 | = | 100 % |

**Most likely rate change mentioned: -0.25 %**

- The outlook for **Italy** and **Spain** has worsened, with GDP growth forecasts for both being cut. In Italy, the economy is expected to stagnate in 2008, while in Spain, retrenchment in the construction sector is seen driving the slowdown.

- This month's special survey is a repeat of our regular compilation of **Long-Term Forecasts** (pages 3, 28, and 29), with consensus expectations for the next 5-10 years.

**G-3 Long-Term GDP Growth Forecasts (see page 3)**

[1]*Signifies average for period* [2]*End period* [3]*End July, 2008* [4]*End April, 2009*

Financial market turmoil and the onset of a possible recession in the US have impacted on near-term GDP growth expectations for all G-7 and Western European countries. Moreover, growth projections going further out have also eased somewhat compared with our survey of long-term trends conducted in October 2007. In the **United States**, the ongoing housing retrenchment – coupled with the deepening credit crunch, faltering job market and inflationary pressures – is battering consumer spending, forecasts for which suggest that expenditure might not immediately bounce back to previous strong rates of expansion. Indeed, while the US downturn itself is expected to be shallow, the recovery may take longer to gather momentum, and GDP forecasts over the next 5-10 years point to growth below 3% (considered the US trend rate). The decade-long era of strong activity and benign inflation – fuelled by the technology revolution which lifted GDP and productivity growth rates – appears to have ended, and the US economy is now grappling with rising inflation and heavily indebted equity markets and households. The **United Kingdom** faces similar challenges given that it, too, is reliant on an influential financial sector and overextended property market. Other countries are somewhat less exposed to US volatility. However, globalisation (which at one time helped to keep import costs down) has contributed to resurgent commodity prices. Our panels' short-term inflation forecasts suggest a jump for most countries surveyed (**Canada** being a notable exception). Indeed, central banks are worried that stronger inflation could become more entrenched. In particular, the **ECB** has remained cautious about cutting interest rates in the face of above-target inflation and has to-date refrained from doing so. The **Bank of England**, wary of rising inflation expectations, has cut rates only gradually. The **Bank of Japan**, meanwhile, is unlikely to loosen monetary policy given that rates remain at such low levels. Moreover, inflation expectations are unlikely to break 1.5% over the next 10 years.

**YEC-YECL-40**

**Reference:** Capital Structure

**Requests:**

(a) Please provide a copy of schedule 1.1 for YECL under each of the following assumptions as to equity ratio in the capital structure: 40 , 41 , 42 and 43 .

(b) Please provide a copy of schedule 1.1 for YECL assuming a capital structure of 52.5 common equity and a return on equity of 8.75 .

(c) Please confirm that YECL has operated at a capital structure of approximately 40 to 43 equity for each year from 2003 through 2007.

(d) Please discuss, and provide any relevant evidence, if YECL has had difficulty accessing capital markets with a capital structure of 40-43 equity. If so, please provide a detailed summary of those difficulties and the debt cost impacts on YECL from 2003 to 2007.

(e) Please confirm that obtaining a capital structure of 46.86 by mid-year for the 2009 test year requires additional mid-year equity of 3.181 million in 2008 and 4.305 million in 2009 (if not, please provide the correct equity amounts in each year). Please confirm that the largest increase in mid-year equity for the period 2003 through 2007 was 0.652 million in 2005 (per Schedule 8.1 provided in the package dated July 4 2008).

(f) Please elaborate on the need and justification for these large increases in equity in the test years. Please explain in detail why such large equity increases were not required between 2004 and 2007.

(g) Please provide a copy of the source of Table 5 (page 27) of the Foster Associates Inc. evidence.

(h) Please explain in detail how the business risk score of 4 , the notional business risk score attributed to YECL was determined (page 27 of the Foster Associates Inc. evidence).

(i) Please provide the impact on customers resulting from the increase in YECL's equity component.

**Response:**

(a) This information is not being provided as any number of combinations have been or could have been requested and the information is readily available through the spreadsheets provided in the application.

(b) This information is not being provided as any number of combinations have been or could have been requested and the information is readily available through the spreadsheets provided in the application.

(c) Confirmed.

(d) Yukon Electrical does not access capital markets directly as all debt financing required by Yukon Electrical is completed by CU Inc. Equity financing when required would be completed by CU Inc.'s parent company, Canadian Utilities Limited. Both CU Inc. and Canadian Utilities Limited. have, to this point, been able to access capital markets directly when required and YECL therefore benefits from the financial strength of both CU Inc. and Canadian Utilities Limited.

(e) Confirmed.

(f) The need for the large increases in equity is explained in detail in Ms. McShane's testimony in Section 8, Attachment 1 of the Application.

These increases in equity would have been required between 2004 and 2007 for the reasons stated in Ms. McShane's testimony. However, to seek this increase Yukon Electrical would have been required to file a General Rate Application. Given the costs to customers for such an application combined with the fact that YECL could continue to operate under existing rates, management decided to continue operations with the existing structure and defer seeking an increase in the equity thickness until such time as a GRA was required.

(g) The requested document is attached as YEC-YECL-40(g) Attachment 1.

(h) The assignment of a 4 was discussed at page 25, lines 659-662 and was based on the conclusion that, on balance, as a very small utility operating in a service territory with an undiversified economic base tied to a single industry and facing significant geographic physical operating challenges, Yukon Electrical is exposed to a higher degree of business risk than the typical electricity distribution utility in Canada, is of higher than average business risk within the spectrum of Canadian utilities and is of approximately equal risk to the A rated U.S. utilities. The average business profile score that was assigned to Canadian utilities was 3. A score of 4 reflects the average score that was assigned to A rated U.S. utilities, which is lower than the average score of 5 that was assigned to the universe of U.S. electric utilities. The guidelines referenced by Ms. McShane on page 27 were last published in the S&P report attached in response to part (g) above.

(i) The impact is an increase in the Revenue Requirement of approximately 173,000 per year (approximately 0.4 rate increase on existing rates) for 2008 and an additional 113,000 in 2009 going from a 40 to 47.5 equity ratio.

### Key Credit Factors:

# Assessing U.S. Vertically Integrated Utilities' Business Risk Drivers

**Publication date:** 14-Sep-2006
**Primary Credit Analyst:** Barbara A Eiseman, New York (1) 212-438-7666; barbara_eiseman@standardandpoors.com
**Secondary Credit Analyst:** Richard W Cortright, Jr., New York (1) 212-438-7665; richard_cortright@standardandpoors.com

The methodology that Standard & Poor's Ratings Services uses to rate vertically integrated electric, gas, and combination investor-owned utilities in the U.S. is based on the same precepts that we have used for many years, though the emphasis has changed as the utility industry has evolved. The fundamental methodology encompasses two basic components--business risk and financial risk--and their relationship. Where a utility presents a strong business risk profile, the financial profile can be less robust for any given rating. Likewise, where a utility's business risk profile is weaker, its financial performance must be stronger for any given rating. For combination utilities, the gas operations may have a stabilizing influence on credit quality, but since the electric business is typically significantly larger, it is the major credit driver. (For details on Standard & Poor's analytical approach to gas utilities, see "Key Credit Factors For Natural Gas Distributors" published Feb. 28, 2006.)

Often, an integrated utility is a part of a larger holding company structure that also owns other businesses, frequently unregulated electricity generation. This fact does not alter how we analyze the utility, but it may affect the ultimate rating outcome due to any credit drag that the unregulated activities may have on the utility. Such considerations include the freedom and practice of management with respect to shifting cash resources among subsidiaries and the presence of ring-fencing mechanisms that may protect the utility.

## Five Factors Determine The Business Profile

Five basic characteristics define a vertically integrated utility's business profile:

- Regulation,
- Markets,
- Operations,
- Competitiveness, and
- Management.

Standard & Poor's is most concerned about how these elements contribute individually and in aggregate to the predictability and sustainability of financial performance, particularly cash flow generation relative to fixed obligations. While considerable attention has focused in recent years on companies in states that deregulated in the late 1990s and the early part of this decade and the related credit consequences of disaggregation and nonregulated generation, 27 states (plus four that formally reversed, suspended, or delayed restructuring) have retained the traditional regulated model. For utilities operating in those states, the quality of regulation and management loom considerably larger than markets, operations, and competitiveness in shaping overall financial performance. Policies and practices among state and federal regulatory bodies will be key credit determinants. Likewise, the quality of management, defined by its posture towards creditworthiness, strategic decisions, execution and consistency, and its ability to sustain a good working relationship with regulators, will be key. Importantly, however, it is virtually impossible to completely segregate each of these characteristics from the others; to some extent they are all interrelated.

On Standard & Poor's business profile scale (where '1' is excellent and '10' is vulnerable), vertically integrated utilities generally have satisfactory business profiles of '5' or '6'. (See tables 1 and 2 in the Appendix below for business profile benchmarks plus a list of utilities we rate and their business profile scores.) We view a company that owns regulated generation, transmission, and distribution operations, as positioned between companies with relatively low-risk transmission and distribution operations and companies with higher-risk diversified activities on the business profile spectrum. What typically distinguishes one vertically integrated utility's business profile score from another is the quality of regulation and management.

**Regulation**

Regulation is a critical aspect that underlies integrated utilities' creditworthiness. Decisions by state public service commissions can profoundly affect financial performance. Standard & Poor's assessment of the regulatory environments in which a utility operates is guided by certain principles, most prominently consistency and predictability, as well as efficiency and timeliness. For a regulatory scheme to be considered supportive of credit quality, commissions must limit uncertainty in the recovery of a utility's investment. They must also eliminate, or at least greatly reduce, the issue of rate-case lag, especially when a utility engages in a sizable capital expenditure program and incurs substantial deferrals of fuel costs.

Standard & Poor's evaluation encompasses the administrative, judicial, and legislative processes involved in state and federal regulation, and includes the political environment in which commissions render decisions. Regulation is assessed in terms of its ability to satisfy the particular needs of individual utilities. Rate-setting actions are reviewed case-by-case with regard to the potential effect on credit quality. As frequently postulated in prior years, our evaluation of regulation focuses on the willingness and ability of regulation to provide cash flow and earnings quality adequate to meet investment needs, earnings stability through timely recognition of volatile cost components such as fuel and satisfactory returns on invested capital and equity. Regulators' authorization of high rates of return is of little value unless returns are realistic and achievable. Allowing high returns based on noncash items does not benefit bondholders. A regulatory jurisdiction that permits incentives whereby utilities are allowed to earn a return based on their ability to sustain rates at competitive levels is viewed favorably. In addition to performance-based rewards or penalties, flexible plans could include market-based rates, price caps, index-based prices, and rates premised on the value of customer service. Also important is the ability to enter into long-term arrangements at negotiated rates without having to seek regulatory approval for each contract.

Because the bulk of a utility's operating expenses relate to fuel and purchased power, of primary importance to rating stability is the level of support that state regulators provide to utilities for fuel cost recovery, particularly as gas and coal costs have risen. Utilities that are operating under rate moratoriums, or without access to fuel and purchased-power adjustment clauses or with fixed-fuel mechanisms, or face significant regulatory lag, also are subject to reduced operating margins, increased cash flow volatility, and greater demand for working capital. Companies that are granted fuel true-ups may be required to spread recovery over many years to ease the pain for the consumer. Standard & Poor's notes that fuel-adjustment mechanisms have become more common in the industry, but not all are created equal. While some jurisdictions permit recovery on a dollar-for-dollar basis over a defined time period, certain jurisdictions, such as Washington State, impose a deadband in which the company absorbs all the risk and rewards of fuel costs above and below the established recovery rate. Beyond the deadband there is a sharing of risks and rewards with ratepayers. In Arizona, Arizona Public Service Co. has a 90/10 sharing mechanism between the company and ratepayers, respectively, for all costs passed through the power supply adjuster. The mechanism is triggered based on a date (once a year in February 2006) and not on a threshold level of deferrals. The annual adjustment is also subject to a lifetime cap of 4 mils per kilowatt-hour, which has led to power deferrals.

In addition to fuel cost recovery filings, regulators will have to address significant rate increase requests related to new generating capacity additions, environmental modifications, and reliability upgrades. Current cash recovery and/or return by means of construction work in progress support what would otherwise be a sometimes significant cash flow drain and reduces the utility's need to issue debt during construction.

Moreover, allowing rate recovery of projected costs with subsequent periodic updates for actual results reduces lags in cost recovery. Also supportive of credit quality is the ability of the utility, commission staff,

consumer advocates, and other major interveners to reach a comprehensive settlement before construction of new base load capacity. Certain states, such as Indiana, Texas, Kansas, and Minnesota, have adopted environmental tracking mechanisms and other riders that allow companies to reflect in rates capital costs associated with environmental compliance equipment without having to file a formal rate case. Creditworthiness can also be enhanced when a company has the authority to timely recover unanticipated costs, such as those incurred for repairing storm damage, as in Florida. While the Alabama Public Service Commission does not currently employ a separate storm repair cost recovery mechanism to ensure rapid recovery of storm repair costs, it has shown a willingness to work with utilities to help them recover at least some of these costs on a timely basis and to start replenishing storm reserves. Finally, the greater the percentage of a utility's rates that are recovered through fixed charges rather than volume-based charges, the greater the support for credit quality.

For utilities that own a natural gas business, automatic and timely pass-through of commodity costs provides the strongest level of credit support. Lesser clauses, including mechanisms that require after-the-fact sign-off by regulators, introduce the potential for disallowance if the regulator deems gas to be purchased at imprudent cost levels.

Due to the extreme volatility and high gas prices over the past few heating seasons, more regulators have revised gas adjustment clauses to provide monthly gas adjustments rather than awaiting the end of the heating season to begin reimbursement. This expedited treatment helps the utility to reduce any regulatory lag to recover costs and streamlines working capital needs, which in turn should allow the firm to modestly temper rising gas bills to their customers.

Both regulators and natural gas companies are increasing customer-education programs on energy efficiency and conservation. Lawmakers, state regulators, and companies are in preliminary discussions to potentially restructure the current rate structures to encourage these goals of energy conservation and efficiency without hurting the company's bottom line and still allow utilities to achieve their approved regulated rate of return. In essence, "conservation tariffs" would aim to decouple earnings and rates of return from delivered volumes and should eliminate a current major disincentive for utilities to develop such conservation programs. This would also better align the interest of consumers with utility shareholders by implementing innovative rate designs that would encourage energy conservation and efficiency.

Key success factors include:

- Alternative ratemaking/flexibility,
- Attention to credit quality,
- Timely and consistent rate treatment,
- Support for fuel cost recovery,
- Support for a reasonable cash return on investment, and
- Support for rapid return on investment.

**Markets**

Assessing market dynamics begins with an economic and demographic evaluation of the service area in which a utility operates. Strength of long-term demand for energy is examined from a macroeconomic perspective, which enables Standard & Poor's to measure the affordability of rates and the staying power of demand. Distribution by classification according to total number of customers, revenues, and margins is closely scrutinized to assess the depth and diversity of the utility's customer mix. For example, heavy industrial concentration is viewed with some caution because the utility may be exposed to cyclical volatility and face competitive alternatives. A large residential component, on the other hand, produces a more stable and predictable revenue stream. The utility's largest customers are identified to determine their stability and importance to the bottom line because the loss of one large customer could adversely affect the utility's financial position. Moreover, large customers may turn to self-generation, potentially leading to less financial protection for the utility.

Standard & Poor's also analyzes any long-term consumption trends and the reasons behind them. Factors addressed include the market's size and growth rate, the franchise's strength, historical and projected growth rates, income levels and trends in population, employment, and per capita income. A utility with a

healthy economy and customer base, as illustrated by diverse employment opportunities, average or above-average wealth and income statistics, and low unemployment, will be better able to support its operations.

For the gas business, Standard & Poor's also examines customer saturation. Firms that operate in service areas with low growth potential still can expand at healthy rates if a relatively low level of customer saturation permeates the service territory. For example, customers who convert to natural gas from other fuel sources (such as oil) provide growth opportunities to companies operating in low population growth service areas.

Despite the review of market characteristics, they are clearly a secondary consideration to regulation. In Nevada, for years the country's fastest growing state, Nevada Power Co. and Sierra Pacific Power Co. struggled to recover capital expenditures on a timely basis, and were accordingly rated as low investment-grade credits. In Florida, which has competed with Nevada for years in its pace of growth, the Florida Public Service Commission established polices of quick recovery of capital investments and, on a stand-alone basis, the state's utilities' credit metrics have remained strong.

Critical success factors include:

- A healthy and growing economy,
- Growth in population and number of customers,
- An attractive business environment, and
- An above-average residential base.

**Operations**

Standard & Poor's focuses on cost, reliability, safety, and quality of service when assessing a utility's operations. Management is always under pressure to optimize the use of resources, and if it is not cost-effective in meeting service standards and reliability, regulatory or competitive pressures are likely to increase. Consequently, Standard & Poor's emphasizes areas that require heightened and ongoing management attention, in the absence of which political, regulatory, or competitive problems are likely to arise.

The status of utility plant investment is reviewed with regard to generating station availability, efficiency, and utilization, as well as for compliance with existing and potential environmental and other regulatory standards. The record of plant outages, system losses, equivalent availability, load factors, heat rates, and capacity factors are examined. Important considerations include the projected capital improvements and plant additions necessary to provide high-quality, reliable service. The general condition of the assets and how well such assets are maintained are also important considerations.

Emphasis is placed on reserve margins, fuel mix, fuel contract terms, purchased-power arrangements, and system operators. Moreover, the quality and concentration of capacity is just as important as the size of reserves. Standard & Poor's recognizes that reserve requirements differ among companies, depending upon individual operating and load characteristics.

Fuel diversity provides flexibility in a changing environment. Supply disruptions and price hikes can raise rates and ignite political and regulatory pressures that ultimately lead to erosion in financial performance. Thus, the ability to switch generating sources to take advantage of cheaper fuels is viewed favorably. Dependence on any single fuel, or asset concentration in one or two large generating stations, can cause significant swings in a company's financial performance. Similarly, utilities that rely on nuclear generation receive an elevated degree of attention due to the scale, technical complexity, and politically sensitive nature of nuclear facilities. Indeed, the sound operation of nuclear units can define a utility's operational risk profile and its ability to achieve projected financial results. Standard & Poor's seeks to distinguish between those operators that have exhibited sound and stable operational performance, and the likelihood that it will continue, and those whose nuclear operations are vulnerable to problems that may impair financial results.

But having a large concentration of capacity based on fossil fuels also imposes certain risks. Coal-fired capacity is burdened with increased environmental costs related to reducing sulfur dioxide, nitrogen oxide,

mercury, and eventually carbon dioxide emissions. Gas-fired capacity presents its own challenges, particularly the extreme volatility and significant increase in gas prices over the past few years. Buying power may be a more appropriate option for a utility than new plant construction because the utility avoids construction costs and the financial risks posed by regulatory lag when seeking recovery of costs. Purchasing power may enhance supply flexibility, fuel resource diversity, and maximize load factors. Utilities that plan to meet demand projections with a portfolio of supply-side options also may be better able to adapt to future growth uncertainties. Despite these benefits, such a strategy does commit the utility to a fixed obligation, which Standard & Poor's captures analytically through certain adjustments to financial statements. We calculate the net present value of future annual capacity payments (discounted at the company's cost of debt) over the life of the contract. Standard & Poor's then applies a risk factor against this value and adds the result to the utility's balance sheet. The risk factor is largely a function of the strength of the regulatory recovery mechanisms established to address procurement costs.

Other operational characteristics that will support an above-average evaluation for vertically integrated companies are assets that are in good physical condition and are well maintained. In addition, capital expenditures for necessary system improvements must be at manageable levels, yet sufficient to provide for constant renewal and refurbishment of the system. Operating performance, reliability statistics (such as outage duration and frequency), and efficiency measures are expected to meet industry and regional averages. Having interconnections that provide access to low-cost and diverse power supply sources is viewed favorably, as is limited environmental exposure.

For a gas company, drawing from a single interstate pipeline or relying on a particular gas basin exposes it to event risk and negative supply shocks, respectively. The ability to access multiple sources of gas supply through multiple pipelines protects the utility from such disruptions. Adequate storage access not only helps supply incremental gas needed to meet peak demand, but also provides opportunities without purchased-gas adjustment clauses to arbitrage seasonal pricing fluctuations. Gas distributors benefit from storage if the cost of buying peak gas exceeds the cost of making off-season purchases and the associated carrying cost. Outdated systems requiring extensive maintenance and capital expenditures lower profitability and efficiency metrics. Newly installed systems mainly consisting of plastic pipe require limited expenditures over the long term compared with older, cast-iron systems that need replacing as they age. In addition, operational efficiencies can be obtained through the use of new technology.

Critical success factors include:

- Well-maintained assets,
- Solid plant performance,
- Fuel diversity,
- Adequate generating reserves, and
- Compliance with environmental standards.

**Competitiveness**

For vertically integrated utilities, competitive factors include percentage of firm wholesale revenues that are most vulnerable to competition, industrial load, and revenue concentrations, particularly in energy intensive industries; exposure of key customers to alternative suppliers; commercial concentrations; rates charged to various customer classes; rate design and flexibility; production costs, both marginal and fixed; the regional capacity situation; and transmission constraints. A regional focus is evident, but high costs and rates relative to national averages are also of significant concern because of the potential for electricity substitutes over time.

Electricity competes with other fuels--particularly natural gas--for certain segments of the market like space heating, water heating, and cooking. Thus, high electricity prices, which can be attributed to inefficient operations, are cause for concern if customers have access to alternative energy sources. Self-generation has been a risk, as large commercial and industrial customers may take advantage of cogeneration technologies to reduce their reliance on, and in some cases to disconnect from the system. In the future, technology could pose a greater threat. Bypass risk, too, may grow if distributed generation, microgeneration, and self-generation prove more economically attractive for smaller customers.

Due to their proximity to interstate gas pipelines, some large customers can directly tie into a transmission

line and completely bypass gas distributors' services. Although such pipelines provide key sources of gas supply for these companies, it is important to recognize this bypass risk. Ideally located gas companies have adequate transmission access but have industrial customers far from interstate pipelines.

Critical success factors include:

- Low cost structure,
- Limited bypass risk, and
- Management's commitment to lowering costs.

**Management**

Evaluating management is of paramount importance to Standard & Poor's analysis because management decisions affect all areas of a company's operations and financial health. Although regulation, the economy, and other outside factors certainly influence results, the quality of management ultimately determines a company's success. Standard & Poor's private meetings with senior management significantly augment the public record in the effort to appraise management. Meetings are very useful for the candid interpretation of recent developments and, importantly, to provide executives with a forum for the presentation of goals, objectives, and strategies.

Management assessment is based on tenure, turnover, industry experience, financial track record, corporate governance, a grasp of industry issues, and knowledge of regulation, of customers, and their needs. Management's ability and willingness to develop workable strategies to address system needs, and to execute reasonable and effective long-term plans are assessed. Management quality is also indicated by thoughtful balancing of multiple--and often incompatible--priorities; a record of credibility; and effective communication with the public, regulatory bodies, and the financial community.

Standard & Poor's also focuses on management's ability to achieve cost-effective operations and commitment to maintaining credit quality. This can be assessed by evaluating accounting and financial practices, capitalization and common dividend objectives, and the company's philosophy regarding growth and risk-taking.

In addition, a company's accounting and financing practices are critical to Standard & Poor's analysis. For example, proactive management will likely adopt accounting practices that are more appropriate in a competitive environment such as higher depreciation rates for electric generation equipment. Large, growing cost deferrals or regulatory assets are viewed more negatively. Management can enhance its financial condition by taking any number of discretionary actions, such as selling common equity, reducing the common dividend payout, and deleveraging. A utility's management will also be evaluated on cost-cutting ability and creativity in entering into strategic alliances that improve efficiency.

Strong corporate governance, reflected in active, independent board of directors that participate in determining and monitoring corporate controls, help to support management's credibility and corporate financial disclosure. If it is evident that a company's board is passive and does not exercise proper oversight, it weakens the checks and balances of the organization and may detract from credit quality. Included in Standard & Poor's review of corporate governance is the proportion of independent directors on the board, the breadth and depth of the directors' experience, the proportion of independent directors on the board's audit committee, and directors' compensation.

Some vertically integrated utilities have felt compelled to invest outside their traditional businesses to increase earnings, especially as stock prices have underperformed market indices. Participation in higher-risk, unregulated activities such as merchant generation, exploration and development, gathering and processing, or marketing and trading can significantly detract from the consolidated entity's credit profile. In this regard, credit ratings are not based on the regulated business only, but on the qualitative and quantitative fundamentals of the consolidated entity. Standard & Poor's considers the ratings of the regulated businesses as being less vulnerable to the negative credit influence of other affiliates and holding company activities, as relevant, where very strong structural and/or regulatory insulation exists, which tends to be more the exception than the rule.

Critical success factors include:

- Commitment to credit quality,
- Credibility,
- Strong corporate governance, and
- Conservative financial policies, especially regarding nonregulated activities, if relevant.

## Effect On Ratings

In summary, Standard & Poor's examines the key business risk drivers for vertically integrated utilities--regulation, markets, operations, competitiveness, and management--in conjunction with financial measures when assigning credit ratings. The credit quality of most vertically integrated utilities is solidly investment grade. This is a primarily a function of the existence of regulation. As discussed above, the factors that further differentiate ratings among this sector include their markets, operational track record, competitive posture, and management's risk appetite. Vertically integrated utilities generally have satisfactory business risk profile scores, with only a few having strong or weak business positions.

**YEC-YECL-41**

**Reference: Cost of Debt**

**Requests:**

(a) Please provide the basis for the 200 basis point spread over the 4.55 forecast long-term Canada Bond yield used to estimate the cost of debt in the test years.

(b) Please provide the actual spread over long-term Canada bond yields for each actual debt issuance from 2000 through 2007.

(c) Please explain why the effective cost rates (per Schedule 8.3) for the forecast 2008 and 2009 debt issuances are substantially higher than the effective cost rates for the 2004 through 2006 debt issuances.

(d) Please provide a copy of Schedule 8.3 assuming:

i. The spread over the long-term Canada bond yield for debt issuances in 2008 and 2009 is the average spread for the actual debt issuances from 2002 through 2006.

ii. The long-term Canada bond yield for 2008 used is the actual average yield for the first six months of 2008.

**Response:**

(a) The 200 basis point spread is based on:

(i) Yukon Electrical's affiliated company, ATCO Gas, filed a 2008-2009 GRA using a 200 basis point spread. In that proceeding, ATCO Gas in response to IR, UCA-AG-67(b) Supplemental (filed March 12, 2008) stated:

*"(b) At the time of preparation of the rate application, it was the general consensus of our financial advisors that the financial markets were very volatile due to the sub prime credit crisis and that credit spreads were anticipated to go much higher than current levels being seen in the market at that time. While the ultimate impact of the sub prime crisis could not be known with certainty, the consensus of the financial advisors was that it would be significant and in the range of 200 basis points. The impact of the sub prime crisis continues to have a significant impact on the markets today and is expected to have a significant impact going forward. It is a common belief in the financial community that the impact on credit spreads has not yet peaked. The increase in credit spreads is evident in the response to CAL-AG 24(a) where the average historical spread for CU Inc.'s 30 year bonds was approximately 90 basis points as seen in June, 2007, and has jumped to approximately 130 basis points towards the end of 2007. Further, as of March 10, 2008 CU Inc.'s 30 year debenture spread is 154 basis points over long Canada bonds. This confirms the trend of increasing spreads and higher volatility that the financial advisors were predicting and because of the opinion that the crisis is not yet over, it is reasonable to assume a 200 basis point spread over the average long Canada bond rate for ATCO Gas' forecasted debenture rates."*

(ii) As well, it is important to note that the CU Inc. 30 year spread continues to increase. This is evidenced by the July 21, 2008 RBC Capital markets

publication which indicates the 30 year CU Inc. spread is now 165 basis points.

(b) The actual spreads over long Canada bond yield for each actual debt issuance from 2000 to 2007 were based on the then existing market conditions and are as follows:

| Series | Issue Date | Company Rate | Long Canada Bond Yield | Spread |
|---|---|---|---|---|
| L | 06-02-2000 | 7.00 | 5.71 | 1.29 |
| N | 11-22-2002 | 6.16 | 5.67 | 0.49 |
| O | 01-23-2004 | 5.42 | 5.11 | 0.30 |
| P | 11-18-2004 | 5.11 | 5.11 | -- |
| Q | 11-21-2005 | 5.18 | 4.38 | 0.80 |
| R | 22-10-2006 | 5.02 | 4.26 | 0.76 |

(c) The effective cost rate in the test period is driven by the forecast for long Canada bond yield of 4.55 and a 200 basis point spread for corporate bonds. The increase in this rate compared to the rate for 2004-2006 issues is primarily due to the increase in the spread that is now required as outlined in (a) above.

(d) (i) The average spread as per (b) above for the period 2002-2006 is 0.47 . As such, the debt issues using this spread would be 5.07 comprising 4.55 long term Canada Bond Yield, a 0.47 spread and 0.05 issue costs. Please refer to YEC-YECL-41(d) Attachment 1 which uses the 5.07 debt rate for 2008 and 2009.

(ii) The average yield for the six months to June 2008 was 4.1 . Given a 200 basis point spread and 0.05 issue costs, Schedule 8.3 attached (YEC-YECL-41(d) Attachment 2) has used a 6.15 debt rate for the 2008 and 2009 issues.

**Schedule 8.3**

**YEC-YECL-42**

**Reference:** Accounting Policy

**Requests:**

(a) Describe any changes in YECL's accounting policies since the time of YECL's last General Rate Application and indicate the impact of each change on the revenue requirement.

**Response:**

(a) Please refer to CW-YECL-5 below:

In accordance with Board Order 2008-5, information dating prior to 2003 was not required to test the revenue requirement. However, given that changes occurring since 1997 impact the test period, to the extent the changes are still applicable, the requested information is as follows:

Changes in Accounting Practice:

2000 Effective January 1, 2000 the Corporation prospectively adopted the recommendations of the Canadian Institute of Chartered Accountants on accounting for employee future benefits. This accounting change had the effect of decreasing earnings by 35,000.

2001 Effective January 1, 2001, the Corporation retroactively adopted the Canadian Institute of Chartered Accountants recommendations to disclose its unrecorded future income taxes. Under these recommendations, income taxes are accounted for using the liability method where by future tax liabilities and assets are recognized for the estimated tax consequences attributable to differences between the financial statement carrying amounts of assets and liabilities and their respective tax bases. Future tax liabilities and assets are measured using enacted tax rates and substantively enacted tax rates.

Previously, the Corporation determined its unrecorded future income taxes using the normalized deferred method.

2004 Effective January 1, 2004, the Corporation prospectively adopted the CICA recommendations on accounting for asset impairment. These recommendations require an impairment of property, plant and equipment to be recognized in earnings when the asset's carrying value exceeds the total cash flows expected from its use and eventual disposition. The impairment loss is then calculated as the difference between the asset's carrying value and its fair value, which is determined using present value techniques. The impairment loss may be deferred by the Corporation if there is reasonable assurance that the loss will be included in future rate to customers. The adoption of this recommendation had no effect on earnings for the year ended December 31, 2004.

Effective January 1, 2004, the Corporation retroactively adopted the CICA recommendations on accounting for asset retirement obligations. The CICA recommendations require the Corporation to identify legal obligations associated with the retirement of tangible long lived assets. To the extent that they can be quantified, these obligations are measured and recognized at fair value, which is determined using present value techniques. An asset retirement obligation is recorded as a liability, with a corresponding increase to property, plant and equipment. The liability is accreted over the estimated time period until settlement of the obligation, with the accretion expense included in depreciation and amortization. The asset is depreciated over its estimated useful life.

The Corporation has determined that it has tangible long lived assets where there is a legal liability regarding asset retirement. For these tangible long lived assets, asset retirement obligations have not been recorded as the Corporation expects to use the assets in service for an indefinite period. As such, no final removal date can be determined and, consequently, a reasonable estimate of the related retirement obligations cannot be made at this time.

2005 Effective January 1, 2005, the Corporation prospectively adopted the CICA guideline pertaining to the consolidation of variable interest entities. The guideline requires the Corporation to identify variable interest entities in which it has an interest, determine whether it is the primary beneficiary of such entities and, if so, to consolidate them. This change had no effect on the financial statements.

Effective January 1, 2005, the Corporation prospectively adopted the CICA guideline pertaining to lease arrangements. The guideline requires the Corporation to identify arrangements that do not take the legal form of a lease but convey a right to use a tangible asset in return for a payment or series of payments and, if so, to account for them as leases. This change had no effect on the financial statements.

2006 Effective January 1, 2006, the Corporation retroactively adopted the CICA Emergency Issues Abstract regarding conditional asset retirement obligations. This Abstract requires an entity to record a liability for an asset retirement obligation even if the obligation is conditional upon the occurrence of a future event that may or may not be within the control of the entity. This change had no effect on the financial statements.

2007 Effective January 1, 2007, the Corporation prospectively adopted the CICA recommendations pertaining to financial instruments, which establish standards for the recognition, measurement, disclosure and presentation of financial assets, financial liabilities and non-financial derivatives. These recommendations require that fair value be used to measure financial assets that are held for trading or available for sale, financial liabilities that are held for trading and all derivative financial instruments. Other financial assets, such as loans and receivables and investments that are held to maturity and other financial liabilities are measured at their carrying value. This change in accounting had no effect on the financial statements for the year ended December 31, 2007.

Effective January 1, 2007, the Corporation prospectively adopted the CICA recommendations pertaining to hedges, which establish standards for the identification, designation, documentation and

effectiveness of hedging relationships for the purpose of applying hedge accounting. The purpose of hedge accounting is to ensure that gains, losses, revenues and expenses from effective hedging relationships are recorded in earnings in the same period. This change in accounting had no effect on the financial statements for the year ended December 31, 2007.

Effective January 1, 2007, the Corporation prospectively adopted the CICA recommendations regarding the reporting and disclosure of comprehensive income. Comprehensive income consists of changes in the equity of the Corporation from sources other than the Corporation's share owners, and includes earnings of the Corporation, unrealized gains and losses on changes in fair values of available-for-sale assets and effective cash flow hedging instruments. Other comprehensive income comprises revenues, expenses, gains and losses that are recognized in comprehensive income but are excluded from earnings of the period. Comprehensive income is disclosed in a separate statement in the financial statements.

Changes in Regulatory Practices:

The following components were added to working capital, Schedule as compared to the same calculation in the 1996-1997 GRA.

- Return - Long Term Debt
- Return - 50 of Common Equity
- Net Depreciation

These changes are appropriate and are consistent with the calculation approved by the Alberta Utilities Commission for ATCO Electric.

As stated on Page 8-2 of the Application, other post employment benefits are now accounted for on the cash basis.

**YEC-YECL-43**

**Reference:** Pre-Tax Interest Coverage

**Requests:**

(a) Provide YECL's pre-tax interest coverage for the past five years and the projections for 2008 and 2009 based upon the application.

**Response:**

(a) Please refer to YEC-YECL-43 Attachment 1.

## YEC-YECL-44

**Reference:** Fixed Charges

**Requests:**

(a) Provide YECL's fixed charge coverage ratios for the past five years and the projections for 2008 and 2009 based upon the application.

**Response:**

(a) Please refer to YEC-YECL-43 Attachment 1.

## YEC-YECL-45

**Reference:** Rate Case

**Requests:**

(a) Provide a detailed breakdown by major component of the forecast regulatory hearing costs for 2008 and 2009 (page 8-5).

(b) What was the difference between the forecast and actual hearing costs for the 1996 1997 GRA? Explain the variances.

(c) As part of the 1996 1997 GRA, did YECL have a rate case reserve as a component of rate base and revenue requirement?

(d) If yes, please provide a continuity schedule of what has been expensed and what has been incurred for each of the years 1996 through to what is forecast for 2008 and 2009. For greater clarity please update the Regulatory Cost component of 1996 1997 GRA CITY-YEC YECL-1-19.

(e) For each of the years 1996 through to December 31, 2007, please provide a detailed schedule that shows regulatory expenses incurred that exceed the allowed rate and the net expense charged against the deferred regulatory account.

(f) Please confirm your accounting of regulatory disbursements is consistent with the proposal detailed in 1996 1997 GRA UCG-YEC YECl-1-7. If not, please explain why.

(g) Please provide copies of all correspondence with the Board with respect to regulatory costs between 1996 and December 31, 2007.

(h) Please explain and justify the treatment of any deferred credits taken into income since 1996 from the rate case reserve by YEC, e.g. see Schedule 8.8 for 2008.

**Response:**

(a) The table below outlines the forecast.

| | | |
|---|---|---|
| **Yukon Utilities Board:** | Hearing costs | 250,000 |
| **Yukon Electrical:** | | |
| Internal | GRA prep and hearing costs | 30,000 |
| AEL | Phase 2 | 105,000 |
| External - Gannet Flemming | Depreciation consultant | 60,000 |
| External - Foster & Ass. | Cost of Capital consultant | 105,000 |
| Bennett Jones | | 130,000 |
| **Intervenors:** | | |
| YEC | | 30,000 |
| Utilities Consumers Group | | 10,000 |
| City of Whitehorse | | 20,000 |
| Yukon Conservation Society | | 5,000 |
| Leading Edge | | 5,000 |
| **TOTAL** | | 750,000 |

(b) This proceeding was a joint proceeding.

| | |
|---|---|
| The forecast costs for this joint proceeding were | 600,000 |
| The actual costs for this proceeding were: | 533,000 |
| Reduction from forecast: | 67,000 |

The main reason for these joint costs being lower than forecast is a result of the 1996 97 proceeding being a negotiated settlement.

(c) At the time of the 1996 97 proceeding Yukon Electrical did have a rate case reserve. In 2005, however, this treatment changed to be consistent with the treatment followed by YEC and supported in Board Order 2005-17. In this application Yukon Electrical, is seeking to re-establish the reserve account treatment for its rate case costs as outlined on page 8-5 of the Application.

(d) In accordance with Board Order 2008-5, information prior to 2005 is not required to test the revenue requirement. Given that the rate case costs were not being treated as a reserve account through to the test period, as outlined in (c) above, a continuity schedule prior to 2005 is not required to test the revenue requirement in the test period. Please refer to Schedule 8.8 of the Application for the continuity schedule from 2005.

(e) In accordance with Board Order 2008-5, information prior to 2005 is not required to test the revenue requirement. Given that the rate case costs was not a reserve account in 2005 (see (c) above), there was not a balance in this account at 2005. As such, information prior to 2005 does not impact the revenue requirement in the test period and is not being provided.

(f) As outlined in (c) above, Yukon Electrical's treatment of these costs is consistent with Yukon Energy's approved treatment followed in its 2005 GRA.

(g) In accordance with Board Order 2008-5, information prior to 2005 is not required to test the revenue requirement. Given that the rate case costs was not a reserve account in 2005 (refer to (c) above) there was not a balance in this account at 2005. As such, information prior to 2005 does not impact the revenue requirement in the test period and is not being provided. There has been no correspondence with the Board with respect to regulatory costs subsequent to 2005.

(h) To be consistent with the treatment followed by YEC in its 2005 06 GRA and supported by Board Order 2005-17, Yukon Electrical adjusted its treatment of rate case costs in 2005 such that it was no longer accorded deferral account treatment for the period 1998-2007.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

## YEC-YECL-46

**Reference:** General Plant and Equipment

**Requests:**

(a) Provide details of items for which capital expenditures were made planned for 2006-2009 under the category of general property and equipment (e.g., list in detail the anticipated purchases of Office Computer Equipment).

(b) Provide policies and procedures followed for approval of capital expenditures.

**Response:**

(a) Please refer to Schedule 9 for a break down of costs in GP&E. To be helpful, Tools, instruments & equipment relates to the aforementioned for service and line staff and technicians as well as safety equipment. Office furniture and equipment is as the title describes. Office Computer equipment relates to small specialized pieces of software or hardware that are not provided by ATCO I-Tek. Communications equipment mainly relates to a Northwestel telephone protection upgrade. Transportation equipment mainly relates to line and service vehicles, a digger and a forklift. Land and buildings mainly relates to small upgrades at company houses, heating and fuel storage work at the downtown Whitehorse office as well as Service Complex and a new bunkhouse in Old Crow.

(b) Capital expenditures are provided for in the annual capital forecast which is prepared by the Yukon Electrical management team and ultimately approved by the Company's Board.

Yukon Electrical has a comprehensive capitalization policy that it adheres to based on the requirements that pertain to the company as determined from time to time. Although the document is of significant size to be helpful attached is an excerpt from the policy. Please refer to YEC-YECL-46(b) Attachment 1.

## A. – POLICY

### A.1 – Objectives of the Capital Expenditure Program

Through the planning and control of capital expenditure programs, management exercises a basic and important function, the allocation of the Company's managerial and financial resources.

Accordingly, the Company has established a uniform policy for the planning and control of capital expenditures to ensure major capital expenditure programs receive objective corporate evaluation within the framework of the Company's long-range goals.

### A.2 – Scope

The term "capital expenditure" will be used in this document to refer both to the cash outlays on capital items of a appropriation or plan plus any future "capital commitments" of expenditures implied by the approval of a given appropriation or plan. The object is to avoid piecemeal approvals of capital projects and ensure that all capital expenditures resulting from an appropriation or plan are considered when the appropriation is initially approved. For the purposes of this policy, capital expenditures are defined as in policy D.1.a:

*An expenditure is capital in nature if it involves: constructing or purchasing a new asset or upgrading, rehabilitating or replacing an existing asset.*

*a. Constructing or purchasing a new asset*
- *i. Outright purchase of fixed assets, such as land, a building, a vehicle, machinery, standby equipment, office furniture, etc.*
- *ii. The entire cost of constructing new additions to physical assets such as transmission lines, distribution facilities, substations, etc.*
- *iii. All start up and commissioning costs*

*b. Upgrade existing assets*
- *i. An enlargement of existing structures or facilities*
- *ii. To increase the capacity of an existing asset*
- *iii. A substantial improvement in the facility affecting quality of output or reduces operating costs*

*c. Rehabilitate existing assets*
- *i. As a general guideline, to determine if a cost falls into this category, one must consider if the expenditures were planned to be incurred at the time of purchasing the asset.*

1. *If these expenditures were planned at time of purchase to occur in the future, they will be expensed to O&M when they are incurred.*
2. *When extraordinary, material unplanned items are incurred in the future, they will be considered capital*

ii. *To insure achievement of life of an asset*
iii. *To extend the life of an asset beyond its normal service life*

d. *Replace existing assets*
   i. *The substitution of new for existing facilities that are worn out, irreparably damaged, or have been become inadequate in service.*
   ii. *The substitution having substantially no greater capacity than the facility for which it is substituted.*

### A.3 – Administrative Responsibility

The Vice President & Controller is responsible for the development of this policy.

The President is responsible for assuring the implementation of procedures that will fully support both this policy and the general principles of sound planning, analysis and control of the Company's capital expenditures programs.

## B - PROCEDURES

### B.1 – Annual Capital Expenditure Business Plan

Annually, at dates to be established by the Vice President & Controller, each department shall submit an Annual Business Plan incorporating a Capital Expenditures forecast updating its current year capital expenditure requirements and detailing new capital commitments for the next three ensuing years. As a minimum, detail should include, for each carry over and new appropriation (including blanket appropriations), appropriation title, timing of expenditures and supporting business cases.

The first year of the business plan will only include those appropriations that have a high probability of proceeding. The projected expenditures for each appropriation shall be the most probable expected amount. It is recognized that future years of a business plan, because of the time period involved, may include more speculative appropriations.

Capital Expenditures incorporated in the business plan will ultimately require approval by the Board of Directors. It must be emphasized that this approval does not constitute authorization to expend funds on any appropriation. This authorization can be secured only through the proper approval of a Capital Expenditure Appropriation Request (CEAR) as outlined in section E.2.d. Authorization to expend funds must be obtained prior to the commencement of any appropriation. This does not preclude the necessary internal allocation of funds to outline and define proposed appropriations. CEAR authorization may be deferred in cases where it is necessary to purchase specialized equipment such as transformers and breakers to meet an in-service date. Written guarantees must be in place with the customer **whose credit quality has been approved by the Chief Financial Officer.** Also, regulatory approvals in progress may result in the delay of the formal application of the CEAR.

## B.2 – Approval of Capital Expenditures

### B.2.a - Delegation of Approval Authority

Authority to approve the expenditure of funds for capital commitment proposals as outlined in Appendix 2, ATCO Electric Capital Expenditure Authorities. Appropriations that extend beyond one year only require approval for the total appropriation in the year expenditures begin unless overruns occur in excess of the defined limits.

### B.2.b - Approval Amount

The approval amount for a specific capital expenditure proposal shall represent gross-capital expenditures required for the proposal, and shall not have netted against it any prepaid expenses, grants or incentives, disposals, trade-ins, financing plans, customer advances or salvage value.

### B.2.c - Submission of Capital Commitment Proposals

All capital commitment proposals and overrun requests shall be submitted for approval in Capital Expenditure Appropriation Request (CEAR) format.

### B.2.d - Evaluation of Capital Commitment Proposals

The evaluation of any capital commitment proposal will be based upon a thorough consideration of its technical and business integrity, its economic and intangible benefits, risk characteristics, and its relationship to the strategic plans of the departments and to the long-range objectives of the Company.

| | **Date:** 06-01-27 **Number:** D.1.a.1 |
| **PREPARED BY:** D.R. MacIver | **APPROVED BY:** Dennis DeChamplain |
| | **UPDATED:** January 27, 2006 |

## B.3 - Appropriation Development Costs

Project development costs incurred prior to the actual commencement of an appropriation will form part of the CEAR approved amount if the project proceeds. If it is decided a project does not proceed, a determination will be made as to whether the costs are written off to O&M or may be capitalized as part of ES&G. Costs are eligible to be included in ES&G if the study findings are applicable to future capital appropriations.

All development costs are segregated in projects in an unapproved appropriation. Financial Reporting will review this appropriation periodically and take the actions noted in the above paragraph once it has been determined if an individual project will proceed.

## B.4 – Capital Expenditure Reporting

A Capital Expenditure Status Report (CESR) on all planned appropriations and all appropriations approved since the Business Plan will be prepared on a monthly basis. For information on report contents and layout refer to section D.

## B.5 – CEAR Post Completion Review

Upon completion of an appropriation (which is generally considered the in-service date/energization date or the end of the calendar year for a blanket CEAR), a Post Completion Review (PCR) shall be prepared within three months. This applies to all CEARs (except cancelled CEARs with no expeditures). The objective of this analysis is to determine the reason for deviations in appropriation expenditures. This will enable the Company to justify any overspending or underspending, improve cost planning and learn from any problems that may have arisen.

It is company policy that no expenditures are incurred without prior management approval. However, it is recognized that in some circumstances, expenditures on an approved appropriation may exceed the approved amount before a revised CEAR can be obtained. In such a situation a PCR will be prepared explaining the reasons for the overrun and the fact that prior approval could not be obtained.

If the appropriation incurred a cost overrun and a revised CEAR was prepared, the analysis would involved comparing actuals against the revised CEAR. Any variance between the original CEAR and the revised CEAR should have been explained on the revised CEAR.

The post completion analysis shall be reviewed and approved by the Originator of the CEAR, generally the Vice President of the department responsible for the CEAR and the President. A copy of this analysis will be made available as required to Internal Audit as part of the ongoing audit of capital expenditures and the original filed with the CEAR in the permanent records found in the Controllers Department.

## C - DEFINITIONS

### C.1 - Approval Amount

The approval amount for a specific capital expenditure proposal determines the ultimate organization level of approval required for authorization to commit funds. The approval amount is in general, the gross amount of anticipated expenditure requirements. Cost of retirement excluding salvage, are to be included in the CEAR amounts. The salvage value can be reflected in a separate line on the CEAR form.

Specific exceptions to this general rule are as follows:

### C.1.a - Leases

For appropriations which propose the lease of land, buildings, equipment and any other capital asset, the approval amount shall be determined as follows:

#### C.1.a.1 - Type A Leases

If assets proposed for lease can also be acquired by purchase, and/or are normally available for purchase, then the approval amount shall include the actual or estimated purchase price; and

#### C.1.a.2 - Type B Lease

If the assets cannot be, or normally are not, acquired by purchase, the approval amount shall include the total of all lease payments for such assets over the life of the appropriation.

Prior regulatory approval is required for all capitalized leases.

| ATCO ELECTRIC LIMITED ACCOUNTING POLICY MANUAL | *Planning and Control of Capital Commitments and Expenditures* |
|---|---|
| | **Date:** 06-01-27 **Number:** D.1.a.1 |
| **PREPARED BY:** D.R. MacIver | **APPROVED BY:** Dennis DeChamplain |
| | **UPDATED:** January 27, 2006 |

## C.1.b - Disposals

### C.1.b.1 - Cost of Retirement

Dismantling, selling or other related disposal expenses.

### C.1.b.2 - Salvage Value

Sales or salvage proceeds. Cost of retirement as outlined in C.1.b.1 is not factored in salvage value.

### C.1.b.3 - Disposal Without Replacement

For appropriations which the sole purpose is to dispose of, or retire a capital asset without replacement, a Disposition CEAR is required. The approval amount of the CEAR will be the greater of the net book value (NBV) of the asset being disposed or the salvage value. Any cost of retirement will be included in the CEAR value. The amount of the salvage value can be identified on the CEAR in the salvage area.

Example (disposal without replacement) A transformer is no longer needed for operations and is to be sold. It has a net book value of $350,000, but can be sold for $300,000. Estimated cost of retirement is $75,000. The amount of the CEAR will be the net book value, which is greater than the salvage value, plus the cost of retirement.

| | |
|---|---|
| Greater of NBV or Salvage Value | $350,000 |
| Cost of Retirement | $ 75,000 |
| CEAR Approved Amount | $425,000 |
| Grants and Contributions | 0 |
| Salvage Value | ($300,000) |
| Net Cost to Company | $125,000 |

### C.1.b.4 - Disposal With Replacement

For appropriations that involve the replacement of a capital asset which will then be disposed or retired, the approval amount of the CEAR will include the replacement asset and the cost of retirement. The amount of the salvage value of the asset can be identified on the CEAR in the salvage area.

Example (disposal with replacement) The same transformer (example above) is to be replaced by a larger one costing $900,000. Installation expenses for the new transformer are $125,000. Estimated cost of retirement for the old transformer are $75,000. The appropriation approval amount is then:

| | |
|---|---|
| New Transformer Purchase Price | $900,000 |
| Related Expenses: Installation | $125,000 |
| Cost of Retirement | $75,000 |
| CEAR Approved Amount | $1,100,000 |
| Grants and Contributions | 0 |
| Salvage Value | ($300,000) |
| Net Cost to Company | $800,000 |

## C.2 - Blanket CEAR

In certain circumstances expenditures of the same category may be combined and approved as one appropriation. Examples include distribution systems, transmission line improvements and general property expenditures where individually the amounts are relatively small but collectively are significant. A blanket CEAR shall not include individual projects in excess of $500,000.

Blanket CEARs expire at the end of the calendar year for which the CEAR was approved. Projects not commenced shall be included on the CEAR for the next calendar year. Should a blanket CEAR for a year be insufficient to complete all projects already commenced, a revised CEAR must be submitted for that year in accordance with section C.8.

## C.3 - Capital Assets

Capital assets are defined to include land, building, poles, towers, conductors, machinery and equipment, furniture and fixtures, automotive equipment, tooling, software development, etc. In general, a capital asset is any unit of property which can be physically identified and normally expected to have a useful life in excess of one year. The value of a capital asset shall include any non-recurring, related appropriation costs that are normally capitalized.

### C.4 - Capital Commitment

The aggregate of capital expenditures required to fulfill a given capital expenditure proposal, regardless of the timing of actual expenditures, constitutes the amount of capital commitment. Because this amount is also the approval amount, it represents the level of commitment of capital that is implied by the approval of a given proposal, or a group of proposals. The capital commitment represented by the Business Plan is, therefore, the total capital expenditure requirements of all proposals included in that plan, including allowance for funds used during construction.

### C.5 - Cancelled Appropriation

For cancelled appropriations where a CEAR has been raised and there are expenditures, the variance to approved amount will be explained in a PCR. The costs of a cancelled appropriation will not be capitalized unless the cost can be clearly shown to provide a benefit to another capital appropriation.

For cancelled appropriations where a CEAR has been raised and there are no expenditures, the only actions required are to indicate CANCELLED on the CEAR, distribute to the appropriation signatories and file it in the permanent records.

### C.6 - Expired CEAR

Authority to spend money expires on a Capital Appropriation that has not commenced by the end of the calendar year for which commencement was approved.

Where the Capital Appropriation has commenced, the authority to spend money continues until the appropriation is completed. When the completion of the appropriation is delayed beyond one year this shall be reflected in the next operating plan. No additional approval is required.

### C.7 - Original CEAR

The first approved CEAR for an appropriation. Where an appropriation runs over several years and there are cost revisions the amount of the original CEAR will be disclosed on any subsequent CEARs.

### C.8 - Overrun/Underruns

Overruns are the amount by which the final indicated costs of the facilities authorized to be acquired by capital expenditures, and required to completely satisfy the original, undiminished intent of the appropriation, exceed the level of capital expenditures currently authorized. By this definition, appropriations that cannot be completed within their authorized capital expenditure limits without a curtailment or alteration of their originally stated intent are said to be in overrun status. Where projected expenditures are expected to exceed 10% of the approved amount of a CEAR, a Revised CEAR must be raised immediately and before any over expenditure can occur.

There is no action required for cost underruns. The reflection on these facts will be reported in the Capital Expenditure Status Report (CESR) and the PCR and is sufficient notification to management.

### C.9 - Emergency CEAR

In the event of an extreme situation requiring immediate action to be carried out in the best interests of the Company, the President or his designate is authorized to approve the necessary expenditure. This is then followed as soon as possible with a regular CEAR.

### C10 - Appropriation

A basic principle of the policies for planning and control of capital expenditures is that proposals shall be developed, reviewed and controlled on an appropriation basis. An appropriation shall be a complete, self-contained program intended to accomplish a specific objective. Its completion or effectiveness shall not depend upon, or require, the approval of any other appropriations, or any additional expenditure for items other than those included in the appropriation. Too narrow an appropriation scope may foster "piece meal" planning and disguise the true financial impact of a total program.

The scope of an appropriation, however, shall not be so broad that it represents a consolidation of multiple capital expenditure actions that could be taken independently. Certain expenditures of the same category can be combined and approved as one appropriation (i.e. Blanket CEAR).

### C.11 - Planned Appropriation

A capital expenditure proposal which was specifically included in, and approved as part of, the Business Plan Expenditures.

| ATCO ELECTRIC LIMITED ACCOUNTING POLICY MANUAL | *Planning and Control of Capital Commitments and Expenditures* |
|---|---|
| | **Date:** 06-01-27 **Number:** D.1.a.1 |
| **PREPARED BY:** D.R. MacIver | **APPROVED BY:** Dennis DeChamplain |
| | **UPDATED:** January 27, 2006 |

## D - CAPITAL EXPENDITURE REPORTING

The CESR summarizes by function (e.g.: Transmission, Distribution etc.) the capital expenditures included in the most recent Business Plan and compares forecasted expenditures for the period with actual costs incurred.

Commitments, which can be incurred prior to the actual expenditures, should not be included in actuals.

### D.1 - Total CEAR Program

Total CEAR Program is the sum of the capital expenditures by function.

### D.2 - Purchases of Property, Plant and Equipment

The term Purchases of Property, Plant and Equipment is used to describe the Total CEAR Program less depreciation capitalized.

### D.3 - CEAR Requirement Approved by Board of Directors

The CEAR Requirement Approved by Board of Directors is the Purchases of Property, Plant and Equipment plus depreciation capitalized and expenditures approved for future years less expenditures approved in prior years.

### D.4 - Appropriation Final Forecast

Appropriation Final Forecast is comprised of total expenditures over the life of the appropriation including prior year's expenditures, current year forecasted expenditures and forecasted costs to complete the appropriation in future years.

### D.5 - Total Approved CEAR

Total approved CEAR expenditures for the appropriation

### D.6 - Total Appropriation Over/Under CEAR

This indicates the difference between the Appropriation Final Forecast and Total Approved CEAR.

| | **UPDATED:** January 27, 2006 |

# E - CAPITAL EXPENDITURE APPROPRIATION REQUEST (CEAR)

## E.1 - Authorization

The granting of authority to commit funds for capital appropriations is the second part of a two-step process. The first is the approval in principle of the Annual Business Plan that includes the capital program.

Subsequent to business plan approval all appropriations require authorization prior to commitment of funds. This is achieved with the approval of a "Capital Expenditure Appropriation Request" (CEAR). For an example of a CEAR see Appendix 1.

If overruns above approved amounts exceed allowable tolerance levels, a Revised CEAR would also have to be authorized. A chart outlining the levels of authorization is shown in Appendix 2, ATCO Electric Capital Expenditure Authorities .

## E.2 - CEAR Completion Guide

To assist in the completion of the CEAR, the following sections are explained below.

### E.2.a – Appropriation Start Up

The date when the first contract is signed or when funds are expended other than internal funds used to prepare and define the appropriation.

### E.2.b - Description of Proposal

This section shall include a brief summary of the proposed appropriation and the rationale for it. The description of the appropriation shall include any other significant factors such as customer contributions, service contracts, etc. which will assist management in their approval decision. Reference should be made to any site visits that have been conducted and the findings from those visits. Further information may be necessary and this shall be attached to the CEAR form. An example of further information required would be a listing of major items included in a "blanket" CEAR or an analysis of total appropriation costs. Explanations for any increases over planned amounts and previously approved CEAR's shall be set out in this section.

If the appropriation extends over a period greater than one year this section should also contain details of projected expenditures by year, for the CEAR, original CEAR (if applicable), current Business Plan and most recently submitted GTA.

### E.2.c - Appropriation Investment

The appropriation investment is the amount that the appropriation should cost following reasonable assumptions as to pricing, construction time, etc. This should be the amount that is included in the Business Plan for planned appropriations. If not, any deviations from the planned amount shall be explained.

### E.2.d - Approvals

A single owner will be assigned to each CEAR. The CEAR owner is responsible for reviewing the CEAR on an ongoing basis and obtaining CEAR approval.

Prior to a CEAR being approved at the department level, it shall be sent to Regulation and Business Plans who will ensure that it has been correctly completed. Regulation and Business Plans will then arrange for any required Company and ATCO approvals. Refer to Appendix 2, ATCO Electric Capital Expenditure Authorities. When fully approved, Regulation and Business Plans will retain the original copy and copies will be sent to those on the distribution list.

Where signatures of approval are not required or when Board of Director approval is not required, the appropriate box shall be completed with the words “Not Required”.

## YEC-YECL-47

**Reference:** Reliability

**Requests:**

(a) Identify which capital projects are improving reliability and provide an explanation for how they improve reliability.

(b) Describe (for each project in a that is improving reliability) the reliability criteria used and how it would be violated if the project were not undertaken.

**Response:**

(a) All capital work that is either replacing like for like, upgrading or adding to the system will inherently improve reliability, since it will be newer equipment and built to an improved standard. Certain projects have been justified primarily on reliability, while others have been justified by other drivers like safety. Yukon Electrical conducted a review of its forecast improvement projects for 2008 and 2009 and determined that all projects improved reliability in some way or another. The explanations provided in Yukon Electrical's Application, Section 9, provide information on why a project is to be undertaken and outlines reliability benefits on a project by project basis.

(b) The reliably criteria for the projects referred to in (a) above can be found in Section 9 of Yukon Electrical's GRA. Yukon Electrical has developed its system improvement forecast identifying projects that are necessary to maintain the safety and reliability of the power system. The power system cannot be run to failure but rather must be maintained and upgraded on a timely basis. Yukon Electrical uses its professional expertise, the experience of qualified trades people, industry standards and data it gathers regarding its facilities and operations to determine which projects must be undertaken to benefit customers and fulfill Yukon Electrical's obligation to serve. If these projects are not undertaken, Yukon Electrical believes that safety and reliability will be impacted negatively. The response to YEC-YECL-23 has numerous other factors taken into consideration when preparing System Improvement plans.

## YEC-YECL-48

**Reference:** Deferred Costs

**Requests:**

(a) Please provide a continuity schedule for each category of deferred cost for YECL for the years 1996 to 2009 showing additions and amortizations.

**Response:**

(a) In accordance with Board order 2008-5 information dating back to 1996 is not required to test the revenue requirement in the test period.

Please refer to YEC-YECL-48 Attachment 1 for a continuity schedule going back to 2003.

| | 000's | 000's |
|---|---|---|
| **January 1, 2003 Beginning Balance** | | **(140)** |
| 2003 Write-off | | **(75)** |
| Watson Lake pole damage June 11, 2003 | **7** | |
| Watson Lake Unit 6 March 21, 2003--bearing seizure | **52** | |
| Service Complex flood May 19, 2003--water tank failure | **25** | |
| D. Bay Unit 2 September 2003--generator bearing failure | **29** | |
| **2003 Costs** | | **113** |
| **December 31, 2003 Ending Balance** | | **(102)** |
| | | |
| **January 1, 2004 Beginning Balance** | | **(102)** |
| 2004 Write-off | | **(75)** |
| Pelly Unit 3 Jun 15, 2004--turbo failure(internal explosion)--valve | **28** | |
| Pelly Unit 2 Sept. 30, 2004--cracked cylinder block | **82** | |
| wind storm damages September 2004 | **45** | |
| wind storm damages October 2004 | **95** | |
| rain snow ice storm damages November 2004 | **85** | |
| **2004 Costs** | | **335** |
| **December 31, 2004 Ending Balance** | | **158** |
| | | |
| **January 1, 2005 Beginning Balance** | | **158** |
| 2005 Write-off | | **(75)** |
| Pelly Unit 2 Sept. 30, 2004--cracked cylinder block(core credit) | **(5)** | |
| **2005 Costs** | | **(5)** |
| **December 31, 2005 Ending Balance** | | **78** |
| | | |
| **January 1, 2006 Beginning Balance** | | **78** |
| 2006 Write-off | | **(75)** |
| Watson Lake Unit 5 Dec 05--unit failure | **26** | |
| Watson Lake Units 1 & 6--2006 premature cylinder failure | **25** | |
| **2006 Costs** | | **51** |
| **December 31, 2006 Ending Balance** | | **54** |
| | | |
| **January 1, 2007 Beginning Balance** | | **54** |
| 2007 Write-off | | **(75)** |
| Watson Lake Unit 4 Aug 07--unit failure | **22** | |
| Pelly Unit 3 Aug 07--unit failure | **51** | |
| **2007 Costs** | | **73** |
| **December 31, 2007 Ending Balance** | | **52** |

**YEC-YECL-50**

**Reference:** YECL Income Tax Computation

**Requests:**

(a) Please provide a detailed Income Tax computation for 1997 to 2009 including a reconciliation of earnings to taxable income in the format of T2S (1).

(b) Please provide a continuity schedule of capital cost allowance in similar format to T2S (8).

**Response:**

(a) In accordance with Board Order 2008-05 information prior to 2003 is not required to test the revenue requirement. As such Yukon Electrical will not be providing information prior to 2003. For the 2003-2009 information please refer to YEC-YECL-50(a) Attachment 1.

(b) In accordance with Board Order 2008-05 information prior to 2003 is not required to test the revenue requirement. However given that Undepreciated Capital Cost impacts the revenue requirement in the test period Yukon Electrical has provided the information requested (please refer to YEC-YECL-50(b) Attachment 1).

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

## YEC-YECL-51

**Reference:** Deferred Study Costs

**Requests:**

(a) In a manner consistent with information provided in 1996 1997 GRA CITY-YEC YECL1-19 please provide a listing of the various deferred study cost Total Expenditures, Amortization Rate and Method (including commencement date), Accumulated Amortization and Unamortized balance for the actual years 2006 and 2007 as well as the test years 2008 and 2009. December 31, 2006 and December 31, 2007.

(b) For all deferred study cost projects please complete a table that details (1) project name and total expense capitalized, (2) project description, (3) rationale justification and (4) cost benefit.

(c) Please provide a summary to any changes or expected changes to terms and conditions of licences for any facilities re-licenced. Please provide an assessment of the financial implications of any of these changes on ratepayers.

**Response:**

(a-c) There are no deferred study costs.

## YEC-YECL-52

**Reference:** Inventory

**Requests:**

(a) For each year starting in 1996 and including forecast 2008 and 2009, please provide a breakdown of YECL's fuel, distribution, transmission and generation inventory as of December 31. Please ensure the analysis breaks down distribution, transmission and generation inventory in their respective major categories.

(b) Please provide variance analysis for increases or decreases including annual turnover analysis for distribution inventory.

**Response:**

(a) The last approved test period was 1996 1997. Information provided in response to information requests is in accordance with Board Order 2008-05, which confirmed that Yukon Electrical is not required to provide information prior to 2003 to test the revenue requirement.

| | ( 000's) | | | | | |
|---|---|---|---|---|---|---|
| | Actual 2004 | Actual 2005 | Actual 2006 | Actual 2007 | Test 2008 | Test 2009 |
| **Distribution** | 890 | 1,054 | 1,381 | 1,272 | 1,334 | 1,400 |
| **Fuel** | 399 | 421 | 404 | 577 | 606 | 636 |
| **Transmission** | 0 | 0 | 0 | 0 | 0 | 0 |
| **Generation** | 0 | 0 | 0 | 0 | 0 | 0 |
| **TOTAL** | 1,289 | 1,474 | 1,784 | 1,849 | 1,940 | 2,036 |

(b) In regard to the distribution inventory the increase between 2005 and 2006 is mainly attributed to price increases of various line materials. These price increases were driven by robust economies in North America as well as by natural disasters and higher commodity prices that had an impact on supply and cost of materials. Yukon Electrical experienced significant increases in the cost of underground cable, copper wire, and transformers.

The increase in fuel inventory between 2006 and 2007 is as a result of price increases.

The inventory turnover is not available for the years 2003 -2005. For the years 2006 to 2007 it was 1.12 and 1.02 respectively.

## YEC-YECL-53

**Reference:** Retirements, Disposals and Adjustments

**Requests:**

(a) For each year starting in 1996 and including 2008 and 2009 forecast please provide a breakdown of YECL's retirements, disposals and adjustments.

**Response:**

(a) Please refer to YEC-YECL-53(a) Attachment 1. Information provided in response to information requests is in accordance with Board Order 2008-05, which confirmed that Yukon Electrical is not required to provide information prior to 2003 to test the revenue requirement.

| Total | 54 | 54 | 77 |

AFUDC prior to 2005 is not available by project however the amounts are not considered significant and in total are as follows:

| Year | Amount ( 000's) |
|---|---|
| 1996 | 17 |
| 1997 | 20 |
| 1998 | 8 |
| 1999 | 7 |
| 2000 | 47 |
| 2001 | 42 |
| 2002 | 23 |
| 2003 | 44 |
| 2004 | 51 |

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

## YEC-YECL-55

**Reference:** Distribution and Transmission Construction (Technical) Standards

**Requests:**

(a) Has YECL developed distribution and transmission construction (technical) standards? If yes, please describe how these standards are documented and utilized on an ongoing basis.

(b) Please provide the amount spent each year since 2003 on external as well as internal resources on the development and maintenance of Distribution and Transmission Construction Standards. Please confirm whether these expenses have been capitalized or expensed.

**Response:**

(a) Yes, YECL has developed and maintains a Distribution Construction Standards Manual. Each print is designed and approved by a Professional Engineer holding a permit number; the print is assigned a specific identification number and index in a manual. In the design stages of a project these prints are referred to and incorporated as appropriate. YECL does not maintain a transmission standards manual however has access to detailed construction standards through its parent company.

(b) Over the years these standards have been collaboratively developed and updated with our parent company. Suggested changes or adjustments to the standards are vetted though ATCO Electric's standards group and implemented if appropriate. Updates and changes are generally one of's with minimal financial impacts to the overall cost of the manual. Time specifically spent on this process is capitalized; the funds spent are not tracked in detail but rather would be part of the pre-set labor allocations of those involved in this activity. If a significant amount of work was required in regard to the standards a project number would be established for tracking of costs and allocated to the appropriate capital and O&M accounts.

**YUB-YECL-1**

**Reference:** Overview, Application, page 1-2 Background

**Issue Sub-Issue:** Performance Metrics

**Quote**: Although Yukon Electrical has not been before the Yukon Utilities Board with a General Rate Application since the test years 1996-1997, Yukon Electrical has continued to provide safe reliable and cost effective service to our customers. However there have been significant cost pressures in recent years that require Yukon Electrical to come forward to the Board to ensure that it is possible to continue to deliver the same

**Preamble**: The Board wishes further information regarding reliability measures.

**Request:**

(a) Please provide a table showing reliability performance measures on a calendar year basis with respect YECL's service area. The table should include such indices as:

the System Average Interruption Duration Index (SAIDI),

the System Average Interruption Frequency Index (SAIFI),

the Customer Average Interruption Duration Index (CAIDI), for the period 2002 to 2007,

Annual averages must be derived from raw data, not by averaging monthly averages.

(b) Please identify any formalized evaluation process that YECL has in place in order to identify worst-performing circuits in its service area. For the period 2003 through 2007, please identify the top 5 of the worst performing circuits on YECL's system and identify reasons for the poor performance.

(c) Please provide a table that shows YECL's performance in respect of the Canadian Electricity Association's (CEA) All Injury Illness Frequency Rate (AIIFR) performance index for the period 2003 through 2007.

(d) Please provide a table that illustrates YECL's performance in relation to the Canadian Electricity Association's (CEA) Motor Vehicle Accident Frequency Rate (MVAR) performance index for the period 2003 through 2007.

(e) In regard to call answer performance measures, please indicate if YECL has such a metric. If YECL has such a performance measure, please provide the metrics, the minimum performance standards that YECL has dictated for itself, and performance measure results for the last 5 years. If not, please explain why YECL does not monitor such metrics.

(f) Please provide an Excel spreadsheet containing data regarding YECL's annual operational and financial results for the period 2003 through 2007. Please use the attached Excel spreadsheet YUB-YECL-1 Operational Financial Reporting attachment.xls as a template.

(g) Please provide a comparison of actual 1996-97 results versus the latest Board Decision relating to those years.

**Response:**

(a) Please refer to the following table;

| | **2002** | **2003** | **2004** | **2005** | **2006** | **2007** |
|---|---|---|---|---|---|---|
| SAIDI | 5.15 | 2.57 | 7.41 | 3.11 | 8.99 | 4.54 |
| SAIFI | 4.85 | 3.23 | 5.78 | 4.11 | 6.76 | 4.69 |
| CAIDI | 1.06 | 0.79 | 1.28 | 0.76 | 1.33 | 0.97 |

(b) Yukon Electrical does not specifically track its reliability statistics on a line or feeder basis but rather it tracks reliability on the system as a whole. Yukon Electrical's operations group meets weekly with engineering to discuss the past weeks system performance. Of priority at these weekly meetings are all unplanned distribution outages or events which cause supply disruptions to customers. Events are recorded and trends are identified, i.e: reoccurring failures of specific feeders, transformers or services. Trends are then investigated by researching the causes. Supporting information may be available by reviewing service interruption reports. Depending on the cause of the outages a determination is made to either immediately make corrections to the equipment or if the asset repairs can be put into the capital business planning cycle.

Yukon Electrical has approximately 65 feeders in its service area. For four feeders, or approximately 5 of the total number of feeders, based on a general assessment and operating experience Yukon Electrical has concluded that the worst performing feeders currently are in the Southern Lakes region. Yukon Electrical has recognized this and has included projects in its capital plan to address deficiencies.

(c) **Disabling Injury Statistics:**

| | 2003 | 2004 | 2005 | 2006 | 2007 |
|---|---|---|---|---|---|
| Accidents | 0 | 0 | 0 | 0 | 1 |
| Days Lost | 0 | 0 | 0 | 0 | 1 |

| | 2003 | 2004 | 2005 | 2006 | 2007 |
|---|---|---|---|---|---|
| YECL | 0 | 0 | 0 | 0 | 0.07 |
| CEA | | | | | |

-Disabling Injury frequency is calculated in the following manner: $\frac{\text{Number of Disabling injuries x 200,000}}{\text{Exposure hours (hours worked)}}$

Yukon Electrical is not a member of CEA and as such is not able to provide this data. Yukon Electrical's parent is a member of CEA and Yukon Electrical does compare its statistics to CEA internally however cannot disclose this information publicly. Yukon Electrical can confirm that its injury statistics are better than the CEA average.

(d) **Vehicle Incident Statistics:**

| | 2003 | 2004 | 2005 | 2006 | 2007 |
|---|---|---|---|---|---|
| Vehicle Incidents | 3 | 2 | 5 | 7 | 10 |
| CEA | | | | | |

Please refer to YUB-YECL-1(c).

(e) Yes. Yukon Electrical tracks the performance of its after hours call center. However Yukon Electrical has only been with its current after hours call center provider since January of 2007. Prior to 2007 Yukon electrical used a small local service provider that did not have the technology to provide statistics. As a feature with our after hours trouble call service provider, call performance measurement is offered. Statistics are compiled monthly. Primarily the number of calls answered and the number of seconds the caller waits on the line before the call is answered is tracked. Yukon Electrical is still in the process of

assessing which factors are most beneficial to monitor and ultimately benchmark. At the present time Yukon Electrical reviews the reports that are provided and addresses any concerns brought forward by customers. Please refer to YUB-YECL-1(e) Attachment 1 as a sample of data available from the call center.

(f) Yukon Electrical has provided fully detailed schedules relating to its annual operational and financial results. Given the size of Yukon Electrical, Yukon Electrical does not believe a detailed filing that is in place for those major electric utilities in Alberta should be required. To do so would require increased resources on the part of Yukon Electrical.

As well, it should be noted that Yukon Electrical does not have an approved forecast for the years requested so all variance analysis would be to the prior year in accordance with EUB Directive 014. As such this information has been provided in the various schedules throughout the application.

(g) Yukon Electrical believes, that in accordance with Board Order 2008-5, it is not required to provide information dating back to 1996-1997 to test the revenue requirement in the test period. In order to be helpful Yukon Electrical will provide the information requested as follows:

| | | 1996 97 GRA | Actual |
|---|---|---|---|
| **1996** | Revenue Requirement | 29,360 | 29,798 |
| | Net Rate Base | 30,895 | 29,778 |
| | Return on Equity | 11.25 | 13.03 |

**YUB-YECL-2**

**Reference:** Overview; Application, page 1-5

**Issue Sub-Issue:** Deferral Accounts

**Quote**: The above noted ongoing and new deferral accounts meet the typical criteria for the establishment of a deferral account and are required as the costs related to these deferral accounts are:

1) Not under the control of the company and are not reasonably forecastable; or

2) An error in forecasting could produce a loss or gain of a substantial magnitude.

**Request:**

(a) Please define what YECL would describe as being a loss or gain of a substantial magnitude.

(b) Please provide an update to the forecast in respect of the connection of Pelly Crossing to the WAF grid effective November 1, 2008.

**Response:**

(a) A loss or gain of substantial magnitude is a loss that would have a material impact on the company's earnings. What is material is a matter of judgement and would be determined on a case by case basis. This position is consistent with the criteria used for Yukon Electrical's parent company ATCO Electric.

(b) The scope of this project has changed since the original filing of Yukon Electrical's General Rate Application (GRA). On July 18 2008, YEC's consultant suggested that 2nd 138kv to 25kv transmission line proposed for the community of Pelly Crossing is being reviewed. An alternate interim interface point and configuration has been proposed by YEC. Essentially the change requires that, from the interface tie between YEC and Yukon Electrical, there will be an OSS (Oil Sectionalizing Switch) to sectionalize from and synchronize to the grid when

required. Yukon Electrical will then step the voltage down to the current community distribution voltage of 2400V. A short distribution line will be built to reach the community's existing distribution system. Construction of the tie is tentatively scheduled for the 3rd week of August 2008, completion by September 15 2008. Yukon Electrical's design is complete, material is on hand, a final field check has been completed and we are in the process of securing a line route (July 28, 2008).

It is expected that if the transmission or distribution line required to extend the power system from the Minto Mine to Pelly is in place by October 1, 2008 that Yukon Electrical will meet the November 1, 2008 proposed connection to the grid date.

**YUB-YECL-3**

**Reference:** Overview; Attachment 1

**Issue Sub-Issue:** Manpower requirements

**Request:**

(a) Please explain and provide details regarding the changes that have necessitated the need for an additional Field Service Representative for 2009.

(b) Please provide YECL's vacancy rates for the period 2003 through 2007.

**Response:**

(a) The continued shortage of qualified utility employees (journeyman lineman) has forced Yukon Electrical and other utilities to pursue other methods of completing required work. With the additional Field Service Representative (FSR) for 2009, we are able to off-load some of the non-journeyman work from the qualified linemen. The Field Service Representative is a utility employee that is able to work on energized equipment and apparatus below 750 volts between conductors. This allows Yukon Electrical to assign low voltage work to a Field Service Representative and use the qualified journeyman linemen to complete the essential high voltage work. Additional value is obtained from this position, as the FSR can assist during after hours emergency call-out, where two men must be dispatched due to the nature of the work or location. This position provides another option to support power restoration.

A Field Service Representative can be trained and take on non-critical, low hazard, tasks to the operations group in 6 to 12 months. For a journeyman lineman it takes a minimum of 4 years of training before they become fully qualified.

The addition of an FSR is one component of a multiple solution approach being implemented by Yukon Electrical to meet increased workloads, reduce long term costs, and address attraction and retention issues.

(b) Vacancy rates are calculated based on an approved complement for FTEs. As such vacancy rates are not applicable for this period given that there were no Board approved FTEs.

**YUB-YECL-4**

**Reference:** Forecast Process; Application, page 2-2

**Issue Sub-Issue:** Derivation of the Forecast

**Quote**: The forecast process involves the review of historic sales data by customer class and takes into account the most recent information available at the time the forecast is prepared.

The normalization calculations are provided in Attachments 1 to 28.

**Preamble**: The Board wishes to understand fully the normalization calculations

**Request:**

(a) Please provide the spreadsheets that underpin the Normalized UPC (kWh) numbers illustrated in Attachments 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, and 25; Please ensure that all spreadsheets are complete with formulae and linkages that clearly show all the calculations in order to arrive at the numbers in the above referenced Attachments.

(b) Please provide the spreadsheets that underpin the Normalized UPC (kWh) numbers illustrated in Attachments 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, and 26; Please ensure that all spreadsheets are complete with formulae and linkages that clearly show all the calculations in order to arrive at the numbers in the above referenced Attachments.

**Response:**

(a&b) Please refer to YUB-YECL-04 Attachments 1-30 in Excel format. These spreadsheets contain all the formulae and linkages necessary to show the calculations used to arrive at the Normalized UPC (kWh).

**YUB-YECL-5**

**Reference:** Purchase Power; Application, page 3-1

**Issue Sub-Issue:** Fish Lake Hydro generation rebuilds

**Quote**: The Fish Lake hydro generation in the test period outlined in Schedule 3.2, is based on the average generation over the last 10 years at Fish Lake adjusted for estimated downtime in the test period, for required rebuilds.

**Preamble**: The Board wishes to understand the necessity of required rebuilds

**Request:**

For the period 2003 through 2007, please provide on an annual basis the generation output, type of and length of maintenance outages, and rebuilds and reasons for the rebuilds if any.

**Response:**

Please refer to YUB-YECL-05 Attachment 1, YUB-YECL-05 Attachment 2, YUB-YECL-05 Attachment 3 and YUB-YECL-05 Attachment 4. There were no rebuilds on the Fish Lake Hydro System between 2003 and 2007.

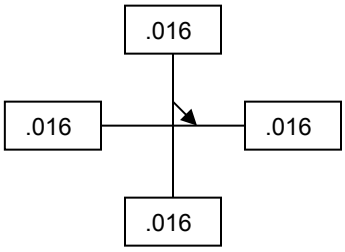
# FISH LAKE UNIT 1 INSPECTION

Inspection period: September 15 to September 19, 2007

Inspected by: Gaetano Grubisa, Peter McCollum, YECL
Lorne Bowes, Norm Curzon, YECL

Prior to shutting down Unit 1 for the inspection on September 15, a complete set of readings was taken to determine if it could carry full load without any difficulty. The governor was controlling the deflector shaft in the wide open position and the spear valve was open wide enough to produce 400 kw. At this load, the turbine was operating quietly with no cavitation sounds within the turbine and very little vibration at the two bearings. The generator bearings showed no vibration, running smoothly, and had a loud buzzing sound coming from the left side. The generator rotor and stator was very dirty, the slip ring area was fairly clean, there was no sparking of the brushes with minor etch marks on the outboard slip ring. The exciter was also dirty and the commutator was smooth with no significant wear on the surface. There was minor brush noise indicating the commutator may need machining. All carbon brushes were in good condition.

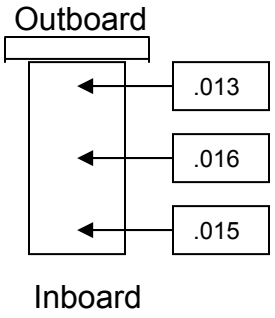


Readings recorded on September 14, 2007:

| | | Head | Spear Valve | JOURNAL BEARINGS | | | | |
|---|---|---|---|---|---|---|---|---|
| Time | Load | Press | Pressure | Turbine | Turbine | Generator | Generator | Exciter |
| 14:20 | 400 kw | 188 psi | 0 | 37 C | 29 C | 33 C | 37 C | 35 C |
| 14:35 | 500 kw | 185 psi | 0 | 37 C | 29 C | 32 C | 37 C | 35 C |
| 14:50 | 600 kw | 182 psi | 0 | 37 C | 29 C | 32 C | 37 C | 34 C |
| 15:10 | 690 kw | 179 psi | 0 | 41 C | 30 C | 33 C | 38 C | 36 C |

Pressure gauge missing.
Full load on the turbine is 700 kw.

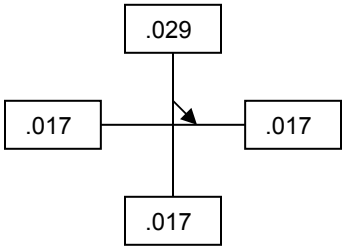
**Turbine Outboard Bearing**



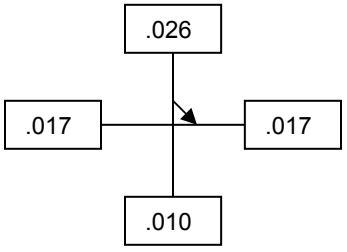
Mitchell journal bearing from Mitchell Bearings Ltd.
Order 30493

Turbine outboard bearing

oil seal (inner)



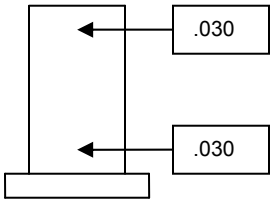
Bearing Clearances: (lead wire) .013 to .016



- Bearing housing has no dowel pins; corner bolts on bearing are body-fit.
- Bearing journal and thrust bearing in good condition.
- Bearing clearance is .013 to .016 .
- The turbine outboard thrust pads are installed only on the bottom half of the bearing. Eight small thrust pads are installed on the inboard side of the thrust collar to resist the thrust created by water hitting the runner wheel. All thrust pads are in good condition except the first pad on the right side. This pad has a small piece missing (1 8 x ) at the top split line. All pads were cleaned up and reinstalled. All pads are numbered P12 90R.
- Shaft journal is slightly rough and was cleaned with emery cloth.
- Thrust collar is in excellent condition.
- Oil was drained, the sump was cleaned and new Teresso 46 oil added.
- Bearing housing split line was sealed with Hylomar.

**Turbine Inboard Bearing**

Mitchell journal bearing from Mitchell Bearings Ltd.
Order 30493

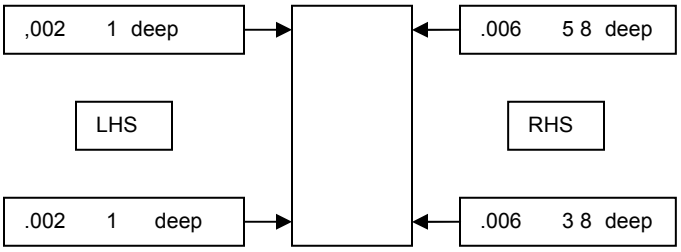


Turbine inboard bearing
oil seal (inner)

Turbine inboard bearing
oil seal (coupling side)

Bearing Clearance (lead wire) .030

Coupling end

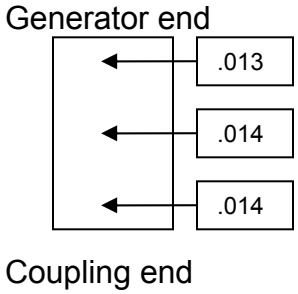


Mitchell Journal Bearing

Mitchell Bearings Ltd.
Order 30493

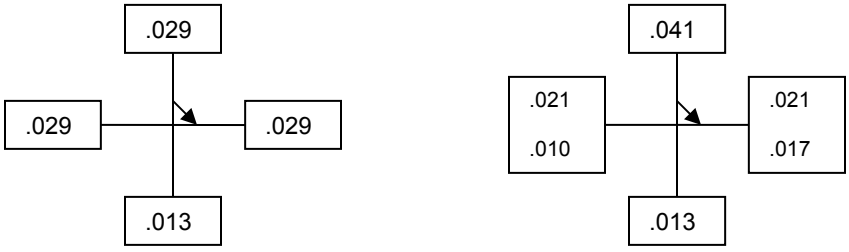
- Bearing has no dowel pins; corner bolts on bearing are body-fit.
- Bearing has no thrust pads.
- Bearing is in good condition.
- Vertical clearance on bearing .030 (lead wire on center pad).
- Journal bearing has 3 pads on the lower and 3 pads on the upper half. All pads are in good condition.
- Shaft journal is slightly rough and was cleaned with emery cloth.
- Oil was drained, the sump was cleaned and new Teresso 46 oil was added.
- Bearing housing split line was sealed with Hylomar.

## Generator Inboard Bearing



Side clearance .002 to .006

Bearing shell to housing fit
RHS 0
LHS .012

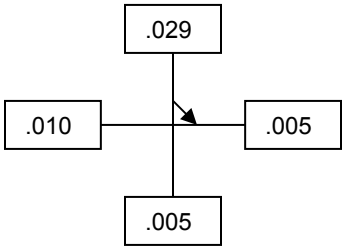


- The lower pedestal, bearing and bearing cover to be shipped to the machine shop for rebabbitting and spray welding the outside diameter of the bearing. It is .012 loose on the sides and .022 loose vertically.

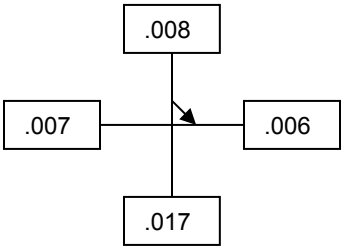
Bearing Clearance .013 to .014

Bearing cap pinch .001
left .024
right .022
Three shims each .007 were reinstalled after pinch readings were taken.

Bearing cap seals



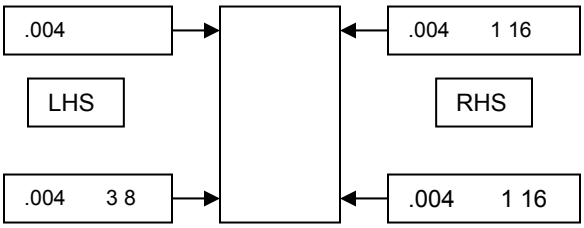
generator side coupling side



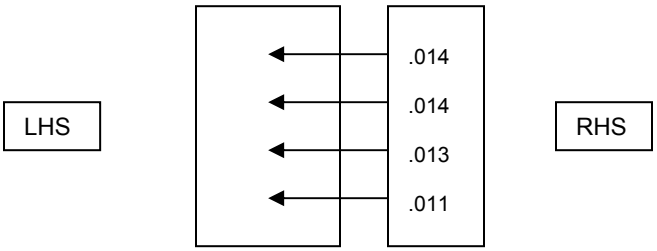
- This bearing is in fair condition.
- The babbitt is separating along the split line in places on both the upper and lower shells. The upper shell is the worst in the areas where the oil groove was repaired in 1997.
- Shaft contact is good and even on the bottom half.
- Bearing clearance is .013 to .014 .
- The bearing is loose in the housing and shows signs of fretting and loss of metal on both the upper and lower housings. It is also .012 loose at the split line on the left side. If the generator is shipped out for clean-up, this bearing and pedestal should be rebabbitted and spray-welded.
- Oil slinger rings were cleaned and fitted with new Robertson screws at the splits.
- Oil was drained, the sump was cleaned and new Terresso 46 oil was added.
- Bearing housing split line was sealed with Hylomar.
- Identification of oil slinger rings: coupling side 7
  generator side 27

**Generator outboard bearing**

As Found



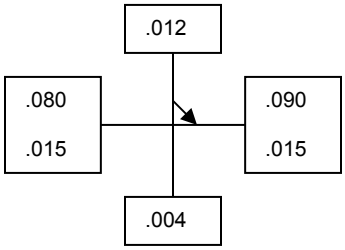
Outboard bearing oil seals



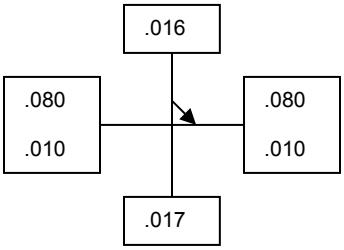
Inboard bearing oil seals

Side clearance .004

Bearing clearance .011 to .014



Bearing clearance (lead wire)



- Babbitt bearing is in good condition.
- Shaft, bearing, oil and sump were black and very dirty.
- Wear pattern is good; however, slightly to the right hand side.
- Oil slinger rings in good condition and have slightly worn into the babbitt in the upper oil slinger grooves.
- Oil was drained, the sump was cleaned and new Terresso oil was added.
- Bearing housing split line was sealed with Hylomar.
- Identification of oil slinger rings: outboard 19
  inboard 2

## Generator outboard bearing

Final

Outboard bearing cap oil seals

Inboard bearing cap oil seals

## Generator

At the start of the inspection, with 400 kw load, the generator had a loud buzzing sound coming from the upper left hand side of the generator. There was no external indication where the sound was coming from but it appears to be occurring at all loads.

During the inspection, the generator upper-end cover was removed on the outboard end and no obvious signs of looseness could be found. The generator windings are very dirty and the cooling slots in the stator are completely plugged. This generator needs to be shipped to an electrical motor repair shop for cleaning, testing and repairs.

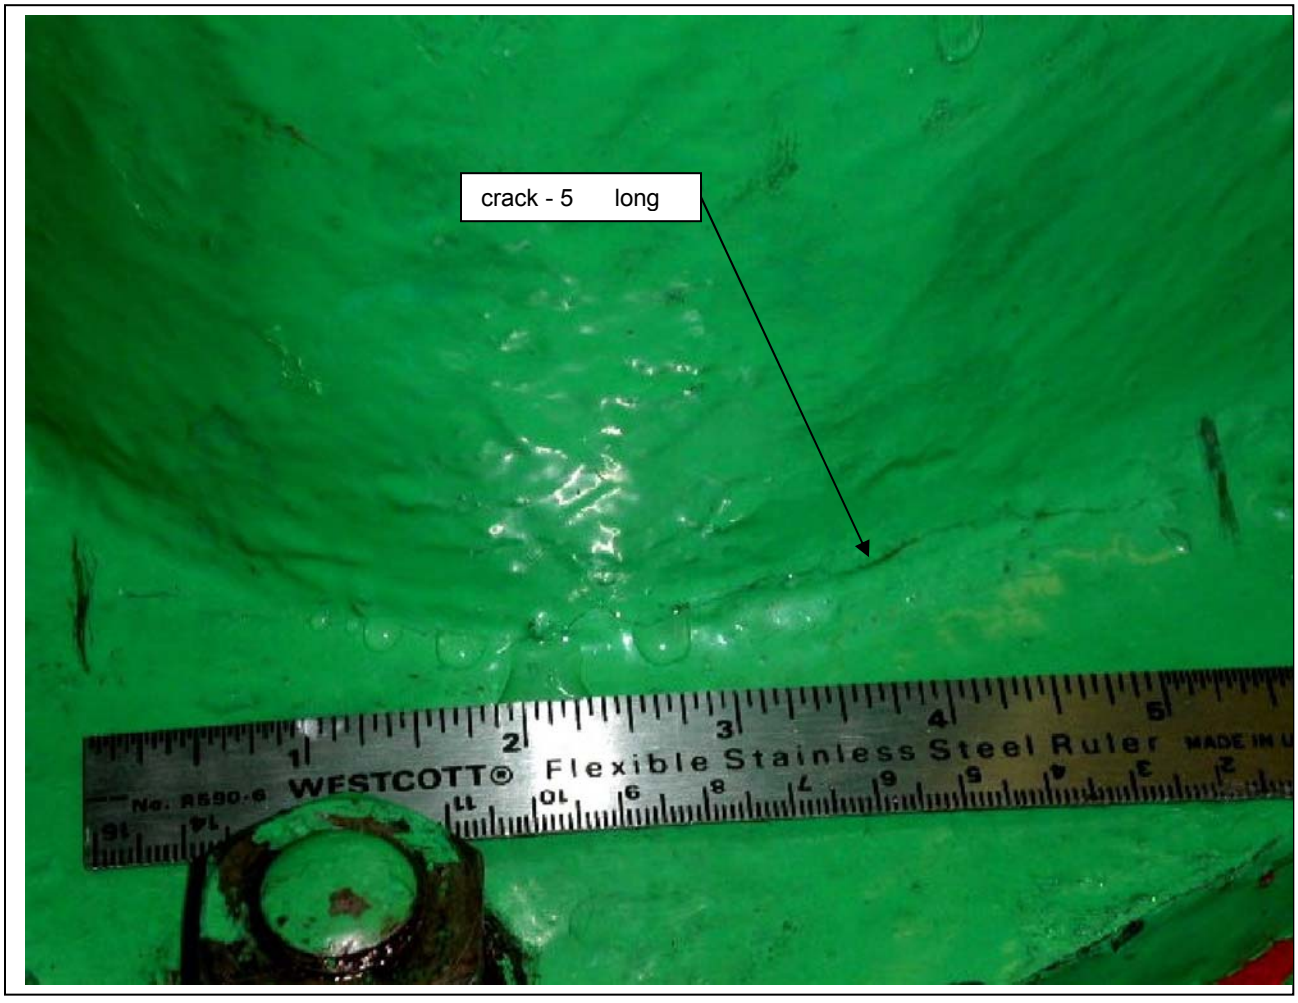
## Generator slip rings

The slip rings are, generally, in good condition with good wearing surfaces. The outboard ring; however, it has minor scuffing and was stoned and polished during start-up on September 18, 2007. When the generator is shipped out for clean-up, the slip rings will be machined and polished.

## Exciter

The exciter windings are dirty with carbon dust, tree fluff and road dust and should be cleaned at the same time the generator is serviced. The commutator is in good condition and should be machined and undercut when the exciter is in the electrical shop.

## Main Coupling

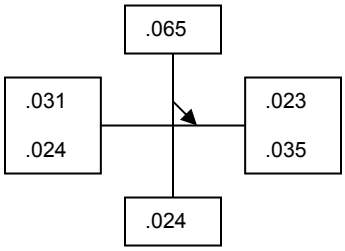


The cracks found on the turbine side coupling hub keyway remain unchanged since 1997. The generator side coupling hub is free of cracks around the keyway.

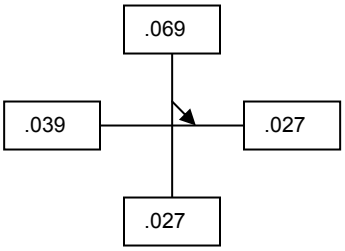
**Water wheel casing**

The water wheel casing is in good condition. When the upper half was removed for the inspection, the 1 16 thick rubber gasket was in good condition and had to be reused. Silicone sealant was used on both sides of the gasket to assure no leaks on start-up.

The repairs made by Jacobs Machine Shop of Whitehorse approximately 15 years ago on the lower water wheel casing remains in good condition. The welded cracks and the internal reinforcing plate and bolting are unchanged since the repair. Three nuts on the exterior of the housing show signs of leaking, copper gaskets and silicone was used to provide a better seal around these bolts.



After the inspection and start-up, we noticed a crack on the right side upper casing. This crack is 5 long and is located just above the split line. This crack is leaking slightly and should be ground out and welded if additional work is scheduled on the runner wheel vane cracks.



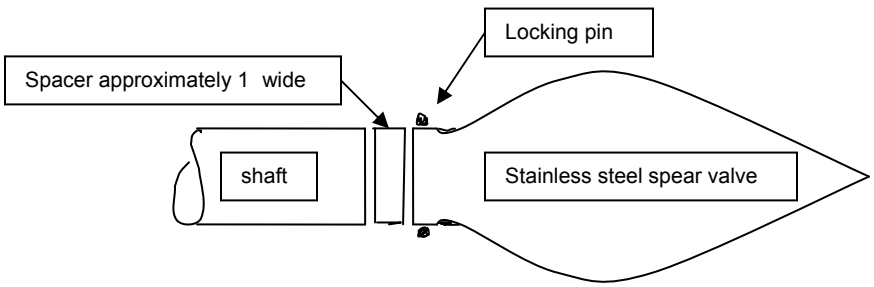
Water wheel casing, RHS

Water wheel casing cover seal clearances

Final

Outboard end

Inboard end



**Runner wheel**

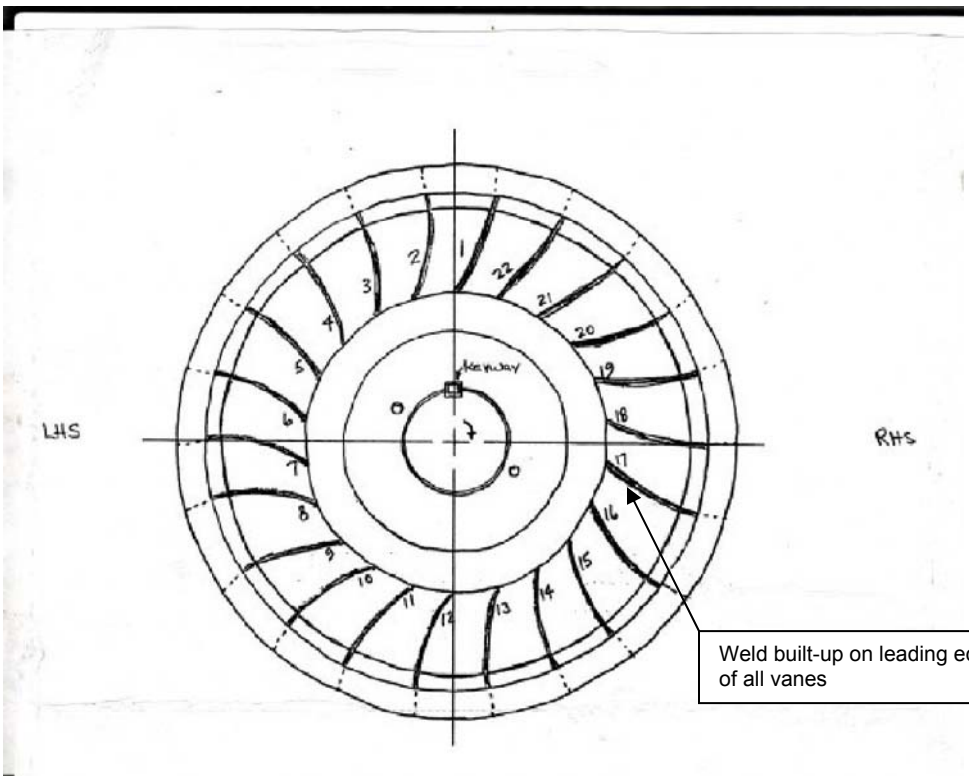
The runner wheel is still in good condition with many cracks found in the repaired areas of the vanes. Vanes 17 and 22 have extended cracks and should be inspected annually. When the generator is shipped out to be cleaned, the casing should be removed and the cracks ground out, silver soldered and built up in the area on both sides of the vanes.

**Spear valve**

The spear valve was inspected through the inspection hole on the elbow and from the tailrace. It appears to be in good condition with no cavitation or metal loss on the spear or the spear nozzle plate. The shaft bushings show little wear and remain in good condition.

It appears some modifications were made to the end of the shaft on previous overhauls as a 1 spacer is installed prior to threading the spear valve on the shaft. There is mechanical looseness at this spacer and the spear valve can be moved vertically up and down by approximately . The locking pin through the spear valve and threaded shaft is solid and in good condition. This valve with mechanical looseness would not be centered in the nozzle plate and could have some effect on the direction of flow to the runner wheel. Some turbulence could be occurring if the water is not hitting the vanes at the proper point on the runner wheel.

Inlet Spear Valve



**Runner vanes - inlet leading edge**

| Vane | Vane condition |
|---|---|
| 1 | 4 - cracks, 6 cracks 1 8 long |

Turbine runner
Inlet vanes

Turbine runner - outlet vanes

## Fish Lake Unit 1 Start-up

09:00 rotated machine to approximately 100 rpm to stone and polish the outboard slip ring on the generator.

11:45 with the spear valve open by approximately , the unit was started and the governor automatically opened the deflector to 100 open position. Head pressure was 190 psi; pressure before spear valve was 184 psi.

12:02 on line, load was increased by opening the spear valve using the automatic controls.

Readings taken on September 18, 2007

| | Head | Spear | | Spear valve | Journal Bearings | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Time | Pressure | Pressure | Load | Open | Brg 1 | Brg 2 | Brg 3 | Brg 4 | Brg 5 |
| 12:05 | 190 psi | 184 psi | 130 kw | .250 | 21 C | 18 C | 11 C | 12 C | 17 C |
| 12:18 | 190 psi | 182 psi | 300 kw | 7 8 | 27 C | 22 C | 13 C | 14 C | 20 C |
| 12:45 | 190 psi | 182 psi | 300 kw | 7 8 | 32 C | 25 C | 17 C | 18 C | 24 C |
| 12:50 | 190 psi | 179 psi | 400 kw | 1 3 8 | 33 C | 27 C | 19 C | 21 C | 26 C |
| 13:20 | 190 psi | 176 psi | 500 kw | 2 | 38 C | 28 C | 21 C | 23 C | 28 C |
| 14:00 | 185 psi | 172 psi | 600 kw | 3 | 38 C | 28 C | 24 C | 26 C | 32 C |
| 14:40 | 185 psi | 165psi | 680-690kw | 4 7 16 | 40 C | 29 C | 27 C | 28 C | 34 C |

Bearing temperature readings taken with an infrared gun.

Turbine cavitation noise began around 400 kw and noise increased to full load. Generator noise was not evident at 130 kw but was buzzing from 400 kw to full load.

Reduced load to 400 kw and left site 15:30.

## Recommendations

- Replace the leather belt to governor drive.
- The generator and exciter urgently require cleaning and testing in an electrical repair shop
- The generator inboard bearing is loose in the bearing pedestal housing. The housing and bearing should be spray welded to bring it back to standard size., If this work is done, the bearing would have to be rebabbitted.
- The spear valve should be removed and dismantled to determine reason for mechanical looseness. A quotation for a new spear valve and nozzle plate should be obtained from Gilkes in England
- Provide high temperature alarm trips for the four journal bearings
- Provide overspeed protection to open the generator breaker and stop the governor. A small gear could be provided to be installed on the turbine shaft for the speed pickup.

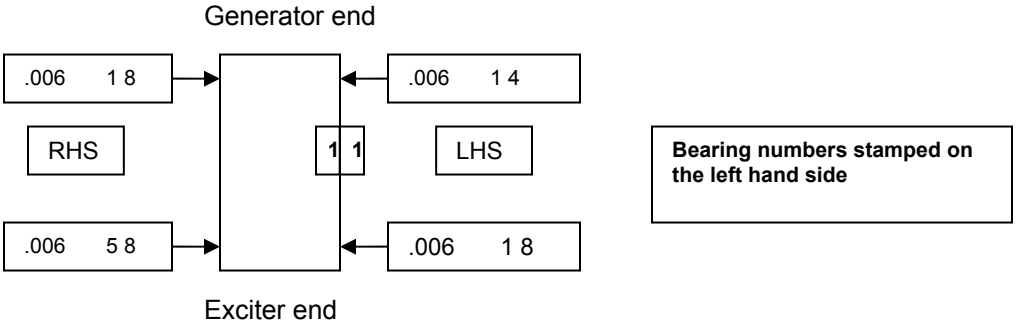
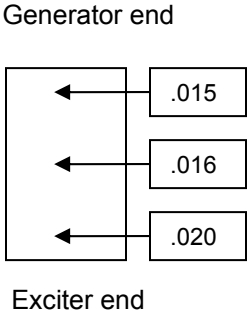
# FISH LAKE UNIT 2 INSPECTION



Inspection period: September 10 to September 14, 2007

Inspected by: Gaetano Grubisa, Lorne Bowes, Peter McCollum, YECL, Norm Curzon, YECL

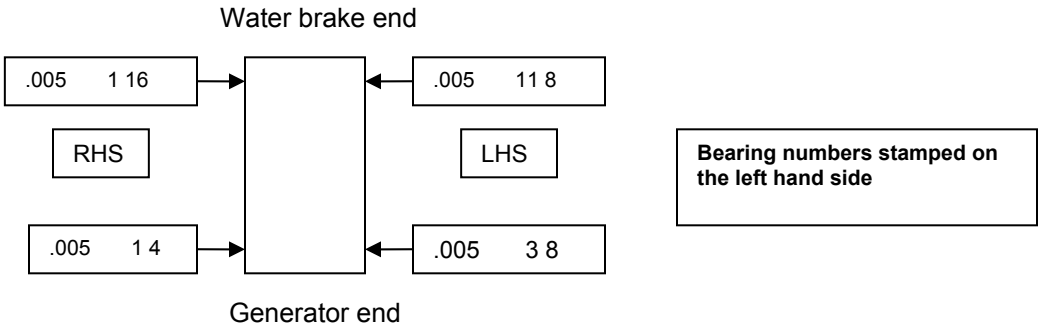


Prior to shutting down Unit 2 for the inspection on September 10, 2007, the load was increased from 375 kw to 506 kw. The governor and gates were completely open and the maximum load obtained was 506 kw. Vibrations were normal on the turbine bearing and both generator bearings. There were no strange sounds coming from the turbine or generator and the unit operated smoothly at full load. There was no head pressure gauge on the inlet pipe and the pressure gauge installed off the turbine casing was not working (later found the vibration pulsator plugged). The water flowed evenly through the discharge elbow and didn't appear to be cavitating. The vacuum gauge was not working on the discharge from the turbine even though it showed 10 of Hg. The valve was partly open indicating the vacuum was probably set correctly.

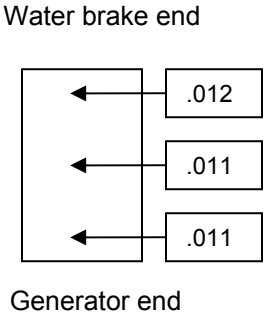
## Generator Outboard Bearing 1

Bearing side clearance .006

Bearing clearances (lead wire) .015 to .020



Clearances: journal bearing clearance .015 to .020
journal bearing side clearance .006



- This bearing was found in good condition. Clearance is .015 to .020 and contact to the shaft was fair with heavy contact on the exciter end. The bearing was cleaned and reinstalled as found.
- The oil slinger rings had worn a groove in the babbitt on both inboard and outboard channels of the upper bearing shell. The bearing was left as found but the oil slinger rings were filed smooth at the split lines and new Robertson screws were installed on both rings.
- Oil was drained, the sump was cleaned and new Terresso 46 oil was added.
- Bearing housing split line was sealed with Hylomar.

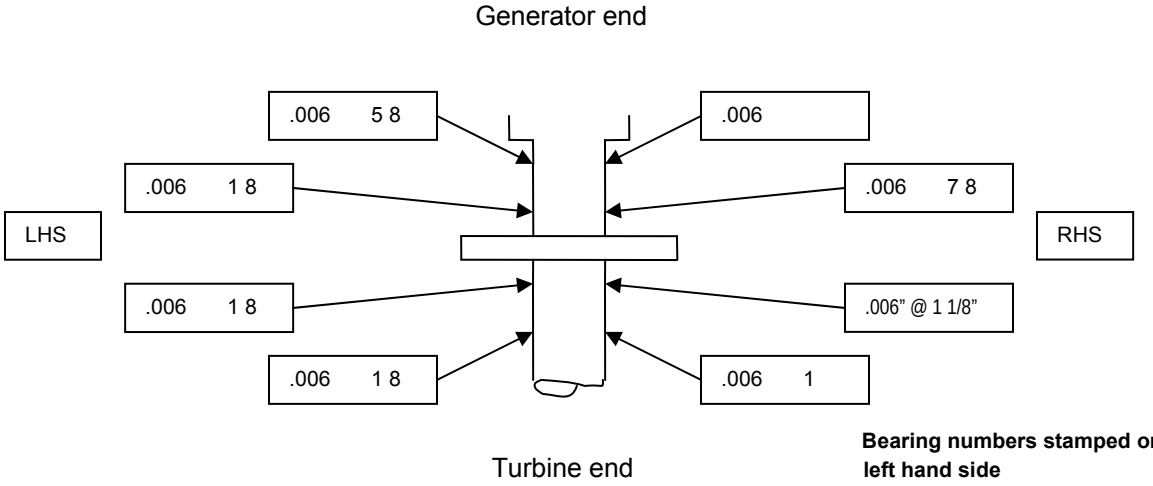
## Generator Inboard Bearing 2

Bearing side clearance .005

Bearing clearance (lead wire) .011 to 012

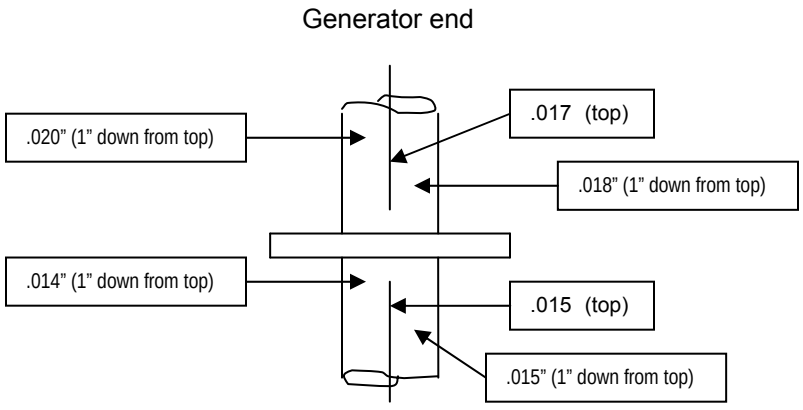
Clearances: journal bearing .011
journal bearing side clearance .005

- This babbitt bearing was found in good condition. Bearing clearances were good and the condition of the babbitt was good except in a couple of areas along the split line.
- When the lower half bearing was rolled out we noticed one small area of electrolysis on the left side and several small areas on the generator shaft. These were cleaned



and the shaft polished with fine wet and dry emery paper. It was later discovered that the source of the electrolysis was a loose generator ground wire clamp and it had been secured to the painted generator frame. This painted area was scraped, polished and the ground clamp bolt was tightened properly.

- Both oil slinger rings were cleaned and filed smooth at the split lines and new Robertson screws installed.
- Oil was drained, the sump was cleaned and new Terresso 46 oil was added.
- Bearing housing split line was sealed with Hylomar.

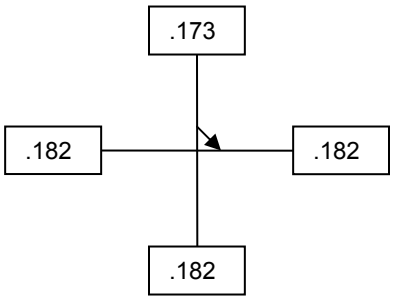


## Turbine thrust Bearing 3

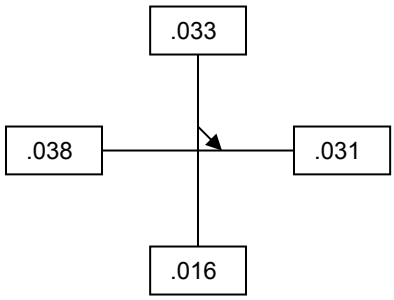
Mitchell Bearings Ltd.
Bearing No. 36187
Fore and aft clearance .025
Journal clearance .010

Bearing side clearances .006

Bearing clearance (lead wire) .015 to 017



Turbine end

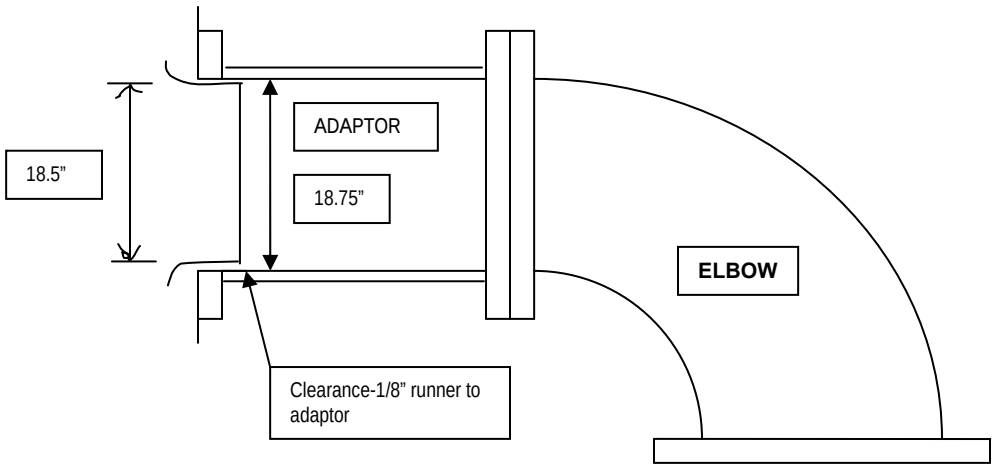


Clearances: journal bearing clearance .015 to 017
journal bearing side clearance .006
thrust bearing clearance .012

- The combination thrust journal bearing was completely removed, inspected, cleaned and reinstalled. The turbine side thrust collar is slightly grooved and the generator side collar is in good condition. The six lower pads on the turbine side are slightly scratched from the roughness of the ring.
- The lower generator side pads (4) are all in good condition. The bearing journal on the lower half is in good condition but the wear pattern is poor indicating contact on the sides at 45 degrees below split line.
- The upper half thrust journal bearing is in good condition. There is no evidence of the shaft hitting the top half so minor scraping and cleaning was only necessary. The six thrust pads on the turbine side are slightly rough while the 4 thrust pads on the generator side are in good condition.
- The turbine bearing cover and the center intermediate block had no dowel pins installed from previous overhauls. Considerable time was taken to set the upper bearing cap so the dowel pins could be installed. The left hand side dowel pin was installed without reaming the hole; however, the right hand side dowel pin hole had to reamed with a reamer before the dowel pin could be installed.
- Oil was drained, the sump was cleaned and new Terresso 46 was added.
- Bearing housing split line was sealed with Hylomar.

## Discharge Elbow and Adaptor

Clearance - runner to elbow adaptor



Clearance - runner to scroll cage wear rings

## Gaskets

| | As found gaskets | As left gaskets |
|---|---|---|
| Elbow to floor | 1 - rubber gasket 1 8 thick<br>1 - 1 16 garlock gasket | 1 - 1 8 rubber |
| Elbow to adaptor | 1 - 1 32 garlock gasket | 1 - 1 16 garlock gasket |

| | | |
|---|---|---|
| Runner casing to adaptor | 1 - 1 16 garlock gasket | 1 - 1 16 garlock gasket |

## Runner Wheel to Adaptor

The runner wheel wear ring, elbow adaptor and the discharge elbow are all in good condition. The runner wheel wear ring is 18 years old and shows no signs of wear. The draft tube below the discharge elbow, also, is in good condition.

## Runner Wheel Casing

The interior of the runner wheel casing is in good condition. The inlet screen was clean except for a few small branches caught in the screens. The gates are in good condition viewed through the small inspection holes in the casing.

The outboard casing wear ring is worn on the interior (next to the gates) and wear is estimated at least 3 16 to . The outboard casing wear ring as viewed from the discharge elbow is not worn and measured .033 on the right and .038 on the left side. The inboard casing wear ring could not be viewed or measured but it is assumed that it will be worn the same as the outboard wear ring.

## Runner Wheel

This runner wheel was installed new in 1989 and has erosion on the outlet vanes which has worn very thin and created holes in some vanes. Five out of the eleven vanes have holes varying from 1 8 to in diameter. Other areas where the vanes are eroded will soon have holes and pieces missing. This runner may have another year or two of operation before it should be replaced.

Runner Wheel Damage

1 vane in line with keyway

nominal thickness of vanes near inner rim is .150

Fish Lake 2

Runner Wheel

| Vane | Vane outlet thickness | Damage |
|---|---|---|
| 1 | .047 | |
| 2 | .068 | one hole in vane |
| 3 | .064 | |
| 4 | .089 | one hole in vane |
| 5 | .073 | |
| 6 | .093 | one hole in vane |
| 7 | .062 | two holes in vane |
| 8 | .075 | |
| 9 | .098 | |
| 10 | .072 | |
| 11 | .061 | one hole in vane |

## Generator and Exciter

The generator rotor and stator is still fairly clean after being rewound at the Standard Electric shop in 2000. The outboard slip ring had been damaged slightly by an excessively worn brush and this slip ring was stoned and polished before start-up.

The exciter was also last serviced in 2000 and is still fairly clean. Measurements were taken to install a new gear at the end of the shaft if the decision is made to provide overspeed protection.

## Gilkes Water Brake

The water brake was not dismantled and appears to work properly when slowing the unit down.

## Other Work Completed

- Replace 1 leather belt to upper governor drive.
- Remove 2 links off lower 3 belts driving governor gear pump.
- Clean strainer and replace cooling pipe with hydraulic hose to the governor.
- Clean strainer on supply pipe to turbine bearing housing.
- Drained oil from governor and added new Terresso 46 oil.
- Welded threadolet on penstock for installation of head pressure gauge.

## Past History

- New runner wheel and shaft installed in 1989.
- New turbine casing wear rings installed in 1989.
- Turbine bearing had some work done on it in 2000.
- Generator stator failed and was rewound in 2000.

**Start-up**

11:00 - 11:30 spin unit to synchronous speed
12:00 on line loaded to 150 kw

| | | | - - JOURNAL BEARINGS - - | | | | |
|---|---|---|---|---|---|---|---|
| Date | Time | Load | Turbine | Generator Inboard | Generator Outboard | Head Pressure | Turbine Casing Pressure |
| Sept 14 | 12:30 | 150 kw | 55 C | 52 C | 38 C | 83 psi | 81 psi |
| Sept 14 | 13:00 | 150 kw | 50 C | 53 C | 39 C | 84 psi | 81 psi |
| Sept 14 | 13:10 | 155 kw | 48 C | 55 C | 40 C | 84 psi | 81 psi |
| Sept 14 | 13:15 | Off line | | Install lower generator brushes | | | |
| Sept 14 | 17:00 | Unit put on line | | 200 kw | | | |
| Sept 15 | 11:30 | 200 kw | 45 C | 60 C | 45 C | 84 psi | 80 psi |
| Sept 17 | 15:00 | 200 kw | 45 C | 60 C | 45 C | 84 psi | 80 psi |

**Recommendations**

- Purchase and install a new vacuum gauge on the discharge elbow and adjust the vacuum to its' highest steady reading.
- Provide overspeed protection. A new gear should be installed on the exciter end c w mag pick-up and electrically connected to trip the generator breaker and slow the governor speed.
- Provide shutdown protection for high bearing temperature. Currently, RTD's are installed, alarm circuit is operational; however, the trip circuit is not connected.
- Order a new bronze runner wheel and shaft from Gilkes in England. Alternative to the bronze runner would be to supply it in stainless steel material. When the new runner is installed, the wear rings, gates, bushings, etc. would have to be checked over and new parts installed where required.
- To remove the turbine bearing 3 pedestal in the future, the center bearing pedestal has to be dowelled to the lower bearing pedestal. Currently, the dowel pins are missing between the center and lower pedestals.

**YUB-YECL-6**

**Reference:** Deferral Account; Application, page 3-2

**Quote**: These rates do not include any adjustment to the rates equal to the approved run out rate for non-governmental residential service for the hydro zone.

Overall line losses are determined based on a five year historical average of 6.2 .

**Preamble**: The Board wishes further information.

**Request:**

(a) Please provide a detailed explanation and example as to what is meant by the above quote, in particular the part of the phrase that refers to run out rate".

(b) Please provide a detailed explanation and a spreadsheet analysis complete with formulae and linkages that illustrate the determination of the five-year historical average of 6.2 line loss percentage shown on page 3-2.

(c) Please provide explanation and a spreadsheet analysis complete with formulae and linkages that determines the line loss percentages for each of the five years that make up the five-year historical average referred to in the above quote.

**Response:**

(a) Yukon Electrical's Application incorporates a forecast purchased power rate of 6.84 cents per kWh for power purchased from Yukon Energy as per the currently approved Wholesale Power Rate Schedule 42. The purchased power expense also reflects a flow through of Rider J collections through to Yukon Energy. Please refer to YUB-YECL-6(a) Attachment 1 for a copy of Rate Schedule 42 that details the 6.84 cents per kWh as well as a description of the Energy Reconciliation Adjustment.

The Energy Reconciliation Adjustment (ERA) refers to the wholesale rate charged from Yukon Energy to Yukon Electrical being periodically adjusted to reconcile actual wholesale purchases to test year forecast purchases. To the extent that actual wholesale purchases fall short or exceed forecast wholesale purchases, an adjustment to the Yukon Electrical bills will be made at a rate equal to the approved run out rate for non-government residential service for the Hydro zone. This rate has been set at 10.45 cents per kWh since the 1996 1997 GRA. Such adjustment for shortfalls in actual wholesale purchases will be limited to minus 10 of the forecast wholesale purchases in any period. In 1999, it was clarified the ERA mechanism would apply only during months when diesel was on the margin for the WAF system.

It is important to note the design of Rate Schedule 42 was done at a time when Yukon Electrical and Yukon Energy were jointly preparing and simultaneously filing their phase I and phase II applications. Diesel was also on the margin due to Yukon Energy's industrial sales to the Faro mine. Neither one of these two important factors is applicable for the 2008-2009 test period.

Yukon Electrical does not know whether diesel will be on the margin for the WAF system during the test period. Yukon Electrical also does not know whether Yukon Energy will interpret the currently worded rate Schedule 42 in a way that would result in the Yukon Energy charging or crediting Yukon Electrical 10.45 cents per kWh for actual wholesale purchases that fall short or exceed forecast wholesale purchases. Yukon Electrical anticipates these matters will be addressed as part of Yukon Energy's pending phase I and phase II applications. In the meantime, Yukon Electrical is requesting the continuation of a deferral account to flow through increases or decreases to purchased power rates.

(b) Please refer to the YUB-YECL-06(a) Attachment 1. The average calculation of 6.2 is shown. Please note that there was a keying error on Schedule 3.2 Line 7 for 2005 Hydro generation.

(c) Please refer to the YUB-YECL-06(a) Attachment 1. The line losses are calculated based upon the difference between actual sales and the total power generated and purchased. The purchased power and generated power are measured at source, before distribution. The amount of sales includes an estimate of unbilled usage at month end. Since electricity cannot be stored the

difference is the 'loss' of power. Yukon Electrical does not separate out Company used power and this is included in the line loss figure.

Note that in the revised GRA schedules submitted July, 4 2008, Schedule 3.1 Line 7, for the year 2005, there was keying error. Hydro generation was input as 6,239 MWh and should have been 6,858 MWh. This error did not have any effect on the five year average line loss percentage of 6.2 used in the test years. The Attachment shows the correct figure.

# RATE SCHEDULE - 42

# WHOLESALE PRIMARY

**AVAILABLE:** To The Yukon Electrical Company Limited.

**APPLICABLE:** For wholesale primary supply to The Yukon Electrical Company Limited.

**RATE:**

Energy Charge

All Energy consumed at 6.84 per kW.h

Energy Reconciliation Adjustment

Charges to YECL will be periodically adjusted to reconcile actual wholesale purchases to test year forecast purchases. To the extent that actual wholesale purchases fall short or exceed forecast wholesale purchases, an adjustment to the YECL bills will be made at a rate equal to the approved run out rate for non-government residential service for the Hydro zone. Such adjustment for shortfalls in actual wholesale purchases will be limited to minus 10 of the forecast wholesale purchases in any period.

**ELECTRIC SERVICE REGULATIONS:** The Company's Electric Service Regulations approved by the Yukon Utilities Board form part of this rate schedule and apply to the Company and every customer supplied with electric service by the Company in the Yukon and British Columbia. Copies of the Electric Service Regulations are available for inspection in the offices of the Company during normal working hours.

**Yukon Electrical - Purchased Power Sales**
**Line Loss Analysis (kW.h's)**

**YUB-YECL-7**

**Reference:** Diesel Fuel Costs; Application, page 4-2

**Issue Sub-Issue:** Forecasting Fuel Costs

**Quote**: Diesel fuel costs are a function of forecast sales, line losses, plant efficiencies. and delivered fuel prices.

**Preamble**: The Board wishes to understand the forecasting fuel costs process.

**Request:**

(a) Please provide process documentation as to how the fuel providers are chosen and contracts are awarded.

(b) Please provide the list of vendors who have supplied fuel to YECL for the period 1998 through 2007.

(c) With respect to YECL's diesel plants, please provide by community the size, type and make of diesel plant, as well as the age vintage of the plant.

(d) Please confirm that, in regard to Schedule 4.2, the values shown in Line No. 17 through 23, are calculated by dividing the Generation (MWh) per respective plant by the Litres Consumed (000s).

(e) It appears that for the forecast test period, the heat rates associated with YECL's generation plant are flat or worsening slightly. Please provide details as to the upgrades that YECL has planned, if any, in order to improve the efficiencies of its plant and at the same time lessen the impact of the costs associated with diesel generation on its customers.

(f) Please provide an explanation as to what Hydro grid standby diesel generation is as well as an explanation for the significant increase in Hydro grid standby diesel generation that was experienced in 2007 and is illustrated in Schedule 3.2, line No. 8.

(g) In light of current fuel economics that have been developing for some time, it appears that because of higher fuel costs, heating with electricity may be more

economical. Does YECL wish to update the diesel generation forecast illustrated in Schedule 3.2? Please provide an explanation in regard to the assumptions that underlie YECL diesel generation forecast wherein diesel generation is forecast to decrease by 1.5 and 6.6 in 2008 and 2009 respectively.

(h) Does YECL envision putting in place or has YECL put in place demand-side management programs that benefit its customers? If programs have been implemented, please describe the types of programs and successes that have arisen through their implementation.

(i) Has YECL considered other sources of power or the implementation of efficiency increases in respect of its generation plant and or loss reductions in its delivery of power?

(j) With respect to increased fuel costs associated with Pelly Crossing, the information shown on page 4-3 of the Application indicates a heat rate of 3.62 kWh per liter whereas Schedule 4.2 shows a heat rate of 3.71 kWh liter; please reconcile the differences.

**Response:**

(a) Yukon Electrical initiates a tender process where fuel providers are invited to submit proposals for the delivery of diesel fuel to Yukon Electrical generating plants. The proposals are reviewed and evaluated with the criteria being price, reliability, safety, reputation, responsiveness to Yukon Electrical, and flexibility. Please refer to YUB-YECL-07 (a) Attachment 1.

(b) Air North, Great Northern Oil, Husky Petroleum, Mackenzie Petroleum, North 60 Petro, Petro-Canada, Total Trac

(c) Please refer to YUB-YECL-07(c) Attachment 1

(d) This is confirmed.

(e) Yukon Electrical believes that the heat rates overall when looking at the average over the past 3 years is very flat and are not worsening . Heat rates do vary based on which units are running (when and for how long), how old the unit is and the type of unit.

Yukon Electrical has no particular upgrades planned that are being specifically undertaken to reduce the heat rates in the diesel communities however it does monitor heat rates by plant and anomalies are investigated if and when they occur. In addition when new engines are purchased heat rates are one of many considerations used in the purchasing decision.

(f) Standby diesel were called peaking units when the Faro mine was running. These units are now only used when grid power is not available (standby mode). In 2007 Yukon Electrical made a concerted effort to run each of it's plants at least once a month for 1hour. This is to help us ensure they are operationally ready if needed. This explains the one component of the increase fuel consumption, with the balance being due to loss of supply from the grid.

(g) Yukon Electrical does not wish to update the Schedule 3.2 generation forecast. Yukon Electrical remains of the view that it's sales forecast, line losses, and generator heat rates ie: the inputs that drive the diesel generation, are reasonable. The decrease in diesel generation is primarily driven by assumptions regarding Pelly Crossing cutover to the WAF grid in 2008. Please refer to YCS-YECL-09 below:

Although the cost of fuel has been significant over the past number of months there have been other factors that have provided a price signal to customers that would actually encourage customers to use less electricity, such as the loss of 50 of the Rate Stabilization Fund. Therefore Yukon Electrical has not seen a significant number of customers converting to Electric heat from fossil fuels. In fact the energy use per customer as shown in section 2 of Yukon Electrical's application demonstrates that energy usage has remained relatively flat for many years despite ever changing market conditions.

Yukon Electrical has also seen that several customers are converting to pellet stoves for heating which has little or no impact on electric usage. The cost for conversion to change heat sources can be significant for customers and there are those who still believe that fuel costs may actually go down in the near future.

Therefore based on a number of external factors it is not expected that the average use per customer will be impacted in any significant way in the test years and Yukon Electrical believes its sales forecast is reasonable.

(h) The following is the response provided to LE-YECL-16

Yukon Electrical has taken the approach that education and providing information to consumers is the practical and cost effective focus of its efforts regarding promoting efficiency and conservation in the communities it serves. Yukon Electrical makes available a variety of printed material to assist customers in energy planning. These include:

- Managing Electricity Costs
- Make Your Home Powersmart
- Guide to Conservation

These same publications are also available on Yukon Electrical's website.

Yukon Electrical works closely with the Energy Solution Center (ESC) in a number of ways including the following:

- Providing information and data that is helpful to ESC in developing there energy programs for Yukoners.
- Yukon Electrical includes bill inserts comprised of materials that ESC wants to get out to the public.
- Yukon Electrical refers its customers to the ESC for assistance with home audits etc.

Yukon Electrical also places ads in Yukon newspapers that provide conservation tips to customers.

Yukon Electrical proposes to update its energy management publications and information on its website and continue to make the information available to its customers throughout the test period. Yukon Electrical will also continue to work

with the ESC and the Government of the Yukon with respect to their various initiatives.

In terms of the programs success customers still seek out the information and appear to be appreciative of the response from Yukon Electrical and its staff.

(i) The following is the response provided to LE-YECL-14.

Yukon Electrical has been having discussions with some of its diesel served customers on exploring micro-hydro opportunities. In fact, Yukon Electrical has a confidential Memorandum of Understanding with one customer group on a micro hydro project. Initial data collection on water flows has been completed and the project will move to the next stage of pre-feasibility. In the past Yukon Electrical has worked with customers and their consultants regarding the incorporation of wind energy into the diesel production mix.

Yukon Electrical also monitors other jurisdictions such as the Northwest Territories to ascertain if there are alternate sources of generation for diesel communities. To date Yukon Electrical is not aware of any non grid connected generation alternative that has proven financially beneficial or that meets the reliability standards that are required in the jurisdictions it has looked at.

Yukon Electrical is participating in the development of a Yukon Government Energy Strategy and has provided input to government officials into its thoughts on how the strategy may best serve Yukoners.

Yukon Electrical participates in seminars, workshops and conferences when appropriate to learn more about technologies such as wind and solar and to determine if break throughs have been made that will allow for successful conversion of diesel communities.

In addition Yukon Electrical takes advantage of any grid extension that could remove customers from diesel onto hydro such as it is doing in Pelly Crossing.

Yukon Electrical has not included any costs in its revenue requirement for research and development looking at new technologies. Yukon Electrical will, however, continue to support worthwhile initiatives being pursued by qualified groups and lend its expertise as necessary. If there are viable solutions and

alternatives being put forward, Yukon Electrical is always prepared to review the information for applicability in serving its diesel communities.

In regard to line losses Yukon Electrical does consider line losses when it is undertaking work on the system. Specifically Yukon Electrical, based on a 2003 analysis, is using 1 0 conductor as a minimum on all 3 phase lines. In addition all transformers are purchased with line losses being considered in the overall life cycle cost analysis. The losses being experienced by Yukon Electrical are in line with the losses being experienced for similar systems in the Northwest Territories and on similar portions of the ATCO Electric system.

(j) The schedule 4.2, line 21, does show Pelly Crossing with a 3.62kWh Litre heat rate consistent with page 4-3 of the application. The 3.71 kWh litre is the overall average heat rate for all plants shown on schedule 4.1 line 2.

**ATTACHMENT 1A**

On behalf of Yukon Electrical Company Limited we have been requested to clarify an issue about fuel for Watson Lake, Yukon. We had requested P18 fuel be quoted for twelve months of the year, within our tender document, but have experienced in the past, an alternative product being supplied, other than what was requested. As such we need to know if your Company is quoting P18 during the November to April time frame or is P18 only being available May to October and the balance of the year being P40 or P50 product. Also indicate how YECL is to discern the type of product being received and when, if your product is coded and what the code for the product will be.

**RE: Quote F-1708, Fuel: Diesel (Generation) - YECL**

You are hereby requested to submit a proposal on the supply of diesel fuel for YUKON ELECTRICAL COMPANY LIMITED. (Further reference to this company shall be as the "Purchaser"). Proposals are to be submitted for the following requirements and include all costs to refine, transport, off-load and meter diesel fuel.

D.P.P. the Purchaser's storage tanks as specified for the various ATCO Group of Companies.

NOTE: ALL QUESTIONS TO BE FAXED INTO PATTY BIDLOCK AT (780) 420-7436.

**Contract Term**

The contract is for 1 (one) year, beginning October 1, 2008 thru September 30, 2009. Through successful negotiation, there may be an option to extend for a second and third year term. The contract may not exceed 3 years in total.

What benefit is there to the Yukon Electrical Company, to enter into a contract for a longer period of time, example: 2 or 3 years.

**Supply Option(s)**

- supply and delivery of diesel fuel to selected locations

Also, please include information or a proposal (if applicable) as to what type of firm price (hedging) options you may have to offer.

What is your minimum fuel requirement for Hedging Agreements? I

Each proposal shall include the following information:

- refinery locations and owner
- supply point to each storage location in Attachment E
- name of carrier who will transport diesel fuel to Purchaser

## Pricing

Prices are to be submitted on Attachment D, attached. For Attachment D prices net prices are to encompass all costs to refine, transport, off-load, meter required too supply diesel fuel, D.P.P. Purchaser's storage facilities.

Prices shall be provided in liters and segmented as follows:

- *crude cost*-price D.P.P. refinery
- *freight cost*-transportation price from refinery or distribution point to Purchaser's storage
- *net*-addition of two (2) factors above to arrive at Purchaser's final delivered price
- Supplier to specify if rack or crude price base is used.

Prices are to be submitted in Canadian funds, corrected to 15 degrees Celsius with all taxes listed extra. Yukon Electrical uses P18, 40 and 50 fuel and requires pricing for these blends.

Pricing should be based on current market conditions. Can pricing be locked in firm for 30 days? Y or N.

## Method of Price Change

Proposals shall be submitted based on prices effective October 1, 2008 and include method of recalculating subsequent changes. Proposals are to include an explanation of how prices are obtained, a method of substantiating changes and reporting changes to the Purchaser. Should prices change during the evaluation period, due to changes in crude, rack or exchange rates, Bidders shall provide to Purchaser a notification of such changes within one (1) day of change.

## Estimated Quantities

Quantities expressed on Attachment D are our best estimates of volumes to be taken during the Term of Contract. Nevertheless, any diesel fuel deliveries taken under contract shall be at Purchaser's absolute discretion and Purchaser shall not be obligated to purchase any specific or aggregate quantity, nor pay any specific or aggregate dollar amount. Purchaser's sole obligation with respect to quantity or expenditures shall be to pay for the fuel requested and received in satisfactory condition.

## Emergency Inventory of Fuel for Yukon Electrical

Successful bidder shall be required to continuously inventory sixty thousand (60,000) liters of seasonal fuel in Watson Lake and at no charge to Purchaser. Fuel shall be for the exclusive use of Purchaser and not stored at Purchasers site.

## Taxes

Purchaser certifies that the diesel fuel shall be used exclusively for the generation of electricity, lighting or heating or operation of microwave stations and is therefore exempt from Federal Excise Tax. Yukon Electrical shall be exempt from Yukon territorial taxes. Fuel for deliveries into British Columbia are subject to provincial fuel tax. Goods and Services Taxes are extra. All Fuel shall be marked.

**Site Conditions and Delivery**

It is the responsibility of each bidder to become familiar with the delivery site location and be suitably equipped for local conditions; including having the necessary spill kits.

Yukon Electrical fuel deliveries will be as requested or prescheduled during the Contract Term.

**Diesel Fuel Quality**

Fuel provided by Bidder shall be subject to random testing to ensure compliance with Purchaser's specification as outlined in Attachment A, B, and C. Bidder shall replace at no cost to Purchaser any diesel found not in accordance with specification.

Bidders shall submit on Attachment A, B, and C guaranteed product properties and characteristics for P18, P40 and P50 offered.

**Contract Terms and Conditions**

Attachment E contains the proposed Terms and Conditions of the Contract. Submit with proposals any exception or deviations to this document.

**Confidentiality of Pricing**

Prices submitted with proposals remain confidential and shall not be revealed to other bidders. The Yukon Utility Board may request price information which the Purchaser is obligated to provide. The information provided the Utility Board shall be those prices agreed in the contract between the Purchaser and successful Bidder.

**Submission of Proposals**

Pricing of all proposals must be submitted on Attachment D attached. All or any combination of options will be considered. A new schedule shall be submitted for each option and in the space provided refer to the type of option being submitted. (i.e. **Supply of all location based on average of previous months crude**).

Proposals shall be accepted for consideration up to and including bid closing **time** identified herein. **Late bids shall not be accepted.** Proposals shall be submitted in a sealed package, distinctly marked on the outside with reference number **F-1708**, to ATCO Electric Ltd., P.O. Box 2426, 15th Floor ATCO Centre, 10035 - 105 Street, Edmonton, AB, T5J 2V6. Proposals shall also be accepted via facsimile transmission to 780-420-7436, provided original documents, enclosures and attachments are received within two (2) working days of bid closing date or via email to (**Quotes atcoelectric.com)**. *Do not send completed documents to either S. Newman's or Buyer's email address*.

Proposals are to be received by Purchasing no later than **August 7, 2008** at **2:00 P.M.** Lowest or any proposal not necessarily accepted.

A copy of this quotation is available in an electronic format. Contact Janet Butler of ATCO Electric via email address janet.butler atcoelectric.com if a copy is required.

## FORM OF CONTRACT

BLANKET ORDER

For the supply of diesel fuel to the following locations as required. This order not to exceed _____dollars in total. Prices below based on starting date of _____.

| LOCATION | EST. USAGE / L | BASE PRICE OF FUEL | | | FIRM FREIGHT COST | FUEL SURCHARGE % | NET PRICE DELIVERED TO YECL |
|---|---|---|---|---|---|---|---|
| | | P18 | P40 | P50 | | | |
| BEAVER CREEK | x | | | | | | |
| DESTRUCTION BAY | x | | | | | | |
| HAINES JUNCTION | x | | | | | | |
| CARMACKS | x | | | | | | |
| PELLY CROSSING | x | | | | | | |
| ROSS RIVER | x | | | | | | |
| STEWART CROSSING | x | | | | | | |
| SWIFT RIVER | x | | | | | | |
| TESLIN | x | | | | | | |
| WATSON LAKE | x | | | | | | |

Supplementary Terms and Conditions

1. Term

1.1 This Blanket Order shall cover the period October 1, 2008to September 30, 2009 unless otherwise extended or terminated prior to scheduled expiry by actions of Purchaser or Supplier, and in accordance with the terms and conditions herein.

1.2 Any agreed extension(s) to the term of this Blanket Order shall be authorized by means of a written revision to this Blanket Order, or a replacement blanket order, at Purchaser's discretion.

1.3 Supplier guarantees supply of product in the event contract is assigned to a third party.

2. Estimated Quantities

2.1 Quantities or dollar values expressed herein or otherwise communicated in writing by Purchaser to Supplier represent Purchaser's best estimate of volumes to be taken or expenditures to be made under this Blanket Order. Nevertheless, any fuel deliveries under this Blanket Order shall be at Purchaser's absolute discretion and Purchaser shall not be obligates to purchase any specific or aggregate quantity, nor to pay any specific or aggregate dollar amount to Supplier.

2.2 Purchaser's sole obligation with respect to quantities or expenditures with Supplier shall be to pay for the fuel requested by Purchaser under this Blanket Order and received in satisfactory conditions under the terms of this Blanket Order.

3. Fuel Quality

3.1 Fuel provided by Supplier under this Blanket Order shall be subject to random testing to ensure compliance with Purchaser's Fuel Specification (Attachment A, B and C) Limited of Purchaser's Request for Proposal). Supplier shall replace at no cost to Purchaser any diesel found not in accordance with specification.

4. Authorization to Supply

4.1 Purchaser shall authorize shipment of fuel under this Blanket Order via telephone call from one of Purchaser's representatives to Supplier's agent at _____.

5. Shipment and Delivery

5.1 Purchaser shall instruct Supplier's representative as to when delivery of the fuel is to be made and the specific delivery location.

5.2 Supplier shall load fuel, seal discharge line, record serial number of seal and type of fuel being delivered on the delivery ticket prior to departure of delivery vehicle.

5.3 Purchaser's representative shall verify serial number of seal applied and recorded on the delivery ticket and witness removal of seal at time of delivery to Purchaser's location. Purchaser's representative shall verify via means of Purchaser's own metering devices or the delivery vehicle meters the quantity of fuel off loaded and confirm agreement with the delivery ticket or record the different quantity on the delivery ticket.

5.4 When delivery is specified for a location not attended by Purchaser's representative, Supplier shall ensure the delivery person separately records the quantity metered by the delivery vehicle as fuel is off loaded and records such quantity on the delivery ticket. Should supplier's delivery vehicle not be equipped with a metering device, delivery person shall record tank levels both prior to and after delivery on delivery ticket.

5.5 Supplier shall not fill tanks greater than ninety (90) percent of the nameplate capacity.

5.6 Any discrepancy between the quantity recorded at time of shipment and that noted by Purchaser's representative, or the delivery person in the Purchaser's representative absence, at time of delivery shall be subsequently resolved to the mutual satisfaction of Supplier and Purchaser, after determination as to the reason for such discrepancy.

5.7. Supplier shall be required at the point of delivery to have various fittings to hookup to Purchasers tanks.

5.8 Contractor shall not assign any obligation or benefit arising from the Contract without Purchasers prior consent. Contractor shall not, without the prior written approval of the Purchaser, assign or subcontract the supply and delivery of fuel or any portion of the supply and delivery of fuel. Contractor shall ensure all permitted Subcontractors agree to be bound by the provisions of this Contract Document with respect to the part of supply and delivery of fuel to be performed by them.

6. Pricing

6.1 Fuel prices shall be as specified herein. Purchaser shall receive written notice (attention: Shirley Newman) from Supplier of any subsequent (daily, weekly, monthly) changes.

6.2 Crude Cost adjustments shall be (daily, weekly, monthly). Supplier shall receive immediate notice if price increase is rejected.

6.3 Prices for freight and margins or overhead shall remain firm for the contract period.

6.4 In the case of rejection of a proposed price increase Supplier and Purchaser shall negotiate a mutually acceptable price increase and Supplier shall continue to supply fuel to Purchaser for a period of not less than thirty (30) days at the price then in effect.

6.5 Any negotiated price shall be retroactively applied to the implementation date originally proposed by Supplier by means of a separate billing for all fuel supplied at the previous price during the negotiation period.

6.6 Failure to negotiate a mutually acceptable price increase within thirty (30) days of rejection of proposed increase shall terminate this Blanket Order and any subsequent additional payment in lieu of price increase for fuel supplied during the negotiation period shall be at Purchaser's absolute discretion.

6.7 Prices and quantities shall be temperature corrected to 15 degrees Celsius.

7. Taxes

7.1 Purchaser is exempt from Federal Excise Tax and such tax shall be excluded from all prices and billing.

We certify that the fuel oil ordered hereby is for use by us exclusively in the generation of electricity or for lighting or heating purposes.

8. Billing

8.1 Supplier shall issue invoices to Purchaser for each shipment made and shall include reference to the delivery location, date of delivery, and this Blanket Order number. Temperature corrected quantity, price per liter, and the Goods and Services Tax shall be indicated separately.

9. Payment

9.1 Purchaser shall make payment to Supplier within thirty (30) days of satisfactory receipt of fuel, or receipt of satisfactory invoice; whichever shall be the later.

9.2 In case of discrepancy between the quantity recorded at time of shipment and that noted by Purchaser at time of delivery, payment shall be made for the lesser quantity within the prescribed time period and any subsequent payment with respect to such discrepancy shall be made within thirty (30) days of resolution to the mutual satisfaction of Supplier and Purchaser.

9.3 Supplier shall provide a current clearance letter fromWCB stating their current status.

10. Termination of Agreement

10.1 Purchaser shall have the right to terminate this Blanket Order at any time by reason of unsatisfactory performance of Supplier, as judged exclusively by Purchaser, or by reason of Supplier’s failure to meet the terms and conditions of this Blanket Order.

10.2 Supplier shall have the right to terminate this Blanket Order at any time by reason of Purchaser's failure to meet the terms and conditions of this Blanket Order.

11. Site Safety

11.1 The Purchaser shall provide the Supplier a Site Safety orientation prior to delivery of fuel to site with yearly reviews.

11.2 Supplier shall provide written proof that their delivery persons have completed WHMIS training and hold TDG certification.

11.3 Supplier shall ensure that prior to connecting the delivery hoses the Supplier’s vehicle shall be electrically bonded to the stations ground grid. Purchaser shall provide connection details for each site.

11.4 Where the Purchaser is of the view that the Supplier or an employee or agent of the Supplier is contravening any rule or regulation relating to safety (contained in either the rules and regulation provided by the Purchaser or legislation) the Purchaser's may give the Supplier written notice to take immediate corrective action and the Supplier shall forthwith take such steps as may be required to comply with such rules or regulation.

11.5 The Purchaser's shall have the right to exclude from the site any person who contravene rules and regulations relating to safety.

11.6 If providing fuel and delivery of same, requires the Contractor to perform services at the designated sites, Contractor shall inform all employees of all safety and environmental rules, regulations and practices in force on Site as provided by the Purchaser; including Purchaser's fitness for work program or Contractor's equivalent alcohol and drug policy if judged acceptable solely by the Purchaser. Fitness for work shall mean the ability to perform work safely and productively free from any physical or mental limitation due to the use of alcohol or drug, health problems, fatigue, illness or injury.

12. Fuel Spills

12.1 Supplier's employee shall immediately report any and all fuel spills, no matter what quatity to the Purchaser by contacting (867) 633-7000.

12.2 Prior to commencement of the contract the Supplier shall inspect and verify the condition of each delivery site. Supplier shall then be accountable not to degrade the site by way of fuel spills.

12.3 Supplier shall be responsible to remediate fuel spills due to their negligence and return site to the condition as it was prior to the spill.

12.4 Supplier shall be responsible for all litigation costs and fines resulting from fuel spills due to negligence on the part of the Supplier.

12.5 Supplier shall have access to Purchaser's spill response kits and shall immediately report the use and removal of material from the kit to the Purchaser's representatives listed in 12.1.

12.6 Supplier shall ensure the appropriate containment is used when connecting and disconnecting delivery hoses. (e.g.: 20 litre pail and absorbent material).

12.7 Supplier shall be in constant attendance and control when fuel is being transferred. Supplier shall monitor and inspect all storage and delivery components while fuel is being transferred. Transfer of fuel shall stop should the Supplier leave the immediate transfer and control area.

12.8 Supplier shall ensure all fuel product delivered by truck shall have a Spill Response Kit available.

In the event the Spill Kit is used, Purchaser's representative shall be notified as outlined in section 12.1.

13. Insurance

13.1 Unless otherwise specified by Owner, Contractor shall obtain comprehensive general liability insurance with a minimum bodily injury and property damage limit of two million dollars ($2,000,000) inclusive. Coverage shall include product and completed operations, Owner's and Contractor's protective liability, tortuous liability, blanket written contractual liability, contingent employer's liability, personal injury, cross liability, Owner and its employees and agents as additional named insurers, broad form property damage, occurrence property damage, forest fire and other fire suppression liability, loss of use without prior physical damage, underground property damage, attached machinery, co-owners and joint venture liability, sudden and accidental pollution liability and automobile liability insurance on all owned, non-owned or hired vehicles covering third party bodily injury, death and property damage, with a combined single limit of two million dollars ($2,000,000) per occurrence.

13.2 Supplier shall maintain Environmental Liability Insurance to a minimum of $1,000,000 during the contract. Confirmation of such insurance shall be provided to Purchaser prior to delivery of fuel.

13.3 Supplier shall maintain Forest Fire/Fire Suppression Insurance with a minimum of $2,000,000.00 during the contract term. Confirmation of such insurance shall be provided to Purchaser prior to the initial delivery of fuel.

14. Governing Laws

14.1 The laws of the province in which the Site is located shall govern contract and the parties hereby agree to the exclusive jurisdiction of the courts of such province or territory.

**YUB-YECL-8**

**Reference:** Labour Costs; Application, Section 5 Operations and Maintenance Expenses

**Issue Sub-Issue:** Labour Costs

**Request:**

(a) For the period 2003 through 2007, please provide a table, showing wage increases year-on-year for the YECL employee association groups compared to similar groups in its counterpart ATCO Electric.

(b) For the period 2003 through 2007, please provide a table illustrating labour inflation in respect of YECL, that compares YECL with Yukon, British Columbia and Alberta labour inflation indices.

(c) Please provide details in regard to the additional travel benefits due to commence in 2009 that YECL employees will be entitled to.

(d) Please provide a table illustrating YECL vacancy rates for the period 2003 through 2007.

(e) In consideration of the tight labour market south of 60 , please explain why a vacancy rate of 1 FTE is reasonable and attainable.

(f) Please provide a table illustrating non-labour inflation for the provinces of Alberta and British Columbia, as well as Yukon for the period 2002 to 2007.

(g) Please provide a schedule of retirements from 2005 to 2009 inclusive.

**Response:**

(a) Please refer to YUB-YECL-8(a) Attachment 1 for a spreadsheet with the negotiated increases of ATCO Electric and Yukon Electrical.

(b) The inflation rate is as follows:

| | BC | AB | Territories |
|---|---|---|---|
| 2003 | 1.3 | 3.0 | 2.5 |
| 2004 | -1.6 | 3.1 | 3.0 |
| 2005 | .5 | 3.0 | 3.0 |
| 2006 | 2.5 | 3.4 | 3.1 |
| 2007 | 3.0 | 4.9 | 3.0 |

The source of this information is from the Government of Canada Website Human Resources and Social development Canada.

The information above may not include market adjustments that may have been provided to employee positions that are extremely competitive in the labor market.

In addition to the above, the following is the information that is provided in LE-YECL-17:

> LE-YECL-17 Attachment 1 is a report from Alberta Finance and Enterprise that provides the information requested. It is important to note that the numbers reflected in the report do not necessarily show market adjustments that can occur to base salaries but rather it would show the economic increases that have been afforded to the various sectors in Alberta and Canada.
>
> In regard to labor inflation data from CEA for the electric utility sector Yukon Electrical was not able to locate such data. However LE-YECL-17 Attachment 2 is a CEA report on the labor market in the Electrical Utility sector. It serves as further information as to why labor cost increases are and will continue to be a likely reality in the industry.

In addition please refer to YUB-YECL-8(b) Attachment 1

(c) The travel benefits are embedded in the collective agreement between Yukon Electrical and the Yukon Electrical Employees Association for in scope positions and in policy for out of scope positions. At the present time each employee receives one flight out for themselves and each eligible dependant up to a maximum of 800.00 per person. There is also an amount that is identified in the collective agreement for the payment made to those employees who drive out rather than fly. There have been no adjustments to the travel benefits for employees in over 10 years.

Yukon Electrical looked at a number of possible options to enhance its benefits package for attraction and retention of employees before settling on an additional flight out. In its research it was obvious that employee compensation packages are varied and that employers consider them as competitively sensitive. However Yukon Electrical recognized that employees in the north generally appreciate assistance when flying or driving out of the territory due to the high cost of travel. Yukon Electrical also wanted to mirror the programs that are in place in the Northwest Territories and northern Alberta through its sister and parent company.

(d) Vacancy rates are calculated based on an approved compliment for FTEs. As such vacancy rates are not applicable given that there were no Board approved FTEs for this period.

(e) Although it is a tight labor market, based on the programs that Yukon Electrical has put into place in recent months the vacancies have been reduced substantially. Yukon Electrical has also begun an apprentice lineman and Field Service Representative program which it is also confident will stabilize its workforce. At the present time Yukon Electrical has only two journeyman lineman vacancies, (one being filled by the end of August) indicating that its approach is helping.

The program enhancements that Yukon Electrical has added are a Community Skills Premium similar to the program implemented by its parent company ATCO Electric and the Northland Companies. This program provides a payment to attract and retain key trades people to northern communities.

In addition, as stated above, Yukon Electrical proposes to enhance its northern benefit package to include one additional flight out for employees and their families. This is also in an effort to match similar benefits in the Northwest Territories and northern Alberta communities as well as some Yukon companies that compete with Yukon Electrical for resources.

There have been no improvements to the northern benefit package in Yukon Electrical for over 10 years.

Carrying an involuntary number of vacancies over the past several years, particularly in key trade positions, has put a burden and strain on the employees who are asked to get the required work completed. Extended on-call responsibilities and a negative impact on quality of life has forced Yukon Electrical to improve its recruiting methods and compensation packages. Part of this means providing overlap where possible for positions prior to an employee leaving to another job or retiring. This change in managing recruitment also places downward pressure on vacancy rates.

These programs are some of the components that are required to attract and retain employees. Yukon Electrical has seen positive results and therefore believes that a 1 FTE vacancy rate is reasonable for the test period.

(f) Please refer to the following table:

**Consumer Price Index (CPI) All-items, 2002 100**

| | Alberta | | British Columbia | | Whitehorse | |
|---|---|---|---|---|---|---|
| | Index | Y-O-Y ( ) Change | Index | Y-O-Y ( ) Change | Index | Y-O-Y ( ) Change |
| 2002 | 100.0 | *3.4* | 100.0 | *2.4* | 100.0 | *0.7* |
| 2003 | 104.4 | *4.4* | 102.2 | *2.2* | 101.9 | *1.9* |
| 2004 | 105.9 | *1.4* | 104.2 | *2.0* | 103.0 | *1.1* |
| 2005 | 108.1 | *2.1* | 106.3 | *2.0* | 105.3 | *2.2* |
| 2006 | 112.3 | *3.9* | 108.1 | *1.7* | 106.8 | *1.4* |
| 2007 | 117.9 | *5.0* | 110.0 | *1.8* | 109.5 | *2.5* |

(g)

| YEAR | ELIGIBLE RETIREMENTS YECL |
|---|---|
| 2005 | 3 |
| 2006 | 0 |
| 2007 | 1 |
| 2008 | 0 |
| 2009 | 1 |

In addition to the above, it is an important to understand that ATCO Electric has approximately 346 employees who are eligible for retirements over the next 10 years. In fact, the ATCO Group has approximately 1,000 employees eligible for retirement over the same time period. This will create a number of promotion and career opportunities for Yukon Electrical employees and it will be increasingly difficult to attract and retain employees necessary to deliver safe, reliable and cost effective service to Yukon customers.

| Year | ATCO Electric Increases | YECL Increases |
|---|---|---|
| 2003 | 3.25% | 3.5% & 4.25% (see note 4) |
| 2004 | 3.25% | 3.25% |

| 2009 | 5.5% & 5.25% (see note 3) | |

**Note 1:** 3 yr. collective agreement, 2005-07; 2.5 clerical for all 3 years; All other job classes - 2005 - 3.5 , 2006 - 3.0 & 2007 - 3.25 .

**Note 2:** 2 yr. collective agreement, 2008-09; 2008 - 2 - 3 competitive adjustment for select operational field support (meter and comm. techs, mechanics, maintenance techs.) plus a 5.25 economic increase.
2008 - 7 competitive adjustment for power lineman journeymen, electrical technologists and system control centre operators plus a 5.25 economic increase.
2008 - 5.5 increase for all clerical jobs.

**Note 3:** 2009 - 5.5 increase for all clerical jobs and 5.25 increase for all other job classes.

**Note 4:** 2 yr. collective agreement, 2002-03; 2002 - 3 alignment increase for tech., trades and clerical; plus 3 across the board increase to all wage schedules.
2003 - 4.25 for line and techs. and 3.5 for all other job classes.

**Note 5:** 2 yr. collective agreement, 2007-08; 2007 - 4.75 for tech. and trades (linemen, technologists, plant maintenance and plant operators). All other job classes - 3.5 .
2008 - 4.5 for tech. and trades and 3.5 for all other job classes.

# ADDRESSING THE HUMAN RESOURCE CHALLENGE IN THE ELECTRICITY INDUSTRY

Brief prepared by the Human Resource Committee
of the Canadian Electricity Association

**February 2007**

Canadian Electricity Association canadienne de l'électricité

The voice of Canadian Electricity. La voix de l'électricité canadienne.

**Canadian Electricity Association**
**Association canadienne de l'électricité**
www.canelect.ca

## Executive Summary

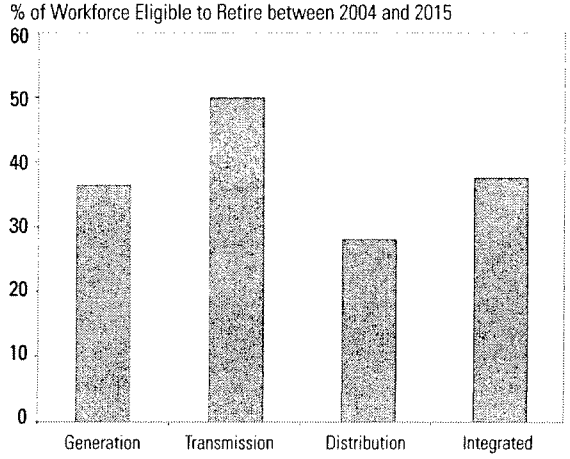
A safe, secure, reliable, sustainable and competitively priced supply of electricity is essential to Canada's prosperity. As the critical enabler of the economy and an enhanced quality of life, a strong electricity industry is fundamental to realizing our potential as individuals, as communities and as a nation. Investing in our electricity supply is tantamount to investing in Canada's present and future success.

While the electricity industry consists of a vast infrastructure representing generation, transmission and distribution, at the root of this complex and expansive system is a labour force that is facing significant challenges in the years ahead. An aging workforce and pending retirements in the short and mid-term could have devastating impacts on an industry already challenged by increasing demand, technological change and regulatory instability.

According to the Canadian Electricity Human Resource Sector Study commissioned by the Canadian Electricity Association (CEA) in 2004, almost 40 percent of the electricity sector's non-support staff will be eligible to retire by 2014. A shortage of skilled labour could compromise the electricity sector in a number of ways including reduced reliability, increased cost of production, infrastructure projects delays, and decreased safety and productivity due to less experienced employees and worker shortages.

In this brief, CEA has developed a series of recommendations that provide concrete solutions to addressing the electricity industry's workforce challenges. The Association strongly believes a collaborative effort between the industry and the federal government in three focus areas will secure a strong future for the electricity workforce:

1. We must build our Canadian skills base by investing in education, skills training and apprenticeships, particularly in underrepresented communities.
2. We must ensure trained, skilled workers are able to work and flourish in their area of expertise by streamlining certification and credential recognition, and facilitating workforce mobility.
3. We must attract and retain skilled foreign workers by ensuring successful community and workplace integration.



In its economic plan entitled *Advantage Canada*, the federal government acknowledges that people are "the most critical contributor to the national economy over the long term" and recognizes its role in helping individuals and industries reach their full potential *(p. 13)*. The electricity industry is encouraged by the government's intention of investing in Canada's talent pool. It is therefore CEA's intention to assist the government in this effort through the recommendations in this brief.

## I Introduction

For over 125 years, the electricity industry has powered Canada's economy and way of life, and has provided the foundation for our country's growth and prosperity. Ensuring an adequate, skilled and internationally-competitive workforce for the electricity industry is critical to our economic prosperity and quality of life.

The electricity industry currently employs 98,000 people. According to the *Canadian Electricity Human Resource Sector Study* commissioned by the Canadian Electricity Association (CEA) in 2004, almost 40 percent of the electricity sector's non-support staff will be eligible to retire by 2014 *(figure 1)*. Retirements estimates show that the sector will need more than 17,000 people in technical positions in the next 8 years *(Figure 1)*.

***Figure1: A Human Resource Challenge: Eligibility to Retire between 2004 and 2015***

Source: 2004 Canadian Electricity Human Resources Sector Study

Training requirements are also posing a new set of challenges to the industry. The evolution of technologies in the electricity sector is constant with developments such as increased distributed generation, and the introduction of SCADA systems and "green" technologies. These new technologies have created the need for new training and skills development, and "re-skilling" of the existing and future labour force.

In this brief, the CEA has set out to inform the federal government on how the current crisis facing the electricity industry is of critical importance to all Canadians. More importantly, CEA has provided recommendations on how industry and government can work together to ensure a strong electricity future for Canada.

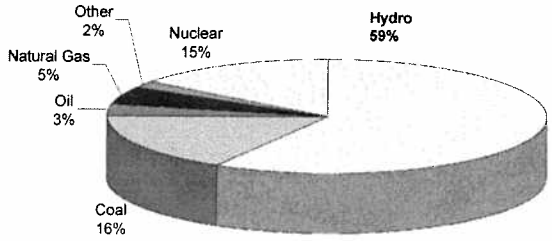
## II Canada's Electricity Industry

Built with vision, innovation and intent, Canada's electricity system distinguishes itself on an international scale. Ranked fifth globally in total electricity generating capacity and production, Canada also has one of the cleanest electricity generation portfolios in the world. Canada is also recognized for its technological innovations in long-distance electric power transmission, in particular in High Voltage Direct Current (HVDC) transmission systems. It is also a world leader in the deployment of advanced distribution technologies. For example Ontario utilities will install 4.5 million smart meters by 2010.

Canada's electricity industry provides an essential service with far-reaching and immediate impact. It underpins and enables growth in other sectors of the economy and contributes significantly to Canada's export revenues. Twenty-four hours a day, 365 days of the year, Canadian utilities must match production from generating plants with customer demand at competitive prices, while maintaining system reliability, meeting environmental objectives, and fulfilling safety and human resource needs. The result is a highly developed system that optimizes generation, transmission and distribution technologies.

### i) Diversified Generation

Canada possesses a diverse generation portfolio, covering a range of mature and



emerging electricity-producing technologies *(Figure 2)*. Hydro power – of which Canada is the global leader – produces the largest share at close to 60% of electrical production, followed by fossil fuels (coal, natural gas and oil) at 28% and nuclear at 12%. Wind, bioenergy and other sources are now being considered as contributors to the overall generation mix, although when combined, represent only 2% of Canadian electricity production.

As jurisdictions look to reducing greenhouse gas and other air emissions, there exists significant potential for Canada to increase the use of hydro, nuclear and emerging renewable sources of power, while also being on the global cutting edge of innovations relating to thermal generation, such as clean coal technologies.

### ii) Rising Demand

In addition to being a world leader in electricity production, Canada is also one of its top consumers. In 2003, Canada used about 3.6% of total world consumption and about 12% of total North American consumption.

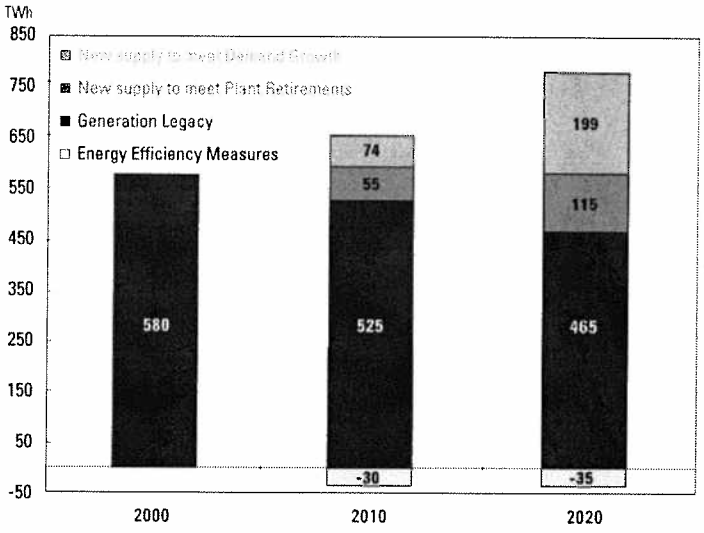


***Figure 1: Net Electricity Generation, 2004 Total = 577 TWh***

Source: Statistics Canada, Electric Power Generation, Transmission and Distribution, 2004 and Report on Energy Supply & Demand in Canada, 2004

The combination of increasing population, economic growth and greater use of electrical equipment means that electricity demand will continue to grow at an annual average rate of 1.5 to 2 percent. According to an average of two National Energy Board (NEB) scenarios produced in 2003, Canada's electricity supply will need to reach 814 TWh in 2020 from its current level of 594 TWh to meet requirements. CEA estimates that energy efficiency efforts could reduce future needed supply to 779 TWh. The increase in supply must also compensate for the anticipated retirement by 2020 of approximately 20 percent of facilities operating in 2000. Thus, an additional 314 TWh must be generated by 2020 to meet both system demand growth and plant replacement needs (Figure 2).

***Figure 2: CEA Generation Projection to 2020***

Source: CEA
Energy Efficiency Measures and New Supply to meet Plant Retirements calculated from average or MARKAL 2001, NRCAN 1999, and NEB 1999 models and New Supply to meet Demand Growth calculated from NEB 2003 Scenarios

A growing economy, rising population and the subsequent rise in electricity demand are creating a need to expand both traditional and new emerging technologies to meet rising demand.

### iii) Human Resource Implications

The impact of impending retirements, rising demand, the need to build new infrastructure and the introduction of new technologies are not without significant consequence to the Canadian electricity workforce. The strain posed by these factors on individual utilities and on the electricity system as a whole could diminish the industry's ability to deliver reliable, safe, sustainable and competitively priced electricity.

A shortage of properly trained and skilled labour could have serious repercussions for the electricity sector in a number of ways including:

- Reduced reliability;
- Increased cost of production;
- Infrastructure project delays;
- Decreased safety and productivity due to less experienced employees and worker shortages.

## III Addressing the Electricity Industry's Human Resource Challenge

CEA welcomes the government's commitment in *Advantage Canada* to support Canada's emergence as an energy superpower in part by making the needed investments in knowledge and people. Canada's energy sector is as much a knowledge industry as is the high tech sector. Trained and experienced workers are essential to ensure the long-term stability of Canada's electricity supply. Recognizing the significant human resource challenges facing the electricity sector, governments and industry must increase their efforts to build our Canadian skills base, ensure trained, skilled workers are able to work and flourish in their area of expertise, and attract and retain skilled foreign workers.

### i) Building a Canadian Skills Base

Growing Canada's domestic labour pool and tapping into our potential as a nation is an important element in addressing the electricity industry's workforce challenges. Increasing participation of under-represented groups, expanding and improving skills training and apprenticeship funding, and raising awareness on electricity-related career choices are critical factors in developing a skilled, educated and adaptable workforce.

**Engaging Non-Traditional Communities**

Increasing the engagement of the non-traditional workforce is an important step in building a dynamic and sustainable Canadian skills base. CEA is encouraged by the federal government's commitment to take action in this area by "eliminating barriers to labour force participation for under-represented groups" *(Advantage Canada, p.50)*

According to the *2004 Canadian Electricity Human Resource Sector Study,* women, visible minorities and Aboriginal workers are currently underrepresented in the electricity sector. Women account for only 25.4% of all electricity employees and 6.1% of trade staff, engineers and managers/supervisors, which is well below the national average where 46.9% of the total workforce is female.

Visible minorities also fare poorly representing only 7% of total electricity sector workers as compared to 12.6% nationally. This labour group is growing at a rapid pace and based on Conference Board of Canada estimates, could reach 18.4% of the labour force by 2016.

While the electricity industry can provide significant employment opportunities for Aboriginal workers in certain jurisdictions, this labour group represents only 2.2% of electricity industry workers, a slightly lower figure than the national average of 2.6% *(Statistics Canada Census).*

**Aboriginal Engagement**

As the development of electricity resources increases in areas with growing Aboriginal populations, there exists the potential for increased electricity sector and government collaboration to further engage Aboriginal communities. Utilities have already benefited

from Aboriginal partnerships established through the course of project development.

For example, the Hydro Northern Training and Employment Initiative was launched as a result of two proposed Manitoba Hydro hydroelectric projects in Northern Manitoba representing $4.0B in construction costs, 2,000 jobs, and is expected to contribute $2.0B to the national Gross Domestic Product. This Initiative is the first large-scale Aboriginal human resource strategy in northern Manitoba to be planned, designed and implemented by northern Aboriginal Partners. A $60.3M multi-year program receiving $22.0M from the federal government through the Aboriginal Skills and Employment Partnership, the Initiative is training and preparing over 1,000 Aboriginal residents for 800 Manitoba Hydro construction and related employment opportunities.

Another example of a pro-active industry-Aboriginal partnership is BC Hydro's Aboriginal Employment and Education Strategy, established as a long term approach to building internal awareness and conducting recruitment outreach with Aboriginal communities in British Columbia. The utility recently created the "trades trainee" role that now provides BC Hydro with an opportunity to work directly with Aboriginal and other youth who are who are inspired to compete in the next recruitment cycle. BC Hydro is also meeting with Aboriginal educational and employment groups across B.C. to develop partnerships to support students and develop regional training programs. Last summer First Nations students were hired as Youth Trades workers and received a half day of high school tutoring and then gained a half day work experience at a generation station. This initiative was widely supported by the school principal and the community.

The Hydro Northern Training and Employment Initiative and BC Hydro's Aboriginal Employment and Education Strategy clearly demonstrate the value for Aboriginal communities and for the electricity industry, of supporting comprehensive and consistent approaches to Aboriginal engagement and partnerships throughout the country. The federal government's role as a facilitator in fostering new partnerships between Aboriginal communities and the electricity sector is a significant contributor to success.
Recommendation: CEA encourages the federal government to support the creation of a national strategy to engage, support and train Aboriginal peoples in the electricity sector.

**Enhancing Apprenticeships and Skills Training**
By enhancing the quality, efficiency and availability of apprenticeships, skills training programs, student aid and scholarships, the federal government can assist in increasing the participation of all Canadians in the electricity workforce and meeting labour needs.

CEA welcomes the federal government's Apprenticeship Incentive Program announced in the 2006 Federal Budget which includes a tax credit for employers hiring an apprentice and the Apprenticeship Tax Grant. While these developments are steps in the right direction, they only apply to "Red Seal" trades, thus limiting their applicability in the electricity sector.

Recommendation: CEA calls on the federal government to expand the application of the tax credit for employers hiring an apprentice and the Apprenticeship Tax Grant included in the 2006 Federal Budget to reach a broader range of trades.

Apprentices are required to invest a significant amount of unpaid time and experience work interruptions during the term of their apprenticeship, which can last up to 5 years to complete. The concerns raised by the lost income can be a disincentive to potential apprentices, particularly for northern and Aboriginal students, and students from disadvantaged communities seeking pre-apprenticeship upgrading in order to qualify to apply for an apprenticeship. Depending on the type of apprenticeship and the jurisdiction in

which they live, some students may have to fund their own schooling and lose their qualification for Employment Insurance due to the timing or structuring of work placement hours. Such lost income can lead to lower participation and higher attrition rates. To ensure the successful completion of apprenticeship programs in order to develop a highly skilled Canadian workforce, the federal government must look at options to help defer the financial hardships faced by apprentices through changes to provisions in the Employment Insurance Act.

Recommendation: CEA encourages the federal government to modify provisions in the Employment Insurance Act that act as barriers to apprentices to earn income during the duration of the apprenticeship program.

### ii) Enabling Opportunity and Success

CEA shares the government of Canada's vision identified in *Advantage Canada* of creating opportunity and incentives for Canadians to succeed, excel and contribute to a strong and growing national economy. With the development of a new wave of infrastructure projects and the introduction of new technologies, the electricity industry is a significant contributor to Canada's *"Knowledge"* and *"Infrastructure" Advantage.*

However, the electricity sector's ability to meet the supply and demand challenge, build new infrastructure and integrate new technologies is dependant upon an adequate and skilled workforce. Trained and experienced workers are essential to ensure the long-term stability of Canada's electricity supply. Recognizing the significant human resource challenges facing the electricity sector, governments and industry must increase their efforts to address issues such as recruiting and retaining workers, facilitating school-to-work transitions and developing sector and career awareness strategies.

#### Raising Career Awareness

Increasing awareness of the career choices and opportunities available in the electricity sector is a critical factor in the industry's ability to attract Canadians in all communities and all jurisdictions. The federal government has an important role to play in improving labour market programming to help Canadians develop the skills they need and employers want.

Through its participation in the Electricity Sector Council, CEA is actively involved in efforts to increase career awareness in underrepresented communities as well as in the population at large. One such effort is the work currently underway to expand the reach of the successful "Trade Up" program developed jointly by Hydro One, Ontario Power Generation, Bruce Power and the Power Workers Union. Comprised of a comprehensive kit including a student guide, lesson plans, information on trades and hands-on learning activities, the "Trade Up" campaign promotes skilled trade careers in the electricity sector and encourages teachers, counselors, parents and students to consider apprenticeships as an option.

While the "Trade Up" program is a good example of a collaboration between industry and labour to raise career awareness in Ontario, campaigns such as this must be developed on a national scale and tailored to the needs and values of targeted communities.

Recommendation: In recognition of the critical role electricity plays in the economy and daily lives of Canadians, CEA calls on the federal government to provide financial support of Electricity Sector Council Program initiatives aimed at increasing career awareness in the electricity sector.

#### Occupational Standards and Certification Recognition

Currently, the standards defining trades and occupations within the electricity industry are not evenly recognized throughout the country. Differences regarding certification and the recognition of various positions in the sector, as well as non uniform trade names and job

descriptions act as barriers to workforce mobility within Canada and impede effective comparative work to support best practices in human resources management.

In *Advantage Canada*, the government of Canada has identified "facilitating workforce mobility" (p. 48) as a priority. CEA believes support of national occupational standards for the electricity sector is an important step in removing mobility barriers and improving opportunities.

CEA is encouraged by the federal government's support of the Electricity Sector Council's occupational standard project and encourages the government to continue its support in this area.

Recommendation: CEA calls on the federal government to maintain support to the Electricity Sector Council for the establishment of national occupational standards for the electricity industry.

**Ensuring a Workforce Aligned with the Needs of the Economy**

The capacity to accurately forecast labour market demand and workforce supply is a critical factor in the ability of all industries to respond to the needs of Canada's economy. Labour market information is particularly germane to the electricity sector which faces a host of adjustments in the coming years including pending retirements, rising demand, increased energy conservation, the introduction of new technologies and increased environmental regulation.

In this changing market environment, there is clearly a need for the government of Canada to work with the provinces, territories and the private sector to ensure training and skills development in the electricity sector are aligned with the needs of the economy. This will require governments to enhance labour market information available to Canadians.

As a first step, we commend the federal government's support of the Electricity Sector Council's *Electricity Industry Labour Market Information System* (LMIS) project. Through a three-year phased approach, this multi-layered project will conduct an industry level labour market assessment with sufficient specificity to measure and forecast current and future need for diverse groups and key occupations.

Through the continued support of initiatives such as the Electricity Sector Council's LMIS project, the federal government can help the electricity industry plan its workforce, analyze its needs, identify training requirements and mitigate business risk related to human capitol management. The resulting operational system will better equip the electricity industry to adjust and align its labour practices to support a thriving Canadian economy.

Recommendation: CEA encourages the federal government to continue to support initiatives to assist the electricity industry analyze and plan its workforce, identify training requirements, and mitigate business risk related to human capital management.

### iii) Attracting and Retaining Foreign Workers

In *Advantage Canada*, the federal government recognizes that slowing labour force growth and emerging skills shortage have created the need to introduce more workers into the labour force *(p. 49)*. Canadian utilities are increasingly turning to internationally trained workers to broaden their candidate pool and are developing programs to ensure their successful integration. For instance, BC Hydro actively recruits internationally trained professionals (ITP) in B.C. and supports these new hires in a number of ways including: creating intermediate opportunities that help ITPs gain Canadian experience; encouraging structured development plans (i.e. with formal mentoring); and linking ITPs with an internal support group

and other resources such as HR providers and the Hydro Employee Multicultural Society.

Attracting skilled workers to Canada is critical in addressing the electricity sector's human resource needs. Moreover, the federal government must examine ways to make it easier for foreign students and temporary workers to stay in Canada. Current barriers impeding foreign-trained workers from entering the workforce include inhibitive security clearances and visa restrictions, particularly in the areas of transmission and generation, and foreign credential recognition. Other obstacles include: poor advanced preparation prior to immigration; requirements for Canadian work experience; lack of recognition of prior work experience and qualifications, and lack of relevant language skills.

**Support for Qualification Programs**
Recognizing the contribution of foreign-trained workers to filling the labour gap in the electricity industry, Manitoba Hydro has been actively involved with the Internationally-Educated Engineers Qualification (IEEQ) Program at the University of Manitoba. This innovative program provides immigrants with engineering credentials obtained outside of Canada to meet part of the licensing requirements for professional engineering practice in Manitoba. This year, the IEEQ Team at Manitoba Hydro developed formal employment systems including bursary supports (two $1500 bursaries), up to six co-op opportunities and a career development program that supports one full-time opportunity per year. The team also actively promotes IEEQ graduates to line management for consideration for current complement vacancies.

The IEEQ model shows tremendous potential for assisting foreign-trained engineers and other workers on a national scale. By broadening the educational scope and expanding models such as IEEQ nationwide, the successful integration of immigrants in the electricity sector labour force would be significantly improved and employer needs would be better met.

Recommendation: CEA encourages the federal government to support the establishment of internationally-educated qualification programs in educational institutions throughout the country.

**Foreign Credential Recognition**
HRSDC's Foreign Credential Recognition program is an important component of the Internationally Trained Worker Initiative and should be enhanced to ensure processes are fair, appropriate and consistent. Of particular interest to the electricity industry is the continued support of programs such as the Canadian Council of Professional Engineers's initiative to develop and implement an action plan to more quickly and efficiently integrate international engineering graduates into the Canadian labour market.

Greater funding in the field of immigrant labour market integration is also needed to accelerate and improve foreign credentials evaluation in the country of origin, and improve linkages between stakeholders and jurisdictions.

Recommendation: CEA calls on the federal government to support the establishment of a comprehensive pre-qualification process for foreign-trained workers in their country of origin. This could be achieved through the development of a process based on the existing accreditation infrastructure developed by various unions in the electricity industry.

Recommendation: CEA calls on the federal government to examine ways to make it easier for foreign students and temporary workers to stay in Canada.

**Easing Visa Restrictions**
CEA believes that Citizenship and Immigration Canada should increase efforts to attract skilled workers to Canada through focused initiatives such as easing visa restrictions for low risk applicants who have a strong interest in work opportunities in Canadian trades.

Recommendation:
CEA encourages the federal government to increase efforts to attract skilled workers through easing visa restrictions for low risk applicants where there is a strong interest in work opportunities in Canadian trades.

**The Immigration Point System**
The Immigration Point System should also be better aligned with Canadian labour market information and should be amended to recognize the value of trade workers. The need for, and value of skilled trades people must be reflected in Canada's immigration system.

Recommendation: CEA calls on the federal government to better align the Immigration Point System with Canadian labour market information, and to recognize the value of trade workers within the Point System.

**Bridge to Work**
Enhanced funding is required for a national Bridge to Work program that can provide consistent, Canada-wide support to foreign trained workers, from pre-employment to successful workplace integration. Initiatives providing comprehensive career information aimed at foreign trained workers need to be encouraged and supported so that such workers understand the processes involved in order to successfully work in Canada in their field of choice.

Recommendation: CEA encourages the federal government to establish a comprehensive national Bridge to Work program to support foreign trained workers, from pre-employment to successful workplace integration.

## IV Conclusion

The electricity industry could face serious workforce challenges in the coming years and now is the time for industry and government to find solutions. CEA strongly believes the federal government has a leadership role in ensuring our electricity supply is in the hands of a skilled, adequate and internationally-competitive workforce.

In this brief CEA has explored various avenues where the electricity industry and the federal government, along with stakeholders and communities, can change the course of a potential labour shortage. Through its recommendations, the Association proposes a list of policy initiatives that will ensure the Canadian electricity industry can maintain and enhance its human and electricity potential.

CEA is prepared to develop detailed implementation plans and programs to operationalise any and all of the recommendations which HRSDC deems to be worth pursuing.

## Summary of Recommendations

### 1. Building a Canadian Skills Base

**Aboriginal Engagement**

- CEA encourages the federal government to support the creation of a comprehensive national strategy to engage, support and train Aboriginal peoples in the electricity sector.

**Enhancing Apprenticeships and Skills Training**

- CEA calls on the federal government to expand the application of the tax credit for employers hiring an apprentice and the Apprenticeship Tax Grant included in the 2006 Federal Budget to reach a broader range of trades.
- CEA encourages the federal government to modify provisions in the Employment Insurance Act that act as barriers to apprentices to earn income during the duration of the apprenticeship program.

### 2. Enabling Opportunity and Success

**Raising Career Awareness**

- In recognition of the critical role electricity plays in the economy and daily lives of Canadians, CEA calls on the federal government to provide financial support of Electricity Sector Council Program initiatives aimed at increasing career awareness in the electricity sector.

**Occupational Standards and Certification Recognition**

- CEA calls on the federal government to maintain support to the Electricity Sector Council for the establishment of national occupational standards for the electricity industry.

**Ensuring a Workforce Aligned with the Needs of the Economy**

- CEA encourages the federal government to continue to support initiatives to assist the electricity industry analyze and plan its workforce, identify training requirements, and mitigate business risk related to human capital management.

### 3. Attracting and Retaining Foreign Workers

**Support for Qualification Programs**

- CEA encourages the federal government to support the establishment of internationally-educated qualification programs in educational institutions throughout the country.

**Foreign Credential Recognition**

- CEA calls on the federal government to support the establishment of a comprehensive pre-qualification process for foreign-trained workers in their country of origin. This could be achieved through the development of a process based on the existing accreditation infrastructure developed by various unions in the electricity industry.
- CEA calls on the federal government to examine ways to make it easier for foreign students and temporary workers to stay in Canada.

**Easing Visa Restrictions**

- CEA encourages the federal government to increase efforts to attract skilled workers through easing visa restrictions for low-risk applicants where there is a strong interest in work opportunities in Canadian trades.

**The Immigration Point System**

- CEA calls on the federal government to better align the Immigration Point System with Canadian labour market information, and to recognize the value of trade workers within the Point System.

**Bridge to Work**

- CEA encourages the federal government to establish a comprehensive national Bridge to Work program to support foreign trained workers, from pre-employment to successful workplace integration.

**YUB-YECL-9**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 62600 Hydro Generation

**Quote**: Cost increase from 2005 to 2006 mainly due to a one-time catch-up of 1998 2006 water license fees. (Schedule 5.2, Line No. 5)

**Preamble**: The Board would like more detail.

**Request:**

(a) Please explain in respect of the cost increase from 2006 to 2007, what is meant by This increase is offset by a one-time catch-up in 2006 of 1998 to 2006 water license fees to the government ( 27) (Schedule 5.2, Line No. 8-9.)

(b) Please explain in respect of the cost increase from 2008 to 2009, what the additional inspections and type of inspections are to meet the requirements of the new water license.

**Response:**

(a) The Yukon Water Board advised Yukon Electrical in 2006, that due to a clerical error, Yukon Electrical had not been invoiced since 1998 for 2 water licenses. Correcting invoices from the Yukon Water Board were processed in 2006.

(b) The three year temporary water license renewal recommendations, as detailed in YUB-YECL-09 (b) Attachment 1 and the YUB-YECL-09 (b) Attachment 2-YESAB decision document 2007-0150. Based on the cumulative directives of these documents Yukon Electrical forecasts an increased focus on the operation of the Fish Lake Hydro facility. Some of the activities are listed below:

- Frequently inspect Louise Lake Containment dike year round.
- Install and monitor Piezometers at Louise Lake Dike.
- Investigate seepage near Ditch unit 1 overflow structure.

- Inspections of penstock unit 1 for corrosion.
- Inspect anchor points for penstock unit 1
- Inspect and clean spill basin at unit 2 head pond

It should be noted that there are a number of studies required as a condition of the relicensing process. However as a result of water flow and water level studies, the daily operating regime will change, requiring additional time.

# 1. Introduction

The Fish Lake Hydro development is located to the west of the city of Whitehorse, and includes the following components:

- Fish Lake control structure (including associated dikes)
- Control structures related to Jackson Creek interconnection
- Louise Lake Control structure
- Power Plant No. 1
- Power Plant No. 2

Earlier studies by Jacobson Engineering highlighted a number of concerns related to infrastructure containing the main reservoir for the development – Fish Lake. The report recommended that the main dike at the north end of the lake be upgraded (including upgrading of rip rap protection), and that an emergency spillway be constructed to minimize surcharge during the passage of large flood events. The purpose of the current study was to conduct a dam safety review of the major structures, with particular emphasis on the major water retaining structure formed by the Fish Lake control structures.

The safety assessment of a dam comprises an evaluation of the ability of a water retaining structure to withstand all forces that it could be expected to experience during its lifetime. For this purpose a number of criteria have been established to allow a systematic evaluation and classification of structures with respect to the potential failure risk it presents. These criteria have been derived from the most frequently observed types of dam failures and incorporate a classification system that addresses the following:

- hazard classification
- flood passage capability assessment
- dam break flooding assessment
- structural integrity and stability assessment.

The hazard classification of a dam is determined by the degree of exposure of developments located downstream of the dam, in terms of loss of life and flood damage in the event of dam failure. Based on this assessment an Incremental Hazard Potential (IHP) is determined and a corresponding Inflow Design Flood (IDF) is assigned. Incremental Hazard Potential is also referred to as Incremental Consequence Category (ICC). It must be reiterated that IHP is determined by the potential hazard that will occur in case of failure of the dam and not the magnitude of the flood event.

A spill structure is rated on the basis of its capacity and ability to respond to emergency flood conditions. These ratings are compared to the IHP and IDF requirements.

The objective of this review was to identify an appropriate hazard classification for each major water retaining component of the facility, and to assess any deficiencies related to the development's performance in passing the recommended Inflow Design Flood. The various minor components of the Fish Lake hydro development were also reviewed, but the review for these smaller structures was limited to a condition assessment similar to that performed in previous inspections. This report presents the results of this dam safety review.

## 2. General Description of the Fish Lake Hydro Facility

The Fish Lake hydro facility was built in 1948 with a Pelton impulse turbine/generator set (250kW) at Plant #1. In 1953 an additional Turgo Impulse turbine/generator set (700kW) was added to the extended Plant #1 building, and in the next year the Plant #2 with a Francis turbine/generator set (600kW) was also installed. Currently only the last two units are operational with a combined capacity of 1300 kW.

Layout of the Fish Lake hydro facility is shown on Figure 1. Spring and summer runoff from Fish Creek watershed is stored in Fish Lake - the primary storage reservoir, for winter release through a gated steel culvert. As the reservoir is getting full, part of inflow is released for summer generation. Fish Lake and the Plants #1 and #2 are interconnected by a combination of more than 6 miles of natural creek channels and manmade channels.

Part of the natural stream of Fish Creek, canal Ditch #3 and a concrete control structure connect Fish Lake with Louise Lake which serves as a secondary storage reservoir. Runoff from Bonus Creek is intercepted by a diversion dam and flow to Fish Creek to augment the flow volume.

From Louise Lake, water passes through another concrete control structure, canal Ditch #2, part of the Porter Creek and canal Ditch #1 to reach #1 Head Pond, where the concrete #1 Intake structure directed water into the #1 steel penstock that leads to #1 Power House. Only the newer second unit is operational in Plant #1. An overflow structure is located at upper end of Ditch #1.

A fish farming company – Icy Water Ltd. has added an intake structure at the north end of the Plant #1 discharge channel and diverts most of the tailwater for their operation. After going through the fish tanks, the diverted water is discharged back further downstream to West McIntyre Creek that leads to the #2 Head Pond. The remaining tailwater flows to the south and joins West McIntyre Creek. Water from Ditch #1 overflow structure and runoff not intercepted by the ditches are collected by Porter Creek where Icy Waters takes part of this water for their operation and discharges the water back to West McIntyre Creek further downstream.

A portion of West McIntyre Creek was blocked by a dam to form #2 Head Pond where #2 Intake structure and a spillway are located. #2 penstock is partly woodstave and partly steel. Tailwater from the unit in #2 Power House is discharged back to McIntyre Creek.

# 3. Project Hydrology

The purpose of the hydrologic analysis was to estimate peak flood flows and hydrographs for major flood events on the Fish Lake basin. The design flows were used for the flood routing and subsequent dam safety assessment analysis that is described later in Section 4. Since hydrological records at the dam are not complete, peak flows and hydrographs were estimated using regional statistical flood frequency analysis methods.

## 3.1 Climate

The Fish Lake basin is located in a sub arctic continental climate zone, and could be classified as semi-arid in nature. The climate is characterized by relatively large seasonal and daily fluctuations in temperature, and low to moderate precipitation amounts. Winters can be harsh and cold, and average annual snowfall within the basin is approximately 135 cm. Total rainfall in the basin averages approximately 155 mm, bringing the total annual average precipitation to approximately 265 mm.

As with any typical northern river system, streamflow within the basin is generated through the spring melt of winter snowpacks and rainfall which may occur during the spring, summer, and fall seasons.

## 3.2 Available Data

Data available for these hydrological studies consists of the following:

### 3.2.1 Meteorological Data

Although there are no precipitation stations located within the Fish Lake basin, a number of stations surround the basin, operated by the Meteorological Services of Canada (MSC). These stations are listed in Table 3.1 below.

**Table 3.1**
**Summary of MSC Meteorological Stations**

| Station | Years of Record | Average Annual Precipitation (mm) |
|---|---|---|
| Annie Lake Robinson | 1976 – 2002 | 236 |
| Carcross | 1907 – 2002 | 241 |
| Marsh Lake | 1994 – 2002 | 259 |
| Whitehorse A | 1942 – present | 265 |

### 3.2.2 Streamflow Data

Although daily water level records are available at the Fish Lake dam from 1996 onwards (shown in Figure 2), information on water releases through the structure was not available. Back calculation of the Fish Lake releases based on the available water level record would require continuous information on the gate setting for the control structure. Since this information was not available, it was necessary to construct flood inflow hydrographs based on the use of regional analysis techniques.

Historical discharge data was required for the regional flood assessment. Data was available for the Water Survey of Canada Gauging Stations listed in Table 3.2 below. The location of each of these stations is shown in Figure 3.

**Table 3.2**
**Summary of Water Survey of Canada Stations**

| Station | Years Available |
|---|---|
| Tagish Creek | 15 |
| Pine Creek | 15 |
| Watson River | 16 |
| M'Clintock River | 40 |
| Lubbock River | 40 |

## 3.3 Regional Flood Frequency Analysis

Historical records of Fish Lake flows are not available for use in determining flood frequency flows. For this reason a "regional flood frequency analysis" was required to estimate the Inflow Design Flood for the project.

In conducting a regional analysis, historical streamflow data which may exist for a number of gauged river basins in an area are used to establish an estimate of flood frequency for similar ungauged catchments. Typically a relationship will exist between drainage basin discharge or volume and drainage basin area for similar catchment types, and the purpose of this analysis was to estimate such a relationship for basins in this area.

Water Survey of Canada records were examined for stations which could be used in the analysis of Fish Lake flows. Five stations were identified in the immediate area which had suitable record length, and which displayed reasonably similar runoff characteristics. The drainage basins used in the regional analysis ranged in area from 57 $km^2$ to 1770 $km^2$. Table 3.3 lists the stations used for analysis.

**Table 3.3**
**Summary of Stations Used in Regional Analysis**

| No. | Station Description | Water Survey of Canada Gauge No. | Drainage Area ($km^2$) | Mean Annual Flow ($m^3/s$) |
|---|---|---|---|---|
| 1 | TAGISH CREEK | 09AA011 | 76.9 | 0.3 |
| 2 | PINE CREEK | 09AA008 | 697 | 5.1 |
| 3 | WATSON RIVER | 09AB009 | 1150 | 5.1 |
| 4 | M'CLINTOCK RIVER | 09AB008 | 1700 | 9.8 |
| 5 | LUBBOCK RIVER | 09AA007 | 1770 | 4.2 |

A volume based frequency analysis was conducted for each of the stations listed in Table 3.3. It was recognized early on that with the very large lake area associated with Fish Lake, it would be the volume of a potential flood event that would drive the most critical response on Fish Lake rather than the peak inflow rate. Furthermore, it was judged that critical flood events on the lake are likely the result of multiple events involving both snowmelt and rainfall, and that these events may be distributed over a significant time frame.

The procedures used in conducting the volume analysis were based on those recommended in USBR publication "Flood Hydrology". The basic steps undertaken consisted of the following.

- Each basin's flow records were analyzed to determine, for each water year, the flow volume observed for each open water season. For the purpose of this analysis, the open water season was defined as the period from May to October.
- Using the data generated in the above step, a statistical computer program was used to provide estimates of the annual flow volume over the summer period for the 1:2, 1:100 year, and 1:1000 year return periods.
- A logarithmic plot was then prepared for each return period comparing the open water flood volume with the drainage basin area of each gauge. An envelope line was then drawn on each plot, and this line was used to estimate flood potential for other catchment areas (e.g. Fish Lake). Figure 4 illustrates a sample plot prepared for the 100 year return period.
- The flood volume associated with each return period was then converted into a daily inflow hydrograph. This was done based on a review of watershed response observed at the Tagish Creek gauging station. The Tagish Creek gauge was selected as a proxy station for this analysis, since it is closest in size to that of Fish Creek, and it was judged that runoff patterns on the Fish Lake basin would be similar in nature. Therefore the historical flow record at Tagish Creek was reviewed, and three of the most severe runoff events were identified and plotted (see Figure 5). Of these three, the 1957 flow hydrograph was eventually selected as the critical runoff pattern to be used in transforming the summer flow volume for each event into daily flows. This was done by simply prorating the 1957 flow hydrograph until the May to October flow volume matched that of each of the 1:2, 1:100, and 1:1000 year flood volumes identified for the Fish Lake basin.

Figure 6 illustrates the final Fish Lake inflow hydrographs for the 1:2, 1:100, and 1:1000 year floods.

Estimates of peak flood inflow (due to local runoff) were also prepared for the Louise Lake dam, and also for the reservoir of Power plant No. 2. Potential flood flows for these smaller reservoirs were estimated taking into consideration the much smaller local drainage basin area associated with each, rainfall intensity curves for the area, the location of available overflow areas along the canal system into existing creeks and streams, and the properties of the local soils. Based on this analysis, it is estimated that peak inflows to the Louise Lake dam would be 4.1, and 10 $m^3/s$ respectively for the 1:2 and 1:100 year floods respectively. It is estimated that peak inflows to Headpond #2 would be 1.1, and 3.0 $m^3/s$ for the 1:2 and 1:100 year floods respectively. It should be noted that the above flows represent inflows in excess of the powerplant diversion flows which may be occurring at the time of the event.

# 4. Hazard Classification Assessment

The consequences of dam failure are assessed in terms of the incremental hazard posed by a dam structure, based on guidelines and procedures given in the Canadian Dam Association guidelines. The Hazard Potential Classification (HPC) can be defined as the potential for increase in loss of life, property damage, and disruption of social and economic activities caused by failure of the dam structure above that which would have occurred without failure of the dam.

The following steps were followed in establishing the Hazard Classification for the Fish Lake dam, the largest water retaining structure in the system:

- Development of a flood routing models
- Preliminary dambreak analysis and estimation of downstream impacts
- Selection of the consequence category.

Each of these is discussed in more detail below.

## 4.1 Development of Flood Routing Models

Two separate models were used in these analyses to i) assess the performance of the Fish Lake discharge facilities in passing a given flood event, and ii) roughly estimate the impacts should the dam ever fail. The two models selected and used were the:

- FLDRT Model. The FLDRT model is a proprietary Hatch program that is used to simulate the passage of a flood event through a specific development. Using supplied information on the inflow hydrograph, stage discharge hydrographs for all outlet structures (separate rating curves for each structure can be entered), and the stage storage relationship for the reservoir, the program will route a specific flood event through the system based on standard level pool routing techniques.
- HECRAS Hydrodynamic Program. The HECRAS model was set up and utilized to perform a simplified dambreak analysis in this study for the Fish Lake dam. This model is becoming an industry standard for performing such analyses, and contains many of the same features as it's predecessor, the National Weather Service dam break modeling program - DAMBRK. Given a set of user specified breach parameters for any structure, the model can be used to simulate the development of a breach in a dam, and then to route the resultant flood wave through a downstream reach. For Fish Lake, the model was setup to simulate passage of a dam break flood wave along a reach extending from the Fish Lake dam down to the Takhini River – the point at which it is estimated these breach flows would enter this much larger stream. Further details on the setup of the HECRAS model are provided in section 4.2 below.

Both models require the input of common key parameters, including the storage relationship of the upstream reservoir, and the discharge capacity of the dam's outlet facilities. The development of each of these is further discussed below.

### 4.1.1 Assessment of Discharge Capacity

**Fish Lake Dam**

The discharge facility at the Fish Lake dam consists of a single 0.86 m diameter gated culvert. This is the only formal discharge outlet for the lake. However, there is also a low section of the crest at the site of the access road to the to the east of the control structure. This low section is approximately 70 m in width, and would be the first section of the dam to overtop during a large flood event.

Discharge rating curves were derived for both the control structure and the dike overflow section. Available drawings, confirmed through site observations, were used to determine required parameters for this analysis.

The rating curve for the culvert control structure was developed based on standard culvert hydraulic theory, assuming it would act under inlet control. The invert for the culvert was estimated to be elev. 27.45 m (Local datum). The final rating curve for the outlet structure, assuming a fully open culvert, is shown in Figure 7.

Calculation of the flow over the dam crest at the overflow section was based on use of the general weir equation:

$$Q = CLH_e^{3/2}$$

Where,

C = discharge coefficient, based on weir shape
L = effective length of crest (m)
He = actual head being considered (m).

C was approximated to be a value of 1.6 (metric), and the weir was assigned a length of approximately 70 m based on recent crest surveys. The crest elevation of the overflow section was estimated to be elev. 30.75 m (local datum).

Figure 8 illustrates the discharge capacity of the overflow section. All numbers are with respect to local datum.

**Louise Lake Dam**

During times of flood, excess flow is released at Louise Lake through an emergency overflow spillway located on the west corner of the lake. The invert for this spillway is estimated to be at the Louise Lake FSL of 30.3 m, and the structure is 3.048 m wide. The spillway is capable of passing 3 $m^3/s$ with a 1 m surcharge to elev. 31.3 m, and 13.8 $m^3/s$ at incipient overtopping of the dam crest (estimated to be 32.3 m). This is close to the predicted inflow and no flood routing analyses were necessary.

**Headpond #2 Dam**

Spill flows at the Headpond #2 dam are released either through a 24 inch diameter low level outlet, or through an overflow spillway located along one bank of the reservoir. The overflow spillway consists of a 3.65 m wide chute, with an invert elevation of 796.44 m (0.6 m below the FSL elv. of 797.1 m). In the absence of flood, stoplogs are typically placed in the overflow structure to maintain the project FSL. It is estimated that the combined capacity of these two structures is approximately 5 $m^3/s$ at the project FSL assuming, the outlet is fully opened, and that all spillway stoplogs have been removed. With a 0.6 m surcharge, the combined capacity of the two outlets rises to 10.7 $m^3/s$. This is substantially larger than the predicted inflow and no flood routing analyses were necessary.

### 4.1.2 Stage/Storage Relationships

**Fish Lake**
At its normal supply level, the area of the Fish Lake reservoir is approximately 1386 ha. A stage storage curve was developed for the lake based on this estimate of lake area.

**Louise Lake**
At its normal supply level, the area of the Louise Lake reservoir is approximately 51.8 ha . The stage storage relationship for this lake was based on this lake area.

**Headpond No. 2**
At its normal supply level, the area of the Headpond #2 reservoir is approximately 4 ha. The stage storage relationship for this lake was based on this lake area.

## 4.2 Dambreak Analysis/Estimation of Impacts

**Fish Lake Dam**
To assist in assessing the potential damage which may result from a failure of the Fish Lake dam, a simplified dam break model was setup using the HEC-RAS hydrodynamic backwater model. The purpose of this analysis was to identify approximate flow and stage increases in the downstream channel should the dam fail. Storage information input to the model was based on the data summarized in section 4.1.2. Simplified cross sections were entered into the model to roughly represent the anticipated path of the flood flows in the downstream channel. It was judged that in the event of a breach, released flows would quickly exceed the capacity of Ditch 3, and would result in overtopping and breaching of the canal bank. The uncontrolled release would then return to the original watercourse of Fish Creek, would pass through Franklin Lake, into Jackson Creek, into the Ibex River, and would eventually discharge into the Takhini River some 35 km downstream of the Fish Lake dam. Figure 9 illustrates the expected path of the breach outflows. As a worst case scenario, it was assumed that a breach width of 15 m would form – this is roughly equivalent to 5 times the height of the dam at it's deepest point near to the control structure. Breach parameters were selected based on recommendations made by the Federal Energy and Regulatory Commission (FERC) in Table 1, Chapter II, of their 1993 publication. These guidelines suggest that the maximum breach width not exceed 5 times the breach height, that breach side slopes of 1H:1V be adopted, and that a formation time of 1 hour be utilized in the analysis.

The results of the analyses indicate flows as high as 190 $m^3/s$ may be released by the breaching dam into the downstream channel. Figure 10 illustrates the approximate discharge hydrograph immediately downstream of the dam site, and also for locations 8 km (approximate location of Franklin Lake) and 35 km downstream of the dam. As shown, because of the relatively steep nature of the downstream channel, and the large volume of water being supplied by Fish Lake, the peak does not attenuate appreciably in magnitude with distance downstream of the dam. This preliminary run indicates that initial stage increases may approach 2 m downstream of the dam, and that similar increases are possible at other downstream locations.

To assess potential loss of life should the dam fail, 1:50,000 scale topographic maps were studied to identify any susceptible development in downstream areas. The maps indicate that there is little development along the downstream water course that could be impacted. There are no permanent residences, and impacts would be limited to possible day users of Franklin Lake, or users of any trails located along the downstream water course. Based on the level of detail shown on the current mapping, it is not possible to tell how near to the stream these

trails are, but any users would have ample warning of the increasing flows, and would be able to stay clear of the stream during such an event. Therefore, the risk for loss of life to occur is considered to be low.

Recreational use of the upstream lake would be impacted, and there may be a short term impact on the lake fish population due to the uncontrolled lowering of lake levels. Economic losses would include property damage related to breach failure (the costs to rebuild the dam and canal itself), and the loss in generation incurred by the utility until the dam and canal can be rebuilt.

It should be noted that the above represents a worst case breach scenario. Should a breach occur during a major flood, it is more likely that the dam would breach along the roadway access section, where the dyke is shallow (approximately 1 m high). The crest elevation of this section of the dam is lower than other sections of the embankment, and would be the first to overtop. Should the breach occur here, uncontrolled outflows to downstream areas would be considerably smaller, and impacts would be reduced accordingly.

**Louise Lake Dam**

In the event that the main embankment at the Louise Lake dam were to breach, the reservoir would be released to flow through the spillway discharge channel, back towards Franklin Lake, into Jackson Creek, and from there would follow a path identical to that described above for the Fish Lake breach. Given the limited storage area of the reservoir however, breach flows would peak and quickly begin to dissipate as the overall head (and water volume) in the reservoir drops.

Although dambreak runs were not performed for this case, it is expected that the impacts on downstream areas would be significantly reduced from those described above for the Fish Lake breach. Breach flood flows would dissipate relatively quickly with time and distance downstream of the dam. Given the remote area of the site, it is expected that the potential for loss of life to occur would be low. Likewise, damage estimates would be limited to the costs to rebuild the dam, and any lost generation incurred by the utility until the dam can be rebuilt.

**Headpond #2 Dam**

In the event that the main embankment at the Headpond #2 dam were to breach, the reservoir would be released into a tributary to McIntyre Creek which would eventually join with the main stem of the creek approximately 500 m downstream of the dam. From this point, breach flows would follow the natural course of McIntyre Creek, and flow for a distance of 6 km before discharging into the Yukon River. Based on existing 1:50,000 scale mapping, and satellite imagery of the area, there is little permanent infrastructure downstream of the dam that would be impacted. Breach flows would cross the Alaska Highway approximately 2.5 km downstream of the dam, and may temporarily flood two secondary road crossings located near to the Yukon River (depending on the size of the roadway culverts). However, given the limited storage area of the reservoir, breach flows would peak and quickly begin to fade as the overall head (and water volume) in the reservoir drops.

Although dambreak runs were not performed for this case, it is expected that the impacts on downstream areas would be minimal. Breach flood flows would dissipate relatively quickly with time and distance downstream of the dam and it is expected that the potential for loss of life to occur would be low. Likewise, damage estimates would include costs to rebuild the dam, repair any damage to downstream streamflow crossings, and any lost generation incurred by the utility until the dam can be rebuilt.

## 4.3 Selection of Consequence Category

The consequence classification for the Fish Lake structures was selected based on the 2007 Dam Safety Guidelines, and the impacts of failure discussed in section 4.2. Table 4.1 summarizes the CDA selection criteria.

**Table 4.1**
**CDA Dam Classification Criteria**

| Dam Class | Population at Risk (note 1) | Incremental Losses | | |
|---|---|---|---|---|
| | | Loss of Life (note 2) | Environmental and Cultural Values | Infrastructure and Economics |
| Low | None | 0 | Minimal short term loss<br>No long term loss | Low economic losses; area contains limited infrastructure or services |
| Significant | Temporary | Unspecified | No significant loss or deterioration of fish or wildlife habitat<br><br>Loss of marginal habitat only<br>Restoration or compensation in kind highly possible | Losses to recreational facilities, seasonal workplaces, and infrequently used transportation routes |
| High | Permanent | 10 or fewer | Significant loss or deterioration of important fish or wildlife habitat<br><br>Restoration or compensation in kind highly possible | High economic losses affecting infrastructure, public transportation, and commercial facilities |
| Very High | Permanent | 100 or fewer | Significant loss or deterioration of critical fish or wildlife habitat<br><br>Restoration or compensation in kind possible but impractical | Very high economic losses affecting important infrastructure or services (e.g. highway, industrial facility, storage facilities for dangerous substances) |
| Extreme | Permanent | More than 100 | Major loss of critical fish or wildlife habitat<br><br>Restoration or compensation in kind impossible | Extreme losses affecting critical infrastructure or services (e.g. hospitals, major industrial complex, major storage facilities for dangerous substances) |

**Note 1**: Definitions for population at risk:

**None** – There is no identifiable population at risk, so there is no possibility of loss of life other than through unforeseeable misadventure

**Temporary** – People are only temporarily in the dam breach inundation zone (e.g. seasonal cottage use, passing through on transportation routes, participating in recreational activities)

**Permanent** – The population at risk is ordinarily located in the dam breach inundation zone (e.g. as permanent residents); three consequence classes (high, very high, and extreme) are proposed to allow for more detailed estimates of potential loss of life to assist in decision making if the appropriate analysis is carried out)

**Note 2.** Implication for loss of life:

> **Unspecified** – The appropriate level of safety required at a dam where people are temporarily at risk depends on the number of people, the exposure time, the nature of their activity, and other conditions. A higher class could be appropriate, depending on the requirements. However the design flood requirement, for example, might not be higher if the temporary population is not likely to be present during the flood season.

Based on a review of these criteria, it is recommended that the consequence classification for all of the Fish Lake structures (i.e. Fish Lake Dam, Louise Lake Dam, and Headpond #2) be selected as LOW. There is very little risk to loss of life should any of the structures fail, and third party economic losses would also be low. Although there may be some temporary loss of fish habitat, these structures would likely be rebuilt quickly, minimizing overall impacts on the upstream lake fishery.

# 5. IDF Selection and Review of IDF Passage

## 5.1 Inflow Design Flood Selection

The Inflow Design Flood (IDF) for the Fish Lake structures were selected based on recommendations contained in Table 6-1 of the 2007 CDA guidelines. This table's recommendations are reproduced in Table 5.1 below.

**Table 5.1**
**Recommended Inflow Design Flood (IDF)**

| Dam Classification | Recommended IDF |
|---|---|
| Low | 100 year flood |
| Significant | Between 100 and 1000 year flood |
| High | 1/3 between 1:1000 year flood and PMF |
| Very High | 2/3 between 1:1000 year flood and PMF |
| Extreme | PMF |

Based on the Hazard Classification selected for the Fish Lake structures (LOW), it is recommended that the 1:100 year flood be selected as the project's IDF.

## 5.2 Capability of Project to Pass Inflow Design Flood

**Fish Lake Dam**
The main structures of the Fish Lake Dam must be capable of safely passing an IDF equivalent to the 100 year flood event for the site. The recommended IDF hydrograph is summarized in Figure 11.

In routing the flood hydrograph through Fish Lake, the following operational assumptions were made:

- At the start of the flood event, it was assumed that the lake would initially be at an elevation of 29.5 m local datum. This represents a drawdown of approximately 0.5 m from FSL ( elev. 30 m). It was judged, based on a review of the hydrological response of gauged stations, that major flood events on these northern basins would involve both melt of the winter snowpack as well as spring or early summer rainfall. Therefore, the critical event would likely begin in the early spring – a time when the Fish Lake reservoir would be at it's lowest point in the annual cycle.
- It was assumed that Fish Lake outflows would initially be limited to a riparian flow release of 0.15 $m^3/s$. Local runoff between the Fish Lake site and the downstream powerplants would likely provide sufficient water for these units during the early part of the spring freshet, and therefore it was considered possible that flow releases would not be high initially.
- It was assumed that once the reservoir reached the FSL of 30.0 m, that the outlet control structure would be fully opened, releasing discharges approaching and eventually exceeding 2 $m^3/s$. We understand that a release of this magnitude may exceed the current capacity of the downstream diversion channel (Ditch #3). However, it was assumed that in such an emergency, the safety of the dam would take priority over that of the downstream canal.
- It was also assumed that a natural overflow area would continue be maintained at the location of the existing access road, to the east of the main dam. This overflow area would begin to be mobilized once the water level exceeded elev. 30.75 m.

Figure 12 illustrates the resulting inflow and outflow hydrograph for the Fish Lake Dam during passage of the IDF under this operational scenario. Figure 13 illustrates the resulting lake level. As shown, the peak water level reached on Fish Lake during passage of the IDF is elev. 30.74 m. The peak outflow from the lake is 2.4 $m^3/s$. It should be noted that all of this flow would be released from the outlet structure, and that although the water level would rise to the point of overtopping the overflow section, it would not actually flow over the crest of the dam at this location. Freeboard requirements for the dam during passage of the IDF are discussed in the following section.

**Louise Lake Dam**

The main structures at the Louise Lake dam must be capable of passing the 1:100 year flood event, which is estimated to have a peak inflow of 10 $m^3/s$. In passing this event, it is assumed that:

- Louise Lake would initially be at it's FSL of 30.3 m
- The settings of the control structure releasing water into Ditch no. 2 would be unchanged, and therefore releases through this structure would continue to equal the original inflow to the lake through Ditch 3.
- Inflows to Louise Lake through Ditch 3 would be limited to the overall canal capacity of Ditch 3, and may in fact drop to nothing if the canal bank were to breach in any area, or if the Ditch 3 control structure gate were used to control inflows.
- All water would be released through the emergency spillway overflow, or stored within the reservoir.

In assessing the capability of the Louise Lake structure to pass this event, it is noted that the capacity of the overflow structure is approximately 10 $m^3/s$ when the lake is surcharged to a level of 31.9 m. This would represent the maximum stage the lake may rise to, discounting any routing effects within the lake. Therefore it is a conservative estimate of surcharge and the existing outlet capacity is adequate.

**Headpond #2**

The main structures at Headpond #2 must be capable of passing the 1:100 year flood event, which is estimated to have a peak inflow of 3 $m^3/s$ (on top of initial diversion flows being passed through Ditch 2). In passing this event, it is assumed that:

- Headpond #2 would initially be at it's FSL of 797.05 m
- The low level outlet was operational and could be mobilized as required to pass these flood flows.
- Stoplogs could be removed from the emergency bypass spillway as required to mobilize capacity.
- Initial discharges to the Power plant through Ditch 2 would be near long term averages (approximately 1.1 $m^3/s$.
- Power plant 2 was not operating.

In assessing the capability of the Headpond #2 outlet facilities to pass this event, it is noted that the combined capacity of the outlet and emergency spillway is approximately 10.7 $m^3/s$ when the lake is surcharged by 0.6 m to a level of 797.65 m. This is far in excess of expected flood inflows. In fact, with everything operational, the structures can pass the flood event without surcharge above the FSL. If the stoplogs are not removed from the bypass spillway, surcharge on the upstream reservoir may reach 0.6 m above FSL (796.65 m).

## 5.3 Freeboard Analyses

Calculations were also undertaken to estimate freeboard allowances at the Fish Lake dam. These allowances have been estimated based on recommendations contained within the 2007 CDA guidelines. The CDA guidelines recommend that freeboard at a facility be sufficient to contain wind and wave effects on the upstream reservoir for the following two conditions:

- With the reservoir at its normal full supply level, any embankment crest elevation must be sufficiently high to prevent overtopping by 95 % of wind generated waves for a wind event with an Annual Exceedance Probability (AEP) of 1 in 1000 years
- With the reservoir at its maximum surcharge level during passage of the IDF (1:100 year flood for the Fish Lake Dam), any embankment crest elevations must be sufficiently high to prevent overtopping by 95 % of wind generated waves for a wind event with an AEP of between 1:2 and 1:100 years

Regarding the latter requirement, the CDA guidelines recommend adoption of a coincident 1:100 year wind during passage of the IDF for LOW consequence dams.

To assess freeboard requirements for the Fish Lake dam, hourly wind speed data was obtained for the Meteorological Services of Canada (MSC) station located at Whitehorse. This station is in close proximity to the Fish Lake Dam and therefore was used for estimates of wind speed. The AES program DSWind was used to process wind speed return periods. This was done by grouping the data according to direction and fitting it to a Gumbel distribution. The fitted model was then used to derive wind speeds for each return period of interest. The wind speeds used in this study were then increased according to standard procedures to reflect an "over water" condition.

Fetch lengths for the dam were estimated based on existing 1:50,000 topographic mapping of the reservoir. These estimates were made based on procedures recommended within the USACE Shore Protection Manual. Lake depths for Fish Lake were estimated using available bathymetric charts (See Figure 14). Due to the orientation of the reservoir, it was found that the critical wind direction for the Fish Lake Dam is from the South. The critical orientation for Louise Lake is from the North East, whereas the critical orientation for Headpond #2 is from the South West.

As shown in Figure 14, the reservoir depths within Fish Lake in the area immediately upstream of the dam are less than 5 m. This was confirmed during the recent site inspections and dike surveys. Observations gathered during these activities indicated the level of the approach to be approximately elev. 27.5 m in front of the control structure. In other more western sections of the dam, the apron is shallower as evidenced in Figure 15. The shallow nature of the approach in this area is demonstrated by the small shrubs seen growing within the reservoir some distance upstream of the dike. The water depth over the shelf fronting western sections of the dam was estimated to be approximately 1 m at the time of the inspection. The inspection was held on June 5th, and the water level on Fish Lake at that time was estimated to be 29.8 m (local datum). Therefore the invert elevation of the upstream apron is estimated to be approximately 28.8 m in these areas.

This shallow shelf can have a significant effect on wave runup, as it will cause larger waves to break prior to reaching the dike face. This will reduce the effective runup on the dike, as much of the wave's energy will be dissipated on this shallow foreshore prior to reaching the dike's side slope. Therefore runup was calculated for westernmost sections of the dam separately from those calculations undertaken for eastern sections:

- Eastern Sections - without the upstream apron. For these deeper regions, is was assumed that waves are able to propagate right up to the embankment slope before breaking.

- Western Sections - with the upstream apron. For western regions, it was assumed that the upstream apron extends upstream of the dam for a distance of 10 m, and is at elevation 28.8 m.

It was also assumed that in the absence of flood, the Fish Lake reservoir would normally be at or below elev. 30.0 m, and this level was adopted as the FSL for this analysis. In passing the IDF for this project, it is estimated that the reservoir could surcharge to elev. 30.74 m.

The upstream slope of each dike was set to 3H:1V based on proposed construction drawings. Figure 16 illustrates a typical cross section of the Fish Lake dyke as published earlier by Jacobson Engineering. Past surveys of the dike indicate the existing crest elevation varies along its length, from a high of 31.5 m near the center of the structure, to a low of 30.75 m near the east abutment.

The results of the analysis for Fish lake are summarized in Tables 5.2 and 5.3.

**Table 5.2**
**Summary of Freeboard Requirements – Extreme Wind**

| Condition | Reservoir Level (m) | Wind Event | Setup (m) | Runup (m) | Total (m) | Maximum Uprush Elev. (m) | Remaining Freeboard (Based on minimum crest elev. of 30.75 m) (m) |
|---|---|---|---|---|---|---|---|
| Eastern Areas Without Apron | 30.0 | 1:1000 yr | 0.04 | 0.69 | 0.73 | 30.73 | 0.02 |
| Western Areas With Apron | 30.0 | 1:1000 yr | 0.04 | 0.24 | 0.28 | 30.28 | 0.47 |

**Table 5.3**
**Summary of Freeboard Requirements – IDF Passage**

| Condition | Reservoir Level (m) | Wind Event | Setup (m) | Runup (m) | Total (m) | Maximum Uprush Elev. (m) | Remaining Freeboard (Based on minimum crest elev. of 30.75 m) (m) |
|---|---|---|---|---|---|---|---|
| Eastern Areas Without Apron | 30.74** | 1:100 yr | 0.03 | 0.58 | 0.61 | 31.35 | -0.60 |
| Western Areas With Apron | 30.74** | 1:100 yr | 0.03 | 0.58* | 0.61 | 31.35 | -0.60 |

* Waves do not break on the apron.
** Maximum water level during passage of IDF.

In reviewing these results, existing freeboard allowances appear to be sufficient under normal operating conditions, but may be deficient under flood passage conditions by up to 0.60 m.

The results of the analysis for Louise Lake are summarized in Tables 5.4.

**Table 5.4**
**Summary of Freeboard Requirements – Louise Lake**

| Condition | Reservoir Level (m) | Wind Event | Setup (m) | Runup (m) | Total (m) | Maximum Uprush Elev. (m) | Remaining Freeboard (Based on minimum crest elev. of 32.3 m) (m) |
|---|---|---|---|---|---|---|---|
| Normal Operating Condition | 30.3 | 1:1000 yr | 0.01 | 0.53 | 0.54 | 30.84 | 1.46 |
| IDF Passage | 31.9 | 1:100 yr | 0.00 | 0.44 | 0.44 | 32.34 | -0.04 |

In reviewing these results, existing freeboard allowances appear to be sufficient under normal operating conditions and under IDF passage.

The results of the analysis for the Headpond #2 Dam are summarized in Tables 5.5.

**Table 5.5**
**Summary of Freeboard Requirements – Headpond #2**

| Condition | Reservoir Level (m) | Wind Event | Setup (m) | Runup (m) | Total (m) | Maximum Uprush Elev. (m) | Remaining Freeboard (Based on minimum crest elev. of 797.97 m) (m) |
|---|---|---|---|---|---|---|---|
| Normal Operating Condition | 797.05 | 1:1000 yr | 0.00 | 0.16 | 0.16 | 797.21 | 0.76 |
| IDF Passage | 797.65 | 1:100 yr | 0.00 | 0.14 | 0.14 | 797.79 | 0.18 |

In reviewing these results, existing freeboard allowances appear to be sufficient under normal operating conditions and under IDF passage.

## 5.4 Recommended Full Supply Level

The currently proposed FSL for the Fish Lake reservoir is elev. 30 m (local datum). At this level, freeboard allowances on the existing structures are sufficient to contain wind and wave effects caused by a 1:1000 year wind event. However, in order to provide adequate protection during the passage of the project IDF, the dam crest must be raised by 0.6 m, to a level of approximately 31.4 m.

As a large flood event on Fish Lake is a relatively slow occurring event (over several weeks), we recommend a contingency plan to address the deficiency in freeboard on Fish Lake dam be developed by Yukon Electric Company Limited until the dam heightening is implemented. One possible alternative to consider is stockpiling sandbags which can be placed on the dam crest as required to maintain freeboard.

It should be noted that it would be possible to operate at a higher FSL, but this would require an additional increase in the dam crest elevation. For example, if the dam crest were raised to elev. 31.9 m, as proposed in the Jacobson engineering study, the FSL for the project could conceivably be raised by 0.5 m to elev. 30.5 m. The optimization of the FSL for the project is the subject of a second study currently being conducted by Hatch Energy.

# 6. Structure Inspections – Fish Lake to Plant #2

Lance Bendiak and Paul Oblander (Hatch Ltd.), accompanied by Brock Coulthard (Yukon Electrical Company Limited), inspected the Fish Lake Hydro Facility on June 5, 2007. The weather was dry and warm (about 10 to 15°C). The purpose of the inspection was to update the 2005 inspection report of the hydro facility structures as required by the Yukon Territory Water Board.

The 2005 inspection report has been used as a basis for this report. Prior to the site inspection an inspection of available drawings for the facilities were reviewed. Other detailed files were not reviewed.

Most of structures within the system appeared to be in good or reasonable operation condition. Due to a lack of original design and construction information, investigation and monitoring are recommended for certain structures; while maintenance is required on some specific structures. Please see detailed comments on individual structures below.

## 6.1 Fish Lake Dyke

### *6.1.1 General Description*

The dyke is about 600 m (2000 ft) long with a height between 1.8 m (6.1 ft) to 2.7 m (8.7 ft) above the foundation level, and the crest width varies between 2.5 m (8.2 ft) to 10 m (32.8 ft). The upstream side of the dyke has some angular riprap but is badly eroded by wave action and has resulted in a steep face; while the downstream side has an approximate slope of 2H:1V (See photos 1 to 4). We understand that planning and design for upgrading the dyke has been completed by YECL.

There is no drawing available showing original cross section and what the dyke was constructed of. Three boreholes drilled in January 2003, found the dyke material to be mainly angular to sub-angular gravely and sandy till with 15 to 20% of fines. The foundation materials are between sands and sandy gravely till with 18 to 35% fines. Bedrock was probably between 4.0 m (13 ft) to 5.5 m (18 ft) below base of the dyke. Based on the granular nature of the dyke fill and foundation materials, there is seepage of water during high water level, as exemplified by existence of the wet swamp area downstream from dyke toe and beyond. Insufficient freeboard was also an issue during high lake levels but this is addressed in the previous sections of this report.

Photo 1 – U/S Face of Dyke

Photo 2 - Riprap

Photo 3 – D/S of Dyke

Photo 4 – Dyke Crest

The lake water level is regulated by a gated 900 mm (36 in) corrugated steel culvert (about 14 m (46 ft) long and at 1.1% gradient) that is located at middle of the dyke. The dyke upstream face around the culvert is protected by stoned fill gabion mattresses. A removable trash screen and walkway are supported by a steel frame at upstream end of the culvert. A staff gauge attached to east leg of the steel frame is regularly used to monitor the lake level. The control gate is housed in a vertical corrugated steel shaft protected by an insulated steel box. Flow capacity of this culvert is discussed in previous sections of this report. The original 1950 regulating gate was a timber structure and it is not clear when this structure was replaced by the gated culvert. (See photos 5 and 6)

Photo 5 – U/S Gatewell

Photo 6 – D/S Gatewell

One of the 1950 drawings show there was an outlet at the west end of the dyke to spill excess inflow back to Fish Creek. This outlet can no longer be found. There are low areas at both ends of the dyke that serve as emergency spillways. These low areas are not protected for washout but should spilling occur would relatively safely release large floods downstream to Fish Creek.

### 6.1.2 Recommendation

It is recommended at the following be carried out:

a. Previously planned construction to add riprap, to increase width and height of the dyke and to add an emergency spillway should be updated and completed.
b. Inspect the gated culvert control structure for remaining service life and carry out replacement or life extension (corrosion protection) as required.
c. Extend the staff gauge to the new dyke crest level, and check the staff gauge against a known stable bench mark for elevation.
d. Cut existing trees and shrubs that are growing on the existing dyke, and cut regularly to prevent trees and shrubs from growing on the new dyke.

## 6.2 Fish Creek

### 6.2.1 General Description

Fish Creek was not inspected, except the area close to the Fish Lake dyke.

Downstream of the Fish Lake dyke, the lower end of the control culvert discharge releases water into the natural Fish Creek which is a shallow stream with sand and gravel bed. The area next to the dyke toe is swampy and is full of willows. The valley floor has a very gentle slope toward the Creek. It is expected that most of the leakage through the dyke and foundation will end up in this creek within a kilometre from the dyke. Thus the seepage water is not lost but is still being collected by the system for generation.

Some 5 km (3 miles) from the Fish Lake the flow is directed into a canal known as Ditch #3. Fish Creek drops more than 60 m (200 ft) in elevation between the lake and Ditch #3. Most of this drop occurs within last 1.5 km (1 mile) of the creek where the creek bed is lined with cobbles and boulders that characterizes a fast moving stream.

### 6.2.2 Recommendation

No recommendations.

## 6.3 Bonus Creek Diversion Dam

### 6.3.1 General Description

This small gravel and earth fill dam diverts the flow from Bonus Creek towards Fish Creek to augment total flow to the system. Due to problems of access, this structure was not inspected. There is no drawing available for this dam.

### 6.3.2 Recommendation

It is recommended at the following be carried out:

a) Locate and document condition of this structure.

## 6.4 Ditch #3 Diversion Structure

### *6.4.1 General Description*

At the upstream end of Ditch #3, the timber Ditch #3 Diversion Structure used to release excessive water to Franklin Lake was removed in spring 2003 and the gap plugged by extension of the Ditch #3 embankment. This structure was not inspected.

### *6.4.2 Recommendation*

No recommendations.

## 6.5 Ditch #3

### *6.5.1 General Description*

Ditch #3 is an approximate 1,300 m (4,300 ft) long cut and fill canal in sandy gravely till that diverts water from Fish Creek towards Louise Lake. Over the length, the ditch drops only 2.1 m (7 ft) in elevation. Typical ditch bottom design width was 1.2 m (4 ft) with 1:1 slope at all faces. Typical minimum cut was 1.8 m (6 ft) while the embankment fill height at the canal side is only about 0.6 m (2 ft). The fill embankment has a 4.3 m (14 ft) wide crest roadway (see drawing dated Dec.20, 1948).

The lower one third of the fill embankment was walked and the toe intermittently inspected for sign of spring. The toe was dry with no sign of wetness. Trees and shrubs are growing on both downstream face and the crest and occasionally on the upstream face. Due to the steep design slopes, undercutting by erosion has occurred and the ditch bottom is a lot wider than 1.2 m (4 ft) (around 2.4 m (8 ft) average) and probably higher than the design elevation due to sedimentation.

Photo 7 – Canal Bank

Photo 8 – Canal Crest

In the spring of 2001, a section of the ditch embankment about 120 m (400 ft) from downstream end failed. The cause of failure is believed to be due to excessive inflow to the ditch prior to the drop structure gate being raised, and the excessive inflow subsequently overtopped the failed section that has the lowest crest elevation. Sandy gravely till was used for the repair, the new embankment is about 4.5 m (15 ft) high at the downstream end with 1:2 slopes and a 4.0 m (13 ft) wide berm at bottom 1/3 of the height. No wet spot could be found at the toe area (See photos 7 and 8).

### *6.5.2 Recommendation*

It is recommended that the following be carried out:

a. Cut all existing trees and shrubs on crest and upstream/downstream faces of the embankment.

## 6.6 Ditch #3 Drop Structure and Control Gate

### *6.6.1 General Description*

At end of Ditch #3, there is a concrete flip bucket Drop Structure with timber Control Gate (see drawing YECL-1 Rev.3, dated Jun 27, 1989). This structure dissipates energy and drops the water from Ditch #3 down 5.0 m (16.5 ft) to a short canal that connects to Louise Lake. The structure is in good operation condition, except that there is slight undercutting at bottom of left wall (west side) close to the flip bucket where velocity is high (See photos 9 and 10). In winter, gate will be installed at this drop structure to choke down the flow and increase water level in Ditch #3 so that formation of frazil ice is greatly reduced by slower flow velocity and ice sheet cover at top of water.

Photo 9 – Inlet

Photo 10 – Outlet

### 6.6.2 Recommendation

It is recommended that the following be carried out:

a. Since the Ditch #3 Diversion Structure has been removed, controlling the gate at the Ditch #3 Drop structure to limit rise of water level within the Ditch #3 during spring thaw period became more important than ever. Monitoring of inflow to Ditch #3 in spring has to be carried out as often as required.

## 6.7 Louise Lake Containment Dyke

### 6.7.1 General Description

The secondary storage reservoir in the system is Louise Lake (also known as Jackson Lake) which is actually two lakes jointed by a short creek. At southerly end of Louise Lake there is about a 150 m (490 ft) long and 7.3 m (24 ft) high earth and rock fill structure that has no drawing available in the files. This is the highest structure in the whole Fish Lake Hydro system. (See photos 11 and 12).

From survey, the dyke is about 7.3 m (24 ft) high and has a 1.7:1 slope on both slope faces. Lake water level was about 2.0 m (6.5 ft) below the dyke crest. The dyke appeared to be stable, and although it has only gravel/cobbles on the upstream face there was no sign of wave erosion. Shallow digging confirmed that upper portion of the dyke at both faces have sand and rounded gravel fill. At downstream toe, the face is covered with rounded to sub-rounded cobbles and small boulders which were not that stable for walking because of the steep slope.

Photo 11 – D/S slope

Photo 12 – Crest of Dam

Photo 13 – D/S toe

Photo 14 – Seepage

Toe of the dyke is covered by a pond that had water depth of 0.9 m (3 ft) to 1.5 m (5 ft). The shore line of the pond suggested that the high pond water level would be 1.5 m (5 ft) higher than observed, and there is no outlet for this pond. Above the pond level some areas of dyke toe and the original ground in general had grass that thrives in wet environment. At left junction (south side) between abutment and the dyke, there is a small spring emerging from the cobbles about 0.9 m (3 ft) above the pond level. It appeared the pond was being partly fed by this spring and seepage through the dyke/abutments and foundation. Sand and gravel with some fines (till) were confirmed by shallow digging at right abutment.

### *6.7.2 Recommendation*

It is recommended that the following be carried out:

a. Carry out a geotechnical investigation to confirm the dyke fill and foundation materials and then analyse seepage and slope stability of the dyke.
b. Install piezometers in the dyke, foundation and abutments to monitoring seepage conditions.
c. Also carry out topographic survey of the dyke.
d. Frequently inspect this dyke to note seepage conditions (this includes winter when seepage emerge point generally will move higher).

## 6.8 Louise Lake Emergency Dyke and Timber Control Structure

### *6.8.1 General Description*

This is a 3.0 m (10 ft) high earth fill dyke that includes a 1.2 m (4 ft) deep cut-off trench. The dyke was originally to be 3.7 m (12 ft) wide at crest, but was built about two times the design width (see drawing dated Dec.20, 1948).

The control structure was re-built with pressure treated timber in 1990. The structure is 3.0 m (10 ft) wide and 2.0 m (6.6 ft) height with cut-off wall at both ends and middle. Stop logs can be inserted at steel guides at upstream end to control lake level (see as-built drawing YECL-3 Rev. 1, dated Nov.27, 1990).
This structure is in good condition.

Photo 15 – Control Structure

Photo 16 – Dyke & Structure

### *6.8.2 Recommendation*

No recommendations.

## 6.9 Louise Lake Outlet Structure

### *6.9.1 General Description*

This structure is actually located at about mid-length of Ditch #2. The original timber outlet structure was replaced by a concrete structure in 1958 (see drawings 3821-A, dated Oct.10, 1960; drawing 3821-B, dated Sept.13 1960, and drawing 3821-C, dated March 5, 1958). The structure has an opening 3.7 m (12 ft) in height and 1.4 m (4.5 ft) in width. There are 5.5 m (18 ft) long upstream wing walls on each side and 4.9 m (16 ft) long "L" shaped downstream wing walls. The timber control gate is supported by four concrete beams bridging across the opening. Water is released from below the gate, and goes into a concrete stilling basin before discharge to the riprap lined apron. Minimum 0.8 m (2.6 ft) length of creosoted timber sheet piles driven into the ground were used as cut-off under the upstream wing walls and there are three lines of cut-off under the main outlet structure slab.

The structure appeared to be functioning properly. Due to age of the concrete, there are considerable freeze and thaw damage and spalling is occurring at water line at upstream south corners and downstream splash zone. The lowest cross beam has vegetation growing on it. There is some bank erosion at end of downstream wing wall at right hand (south) side, and is reducing the seepage path from the upstream wing wall. (See photos 17 to 20).

Remains of the old timber structure are still visible at the downstream channel bed. Since the creosoted timber cut-offs have been under groundwater table all the time, they should still be relatively intact. The Bench Mark No.2 installed in 1960 is still on the structure.

Photo 17 – Inlet

Photo 18 – Inlet Detail

Photo 19 – Outlet

Photo 20 – Outlet Detail

### *6.9.2 Recommendation*

It is recommended that the following be carried out:

a. Add sufficient riprap (for maximum discharge flow) to stop further bank toe erosion at south side of the downstream channel.
b. Remove the vegetation that is grown on top of the cross beams.
c. Chip out the freeze and thaw damages and spalling areas, and patch the areas with cement mortar.

## 6.10 Ditch #2

### *6.10.1 General Description*

This is a 180 m (600 ft) long canal that takes the flow from the raised Louise Lake into the head of Porter Creek (see Drawing 3821, dated Dec.20, 1948). About half of the Ditch length is submerged in water upstream of the Louise Lake outfall structure. From observation at Louise Lake Outfall Structure and contour plan, the Ditch #2 appears to be entirely created by excavation in non-plastic sandy silty till with some rounded to sub-rounded gravel and cobble. The canal slopes are about 2:1 with depth up to 5.2 m (17 ft) (See photo 21).

Photo 21 – U/S of Outlet Structure

Porter Creek between Ditches 1 and 2 is about 4 km (2.4 miles) long.

### *6.10.2 Recommendation*

No recommendations.

## 6.11 Ditch #1

### *6.11.1 General Description*

Ditch #1 is a 500 m (1600 ft) long cut and fill canal that intercepts Porter Creek and brings the water to #1 Intake. Over the length the Ditch drops only 0.6 m (2 ft) (see drawing dated Dec. 20, 1948). Original cross section of this Ditch is not available.

Up to the overflow structure (about 2/3 length) was walked. South (right hand) side of the canal embankment is formed by fill and the crest is about 6 m (20 ft) wide and there was only 0.6 m (2 ft) of water in the Ditch and Ditch height varies between 1.2 m (4 ft) to 1.8 m (6 ft). Tress up to 9 m (30 ft) high are growing on the downstream slope of this embankment. No wet spots were found by occasional checks at toe, except upstream of the Ditch #1 Overflow Structure (see section 6.12 below).

North (the left hand) side of the canal is lined with a 6 m (20 ft) wide access road. The exposed excavation faces show that the soils at Ditch #1 are mainly sandy till with small amount of gravel and cobble. The ditch bottom has been regularly dredged, and piles of sand have been dumped at the fill embankment side. At #1 Head Pond, the ditch embankment is highest (about 4.3 m (14 ft)), but no wet area was detected at toe. The upstream bank has vegetation growth and has no sign of erosion.

### *6.11.2 Recommendation*

It is recommended that the following be carried out:

a. Cut all existing trees and shrubs on crest and faces of the south embankment.
b. Survey embankment crest elevation along the whole Ditch #1 length to discover low sections for topping up to prevent overtopping.

## 6.12 Ditch #1 Overflow Structure

### *6.12.1 General Description*

This structure is located at head of Ditch#1 where Porter Creek is intercepted by Ditch #1. The original diversion timber box structure was replaced by a horse shoe shape corrugated steel culvert (1.2 m (4.1 ft) rise and 1.9 m (6.2 ft) span) surrounded by concrete and the 3.0 m (10 ft) to 4.9 m (16 ft) long steel sheet pile wing walls. The 9 m (30 ft) long culvert has no provision to raise the canal level. At downstream end of this overflow structure, there is a 5.0 m (16.5 ft) long timber mat for erosion protection. In front of the timber mat there is a small pool of water that was fed by small seepage/run-off collected by the Porter Creek bed that is running along toe of the embankment upstream of the Overflow Structure Gravel and small cobbles lined the creek bed in front of this pond. (See photos 22 and 23).

Photo 22 – Overflow Structure Inlet

Photo 23 – Overflow Structure Exit

There is no drawing available for this structure to determine when it was installed.

### 6.12.2 Recommendation

It is recommended that the following be carried out:

a. The seepage/flow at toe of Ditch#1 embankment upstream of the overflow structure should be investigated to find the source(s).
b. Assess condition of the timber mat and replace it with riprap on geotextile at appropriate time.

## 6.13 #1 Intake Structure

### 6.13.1 General Description

The original timber pressure box was replaced by a concrete structure in 1974 which was again replaced in 1993 by the current concrete sub-structure. The two compartment structure measures 5.6 m X 3.2 m (18.3 ft X 10.5 ft) in plan and 3.4 m (11 ft) in depth and with 1.5 m (5 ft) wing wall at both downstream sides. There are two trash screens at the south side wall, and the penstock compartment can be blocked off by stop logs.

In 1963 the top end of steel penstock was enlarged from 760 mm to 915 mm (30" to 36") (see drawing 6490 dated May 28. 1963) which was cast into the concrete wall. A 400 mm (16") vent pipe was also added to the 915 mm (36") pipe (see Drawing FISHLAKE -1 Rev. A, dated April 27, 1993). There is a control gate at end of the penstock and the structure is covered by a heated metal cladding building (See photo 24).

Photo 24 – Intake

### 6.13.2 Recommendation

It is recommended that the following be carried out:

a. Confirm that stoplogs are functional and can be fully closed.

## 6.14 #1 Penstock

### *6.14.1 General Description*

This steel penstock is completely buried in the ground with minimum of 0.6 m (2 ft) fill, except were it cross the Porter Creek where the twin pipes 450 mm and 500 mm (18" and 20") day lighted for about 7.5 m (25 ft). The penstock started at elevation 960 m (3145 ft) and has a gross head of 133 m (435 ft).

The drawings available only show the original woodstave and steel arrangement of the 1962 twin pipe proposals. There were five anchorage points along the length with the last one at the Plant#1 power house. Other than the 400 mm (16") vent pipe at top and turbine shut-off valve just upstream of both turbines, there seems to be no other valve on the penstock.

The penstock details listed below are from the 1985 water licence application: 493 m (1618 ft) of 812 mm (32") steel; 240 m (787 ft) of 760 mm (30") steel pipe; 172 m (546 ft) of 672 mm (26.5") steel pipe, 137 m (550 ft) of twin 460 mm (18") and 510 mm (20") steel pipes. The twin pipes joint back together about 15 m (50 ft) above Plant#1 into a single 460 mm (18") pipe. Pipe thickness was not mentioned.

### *6.14.2 Recommendation*

It is recommended that the following be carried out:

a. The penstock should be uncovered at selected locations for corrosion inspection and pipe thickness.
b. Find and uncover the anchorage points for inspection.

## 6.15 #1 Power House

### *6.15.1 General Description*

#1 Power House consists of concrete substructure and a timber superstructure. The Power house was enlarged in 1953 to accommodate the second unit with attachment for a two car garage and an upstairs apartment (see drawing dated Jan.4, 1953). Currently only the second 700kW unit is in operation and tail water is discharge into an 2.4 m (8 ft) wide and 2.1 m (7 ft) high concrete/stone masonry channel that direct water to the south to join West McIntyre Creek. Both are however, in reasonably good shape. (See photos 25 and 26).

West of power house, Porter Creek turns to north and there is a discarded timber diversion structure that used to divert water into West McIntyre Creek at the south.

A fish farming company – (Icy Waters Ltd.) has added an intake structure at the north end of the discharge channel, and diverts most of the tail water for their operations. After going through fish tanks, the diverted water is discharged back further downstream to West McIntyre Creek that leads to the #2 Head Pond. The remaining tail water flows to south and joins West McIntyre Creek. Water from Ditch#1 overflow structure and runoff not intercepted by the ditches are collected by Porter Creek where Icy Waters also takes part of this water for their operation and discharges the water back to West McIntyre Creek further downstream.

The discharge channel has some freeze thaw damage and it appeared part of the masonry wall was covered by a layer of concrete not too long ago. Stop logs can be installed in this channel to regulate the flows.

Photo 25 – Powerhouse Equipment

Photo 26 – Powerhouse Outlet

### *6.15.2 Recommendation*

No recommendations.

## 6.16 #2 Head Pond Dam

### *6.16.1 General Description*

#2 Head Pond was formed by a dam blocking West McIntyre Creek. The 85 m (280 ft) long dam has a maximum depth of 10 m (32 ft) (includes 2 m (7 ft) cut-off trench in bedrock), and 3: 1 slope at both faces. The dam consists of a wide clayey till core with 5 m (16 ft) width cut-off trench in bedrock, and decomposed granite toe drain and upstream shell. The dam surfaces are protected by an 450 mm (18") layer of coarse copper mine tailing rock in cobble size.

The 7.3 m (24 ft) wide dam crest serves as access a road to #2 Power house. There is 1 m (3 ft) of freeboard at high operating water level. A stop log controlled overflow spillway with concrete slab cover and channel excavated through bedrock is located off the dam at north side. Spilled water goes to the former West McIntyre Creek. Both the 760 mm (30") steel penstock pipe and 610 mm (24") low level spill pipe penetrate the dam with two cut-off collars in the dam core. There is a concrete stilling basin at downstream end of the 610 mm (24") spill pipe (see drawings dated Aug. 30, 1954). (See photos 27 and 28).

Shrubs and grasses are growing on the upstream slope of the dam and shore of head pond, and there is no sign of wave erosion. Pond water level was raised by several stop logs at the spillway. There were some tree branches and other debris accumulated within the spillway behind the stop logs. The masonry walls that formed the spillway have some freeze thaw damage.

The concrete spill pipe stilling basin was full of water with small amount flowing away. There was small amount of water seeping out from the mine tailing fill around the stilling basin. Water loving grasses were generally growing around the basin and downstream of it. These indicate that there is some leakage which is most probably through the rock joints under and around the dam. The copper mine tailing rocks have oxidized and generally have some green patches on surface that indicates existence of acidic condition.

Photo 27 – Headpond Dam and Intake

Photo 28 – D/S Slope of Dam

### *6.16.2 Recommendation*

It is recommended that the following be carried out:

a. Repair the freeze thaw damage by chipping and patching with mortar.
b. Remove all trees and shrubs on both faces of the dam, within 6 m (20 ft) of the dam toe; and around and below the spillway channel.
c. Clean the stilling basin to check existence of outlet hole at east wall. If there is no existing hole, drill/core a 75 to 100 mm (3 to 4 inch) hole at bottom of east wall of the spill pipe stilling basin so that no seepage water will accumulate in the basin. Clean the basin regularly, so that this hole is not blocked by debris.

## 6.17 #2 Intake Structure

### *6.17.1 General Description*

The 1954 built 6.7 m (22 ft) high concrete structure is located at upstream toe of the #2 Head Pond Dam. The structure measures 4.0 m (13 ft) long and 3.1 m (10.2 ft) wide, with 2.4 m (8 ft) thick base block sitting on bedrock and upstream guiding apron that is 3.0 m (10 ft) long and 7.8 m (25.7 ft) wide at the front. The intake is equipped with an inclined trash rack and stop log guide for dewatering. A cat walk connects the Intake with the dam crest. There is minor freeze and thaw concrete damage at water line.

Both the 915 mm (36") penstock and 610 mm (24") spill pipe were cast into the structure and are controlled by wooden gate inside the heated timber building. There is a 100 mm (4") penstock vent pipe that ends inside the building. It is our understanding that the penstock inlet valve was not designed to close fully which allows for the passage of a riparian flow through the penstock. However, should there be any type of penstock failure whether minor or catastrophic, the water flow into the penstock cannot be completely stopped.

### 6.17.2 Recommendation

It is recommended that the following be carried out:

a. Repair the freeze thaw damage by chipping and patching with mortar as required.
b. Current stoplogs are inadequate. Review dimensions of the inlet structure, stoplog guides, etc and design stoplogs. Permanent stop logs should be manufactured from either steel or concrete and be placed in the stop log guides so that the installation of the remaining wooden stoplogs can be performed with relative ease and safety. We would recommend the use of steel with appropriate seals attached because of the limited access to the stop log guides. Note that some stoplogs may be placed in the stoplog guides and left on a permanent basis.
c. The existing penstock inlet valve does not close completely and should be assessed to determine if the valve should be either replaced or rehabilitated. If the valve is to be rehabilitated the options are to assess the existing stem to see if it can be reused with a shorted pedestal beneath the actuator gear box, or whether the stem itself requires replacement.

## 6.18 #2 Penstock

### 6.18.1 General Description

The available drawings are showing contradicting information about the penstock. The penstock details listed below are from the 1985 water licence application: 46 m (150 ft) of 914 mm (36") steel pipe that passes through the Head Pond dam, 274 m (900 ft) of 914 mm (36") woodstave pipe, 229 m (750 ft) of 838 mm (33") woodstave pipe and approximately 152 m (500 ft) of 914 mm (36") steel pipe, and 15.2 m (50 ft) of tapered steel pipe that changes from 760 mm (30") to 460 mm (18") immediately above the #2 Power House. Pipe thickness was not mentioned. The woodstave pipes lay directly on grade, and there are some concrete anchors for the steel pipes on the steep slope. Location of these anchor points is unknown, as most of the steel pipes are buried 0.9 m (3 ft) in the ground. The woodstave pipe was walked for the entire length, while only the upper and lower steel sections can be inspected.

The penstock upstream end is buried under the dam. The exposed woodstave penstock is in fair condition, while most of the creosote has disappeared from exterior surface, particularly at top of the pipe. The steel woodstave pipe bands were in good shape and not overly rusty even at leaking sections.

There are many small leaks and some were sealed with plate and screws. There are five major sections that leakage water was either ponding next to the pipe or running along the pipe and drained to hill edge. The worst location was at about chainage 10+50 downstream from the rock canyon where the pipe is sitting in a very narrow bench cut of till. Leakage water was running along the bench and down a very steep slope, washing the soils away. This section of penstock was replaced with steel penstock in the fall of 2005. Other major leakage sections are upstream from this and most of them are next to the rock canyon so draining to the edge is not a concern, but ponding is. (See photos 29 to 36).

Photo 29 – Typical Woodstave

Photo 30 – Typical Leak

Photo 31 – Wood stave prior to Replacement with Steel in 2005

Photo 32 – Wood stave prior to Replacement with Steel in 2005

Photo 33 – Steel Repair 2005

Photo 34 – Steel Repair Backfilled

The condition of the remaining woodstave penstock was assessed at the connection points with the steel penstock replacement section. The condition of the woodstave pipeline was relatively good considering its age and the seasonal stresses and vandalism that the pipeline has suffered. The condition of the untouched runs of woodstave was consistent with expectations with minor degradation of the interior wooden surfaces. Alternately there appears to have been a period of time when the various leaks and damage were being patched using rubber sheets with steel cover plates screwed down to the woodstave. These areas show a very advanced state of decay with some of the areas witnessed having virtually no wood remaining. The present methods being used to patch the various leaks is a more acceptable procedure with the hoops being slackened and rubber sheets backed by steel plates being affixed by retightening the hoops. In addition to this repair method the use of the remaining Oakum from the recent construction/repair will allow for repairs to additional leaks that have previously been difficult to stop.

Between chainage 13+40 and 17+70 ft, the woodstave pipe is located in a deep cut trench in till, and the pipe is partially buried by soil and rock washed down from the steep cut faces. The slopes have been trimmed and stabilized in this area in the fall of 2005. At end of the cut trench, there is a heated shed that houses three valves (presumably for air, vacuum and pressure relief).

Photo 35 – Slopes prior to Trim

Photo 36 – Slopes after Trim

Further downstream, the pipe is covered by an access road embankment. The joint between woodstave and original steel pipes was not leaking at the time of inspection although it has been known to leak slightly. The leakage water apparently runs a short distance down the slope and disappears into the ground. The steel pipe has only some slight rust.

Close to bottom of the hill above the #2 Powerhouse, a short section of the steel pipe is exposed. There is some slight rust where the paint has been lost. There is a turbine shut-off valve in #2 Power House just upstream of the turbine. (See photos 37 and 38).

Photo 37 – Slope US of Powerhouse

Photo 38 – Slope US of Powerhouse

### *6.18.2 Recommendation*

It is recommended that the following be carried out:

a. Periodically inspect the woodstave pipe and seal the leakages by appropriate method. Reinforce the decay wood with appropriate means or consider complete wood stave replacement.
b. Ponding water next to pipe should be drained away by ditching.
c. Cut all shrubs along the route 0.9 m (3 ft) tree free zone both sides) and remove any vegetation growing on the pipe.

## 6.19 #2 Power House

### *6.19.1 General Description*

#2 Power House was built in 1954 and consists of a concrete substructure and a timber superstructure. The powerhouse was extended 1.8 m (6 ft) in length some time later. The single horizontal Francis turbine/generator set is rated at 600kW. (See photos 39 and 40).

A steep hill with weather granite bedrock leads the steel penstock to the power house The floor slabs next to the discharge channel have settled up to 50 mm (2"). The discharge channel has some freeze thaw damages). The power house is still functionally adequate.

Photo 39 – Powerhouse Equipment

Photo 40 – Powerhouse Outlet

### *6.19.2 Recommendation*

No recommendations.

# 7. Conclusions and Recommendations

The dam safety review of the Fish Lake hydropower project has been completed, and the following points summarize major conclusions reached as a part of this analysis:

- The incremental consequences of failure resulting from breach development in the Fish Lake Dam, Louise Lake Dam, and Headpond #2 Dam are limited. Therefore the Hazard Classification selected for each of these structures is "LOW".

- The IDF selected for each of these structures is the 1:100 year flood.

- Hydrological studies were performed to estimate the 1:100 year flood event for the Fish Lake dam, Louise Lake Dam, and Headpond #2 Dam. The final hydrograph for the Fish Lake event was developed based a regional assessment of flood potential, and is shown in Figure 11.

- An assessment was make of the ability of each structure to pass the IDF in it's current state. For Fish Lake, It was determined that in passing the IDF, water levels on the lake would surcharge up to elev. 30.74 m (local datum). Freeboard analyses indicate this degree of surcharge would result in a freeboard deficiency of 0.60 m during passage of the IDF. Therefore it is recommended that the dam height be raised to mitigate this deficiency.

- As a large flood event on Fish Lake is a relatively slow occurring event (over several weeks), we recommend a contingency plan to address the deficiency in freeboard on Fish Lake dam be developed by Yukon Electric Company Limited until the dam heightening is implemented. One possible alternative to consider is stockpiling sandbags which can be placed on the dam crest as required to maintain freeboard.

- Freeboard analyses also indicate that wind and wave allowances are adequate for normal operating conditions on Fish Lake, based on a project FSL of 30.0 m.

- Freeboard analysis indicate that wind and wave allowances are adequate under both normal operating conditions and during IDF passage for both the Louise Lake dam and Headpond #2.

The inspection of the entire Fish Lake Hydro development was completed in June 2007. The structures are generally in good or reasonable operation condition. Investigation and monitoring are recommended for certain structures while maintenance is required on some others. Refer to Section 6 of this report for detailed structure specific recommendations.

We recommend that a program be developed by Yukon Electric Company Limited to implement the recommendations of the inspections referred to in Section 6 over the next three to four years. Once the program is developed it should be reviewed and statuses updated on a semi-annual basis.

# *Yukon Environmental & Socioeconomic Assessment Act*
# Decision Document Final

This document meets the Yukon government's requirements as a Decision Body as set out in the *Yukon Environmental & Socioeconomic Assessment Act*

## Decision Document Issued By

| | |
|---|---|
| **YG Decision Body:** | Territorial Minister, as authorized under section 7, to Director, Energy Solutions Centre, Energy, Mines and Resources |
| **Federal Decision Body(ies):** | *[where applicable]* |
| **First Nation Decision Body(ies):** | *[where applicable]* |

## Project

| | | |
|---|---|---|
| **Project Name :**<br>Operation of the Fish Lake Generating Station | | YESAA File Number<br>2007-0150 |
| **Proponent Name:** | Yukon Electrical Co. Ltd. | |
| Project Description:<br>Continued operation and maintenance of the Fish Lake hydroelectric generating station, including<br>- ongoing operations of existing structures including control of flows in the system,<br>- regular maintenance activities of the hydro system including removal of beaver dams, brushing, mostly along ditch #3 and ditch #1, removal of debris in trash racks, and regular maintenance of the turbines. | | |

## Other Decision Bodies

| | |
|---|---|
| **Other Decision Body Consultation:** | *[list decision bodies consulted, where applicable]*<br>*N/A* |
| **Consolidated Decision Document:** | ☐ N/A<br>X No<br>☐ Yes *[list the decision bodies whose decision documents were consolidated, where applicable]* |

## Non-Self Governing First Nations

| | |
|---|---|
| **Non-self governing First Nation Consultation:** | *[list First Nation consulted, where applicable]*<br><br>N/A |

Yukon
Government

## Decision

| | |
|---|---|
| Pursuant to YESAA s. 75, 76 and 80, the Yukon government has considered the assessment of this project and: | |
| | a) Yukon government accepts the following recommendation (inserted below)<br>• *[List Terms and Conditions and responsible YG department, where applicable]* |
| | b) Yukon government rejects the following recommendation (inserted below) for the following reason(s):<br>• *[List specific reasons]* |
| X | c) Yukon government varies the recommendation (inserted below) by changing the following term(s) and condition(s) for the reason(s) specified:<br><br>**The following terms and conditions remain unchanged:**<br><br>6. Maintenance/repair of the generating units and/or channels shall maintain minimum riparian flows adequate for fish and fish habitat downstream of work area.<br>7. No heavy equipment shall be used for brushing along the ditches.<br>8. Excavated sediment from dredging of ditch #1 shall be stockpiled along the upslope side of the ditch.<br>9. Excavated materials and debris should be disposed of above the high water mark and located such that they do not enter any watercourse.<br>10. To the extent possible, ensure adequate lake levels to prevent fish stranding.<br>11. To the extent possible, ensure adequate minimum water discharge and riparian flow to maintain fish habitat and prevent fish stranding.<br>12. To the extent possible, ensure adequate fish control measures at the overflow spillway to Franklin Lake to prevent the entrainment, entrapment and/or stranding of fish.<br>13. Investigate fish control mechanisms (eg. fish screen) that would prevent potential entrapment, entrainment, and/or stranding of fish in the channel between Louise Lake and Franklin Lakes.<br>14. Investigate minimum flow rates at control gates, minimum riparian flows within channels and low level supply level of lakes that will effectively minimize, reduce, or control fish entrapment and maintain fish habitat for fish species and their lifecycle stages in the system.<br>15. Monitor discharge volumes from specific system components, including Fish Lake control gate, Louise Lake control gate, Louise Lake spillway, Plant #1 and Plant #2.<br>16. Monitor water levels of Fish Lake and Louise Lake.<br>18. Correlate Fish Lake levels with the amount of inundation to settlement lands adjacent to Fish Lake. Identify a preferred operating range from the perspective of landowner(s).<br>20. At a minimum, adhere to the Canadian Dam Associations "Dam Safety Guidelines" to conduct necessary studies, identify necessary upgrades, and/or continue maintenance of Fish Lake Hydro infrastructure.<br><br>**The following terms and conditions are changed with reasons provided:**<br><br>1. The Minimum Low Supply Level of Fish Lake shall be 28.5m (93.5 ft) as referred to |

Yukon
Government

| | |
|---|---|
| | bench mark 1L321, G804, BM 1956 set in standard post to arbitrary elevation of 100 feet and located on the easterly side of Lot 321, G 804.<br>2. Minimum discharge from Fish Lake through the control gate into Ditch #3 shall be 0.15 m3/s.<br>3. Minimum Low Supply Level of Louise Lake shall be 29 m (91.5 ft) as referred to the top of a standard post in concrete marked 7L281, G804, BM1, 1960 set at arbitrary elevation of 100 feet and located on the southerly side of Lot 281, G804.<br>4. Minimum discharge from Louise Lake through the Louise Lake Control structure into Porter Creek shall be 0.1 m3/s.<br>5. Maintain minimum riparian flows of at least 0.08 m3/s through water channels.<br>17. The Full Supply Level of Fish Lake shall be 30.0m (98.4 ft) as referred to bench mark 1L321, G804, BM 1956 set in standard post to arbitrary elevation of 100 feet and located on the easterly side of Lot 321, G 804.<br><br>**Reason for change:**<br>The above terms and conditions are too prescriptive. Setting the specific levels will be left up to the Waterboard process.<br><br>**To be replaced with:**<br>Minimum Low Supply Levels, Full Supply Levels, and discharge levels at Fish Lake and Minimum Low Supply Levels and discharge levels at Louise Lake through the Louise Lake Control structure and Franklin Lake shall be set such that fish habitat be protected and minimum riparian flows through water channels be maintained.<br><br>**The following term and condition is being removed:**<br><br>19. Identify any areas of heritage importance that are not included within the established Settlement Land Parcels. Correlate Fish Lake levels with the amount of inundation to areas of heritage importance adjacent to Fish Lake. Identify a preferred operating range from the perspective of landowner(s).<br><br>**Reason for removal:**<br>The above proposed mitigation has been satisfied through comprehensive work completed by the Yukon government Heritage Branch in collaboration with Kwanlin Dun First Nation Elders. This work identified areas of significant archaeological and heritage importance in the larger Fish Lake area. The result of this collaboration is documented in the 1994 "Lu Zil Män Fish Lake - Uncovering the Past" report which is referenced in the project proposal and the Kwanlin Dun First Nation submission. |

## Dates

**YUB-YECL-10**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 84600 Diesel Generation

**Quote**: Costs increase from 2007 to 2008 mainly due to scheduled diesel overhaul costs ( 167). (Schedule 5.2, Line No. 48.)

**Preamble**: The Board would like more detail to understand the genesis of the diesel maintenance expenses that are illustrated in Schedule 5.2.

**Request:**

(a) Please provide greater detail such as vintage, operational hours, and size of the generation plant as well as generator manufacturer.

(b) Please explain the sustained increases for diesel maintenance costs for the test period.

**Response:**

(a) Please refer to YUB-YECL-7 (c) Attachment 1

(b) This is due to increased overhaul activity according to Yukon Electrical's scheduled maintenance program, as well as labour and other inflation as shown on schedule 5.2.

**YUB-YECL-11**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 87100 Brushing

**Quote**: Costs increase from 2005 to 2006 due to additional brushing activity ( 56) and labour cost increases due to increased brushing activity ( 19). (Line No. 66-67.)

Costs increase from 2006 to 2007 mainly due to an enhanced brushing program ( 40), labour cost increase due to increased brushing activity ( 11) (Line No. 69-70.)

Costs increase from 2007 to 2008 due to increases to the labour compliment (Line No. 73.)

**Preamble**: The Board would like to have a greater understanding of YECL's brushing program.

**Request:**

(a) Please provide an in-depth description of YECL's brushing program.

(b) Was the 2005 to 2006 increase due to brushing that was scheduled but not performed in the previous year?

(c) Please explain the difference between additional brushing activity (Schedule 5.2, Line No. 66) vs increased brushing activity (Schedule 5.2, Line No. 70).

(d) What is the enhanced brushing program that YECL is referring to? Please describe the enhancements.

(e) Were there increases to the brushing labour compliment for 2008 permanent?

**Response:**

(a) Yukon Electrical's brushing program is best described as maintenance of power line right of ways (ROW's) by the removal of vegetation and second growth trees within the right of way. Each year brushing requirements are identified through patrols of lines completed by operational staff, and customer input, as well, trouble areas are identified through outage and reliability data.

Yukon Electrical uses a number of methods to complete the brushing requirements, including community based contract crews supervised by Yukon Electrical staff, Qualified Utility Arborists and Utility Tree Trimmers, Bucket truck aerial trimmers, and Hydro Axe Mowers. In most cases usable fuel wood greater than 4 inches in diameter is stacked along the right of way for use of property owners and general public. The debris and vegetation are removed by burning when possible or chipping with a wood chipper.

Yukon Electrical uses a number of local contractors to complete the brushing requirements. Three Whitehorse based companies are used mainly with support from contract crews supplied by First Nations within the smaller rural communities around Yukon.

In recent years Yukon Electrical has enhanced the brushing program to include the widening of many existing R.O.W'S to upgrade R.O.W widths to today's standards. The brushing program also includes the identification and removals of Danger Trees from outside of the R.O.W. Danger Trees are trees which are dead or leaning into the R.O.W. Danger Trees also include trees that have damaged root systems from a previous high wind event, they pose an obvious risk to falling on the line.

For further information please refer to YUB-YECL (a) Attachment 1, 2 and 3. Yukon Electrical applies the same criteria as used by its parent company, ATCO Electric Ltd., adapted for Yukon Electrical.

(b) No.

(c) Additional brushing activity in 2006 refers to more volume of brushing and resources to complete the program.

The increased brushing activity in 2007 refers to more Yukon Electrical labour required as a result of both the enhanced program in 2007 as well as additional brushing undertaken by contactors.

(d) In the past the brushing program focused mainly on the maintenance of existing right of ways and removal of second growth trees and vegetation along the R.O.W. Yukon Electrical enhanced its brushing program in 2005 to include widening the R.O.W's wherever possible to increase clearances to power lines consistent with current standards. Today's brushing program also includes the identification and removal of danger trees . Danger trees are trees outside of the R.O.W which are dead, leaning or have damaged root systems caused by high winds, they pose an obvious risk of falling on the line.

(e) The labor complement was not specifically increased to manage the brushing program and related administrative requirements, however a percentage of specific job classes were allocated to the brushing program. It is proposed that the increases will be permanent for the brushing function.

| RIGHT-OF-WAY MAINTENANCE | Foreword |

These right-of-way preparation and maintenance standards have been established to achieve corporate objectives of customer service, public safety, worker protection, facility protection, system integrity, compliance with legislation and environmental stewardship. The maintenance standards promote an integrated vegetation management program for distribution rights-of-way and facilities.

|---|---|
| RIGHT-OF-WAY MAINTENANCE | General Safety Requirements |

### *4.1.1 General Safety Requirements*

*PURPOSE: To outline the general safety requirements related to vegetation maintenance activities.*

1. Vegetation control around energized facilities is hazardous work. All activities are to be carried out with diligence and the proper attention to the governing safety legislation, standards, policies and manuals – the ones that apply directly are as follows:

   Occupational Health and Safety Act
   Safety Standards Manual
   Electrical and Communication Utility Code
   Motor Transport Act
   TDG Act
   WHMIS

2. All work is to be properly planned and documented in a Job Start Up form with hazards and barriers identified and detailed descriptions of the communication and evacuation plans. For small jobs of 5 days duration or less, the Tailboard meeting summary may serve as the JSA.

3. All workers are to be properly trained, oriented to job sites and made aware of specific hazards and barriers.

4. All contractors are to be properly assessed and supervised to reduce the risk of incidents. The Forest Operations Department is to maintain a list of all contractors evaluated, any noted concerns and recommendations or conditions for work for each contractor.

5. Safe Limits of Approach for persons and equipment to energized electrical equipment must be maintained at all times. See *Section 4.7* for Safe Limits of Approach distances.

6. Wherever practicable, work is to be inspected regularly by the Forest Operations coordinator or designate, and a summary of the inspection is to be made and kept on file. A copy of the inspection summary with any recommended follow up actions should also be provided to the contractor.

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

## *4.2 Rights-of-Way*

### *4.2.1 Right-of-Way Width*

*PURPOSE: To outline the standard right-of-way widths to be maintained for various distribution voltage levels.*

**TABLE A:** Distribution power line Right-of-Way Widths requirements Right-Of-Way Width Maintenance Requirements

| **Voltage (Phase to Phase)** | **Location** | **Primary** | **VCE** |
|---|---|---|---|
| 25 kV | Road Allowance | 7.5 m | Variable (based on tree height) |
| | Cross-Country | 15.0 m | Variable (based on tree height) |
| | Section & ¼ Section Line | 15 m | Variable (based on tree height) |
| 14.4kV | Road Allowance | 7.5 m | N/A |
| | Cross-Country | 15 m | Variable (based on tree height) |
| | Section & ¼ Section Line | 15 m | Variable (based on tree height) |

* Where mature stands of tall trees or side slopes are located, right-of-way widths may exceed the widths outlined in Table A. Vegetation on VCE's is typically maintained at a less frequent cycle than the primary right-of-way due to the decreased hazard from re-growth situated further from the electrical facilities.

ATCO Electric

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

### *4.2.2 Right-Of-Way Vegetation Maintenance*

*PURPOSE: To outline the standards for maintenance on distribution rights-of-way.*

1. Objectives of right-of-way vegetation management are to:

   - create a safe environment for the public at all times,
   - create a safe working environment for ATCO Electric employees and contracted workers,
   - maintain the integrity and security of facilities
   - provide access to rights-of-way and electric facilities,
   - provide constant reliability and integrity of service to ATCO Electric's customers,
   - reduce outages,
   - prevent tree to line contacts and prevent forest fires,
   - minimize environmental impacts, and
   - comply with legislation

2. Distribution right-of-way maintenance will follow the "Industry Standards and Good Practices for Vegetation Management" guidelines produced by the Industrial Vegetation Management of Alberta (IVMAA). These Industry standards will be used when planning and implementing vegetation management programs, and will strengthen our commitment to safety, customer service and the environment. ATCO Electric Ltd. will support the IVMAA by maintaining an active membership in the association.

3. On Crown land, right-of-way maintenance activities are governed by operating conditions on the easement. The operating conditions ensure minimal surface damage and satisfactory reclamation. Operating conditions are on file with ATCO Electric, Lands and Properties Group and are referenced by legal land description. Complete files are also held at the Public Lands Division Office in Edmonton.

4. On private land, conditions may be imposed on a case-by-case basis by the landowner during the consenting process. Occasionally, there may be formal agreements in place between the landowner and the Company. Any such agreements would be on file with the Lands and Properties Group.

5. Only lands held under power lines easement are to be maintained on an on-going basis. Where no easement is in place over private lands, the easement width noted in Table 1 is to be maintained.

ATCO Electric

**DISTRIBUTION LINE MAINTENANCE STANDARDS**

| ORIGINAL DATE | REVISION NO. | PAGE | INDEX NO. |

| 97-05-20 | R0 | 7 | 4.2 |
| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

6. Disposal standards must meet ATCO Electric requirements and the standards outlined by governing agencies. Specific conditions may be required in approval documents (e.g. easements and landowner consents).

7. Where possible, compatible vegetation is to be retained.

8. There are specific, different requirements governing maintenance on provincially administered lands in the agricultural area. These are:

   i. Authorization is required from Public Lands Division prior to right-of-way maintenance on unoccupied public land in the White Area. On occupied public land lessee consent is required as well as authorization from Public Lands Division.

   ii. The Surface Rights Act Chapter S-27.1, Section 14(1) and (2) provides that an operator or his employee can enter upon any crown or other land to conduct a survey provided they have notified or have made reasonable attempt to notify the owner or occupant. Compensation is payable for any damages to the land or improvements resulting from the entry.

9. Comprehensive vegetation management:

   In order to meet objectives for distribution line right-of-way maintenance, a broad suite of treatment methods are utilized. These include general and selective herbicide treatments as well as mechanical methods such as hand slashing, mowing, mulching and trimming.

   Mechanical treatments of large areas of the right-of-way, such as mowing, mulching and hand slashing are typically based on a three to five year rotation. Mechanical treatments may be followed by a herbicide program within three years, depending on the height of the vegetation, which varies according to species, microclimate, soil conditions, aspect, slope, etc.

   Individual tree trimming programs are designed to maintain limit of approach distances between re-growth and power lines. Treatment cycles are usually around three or four years depending on growth rates and landowner constraints.

   Where they are permitted, herbicide programs are typically completed within 2 or 3 years of initial clearing or mechanical right-of-way treatment. Where possible, the right-of-way will be maintained on a three or four year herbicide program thereafter. This cycle is dependent on tree species, growth rates and type of herbicide used.

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

In order to complete programs, patrols are completed on geographic areas prior to the end of each cycle. The standard for right-of-way patrols and inspections is described in detail in Section 4.4.

10. Target species

Trees and shrubs will mature to heights that interfere with the safe and reliable operation of the distribution system must be removed or maintained. Lower growing shrubs may also be removed if access is limited.

In forested areas, low growing shrubs and grasses are promoted for ground cover and wildlife habitat.

In agricultural areas, the rights-of-way are maintained in grass or used as cropland.

The following is a list of tree species that commonly pose problems in right-or-way maintenance due to their heights are maturity:

| | |
|---|---|
| - Aspen Poplar | Populus tremuloides |
| - Balsam Poplar | Populus balsamifera |
| - White Birch | Betula papyrifera |
| - White Spruce | Picea glauca |
| - Black Spruce | Picea mariana |
| - Balsam Fir | Abies balsamea |
| - Tamarack | Larix laricina |
| - Lodgepole Pine | Pinus contorta |
| - Jack Pine | Pinus banksiana |

| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

### *4.2.3 Standard for Hazard Tree Removal on Crown Lands*

*PURPOSE: To outline the standard for hazard tree removal on Crown lands.*

1. Distribution facilities are to be maintained free of hazard trees.

2. Hazard trees are trees that have the potential of contracting or passing within the Limits of Approach of the distribution line and are defined in the ATCO Electric/ASRD Wildfire Agreement. Hazard trees must be removed or topped to ensure line safety and reduce the risk of fire.

3. Hazard tree removals are governed by the Fire Control Plan, which is updated annually and submitted to ASRD for approval. As much as possible, the removal of individual hazard trees should be carried out in conjunction with regularly scheduled maintenance programs.

4. Approval of specific hazard tree removal projects on Crown lands in the Green Zone of Alberta is granted by the local office of Alberta Sustainable Resource Development. Authority is granted in the form of a Letter of Authority or Temporary Field Authorization (TFA). However, if groups of hazard trees are being removed, a vegetation control easement (VCE) may be required.

5. Hazard trees are salvaged only if directed by ASRD. Usually salvage is not required unless the quantity of timber is sufficient and access is reasonable. Otherwise, individual trees may be felled, limbed, bucked and positioned in contact with the ground.

6. The removal of individual hazard trees does not usually result in timber damage costs to ATCO Electric. However, if trees are to be salvaged, timber damage is payable to the Forest Management Agreement holder (FMA) or to the Provincial Government. In that case, the timber becomes the property of ATCO Electric. There is no obligation to provide first right-of-refusal to any forest agreement holder, unless that was an agreement made in the original consent.

7. Consent to remove hazard trees is required from the forest license agreement holder (FMA, TL, etc.) whether individual or groups of trees are removed. Approvals may also be required from other agencies (Department of Fisheries and Oceans, Ministry of Environment, etc.).

ATCO Electric

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

8. If a VCE is required, potentially affected trappers must be notified by Registered Mail. Due to the fact that heavy equipment and log haul may be required, crossing and road use agreements may be required with pipeline companies or other third parties.

9. For VCE applications, the approval process is usually led by the Lands and Properties Group. An application for a VCE, containing an appropriate survey plan of the area to be cleared along with an Environmental Field Report (EFR), must be submitted to ASRD, Public Lands Division in Edmonton.

10. Removal of individual hazard trees does not entitle ATCO Electric to maintain the cleared area in the future. A VCE, however, grants the right to maintain the cleared area and requires rehabilitation upon surrender.

11. All line clearing activities are to be coordinated through the respective Forest Operations Coordinator and District office.

12. Once an individual hazard tree removal program is complete for a line or geographic area an acknowledgement of the work completed is required from ASRD. This acknowledgement will limit ATCO's liability in the event of a tree related fire in the future. Therefore, acknowledgement letters must be filed accordingly.

| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

### *4.2.4 Planning Distribution Lines for Tree Freeing (VCE)*

*PURPOSE* *To outline the standard for maintaining a tree free 25kV or 14.4 kV distribution right-of-way.*

1. Some distribution line rights-of-way may be selected for maintenance at a "tree free" width.

2. Candidate power lines are selected for tree freeing based on the following criteria:
   - significance of service,
   - remoteness, and
   - degree of risk from adjacent stands.

   The local forest operations coordinator will evaluate potential tree-free candidate lines in consultation with the local servicemen.

3. On private land, additional tree free widths will be negotiated with the land owner.

4. On Crown land, authority must be granted by the Crown, through a VCE.

5. Identified lines are ranked according to priority and reviewed with the local Forest Officer for general agreement on the list of candidate areas.

6. The list is submitted to the Senior Forester in Edmonton for review and scheduling.

7. The senior forester will develop a five year plan for completion of the projects and include it in the Fire Control Plan.

8. Co-coordinator will proceed with tree free projects in their area in accordance with the schedule developed by the Senior Forester.

9. Although VCE's will be obtained from ASRD for every tree free project, TFA's may be sought for early entry after an application for a VCE has been submitted (in some cases, a forest officer may grant early entry prior to VCE application, although this is rare).

10. Timber will be salvaged according to direction from ASRD, typically based on information contained in the EFR. A field review by the Forest Officer may be required.

11. VCE areas are not typically maintained for distribution lines but specific hazards will be addressed if identified during patrols.

### *4.2.5 Standard for Fire Suppression on Crown Lands*

*PURPOSE: To outline the Maintenance Standard for fire suppression on Crown lands.*

1. During the fire season, company and contractor vehicles shall be equipped, at minimum, with a serviceable shovel, axe and a backpack pump of at least five liters liquid capacity. All ATV's shall be equipped with a collapsible shovel. All vehicles or work sites with three or more employees must meet additional fire fighting equipment requirements, as indicated in Table 1302-1, Section 1302 of the *Safety Standards Manual*.

2. The Forest and Prairie Protection Act requires that any person carrying on or having charge of an industrial or commercial operation in or within one kilometre of any public land shall have on hand fire fighting equipment in accordance with the regulations capable of controlling and suppressing any fire that may occur directly or indirectly as a result of the operation (See the Table A, below from the Forest and Prairie Protection Regulations, Part I). Note that ASRD may require a fire control plan and burning permit for any burning.

**TABLE A**

| Required Equipment for Fire Control | Men Employed at the Site of Operations | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 1 | 2 | 3 | 4 | 5 | 6-10 | 11-20 | 21-30 | 31-40 | 41+ |
| Shovels | 1 | 1 | 2 | 2 | 3 | 5 | 10 | 15 | 20 | Same as 31-40 plus increase by Minister |
| Backpack with Pump | 0 | 0 | 1 | 2 | 3 | 5 | 10 | 15 | 20 | |
| Axe or Pulaski | 0 | 1 | 1 | 1 | 2 | 5 | 10 | 15 | 20 | |
| Fire Pump | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | |
| Fire Hose (metres) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 450 | 450 | |
| Power saws | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | |

3. All fires, regardless of size, must be reported to the Sustainable Resource Development and AE's Forest Operations group as soon as possible. This also pertains to fires extinguished by employees, contractors or others.

ATCO Electric

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Right-of-Way |

4. The fire season is from April 1 to October 31 or as established by the Minister of Forests. During the fire season, no person shall light an outdoor fire on land in a permit area unless that person is a holder of an existing fire permit.

5. Outside the fire season, brushing debris and non-salvage timber may be disposed of by burning, upon approval of ASRD.

6. Contractors working on behalf of ATCO Electric in right-of-way clearing and burning, are required to verify that all fires are extinguished. A return trip to all burn locations is required to ensure that holdover fires do not exist.

|---|---|---|---|
| 97-05-20 | R0 | 14 | 4.3 |
| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Environmental Protection |

## *4.3 Environmental Protection*

*PURPOSE: To outline the standards to achieve good environmental stewardship in right-of-way vegetation management.*

*4.3.1.General Program Requirements*

1) All programs will meet all applicable environmental legislation requirements.

2) All programs will follow the guidelines set forth in the Industrial Vegetation Management Association of Alberta's Industry Standards and Good Practices for Vegetation Management (Current Edition)

3) All programs will follow the Corporate Principles and Policies (HSE 2P Manual) and the Safety Standards Manual.

*4.3.2 Specific Requirements*

The applicable provincial legislation for environmental protection are:

- the *Species at Risk Act* (SARA) which is concerned with the protection of at-risk and endangered species, and
- the *Fisheries Act* which is concerned with the protection of fish and fish habitat

Both Alberta Environment and Department of Fisheries and Oceans have published guides and best practices for activities in and around water bodies. All right-of-way clearing and maintenance activities are to comply with these documents.

1. Buffers

To ensure herbicide products do not enter water courses, buffers will be maintained at all watercourses. Buffer widths will be determined by the specific herbicide used, as well as the application technique. (Refer to the AEP Code of Practice for Pesticides for specific references)

- All broadcast foliar applications require a 30 meter buffer to all watercourses.
- The use of Tordon 101 requires a buffer of 30 meters.

- Garlon 4 (triclopyr), Roundup (glyphosate) and Dycleer 24 (dicamba + 2,4-D) can be applied between 5 and 30 horizontal meters of an open body of water if using backpacks or a method that treats individual woody plants. Treatments are limited to less than 30% of the total vegetation present.

2. Water Body Crossings

To minimize soil compaction and damage to water quality and fish habitat, ATCO Electric will follow the Guidelines for Waterbody Crossings issued by Alberta Environment and the Best Practices for Waterbody Crossings issued by the Department of Fisheries and Oceans.

3. Soil Erosion

Erodible soils and steep slopes will be managed to encourage a dense cover of compatible species. Woody plants provide a far more extensive root system than most grasses, forbs and sedges. Compatible woody plants are to be fostered on the right of way in areas prone to soil erosion. In these areas woody shrubs should not be removed. Surface water movement over slopes should be controlled to minimize erosion. Use of properly situated diversion ditches will help minimize the likelihood of soil erosion and allow a plant community to establish. 6. Native vegetation is to be retained on all erosion prone sites. Selective hand removal should be considered for non-compatible vegetation.

4. Soil Compaction

Heavy equipment can damage soil through compaction and rutting which can lead to erosion. The use of heavy equipment should be avoided on slopes, near water bodies, and erosion prone areas. If heavy equipment must be used, low ground pressure equipment is preferred.

5. Habitat

Many species of wildlife utilize the right of way for habitat. Maintenance should be scheduled at times that minimize impacts to animals. Where possible, habitat enhancement should be considered for rare or endangered species. AEP Fish and Wildlife can assist with providing useful information pertaining to species requirements.

ATCO Electric

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Environmental Protection |

6. Emergency Spill Response

Crews working with heavy equipment, herbicides, fuels/oil or other substances shall be equipped with spill response kits in accordance with the requirements of Section 1203 and Appendix D of the Safety Standards Manual. WHMIS and TDG regulations must be followed where applicable.

Unauthorized releases must be reported as per the Safety Standards Manual, Section 1203 and the HSE 2P Manual.

7. Environmental Stewardship

Work sites shall be kept clean at all times. All litter and excess materials are to be removed from the right-of-way areas. Right-of-way and facility sites are to be maintained and kept in an environmentally acceptable condition.

Heavy equipment should be in good repair, without leaks, and must be inspected for cleanliness by the contractor prior to the start of each project. ATCO Electric coordinators will also inspect the condition of equipment during general contract inspections.

Fuel shall be transported and stored only in appropriate containers. Fueling should only take place in areas where any releases will not reach any natural water body.

Herbicides shall be handled in accordance with all applicable legislation and practice manuals, Namely

i. The Environmental Protection and Enhancement Act,
ii. the Pesticide Sales, Handling, and Use and Application Regulation,
iii. the Pesticide (Ministerial) Regulation (AR 43/97), and
iv. the Code of Practice for Pesticides

The safe handling of pesticides is dealt with in greater detail in Sections 4.9 and 4.10

| RIGHT-OF-WAY MAINTENANCE | Patrol/Inspection |

***4.4 Standard for Distribution Right-of-Way Vegetation Patrols and Inspections***

*PURPOSE: To specify the standard for patrolling and inspecting distribution rights-of-way and for the consenting of activities*

Overall, right-of-way patrols are completed in order to gather information that will allow for the development of appropriate vegetation treatments and schedules. By scheduling the right treatments at the right times, the Company can:

a) Provide for the economic, orderly, and efficient operation of the distribution system,
b) Comply with the requirements of the Hydro and Electrical Energy Act, which seeks the observance of safe and efficient practices in the distribution of electric energy.

1. The immediate objectives of distribution right-of-way patrols and inspections are to:

a) Document the condition of the right-of-way
b) Confirm that work is being carried out as planned
c) Identify and correct environmental damage

2. Once the physical condition of the right-of-way is documented, a maintenance schedule can be developed. The objectives of the maintenance activities are to provide for:

a) Access to Facilities

Right-of-way are maintained to ensure physical access to the right-of-way and to permit visual assessments of the electrical facilities.

b) Public and Worker Safety

Right-of-way maintenance activities are scheduled to prevent and eliminate hazards to employees and the public. Safety hazards noted during patrols are to be corrected as soon as possible.

c) Security of Facilities

Tree and tree-related contacts can result in outages, threaten system integrity and physical integrity. Therefore, distribution rights-of-way must be maintained free of hazards wherever possible. This includes removing or altering trees within striking distance of any electrical facility. Patrols and subsequent maintenance activities must be conducted at regular intervals to ensure that vegetation does not grow to the point where security is threatened.

d) Identification of Potential Fire Hazards

In addition to threatening the integrity of the distribution system, hazard trees represent a high risk of fire in the event of a line contact. Regular patrols and maintenance activities serve to reduce the risk of fire from hazard trees. Hazard reduction programs are described in detail in the annual Wildfire Agreement Plan between ATCO Electric Ltd. and ASRD.

e) Correction of Environmental Damage

Soil erosion, rutting, and compaction, or conditions with the potential to damage water bodies, must be corrected. Once a problem or potential problem has been identified, a reclamation plan is developed to address the cause. Plans may range from minimal soil stability work to the relocation of facilities and should include a schedule of monitoring. The plan should be implemented in a timely manner. Reclamation problems identified by Alberta Forestry Lands and Wildlife must also be rectified as soon as possible.

ATCO Electric

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Patrol/Inspection |

3. Timing of patrols and inspections:

a) The distribution system is maintained on a geographic area basis, generally by customer class (e.g. by city, rural, oilfield, etc.). An on-the-ground distribution right-of-way patrol or inspection is completed at least once in every three year period. At that time, every site along the right-of-way is viewed and the condition of the vegetation is documented. Every site is assigned a year by which time the vegetation must be treated in order to maintain required clearances between treatments or, in the case of spray, the last year by which chemicals can still be applied. The operation and rules for clearances are contained in the table below:

| **Operation** | **Guide for Scheduling Treatments (maximums)** |
|---|---|
| Trim | Section 10-002(2) Subsection 3.1.7 of the ECUC. These distances must be maintained at all times, including the time between trims:<br>1. Vertical distance of 2.0m and horizontal distance of 1.0m plus distance to prevent flashover to any part of a tree that will support a person,<br>2. Vertical distance of 0.6m and horizontal distance of 0.3m plus distance to prevent flashover to any part of a tree that will <u>not</u> support a person,<br>Where the line is operated <750 volts, and is metal sheathed, polyethylene covered or insulated - up to but not touching. |
| Mow/Slash | Same as for vertical clearance on Trim |
| Grass Mow | Estimated size of brush not to exceed 2.5 centimetres diameter or 2.5 metres in height |
| Spray | Not to exceed:<br>**<u>1.5m</u>** in height adjacent to a <u>numbered highway</u> or **<u>2.5m</u>** adjacent to a <u>road</u> (unless < 30% of the woody plants being controlled on a one kilometre span exceed the heights specified in that section and any vegetation > 4m height is removed > 1 year after treatment).<br>**4.0m** on a <u>cross-country ROW</u><br>(see Section 12 of the *Code of Practice for Pesticides*) |

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Patrol/Inspection |

Site specific information and experience are required to determine the subsequent treatment due to the variable growth rates of vegetation throughout the province.

A three to five year period year period is the maximum allowable, based on experience, to capture the vegetation condition in time for appropriate treatment. Vegetation must be treated before it becomes an obstacle for safe and efficient operation of the system, or becomes expensive to maintain because of its proximity to energized facilities. In the case of herbicide programs, patrols must be completed in time for programs to proceed before the vegetation reaches a maximum treatable height.

4. Notation and data collection:

a) A written or data record outlining the maintenance requirements for each site is prepared. This notation will log all comments and field instructions pertaining to the required field work. Field notation will be ATCO Electric standard brushing notation, guided by project specifications and survey brushing notes.

b) Worksites are identified by property boundaries and physical features and referenced to known locations or markers, if available. Water courses and water bodies should be referenced to known locations, structure numbers or aerial markers. Some cross-country distribution lines have an aerial marker every tenth structure so that significant reference points can be recorded in relation to the distribution power lines. Buffer areas are to be retained where possible along all water courses and water bodies.

c) Treatment is described by brush species, height, area, the operation to be conducted and the year by which the treatment should be completed. Factors affecting the completion of the work (access, ground conditions, government requirements, etc.) are also be recorded. Maps, drawings, and landowner conditions complete the information.

|---|---|
| RIGHT-OF-WAY MAINTENANCE | Landowner Consenting |

## *4.5 Landowner Consenting*

*PURPOSE: To outline the procedure for gaining access to private or public lands for right-of-way maintenance.*

1. ATCO Electric will make reasonable attempts to obtain permission from all affected land owners and occupants prior to vegetation management on distribution line rights-of-way. If the lands are covered by easements, and the work required warrants immediate attention, the work may proceed without consent under the direction of the Forest Operations Coordinator or supervisor.

2. Verbal consent for access and maintenance is acceptable, but a signed permission form is preferred. Verbal consents must be documented on a permission form. In either case, the date the permission was obtained must be recorded on the form.

3. Where personal contact is made, the landowner or occupant shall be provided a copy of the permission form.

4. Consenting may be performed either by the Company or a contractor.

5. Substandard work arising from consents that are unclear, misrepresent either the landowner conditions or the work to be undertaken, or omit relevant and necessary information are the responsibility of the consenting company. If the consenting is performed by ATCO Electric, the company would be responsible to resolve landowner or occupant concerns. All consenting companies shall carry insurance that insurance meets ATCO Electric requirements.

6. The consent form shall describe the location and scope of the work, the conditions and concerns of the landowner, the landowner or occupant address and the name of the person that granted permission.

7. Liability resulting from deviations from the work described in the consent form shall be the responsibility of the contracting company performing the field work.

8. For locations that will require repeat vegetation maintenance, the consenter will attempt to obtain a permanent consent from the land owner.

9. Consenters may not negotiate an interest in land. The sites requiring land interest must be identified to the Forest Operations Coordinator. Such interests may only be negotiated by an ATCO Electric Land Agent.

10. Where work is required within the traditional territory of aboriginal people, ATCO Electric will consult appropriately with the affected community.

| RIGHT-OF-WAY MAINTENANCE | Contracting |

## *4.6 Contracting*

### *4.6.1 Contract Packages*

*PURPOSE: To define the requirements and information to be supplied to contractors prior to initiating work*

1) ***Maps*** are supplied to the contractor assigned to do the work as part of the tender package and should depict:

   a) Location of the power line
   b) Legal land locations
   c) Location item numbers
   d) Topographical information such as water bodies, access roads, and developments

2) Completed ***landowner permission forms*** constitute the work instructions for each of the land locations

3) The ***workplan*** summarizes the treatments and areas contained in the permission forms.

4) **Easements**.

5) ***Work Specifications*** serves as the standards for work quality, cleanup requirements and general expectations of the contractor. Specifications shall give clear direction on work quality expected and also any operational concerns (See Appendix 4.15.1, 4.15.2 and 4.15.3 for sample work specifications).

6) The ***contract***. All maintenance work is carried out under an hourly, unit rate or lump sum contract (See Appendix 4.15.4 for sample contracts).

7) The ***Pre-job Safety Analysis***. Prior to the start of work, a job safety analysis (JSA) must be completed by the contractor and approved by AE. Copies of the JSA must be kept on site by the crews performing the work. JSA's form part of the contract documents.

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Contracting |

## *4.6.2 Hiring of Contractors*

*PURPOSE: To outline the requirements for the procurement of right-of-way maintenance contractors.*

### *4.6.2(1) General Requirements*

All work done around energized electrical equipment will be completed under the supervision of a certified Utility Tree Trimmer (UTT), or a Tree Worker (UTW) unless otherwise authorized by the Forest Operations Coordinator. UTTs and UTWs must be certifies by the IVMAA or other body acceptable to the Chief Electrical Inspector, Electrical Protection Branch, Alberta Labor.

### *4.6.2(2) Health Safety and Environment (HSE) 2-P's Manual*

All hiring of contractors will follow the guidelines as set out in the Health, Safety and Environment 2P's Manual.

### *4.6.2(3) Prequalification*

ATCO Electric Ltd. maintains a list of pre-qualified contractors that are routinely engaged in the completion of maintenance work. Other, non-prequalified and unlisted contractors are utilized on as "as-needs" basis. Whether pre-qualified or not, all contractors either meet the requirements of the HSE 2-P's Manual, or are provided direct supervision by the company.

If a contractor's services are absolutely essential and the contractor does not hold a valid COR and is not pre-qualified, then at a minimum, the contractor must have a satisfactory safety system in place and have competent workers. If there is any doubt about the contractor's safety system or the competence of its workers, ATCO Electric will provide direct supervision of the contracted work.

***4.6.2(4) Insurance***

The coordinator in charge will assure current requirements in the following are up to date and valid Insurance.

a) General Liability-minimum of $2 million Comprehensive General Liability (CGL) must include non-owned auto which covers any and all leased vehicles, blanket contractual liability which covers liability assumed by the contractor.
b) Auto-owned (and not owned if not included in GL) Automobile liability with a minimum inclusive limit of $2 million.
c) Forest Fire Fighting-minimum liability of $2,000,000 for each occurrence (sublimit of CGL).

*Note: a copy of current contractors with insurance requirements can be obtained from AE Risk Management.*

***4.6.2(5) One Time Job Under $10,000 Value***

It is ATCO Electric policy that all employers with which it contracts shall be responsible for its own WCB insurance premiums. Further, all contracted employers must, under the terms of the contract, provide verification of such coverage when requested. If this requirement is specifically waived, it must be confirmed in writing and the responsibility for WCB premium payment defaults to ATCO Electric. Incidents involving contracted employers and WCB claims ultimately impact on ATCO Electric's experience rating and related premiums.

Where a contractor does not have WCB coverage, they can still be used for simple (i.e. not complex or high hazard), one-time jobs valued at less than $10,000. The following is a list of minimum standards or actions for such instances:

a) Contact ATCO Electric Corporate Risk Management to inform them of the contractor and the job description (provide a copy of the Purchase order, if requested)

b) Contact Corporate Health & Safety to inform them of the work to cover the contractor working under AE's WCB.

c) Conduct a worksite orientation with all contractor employees to ensure they are aware of the hazards and have appropriate barriers in place.

d) Ensure a jobplan/tailboard is completed

WCB is checked by Accounts Payable prior to the payment of the invoice. If it is a one man company, or small contractor, then Accounts Payable will add the amount to payroll and cover the contractors employees under AE's WCB (i.e. as temporary employees).

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Herbicides |

## *4.8 Herbicide Application*

*PURPOSE: To outline the requirements governing herbicide application on distribution right of ways.*

*The legislated requirements regarding the storage and handling of pesticide products is found in the Alberta Environmental Protection and Enhancement Act, Pesticide Sales, Handling, Use and Application Regulation (126/93)*

### *4.8.1 Selection of pesticide products*

- All herbicides used will be registered with a valid PCP identifier label.
- All herbicides used must have an industrial label registration.
- Herbicides used on agricultural lands may have an agricultural or industrial label registration.
- Herbicides must be selected based on their characteristics. The criteria considered are toxicity, persistence, efficacy, selectivity, mobility, and cost.
- Non-residual herbicides should be used in areas with high water tables, next to tree line or sensitive vegetation, or where hazards may be associated with the potential migration of the product.
- Residual herbicides may be used where there is no anticipated migration of the herbicide, or in controlled site areas.
- As much as possible, selective herbicides will be used in order to control only incompatible Vegetation.
- Non-selective herbicides may be used to obtain total vegetation control in areas of bare ground.

### *4.8.2 Applicators*

- All persons hired to apply pesticides must possess a valid Alberta Industrial Class applicators certificate, or be under the direct on site supervision of an individual who possesses the certificate.
- Applicators will be under the employment of a contractor who has a current Service Registration with AEP Pesticide Chemicals Branch.

|---|---|
| RIGHT-OF-WAY MAINTENANCE | Herbicides |

***4.8.3 Application***

Due to the fact that herbicides are applied by contract crews using a variety of equipment, the application procedures reside with the contractor. At the JSA or pre-job meeting, the Forest Operations Coordinator will ensure that the contractor has detailed procedures available for the following:

1. Handling storage
2. Transportation
3. Disposal of used containers
4. Mixing of herbicide solutions
5. Application techniques
6. Personal protective equipment
7. Unauthorized release response and clean-up

Registered herbicide products shall be applied at recommended label rates and conform to provincial and federal legislation as well as IVMAA Standards and Good Practices. Only registered herbicide tank mixtures will be allowed. The mixture must be on the label or approved in writings by AE.

|---|---|
| RIGHT-OF-WAY MAINTENANCE | Pesticide Products and Containers |

## *4.9 Transportation, Storage and Disposal of Pesticide Products and Containers*

*PURPOSE: To outline the standard for disposal of pesticide products and pesticide product containers.*

1. Disposal of pesticide products and pesticide product containers is addressed by the Alberta Environmental Protection and Enhancement Act, administered by Alberta Environment.

2. Container disposal sites have been established throughout the province for the collection of used pesticide containers. At least one container disposal site is located in each municipality throughout the province. These sites are to be the only places where used pesticide product containers are to be deposited. Plastic containers are not to be burned or buried and metal containers are not to be buried or flattened and left. The contractor must contact the local district agriculturist to determine both permanent and temporary container collection sites. This requirement will be included in the JSA.

3. Pesticide product containers that are not re-useable are to be:

   a) Triple Rinsed: Pour rinseade back into the spray tank.

   b) Punctured: Pesticide containers, once triple rinsed, are to be punctured so as not to be re-used.

   c) Deposited: Provincially approved pesticide container disposal sites are the only sites where pesticide containers are to be deposited.

4. Containers of pesticide products are not to be cached in the forested or agricultural areas. Only sites approved by Alberta Environment may be used for temporary storage.

5. The Clean Water Act requires that no water contaminants are to be permitted to enter water at any time, unless approved by Alberta Environment.

6. Alberta Environment and ATCO Electric Ltd. shall be notified of all unintentional emissions or discharges of agricultural chemicals or substances containing agricultural chemicals on or into the natural environment that are not as previously approved by Alberta Environment or recommended by the manufacturer. Alberta Environment 1-800-222-6514.

7. Excess herbicide spray solution is to be applied to non-compatible vegetation in a section of the right of way in a manner that avoids excessive concentration of active ingredient.

| RIGHT-OF-WAY MAINTENANCE | Mechanical Work |

## *4.10 Mechanical Work*

*PURPOSE: To outline the specific safety observances required for mechanical vegetation control.*

### *4.10.1 Mowing*

- Areas to be mowed must be pre-mowed to the limits of approach of the operator.
- Workers must be qualified and competent to do the work. The mower operator should have at least Electrical Safety Awareness training as offered by the IVMAA through Old's College.

### *4.10.2 Trimming*

- Workers must have a valid Utility Tree Trimmer certificate or be under the direct supervision of a certificate holder.
- Crews must be competent in the operation of aerial devices and rescue techniques.
- Climbing and other trim crews must follow ATCO Electric Transmission Department Policy Trimming Operations in Trees.

### *4.10.3 Slashing*

- Crew must be under the supervision of a Utility Tree Worker or Utility Tree Trimmer as per the OH&S Act and ECUC.

| RIGHT-OF-WAY MAINTENANCE | Weeds |

## *4.11 Weed Control on ATCO Electric Property, Public Lands or Private Lands*

*PURPOSE: To outline the standard required for weed control on public, private and ATCO-owned property.*

1. The Weed Control Act of Alberta authorizes inspectors to issue orders for land occupants or owners to destroy all restricted or noxious weeds growing or located on the land as often as necessary to prevent the spread, growth, ripening or scattering of the restricted weeds, and to control all noxious weeds.

2. The Weed Control Act indicates that no person shall deposit or permit to be deposited any weed seeds or material containing weed seeds in any place where they might grow or spread.

3. Concerning public lands the holder of a disposition shall, with respect to the land contained in this disposition:

   a) Use only First Class Seed that is free and clear of all noxious and restricted weeds.

   b) Cut, keep down and destroy all noxious and restricted weeds.

4. When movement of machinery or vehicles is likely to cause the spread of restricted, noxious or nuisance weeds they are not to be moved. Vehicles are to be cleaned and weeds or weed seeds destroyed.

5. On private lands weed control is the responsibility of the landowner.

6. On privately owned lands where ATCO Electric has easement but annual rental payments for distribution facilities are not made, it is appropriate that ATCO Electric assist with weed control by incurring all or part of the application cost. However, ATCO Electric employees should not supply chemical product to private landowners.

7. In municipal Districts and Counties where distribution lines are located on the road allowance, weed control on the road allowance area is the responsibility of the municipality.

|---|---|
| RIGHT-OF-WAY MAINTENANCE | Weeds |

8. Schedule of Restricted and Noxious Weeds in Alberta.
Note: Local authorities may make by-laws designating weeds to a higher category within the municipal boundaries.

**Restricted Weeds:**

Red bartsia – Odontites serotina
Diffuse knapweed - Centaurea diffusa
Spotted knapweed - Centaurea maculosa
Nodding thistle - Carduus nutans
Eurasian Water Milfoil - Myriophyllum spicatum
Doddler - Cuscuta spp.
Yellow star-thistle - Centaurea solstitialis.

**Noxious Weeds:**

Russian knapweed - Centaurea repens
Field bindweed - Convolvulus arvensis
White Cockle - Lychnis alba
Bladder campion - Silene cucubalus
Cleavers - Galium aparine
Hoary cress - Cardaria spp
Knawel - Scleranthus annuus
Perennial sow thistle - Sonchus arvensis
Cypress spurge - Euphorbia cyparissias
Leafy spurge - Euphorbia esual
Stork's bill - Erodium cicutarium
Canada thistle - Cirsium arvense
Toadflax - Linaria vulgaris
Persian darnel - Lolium persicum
Scentless Chamomile - Matricaris maritima
Common tansy - Tanacetum vulgare
Blueweed -Echium vulgare L.
Ox-eye daisy - Chrysanthemum leucanthemum.
Spreading dogbane - Apocynum androsaemifolium.
Field scabious - Knautia arvensis.
Hound's tongue - Cynoglossum officinale.
Tall buttercup - Ranunculus acris.
Purple loosestrife - Lythrum salicaria

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Vegetation Maintenance on Facilities |

## *4.12 Substations, Yards and Storage Facilities*

*PURPOSE: To outline the standard for vegetation maintenance at substations, yards and storage facilities.*

Permanent facility site vegetation records are to be established for each substation and storage facility location receiving herbicide treatment. The following information should be stored:

- Name of facility
- Legal land location
- Area
- Soil conditions
- Vegetation present at site and adjacent vegetation
- Soil stability
- Environmental concerns
- Arial pictures and sketch of substation and yard sites

Methods of vegetation control can include removal of hazard trees, mowing, digging and burning of weeds, picking of flower heads before seed dispersal and herbicide control. Decisions on methods of control should be made as to the most effective means of controlling the non-compatible vegetation. Besides hazard tree removal, the preferred method of control for distribution facilities is by the use of herbicide.

Substation and communication sites should be inspected annually, if possible, for the presence of noxious and restricted weeds. Inspections should not be less frequent than once in each three year period.

Selection of herbicide control should be dependent on soil type, adjacent land use, potential run-off problems and type of vegetation.

Herbicide vegetation management consists of non-selective bare ground or selective vegetation control. Herbicides used are non-residual, short- or long-term residual. For best results, short and long term treatments should be alternated over time.

ATCO Electric

**DISTRIBUTION LINE MAINTENANCE STANDARDS**

| ORIGINAL DATE | REVISION NO. | PAGE | INDEX NO. |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Vegetation Maintenance on Facilities |

Vegetation maintenance on substation sites should include:

- Bare ground vegetation control for all graveled areas. This could include non-selective residual or non-selective non-residual herbicides.
- Bare ground vegetation control for access roads using non-selective non-residual herbicides or non-selective short term residual herbicides.
- Woody vegetation and weed control for all remaining property using selective non-residual or selective residual herbicides.

Vegetation maintenance on yards and storage facilities should include:

- bare ground vegetation control on graveled areas using non-selective non-residual herbicides or non-selective short term residual herbicides.
- Woody vegetation and weed control for all remaining property using selective non-residual or selective residual herbicides.

No person shall enter a substation except under the direct supervision of a qualified utility employee or a utility employee who has completed P.S.S.P. training and is granted access by their supervisor. Contracted employees may be granted access, without supervision, to complete herbicide work inside substations, if the proper training has been completed. See Section 300 of the TSOP - Substation/Site Entry

|---|---|
| RIGHT-OF-WAY MAINTENANCE | Wood Debris and Timber Salvage |

## *4.13 Standard for Disposal of Wood Debris and Salvage of Timber*

*PURPOSE: To outline the standard for disposal of woody debris and salvage timber from Distribution Right-Of-Way Maintenance Programs.*

### *4.13.1 Agricultural Areas*

1. The consenter will confirm with the landowner the method for dealing with salvage wood. If the landowner so desires, wood is to be cut into pre-determined lengths and piled on the landowners property. Otherwise, all woody debris must be destroyed on site by means acceptable to the landowner or completely removed from the property.

2. If woody debris is to be chipped, the wood chips should remain at the work site if approval is obtained from the landowner or municipality. Otherwise, wood chips should be removed from the property and disposed of at an approved facility.

3. Wood chips shall not be dumped in large piles but evenly distributed over the work area, and wood chips are not to be larger than 8cm x 6cm x 1.5cm (72cu cm). Rails resulting from mowing or mulching operations shall not exceed 1 meter length or 10 cm diameter.

4. Care is to be taken to ensure that wood chips or other debris will not block culverts or result in landowner concern.

5. Burning of brush piles is not recommended as a procedure in agricultural areas because of the risk of uncontrolled wildfire. Automobile tires are not to be used for burning. Brush piles are to be promptly disposed of by chipping, mowing or mulching.

6. Any burning done in the agricultural areas must be authorized by the respective municipal government. During the fire season (usually from April 1 to October 31) the contractor must obtain a fire permit before igniting a fire in the Forest Protection Area. In the White Zone, the municipality may require burning permits at other times of the year.

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Wood Debris and Timber Salvage |

### *4.13.2 Forested Areas*

1. Total disposal of woody debris by burning (preferred method), mulching or chipping is required. Every fire must be controlled and attended by a responsible person or persons approved by a Forest Officer or Fire Guardian. Disposal of wood by chipping and dispersal of wood chips should be considered as an option to suppress re-growth of non-compatible vegetation. If volume of re-growth is low then falling of trees and bucking to the ground may be a viable option.

2. The volume, utilization standards, and species of salvageable timber will be determined by Alberta Forest Service at the District Office or Ranger Station. Special conditions may be negotiated on an individual basis.

3. When road access is available and timber volumes are sufficient, salvage of both coniferous and deciduous species may be a requirement.

4. After twelve months, timber decks become the property of Crown unless other arrangements have been made with Alberta Forest Service Timber Management Regulation AR60/73, Section 110.

5. Log decks are to be positioned in landing areas so that they are readily accessible for pick-up and do not create a roadside hazard. Refer to the requirements of Forest Management Companies regarding salvage. Timber decks are not to be positioned beneath power lines and power lines are not to be constructed over timber decks as future moving may create a safety hazard.

6. Care should be taken to ensure that smoke from burning operations does not create a road hazard. Approval from Alberta Transportation and Utilities is required when burning brush near primary roadways.

| RIGHT-OF-WAY MAINTENANCE | Glossary of Terms |

**Compatible Vegetation:** Plant species that demonstrates growth characteristics which compliment the operation and maintenance of a power lines system. These plants are generally low growing, perennial and at times compete to displace incompatible plant species.

**Crown Land:** Land owned by the federal or provincial government.

**Dangerous Good:** A product, substance or organism specified in the regulations or included by its nature in any of the classes listed in the regulations.

**Easement:** A non-possessing interest acquired by one person on the land of another, permitting partial use of the other's land for a specific purpose, such as a Right-of-Way across it.

**ECUC:** Electrical and Communication Utility Code.

**Forest Management Agreement:** The Minister of Forestry Lands and Wildlife with approval of the Lieutenant Governor in Council may enter into a forest management agreement with any person to enable that person to enter on forest lands for the purpose of establishing, growing and harvesting timber in a manner designated to provide a perpetual sustained yield.

**Forest Management Areas:** Refers to public lands which a forest management agreement or forest management lease has been entered into. The area refers to a tract of forest land over which a company has been given management rights to establish, grow and harvest trees on a perpetual sustained yield basis for a defined period of time.

**Forest Protection Area:** A tract of public land which for the purpose of facilitating fire control was by an Order of the Lieutenant Governor in Council designated as a "forest protection area."

**Fire Guardian:** A person appointed as a fire guardian by the Minister or by a Municipal District under the Forest and Prairie Protection Act.

**Green Area:** Means the area outlined and colored green on a map annexed to the Order Classifying Public Lands dated April 16, 1963 and published in the Alberta Gazette on April 30, 1963, as amended from time to time.

**Hazardous Substance:** A product or substance that is included in Division 2 of Class 9 in List II of Schedule II of the Transportation of Dangerous Goods Regulation.

**Hazard Trees:** These are trees that are dead, diseased or not wind firm that because of their condition pose an immediate danger to the normal operation of the electrical facility.

**Herbicide:** A pesticide product used to destroy or inhibit plant growth.

**Industrial Applicator:** An individual licensed by Alberta Environment to apply pesticides on public land.

**Incompatible Vegetation:** Quick growing plant species that have growth potential sufficient to interfere with the safe and reliable supply of electric power.

**Inspection:** A site specific inspection of the right of way to review completed work or detail required work. This may be completed in conjunction with or apart from the fly by or drive by patrol.

**I.V.M.A.A.:** The Industrial Vegetation Management Association of Alberta.

**Lessor:** The person who grants the use of property by way of a lease to a tenant.

**Non-residual herbicide** A herbicide which is not persistent in soil and is only active upon contact with plants above ground.

**Notation:** A system of characters, symbols and abbreviations used in an art or science to express technical facts or quantities.

**Noxious Weed:** A plant that is designated under the regulations or a bylaw as a noxious weed and includes noxious weed seeds.

**Nuisance Weed:** A plant that is designated under the regulations or a bylaw as a nuisance weed and includes nuisance weed seeds.

**Open Body of Water:** The bed and shore of an irrigation canal, drainage canal, reservoir, river, stream, creek, lake, marsh or other body of water, but does not include the following:

(i) Water works system;
(ii) Reservoirs, lakes, marshes or other bodies of water that are completely surrounded by private land, that have an area of less than 4 hectares and have no outflow of water beyond the private land;
(iii) Reservoirs, lakes, marshes or other bodies of water that are located on public land, that have an area of less than 0.4 hectares, and have no outflow of water;
(iv) Irrigation and drainage canals that are completely surrounded by private land and have no outflow beyond the private land;
(v) Roadside ditches;
(vi) Water system;
(vii) Storm drainage systems;
(viii) Dry streams having a bed and shore averaging 0.5 metres or less in width within the boundaries of the treatment area.

**Owner:** The person in whose name a certificate of title to land is issued under the land titles act or if no certificate of title to the land is issued, the Crown or other body administering the land.

**Patrol:** A fly by or drive by of facilities at which time a cursory review is completed.

**Perennial:** A plant which persists from year to year and usually produces reproductive structures in two or more different years.

**Pesticide:** Any substance intended for controlling insects, rodents, fungi, weeds, and other forms of plants or animal life that are considered to be pests. Antibiotic drugs are not considered pesticides, and vice versa.

| RIGHT-OF-WAY MAINTENANCE | Glossary of Terms |

**Right-of-Way:** A legal right of passage over another person's ground used by the Electric Utility Company to transmit or distribute electricity. It is the area of land utilized for the construction, security, access and maintenance of the power lines facility. On Crown lands, this area will have a surface disposition as a power lines easement (E.Z.E.) and/or vegetation control easement (V.C.E.) and the right of way may overlap other facilities ie: (L.O.C.) License of Occupation.

**Right of Way Maintenance Program:** The Right of Way Maintenance Program employs a combination of procedures to alter the plant community where necessary along the right of way area so that electrical facilities function as designed recognizing safety and operating requirements.

By use of manual, mechanical, herbicide and biological controls the Right of Way Maintenance Programs endeavor to establish a relatively stable plant community that will result in a reduced requirement for future maintenance.

**Riparian Rights:** The rights of the owners of lands on the banks of watercourses to make advantageous use of the water on, under, or adjacent to their land, including the right to assertions.

**Riparian Vegetation:** Stream side vegetation.

**Selective Herbicide:** A herbicide that is more toxic to some species of plant than others.

**Timber:** All trees living or dead, of any size or species and whether standing, fallen, cut or extracted.

**Timber Deck:** A pile of salvaged logs at a landing area.

**TSOP** Transmission Safe Operating Procedures manual.

**Utility Tree Trimmer:** An employee certified by the Industrial Vegetation Management Association of Alberta or other agency acceptable to the Chief Electrical Inspector, to remove trees or portions of trees around power lines or other electrical equipment including aerial trimming in accordance with the requirements of the safety rules.

**Utility Employee:** (i) An employee trained to recognize hazards associated with energized electrical equipment or lines and trained and experienced to work safely around energized electrical equipment or lines in accordance with the requirements of the safety rules while performing duties assigned by an employer, and (ii) if an employer designates such duties, an employee trained and experienced to work safely on energized electrical equipment or lines operating at voltages below 750 Volts between conductors in accordance with the requirements of the safety rules.

**Utility Tree Worker:** An employee certified by the Industrial Vegetation Management Association of Alberta or other agency acceptable to the Chief Electrical Inspector, to remove trees or portions of trees around power lines or other electrical equipment not including aerial trimming in accordance with the requirements of the safety rules.

**Water:** All water on or under the surface of the ground.

**Watercourse:** Means

(i) The bed and shore of a river, stream, lake, creek, lagoon, swamp, marsh, or other natural body of water, or

(ii) A canal, ditch, reservoir or other man-made surface feature, whether it contains or conveys water continuous or intermittently, or

(iii) Refer to open body of water definition.

**White Area:** Titled land held under private ownership in non-forested, agricultural areas of the Province.

**Woody Vegetation:** means trees and shrubs.

### *4.16.1 Sample Maintenance Specifications for Mowing, Trimming and Slashing*

1. All limbs or stems which can not be disposed of will be cut into 1m. lengths and piled neatly on the edge of the right of way.

2. All limbs will be disposed of by chipping unless otherwise approved by ATCO Electric and the landowner.

3. Limbs and trees which have the potential to come within the safe limits of approach to the conductor will be roped off to control direction of fall.

4. All mowing should be done as close to the ground as possible.

5. Slash locations should have stump heights of no greater than **8 cm**. or as close to the ground as possible. All stumps left should have flat tops. Areas of steep slopes will have stump heights high enough to hold slashed material on the slopes.

6. Any rails left as the result of mowing will be less than 1.0 meter in length and laid flat to the ground. If rails are longer the area will be re-mowed, slashed or the rails chipped.

8. Chips will be blown back on the right of way and spread to minimize pile depth to **10 cm.** at the time of chipping.

9. All trimmed limbs will be cut flush with the branch collar.

10. All crews will have mobile communications on site at all times to ensure verbal contact with the Forest Operations Coordinator and the system control center in Vegreville.

11. Poles, guys or other obstacles will be marked and have an area cleared around them for a minimum radius of 1.5 meters whenever mowing.

12. All seed used will be **certified** and **cleaned** to be free of weeds. All tags from the seed will be saved and attached to the invoice.

ATCO Electric

|---|---|
| RIGHT-OF-WAY MAINTENANCE | Appendices |

13. Seeding will be done at such a time to ensure germination and survival of cover. (ie: not from Sept. - Oct.)

14. All seed mixtures will be pre approved by ATCO Electric and the landowner.

### *4.16.2 Sample Specifications for Herbicide Applications*

1. Incompatible vegetation is defined as poplar, aspen alder, spruce and pine, or any tall growing vegetation which has the potential to grow within 4 meters of the conductors.

2. All incompatible vegetation will be controlled with Garlon 4 applied at rate of 6L/Ha or tank mixture of 6L Garlon 4 per 1000L water. All applications must follow label recommendations.

3. Treatments must achieve 90% efficacy after 1 year or re-treatment will occur at the contractor's expense.

4. Areas that are missed during application will be redone the following growing season at the contractor's expense.

5. The contractor will notify all registered trapline holders, by registered mail, at least 10 days before applying herbicide. Copies of letters will be forwarded to ATCO Electric.

6. All crews will have mobile communications on site at all times to ensure verbal contact with the system control centre in Vegreville.

7. All applicators will be supervised by an applicator holding a valid Alberta industrial class applicators certificate.

8. Crown authorities and all landowners that request contact prior to work, will be notified a minimum of 2 days prior to start of application.

9. Applications will follow the guidelines set forth in the IVMAA's third edition of the industry standards and good practices for vegetation management.

10. All off-site damages due to drift, migration or misapplication will be reclaimed at the contractor's expense.

11. Any areas not treated must be recorded, by structure number, and supplied to ATCO Electric with a reason why the area was not treated.

12. Summary records of the application will be supplied at the completion of the job. These will include what herbicides were applied and what lands they were applied to.

13. All work locations not completed as indicated on the permission list will be deducted from the bid price. Holdbacks of 20% minimum will be kept until all work has been completed.

| RIGHT-OF-WAY MAINTENANCE | Appendices |

14. Failure to comply with any Specifications or the Standard Bid Document will result in the crew being shut down until all problems have been corrected.

15. All work locations are to be left neat and tidy, with brush disposal acceptable to both ATCO Electric and the landowner.

16. Crews will conduct Job Safety Analyses and tailboards.

17. All crews will be familiar with the *Electrical and Communication Utility Code* and the *Safe Limits of Approach* for tree work.

18. All crews will be familiar, and comply with, the *Alberta OH&S Act and regulations.*

19. All pipeline crossings must be identified and the pipeline owner contacted prior to crossing the pipeline. Crossing requirements of the pipeline owner will be complied with during the crossing.

### *4.16.3 Sample Specifications for All Distribution Work*

1. All work will be completed and invoiced by the date indicated in the Form of Tender or Contract.

2. Landowner permission forms are regarded as the work instructions. Any deviations must be approved by the Forest Operations Coordinator and arranged with the landowner.

3. The attached ATCO Electric map indicates the location of each brushing site. The patrol notation describes the estimated scope of work required at each location.

4. The contractor will be responsible for any damage to public or private property sustained while completing the identified work.

5. The crew foreman will contact Forest Operations Coordinator as indicated in the job planning meeting, in regard to work progress and, if any difficulties develop.

6. The crew foreman will contact the nearest ATCO Electric service area office and report daily their whereabouts.

7. An operational mobile telephone or ATCO Electric Company radio is required with each brushing crew.

8. Outages are to be arranged a minimum of 48-hrs.in advance with the local ATCO Electric operator in-charge.

9. All work locations will be mapped and the work done on each location will be recorded. This map will be submitted to Forest Operations Coordinator at the completion of the project.

10. The crew foreman will be familiar with and have in his possession, the `SPECIFICATIONS'.

11. Work locations not completed as indicated on the workplan will be deducted from the bid price.

12. The contractor may supply a separate price for all extra work locations not indicated on the attached maps or permission lists. Each location, however, must be approved by ATCO Electric Coordinator.

13. Any changes to brushing activities (as described on the Landowner Permissions form) will be documented (including landowner authorization) on the form, with the revised date and crew foreman signature. Such **changes require prior approval from the Forest Operations coordinator**.

ATCO Electric

**DISTRIBUTION LINE MAINTENANCE STANDARDS**

| ORIGINAL DATE | REVISION NO. | PAGE | INDEX NO. |

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Appendices |

14. Any deficiencies relevant to these specifications or to the "Landowner Permission" requirements will be neatly documented on the specific "Landowner Permissions" form or on an alternate, acceptable report. These "deficiency documents" will all be returned to Forest Operations prior to inspection (and final payment).

15. The contractor will document the status (i.e. bent, missing, or intact) of survey pins belonging to the Province of Alberta at mow locations. No mowing will take place within 0.3 m (1 foot) of any such survey markers or marker pits. Any disturbance or damage to intact survey markers, or marker pits, will require the contractor to bear the cost of their re-establishment.

16. All stumps will be cut as low as possible (no higher than 8 cm (3 in.)) with flat tops, unless required for slope stabilization.

17. All limbs will be disposed of by chipping, unless otherwise approved by the Forest Operations coordinator.

18. All limbs under or to the side of the power line will be trimmed using directional pruning techniques.

19. A Utility Tree Worker or Utility Tree Trimmer will be in charge of each mow crew, if Limits of Approach for non-certified operators may be violated. Otherwise LOA can be achieved through pre-mowing.

20. A Utility Tree Trimmer will be in charge of each trim crew.

21. A Utility Tree Worker or Utility Tree Trimmer will be in charge of each slash or pre-mow crew.

22. Unless the ATCO Electric “Landowner Permissions” form indicates otherwise, the **minimum** right-of-way widths required on each side of the power line (at ground level) are: 7.5 metres for three phase line, and 6 metres for single-phase line, and **tree limb to conductor clearance after mowing should be 5 metres.**

23. All woody vegetation with potential to grow within 3 metres of the primary conductor, will be removed (i.e. poplar, alder, birch, spruce, pine, and some willow), unless indicated otherwise by the Landowner Permission list.

24. All trimmed limbs will be cut flush with the tree trunk (without damaging the branch collar). All limbs above the power line will be removed. **There will be no work over any energized equipment, or within the Utility Tree Trimmer/Tree worker "limits of Approach” unless specific procedures are approved by ATCO Electric Ltd.**

ATCO Electric

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Appendices |

25. Remove all woody species growing under guy wires.

26. All guy wires within 3 metres (10 feet) of mow operations will be flagged in advance. A 3-meter (10-foot) diameter area will be cut out around such guy wires prior to mow operations. This area will be closely examined for guy wire "tails." Such "tails" will be brought to the attention of the local district office.

27. All work locations are to be left tidy, with brush disposal acceptable to both ATCO Electric and the landowner. Mowers may have to make two passes, or have larger trees slashed in advance; especially for large willow, or heavy density deciduous areas (when stem diameters are greater than four inches/ten cm). Greater care is required around yard sites; all exposed limbs and roots over two inches (five cm) in diameter should be removed with the ground being reasonably leveled off prior to seeding.

28. Pre-mowing operations include the removal of larger trees on the side (s) of right of way, and is a requirement at some mow locations. This work will be done in advance of mow operations.

29. All activities conducted for ATCO Electric will conform to the following:

    a) The province of Alberta's:

    - Electrical Protection Act
    - Employment Standards Code
    - Environmental Protection and Enhancement Act
    - Occupational Health and Safety Regulations
    - Forest and Prairie Protection Act
    - Surface Rights Act
    - Weed Control Act

    b) The Government of Canada's:

    - Transportation of Dangerous Goods Act
    - Workman's Compensation Act
    - Workplace Hazardous Materials Information System (WHMIS) regulations

    c) The Industrial Vegetation Management Associations of Alberta's (IVMAA):

    - Safety Rules for Trees Near Power Lines

30. **Before any work begins, the contractor must apply a "Job Safety Analysis" for each operation, and the Forest Operations coordinator must approve the plan.** This work plan will include:

    a) A description of the job,
    b) A list of critical activities/site conditions,
    c) A list of the tools/equipment (with test expiry dates) and materials required,
    d) A list of the hazards and methods used to eliminate or control them,
    e) The necessary level of competency-for all workers,
    f) An emergency plan and,
    g) The general sequence of events (at the work site)

    Each work crew will be in possession of, and familiar with, the completed "Work Plan" form when working on this project.

31. Tailboard meetings will be held prior to starting any job where two or more workers are present. They will also be undertaken where the original "Work Plan" changes, or where the job has been interrupted for a period of time. These interruptions could include breakdowns, lunches, etc. Tailboards must be submitted to ATCO Electric with the appropriate invoice. Each tailboard will indicate at a minimum:

    a) Who is in charge of the crew,
    b) What are the tasks that are to be performed,
    c) What the duties are of each crew member,
    d) What are the hazards of each work site,
    e) What are the main hazards in performing each task, and
    f) How are the hazards going to be controlled or eliminated
    g) Emergency response plan in case of injury

32. A **"Start-Up" meeting** will be conducted with a representative of the ATCO Electric District (Service Area) and all contractor foreman. Each brush crew foreman will be in possession of, and familiar with, the completed "Start-up Meeting" form when working on this project. Forest Operations coordinator's approval will be obtained if any changes to the Work Plan are desired by the contractor (including the change of crew members). Any new foreman must review the Work Plan with the Forest Operations coordinator, and be familiar with the "Specifications" and "Work Plan."

33. ATCO Electric reserves the right to audit crews while they are at their work locations for compliance with; these "specification" requirements and government regulations.

34. If an incident occurs, all work must stop and the incident must be reported to Forest Operations Coordinator and the local ATCO Electric Service Area office immediately. Vehicle accidents associated with ATCO Electric's work must also be reported. ATCO Electric has a policy of non-discipline for accident/incident that are reporting.

35. Limbs or trees with potential to contact the power line during removal will be controlled to prevent contact (i.e. rope).

36. Workers are not allowed to be in the bucket of a boom truck or ride on the outside of the cab of a vehicle while it is in motion.

37. ATCO Electric may stop work and void this contract at any time if:

    a) ATCO Electric is not satisfied with work quality,
    b) The rate at which the work is progressing will create difficulties for ATCO Electric in relation to the specified completion date.
    c) Significant problems are created (in ATCO Electric's opinion) by the contractor with land title holders,
    d) Due to contractor negligence, serious problems develop. ATCO Electric will not be responsible to pay the contractor for the work not done, or not done to ATCO Electric's satisfaction, as a result of the above circumstances.
    f) Worker Health and Safety violations occur.

### *4.16.4 General Safety Expectations for Contract Work*

1. **Health, Safety & Environment (HS&E)**

The contractor must comply with the following requirements:

- Conduct *daily* Tailboard meetings with all crews and ensure all members know and understand their roles and responsibilities.
- Complete the required Health Safety and Environment Evaluation appendix and that the Forest Operations Supervisor has deemed it acceptable at this point in time.
- Ensure all workers understand and comply with the contractor's HS&E program.
- Comply as directed by the Forest Operations Supervisor and the District Operator-In-Charge (OIC) to check on and off the system.
- All workers must report for work capable of performing their assigned jobs in a safe and responsible manner.
- All required Personal Protective Equipment (PPE) must be worn and properly maintained while on the jobsite.
- Ensure an alcohol and drug free workplace by prohibiting possession and/or use of these substances on the jobsite.
- Ensure no firearms are present on the jobsite.
- All new employees must be approved by the Forest Operations Supervisor (or their designate) and must undergo pre-job orientation and training prior to commencing work.
- All workers must conduct themselves in a safe and professional manner.
- All ATCO Electric customers are to be treated with the utmost courtesy and tact.
- All workers have the right and duty to refuse any work they deem as unsafe to perform. Should this situation arise, the Forest Operations Supervisor will be contacted immediately.

2. **Time-Keeping and Invoicing**

a) Daily Time Sheets (in the event of hourly or unit based work)
All daily time sheets must have the following:

- Full names of all workers
- Date
- Start time, end time, and total hours/units/days for workers and equipment
- Summary of type(s) of work conducted
- Signature of designated on-site Foreman

b) Invoices must have the following:

- Date
- Invoice number
- GST number
- Full name and mailing address of business entity
- Total hours/days/units of work completed
- Agreed upon rate of payment
- Totals broken down by “type of work” (ie. Slashing, hazard tree removal, skidding, mowing, etc.)

3. **Miscellaneous Expectations & Conditions**

- ATCO Electric Ltd. does not pay overtime.
- All work is subject to final inspection.
- Unscheduled “Worksite Observations” may be conducted at any time. Full cooperation is required by all workers.
- All subcontractors must be approved by the Forest Operations Supervisor prior to bringing them onto a jobsite.
- Do not use or damage any crossing structures existing on ROW without permission from the Forest Operations Coordinator.
- Report any environmental damage (rutting creeks, oil spills, etc.) or equipment damage (broken insulator, damaged bridge, broken guy wire etc.) to the Forest Operations Coordinator, even if the damage was done by someone else.
- No working alone. All workers must be within eye-sight of another worker at all times.
- A working communication system must be in place (Radio Phone)
- Daily legal location must be maintained on tailboard.
- All required Fire Equipment must be present on site and in working condition.
- Contractor is responsible for obtaining any required work permits or road-use agreements with other commercial stakeholders.

### *4.16.5 Salvage Tracking Procedures*

Any initial clearing or hazard reduction which has salvage wood should follow these steps for salvage tracking to ensure log decks are not lost and all monies can be tracked and credited back to the proper Work Orders.

There are 4 procedures that will help track salvage wood:

1. ***Contract for the Purchase and Sales of Logs***. This is the contract to sell salvage timber set up between the Wood Purchaser and ATCO Electric for a negotiated price. Within this document there should be a section for the *Origin of the Timber*. In this section the EZE # will be documented, as well as the **W.O.#**. Request the Wood Purchaser have checks reference **W.O.#** and made out to ATCO Electric, as well as referencing **W.O.#** on the **TM 9** records.

2. ***TM 88 Timber Salvage Authority and Records***. This is the document that is completed by the Salvage Purchaser and Land Disposition Holder and sent to Land and Forest Services. The Salvage Purchaser and ATCO Electric each keep a copy. Within this document there is a line that says, "*to remove the timber cut under authority of land use disposition no.*" In this section the EZE # will be documented, put the **W.O.#** here as well.

3. ***Mark log decks***. Mark a few of the butts of the logs with the **W.O.#** and AE when the logs are decked and ready to be hauled. This will ensure that ATCO Electric's decks do not get lost if there are other operations in the area. It will also ensure that if the decks are left for a later haul date, decks of logs will be easier to identify and **W.O.#** will not be forgotten.

4. ***TM 9 Forest Products Hauling Record***. These are the forms that are filled out by the wood hauler at the scales for each load. This records where origin of the logs are (EZE #), species and volume or weight of logs. Request that the hauler or the wood scaler at the mill records the **W.O.#** on the **TM 9**. A copy of the **TM 9** is attached to the checks made out to ATCO Electric.

### *4.16.6 Initial Clearing Specifications - Small Projects*

1. All work will be completed and invoiced by the date indicated in the Form of Tender.
2. Landowner easements/permissions will be regarded as the work instructions. Any deviations from the easements/permissions must be arranged with the landowner and ATCO Electric Project Coordinator.
3. In all instances the right of way is to be cleared of trees and brush for a minimum of 7.5 meters from the centerline or as directed by the survey brushing notes. Stumps on the 7.5 meter from centerline AE right of way will be cut flush or removed. Stumps on the outside of this right of way width are to be cut in accordance with accepted practices and procedures.
4. When mulchers/mowers are not used, no debris longer than 1m (3 feet) left on site.
5. AVOID GRUBBING ROOT SYSTEMS IN SENSITIVE AREAS SUCH AS SLOPES AND WATER BODIES.
6. Crown conditions, if provided, are to be on site with the contractor at all times.
7. The contractor will be responsible for any damage to public or private property sustained while completing the identified work.
8. The crew foreman will contact the AE Project Coordinator as indicated in the job planning meeting in regard to work progress and if any difficulties develop.
9. The crew foreman will contact the nearest AE Operator In–Charge and report as directed by Operator In-Charge.
10. An operational mobile telephone or AE company radio is required with each brushing crew.
11. Outages are to be arranged a minimum of 48 hours in advance with the local AE operator in charge.
12. Burning permits must be obtained from the appropriate authority prior to any burning taking place and all conditions of the permit must be adhered to at all times.
13. The crew foreman will be familiar with and have in his possession the “SPECIFICATIONS.’
14. When in significant quantity (2 or more cords), birch will be limbed and decked in log length.

ATCO Electric

**DISTRIBUTION LINE MAINTENANCE STANDARDS**

| ORIGINAL DATE | REVISION NO. | PAGE | INDEX NO. |
|---|---|---|---|
| 97-05-20 | R0 | 60 | 4.16 |
| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Appendices |

15. All salvage is to be topped, limbed, and decked at locations pre-approved by ATCO Electric Ltd.

16. **All** brush greater than **0.5 metres** in height is to be removed.

17. Any changes to brushing activities (as described on the Landowner Easement/Permissions) will be documented (including landowner authorization) with the revised date and crew foreman signature. Such changes require prior approval from the AE Project Coordinator.

18. Complete disposal is required for all non-salvagable wood and debris. Disposal of brush shall be done by burning, mowing or chipping in a manner that is acceptable to AE: Push slash into piles off to one side of the clearing with brush rake attachments to minimize disturbance to ground cover. Maintain 5m minimum clearance to edge of clearing. Windrowed piles will not exceed 20m in length and will be separated by 8m fire breaks. Do not locate piles within 30m of watercourse.

19. Survey stakes are not to be removed or damaged. Necessary resurvey costs will be billed to the contractor.

20. The contractor will document the status (ie. bent, missing, or intact) of survey pins belonging to the Province of Alberta at rotovate locations. No dozing, rotovating or mowing will take place within 1.0 meter of any such survey evidence. Any disturbance or damage to intact survey pins, marker posts or mound and pits will require the contractor to bear the cost of their re-establishment.

21. **Any dead or leaning tree** outside of the power line right-of-way that has the potential to fall on any portion of the power line **will be removed**. Such trees may not have been identified in the brushing notes.

22. All stumps will be cut as low as possible (no higher than 8 cm (3in.)) with flat topes, unless required for slope stabilization.

23. Minimum conductor clearance of **5 metres** from branches or limbs of any tree adjacent to the right-of-way within the White Zone of Alberta.

24. Only the use of propane, diesel or dry wood will be used for burning purposes. Tires will not be allowed for burning of brush.

25. Special care must be taken to ensure rutting from vehicles does not occur on the power line right-of-way.

ATCO Electric

**DISTRIBUTION LINE MAINTENANCE STANDARDS**

| ORIGINAL DATE | REVISION NO. | PAGE | INDEX NO. |
|---|---|---|---|
| 97-05-20 | R0 | 61 | 4.16 |
| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Appendices |

26. When working on other company's property (e.g.: roads, well sites) work permits will be obtained prior to entry.

27. All limbs under or to the side of the power line will be trimmed using acceptable industry practices.

28. All activities conducted for AE will conform with the following:

a) The province of Alberta's:
- Electrical and Communication Utility Code
- Employment Standards Code
- Environmental Protection and Enhancement Act
- Occupational Health and Safety Regulations
- Forest and Prairie Protection Act
- Surface Rights Act
- Weed Control Act

b) The Government of Canada's:
- Transportation of Dangerous Goods Act
- Workman's Compensation Act
- Workplace Hazardous Materials Information System (WHMIS) regulations

c) The Industrial Vegetation Management Association of Alberta's (IVMAA):
- Industry Standards and Good Practices for Vegetation Management

d) AE's:
- Standard Bid Document
- Current Master Services Agreement labour rates

29. **Before any work begins the contractor must supply a Work Plan for each type of clearing crew or operation and the AE Project Coordinator must approve the Work Plan**. This work plan will include:
- A description of the job,
- A list of critical activities/site conditions,
- A list of the hazards and methods used to eliminate or control them,
- The necessary level of competency-for all workers,
- An emergency plan and,
- The general sequence of events (at the work site)

Each work crew will be in possession of and familiar with the completed work plan form when working on this project.

30. **Daily tailboard meetings** will be held prior to starting any job where two or more workers are present. They will be undertaken when conditions change or where the work has been interrupted for a period of time. These interruptions could include breakdowns, lunches, etc.. Tailboards must be submitted to AE with the appropriate invoice. Each tailboard will indicate at a minimum:

    - Who is in charge of the crew,
    - What are the tasks that are to be performed,
    - What the duties are of each crew member,
    - What are the hazards at each work site,
    - What are the main hazards in performing each task, and
    - How are the hazards going to be controlled or eliminated

31. A **"Start-Up" meeting** will be conducted with a representative of the AE District (Service Area), and all contractor foremen. Each brush crew foreman will be in possession of, and familiar with, the completed "Start-up Meeting" form when working on this project. AE project coordinator's approval will be obtained if any changes to the Work Plan are desired by the contractor (including the change of crew members). Any new foreman must review the Work Plan with the AE project coordinator, and be familiar with the "Specifications" and "Work Plan."

32. AE reserves the right to audit crews while they are at their work locations for compliance with these specification requirements and government regulations.

33. Any line contact, near miss (with the potential for serious injury) or worker injury, is to be reported to the Project Coordinator and the local AE District office immediately.

34. Limbs or trees with potential to contact the power line during their removal will have preventative measures taken to avoid this.

35. AE may stop work and void this contract at any time:

    - If AE is not satisfied with work quality,
    - If the rate at which the work is progressing will create difficulties for AE in relation to the specified completion date (re: Specification No. 1 above),
    - If significant problems are created by the contractor with land title holders,
    - Due to contractor negligence. AE will not be responsible to pay the contractor for work not done or not done to AE satisfaction as a result of the above circumstances, or
    - Worker Health and Safety violations occur.

### *4.16.7 Initial Clearing Specifications-Large projects*

**SECTION I: WORK SPECIFICATION FOR SALVAGE LOGGING**

General Brushing Standards:

General measures that apply to all brushing, construction, and maintenance activities are provided below. Note that ant of the general or specific measures may be overruled by landowner or leaseholder agreements, or Crown easement conditions.

1. Efforts shall be made to prevent soil erosion, water pollution and forest fires during all stages of construction and maintenance.

2. No oil changes, refueling or lubricating of construction equipment will be conducted within 30 horizontal metres of open water. Spent oils, lubricants and filters etc., will be collected and disposed of at an approved location.

3. All excess construction garbage will be continuously collected and disposed of at an approved facility. Waste containers will accompany each working unit.

**1.1 Access**

1. Do not ford flowing streams.

2. CONFINE ACTIVITIES TO THE ALLOTTED RIGHT-OF-WAY, EXISTING ROADS AND SHOO-FLIES. If possible, confine vehicles to a single trail on the right-of-way. The standard minimum right-of-way for cross-country alignments will be 15m wide. Tree-freeing (removal of standing live and dead trees) will require brushing of an additional width of right-of-way. The additional width is dependent upon tree height. Vehicle traffic will not be allowed on adjacent pipeline rights of ways.

3. Follow traffic accommodation plan along highway 58. Post truck turning sites near junction of highway 58 and Foggy Tower Road. Minimize interference with the flow of traffic.

**1.2 Survey**

1. THE COMPANY WILL STAKE OR FLAG THE RIGHT-OF-WAY at sufficient intervals so that stakes and flags are visible to brushing crews.

2. THE COMPANY WILL STAKE OR FLAG THE BOUNDARIES OF SALVAGE TIMBER STANDS in order so that salvage timber is not lost.

### 1.3 Brushing

1. DO NOT CLEAR VEGETATION BEYOND STAKES OR FLAGGING, AND FELL TREES WITHIN LIMITS OF RIGHT-OF-WAY.

2. CUT TREES AT GROUND LEVEL.

3. AVOID GRUBBING ROOT SYSTEMS IN SENSITIVE AREAS SUCH AS SLOPES and WATER BODIES, except for centrally-located access trail that may be stumped and graded to permit vehicular access for line construction.

4. PILE ALL SLASH MATERIAL. Push slash into piles off to one side of the center line with brush rake attachments to minimize disturbance to ground cover. Maintain 5m minimum clearance to edge of clearing. Do not locate piles within 30m of watercourse.

5. HARVEST SALVAGABLE TIMBER STANDS using chainsaws, feller-bunchers, or other approved equipment. Do not bulldoze salvage timber. Salvage areas to be confirmed by a Forestry representative.

6. Brush will be machine-cleared, slash will be piled for mulching.

## SECTION II: GENERAL RIGHT-OF-WAY CLEARING AND MAINTENANCE STANDARDS

The Applicant's policy is to maintain an area free of incompatible vegetation adjacent to all distribution lines. This includes the cleared area necessary for construction and any danger trees beyond the minimum standard right-of-way. However, it is also the policy to retain compatible vegetation whenever possible in the vicinity of distribution lines.

### 2.1 Salvage Logging

Salvage logging is the removal of merchantable timber from the power line right-of-way. The basic rule that is followed is the requirement that:

> Trees must not infringe on the required clearance to maintain the safe and reliable operation of the distribution facilities.

This applies to all merchantable timber within the flagged right-of-way and all standing danger trees, particularly those which could potentially fall and either damage the conductors and supporting structures directly, or fall within the flashover distance.

Standard right-of-way widths have been devised for areas having tree growth of varying height to ensure that the clearing rule is applied in all situations where trees could pose a problem.

The clearing standards for tree-freeing are based on tree heights in relation to the location of the nearest conductor at maximum sag. An additional allowance is made for tree-freeing within or near poplar tree growth.

Merchantable timber shall be cut, lopped of roots, branches, and tops and shall be neatly decked separately from all other trees and debris.

In the event that a large number of trees are to be decked and no natural clearing is available in the area, the contractor shall clear an area of deciduous or un-merchantable coniferous timber at intervals designated be Alberta Forest Services for that purpose.

Debris from limbing and bucking activities shall be restricted to the right-of-way or designated tree processing or decking area. Keep branches etc. from roadways as much as possible.

## 2.2 Land Use and Environmental Considerations

Under certain circumstances, trees will be cut selectively in the vicinity of water crossings, very Steep erodible slopes and other ecologically sensitive areas to reduce adverse effects on the environment (i.e. to maintain slope stability and minimize siltation in nearby water bodies).

Stumps are to be cut as close to the ground as possible.

Selective tree cutting cannot be done under all situations regardless of how desirable it may be. Over mature and dead trees, especially those growing on thin and/or saturated soils, will not survive if they are isolated from their closed stand conditions. These trees are readily prone to windfall. Such trees would constitute a hazard, and will therefore be removed at the time of construction.

## 2.3 Clearing Method

Merchantable timber stands located within the right-of-way will be logged and decked along the edge of the right-of-way as required. Merchantable timber will be handled in accordance with government requirements.

Additional clearing will be done by hydro-axe. In environmentally sensitive areas such as stream and river crossings, erosion sensitive solids and scenic road crossings, clearing methods may be adjusted to minimize potentially detrimental effects.

The clean-up operation on and off the right-of-way on Crown lands will also be subject to the requirements of the Crown and easement conditions.

## SECTION III: TECHNICAL SPECIFICATIONS FOR SALVAGE LOGGING

### 3.1 Scope of the Work

Work under this specification includes:

1. Supply of labour and supervision to cut and pile timber, logging, skidding, and decking of timber in the designated “salvage areas.” Salvage areas will be along the edge of the right-of-way along the edge of the roadway, or as agreed by the Owner’s Representative or designate.

2. Supply of materials, plant, and tools, and all equipment necessary for the execution of the work.

3. Provision of temporary buildings and services, sanitary facilities, water, heat, light, power and telephone services, lodgings, meals and medical services, transportation of men, materials, and plant.

- All in accordance with the specification requirements.

### 3.2 Documents

The company will supply to the Contractor sufficient drawings, sketches, plans, notes and other information at the Tender stage, and later, as and when required to enable full execution of the contract.

### 3.3 Survey

a) The company shall have the right-of-way center line surveyed before brush clearing. The survey will define the limits of the area to be cleared on the ground and the brushing notes. These limits will be flagged with fluorescent orange/black tape (easement) and fluorescent pink/black (vegetation control or tree-free easement) in the field at 50 metre intervals.

b) The contractor shall preserve all legal iron pins and survey stakes, and shall replace or pay for replacement of any legal survey post or survey stake that is disturbed.

c) The chainage hubs will be used as control reference for as-builts and for progress measurement as well as for measurement of any extra Work and must be preserved.

d) The contractor shall do the Work in accordance with the Environmental Protection Plan, Brushing Notes and easement conditions. Any conflicts between documentation shall be reported to the Company before the Work is done, so that clarification can be given by the Company. If the Contractor does Work where a conflict existed that is obviously wrong without giving prior notice to the Company, it shall be the Contractor's responsibility to rectify such Work at no extra cost to the Company.

e) As soon as practical during clearing, ATCO Electric Brushing Inspectors will identify "danger trees" by flagging with fluorescent tape or marking with blue tree paint. All work necessary for or incidental to the felling, slashing, piling, burning or otherwise disposing of danger trees (including the disposal of merchantable logs) will be paid for at the appropriate tendered unit price for danger trees. Except that where the Brushing Inspector directs that concentrations of danger trees be cleared in accordance with the requirements of a particular clearing standard. Payment for all Work necessary for or incidental to the felling, slashing, piling, burning or otherwise disposing of such danger trees (including the disposal of merchantable logs) will be made at the appropriate tendered unit price for the appropriate clearing standard.

### 3.4 Right-of-way

a) The Company will provide the right-of-way for the distribution line in a timely manner: not to interfere with the construction activity of the Contractor. The Company will also provide all permits and licenses that can only be granted to the Company, such as permits to cross rivers and other water, railways, roads, drainage or irrigation channels, pipelines, power lines and communication tables.

b) The Contractor’s operations are to be limited as nearly as possible to the right-of-way. In the event that additional space is essential for the Contractor's operations, the Contractor shall first obtain written consent from the Company to secure additional space, and then obtain the written consent of the property owners for the use of the extra space required. Agreements made by the Contractor for the use of additional area shall provide that the Company also have the right to use such area. Any damage or costs incurred as a result of the Contractor's operations outside the Company's right-of-way shall be paid by the Contractor, unless mutually agreed beforehand by the Owner’s Representative.

c) The Company shall endeavor to show in its documentation and have its surveyors mark the locations and nature of other pipelines and structures in, or crossing the right-of-way, but it assumes no responsibility for the correctness or completeness of such information. The Contractor shall be held solely responsible for the locating of such pipelines and structures and for avoiding damage to them.

d) Where the right-of-way parallels or crosses previously installed pipelines, buried telephone cables, overhead power lines and towers, structures or other facilities, either owned by the Company or others, it is the responsibility of the Contractor to do the Work without damage to the existing structures and facilities. The Contractor shall not operate equipment over existing lines without written authorization from the Company. In case the Contractor damages or breaks an existing pipeline, structure or facility, he shall be liable for all damages or losses, including product losses and loss of revenue, and shall indemnify and hold the Company harmless from any personal or property claims.

e) The Company will show in its Environmental Protection Plan any special construction requirements in the right-of-way easements or permits and the Contractor shall strictly comply with such requirements.

f) The Company will notify property owners of the imminence of construction. The Contractor shall consult with the Company's Project Brushing Inspector in advance of entering properties to determine procedures that will result in the least damage or interference with the landowner's operation.

g) The Contractor shall supply and/or pay for additional services required by owners at crossings of railroads, roads, canals, or streams, including items arising from operational or safety requirements either during or after completion of construction Work, such as flagging for railroad Work or necessary subsequent maintenance of repair Work which is either impossible to accomplish at the time of construction or resulting from incomplete or inadequate construction.

h) Permission for work crossing of railroads, highways, rivers and other important water courses for the Contractor's men and equipment shall be secured by the Contractor at his expense, before making the crossings.

i) The right of ingress and egress to the right-of-way will normally be limited to places where the right-of-way intersects public roads. The Company may provide the additional access in some cases and, if necessary to the construction operation, the Contractor may request the Company make such special arrangements. There will be no entry onto lands without Company approval.

j) The Contractor is specifically prohibited from entering into any special agreements with landowners without prior written approval from the Company. This restriction is imposed to prevent any arrangements for off right-of-way brush disposal and to control agreements regarding access to the right-of-way. Forms used for any agreements are subject to written approval from the Company, and the Company shall be given co-equal rights to any agreements made by the Contractor to do with use of land, roadways, or other access or crossing privileges.

### 3.5 Expose Pipelines

In order to avoid accidents, it is required that all existing pipelines and other underground facilities be located and appropriately marked ahead of any work on the right-of-way by heavy equipment. The marking should be maintained a minimum of one kilometer ahead of the clearing operations. The Contractor shall only move heavy equipment across a pipeline right-of-way after having complied with all the requirements of that particular "Crossing Agreement."

### 3.6 Alberta Forest Service and Department of Environmental Approval

Before commencement of clearing crown land, the Alberta Forest Service official and the Department of Environment official with authority over the area shall be consulted jointly by the Contractor and the Company to determine particular requirements and to acquire approval of the Contractor's intended clearing procedures.

### 3.7 Clearing Work

Except where restricted clearing is required by the Environmental Protection Plan or the Brushing Notes, merchantable timber across the whole width of the right-of-way shall be salvaged, as well as any areas outside the boundary of the right-of-way that may be designated for timber landing areas, shoofly roads, etc.

Where restricted clearing is called for by the Environmental Protection Plan or the Brushing Notes, the Contractor shall use whatever procedures are necessary to accomplish this, at no extra cost to the Company. The clearing operation shall not cause trees, debris or dirt to go into any waterway. The Contractor shall explain to his workers the damage such disturbance of water may cause fish and fish spawning areas, that they may appreciate the importance of taking care in their Work to protect water quality.

### 3.8 Stumping

Trees shall be cut at ground level to allow for construction and maintenance traffic.

### 3.9 Additional Contractor Responsibilities

a) Provide all necessary notices required notices required by -and comply with- all laws, ordinances, rules and regulations relating to the execution of the Work.

b) Provide fire protection and fighting equipment to eliminate the possibility of damage by fire in connection with the carrying out of the Work, as per the Forest and Prairie Protection Act (1991).

c) Provide, at the Contractor's expense, all facilities and services required for storage, maintenance, protection and security of the equipment and materials used in connection with the Work (including equipment and materials provided to the Contractor by the Company).

d) Keep the site free from accumulations of waste materials or rubbish caused by the Contractor, its Sub-Contractors and their employees or agents.

e) Upon completion of the work, remove from and about the site all tools, surplus materials, equipment, and rubbish belonging to, or caused by, the Contractor, its Sub-Contractors, and their employees or agents. Company approval is necessary before removal of tools and equipment in accordance with part 3.8

f) Provision of lodging, meals, sanitary facilities, first aid and medical facilities and other services.

## SECTION IV: SPECIFIC CONDITIONS

### 4.1 Scope of the Work

The work to be done under this specification consists of the supply of: all labour (including labour required for handling and distributing materials) and supervision; material specified as being furnished by the Contractor; Plant and Tools; all facilities such as temporary buildings, temporary services, sanitary facilities, water, heat, light, power and telephone services; lodgings, meals and medical services; the transportation of Material and Plant, from and at the Site; the warranty of workmanship; the erection and removal of all temporary works and final cleanup of the Site on completion of the Work.

The Contractor shall be responsible for the quality of all workmanship performed by its employees in the execution of the work described in the specification.

**4.2 Access to the Site (SAMPLE)**

The site is accessible only via provincial roads, municipal roads or rights-of-way and the use by the Contractor of other than designated access routes is strictly prohibited. The Work shall be performed only on that portion of the Site required therefore and as designated by the Company.

The Contractor shall not make private arrangements with landowners with respect to access to the Site. All such arrangements shall be made by the Company although the Contractor may initiate a request for access, to the Company.

The Company may withhold final payment for the Work until it has received a release in form satisfactory to the Company, signed by each property owner adjacent to the Site stating that all claims for land, crop of any other property damages caused or permitted to be caused by the Contractor, Sub-Contractor or by those of whom the Contractor is in law responsible, have been fully paid and resolved or alternatively, until such time as the Company has determined that such property owners have no such claims arising from the performance of the Work. At the Company's discretion, it may remedy any damage to land, crop or any other damages to property adjacent to the Site caused by the Contractor, Sub-Contractor or by those of whom the Contractor is in law responsible and the Company's full cost thereof may be deducted from the final payment for the Work or if such final payment is insufficient to satisfy the Company's claim hereunder, the difference between such amounts shall be a debt due and owing and shall bear interest at the rate of 18% per annum from the date of the Company's request for payment. A statement of the costs incurred by the Company to remedy any damages as provided by this paragraph, certified accurate by a Professional Engineer who is in good standing in the Province of Alberta shall be final and conclusive for all purposes relating hereto.

**4.3 Meals and Lodging**

The Contractor shall be responsible for the provision of meals and lodging for all its personnel engaged in the work.

**4.4 Sanitary facilities**

The Contractor shall supply and maintain all necessary sanitary facilities for all personnel engaged on the Work. These facilities shall comply with the Occupational Health & Safety Act (OHSA).

**4.5 First Aid and Medical Facilities**

The Contractor shall comply with the laws and regulations of Alberta relating to the provision of first aid and medical facilities (OHSA - First Aid Regulations) for all its personnel engaged on the Work.

The Contractor shall also be responsible for the transportation of its sick or injured personnel to hospital, in the even such necessity arises, at the Contractor's expense.

**4.7 Statutes, Regulations and Permits**

Prior to commencing the work, the Contractor shall familiarize himself with any statutes, by-laws, rules or regulations which may in any way affect or apply to the Work, and shall carry out the Work in accordance therewith.

The Contractor shall also note that the provisions of the OHSA - General Safety Regulations regarding shoring of excavations shall be complied with and will be strictly enforced.

No excavation will be permitted until these requirements have been complied with.

**4.8 Records**

The Contractor shall be responsible for keeping and supplying on a weekly basis, to the Company, all such records of Work as the Company may require throughout the course of the Work, including records of its labour force, Plant, hours worked, rates, for appraisal of the progress of the Work.

Blank forms may be supplied from time to time to the Contractor by the Company for the purpose of recording details of the Work. Any such form shall be completed within the time and to the satisfaction of the Company.

**4.9 Compliance with Standard Specifications**

All material, equipment and articles furnished by the Contractor shall comply with the applicable provisions of the standards of the Canadian Standards Association (CSA) or of the Canadian Government Specification Board (CGSB) and where no such standards exist, they shall comply with the applicable provisions of the standard specifications of the American Society for Testing Materials (ASTM).

## 4.10 Protective Measures

The Contractor shall take all necessary precautions for the safety of its employees engaged on the Work. It shall erect and properly maintain at all times, as required by the conditions and process of the Work, all necessary safeguards for the protection of workmen and the public, and shall post danger signs warning against unusual hazards and such other hazards as may be designated from time to time by the Company.

The Contractor shall properly and adequately protect the Work, and Plant (inclusive of all material supply by the Company) against loss, damage or deterioration during construction and shall take every precaution against causing damage to property belonging to the Company or third parties located in, upon, or about the Site, and shall indemnify and save harmless the Company from and against all loss, costs, damages, expenses, suits, claims and demands in respect thereof.

The Contractor shall take all necessary precautions and comply with the regulations of all competent authorities during the execution of the Work so as not to trespass upon or cause damage, disturbance, obstruction of access, removal or disturbance of support to land, buildings or other structures or property beyond the Site, and will indemnify and save harmless the Company from and against all loss, costs, damages, expenses, suits, claims and demands arising out of any such trespass, damage, disturbance, obstruction of access, removal or disturbance of support.

The Contractor shall provide all guards, barriers, fencing, lights or danger signs necessary to adequately warn or protect the public, employees of the Contractor or Company, livestock and wildlife, from any injury due to hazards created during the execution of the Work described in this Specification whether on or off the Site.

The Contractor shall supply fire fighting tools and equipment as may be required by Alberta Forest Service regulations. Where the Contractor wishes to dispose of scrap material by burning, it shall observe all burning restrictions imposed by all applicable laws and regulations. The Contractor shall obtain, at its own expense, all necessary burning permits which may be required.

If the Contractor disposes of any scrap material by burning, the Contractor shall be responsible for ensuring that fires do not become established in logs, stumps or in the ground and that such fires are extinguished to the satisfaction of the Company and any governmental body having responsibility or jurisdiction in such matters.

The Contractor shall be strictly liable for any damage resulting from fires caused by it, its employees, officers, agents and others for whom it is responsible and it shall be solely responsible for all charges which may be incurred in extinguishing such fires and indemnify and save harmless the Company from any loss, claim or expense in relation thereto.

**4.11 Permits to Work**

No inspecting, testing, or operating that is required to take place or be done in, upon, or about, any equipment or facilities owned by the Company and that are or may be electrically charged from any source, shall be permitted unless and until a written "Permit to Work" has been issued for the purpose by the Company. When the inspecting, testing or operating sanctioned by the Permit to Work has been completed, the Contractor shall give written clearance to the Company, stating that Work is complete and all men and equipment have been withdrawn.

**4.12 Explosives**

The Contractor shall not use explosives unless he first obtains approval in writing from the Company of:

a) The type, characteristics and quantity of the explosive that the Contractor proposes to use;
b) The proposed method of transporting, storing, handling and using such explosives, including without limitation, thawing of frozen explosives;
c) The safety procedures proposed to be followed, including without limitation, the signs, sentries and warning devices to be used;
d) The location or locations where the Contractor proposes to use explosives;
e) The proposed location of magazines and other storage facilities for explosives and detonators; and
f) The dates and hours during which the Contractor proposes to carry out blasting procedures.

The Contractor shall at all times exercise the greatest care in carrying out blasting operations. When blasting operations have been completed, all surplus and/or undetonated explosives shall be promptly removed from the Site or placed in a magazine at the Contractor's expense.

**4.13 Extra Work Charges**

a) The Company may:

i) Order work not called for, and outside the general scope of the work required by the contract documents ("Extra Work"), but which is within the capability of the Contractor's existing work force and equipment, or

ii) Make alterations in, additions to or deductions from the Work that falls within the general scope of the Work required by the Contract Documents ("Changes").

And the contractor shall perform the extra work or changes in accordance with the contract documents.

b) No changed shall be affected, or extra work performed, or payment made, unless authorized in writing be the Company and once such authorization is given, the Contractor shall proceed diligently with the work.

c) If the Company orders extra work, the Contractor will provide a lump sum price or unit price for the extra work as requested by the Company and the Company may then:

i) Instruct the performance of the extra work on the basis of the prices so provided by the Contractor; or
ii) Instruct the performance of the extra work on a force account basis as described in paragraph 4.14; or
iii) Withdraw its order for the extra work.

d) If the Company makes changes, either additions or deductions, the amount payable to the Contractor, or credit given by the Contractor, will be determined by agreement between the Contractor and the Company or alternatively, at the Company's option the changes (additions) shall be performed on a force account basis as described in paragraph 4.14.

e) Any claim for an extension or reduction of the time within which the work is to be performed arising from extra work ordered or changes made shall, if possible, be adjusted at the time the Company orders the extra work or makes the changes. If the Contractor and the Company are unable to agree on any extension or reduction, the same shall be determined by arbitration.

**4.14 Force Account Work**

The Company will pay the Contractor in respect of work performed at site on a Force Account Basis the following:

a) Labour

i) Direct wages paid to labour, field supervision (excluding field superintendent) and associated payroll burden;
ii) Transportation, loading and unloading of tools and material; and
iii) Transportation of labour on and about the site; and
iv) Transportation of labour brought to the site specifically for force account work at the request of the Company.

b) Material

Material provided to the Company in respect of such Extra Work to be supplied on the basis of cost of Material as substantiated by the supplier's invoice, including freight and all taxes.

| RIGHT-OF-WAY MAINTENANCE | Appendices |

c) Board and Lodging

An amount calculated at a fixed rate, for providing board and lodging for men employed on force account work (other than operators of construction equipment covered by a rental rate which includes the provision of an operator).

d) Contractor's Tools and Plant

Rentals for the Contractor's construction equipment when used on force account work and when certified as necessary by the Company shall be paid only for Tools and Plant having a value in excess of $500.00 in accordance with the Schedule of Equipment Rental Rates approved by the Company and incorporated herein including additional items of equipment added thereto from time to time with the approval of the Company.

Unless otherwise specified, the rates in the Schedule of Equipment Rental Rates shall include the cost of operators, servicing, fuels, lubricants, maintenance, repairs and all other services and overheads including, in the case of rates including operators, room and board for operators required to operate the equipment at the Site and maintain it in working order.

Rental rates for welding equipment shall include for the provision of all welding rods, fuel, oxygen, acetylene and lubricants.

No payment shall be made for the use of any item of equipment on the Work which is not listed in the Schedule of Equipment Rental Rates or has no rental rate entered against it, except that if the Contractor brings to the Site additional equipment for the construction of the Work and submits a quotation for rental rate which is approved by the Company, such equipment and the approved rate shall be deemed to be entered in the said Schedule.

The rental rates listed in the Schedule of Equipment Rental Rates for each item or equipment will be paid to the Contractor for the number of operating hours the said item or equipment is engaged in the performance of Extra Work or Changes at the request of the Company whether such time is worked on a day shift or a night shift, or both.

One half of the hourly rental rate shall be paid to the Contractor in respect of time during which:

i) The equipment is engaged in traveling from and returning to the place on the Site where the equipment was located when required for Extra Work or Changes;

ii) The equipment is being modified for a different use and restored for its previous uses on completion of the Extra Work or Changes (i.e. changing boom for crane or shovel);

iii) The equipment and operator are ordered by the Company in writing to be held ready for any work required by the Company.

No payment will be made in respect of:

iv) The time during which the equipment is being maintained, repaired or replaced;

v) The time during which the equipment cannot be used because of breakdown, fault of the equipment or Contractor, or because of inclement weather conditions.

vi) The time during which the equipment is not in use except as provided in (a), (b) and (c) above.

e) Sub-Contractors

Any work performed by Sub-Contractors who are not related (as defined in the Income Tax Act, Canada) to the Contractor will be supplied on the basis of cost, substantiated by the Sub-Contractor's invoice, plus a fee of 5% on any amount up to $1,000,000.00 and 2% on any amount over $1,000,000.00. Work performed by Sub-Contractors related to the Contractor without written notification to the Company of such relationship shall be deemed to be fraudulent and provided at no cost to the Company.

f) Service Fee

The Contractor's service fee for Extra Work or Changes performed on a force account basis will be as follows:

| | Fee (expressed as a percentage) |
|---|---|
| Labour | 10% |
| Materials | 10% |
| Sub-Contractors | 5% |
| Non-owned Tools & Equipment | 5% |

The above mentioned fees include payment of the following:

i) Contractor’s profit;
ii) General supervision over and above the field supervision;
iii) General overhead and all head office expenses (including timekeeping costs);
iv) Use of Tools and Plant to value of $500,000 each;
v) Cost of insurance;
vi) Replacement of Contractor owned Tools due to loss or breakage;
vii) Cost relating to field superintendent;
viii) All consumable.

Provided further that no payment will be due back to the Contractor in respect of Work performed on a Force Account Basis:

i) Without the written authority of the Company, or
ii) If not carried out and completed to the satisfaction of the Company, or
iii) If the Contractor has not obtained the approval of the Company before incurring any obligation or making any expenditure on account of such Work.

The Contractor shall keep proper account records of the cost to the Contractor of Extra Work and Changes performed on a Force Account Basis in such form and detail as shall be satisfactory to the Company, and such accounts and records, together with all invoices, receipts and vouchers, shall at all times be open to audit and inspection by the Company or its authorized representatives (who may make copies thereof and take extracts therefrom). The Contractor shall furnish the Company or his authorized representatives with all such information about the accounts as he or they may require.

Daily time sheets shall be prepared in triplicate by the Contractor showing breakdown of hours in accordance with the Company's costing system and listing the names, hours worked and rates of pay for each workman, and hours and rates for equipment engaged on the Extra Work or Changes performed and these shall be submitted daily to the Company for checking. One copy of these time sheets when approved, shall be retained by the Company. The Contractor's monthly billing for labour shall be substantiated with copies of these approved time sheets.

## 4.15 Unit Price Adjustment

If the Tender is submitted on the basis of specifically described portions of the Work ("Units of Work") at a specified price for each unit ("Unit Firm Price") and by estimating such Units of Work ("Estimated Quantity") then, in the event the number of Units of Work required to perform the Work is greater or less than the Estimated Quantity, the successful Bidder agrees to perform all Units of Work required to fully complete the Work and the Contract Prices shall be adjusted as follows:

a) In the event the number of any individually described Units of Work required to perform the Work are greater, but not more than 25% greater than the Estimated Quantity of such Units of Work set forth in the Schedule of Prices forming part of the Tender and provided the Company has in writing expressly authorized the said further Work, the Contractor price shall be increased by an amount equal to the product determined by multiplying the difference between the actual Units of Work required to perform the Work and the Estimated Quantity of Units of Work by the appropriate Unit Firm Price; or

ATCO Electric

**DISTRIBUTION LINE MAINTENANCE STANDARDS**

| ORIGINAL DATE | REVISION NO. | PAGE | INDEX NO. |

| | EFFECTIVE DATE 97-10-20 | | |

| SUBJECT | INDEX DESCRIPTION |
|---|---|
| RIGHT-OF-WAY MAINTENANCE | Appendices |

b) In the event the number of any individually described Units of Work required to perform the Work are less, but not more than 25% less than the Estimated Quantity of such Units of Work set forth in the Schedule of Prices forming part of the Tender and provided the Company has in writing expressly authorized the said further Work, the Contractor price shall be decreased by an amount equal to the product determined by multiplying the difference between the actual Units of Work required to perform the Work and the Estimated Quantity of Units of Work by the appropriate Unit Firm Price; or

c) In the event the number of any individually described Units of Work required to perform the Work exceed or are less than the Estimated Quantity by more than 25%, the Unit Firm Price for such individually described Units of Work may be varied upon the agreement of each of the Company and the successful Bidder or failing agreement by arbitration in accordance with paragraph 3.37 of the General Conditions. Any disagreement between the successful Bidder and the Company as to the variation of a Unit Firm Price pursuant to this sub-paragraph shall not excuse the successful Bidder from supplying all Units of Work required to perform the Work as requested by the Company and during the period of disagreement, the Company shall pay for all Units of Work at the Unit Firm Price as set forth in the Schedule of Prices forming part of the Tender.

Where prices quoted are subject to an adjustment in any instance not specified above, the Bidder shall show the proportion of the prices which are adjustable and shall indicate the formula or formulae to be utilized for adjustment purposes (a formula shall include the applicable indices, their sources and the base index).

### 4.16 Lump Sum Contract

If the Tender is submitted on a Lump Sum basis, the Contract Price shall be a fixed price not subject to measurement or recalculation should the actual quantities of Work and Material differ from any estimates available at the time of delivery, except in regard to Work performed or Material supplied pursuant to paragraphs 4.13 or 4.14 hereof.

### 4.17 Damages and Claims

The Company shall bear the responsibility on the Site and on lands associated with the access facilities to and from the Site for any damages caused to crops, timber, fences, gates, roadways, ditches, pipelines, other structures and the environment which may be affected by carrying out the Work by the Contractor, provided that such damages are occasioned, in the sole opinion of the Company, in the normal course of conduct of the Work carried out in a prudent and conscientious manner. The Contractor shall bear all responsibility for and indemnify and save harmless the Company for any and all losses, damages, costs, claims and demands by whomsoever, made or brought in connection with the carrying out of the Work except as specified therein including, without limiting the generality of the foregoing, all losses, damages, costs, claims and demands resulting from the negligent conduct of the Work by the Contractor, its employees and agents.

The Contractor shall promptly inform the Company in writing of any claims or demands for loss or damage for personal injury or death or loss or damage to property or the environment arising in connection with the carrying out of the Work and, upon having satisfied any such claims or demands obtain a release in respect thereof naming the Company as one of the parties released.

### 4.18 Contractor's Superintendent

The Contractor shall provide all necessary supervision during the execution of the Work, and shall employ and appoint a competent, experienced and authorized representative or agent, herein referred to as the "Superintendent". Such Superintendent shall be fluent in the use of the English language. The Contractor shall inform the Company of this appointment together with all details of his qualifications and experience.

During execution of the Work, the Superintendent shall be continuously on duty at the Site during working hours, unless otherwise requested by the Company, to supervise the due and proper execution of the Work and to receive from time to time on behalf of the Contractor, orders and instructions from the Company relating thereto.

If double shift work is necessary, or if the Superintendent is unavoidably or necessarily absent, the Contractor shall provide an assistant Superintendent, who shall possess sufficient and similar qualities of competence and experience, to take charge on a temporary basis. Any permanent replacement of the Superintendent shall be by agreement with the Company.

When personal supervision becomes difficult for Work in remote areas, the Superintendent may delegate the supervision function to a competent person, provided such person is instructed in all matters concerning the proper execution of the Work. However, the Superintendent must maintain good communication with all supervisors and be fully informed of the progress and all other aspects of the Work and shall visit all work areas regularly.

**4.19 Contractor's Liability**

The Contractor shall be strictly liable for:

a) All damage howsoever caused to the Work and all Material forming part thereof from the date the Contractor commences the Work until the date that the Company makes final payment therefore or the date of the issuance of a Completion Certificate, whichever shall first occur;

b) Any injury (including loss of life), loss or damage to any person or property caused by or resulting from defective Plant, Material, workmanship, fabrication, or construction or by anything done, or omitted to be done, or permitted to be done by the Contractor, any Sub -Contractor, or any of their respective officers, servants, agents or employees;

c) The repair, replacement or compensation to the satisfaction of the owner of any gate, fence, bride, culvert, crop, landscaping, livestock, or other property, whether on or off the Site, damaged by the Contractor, any Sub-Contractor, or any of their respective officers, servants, agents or employees; and

d) Any damage and disruption to any legal or other survey monuments, stakes, benchmarks, mounds or pins established by the Company, any government authority or any other firm, person or corporation.

And in the event the Contractor does not, to a standard and in all respects to the satisfaction of the Company, promptly satisfy the liabilities set forth above, the Company may, as the agent of the Contractor expend such monies, perform such repairs and do all such things it deems necessary in its sole discretion to satisfy the obligations of the Contractor provided by this paragraph 3.12.

## 4.20 Miscellaneous Responsibilities of the Contractor

Without limiting any other obligation of the Contractor specified elsewhere in the Contract Documents, the Contractor shall:

a) Provide and pay for all Material, labour, water, Tools, Plant, transportation, equipment power and heat necessary for the execution of the Work except as may be otherwise specifically provided by the Technical Specification;

b) Obtain and pay for all necessary temporary permits or licenses and field locates of utilities required for the execution of the Work, i.e. equipment transport permits, fire permits, camp licenses and sewage permits. The Company shall obtain all building permits, crossing agreements and access permits required for the execution of the Work;

c) Give all necessary notices and comply with, all laws, ordinances, rules and regulations relating to the execution of the Work;

d) Provide at the Contractor's expense, all facilities and services required for the storage, maintenance, protection and security of the equipment and materials forming part of the Work (including equipment and materials provided to the Contractor by the Company);

e) Keep the Site free from accumulations of waste materials or rubbish caused by the Contractor, its Sub-Contractors and their employees or agents;

f) Upon completion of the Work, remove from and about the Site all tools, surplus materials, equipment and rubbish belonging to, or caused by, the Contractor, its Sub-Contractors and their employees or agents;

g) Take precautions to prevent the disturbance of official monuments, posts, stakes, pins marking property lines, or other survey markers;

h) Provide sufficient fire protection and fighting equipment to protect the Work in the event of fire;

i) Exercise all precautions to protect from injury, persons or property in carrying out the Work; and

**4.21 Liens**

If, during the progress of the Work, the Contractor shall allow any indebtedness to accrue (for labour or materials or Sub-Contractors or others) which results or may result in any lien or liens upon the property of the Company or upon any property in which the Company has a legal or beneficial interest, the Company may withhold from the Contractor such sum as the Company deems appropriate to protect the Company until such indebtedness is paid. If a lien or liens are filed or claimed against any such property as a result of the Work, the Company may, but shall not have the obligation to, obtain discharge of the same by payment into Court of such sum as may be necessary to obtain such discharge and any such payment shall be deemed to be a payment to the Contractor on account of the Contract Price.

RE: Hazard Tree Removal in the (insert name) area

ATCO Electric has successfully concluded its 2005 hazard tree program in the (insert area name) area. All identified hazard trees as detailed in our previous letter dated (insert date of letter of application), have been removed.

To fulfill our requirements as per the Wildfire Agreement, we require written acknowledgement from Forest protection Division that the work has been completed. Signing the second page of this letter will fulfill this requirement. Please sign accordingly and return a copy of to me at (insert fax number).

If you require further documentation, or have any questions or concerns, please contact me at (insert telephone #) or by email at (insert email address).

Thank you.

RE: Hazard Tree Removal in the (insert name) area

Please accept this correspondence as a formal request for an approval letter from Sustainable Resource Development to remove individual hazard trees in the (insert name of area) area. The hazard trees have been marked in the field with a painted blue dot and their locations are marked by corresponding item numbers on accompanying maps.

The townships that we are seeking approval in are:

List townships - for example:
56-5-W6M
56-6-W6M
56-8-W6M
57-5-W6M
57-6-W6M
57-7-W6M
57-8-W6M
58-5-W6M
58-8-W6M

In total, (insert total number of trees to be removed) hazard trees have been identified and these occur sporadically throughout the townships. ATCO Electric identifies hazard trees as those trees that are dead or dying, show visible signs of defects or otherwise pose an imminent threat to ATCO Electric's facilities. Considering the sporadic locations and general poor condition of these trees, ATCO Electric deems them to be non-salvageable.

I trust this letter with the accompanying maps and patrols provides the information you need to make your determination. If you need further information or would like to discuss the proposal, please contact me at (insert telephone #) or by e-mail at (insert email). Thank you.

h) Tree Voucher Letter

ATCO Electric

**Subject: ATCO Electric Tree Voucher Gift Certificates**

Dear Landowner:

Please find enclosed the tree vouchers redeemable at Dunvegan Gardens in Grande Prairie. They can be used to replace the trees we have removed from your property as per our agreement. Please check the enclosed list of trees suitable for planting within 8 meters (26 feet) of the powerline and those that must be planted beyond 8 meters. These certificates can be used for any merchandise; they do not have to be used for trees.

Thank you for participating in this program and helping us reduce maintenance costs to keep the powerlines in a safe and reliable condition.

Thanks,

Utility Forester, Forest Operations
ATCO Electric

ATCO Electric

# SPECIFICATIONS (MAINTENANCE BRUSHING)

1. All work will be completed and invoiced by the date indicated in the Form of Tender or Contract.

2. Landowner permission form will be regarded as the work instructions. Any deviations from the permissions must be arranged with the landowner and Forest Operations Coordinator.

3. The attached ATCO Electric map indicates the location of each brushing site. The patrol notation describes the estimated scope of work required at each location.

4. The contractor will be responsible for any damage to public or private property sustained while completing the identified work.

5. The crew foreman will contact Forest Operations Coordinator as indicated in the job planning meeting, in regard to work progress and, if any difficulties develop.

6. The crew foreman will contact the nearest ATCO Electric service area office and report daily their whereabouts.

7. An operational mobile telephone or ATCO Electric Company radio is required with each brushing crew.

8. Outages are to be arranged a minimum of 48-hrs.in advance with the local ATCO Electric operator in-charge.

9. All work locations will be mapped and the work done on each location will be recorded. This map will be submitted to Forest Operations Coordinator at the completion of the project.

10. The crew foreman will be familiar with and have in his possession, the `SPECIFICATIONS'.

11. Any work locations not completed as indicated on the permission list will be deducted from the bid price.

12. The contractor may supply a separate price for all extra work locations not indicated on the attached maps or permission lists. Each location, however, must be approved by ATCO Electric Coordinator.

13. Any changes to brushing activities (as described on the Landowner Permissions form) will be documented (including landowner authorization) on

ATCO Electric

the form, with the revised date and crew foreman signature. Such changes require prior approval from the Forest Operations coordinator.

14. Any deficiencies to these specifications or to the "Landowner Permission" requirements will be neatly documented on the specific "Landowner Permissions" form or on an ATCO Electric "Brushing Status Report" form. These "deficiency documents" will all be returned to Forest Operations prior to its inspection (and final payment).

15. Any deficiencies to these specifications on Public Land (not documented on a "Landowner Permissions" form) will be documented by the contractor

16. The contractor will document the status (i.e. bent, missing, or intact) of survey pins belonging to the Province of Alberta at mow locations. No mowing will take place within 0.3 m (1 foot) of any such survey markers or marker pits. Any disturbance or damage to intact survey markers, or marker pits, will require the contractor to bear the cost of their re-establishment.

17. All stumps will be cut as low as possible (no higher than 8 cm (3 in.)) with flat tops, unless required for slope stabilization.

18. All limbs will be disposed of by chipping unless otherwise approved by Forest Operations coordinator.

19. All limbs under or to the side of the power line will be trimmed using directional pruning techniques.

20. A Utility Tree worker or Utility Tree Trimmer will be in charge of each Mow crew.

21. A Utility Tree Trimmer will be in charge of each Trim crew.

22. A Utility Tree worker or Utility Tree Trimmer will be in charge of each Slash or Pre-mow crew.

23. Unless the ATCO Electric "Landowner Permissions" form indicates otherwise, the **minimum** Right-of Way width to be maintained on either side of single and three phase power lines (at ground level) is 7.5 metres, except for single phase lines in rurals, which may be maintained at 6 metre width. In all cases, **tree limb to conductor clearance after mowing should be 5 metres.**

24. All woody vegetation with potential to grow within 3 metres of the primary conductor, will be removed (i.e. poplar, alder, birch, spruce, pine, and some willow), unless indicated otherwise by the Landowner Permission list.

ATCO Electric

25. All trimmed limbs will be cut flush with the tree trunk (without damaging the branch collar). All limbs above the power line will be removed. **There will be no work over any energized equipment, or within the Utility Tree Trimmer Tree worker "limits of Approach".**

26. Remove all woody species growing under guy wires.

27. All guy wires within 3 metres (10 feet) of mow operations will be flagged in advance. A 3-meter (10-foot) diameter area will be cut out around such guy wires prior to mow operations. This area will be closely examined for guy wire "tails." Such "tails" will be brought to the attention of the local district office.

28. All work locations are to be left tidy, with brush disposal acceptable to both ATCO Electric and the landowner. Mowers may have to make two passes, or have larger trees slashed in advance; especially for large willow, or heavy density deciduous areas (when stem diameters are greater than four inches ten cm). Greater care is required around yard sites; all exposed limbs and roots over two inches (five cm) in diameter should be removed with the ground being reasonably leveled off prior to seeding.

29. Pre-mowing operations include the removal of larger trees on the side (s) of right of way, and is a requirement at some mow locations. This work will be done in advance of mow operations.

30. All activities conducted for ATCO Electric will conform to the following:
    a) The province of Alberta's:
        - Electrical Protection Act
        - Employment Standards Code
        - Environmental Protection and Enhancement Act
        - Occupational Health and Safety Regulations
        - Forest and Prairie Protection Act
        - Surface Rights Act
        - Weed Control Act
    b) The Government of Canada's:
        - Transportation of Dangerous Goods Act
        - Workman's Compensation Act
        - Workplace Hazardous Materials Information System (WHMIS) regulations
    c) The Industrial Vegetation Management Associations of Alberta's (IVMAA):
        - Safety Rules for Trees Near Power Lines

ATCO Electric

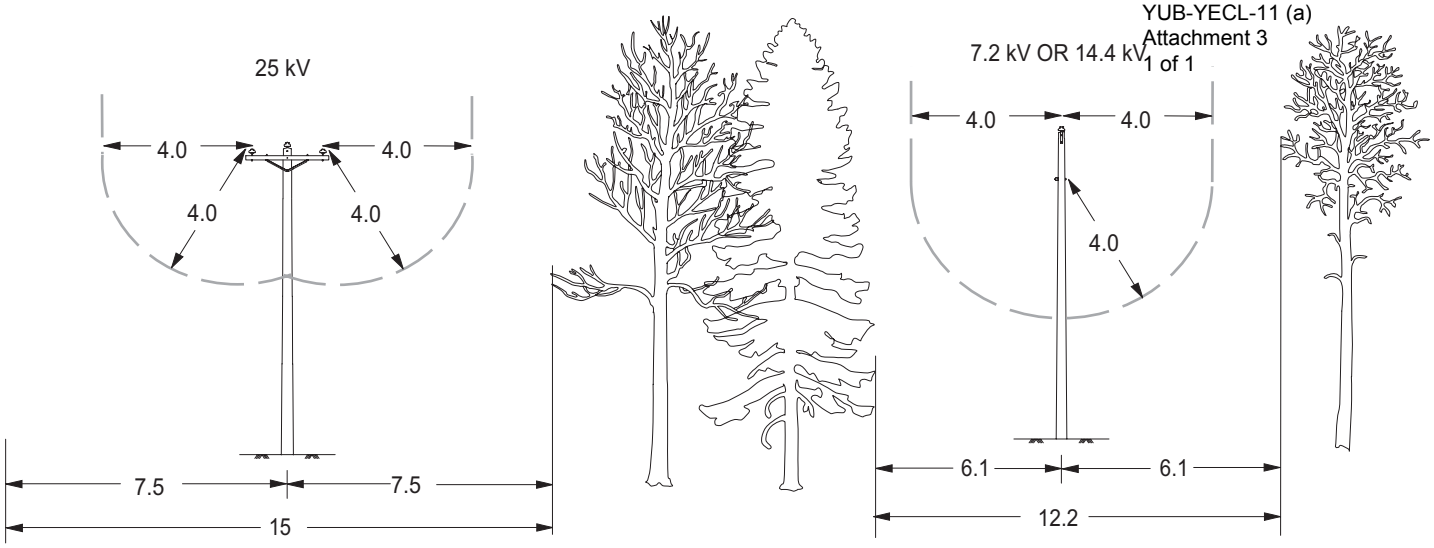
31. **Before any work begins, the contractor must supply a "Job Safety Analysis" for each Operation, and the Forest Operations coordinator must approve the plan.** *This work plan will include:*
    *a) A description of the job,*
    *b) A list of critical activities/site conditions,*
    *c) A list of the tools/equipment (with test expiry dates) and materials required,*
    *d) A list of the hazards and methods used to eliminate or control them,*
    *e) The necessary level of competency- for all workers,*
    *f) An emergency plan and,*
    *g) The general sequence of events (at the work site).*

    Each work crew will be in possession of, and familiar with, the completed "Work Plan" form when working on this project).

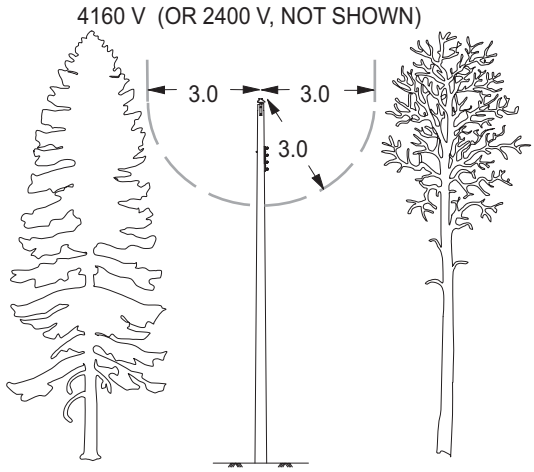
32. **Tailboard meetings** will be held prior to staring any job where two or more workers are present. They will also be undertaken where the original "Work Plan" changes or where the job has been interrupted for a period of time. These interruptions could include breakdowns, lunches, etc. Tailboards must be submitted to ATCO Electric with the appropriate invoice. *Each tailboard will indicate at a minimum:*
    *a) Who is charge of the crew,*
    *b) What are the tasks that are to be performed,*
    *c) What the duties are of each crew member,*
    *d) What are the hazards at each work site,*
    *e) What are the main hazards in performing each task, and*
    *f) How are the hazards going to be controlled or eliminated.*
    *g) Emergency response plan in case of injury*

33. A **"Start-Up" meeting** will be conducted with a representative of the ATCO Electric District (Service Area), and all contractor foreman. Each brush crew foreman will be in possession of, and familiar with, the completed "Start-up Meeting" form when working on this project. Forest Operations coordinator's approval will be obtained if any changes to the Work Plan are desired by the contractor (including the change of crew members). Any new foreman must review the Work Plan with the Forest Operations coordinator, and be familiar with the "Specifications" and "Work Plan."

34. ATCO Electric reserves the right to audit crews while they are at their work locations for compliance with; these "specification" requirements and government regulations.



35. All work must stop if any incident occurs and reported to Forest Operations Coordinator and the local ATCO Electric Service Area office immediately. Vehicle accidents associated with ATCO Electric's work must also be reported. ATCO Electric has a policy of non-discipline for accident incident that are reporting.



ATCO Electric

36. Limbs or trees with potential to contact the power line during their removal, will have preventative measures taken to avoid this (ie. rope).

37. Workers are not allowed to be in the bucket of a boom truck or ride on the outside of the cab of a vehicle while it is in motion.

38. ATCO Electric may stop work and void this contract at any time if:
   a) ATCO Electric is not satisfied with work quality,
   b) The rate at which the work is progressing will create difficulties for ATCO Electric in relations to the specified completion date.
   c) Significant problems are created (in ATCO Electric's opinion) by the contractor with land title holders,
   d) Due to contractor negligence, serious problems develop. ATCO Electric will not be responsible to pay the contractor for work not done, or not done to ATCO Electric's satisfaction, as a result of the above circumstances.
   f) Worker Health and Safety violations occur.

| VOLTAGE | RIGHTS-OF-WAY WIDTH | TREE TO CONDUCTOR CLEARANCE |
|---|---|---|
| 2400 V | - | 3 m |
| 4160 V | - | 3 m |
| 7200 V | 12.2 m (6.1 m EACH SIDE) | 4 m |
| 14400 V | 12.2 m (6.1 m EACH SIDE) | 4 m |
| 24940Y/14000 V | 15.0 m (7.5 m EACH SIDE) | 4 m |

- RIGHTS-OF-WAY WIDTH SHALL BE DETERMINED BY MEASURING THE HORIZONTAL DISTANCE AT RIGHT ANGLE AND GROUND LEVEL FROM THE CENTRE-LINE OF THE POWERLINE TO THE NEAREST BRANCH OF THE CLOSEST TREE. THIS IS DONE ON EACH SIDE OF THE CENTRELINE, IF APPLICABLE.
- TREE TO CONDUCTOR CLEARANCES ARE TO BE DETERMINED BY ESTIMATING THE DISTANCE FROM THE CONDUCTOR TO THE NEAREST TREE BRANCH.
- TREE BRANCHES ARE NOT TO EXTEND OVER THE CONDUCTOR REGARDLESS OF VERTICAL CLEARANCE.
- THE RIGHTS-OF WAY IS TO BE CLEARED OF VEGETATION WHICH IS INCOMPATIBLE WITH THE OPERATION OF AN ELECTRICAL SYSTEM. (TALL GROWING PLANT SPECIES i.e. POPLAR, SPRUCE, etc.)
- WOOD IS TO BE SALVAGED, OR DISPOSED OF, IN AN ACCEPTABLE MANNER.

**YUB-YECL-12**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 87300 Maintenance

**Quote**: Costs increase from 2005 to 2006 mainly due to filling vacancies in 2006 and labour allocation to 71100 in 2005. (Line No. 80.)

Costs increase from 2007 to 2008 due mainly to additional labour as a result of new hires ( 136), vacancy reductions ( 120) (Line No. 82.)

These programs relate to Core certification and environmental requirements. Many of these programs are mandated by outside agencies or are a result of changes to industry standard. The increases also relate to enhanced patrols of lines and the introduction of planned maintenance programs designed to support system performance. (Line No. 84-87.)

**Preamble**: The Board would like to have a greater understanding regarding YECL's maintenance costs.

**Request:**

(a) Please provide vacancy rates for the period 2002 to 2007 for Account 87300.

(b) Please provide detailed explanation regarding in regard the 600 (60 ) increase in maintenance costs when comparing 2009 to 2007.

(c) What is Core certification?

(d) Please explain what is meant by enhanced patrol of lines .

(e) Please provide further detail and explanation regarding the need for expenditures relating to the introduction of planned maintenance programs designed to support system performance .

(f) Did previous programs not support system performance? Please explain.

**Response:**

(a) Vacancy rates are calculated based on an approved complement for FTEs. As such vacancy rates are not applicable for this period, given that there were no Board approved FTE.

(b) The variance explanation can generally be found in Schedule 5.2 lines 73 to 82. To further assist with this Information Request Yukon Electrical, to the extent possible, has provided a further breakdown based on the maintenance costs that make up the referenced variance. The chart below includes labour and other costs associated with each program.

| **Program Cost Item** | **2007 to 2008 Variance ( 000)** |
|---|---|
| 1. Core Certification (Safety Program) | 50 |
| 2. Enhanced Line patrols | 60 |
| 3. Pole Plant program | 50 |
| 4. Ground Rod testing | 50 |
| 5. Skills Premium (Attraction Retention) | 75 |
| 6. Field Service Representative | 25 |
| 7. Operations Admin Support (General, New Programs) | 20 |
| 8. Inflation (labour, fringe, other) | 120 |
| Subtotal | 450 |
| Inflation Increase between 2008 and 2009 | 150 |
| Total variance 2007-2009 | **600** |

As discussed in its application Yukon Electrical has hired certain new positions required to provide safe and reliable service to customers. These positions include, Planned Program and HS&E Supervisor, Operations Administration

Support, Field Service Rep and a journeyman lineman. Yukon Electrical's process allocates employee labour to the various activities where the employee is expected to work. This accounts for the new hire cost increase shown in Schedule 5.2. The filling of lineman vacancies, due to an increased recruitment effort and the community skills premium that has been offered, accounts for the costs for vacancy reduction and attraction and retention pay. This labour then accounts for the forecast increase to fringe, labour inflation (annual pay increases) and a portion of non-labour inflation for increased truck charges. The implementation of new planned maintenance programs account for a portion of the increased costs as well. Details of the programs are attached as YUB-YECL-12(b) Attachment 1; however Yukon Electrical applies the program components to its own unique system needs.

The variance between 2008 and 2009 is essentially inflation as outlined in Schedule 5.2 of Yukon Electrical's application.

(c) The Certificate of Recognition (**COR**) Program is an occupational health and safety certification program for all Yukon employers. Its primary intent is to support employers to provide a safe workplace for employees both small and large in the health, safety and well being of its employee's.

The program is designed to:

- Assist companies in the development and maintenance of a company-wide safety program, policies and procedures.
- Introduce standardized training and compliance with the new Yukon Occupational Health and Safety Regulations came to effect November 1, 2006
- Monitor the safety program through annual audits.
- Certain organizations such as the City of Whitehorse, require their contractors to be COR certified in order to be a qualified contractors.

For more information please contact the following web sites

www.yukonsafety.com www.wcb.yk.ca or email work.safe gov.yk.ca

(d) Any time that Yukon Electrical employees are in an area they asses and monitor the power lines and equipment for any noticeable abnormalities that will require immediate attention. An enhanced line patrol is a dedicated walk up and visual inspection performed by one of our qualified utility employees, with corresponding maps and inspection reports on hand. The various components inspected include poles, hardware, anchors, guy wires, insulators, conductors, grounding, line clearances and the vegetation in the area. Although Yukon Electrical has always completed some form of line patrol the program has been enhanced in order to provide an added level of diligence to the process.

(e) Yukon Electrical is implementing these maintenance programs in order to support ongoing system performance. These programs are pole test and treat, ground rod testing and a lightning arrestor program. Increased costs for these programs are for labour, materials, data management and contractor services. By focusing more effort on planned programs and maintenance practices Yukon Electrical will provide a higher level of reliability for its customers in the long term; and an added level of safety and security in the short and long term.

(f) Previous maintenance programs did support system performance to a certain extent. However, in recent years there have been learnings that support a new or improved approach when it comes to maintenance of a power system. In addition, there has been an increased requirement to improve safety for employees and the public, as well as, a general requirement to demonstrate a higher level of due diligence than may have been the case in the past. Over time processes improve, new methods of doing work evolve and new equipment is installed on the power system. A prudent utility responds to the such changes before past practices cause issues or problems. Modern maintenance programs and approaches also have built in mechanisms for tracking trends and actions which are of great assistance in overall system planning.

## PART I – Program Outline

### 1.0 Purpose

To provide a process for inspecting and repairing the ATCO Electric distribution system and ensure it is in a safe and reliable operating condition meeting corporate standards as well as regulatory requirements.

Public safety is of the utmost concern and attention should be focused not only on the structure but also to observations of surrounding events or areas that could cause conflict in the short or long term. These could include man made or natural events that change the original engineering planning and allow the public to inadvertently encroach safe limits of approach.

The report that is generated will assist in providing overall effective planning strategies for ongoing work activities as well as provide documentation for accurately tracking inspections, maintenance activities and repairs.

This process will be used for day to day activities where a substandard condition is identified. The response will be dictated by the critical nature of the associated safety risks to ATCO Electric and the general public.

### 1.1 Program Category Levels

There are three categories identified in the Distribution System Inspection and Maintenance Program. They are as follows:

| Category | Activity |
|---|---|
| Emergency / Critical | unplanned conditions / immediate repairs / secure area |
| Inspection | ongoing visual inspection to ensure system security |
| Maintenance | close scrutiny hands-on physical maintenance by critical evaluation or schedule |

**Personnel have the duty to identify and report any substandard problem or concern identified with any line, equipment or right of way on the distribution system.**

Lines showing evidence of failures or where a problem is suspected are to be inspected immediately. For example, following unplanned extensive outages that may have caused significant equipment damage, an inspection must be conducted to ensure system security and public safety.
Other problems not affecting system reliability, such as missing guy guards, loose or broken grounds, and hardware should still be repaired immediately after appropriate hazard assessments and measures have been implemented.

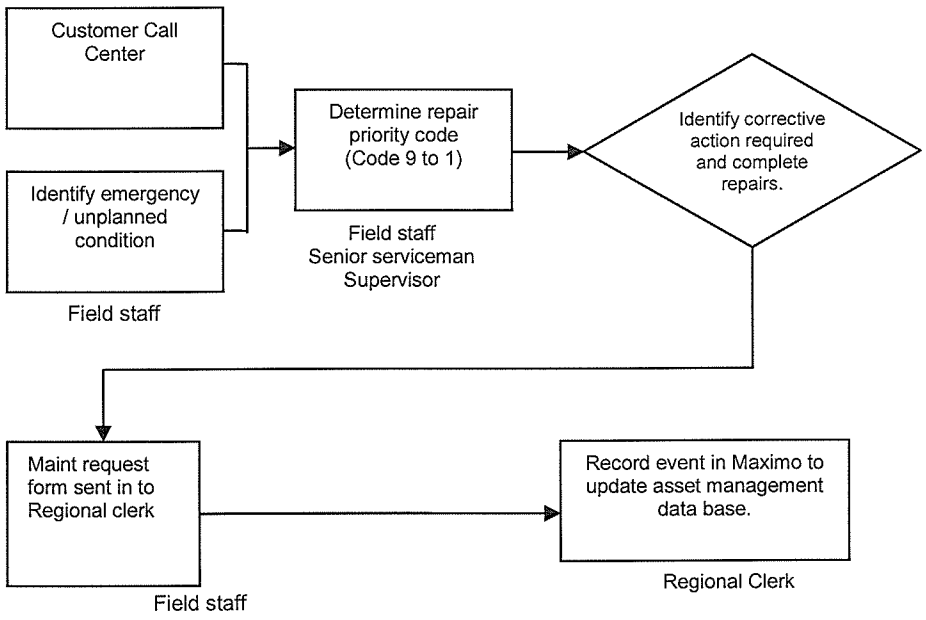
## 1.2 Emergency / Critical

Substandard conditions that have been identified by customer calls, daily travel, or during the inspection activity must be acted upon immediately to protect the general public and/or other workers. A risk assessment shall be conducted and if determined as urgent, shall be corrected immediately or the area secured.

Documentation of the condition, and work activities shall be completed on the Service Interruption , and Maintenance. Request Form with the information entered into Maximo.

The following flowchart identifies the process required to complete emergency or unplanned maintenance activities.

### Emergency or Critical Process



Customer Call Center
Identify emergency / unplanned condition
Field staff
Determine repair priority code (Code 9 to 1)
Field staff
Senior serviceman
Supervisor
Identify corrective action required and complete repairs.
Maint request form sent in to Regional clerk
Field staff
Record event in Maximo to update asset management data base.
Regional Clerk

Figure 1

### 1.3 Inspection

Inspections are completed to:

- identify system problems and make sure repairs are initiated in a planned, proactive and timely manner
- assess the present condition of the distribution system, right-of-way and identify conditions which may affect the safe operation of the system (i.e., encroachment of buildings/trees)
- assess the effectiveness of products, maintenance programs and operating procedures
- meet legal obligations under the Alberta Electrical and Communication Utility Code (ECUC), Pipeline/Gas Field, Transport Canada Aircraft Navigation and, Navigable Water Regulations. (water crossings)
- reduce risk and legal liability due to damage, failure or the evolution of unsafe conditions and hazards

Information gathered and its accuracy during the inspection is used to:

- ensure all substandard conditions are identified, documented, examined and repaired
- report the existence of conditions that may result in injury, loss of life or property
- perform and record repairs that require immediate action (eg. installing guy guards)
- report and record conditions that may result in service interruptions
- establish maintenance and capital budget schedules
- document maintenance activities that will need to be completed at a later date.

An inspection of the Distribution System must be completed at least once each year. The Regional O&M Superintendent in consultation with the Maintenance Supervisor may request additional activities based on findings.
For example:

- infrared scanning to detect hot spots
- unusual sagging conductors
- excessive insulator contamination
- vegetation growth presenting an immediate or potential threat to the system. In this case it must be reported to meet obligations under the Wildfire Agreement and to limit risk and liability on private land.

### 1.4 Maintenance

The appropriate maintenance activities will be determined from the results of the inspections. This is a physical activity performed by either climbing or using an aerial device on overhead systems or physically entering or opening a cubicle, transformer lid, etc on underground systems completing the necessary maintenance.

Observations found and maintenance or repairs that have been completed must be recorded on the corresponding System Inspection form (see Appendix section of this document).

The following flowchart identifies the process required to complete the planned inspection and maintenance activities.

### Planned System Inspection and Maintenance Program Process

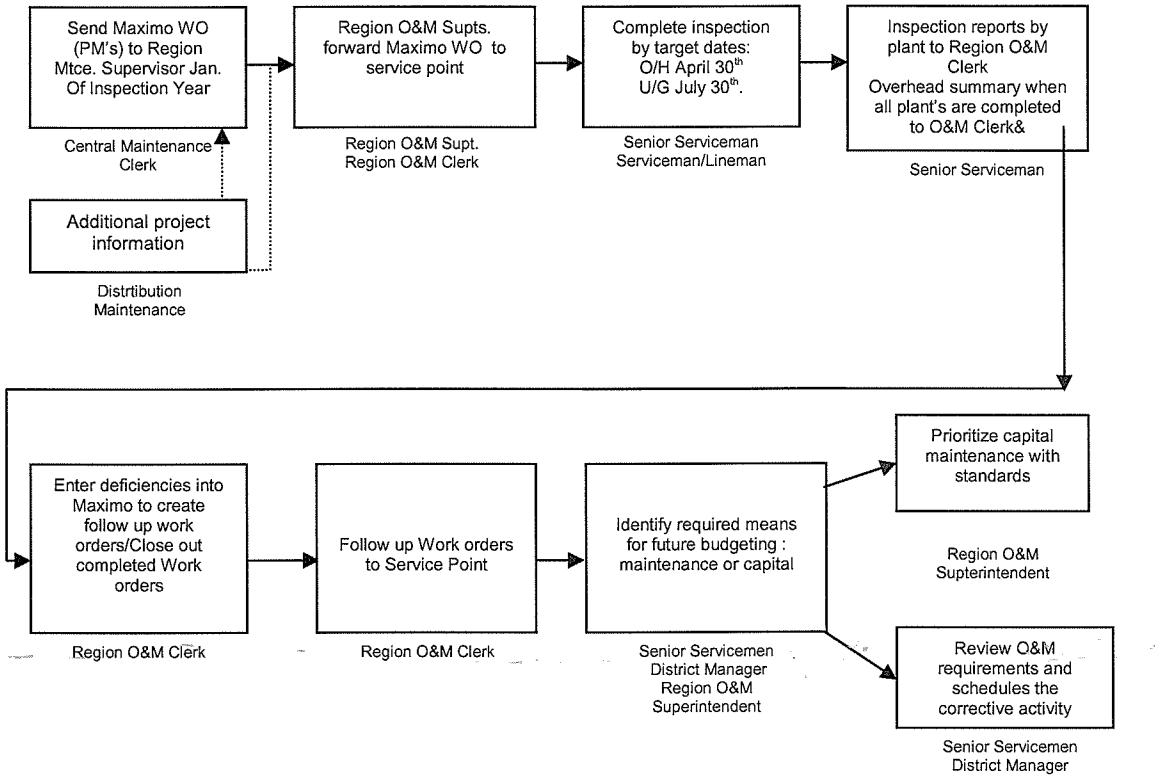


**Figure 2**

## PART II – Additional Inspection and Maintenance Criteria

### 2.0 Purpose

This section shall identify additional criteria pertaining to the inspection and maintenance programs. For detailed Directives on an individual maintenance program and/or Work Procedures, refer to the corresponding internal document.

### 2.1 Personnel

Trades personnel must have the ability to produce quality workmanship using approved work practices and should be dedicated to this project.

Trades personnel in this function must:

- **apply** his skill and knowledge in making observations of substandard conditions
- **complete** the System Inspection Training Module coordinated through the Region O&M Supterintendent
- **determine** and develop barriers to allow inspections and repairs to be completed safely
- **document** repairs that have been completed and items that are to be repaired at a later date
- **forward** the 'original' Distribution Inspection Summary form and System Inspection Report to the Sr. Serviceman indicating all substandard conditions have been addressed
- **ensure** REA inspection and reporting meets REA contract obligations

A Senior Serviceman must:

- **review** and sign off the inspection and maintenance documents
- **send** 'original' Inspection Report with coded information to Regional O&M clerk for entry into Maximo (as soon as each plant is completed)
- **send** a copy of the Summary Report to the: (when all plants have been inspected) Regional Maintenance Clerk to close the Maximo work order

The Region O&M Superintendent must:

- **ensure** the inspection and maintenance reports are entered into Maximo
- **ensure** the regional maint. Clerk runs a capitital and maintenance management plan from data entered in maximo.
-

## 2.2 Reference Material Requirements

The following is a list of additional resources available:

- ATCO Electric's
  - Construction Standards Manual
  - Power System Work Standards
  - System Inspection and Maintenance Program
  - Safety Standards Manual
  - Work Procedures
  - Directives
  - Administrative Practices

## 2.3 Activity Coding

A priority code must be assigned to each outstanding repair by the Inspector, determined by the severity of the risk, and identified in Maximo or on the inspection form.

| Priority | Color | Activity |
|---|---|---|
| 9 | red | Emergency Maintenance (Immediate Action). |
| 8 | orange | Corrective Maintenance (1 to 7 days) |
| 7 | yellow | Scheduled Maintenance (7-30 days). |
| 6-5 | blue | Scheduled Maintenance (1-3 months) |
| 4-3-2-1 | green | Scheduled Maintenance (current or next budget cycle/3 months to 3 years) |
| 0 | | Structure or component is in good condition. No follow-up action required. |

Such documentation of repairs must be kept on hard copy or electronically for a minimum of 11 years.

## 2.4 Account Coding

The following account numbers are to be used for reporting:

| Project # | Task # | Category |
|---|---|---|
| | | **Overhead lines** |
| D0---1 | 87302 | overhead line patrol / inspection |
| D0---1 | 87350 | immediate maintenance from overhead line patrol / inspections |
| D0---1 | 87351 | follow-up maintenance from overhead line patrol / inspections |
| | | **Underground systems** |
| D0---1 | 87402 | patrolling underground system components |
| D0---1 | 87450 | immediate maintenance from underground system inspections |
| D0---1 | 87451 | follow-up maintenance from underground system inspections |

## 2.5 Program Audits

It is the responsibility of the Standards Maintenance Superintendent to audit portions of the system annually by randomly selecting plant numbers on a rotating basis schedule.

The audit is recorded electronically or on a separate inspection form and the field information compared with the inspection report submitted by the region/service area.

A copy of the final report will be reviewed with the Region Maintenance Superintendent, District Manager and Standards Manager.

# 2.6 Workflow Responsibility Matrix

| Activity Task | MGR STDS | District Mgr. & Region Supt.Group Lead | Standardw Mtce. Supt. | Standards Mtce. Sup. | Region Supt & District Mgr. | Group Leader | Trades | Regional Clerk |

| Legend | | |
|---|---|---|
| D | decision | the individual who is ultimately responsible |
| A | action | the individual who actually completes the task, the doer |
| C | consult | the individual to be consulted before the decision is made |
| I | inform | the individuals informed after the decision has been made |

## PART III– Appendix

Included in this appendix are the following forms:

| Document ID | Document Name |
|---|---|
| A | System Inspection Overhead Report |
| B | System Inspection Underground Report |
| C | System Inspection Overhead Clearance Report |
| D | System Inspection Street Lighting Report |
| E | N/A System Inspection Outstanding Maintenance |
| F | Annual Summary Report |
| G | Maintenance Work Request form |
| H | Forest Operations Hotspot Reporting form |

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

**YUB-YECL-13**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 87700 Transformer Repair and Replacement

**Quote**: Costs increase from 2005 to 2006 mainly due to higher unplanned repairs... (Line No. 114.)

...

Costs increase from 2006 to 2007 mainly due to higher unplanned repairs (Line No. 116.)

**Preamble**: The Board would like more detail regarding this account.

**Request:**

(a) Please explain sustained transformer repair and replacement costs for the period 2006 to 2009 when compared to 2005.

(b) As part of the explanation for (a), YECL, if it chooses, may provide detail in regard to transformer repair and replacement costs for the period 1997 through 2004.

**Response:**

(a) These expenditure reflect two activities, refurbishment of voltage regulators and refurbishment and or minor repair of transformers. If the repair can be completed by Yukon Electrical's local staff or repaired by a third party at a reasonable cost, it will be charged to this activity. Professional judgment is exercised when it comes to repair of transformers with minor damage or failure vs replacement. Contributing factors in these decisions include if the transformer is of a unique voltage or size, as well, it's availability from a vendor is a consideration. The forecast put forward in the test period is reflective of previous experience in this activity.

(b) This activity was not tracked separately or consistently prior to 2006.

**YUB-YECL-14**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 87800 Street Light Maintenance

**Quote**: Costs increase from 2006 to 2007 mainly due to increases in number of lights and age of street light infrastructure as well as maintenance of new types of lights such as waterfront decorative lighting ( 31). (Line No. 122-123.)

**Preamble**: The Board would like a better understanding regarding the various types of lights, i.e. street lights and decorative lighting, available in YECL's service territory.

**Request:**

(a) Please provide detailed explanation as to the various types of street lighting and affiliated maintenance and ownership contracts that are available to customers in YECL's service territory.

(b) Please provide detailed explanation as to the various types of decorative lighting and affiliated maintenance and ownership contracts that are available to customers in YECL's service territory.

**Response:**

(a) Please refer to YUB-YECL-14 Attachment 1 for the various types of streetlighting options currently in service in the City of Whitehorse and throughout the territory. In summary these schedules represent the various types of rate options depending on the initial purchase agreement and in some cases, location of the light. In regard to ownership, typically all lights are owned, operated, maintained and replaced at the end of life or after damaged by Yukon Electrical with the exception of a small number of streetlights on Robert Service Way and along Main street in Whitehorse. The other exception relates to streetlights owned by the Yukon Government which are typically on the Alaska Hwy. The streetlights not owned by Yukon Electrical are charged an energy only rate.

(b) Yukon Electrical has a number of styles of decorative lighting based upon customer requests. The ownership arrangement regarding decorative lights is essentially the same as mentioned in response to a) above. Investment in the streetlights by Yukon Electrical is based on the Electric Service Regulations. The currently approved investment level is 700.00 per light. In regard to decorative lighting not owned by Yukon Electrical, a verbal operating, emergency response and repair agreement is in place between Yukon Electrical and the owners where Yukon Electrical will complete requested work on a cost recovery basis.

**YUB-YECL-15**

**Reference:** Application, Schedule 5.2

**Issue:** 87500 Meter and Meter Testing

**Quote:** Costs decrease from 2006 to 2007 mainly due to less one-time costs related to Automated Metering Reading (AMR) feasibility study ( 19) and less miscellaneous material issues and payables ( 18). (Line No. 106-107.)

Costs decrease from 2008 to 2009 due to savings from AMR. (Line No. 111.)

**Preamble**: The Board would like to gain a better understanding regarding meters and meter testing.

**Request:**

(a) Please provide the business case drivers that led YECL to perform an AMR feasibility study in 2006.

(b) Who performed the study and what were the study parameters?

(c) Please provide the results of the AMR feasibility study and the resultant analysis performed by YECL that led to the decision by YECL to incorporate AMR.

(d) Please provide details in regard to what YECL has implemented and plans to implement in the future in respect of AMR as a result of the feasibility study.

(e) Please explain the savings from AMR that are forecast in 2009.

(f) Please provide an explanation as to what is meant by less miscellaneous material issues and payables . (Schedule 5.2, Line No. 107.)

**Response:**

(a) In 2006, Yukon Electrical recognized it was likely going to have to migrate off its legacy billing system in the next few years. While billing systems options had yet to be evaluated, Yukon Electrical set about the task of reviewing AMR options that might be incorporated into a new billing system process. Given that ATCO Electric, Yukon Electrical's parent company, had successfully implemented a Two Way Automatic Communications System (TWACS) AMR system in Alberta, Yukon Electrical wanted to complete testing to confirm whether this technology would work on Yukon Electrical's distribution system in the Whitehorse area as well as south to Teslin, Carcross and Tagish or, conversely, whether a different option was preferable. Based on the testing completed, Yukon Electrical was able to confirm the TWACS technology would work in the Yukon and was the best solution available. As part of the review of billing system options, service providers were told their product needed to be compatible with both manual meter reading and TWACS AMR options.

(b) The study testing work was performed by technologists from Yukon Electrical, ATCO Electric as well as the AMR product supplier. As noted in part (a), the work was completed to confirm whether the technology would work on Yukon Electrical's distribution system.

(c) Please refer to YUB-YECL-15(c) Attachment 1 for a copy of the business case.

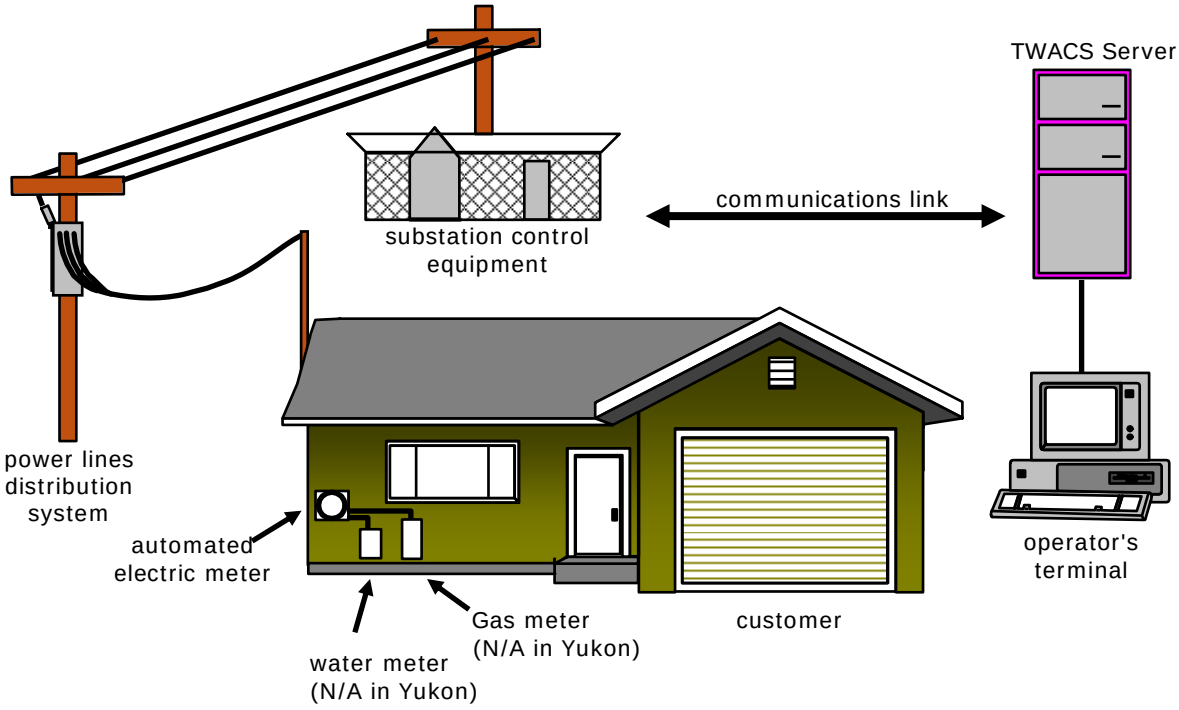
(d) Please refer to the business case in part (c).

(e) Meter and meter testing costs are forecast to decrease in 2009 as a result of the implementation taking place during the year. Please see Schedule 5.1 line 15. Please refer to the business case in part (c) for the analysis of all costs associated with proceeding with AMR as compared to the status quo meter reading option.

(f) This 18,000 refers to inventory issues and other expenses related to the testing of meters. This amount included some costs associated with the Automated Meter Reading feasibility work.

# Automated Meter Reading ("AMR")
# Business Case
# Yukon Electrical Company Limited

# Automatic Meter Reading (AMR) Business Case
# Yukon Electrical Company Limited



## Summary

This project is to convert approximately 13,200 conventional residential and commercial meters to AMR in Whitehorse area as well south to Teslin, Carcross and Tagish. The benefits of the conversion will be improved customer service, long term savings over the life of the system, more environmentally friendly as well as the installation of metering technology that will support the eventual implementation of Time-of-Use rates.

## Background

ATCO Electric has extensive experience in the implementation, operation and support of a system wide AMR system using a powerline frequency carrier technology known as "TWACS" (Two-Way Automatic Communication System) by Aclara. Although this business case is based on using this same technology as ATCO Electric, another powerline carrier AMR technology ("Turtle") was investigated. The choice of TWACS was mainly predicated on the fact that ATCO Electric has an established process and team in place to deal with its own AMR system and that there would be minimal incremental charges being incurred and allocated to Yukon Electrical. Furthermore, given Yukon Electrical's small size and limited northern based technical resources, Yukon Electrical was not prepared to go it alone with a different technology platform.

# How TWACS AMR works

**Project Description**

The project consists of installing TWACS substation communication equipment ("SCE") on two 34.5kV buses (one at Whitehorse Substation S150 and one at McIntyre Substation S170) and replacing approximately 11,176 residential and 2,024 commercial conventional meters with AMR meters. By installing three SCE's at these locations, TWACS AMR will be achieved for all customers fed by McIntyre, Logan, Laberge, Porter Creek, Mountain View, Services, Arkell, Riverdale, Lewes, McRae, Teslin and Shipyard substations.

**Project Cost**

The cost of the project is estimated to be $4.185M

**Project Schedule**

This project is scheduled to be started in 2008 and completed in 2009.

**Business Drivers**

- Accuracy - AMR results in increased customer service by being able to provide an accurate meter reading at any time and eliminates any access or privacy concerns;
- Savings - AMR is expected to result in long term customer savings;
- Access - AMR eliminates the need to access the meter on a regular basis thereby reducing the risk of animal bites to staff and customer complaints. AMR enables 24/7 access to meter readings;
- Customer Service and Planning - AMR provides voltage readings and momentary outages (blinks) at the AMR meters which can be used for engineering studies, operational requirements and customer conflicts;
- Operations - AMR technologies have advanced to include an Outage system, remote disconnect, re-connect systems that can enhance operations and service as there will no longer be a need to physically go to the meter site; and
- Technology Infrastructure - In conjunction with the new billing system, AMR moves Yukon Electrical's metering and billing technologies forward towards being able to offer Time-of-Use rates.

**Specific Benefits (All available once system is up and running by end of 2009)**

- Improved accuracy of meter readings as chances of human error are eliminated;
- Reduction of billing inquiries or disputes from customers when readings are accurate;
- AMR meters are capable of hourly readings thereby providing to ability to produce load profiles and Time-of-Use rates;
- Reduction in manual re-estimations and cancellation/rebilling when readings are more accurate;
- Reduction in off-cycle meter reading requests when actual reads are missed or customer moves;
- Improved monitoring of meter performance such as stopped or failing meters;
- Improved customer service due to bills based on accurate monthly meter readings;

- Improved opportunity to utilize the AMR system to perform value added distribution system O&M functions such as:
    - remote disconnect/reconnect
    - voltage readings at the meter
    - momentary outage counts (blinks) at the meter
    - outage assessment
- AMR system can be used to provide water AMR services to the City of Whitehorse. Yukon Electrical has approached the City of Whitehorse regarding this opportunity and has been advised the City is studying its options.
- *Although all of the benefits above are enabled by AMR technology, some of the items would require additional business cases and revenue requirement prior to implementation.*

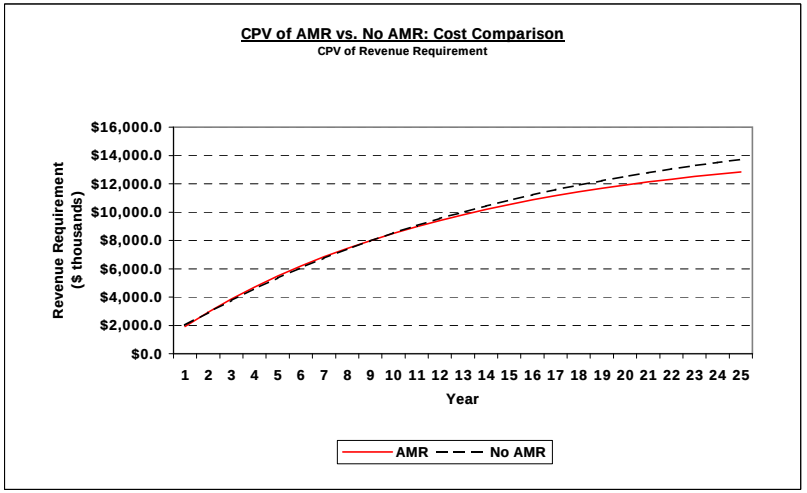
**Risk of Not Proceeding**

- More meter reading errors than otherwise will take place;
- O&M costs will increase over time due to inflation;
- Load profiling would require some other technology; and
- No opportunity to implement Time-of-Use Rates

**Risk of Proceeding**

- Ensuring there are sufficient resources in place to implement the project in 2009.

**Recommendation**



- Proceed with deployment of TWACS AMR technology in 2009.

**YUB-YECL-16**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 71300 Customer Billing & Accounting

**Quote**: Costs increase from 2007 to 2008 due to implementing the new ATCO-CIS billing system. The new system conversion is planned to be completed by July 2008. (Line No. 191-192.)

Costs increase from 2008 to 2009 due to full year impact of the new ATCO-CIS billing system costs. (Line No. 194.)

**Preamble**: The Board would like to gain a better understanding of the new ATCO-CIS billing system.

**Request:**

(a) Please explain what is meant by due to full year impact of the new ATCO-CIS billing system costs .

(b) Please provide a detailed explanation and analysis as to the benefits that YECL customers can expect to accrue as a result of YECL implementing the new ATCO-CIS billing system when the previous and new systems are compared?

(c) Has YECL considered looking at other vendor billing systems? If not, why not? If so, what were the results of the comparison shopping?

(d) Please provide any studies or supporting evidence that show ATCO-CIS as the least-cost alternative.

(e) On an annual basis, excluding the capital component, what is the cost customer of operating the ATCO-CIS system? In similar terms, does YECL know the annual cost customer for billing at YEC?

(f) Please explain the benefits accruing to YECL customers from the implementation of the ACTO-CIS system.

**Response:**

(a) Yukon Electrical's 2008 customer billing is being completed by two systems the legacy system for the first portion of the year and ATCO-CIS for the last portion of the year. Given that ATCO-CIS's operating and maintenance costs are higher than what is being charged for the legacy system in the first part of 2008, the average cost for billing is increasing between 2007 and 2008. As ATCO-CIS will be in place throughout 2009, there will be an increase in the average cost for billing between 2008 and 2009.

(b) Please refer to YUB-YECL-16(b) Attachment 1 for a copy of the Business Case that details the Business Functionality Requirements Evaluation, Technical Feasibility Requirements Evaluation, Ongoing Support Evaluation and Cost Evaluation of the billing options that were reviewed by Yukon Electrical as part of ATCO's North of Sixty Utility Group. It is important to convey the change in billing systems was not predicated on the legacy system not meeting the business needs of the North of Sixty Utility Group. The need to review new billing options was necessitated due unsustainable cost increases as a result of ATCO's large Alberta based utilities migrating off the legacy system's technology platform. This change effectively meant the North of Sixty Companies would be responsible for 100 of the costs associated with operating and maintaining the legacy system.

As detailed in the Business Case, the choice to go with ATCO-CIS was predicated on the system being the preferred choice with respect to ATCO's North of Sixty Companies' Business Functionality Requirements as well as the cost to convert, operate and maintain the system being comparable to the non-related party options.

Some of the more notable features of ATCO-CIS that were not available with the legacy system are as follows:

- Ability of a Customer Service Advisor to on line recalculate previous bills
- ATCO-CIS is windows based which will make is easier to export excel files to customers
- Customer accounts can be bundled (e.g. school boards, RCMP, effectively any customer with multiple service locations)

- There is sufficient space to have all charges itemized - total transparency to customers
- Consumption histogram will be printed on the customer's bill

(c&d) Yukon Electrical, as part of the ATCO's North of Sixty Companies evaluation of options, spent considerable time and effort reviewing other vendor billing systems. Please refer to YUB-YECL-16(b) Attachment 1 for a copy of the Business Case that details the Business Functionality Requirements Evaluation, Technical Feasibility Requirements Evaluation, Ongoing Support Evaluation and Cost Evaluation of the billing options that were reviewed by Yukon Electrical as part of ATCO's North of Sixty Utility Group. In addition to the two potential affiliate solutions, Old CIS and ATCO CIS, four external suppliers were approached to provide cost and other information on their respective billing solutions. One external supplier chose not to file a response to the RFP. A second external supplier was not short listed for further evaluations as its solution did not meet the specified minimum requirements. While Old CIS continued to meet the business functionality requirements of the North of Sixty Companies, the ongoing use of this solution was determined not to be cost effective. This result was due to the larger based ATCO utilities migrating off the system and North of Sixty Companies having to bear 100 of the ongoing operational and capital costs associated with maintaining the Old CIS system. The remaining three billing system solutions were then subjected to a detailed fit analysis based on the evaluation criteria and weightings that were included in the business case. The forecast capital and ongoing operating costs, technical feasibility and ongoing support of Vendor 1, Vendor 2 and ATCO CIS were relatively consistent between each of the three options. The decision to proceed was, therefore, based on ATCO CIS having the highest score for the Business Functionality Requirements. YUB-YECL-16(c) Attachment 1 shows the underlying criteria and scores used to develop each of the 15 weighted scores at page 5 or 34 of the business case. Supporting comments were provided whenever an evaluated score was less than the maximum score.

(e) Please refer to Schedule 5.3 line 11 for the costs associated with billing system services. The number of customers, excluding street and sentinel lights, is on Schedule 2.1 line 39. For 2009, the annual cost per customer is 31.24 ( 484,000 15,490)

With the exceptions of 1998 and 1999, ATCO has continuously provided Yukon Energy billing system services with the legacy system since Yukon Energy's inception in the 1980's. The current fee of 130,000 per year has been offered and accepted for 2008 and 2009. Per Yukon Energy's 2005 Required Revenues and Related Matters Application Tab 7 Filing Schedules, Schedule 11, line 26, Yukon Energy forecast 1,749 firm retail customers in 2005. (Note: This figure would exclude street and sentinel light customer similar to Yukon Electrical.) Using these figures, the annual cost per customer is 74 ( 130,000 1,749). Yukon Electrical is unable to confirm whether the figures provided in this calculation accurately reflect Yukon Energy's total forecast costs and or customers in 2008.

(f) Please refer to (b) and (c).

# 1 Background Summary

The North of 60 Companies (The Yukon Electrical Company Limited, Northland Utilities (Yellowknife) Limited and Northland Utilities (NWT) Limited), collectively known as N60, were advised in 2006 that ATCO I-Tek Business Services intended on retiring the Customer Information System (Old CIS) that had been serving the N60 companies since the 1970's.

Old CIS is a 30 plus year old vendor product based on IMS data base technology that was purchased by ATCO to provide customer care and billing functionality to all of ATCO's utility customers. This technology has not been used to develop new systems. As of 2008, ATCO's Alberta based utilities will have migrated off IMS to database systems that utilize relational database technology. This has meant that N60, as well as the non-affiliated Yukon Energy Corporation, are the only remaining utility companies using Old CIS and the IMS database technology. While Old CIS meets N60's current business needs, the loss of the Alberta based utilities has meant a loss of economies of scale and exposed N60 to the full cost of running and supporting Old CIS and the IMS database.

Due to this situation, a N60 project team was set up in 2006 to define the business functionality requirements for N60 and identify Customer Information System options. This team was sponsored by the General Manager N60 and included key N60 supervisory billing staff. ATCO I-Tek provided assistance on the technical requirements and estimating requirements as this skill set was not available within N60.

Once N60's business functionality requirements were defined, the first phase of the process was to perform a market investigation that identified vendors that provided Customer Care and Billing Services to companies with similar profiles as N60. Based on the information presented in the vendors' responses, a high level comparison and rating was performed on each vendor's product.

Two external vendors were selected for the short list. Based on confidentiality agreements, N60 is not a liberty to disclose the names of the short listed external vendors nor any of the detailed information they provided. A parent company solution, ATCO CIS, as well as the forecast cost of going it alone with the Old CIS were also included with the short list. Each of the vendors was invited to provide a four-day in depth presentation of their product's functionality. The presentations gave N60 and the vendors an opportunity to determine what type of customizations and interfaces would be needed to support N60's business and technical functionality requirements.

# 2 Evaluation Approach

The N60 evaluation consisted of six main activities:

- Requirements gathering
- Market investigation & evaluation of third-party solutions and ATCO CIS
- Estimation of implementation and ongoing costs for vendor solutions
- Estimation of implementation and ongoing costs of ATCO CIS.
- Estimation of ongoing costs of remaining status quo on Old CIS
- Evaluation of Potential Solutions

The evaluation was based on the following criteria and weighting (relative importance) of each criteria, with the weighted points totaling 100.

| Evaluation Criterion | Weighted Point |
|---|---|
| Business Functionality | 60 |
| Technical Feasibility | 5 |
| Ongoing Support | 5 |
| Cost | 30 |
| **Total** | **100** |

Refer to **Appendix A** for the Business Functionality Requirements document.

Refer to **Appendix B** for the Technical Feasibility Requirements document.

Refer to **Appendix C** for the forecast costs of the four options.

# 3 Evaluation Results

### 3.0.1 Business Functionality Requirements Evaluation

Based on the Business Functionality Requirements detailed in Appendix A, the project team performed an evaluation to determine if the business requirements were met by the vendor's product without modification.

The following captures the weighted score of each business functionality category.

| Id# | Business Functionality Major Category | Vendor #1 | Vendor #2 | ATCO CIS | Old CIS | *Maximum Possible Weighted Score* |
|---|---|---|---|---|---|---|
| BR-1 | Core Structure | 4 | 4 | 20 | 20 | *20* |
| BR-2 | Customer Mgmt. | 19 | 21 | 35 | 35 | *35* |
| BR-3 | Service Order Mgmt. | 28 | 18 | 40 | 40 | *40* |
| BR-4 | Billing Accuracy Function | 172 | 200 | 220 | 220 | *220* |
| BR-5 | Automation | 12 | 14 | 40 | 40 | *40* |
| BR-6 | Accounts Receivable Mgmt. | 16 | 16 | 20 | 20 | *20* |
| BR-7 | General Ledger Mgmt | 12 | 16 | 20 | 20 | *20* |
| BR-8 | Credit and Collections | 12 | 8 | 20 | 20 | *20* |
| BR-9 | Payment Remittance | 12 | 16 | 20 | 20 | *20* |
| BR-10 | Meter Management | 12 | 8 | 20 | 20 | *20* |
| BR-11 | Meter Reading Mgmt. | 20 | 28 | 40 | 40 | *40* |
| BR-12 | Route/cycle Mgmt. | 12 | 12 | 20 | 20 | *20* |
| BR-13 | Query and Reporting | 10 | 8 | 20 | 20 | *20* |
| BR-14 | System Administration | 48 | 46 | 80 | 80 | *80* |
| BR-15 | Usability | 84 | 58.5 | 95 | 95 | *95* |
| | **Total Requirement Weighted Score** | **473** | **473.5** | **710** | **710** | ***710*** |
| | **Business Functionality Criterion Weighted Score Out of 60** | **40.0** | **40.0** | **60** | **60** | **60** |

### 3.0.2 Technical Feasibility Requirements Evaluation

ATCO I-Tek defined the technical requirements and the importance rating on behalf of N60 because ATCO I-Tek is the IT service provider for the ATCO Group of Companies. ATCO I-Tek also evaluated the technical requirements for each potential solution.

The following table captures the weighted score of each technical feasibility category.

| Id# | Technical Feasibility Major Category | Vendor #1 | Vendor #1 | ATCO CIS | Old CIS | *Maximum Possible Weighted Score* |
|---|---|---|---|---|---|---|
| TF-1 | Technical Architecture | 16 | 12 | 20 | 8 | *20* |
| TF-2 | Configuration of Workstations | 32 | 35 | 35 | 19 | *35* |
| TF-3 | Configuration of Application Servers | 28 | 25 | 26 | 7 | *35* |
| TF-4 | Configuration of Database and Database Servers | 24 | 32 | 35 | 13 | *35* |
| TF-5 | Shared Hosting Environment | 0 | 6 | 10 | 8 | *10* |
| TF-6 | Systems Integration | 8 | 6 | 16 | 15 | *25* |
| TF-7 | Security | 18 | 32 | 40 | 27 | *45* |
| TF-8 | Redundancy, Backup and Recovery | 25 | 21 | 35 | 19 | *35* |
| TF-9 | Performance and Monitoring | 3 | 2 | 5 | 3 | *5* |
| TF-10 | Network Communication | 28 | 26 | 22 | 30 | *30* |
| TF-11 | Configuration, installation , distribution, and licensing | 18 | 18 | 30 | 24 | *30* |
| TF-12 | Change Management | 28 | 24 | 35 | 15 | *35* |
| | **Total Requirement Weighted Score** | **228** | **239** | **309** | **188** | ***340*** |
| | **Technical Feasibility Criterion Weighted Score Out of 5** | **3.4** | **3.5** | **4.5** | **2.8** | **5.0** |

### 3.0.3 Ongoing Support Evaluation

Ongoing Support describes the level and type of support N60 will receive after the implementation of the potential solution. It includes the service level and the availability of user groups, help desks, system documentation, clearly defined response times and system maintenance. These items support the day to day operations of N60.

Ongoing support evaluation results:

| Ongoing Support Requirement | Vendor #1 | Vendor #2 | ATCO CIS | Old CIS |
|---|---|---|---|---|
| User support offered during N60 business hours | 12 | 12 | 16 | 16 |
| Vendor production outage response time commitments | 12 | 12 | 16 | 16 |
| System upgrades | 16 | 16 | 16 | 8 |
| Documentation and usability | 12 | 12 | 16 | 16 |
| Access to User Groups | 16 | 16 | 16 | 16 |
| **Maximum Weighted Score** | 80 | 80 | 80 | 80 |
| **Total Requirement Weighted Score** | **68** | **68** | **80** | **72** |
| **Business Functionality Criterion Weighted Score Out of 5 (Maximum/Total Score * 5)** | **4.3** | **4.3** | **5** | **4.5** |

### 3.0.4 Cost Evaluation

Implementation and ongoing operations and maintenance costs were forecast for each option and input into the revenue requirement model. (See Appendix C) Given the forecast costs for Vendor 1, Vendor 2 and ATCO CIS were all relatively close to each other, each of these options was given the maximum value. Old CIS was given a minimum value as the ongoing "going it alone" cost to maintain and support the system was clearly not going to be economic to N60.

| Evaluation Criteria | Maximum Value | Vendor #1 | Vendor #2 | ATCO CIS | Old CIS |
|---|---|---|---|---|---|
| Cost | 30 | 30 | 30 | 30 | 0 |

### 3.0.5 Evaluation Criteria Summary

The following outlines the total criteria weighted score for each potential solution:

| Evaluation Criteria | Maximum Value | Vendor #1 | Vendor #2 | ATCO CIS | Old CIS |
|---|---|---|---|---|---|
| Business Functionality | 60 | 40.0 | 40.0 | 60 | 60 |
| Technical Feasibility | 5 | 3.4 | 3.5 | 4.5 | 2.8 |
| Ongoing Support | 5 | 4.3 | 4.3 | 5 | 4.5 |
| Cost | 30 | 30 | 30 | 30 | 0 |
| **Total** | **100** | **77.7** | **77.8** | **99.5** | **67.3** |

# 4 Conclusions and Recommendation

Upon completion of this analysis, a number of conclusions are apparent:

- The legacy system, Old CIS, is not a cost effective solution.
- The forecast capital and ongoing operating costs, technical feasibility and ongoing support of Vendor 1, Vendor 2 and ATCO CIS are relatively consistent between each of the three options.
- Based on the Business Functionality Requirements detailed in Appendix A and the scores awarded in section 3.0.1, ATCO CIS meets the highest amount of N60's business needs in every one of the fifteen categories.

Based on investigative and analytical work completed, it is recommended that N60 proceed with the implementation of ATCO-CIS in 2008.

# APPENDIX A – Business Functionality Requirements

| Business Function Description | Mandatory = M Optional = 0 |
|---|---|
| **1. CUSTOMER MANAGEMENT** | |
| Customer Management provides the facilities necessary for managing customer, account and service location related activities. Typically this includes setting up new services, activating the accounts for billing, consolidating accounts, issuing customer correspondence and terminating service. | M |
| | |
| A customer may have many customer accounts served at many locations. | M |
| | |
| ***1.1 Customer Maintenance*** | |
| Customer Maintenance provides the facilities necessary to maintain data pertaining, to the customer's profile. | M |
| | |
| **1.1.1 Record Customer Data** | |
| Customer data is recorded when a customer applies for service. The information typically recorded about the customer is name, mailing address, and contacts, phone numbers, identification, critical use conditions and other related customer data. | M |
| | |
| **1.1.2 Specify Consolidated Accounts** | |
| This process provides the means to group or consolidate one or more billing accounts to a particular customer. The reason for consolidating accounts is to create one monthly invoice for all the selected accounts as opposed to generating one invoice per account. The billing accounts underlying a consolidated account are for meters billed in **different** billing cycles. The consolidated invoice includes details for each account. | M |
| | |
| **1.1.3 Specify Statement Accounts** | |
| This process provides the means to group multiple billing accounts in the **same** cycle to a particular customer. The reason for grouping statement accounts is to provide a monthly statement for all the selected accounts provided that these accounts are for meters on the same billing cycle. (i.e. for one particular area or community) One invoice is generated for each individual account. One statement is produced per month. | M |
| | |
| ***1.2 Account Maintenance*** | |
| Account Maintenance provides the facilities necessary for the administration of customer accounts. Typically this includes: | |
| > Account set-up (before meter installation). | M |
| > Turn-on. | M |
| > Turn off. | M |
| > Temporary disconnect (seasonal or non-payment). | M |
| > Inactive account with meter. | M |

| | |
|---|---|
| > Inactive account without meter. | M |
| | |
| Different types of accounts include: | |
| > Normal account level meter. | M |
| > Unmetered (flat rate) - energy and demand are estimated values required for billing calculations. | M |
| > Outdoor lights (with or without meter) - consumption is estimated for rider calculation and sales reporting. | M |
| > Manually billed industrial or secondary energy accounts assigned non-standard rates. | M |
| > Subtract metered accounts. | M |
| > Company use accounts (non-billing but consumption to be recorded and reported). | M |
| Payment Options: | |
| > Pre-authorized payment plan (from bank accounts and credit cards). | M |
| > Average monthly payment plan. | M |
| | |
| **1.2.1 Record Account Data** | |
| Account data information is recorded when a customer applies for service. The information typically recorded is the customer name, any aliases, employer, phone numbers, mailing address for invoice delivery, the type of service, type of business as defined in the Standard Industrial Class Code (SIC), rate code, special use conditions and other related account data. Recording of personal data such as dob or health care number | M |
| | |
| For rental properties, recording owner/property management company information is required. (COIN) | M |
| | |
| This also provides for the recording of contract data, the account billing frequency and any billing exemptions that may apply such as late penalty charge category code, applicable provincial or federal taxes, and riders or exemptions therefrom. Franchise tax billing option required. | M |
| | |
| **1.2.2 Assign Location** | |
| A customer name can be associated with multiple locations. | M |
| The search function must allow for search by account number, last or business name or civic address. An expanded search function providing search by phone number, mailing address, date of birth. Legal or rural address, or “sounds like” name is desirable. | M |
| | |
| **1.2.3 Turn-On Account** | |
| The turn-on function is used to activate the account for billing purposes. A connect fee and security deposit may be optionally assessed and the appropriate rate schedule is assigned. | M |
| This function **MUST** create service field orders. Field order production must be automatically assigned by location and or company. | M |
| | |
| **1.2.4 Administer Outdoor Lights** | |

| | |
|---|---|
| The outdoor light function is used to set-up and administer outdoor lights. A customer can be billed different monthly rates for outdoor lights depending on the type and size of the lamps. Outdoor lights are normally connected before the meter and consumption is not recorded as part of the monthly meter reading. However, an average monthly kilowatt-hour value is assigned to each light rate code and must be reported as consumption for monthly statistics. For example, a 100 watt HPS sentinel light has a base charge of $11.64, a 14.63% rider charge of $2.18 and GST of $.97. For regulatory purposes, the system must also record consumption of 40 kWh even though this was not a "measured" amount. | M |
| A customer should receive one bill for both metered energy as well as any light charges. | M |
| | |
| There must also be a function to bill lights on an account without a meter. This type of account will typically have to calculate a bill combining several different types of light rate codes. | M |
| | |
| **1.2.5 Administer Equalized Payment Plan (Budget) Accounts** | |
| This function allows for the set-up, monitoring, and removal of accounts on the equalized payment plan. The billing system would calculate potential budget amount based on previous year's consumption. | M |
| | |
| Ideally, the settlement date for budget accounts does not have to be the same for all accounts. | O |
| | |
| Monitoring refers to the process of assessing whether the monthly budget amount is set too high or too low. Ideally, the customer makes 12 equal payments during the year. System must be able to report budget customers monthly. A mass change mechanism to increase/decrease budget amount is desirable. | M |
| | |
| **1.2.6 Temporary Off Accounts** | |
| The temporary off function is used to temporarily deactivate an account. The temporary offs are issued for delinquent accounts, vacation, safety, special usage or seasonal peak load customers. | M |
| | |
| In the case of a delinquent temporary off, a final invoice may be required after a predetermined number of days. | M |
| | |
| This function **MUST** create service field orders. | M |
| | |
| **1.2.7 Final/Transfer Accounts** | |
| The final function is used to finalize an account. A final invoice is prepared to bill the customer's account to a specified date and reading. | M |
| | |
| When finalizing an account, any deposit amount held will automatically be applied to the final invoice amount if the customer is not establishing a new account. If the customer's final accounts receivable results in a credit balance, a refund cheque will automatically be initiated by the system. | M |
| | |

| | |
|---|---|
| The transfer function is used when the customer is transferring from one service location to another. The final invoice accounts receivable is transferred to the customer's "moving to" account. In addition, current customer data must transfer. (I.e. credit data, deposit data, budget data, and customer data.) | M |
| | |
| This function **MUST** create service field orders. | M |
| | |
| ***1.3 Location Maintenance*** | |
| Location Maintenance provides the facilities necessary to record data for service locations. Typically this includes setting up a new service location, installing a meter or outdoor lights and recording related activity. | M |
| | |
| A new service location number is automatically assigned to create a location record if no service has previously existed at a service location. | M |
| | |
| A location can be associated with both an incoming and an outgoing customer account, but must assign a unique identifier to each customer. | M |
| | |
| **1.3.1 Record Location Data** | |
| This function is used to establish a new service location and maintain existing locations. The information typically recorded about location includes: | M |
| Service address, annual consumption, transformer size, meter number and location, meter reading cycle, route and sequence, community identifier, customer contribution (if applicable), source of power and load information. | M |
| | |
| All metering devices in commission at the premise (i.e. current transformers or potential transformers) are recorded for billing multiplier calculation. | M |
| | |
| **1.3.2 Install Meter** | |
| The meter install function is used to record meter information pertaining to the meter installed at the service location. A control function must ensure a meter can only be assigned to one location at any given point in time and ensure the meter used is "in stock"/inventory for the specified company. | M |
| | |
| This function **MUST** create service field orders | M |
| | |
| **1.3.3 Change Meter** | |
| The meter change function is used to record the exchange of a meter at the service location. The removed meter will be returned to meter stock or retired. | M |
| | |
| The meter change will record the new meter information and calculate consumption for the removed meter as well as the new meter, for the subsequent billing. If consumption falls outside the edit and validation parameters pre-set in the system, a warning must be generated. The change function must be available for inactive accounts. | M |
| | |
| The meter change could be the result of a faulty meter, routine meter change program, damaged meter or load change. | M |
| | |

| | |
|---|---|
| This function **MUST** create service field orders. | M |
| | |
| **1.3.4 Remove Meter** | |
| The remove meter function is used to record the fact that a meter has been removed from a location and returned to meter stock. The billing system will create an account record to maintain the service information on the account. | M |
| | |
| The remove meter function can be used separately or in conjunction with a meter change. | M |
| This function **MUST** create service field orders. | |
| | M |
| **1.3.5 Install/Remove Outdoor Lights** | |
| The install/remove outdoor lights function is used to record information pertaining to the outdoor light installation and removal at the service location. Outdoor lights may or may not be metered. | M |
| | |
| This function **MUST** create service field orders. | M |
| | |
| ***1.4 Customer Communication*** | |
| Customer Communication provides the facilities necessary for administrating customer correspondence. Typically this includes monthly system generated bill messages related to aged accounts receivable, budget and pre-authorized payment customers. This function must also offer a minimum of two adhoc bill messages that can target specific customer groups (i.e. by community or rate class). | M |
| | |
| A function must exist to support/facilitate customer surveys. Requirements include the ability to select customers on the basis of various criteria such as community, rate class or consumption levels. | O |
| | |
| **2. SERVICE ORDER MANAGEMENT** | |
| Service Order Management supports all service orders initiated by customers, employees and the system. The term " Field Service Orders" includes customer contacts, requests for field services, investigations, requests for follow-up actions, etc. | M |
| | |
| Field service orders are categorized to support statistical information and the measurement of customer service response times. This facility **must** automatically print field service orders, once initiated, for action. A pending service order report will be automatically produced for the designated responsible party(ies) for periodic follow-up. | M |
| | |
| Field service orders are not work orders. Work orders are used for capital additions, as well as repair and maintenance. This activity has implications on the capital assets and depreciation. Field service orders have no such implications. | |
| | |
| ***2.1 Template Maintenance*** | |
| A template defines the types of service orders, their generic priorities, escalation procedures, the designated responsible persons or departments, the print location, etc. | M |
| | |
| The template also defines the conditions under which the system will initiate the prompt for follow-up action orders. | |
| | |
| ***2.2 Service Order Maintenance*** | |

| | |
|---|---|
| Service Order Maintenance provides the facilities necessary to initiate, query, change, print, cancel, complete, close and reactivate service orders. It also sets the priority and automatically routes the order to the responsible party(ies) based on manually input directives or defaults to the template assignment. | M |
| | |
| The system reviews the status of the orders on a regular basis and the escalation procedures defined in the template are implemented when necessary. | M |
| | |
| Query can be by company, by service area, by location, by account, by category, by status, etc., provided there is sufficient security authorization. | M |
| | |
| When a service order is changed, cancelled or reactivated, an audit trail is required of the changes made, the reasons for change, cancellation/re-activation and the person who initiated the action is maintained. | M |
| | |
| Service orders **MUST** be printed locally at a designated printer. | M |
| | |
| ***2.3 Produce Statistics*** | |
| Daily, monthly and yearly statistics such as volume of service orders by category, service orders completed, outstanding, cancelled, etc., will be produced for the head office, districts, agencies, departments or responsibilities. | M |
| | |
| ***2.4 Balance and Control*** | |
| The system will ensure that service orders initiated, completed orders, outstanding orders and the cancelled orders can be reviewed and monitored on a timely basis. | M |
| | |
| Facilities are provided for supervisors and/or authorized employees to administer service orders. Typically, the facilities will be used for general leveling of workload, monitoring of service order completions and service orders pending. | M |
| | |
| ***3. BILLING*** | |
| Billing is the processing required to calculate and adjust bills for each service and to produce individual or consolidated invoices for each customer. Billing can be triggered by cycle, by date or by event, depending on the profile of the service account. | M |
| | |
| An operator manual and/or process and procedures manual must be supplied for account billing, error message and correction, data field identification, credit and collections, and cash system procedures. | M |
| | |
| ***3.1 Maintain Rates*** | |
| Rates are designed to bill various types of accounts. Each rate may contain a number of charge components. Current components include: | M |
| 1.) Basic customer charge or demand charge | |
| 2.) Unit charge based on consumption - may be stepped | |
| 3.) Riders as a percentage of a base rate or based on consumption | |
| 4.) Income tax rebate | |
| 5.) GST (invoice must provide subtotal before GST) | |

| | |
|---|---|
| 6.) Territorial Sales Tax or Municipal Franchise Tax | |
| 7.) Territorial Rate Relief or Territorial Support (percentage of customer and or unit charge. May include a claw back mechanism if consumption exceeds defined parameters). | |
| 8.) Optional green rates must be supported as designed to allow for elective customer choices to support energy conservation initiatives. | |
| 9.) Time of use rates must be supported as designed to allow for elective customer initiatives. | |
| | |
| | |
| New rates are added as required by business requirements. Existing rates are modified upon regulatory approval. | M |
| | |
| Rates and or riders no longer in effect should be retained by the system to allow proper automatic calculation for customers who require billing adjustments that straddle change dates. | M |
| | |
| Strong date-effectiveness features are required for rates. | M |
| | |
| ***3.2 Manage Rate Tests*** | |
| This function provides the ability to test the impact of approved rates on the customer accounts. Users can specify the version of rates, riders, taxes etc. to be used in the rate test. Users can also choose to enter generic billing data or select actual production account data for testing. Rates and Pricing will continue to use existing rate design software to design and develop rates. Data file will be provided for this software from the billing system. | M |
| The objectives include: | |
| > Understanding revenue impact. | |
| > Ensuring that rate relief values are correctly set and ensure billing accuracy. | |
| | |
| Users control the elevation of tested rates into the production environment. Proper backup and recovery facilities are provided to support the elevation. Historical rates must be retained for cancel rebill functionality. | M |
| | |
| ***3.3 Bill Customers*** | |
| **3.3.1 Bill Utility Service** | |
| ***3.3.1.1 Calculate/Estimate and Validate Consumption*** | |
| Consumption is used for tracking energy usage and for billing. Units of usage (Energy kWh's and demand kW's) are measured by meter reading, then converted into energy consumption by applying a billing multiplier. | M |
| | |
| For non-metered services, such as outdoor lights, consumption is estimated based on the number of lights and the voltage of the light bulb. All applicable billing components such as riders are calculated on this estimated consumption as required. This estimated consumption value is reported for sales purposes. | M |
| | |
| For non-metered services, such as TV amplifiers, consumption and demand are estimated based on the number of units. The applicable general service rate is applied to the estimated value. This consumption value is also reported for revenue purposes. | |

| | |
|---|---|
| Meters can measure energy or peak demand usage during the billing period. Normally, consumption is calculated for each register on the meter over the billing period. One of the exceptions is the time-of-use meters. Multiple sets of readings are recorded daily based on the time interval agreement. Consumption is calculated for each interval by day. Consumption for the corresponding intervals are accumulated and maintained separately. | M |
| | |
| The billing multiplier for each meter is made up of a number of components. If one of the components changes during the billing period, more than one billing multiplier will be calculated. | M |
| | |
| The actual units of usage are calculated from valid meter readings recorded for the billing period. If there is a billing multiplier change during the billing period, readings will be taken at the time of change. The billing multipliers will be applied to the corresponding portions of the usage. | M |
| | |
| In the absence of valid meter readings, the consumption is estimated based on a formula involving the days of usage, estimate factors, annual consumption, etc. A variable estimate code must be available to identify accounts that cannot be estimated. | M |
| | |
| Consumption is validated using established reasonable high/low ranges. The ranges are determined based on the estimated consumption of the meter for the billing period. A daily report must be produced for follow up on consumption outside established parameters. | M |
| | |
| ***3.3.1.2 Calculate Charges*** | |
| The billing rate determines which pricing factors to use for various charges. If the billing rate changes during a billing period, the consumption is prorated based on the number of days used before and after the rate change. The previous and current pricing factors are applied to the appropriate prorated portions of the consumption. The same principle applies if the service account is assigned a different rate (code) during a billing period. | M |
| | |
| Flat rate billing for outdoor lights is based on a fixed charge per mantle. Different sizes of lights are billed at different rates. Appropriate other charges for rate components may be calculated on this fixed charge (e.g. Rider calculated on a base charge). | M |
| | |
| Other billings are based on usage and metering arrangements. An account may be billed on a combination of energy and demand usage. Calculations vary according to the design of the rates. In the case of time-of use meters, different rates can be applied to the same meter based on different time measurement intervals. | M |
| | |
| The billing demand may be estimated or measured and will have a minimum approved charge value. An example of this type of calculation is the following approved rate for Yukon Electrical. The other N60 utilities may have different calculation types and values. | M |
| (a) The highest metered demand during the billing period. | |
| (b) The highest metered demand during the 12 months ending with the current billing month, excluding the months April through September. | |
| (c) The estimated demand. | |

| | |
|---|---|
| (d) 5 kW. | |
| | |
| Some customers have contract agreements for selected service accounts. The contract terms which affect billing are applied to the billing process. This may impact both demand and energy charges. | M |
| | |
| ***3.3.1.3 Record Manual Bill*** | |
| When a bill for a service is manually calculated, the normal billing process is suppressed or replaced. A staff member must be able to manually enter the charge components as calculated. | M |
| | |
| ***3.4 Bill Corrections*** | |
| A customer's current and prior bills may need to be corrected for reasons such as over-estimating consumption or bills calculated using an incorrect rate assignment. | M |
| | |
| Corrections can be performed by: | |
| 1. Manually applying net revenue adjustments when an automatic function is not available. | M |
| 2. Automatic system adjustment applies when previous month's bill factors were incorrect. The billing period may span multiple months. | M |
| 3. Manual re-bill initiated by customer service staff. Calculation is system generated. (i.e. no bill was produced in the first place) | M |
| | |
| An automatic or manual re-bill initiates the normal billing process. | M |
| | |
| **3.4.1 Cancel Billing** | |
| In order to re-bill, the erroneous bills must be cancelled first. The system will also initiate cancellations when billing accounts recording actual meter readings compares the previous bill and finds estimated bill too high. The entire previous month's bill is cancelled and a new bill calculated. This process must be provided for multiple billing periods as accounts may be estimated for several months. Charge components must be credited to appropriate GL accounts. | M |
| | |
| **3.4.2 Adjust Revenue/Consumption** | |
| Revenue adjustments apply to valid bills. The revenue adjustment is used to net adjust any of the charge components in current or prior bills. | M |
| | |
| ***3.5 Produce Invoice*** | |
| North of Sixty invoice customers for the services provided. Invoices are sent to the bill payer identified at account set up time. | M |
| | |
| North of Sixty places high value on an invoice which: | |
| > Communicates clearly to customers and is accurate. | M |
| > Is aesthetically pleasing. | M |
| > Identifies each component of bill calculation by line item with descriptor for each charge e.g. Energy charge, demand charge, riders, taxes, etc. (GST must be shown as a separate value after a subtotal of charges before GST) | M |
| | |

| | |
|---|---|
| Note: A 13-month consumption history histogram would be a desirable feature. | O |
| | |
| Given that North of Sixty are largely distribution companies purchasing wholesale power from a generator, it would also be desirable to break out the genco vs. the disco components of the bill. | O |
| | |
| **3.5.1 Produce Regular Invoice** | |
| Regular invoices are produced when the service accounts are billed. Every service account is associated with a meter reading route. The route is read on a particular day of the month. This day is associated with a billing cycle number. The billing cycle number determines the billing cut-off day of the month. | M |
| | |
| The account balance forward less the payments made since the last invoice, current period charge components, adjustments, service charges and deposits are all listed and totaled as the invoice amount. | M |
| | |
| Budget accounts are invoiced a predetermined fixed amount rather than the current period charges as calculated. **(Note: Due to recent GST audit results, consideration should be given to calculating GST based on the predetermined fixed amount rather than the bill calculated on consumption.)** The cumulative amount due to / from a budget customer is disclosed on each month's invoice. | M |
| | |
| The payment due date and potential late payment penalty accessed is also printed on the invoice. The calculation method and value varies among the 3 N60 companies. | M |
| | |
| **3.5.2 Produce Consolidated Invoices** | |
| Some customers have multiple service accounts and prefer to receive one consolidated invoice for all or some of their service accounts. The services accounts are billed in different billing cycles and the regular invoices can be suppressed. | M |
| | |
| The consolidated invoice is produced on a pre-determined cycle agreed upon between the customer and North of Sixty. Any adjustments after the billing date and prior to the invoice date are included in the invoice. | M |
| | |
| **3.5.3 Produce Invoice on Alternate Media** | |
| Customers are provided with detailed billing information on all service accounts on the media requested (i.e. hardcopy or disc). The report can also provide subtotals by cost centre/department as defined by the customer. | M |
| | |
| **3.5.4 Produce Usage Statement** | |
| Customers are provided with system generated summary billing information for each of the previous 12 months. This is typically used by: | M |
| > customers operating in-home businesses as part of their year-end accounting and tax processes. | |
| > Realtors for the package of information for prospective buyers. | |
| | |
| **3.5.5 Maintain Global Messages** | |
| Facilities are provided to enter message text, set priority, and define effective and expiry dates and the selection criteria for the designation of messages. May be different for all companies. | M |
| | |

| | |
|---|---|
| Messages must be approved by a pre-defined responsibility such as Corporate Communications prior to being printed. Once approved, no further changes are allowed until the approval is revoked. | M |
| | |
| **3.5.6 Maintain Account Messages** | |
| Facilities to enter account-specific message, which will print on the next invoice and then, are deleted. | O |
| | |
| ***3.6 Maintain Accounts Receivable*** | |
| Each charge component billed will credit or debit the service account accounts receivable. Any cancel, cancel/rebill or manual adjustment will also adjust accounts receivable accordingly. For customers with multiple service accounts, a consolidated accounts receivable must also be maintained. | M |
| | |
| ***3.7 Electronic Posting to General Ledger*** | |
| All revenue, adjustments, tax obligations, service charges, deposits, etc. are accumulated and posted electronically to the appropriate general ledger accounts. | M |
| | |
| A table, which is used to assign the appropriate general ledger account numbers to corresponding items, is maintained. If a general ledger account number is changed, the table must be modified accordingly. | M |
| | |
| The electronic posting should provide sufficient detail for audit as well as resolution of reconciliation problems between the general ledger and the billing system. | M |
| | |
| ***3.8 Manual Posting to General Ledger*** | |
| Sufficient system generated hard copy detail should be available to prepare daily, weekly and/or monthly journal entries not provided by the electronic posting process. It is desirable that manual journal entries are limited and the electronic journal cover all possible requirements. However, manual posting functionality must be available for exceptions. | M |
| | |
| **4. ACCOUNTS RECEIVABLE MANAGEMENT** | |
| Accounts Receivable Management provides the facilities necessary for managing the customer's accounts receivable. It is an important control item at the individual account level as well as at the North of Sixty Companies level. An interface is required to update the appropriate accounts in the GL. | M |
| | |
| The accounts receivable function manages the sum of all due amounts for the balance of an account. The total accounts receivable of all accounts reflects the amount owed to each of the North of Sixty Companies. This data is always managed with controls and audit trails. | M |
| | |
| ***4.1 Transfer Accounts Receivable*** | |
| The accounts receivable transfer function is used to transfer an accounts receivable amount "to" or "from" a customer's account. With each type of transfer there are two options available (i.e.: transfer partial or total charges or credits). | M |
| | |
| Tracer data is created at the transfer "from" and transfer "to" accounts for cross-reference and audit trail purposes. | M |
| | |
| Some reasons for accounts receivable transfers are: | |

| | |
|---|---|
| 1. Customer requested transfer from one account to another. | |
| 2. Customer moving from one location to another. | |
| 3. Charges or credits removed from a customer's account. | |
| 4. Charges or credits transferred to a customer's account. | |
| 5. Payment corrections. | |
| 6. Account balance transferred to write-offs. | |
| | |
| ***4.2 Adjust Miscellaneous Accounts Receivable*** | |
| The miscellaneous accounts receivable function is used to post miscellaneous charges or credits such as connect charges, write-off adjustments, returned cheque charges, penalty charges and special rate refunds to a customer's account. | M |
| | |
| ***4.3 Refund Accounts Receivable*** | |
| The refund accounts receivable function is used to generate a refund when a customer's account has a credit balance as a result of an overpayment, an application of the deposit or a special rate refund. The credit balance of the account is reduced by any existing accounts receivable. | M |
| | |
| The refund may be initiated either at the customer's request or by a North of Sixty Company in the case of a finalized account. | M |
| | |
| This function also provides for the managing of variable interest rates applied to refunds. | M |
| | |
| Refund cheques are produced automatically for all final accounts with credit balances and sent for manual review by staff. | M |
| | |
| ***4.4 Post Payments*** | |
| Post Payments provides the facility necessary to post payments to a customer's account. | M |
| | |
| Payments are automatically posted to specific accounts receivable items such as deposit, service fee, 30, 60, & 90-day arrears, current charge, fees and budget arrears in a predetermined order. This function must provide for manual override. Payments received for consolidated accounts will be allocated automatically to each individual account. | M |
| | |
| The accounts receivable for the customer's account is reduced by the applicable payment amount. If the payment amount is in excess of the balance due, the result will be a credit balance in the customer's accounts receivable. This credit balance may be used to reduce the accounts receivable balance on another account. | M |
| | |
| The post payment facility will prevent the posting of duplicate batch payments. | M |
| | |
| Unpostable batch payments are identified for further investigation and clearance. A suspense account must be available for default posting. | M |
| | |
| ***4.5 Process Returned Cheque*** | |

| | |
|---|---|
| Returned Cheque/pre-authorised payment processing provides the facility necessary to record and maintain returned item data. Typically this includes recording the returned item amount, date, reason and optional service charge. The account receivable must be updated accordingly. | M |
| | |
| When a payment is returned by a financial institution, the account receivable of a customer's account is adjusted to reflect the amount of the bank returned cheque. A service fee may be assessed to the customer's account depending on the reason for return. | M |
| | |
| ***4.6 Accounts Receivable Ageing*** | |
| Accounts Receivable Ageing provides the facility necessary to age and maintain accounts receivable items such as 30, 60, & 90-day arrears and fees for all accounts. An analysis of each customer's account receivable at cycle billing determines the ageing process. | M |
| | |
| ***4.7 Calculate Late Payment Penalties*** | |
| This facility provides the means to assess, charge, or waive late payment penalties. Penalty is calculated based on the penalty charge base (aged receivable balance) less all payments posted as of statement date. If the outstanding balance of an account is not cleared until after the payment due date, a penalty charge may be applied. Late payment charges are waived due to automatic adjustments or manual adjustments. The account receivable for the customer's account is increased by the penalty amount charged. Penalties must be reported to a separate GL revenue account and may differ in both calculation and rate between the N60 companies. | M |
| | |
| ***4.8 Maintain Payment and Credit History*** | |
| A customer's payment history must be retained on the system for a pre-determined period of time even if status of the account changes from active to closed: | M |
| > Support process of determining the security deposit amount due for a new account application. | |
| > Reduce bad debt write offs by limiting credit to customers with a poor payment record. | |
| | |
| ***4.9 Electronic Posting To General Ledger*** | |
| This function provides the facility necessary to post accounts receivable items such as payments, refunds, returned cheques and write-offs to the general ledger. | M |
| | |
| A table, which is used to assign the appropriate general ledger account number, is maintained. If a general ledger account number is changed, the table must be modified accordingly. | M |
| | |
| ***4.10 Manual Posting To General Ledger*** | |
| Sufficient system generated hard copy reports must be available to prepare daily, weekly and/or monthly journal entries covering the above noted transactions. | M |
| | |
| **5. GENERAL LEDGER MANAGEMENT** | |
| General Ledger Management provides the facilities necessary for managing North of Sixty Companies financial transactions. All companies maintain a separate General Ledger. | |
| | |

| | |
|---|---|
| The general ledger function manages all journal entries received from other systems. This function produces analytical and financial reports. This data is always managed with controls and audit trails. | |
| | |
| ***5.1 Manage Chart of Accounts*** | |
| The chart of accounts function is used to establish and de-activate chart of account codes. | M |
| | |
| ***5.2 Manage Cost Centers*** | |
| The cost centres function is used to establish and de-activate cost centre codes. | M |
| | |
| ***5.3 Proof Journal Entries*** | |
| The proof journal entries function is used to validate journal entries and to generate error reports about the journal entries received from sub-systems. | M |
| | |
| The errors are typically addressed by the financial accounting staff in consultation with the staff responsible for the originating system. | |
| | |
| ***5.4 Post Journal Entries*** | |
| The post journal entries function is used to update valid journal entries received from sub-systems. | M |
| | |
| ***5.5 Produce Financial Statements*** | |
| The produce financial statements function is used to produce the following reports: | M |
| 1. Income statement. | |
| 2. Balance sheet. | |
| 3. Sources and uses of funds statement. | |
| | |
| These reports can be produced in various styles: | |
| 1. Comparative year to year or year to budget. | |
| 2. At various levels of detail and/or consolidation. | |
| | |
| These reports are used: | |
| 1. For financial performance management. | |
| 2. As input to the corporate financial consolidation processes. | |
| | |
| ***5.6 Produce Analytical Reports*** | |
| The produce analytical reports function is used to produce the reports that support the following processes: | M |
| 1. Account analysis. | |
| 2. Balance and control of the general ledger. | |
| | |
| The styles of reports can include: | |
| 1. Tabular. | |
| 2. Chart. | |
| | |

| | |
|---|---|
| **6. CREDIT AND COLLECTIONS MANAGEMENT** | |
| Credit and Collections Management provides the facilities necessary for managing activities related to deposits, credit tracking and collection actions for delinquent customer accounts. This facility will enable North of Sixty Companies to equitably carry out established policies with minimal manual intervention. Must provide a facility for recording customer payment arrangements. Must also provide a mechanism to exclude/suspend customer accounts from collection activities based on customer type or needs. Requirements may vary between companies and communities. | M |
| | |
| ***6.1 Deposit Maintenance*** | |
| Deposit Maintenance provides the facilities necessary for managing, refunding and transferring of customer's security deposits. | M |
| | |
| **6.1.1 Manage Deposits** | |
| This function will provide the facilities necessary for recording and maintaining all pertinent information about deposits and the depositor. | M |
| | |
| A deposit may be required when a customer applies for service or as a result of credit review at collection order time. The deposit will be held in trust by North of Sixty Companies until the customer establishes a satisfactory credit rating. | M |
| | |
| The system will automatically calculate a suggested deposit amount based on three (3) times the account's estimated average monthly bill amount. A human decision is required to determine the deposit requested based on the customer's credit history. This amount may differ from the suggested amount. The requested deposit is applied to the customer's account and is billed to the customer. | M |
| | |
| The system will prompt for action if a deposit requires review for refund or increase based on credit and payment history. | M |
| | |
| **6.1.2 Calculate Interest** | |
| This function allows for the automatic calculation of accrued interest on security deposits by the system. The system will apply interest earned on the deposit to the account receivable amount as directed. | M |
| | |
| The interest rates to be applied to deposit refunds will vary on a regular basis. The system must have a facility to modify the interest rate. | M |
| | |
| **6.1.3 Refund Deposits** | |
| This function allows for the refunding of security deposits and interest earned to date. | M |
| | |
| Deposit is refunded to a customer with interest when: | |
| 1. The customer's account is finalized. | M |
| 2. A satisfactory credit rating has been established based on payment habits. | M |
| 3. At the customer's request with staff approval. | M |
| | |
| Deposit can be refunded in three ways: | |
| 1. Applied as a credit to the customer's account receivable. | M |

| | |
|---|---|
| 2. A system generated refund cheque upon anniversary date based on specified credit/payment history | M |
| 3. A system generated refund cheque if a credit balance remains after account is finalized. | M |
| | |
| **6.1.4 Transfer Deposits** | |
| Deposits can be transferred from one account to another in whole or part. Deposit transfers can also occur as result of the customer moving from one location to another. | M |
| | |
| ***6.2 Credit Maintenance*** | |
| Credit Maintenance provides the facilities necessary, for the customer applying for service, to establish credit, or for an existing customer to re-establish credit. This facility will support credit tracking, recording of guarantees and the maintenance of energy assistance programs. | M |
| | |
| **6.2.1 Credit Tracking** | |
| This process provides the means to analyze a customer's accounts receivable and credit status. This will determine the eligibility of the credit rating update and actions to be taken in case of delinquency. | M |
| | |
| The credit rating upgrading or downgrading formula is based on past payment habits and collection activities. | M |
| | |
| **6.2.2 Record Guarantee** | |
| This function allows for the maintenance of all pertinent information regarding the guarantee amount and the guarantor. | O |
| | |
| The guarantee amount may be used to reconcile the customer's account in the case where there is default of payments. | O |
| | |
| ***6.3 Collection Maintenance*** | |
| Collection Maintenance provides the facilities necessary to review delinquent accounts and perform the necessary follow up. This facility allows for the automatic and/or manual production of final disconnect notices, production of collection orders, managing credit extensions and managing write-offs. Adequate system space must be available to record historical information on actions performed both manually and system generated. The system must allow for manual control of a customer's case. Printing options must be available for different types of collection orders/letters. | M |
| | |
| **6.3.1 Produce Final Disconnect Notices** | |
| In a predetermined time period after a delinquent customer's last invoice, an analysis is performed to verify if a payment was received. If still delinquent, a Final Disconnect Notice will be produced advising the customer that service will be discontinued if the account is not paid. This function allows for the creation of different case types based on credit and payment history as well as customer class. Customized notices can be created based on case type. Collection actions may be suppressed manually or by certain conditions on the account, such as a payment arrangement. This function must allow for customized parameters to be set for each service area. | M |
| | |
| **6.3.2 Produce Collection Orders** | |

| | |
|---|---|
| If a customer has not cleared the delinquent balance within the specified number of days after issuing the final disconnect notice a collection order is prepared automatically based on preset parameters. The collection order is printed for the necessary field action follow-up. Different types of collection orders are necessary depending on community location and weather conditions. | M |
| | |
| **6.3.3 Record Payment Arrangements** | |
| This function allows North of Sixty to arrange a credit extension agreement with a delinquent customer. Agreements will be made according to length of time to pay, amounts to be paid, eligible charges, etc. This function allows adequate system space to record data regarding payment arrangements and automatically produces a review if arrangements are not kept. The system will suspend all collection actions during this time. | M |
| | |
| **6.3.4 Manage Write-offs** | |
| This process provides the facilities necessary to administer written-off accounts. | M |
| | |
| All accounts with an unpaid balance for a period longer than a specified number of days after final invoice preparation are automatically written-off against the allowance-for-bad-debts account. Must provide facility to force account to write off as required. | M |
| | |
| The written-off account is transferred into the uncollectible or unclaimed monies file after a specified period of time. Historical record retained for audit purposes. | M |
| | |
| Any finalized account with a zero balance or any account written-off will be retained for historical reference. Purging of records will be managed as required. | M |
| | |
| The original account number is retained as tracer data. Subsequent payments are accepted for written-off accounts and are reported separately for accounting purposes. | M |
| | |
| Unpaid final invoices, after a specified number of days, maybe turned over to a collection agency for possible collections. This process will normally be system controlled, but must allow for manual control. | |
| | |
| ***6.4 Electronic Posting to General Ledger*** | |
| This process provides the means to automatically post deposit and write-off amounts to general ledger account. | M |
| | |
| A table, which is used to assign the appropriate general ledger account number, is maintained. If a general ledger account number is changed, the table must be modified accordingly | M |
| | |
| **6.4.1 Manual Posting to General Ledger** | |
| This process must provide sufficient system generated hard copy detail to prepare the necessary journal entries to post payments and write off amounts to general ledger. | M |
| | |
| **7. PAYMENT REMITTANCES MANAGEMENT** | |

| | |
|---|---|
| Payment Remittances Management provides the facilities to record payments, credits/debits and returned cheques for the purpose of updating customer and company accounts. | M |
| | |
| ***7.1 Process Remittances*** | |
| Payment Remittances provides the facilities to process payment activities through the following sub-systems. These sub-systems allow for the processing of payments, credits/debits and returned cheques. | M |
| | |
| Remittance Processors: Hardware and software to process large volumes of payments and adjustments received through the mail and from Financial Institutions. | O |
| | |
| Online Cash Registers: Hardware and software to process medium volumes of payments and adjustments received at authorized payment locations. | M |
| | |
| Data Entry Terminal: Terminals and software to process small volumes of payments and adjustments received at authorized locations. | M |
| | |
| Using these devices means customer account validation is performed either on-line or during the batch update process. | M |
| | |
| Types of remittances will include: | M |
| 1. Cash. | |
| 2. Cheques. | |
| 3. Pre-authorized bank payments – EFT (system must create file to interface with banking system software). | |
| 4. Debit card. | |
| 5. Credit card. | |
| | |
| Other types of remittances may also include: | O |
| 1. Pre-authorized bank payments from credit card. | |
| 2. E-Billing (both “biller-direct” or third party bill consolidators.) | |
| | |
| **7.1.1 Process Payments** | |
| This function allows for the processing of the following payments: | M |
| | |
| 1. Regular utility payments that will credit the customer's account receivable. | |
| 2. Non-utility payment to the financial system general ledger (i.e. transformer rentals, purchase of power poles, etc.). | |
| 3. non-utility charge to the financial system general ledger (i.e. bank charges, cash shortages) | |
| 4. Non- utility payment for non-electric sales accounts (i.e. cookbooks, hats, etc.). | |
| | |
| All details pertaining to the payment, such as source number, receipt number, type of payment, location of where the payment was made, etc., will be recorded. | M |
| | |

| | |
|---|---|
| Payments can be directed to specific accounts receivable items such as deposit, service fee, 30, 60, 90-day arrears, current charge, budget arrears, etc. | M |
| | |
| **7.1.2 Process Credit/Debit Adjustments** | |
| This function allows for the processing of a manual entry to adjust a payment amount or to reverse an incorrect entry. | M |
| | |
| **7.1.3 Process Returned Cheques** | |
| This function provides the facilities necessary to process returned items that are returned from a financial institution and must be charged back to the customer's account. A service charge must be optional based on reason for returned item. | M |
| | |
| ***7.2 Communicate With Remittance Sub-Systems*** | |
| This function will provide the facilities necessary to interface with external systems for processing payments. This will include pre-authorized payments and payments made at banks. It may also include credit/debit card payments and electronic funds transfers. | M |
| | |
| ***7.3 Balance And Control Remittances*** | |
| Balance and Control Remittances provide the facilities necessary to reconcile remittances processed in the billing system to funds recorded in the general ledger bank account. | M |
| | |
| Each collecting office currently balances daily payment (Daily Cash Report – DCR) totals to their bank deposit. These totals are then summarized and reconciled to the general ledger and the monthly bank statement. | M |
| | |
| Various balancing and control reports are produced in a timely manner to support this function. | M |
| | |
| **8. METER MANAGEMENT** | |
| The Meter Management function manages all in-stock and in-service meters. In-stock meters are inventory at the Meter Shop or held at various Service Points while in-service meters are installed at the customer locations, at company facilities, etc. The meter sample testing and seal extension programs are currently managed by ATCO Electric and it is anticipated that this service will continue to be provided by AE. | |
| | |
| ***8.1 Purchase Meters*** | |
| The meter purchase function is used for adding new meters to the meter inventory. A standard type size format indicates meter characteristics. A number is added to the type size indicator to create a unique identifier for each meter. All inventoried meters must be recorded in ATCO-CIS to support the functions performed by ATCO Electric. | M |
| | |
| Meters can be purchased individually or in large quantities. | M |
| | |
| ***8.2 Maintain Meter/Device Details*** | |
| This function will maintain the characteristics for the various meter and device types and must accommodate automatic meter reading devices. | M |
| | |

| | |
|---|---|
| The information recorded for meters includes the meter number, assigned company number, manufacturer's serial number, purchase date, cost and other characteristics associated for that type of meter. Company equipment installed at the premise (CT's & PT's) must be recorded in the system. | M |
| | |
| Bar Coding could be used to facilitate the recording of meter and device details directly from the manufacturer. | O |
| | |
| ***8.3 Track Meters/Devices In Service and In Stock*** | |
| This function will track the movement of meters in-service and in stock/inventory. It will also record all pertinent information on the meters such as purchase price and date, internal multiplier, demand high scale, number of dials, current/potential transformer requirements, next expected test year, etc. | M |
| | |
| Meter purchases will initially put all meters into stock while meter removes and changes will move meters from in-service to stock/inventory. | M |
| | |
| Meter installs and changes will record the movement of meters from meter stock/inventory to an in-service account. The facility will be in place to track all meters that are installed at a particular location. This function must allow only one active unique location per meter to prevent duplicate premises assigned to one meter. | M |
| | |
| This function will also track the movement of a meter from the date purchased to the date retired. It will also provide for recording a meter back into stock on an immediate basis. | M |
| | |
| ***8.4 Maintain Meter/Device Relationships*** | |
| This function will provide the facility to record devices that are attached to specific meters. This information will be useful for reporting the location of recording devices used by Load Research, etc. | M |
| | |
| ***8.5 Sample Meters*** | |
| Meter sampling is a process required under the Electricity Inspection Regulations Act (Measurements Canada) to randomly select meters for the purpose of verifying the accuracy of those meters. | M |
| | |
| The facility will be in place to generate recall orders for selected meters from the sample group. | M |
| | |
| ***8.6 Test Meters*** | |
| The meter test function is used to record test results. | M |
| | |
| Meter tests, as a result of new purchases, periodic testing or customer requests are posted to the in-service meter or in-stock meter. | M |
| | |
| History will be retained on all test results (i.e. dates, proof readings, and follow-up actions). | M |
| | |
| ***8.7 Retire Meters*** | |
| The meter retirement function is used for retiring meters from the in-stock meter inventory. As these meters are no longer serviceable & tracking is no longer required. | M |

| | |
|---|---|
| | |
| All meters that are to be retired must be removed from active service and returned to stock prior to retirement. | M |
| | |
| ***8.8 Balance And Controls*** | |
| All meter purchase transactions, meter tests, and meters retired, will be controlled by the meter department and held in an equipment group in ATCO-CIS | M |
| | |
| In the case of meters purchased, the purchased date and purchase order number will be retained as part of the purchase transaction. | M |
| | |
| When purchasing mass quantities of meters, a batch header is used to verify the number and total cost of meters within each batch. | M |
| | |
| Meter inventory is reconciled by manually counting the meters in stock and verifying to the number of meters recorded within the system. | M |
| | |
| Meter seal information will be recorded as required to track possible energy diversion. | M |
| | |
| **9. METER READING MANAGEMENT** | |
| Meter Reading provides the facilities necessary to accurately and systematically track consumption at each service after a meter is installed. The ITRON Premier Plus 4 Genesis Portable Computer (G5) is in use in the field. Computer Aided Dispatch (CAD) currently used as interface between PP4 server and billing system. CAD will be retired at end of 2007. Replacement system being developed to be in-service by 2008. | |
| | |
| ***9.1 Route Maintenance*** | |
| Route Maintenance is used to maintain the route and read sequence assignments and to ensure that the number of meters assigned to each route is reasonable. | M |
| | |
| Routes may be split or combined. Re-routing is the change of the assigned meter reading route number. Each meter in the route must be assigned a unique route sequence number. Re-sequencing is required when changes are required in the assignment or as a result of re-routing. Functionality for mass changes must be available. | M |
| | |
| ***9.2 Schedule Meter Reading*** | |
| Meter reading schedules must be produced for meters to be read on-cycle. Readings must be co-coordinated with billing cycles. Off-cycle readings (event driven, i.e. special reads, finals, turn-ons, etc.) must be allowed for billing purposes. This function must allow for the excluding of specified routes and/or individual accounts. This function must allow for different reading schedules by company to accommodate unique holidays etc. | M |
| | |
| ***9.3 Record Meter Reading*** | |
| The meter reading function records consumption readings and other meter reading data for each service. Meter readings may be entered at any time during the month and a facility must exist to record the interim readings for historical reference. | M |

| | |
|---|---|
| Meter reading will be used to complete turn-on/turn-off orders (i.e. readings that have same date as the service request). | M |
| | |
| High/low consumption validation for consumption and demand is performed when the reading is captured by the GPC and at bill calculation time. A report of exceptions must be produced for follow up action. | M |
| | |
| ***9.4 Communicate with Meter Reading Sub-Systems*** | |
| This function provides for the interface to external meter reading sub-systems (i.e. ITRON, AMR, etc.). | M |
| | |
| ***9.5 Produce Performance-Statistics*** | |
| Route statistics are produced to assist in managing route assignments and route sites. This includes the number of meters to be read, by type of account in each route, the number and percentage of actual reads, number of skips and the actual read time of each route. | M |
| | |
| Statistics are also produced to monitor various performance standards associated with reading meters data. (I.e. number of meters read, time required to read a route, etc.). | M |
| | |
| ***9.6 Balance And Controls*** | |
| The meter reading route header precedes each batch of meter readings to verify the number of meter readings within that batch. Meters that are not actually read must be identified for follow-up action. | M |
| | |
| The number of transactions transmitted through meter reading devices must balance to the number of transactions received by the mainframe in an upload/download situation. | M |
| | |
| **10. ORGANIZATION SUPPORT** | |
| Organization Support provides the facilities necessary to support activities related to identifying customer growth and energy conservation. | |
| | |
| Departments, within North of Sixty, that use customer-billing data for additional activities, perform these functions. This data typically includes number of customers by rate class, sales by service area and rate class, average consumption by customer, etc. Pricing and Engineering have been identified as the major areas using this data. This will assist them in performing their business functions. | |
| | |
| ***10.1 Pricing Support*** | |
| Pricing Support provides the facilities necessary to support rate development, pricing analysis, conservation services and product support. | O |
| | |
| **10.1.1 Rate Development** | |
| This function will provide the facilities necessary to perform rate comparisons for individual customers or various rate classes. System must have ability to provide a data file to interface with software used by rate design group. | M |
| | |
| This will enhance the capabilities to supply the customer or a group of customers with the best applicable rate. | M |

| | |
|---|---|
| **10.1.2 Marketing Analysis** | |
| This function will provide the facilities necessary for recording and maintaining customer profiles. This will serve to identify potential new customers and retain customer information if the customer becomes active. | O |
| | |
| **10.1.3 Conservation Services** | |
| This function provides the facilities necessary to support demand side management. This includes promoting energy efficient products, and the analysis of the facilities owned by customers at their own locations. | O |
| | |
| ***10.2 Engineering Support*** | |
| The Engineering Support function will provide for the recording and maintenance of company owned facilities and their locations. It will also provide their distribution relationship for load research and distribution planning. | O |
| | |
| ***10.3 Geographic Coding*** | |
| This function will provide the capability to identify all company facilities and their grid relationships. This will serve to bridge the information into the Automatic Mapping & Facilities Management System (AM/FM). | O |
| | |
| **11. QUERY/REPORTING** | |
| Query/Reporting provides the facilities necessary to support routine and ad hoc requests for information. | O |
| | |
| ***11.1 Routine Query Support*** | |
| Query support provides the facilities necessary to search for information on customers by account number, civic address, service locations, last name, business name, phone number, mailing address, second account name holder, etc. | M |
| | |
| ***11.2 Ad Hoc Query Support*** | |
| Query support provides the facilities necessary to provide information not routinely required such as a search of accounts by SIC code, consumption levels, rate code, business name, location, etc. | O |
| | |
| ***11.3 Routine Reporting Support*** | |
| Routine reporting support provides the facilities necessary to regularly answer predictable questions about selected groups of items such as routes and sequences, budget accounts, pre-authorized payment customers, etc. | M |
| | |
| The routine reports are a set of reports, which can be run with user selection input at any time. Historical reports must be stored and made available for printing for a period of time based on the anticipated need for access/reprinting. | M |
| | |
| ***11.4 Ad Hoc Reporting Support*** | |
| Ad hoc reporting support provides the facilities necessary to easily construct queries, which answer questions about individual or selected groups of items such as accounts by SIC code, consumption levels, rate code, business name, location, etc. | O |
| | |
| The ad hoc reports are created using a tool kit, which can be run with user selection input at any time. Crystal reports are the I-Tek standard at this time. | |

| | |
|---|---|
| **12. SYSTEM SUPPORT** | |
| This function provides support and general-purpose services that are utilized by other functional areas of CIS. It includes capabilities such as task queuing through use of the electronic work queue, task re-directing, ad hoc reporting, on-line report viewing and selection, local printing, message broadcasting, etc. | |
| | |
| ***12.1 Maintain System Security*** | |
| System Security provides system administrators the facilities to control system access. For each user ID, it includes functions such as granting system access, defining the boundary of data access and administering levels of access, such as inquiry, update, control, approval, etc., for each business activity. The system must have the capability of restricting access by user to accounts between companies held in a single database. | M |
| | |
| ***12.2 Maintain System Parameters*** | |
| This function provides the user system administrator the facilities to administer all system parameters. | M |
| | |
| System parameters include general operational and functional specific parameters. Some parameters apply to North of Sixty as a whole and others vary between service areas. | M |
| | |
| General operational parameters, such as billing schedule, meter reading schedule, due dates, rate tables, global messaging, plant and community tables, etc., control the day-to-day operations of the system. These parameters must be flexible to meet the specific needs of the individual company even though the accounts are held in a single database. | M |
| | |
| Functional specific parameters are non-static parameters, which support the business functions. Some examples are the validation criteria for data elements, the interest percentage of deposit refund, the default credit rating for new customers, the late payment penalty charge percentage, the number of days after final invoices for reminder notices, etc. These parameters must be flexible to meet the specific needs of the individual company even though the accounts are held in a single database. | M |
| | |
| ***12.3 Balance System Controls*** | |
| Balance and control procedures are established to ensure the system and data integrity. | M |
| | |
| Balances and controls are performed by the system at individual function/subsystem. Out of balance conditions are identified and reported and prompt for action notifications are generated. A procedure manual must be provided defining error reasons and possible solutions. The balance detail reports are also available for on-line viewing. | M |
| | |
| The balance procedures include monetary and control item count balancing. The global control procedures are in place to enforce system operation controls; data validation criteria, system parameters controls, and security access privileges, system activity controls and error correction controls. | M |
| | |
| ***12.4 System Reporting*** | |
| System Reporting provides the facilities to request for ad hoc and production reports and to view reports on-line with the option to print at designated locations. Error and exception reports will be minimized through task queuing. | O |

| | |
|---|---|
| ***12.5 Audit Trail*** | |
| This function provides an audit trail of data added, changed, deleted and transferred. A record of the date, time and the person responsible is maintained for each update to the data. Record of all daily activities including all cash transactions, billing input, adjustments, etc. must be provided on suitable medium such as CD or microfiche. | M |
| | |
| ***12.6 Manage Data*** | |
| The Manage Data function provide the facilities to archive on-line data off-line, recall off-line historical data, purge historical data exceeding retention criteria, recover data after system failure and apply mass updates to data. A facility must be in place to store archived data as system is purged. Currently microfiche is used but is not the preferred medium of choice. | M |

# APPENDIX B – Technical Feasibility Requirements

| | |
|---|---|
| TR1-Technical Architecture | Ability to comply with and integrate with ATCO's preferred technical Architecture |
| TF2-Configuration of workstations | Ability to run on standard hardware and software platforms in use within ATCO<br>Ability to run in a managed workstation infrastructure |
| TF3-Configuration of Application Servers | Ability to install and run on ATCO's standard application server hardware and software platforms<br>Ability to maintain support for existing and new versions of application server operating system |
| TF4- Configuration of Database and Database Server | Ability to install and run on ATCO's standard database server hardware and software platforms<br>Provides adequate information that database can be supported by existing staff |
| TF5- Shared Hosting Environment | Provides adequate protection within the layers the allows this application infrastructure to execute in a shared resource model |
| TF6- Systems Integration | Provides an interface into the application logic that can be called by other applications<br>Provides an interface into the data layer that can be queried by other applications |
| TF7- Security | Ability to integrate into existing security infrastructure<br>Supports the use of a common user repository outside of the application<br>Ability to conform to existing security policies and controls |
| TF8- Redundancy, Backup and Recovery | Ability to integrate into existing backup and recovery tools and processes<br>Ability to integrate with existing Disaster Recovery tools and processes<br>Ability to run in a fault tolerant mode |
| TF9- Performance and Monitoring | Provides a standard interface or set of tools to monitor health of the application |
| TF10- Network Communication | Uses standard protocols and technologies for communication between layers of the application<br>Optimized for use in low bandwidth infrastructures |
| TF11- Configuration, Installation, Distribution and Licensing | Provides standard approaches to installation and configuration of the application on all platforms<br>Provides the tools or flexibility for ATCO to remain license compliant |
| TF12- Change Management | Vendor provides a well established and reasonable release cycle for updates<br>Application updates can conform to existing ATCO change management guidelines |

**North of 60 CIS project evaluation**

**Scenario 3 - ATCO CIS**

**Option 4 Description**

Cost Impact

**Assumptions:**

1 Financial Parameters

Distribution Incremental Capital Structure and Cost

| | Return | Ratio | B.T. Cost | A.T. Cost |
|---|---|---|---|---|
| Debt | 6.60% | 52% | 3.43% | 3.43% |
| Preferred | 0.00% | 0% | 0.00% | 0.00% |
| Common | 9.25% | 48% | 6.78% | 4.44% |
| TOTALS | | | 10.21% | 7.87% |

## Vendor 1

This table rates the vendors ability to meet the requirement out of the box.

Points on evaluation criteria
0-Optional
1-required low
2-required medium
3-required high
4-mandatory

1 = Not answered, or doesn't meet requirement
2 = Partially meets requirement, on the low end
3 = Partially meets requirement
4 = Partially meets requirement, on the high end
5 = Fully meets or exceeds requirement

| Id# | Description | Req'mt Rank | Weight | Score | Weighted Score | Maximum Score | Comments |
|---|---|---|---|---|---|---|---|
| | | | (0-4) | (1-5) | | | |
| Section A. Business Requirements | | | | | | | |
| BR-1 Core Structure | | | | | | | |
| 1 | Ability to separate data by company, and allow company specific rules and security, in a cost effective, efficient manner. | M | 4 | 1 | 4 | 20 | Software could not offer separation of four companies into one database. Instead data would be manipulated to achieve a quasi four company solution, which didn't offer secure separation by company. |
| BR-2 Customer Management | | | | | | | |
| 2 | Ability to capture and display owner contact information, ensuring prescribed procedures for assigning responsibility. | M | 4 | 2.5 | 10 | 20 | Software required modification to notify Customer Service Representative that a landlord or owner exists. I.e.. could not address the requirement out of the box. |
| 3 | Ability to retain existing customer account number and meter number. | R3 | 3 | 3 | 9 | 15 | The old CIS account number would be converted to a 'location #', and would have been for information purposes only. The customer # (i.e.. account) would be populated a random number by conversion. |
| BR-3 Service Order Management | | | | | | | |
| 4 | Ability to provide different service order templates, and the conditions under which the system will initiate the prompt for follow-up action orders. | M | 4 | 5 | 20 | 20 | Met business requirement. Score equal to ATCO CIS. |
| 5 | Ability to print service orders to local N60 offices. | M | 4 | 2 | 8 | 20 | Software required modification to meet the business requirement. |
| BR-4 Billing Accuracy and Functionality | | | | | | | |
| 6 | Ability to calculate an Initial Bill | M | 4 | 5 | 20 | 20 | Met business requirement. Score equal to ATCO CIS. |

## Vendor 1

This table rates the vendors ability to meet the requirement out of the box.

Points on evaluation criteria

0-Optional

1-required low

2-required medium

3-required high

4-mandatory

1 = Not answered, or doesn't meet requirement

| Id# | Description | Req'mt Rank | Weight | Score | Weighted Score | Maximum Score | Comments |
|---|---|---|---|---|---|---|---|
| | | | (0-4) | (1-5) | | | |
| 7 | Ability to calculate an Final Bill | M | 4 | 5 | 20 | 20 | Met business requirement. Score equal to ATCO CIS. |
| 8 | Ability to calculate a normal bill | M | 4 | 4 | 16 | 20 | Software required modification to calculate a 'monthly' bill and allow different demand calculations (ratchets) for each N60 company. |
| 9 | Ability to perform multi-month calculations | M | 4 | 3 | 12 | 20 | Software required modification to calculate multiple fixed charges for multi-month bill. (e.g. System unable to deal with multiple month cancel rebills.) |
| 10 | Ability to support Consolidated Accounts (cycles not =). | M | 4 | 3 | 12 | 20 | Software required modification to support Consolidated Billing. |
| 11 | Ability to support Statement Accounts (cycle is =). | M | 4 | 5 | 20 | 20 | Met business requirement. Score equal to ATCO CIS. |
| 12 | Ability to perform budget billing. | M | 4 | 4 | 16 | 20 | Software required modification to automate budget and settlement process. |
| 13 | Ability to prorate charges. | M | 4 | 5 | 20 | 20 | Met business requirement. Score equal to ATCO CIS. |
| 14 | Ability to calculate charges to un-metered accounts. | M | 4 | 3 | 12 | 20 | Software required modification to handle estimated consumption and demand for unmetered charges. |
| 15 | Ability to calculate charges for Outdoor Lights. Billing and Reporting | M | 4 | 3 | 12 | 20 | Software required modification to report outdoor light sales consumption. |
| 16 | Ability to Cancel/Rebill historical charges. | M | 4 | 3 | 12 | 20 | Software required modification to automate cancel/rebills. Currently labour intensive process. |
| BR-5 Automation | | | | | | | |

## Vendor 1

This table rates the vendors ability to meet the requirement out of the box.

Points on evaluation criteria

0-Optional

1-required low

2-required medium

3-required high

4-mandatory

1 = Not answered, or doesn't meet requirement

2 = Partially meets requirement, on the low end

3 = Partially meets requirement

4 = Partially meets requirement, on the high end

5 = Fully meets or exceeds requirement

| Id# | Description | Req'mt Rank | Weight | Score | Weighted Score | Maximum Score | Comments |
|---|---|---|---|---|---|---|---|
| | | | (0-4) | (1-5) | | | |
| 17 | Automation of Bill Process & Report Generation. | M | 4 | 1 | 4 | 20 | Software offered no billing automation to process cycle billing and report generation. Would have resulted in increased N60 staff. (ATCO CIS offered fully automated solution) |
| 18 | Ability to interface with external systems and produce data files. | M | 4 | 2 | 8 | 20 | Software required modification to interface with AMR/TWACS, Itron and ATCO CIS (for Equipment). |
| BR-6 Accounts Receivable Management | | | | | | | |
| 19 | Ability to transfer, adjust, refund, and post A/R. | M | 4 | 4 | 16 | 20 | Given vendors four company database solution, ability to accurately report or post A/R was questionable. (e.g. When one N60 company accept a payment on behalf of another N60 company.) |
| BR-7 General Ledger Management | | | | | | | |
| 20 | Ability to interface with Financial systems, and provide tools for reconciliation between sub-ledger (CIS) and general ledger. | M | 4 | 3 | 12 | 20 | Vendor solution interfaced with ATCO General Ledger Application via MS Great Plains, rather than directly to ATCO's G/L Application. Four company database solution also reduced this rating. |
| BR-8 Credit and Collections Management | | | | | | | |
| 21 | Ability to manage deposits, credit tracking and collection actions for delinquent customers. Includes write-off. | M | 4 | 3 | 12 | 20 | Vendor solution required modification to reprint collection orders, and couldn't accommodate different deposit interest calculations for each company. Deposit refunds required significant manual effort. |
| BR-9 Payment Remittance Management | | | | | | | |

**YUB-YECL-17**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 71400 Revenue Collection, 72100 Administrative and 72300 Insurance

**Quote**: offset by decreased payment agent costs from closure of payment agents in some communities outside Whitehorse ( 9) (Line No. 199-120.)

Costs increase from 2008 to 2009 due to the commencement of accepting credit cards for customer payments. (Line No. 205.)

**Preamble**: The Board would like to gain a better understanding of the YECL's revenue collection.

**Request:**

(a) Please provide position descriptions and the functions performed by YECL payment agents.

(b) Please provide the drivers and or study upon which YECL based its decision to not use payment agents in some communities outside of Whitehorse.

(c) Please provide a more detailed explanation as to the 96 increase from 2008 to 2009 because of the commencement of accepting credit cards for customer payments. (Line No. 196.)

(d) Please detail the increased financial reporting requirements and account for the 80 increase. (Line No. 218.)

(e) Are the increased financial reporting requirements in (d) for internal purposes?

(f) Please provide the model of the CGL corporate allocation methodology and describe in detail any changes to previous allocations of CGL. (Line No. 234.)

**Response:**

(a) YUB-YECL-17(a) Attachment 1 is a copy of the standard contract that Yukon Electrical has with its payment agencies. The contract outlines the key responsibilities that are to be performed by the payment agent.

(b) All of the payment agent contracts that were cancelled were done so at the sole discretion of the payment agent. This was for a number of reasons including closing of the business or for lack of resources to continue to collect the payments on behalf of Yukon Electrical.

Yukon Electric did try and seek out competent replacement agents for those who had cancelled their contracts however in many cases none were found. Presently Yukon Electrical has contracts with 5 payment agents in communities outside of Whitehorse.

In communities without a payment agent Yukon Electrical has a contract with a major financial institution to act as a payment agent for customers. In addition Yukon Electrical has many other options in place for customers to pay their bills including preauthorized payment, online and telephone banking.

Based on the above there was no study required as Yukon Electrical did not make the decision to terminate the payment agency contracts.

(c) Approximately 80k of the 96k variance between 2008 and 2009 is as a result of the credit card program. The calculation used by Yukon Electrical for the credit card program is as follows:

Approx. Residential Revenue 14M x 30 (customer usage) x 1.9 (average credit card fee) 80K.

The 30 number comes from the number of customers who typically use the credit card option. It came from actual experience of Northland Utilities in the Northwest Territories and an average take up experienced by other northern utilities.

The remaining variance in this activity is labor inflation and fringe.

(d) The increased costs were rounded to 80 on Schedule 5.2. The actual increases are outlined on Schedule 5.3 and are:

| | 2007 | 2008 | Increase |
|---|---|---|---|
| Regulatory Rider Applications | -- | 12 | 12 |
| Financial Reporting & Regulatory Phase I | 26 | 87 | 61 |
| | | | 73 |

This increase of 73,000 relates to increases in Regulatory Phase I and Rider Application costs and not just financial reporting requirements as outlined in the IR. The increases are moderate and translate into an approximate 0.4 FTE. The increase is required as a result of the increased time being spent in supporting Regulatory filings. To avoid rate spikes this estimate has been based on the time spent in a two year period. Support for regulatory filings includes support for:

- Preparation of Application, Information Responses and Updates if any;
- Preparation and review of rebuttal evidence (if required);
- Review of Intervenor Evidence and preparations of IR's, review of IR Responses
- Presentation of company witnesses;
- All aspects of Rider applications;
- Preparation and review of Argument and Reply; and
- Annual Report on Finances.

Support for financial reporting requirements has also increased and includes support for:

- Monthly financial and management reports; and
- Compliance with company policy with regards to preparation of reports including proposed implementation of IFRS.

In total, it is important to note that this support in the test period comprises approximately 0.75 FTE of the total 1.67 FTEs providing Head Office support.

(e) No, both the regulatory Phase I and Rider Application as well as financial reporting requirements are for internal and external purposes. External purposes are for such things as External Control Certification Compliance and International Financial Reporting Standards.

(f) CGL Allocation: In 2006 ATCO Group undertook a review of the Commercial General Liability allocation methodology. The previous method of allocation was very inconsistent in its approach. A different rate was charged to each ATCO subsidiary company based on factors which ranged from solely payroll or solely revenue, to kilometres of pipeline, number of customers or MW hrs of electricity generated. This method did not take into account the risks associated with a particular type of operation.

In discussion with ATCO's insurance broker it was determined it would be a more consistent and a more equitable approach to allocate the premium based on the factors an insurance company would utilize to underwriter the risk. These factors include revenue, payroll number of employees, loss experience and the risks associated with the particular operations of the company. Each factor was assigned a percentage of the total premium in the following manner: revenue 15 , payroll 15 , number of employees 15 , loss history 20 and operational risks 35 . The resulting premium in each of the factors is then allocated proportionately amongst the ATCO Group of Companies.

This change in allocation methodology has been reviewed and approved by our insurance company.

In conjunction with the review of the Commercial General Liability allocation methodology we also obtained separate stand alone premium estimates from our insurance brokers as follows:

- 2006: 100M limit of liability 145,000 annual premium (premium estimate from insurance broker)
- 2007: 50M limit of liability 130,000 annual premium (premium estimate from insurance broker)

- 2008: 5M limit of liability 90,000 to 115,000
  (indicative terms direct from insurance company)

Please refer to YUB-YECL-17(f) Attachment 1 which outlines the total insurance costs and costs allocated to YUKON Electrical Company for each type of insurance on an actual cost basis for the year 2005-2007 and on a forecast basis for the years 2008 2009.

THIS PAYMENT AGENCY AGREEMENT is effective

BETWEEN: THE YUKON ELECTRICAL COMPANY LIMITED
100-1100 1st Avenue, Whitehorse, Yukon.

AND:

(Herein after referred to as the 'Agent')

Whereas:

The Yukon Electrical Company Limited and the Agent wish to enter into an agency relationship on the terms and conditions set out in this agreement.

THE PARTIES AGREE AS FOLLOWS:

AGENCY

1. (1) The Yukon Electrical Company Limited names as its agent in to provide services to The Yukon Electrical Company Limited's customers on the terms and conditions in this Agreement.

AGENT SERVICES

2. Agent shall:
   (a) accept and hold in trust The Yukon Electrical Company Limited's cash and cheque payments from customers for their bills.
   (b) give customers a receipt when accepting payment.
   (c) direct all customers with inquiries on service and accounts to call The Yukon Electrical Company
   (d) on a bi-weekly basis, the Agent shall submit payment to The Yukon Electrical Company Limited office in Whitehorse.

CONFIDENTIALITY AND PRIVACY OF INFORMATION

3. (1) All information in this Agreement and in any form whatsoever disclosed or received by The Yukon Electrical Company Limited's customers or potential customers, or prepared by the Agent under this Agreement (the "Information") is or becomes the sole property of The Yukon Electrical Company Limited.

(2) Agent shall:

(a) maintain the Information and all parts of the Information in strict confidence;

(b) restrict disclosure of the Information and all parts of the Information to its employees and other persons with a need to use the Information for the purpose of performing this Agreement and who have been properly instructed by the Agent to maintain the Information in strict confidence and to use it only in accordance with this Agreement;

(c) not use the Information or any part of the Information, except for the purpose of performing this Agreement;

(d) not make or cause to be made any copy of the Information or any part of the Information, except for internal use as may be necessary in performing this agreement; and

(e) keep the Information and all parts of the Information in a secure place to prevent access to it by unauthorized persons.

(f) comply with laws governing privacy and access to information for the Yukon Territory and by the laws of Canada.

COMPENSATION

4. (1) The Yukon Electrical Company Limited shall pay the Agent $ dollars) monthly for services rendered.

(2) The Agent shall not charge or collect any additional fee from customers for any service contemplated by this Agreement.

TITLE

5. Title to all equipment and supplies that comes into Agent's possession under this agreement is and shall at all times remain with The Yukon Electrical Company Limited and the Agent shall have no right of property therein except to use said equipment and supplies in accordance with this agreement.

COMPLIANCE WITH LAWS

6. Agent shall comply with all applicable laws, regulation and other governmental requirements that may affect performance of the Agent's obligations under this Agreement.

GOVERNING LAW

7. This Agreement, shall be governed by and construed in accordance with the laws of the Yukon Territory and by the laws of Canada.

TERMINATION

8. (a) This Agreement shall end when either party gives thirty (30) days written notification to the other. The Yukon Electrical Company Limited may end this Agreement immediately by giving notice to that effect without incurring any liability to the Agent, if Agent:

   (1) commits any act of fraud or theft against The Yukon Electrical Company Limited or its customers;
   (2) does not comply with any provision under this Agreement;
   (3) moves or suspends transaction of its usual businesses or declares bankruptcy;
   (4) breaches confidentiality and privacy clause.

By signing below, the Parties have caused this Agreement to be executed by their duly authorized representatives as of the effective date noted above.

**YUB-YECL-18**

**Reference:** Application, Schedule 5.2

**Issue Sub-Issue:** 72600 Training & Safety

**Quote**: Costs increase from 2007 to 2008 mainly due to increased labour for HS&E management position and other staff labour ( 102). (Line No. 250-251.)

**Request:**

(a) Has the HS&E management position, alluded to in Schedule 5.2, Line No. 250, been filled?

(b) Was this a new or vacant position?

(c) If the position has been filled, was it filled internally or externally?

(d) Explain the new national transport safety compliance-training program and the need for such training by YECL personnel.

**Response:**

(a) Yes it was filled.

(b) The Planned Program and HSE Supervisor position is a new position.

(c) This was filled internally.

(d) The National Safety Code (NSC) for Motor Carriers was developed by the member jurisdictions of Canadian Council of Motor Transport Administrators (CCMTA) on behalf of the Government of Canada in conjunction with the motor carrier industry. The NSC is a set of uniform, national minimum safety standards pertaining to the operation of commercial vehicles.

Yukon Electrical is classified as a commercial carrier and is subject to the NSC. The NSC dictates requirements for driver performance, hours of service, vehicle

maintenance and the documentation associated with these activities. Training of drivers and supervisors is required for hours of service, pre and post trip inspections, NSC compliance, load securement, Transportation of Dangerous goods and the required annual vehicle permits and inspections. Further information is available on the YTG web site. www.gov.yk.ca (under Transportation Services)

**YUB-YECL-19**

**Reference:** Taxes Other Than Income; Application, page 6-1

**Issue:** 2008 Increase over 2007

**Quote:** Property tax increases are primarily due to inflation. (Line No. 6-7)

**Request:**

What other factors have caused property taxes to increase? Please provide actual property taxes for 2005.

**Response:**.

The primary cause of property tax increases is from the City of Whitehorse's 2008 budget forecast of 7.5 increase in property taxes in 2008 and 4 in 2009.

An ATCO Company

**YUB-YECL-20**

**Reference:** Depreciation; Application, page 7-1

**Issue:** Reduction in Forecast Depreciation Costs

**Quote:** The impact of the depreciation study is a reduction in forecast depreciation expense of 270,000. (Line No. 10-11.)

**Request:**

Please prepare a table similar to Schedule 7.2 comparing the previous depreciation method with the current method showing the savings of 270,000.

**Response:**

The depreciation method itself has not changed. The recommended service lives and net salvage percentages from the depreciation study are changes from the approved parameters used to calculate depreciation rates since the last GRA. YUB-YECL-20 Attachment 1 provides the calculation of depreciation expense by account using the 2007 depreciation rates. There is also a decrease of 51,000 in the amortization of differences using the recommended parameters as shown in Schedule 7.4 of the Application. The total reduction is calculated as follows:

| | **( 000 s)** | |
|---|---|---|
| Schedule 7.2 per Application | 4,580 | |
| YUB-YECL-20 Attachment 1 | 4,809 | |
| | 229 | |
| Reduction in Amortization of Differences | 51 | |
| Total Reduction | 280 | (Correction to Page 7-1) |

**YUB-YECL-21**

**Reference:** Depreciation Schedule 7.1

**Issue:** Depreciation Expense

**Preamble:** Annual increases in depreciation expense are as follows:

| | |
|---|---|
| Depreciation Expense Increase Over 2005 | 4.7 |
| Depreciation Expense Increase Over 2006 | 6.9 |
| Depreciation Expense Increase Over 2007 | 4.7 |
| Depreciation Expense Increase Over 2008 | 10.8 |

**Request:**

(a) Please explain the variation in the increases to depreciation expense. For example, why is rate of increase in depreciation expense for 2009 more that double that for 2008?

(b) Explain Line No. 3 of Schedule 7.1.

**Response:**

(a) The change in depreciation expense tracks the growth in Property, Plant and Equipment with the exception of 2008. The reason for the lower increase from 2007 to 2008 forecast is that depreciation expense for 2008 is calculated using the lower depreciation rates from the latest depreciation study. As was noted on Page 7-1 of the Application and as detailed in response to YUB-YECL-20, the impact of the new depreciation study is a reduction in forecast 2008 depreciation expense of 280,000.

(b) When vehicles owned by Yukon Electrical are used in the construction of its PP&E, the costs, including vehicle depreciation, are capitalized. Thus these vehicle depreciation costs are not recovered on a current basis but form part of the capitalized costs of the plant constructed and are depreciated over the service life of those assets.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

**YUB-YECL-22**

**Reference:** Depreciation Schedule 7.4

**Issue:** YFR Curve

**Request:**

Please explain the YFR curve and further describe what the amortization of differences entails? How are the amounts for each line item for the amortization of differences determined?

**Response:**

The YFR curve is meant to indicate either the year of final retirement or the IOWA curve type that is used to the forecast retirement dispersion pattern of the assets within the account. The procedure used in the estimation of the IOWA curve type is presented in the Gannett Fleming report stating at page II-3. The combination of the IOWA curve type and the Life estimate will form the IOWA curve as presented for each account in the Gannett Fleming report starting at page IV-2.

The use of a year of final retirement in the development of depreciation rates is meant to forecast the year at which plant may retire due to economic or non-physical forces of retirement. It is also often used to establish an economic planning horizon over which assets are depreciated. In the development of the depreciation rates for Yukon Electrical, only account 425.0 Hydro Equipment was subjected to a YFR calculation. The calculation of the depreciation accrual rate incorporating the use of a Year of Final Retirement (or Probable Retirement Year) for this account is provided at page VI-2 of the Gannett Fleming report.

The net salvage and deprecation rates by account are presented for informational purposes. The amounts of amortization of accumulated depreciation variances for 2008 and 2009 are summarized from the calculations presented in Table 2 of the Gannett Fleming report. For 2006 and 2007 amounts the same calculation was performed using the depreciation parameters from the previously approved depreciation study. The concept of amortizing accumulated depreciation variances is discussed in YUB-YECL-23.

**YUB-YECL-23**

**Reference:** Depreciation Gannett Fleming Study, Section 7, Attachment 1, pg. 2

**Quote:** The depreciation rates are based on the straight-line whole life method using the equal life group procedure.

**Request:**

Please explain the whole life method and the equal life group procedure. Why was this particular estimation technique chosen? Under what conditions is a change in estimation technique warranted?

**Response:**

The calculation of depreciation accrual rates for mass property assets requires the selection of a depreciation method, a grouping procedure and a basis upon which to apply the depreciation rates. In the circumstance of Yukon Electrical, Gannett Fleming has recommended the continuation of the straight line method of depreciation, the equal life group procedure for grouping of assets and the application of the parameters on a remaining life basis. As the selection of these depreciation calculation parameters underpins the booked amount of accumulated depreciation, Gannett Fleming does not recommend changes to these policies unless a significant tolling issue results from the continued use of the practices.

Each of these required depreciation policy selections is discussed below.

Methods of Depreciation. Depreciation, in public utility regulation, is the loss in service value not restored by current repairs or covered by insurance. The determination of annual depreciation accrual rates must consider the amount of service value which an asset or group of assets will lose during the year in which the rates are to be applied. Most assets render service on a relatively uniform basis during each year of life that is the usefulness of an asset does not change over the period of time that the asset is in service. In such circumstances use of a straight line method of depreciation is appropriate. Other methods of depreciation such as the declining balance method (which assumes that an asset is more useful in its early years than later in its life) or sum of the years digits (which assumes an exponential raise in the usefulness of an

asset over its life) are not generally accepted for rate making purposes, although they can be used for financial disclosure or income tax purposes.

Grouping Procedures. When more than a single item of property is under consideration, a group procedure for depreciation is appropriate because normally all of the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group.

In the average service life procedure, the rate of annual depreciation is based on the average life or average service life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life. In this procedure, the accrued depreciation is based on the average service life of the group and the average remaining life of each vintage within the group derived from the area under the survivor curve between the attained age of the vintage and the maximum age.

In the equal life group procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

A simplistic example highlighting the differences in the two procedures is presented on the following page. The example assumes an account with two assets, each costing with an original cost of 1,000 for total investment of 2,000. The example also assumes that one of the assets has a life estimate of 5 years and the second has a 15 life expectancy. As such the asset balance from years 1 through 5 is 2,000 and 1,000 for the years 6 through 15. The average service life for the account would be determined by taking the average of the 5 and 15 year life estimates for an average of 10 years.

In the following example, using the average service life procedure where the rate of annual depreciation is based on the average life or average service life of the group, the rate applied to the surviving balances of the group's cost balance is calculated as follows:

| | | | | | |
|---|---|---|---|---|---|
| 100 | (original Cost) | 0 | (No salvage has been assumed) | 10 years (Average Service Life) | |
| 10 | | | | | |

Therefore the annual accrual for years 1 through 5 is 200 ( 2,000 account balance X 10 ). In the years 6 through 15, following the 1,000 retirement at the end of year 5 the annual accrual is 100 ( 1,000 X10 )

In the equal life group procedure, the property group is subdivided according to service life with each group being depreciated over its specific estimate. As such in the example the annual accrual is developed specifically for each of the two groups, and the requirement for each group is summed to determine the overall expense for the account. As such for years 1 through 5 the annual accrual is determined as follows:

| | | | |
|---|---|---|---|
| | 1,000 (Cost of the first group) | 5 years (life of the first group) | 200 |
| Plus | 1,000 (cost of the second Group) | 15 years (life of the second group) | 67 |
| | 267 ( 200 | 67) | |

In the years 6 through 15 following the retirement of the first asset, the depreciation is 67, being the appropriate amount for the asset remaining in service.

It should be noted that in the example, both procedures result in the full collection of the entire 2,000 investment and the accumulated depreciation balances are zero after the retirement of the second asset. However, using the ASL procedure, if all of the accumulated depreciation is allocated to the first asset, there has been no collection for the second asset at the end of the fifth year. In contrast, when using the ELG procedure an appropriate amount ( 67 X5 years) has been collected towards the recognition of the consumption of the service value of the second asset in addition to fully depreciating the first asset by the time of retirement.

**Example providing the differences in the ASL and ELG Procedures**

| | | Average Service Life (ASL) | | Equal Life Group (ELG) | |
|---|---|---|---|---|---|
| Year | Asset Balance | Annual Accrual | Accumulated Deprn | Annual Accrual | Accumulated Deprn |
| 1 | 2000 | 200 | 200 | 267 | 267 |
| 2 | 2000 | 200 | 400 | 267 | 534 |
| 3 | 2000 | 200 | 600 | 267 | 801 |
| 4 | 2000 | 200 | 800 | 267 | 1068 |
| 5 | 2000 | 200 | 0(1) | 267 | 335(2) |
| 6 | 1000 | 100 | 100 | 67 | 402 |
| 7 | 1000 | 100 | 200 | 67 | 469 |
| 8 | 1000 | 100 | 300 | 67 | 536 |
| 9 | 1000 | 100 | 400 | 67 | 603 |
| 10 | 1000 | 100 | 500 | 67 | 670 |
| 11 | 1000 | 100 | 600 | 66 | 736 |
| 12 | 1000 | 100 | 700 | 66 | 802 |
| 13 | 1000 | 100 | 800 | 66 | 868 |
| 14 | 1000 | 100 | 900 | 66 | 934 |
| 15 | 1000 | 100 | 0 | 66 | 0 |
| Total | | 2000 | | 2000 | |

(1) Calculated as follows: 800 200 - 1,000 (retirement of first asset)
(2) Calculated as follows: 1,068 267 - 1,000 (retirement of the first asset)

Gannett Fleming views that the ELG procedure better aligns the consumption of the service value of the assets to the resultant depreciation expense. Furthermore, the ELG does result in enhanced generational equity between the users of the two assets. However, the ELG procedure does result in an increased level of depreciation expense early in the account's life.

While some interveners and regulators have not been willing to approve the ELG procedure, given the high level of depreciation expense early in the asset's life, many a number of regulators have allowed the procedure.

Application Basis. Once a method of depreciation (i.e. straight-line) and a grouping procedure (i.e. the ELG procedure) have been established the actual depreciation rate calculation can be made. Use of the whole life basis develops the annual and calculated depreciation calculations assuming that the current depreciation parameters

have been in place from age zero of an asset's life through to the end of the maximum age of the asset account's life. Use of the whole life basis results in new plant additions being properly depreciated on the basis of the most current estimated depreciation parameters. These calculations are presented in Table 1 of the Gannett Fleming report.

As there have been changes in both the assets average service life and net salvage estimates over the many years of the asset accounts life, and given that not all assets retire at the precise timing estimated in depreciation studies, a variance between the calculated and booked accumulated depreciation amounts exists, as presented in table 2 of the Gannett Fleming report. In order to adjust for the variance between the calculated and actual amounts of accumulated depreciation, table 2 of the Gannett Fleming report amortizes the variance over the estimated composite remaining life of the account.

**YUB-YECL-24**

**Reference:** Depreciation Gannett Fleming Study, Section 7, Attachment, pg. 7

**Quote:** The combination of the historical trend and the estimated future trend yielded a complete pattern of life characteristics from which the average service life was derived.

A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirement was obtained through contact with Company personnel.

**Request:**

(a) For each asset type was there a significant difference between the historical trend and the estimated future trend? If so, why would such a difference occur?

(b) Were the reasons for past retirements and the expected future causes of retirement consistent? If not please provide details where the reasons were not consistent.

(c) What statistical analysis was used to determine the appropriateness of the curve selected? For each of the graphs in the study provide the $R^2$ for the graph selected.

(d) For each of the graphs in the study was the curve with the best $R^2$ selected? If not which graphs did not use the curve with the best $R^2$?

**Response:**

(a) Results of the retirement rate analysis for each account are presented in account order stating at page IV-2 of the Gannett Fleming report. In the following accounts there were virtually no retirement history, therefore no historic trend could be estimated. In these circumstances the average service life estimates

were based on the discussions held with operation staff, the experience of Gannett Fleming, or experience of peers:

- Account 425.0 Hydro Equipment
- Account 442.0 Structure and Improvements Production plant
- Account 447.0 Misc. Power Plant Equipment
- Account 471.0 Land Rights
- Account 471.0 Underground Conduit
- Account 475.1 Underground Services
- Account 476.3 AMR meters
- Account 477.1 Distribution Substation Equipment
- Account 488.2 Company Houses

In the circumstances of the remaining accounts, either a sufficient amount of retirement history was observed for a meaningful stub curve to be developed or a full life cycle was studied. A stubbed survivor curve refers to a circumstance where a complete life history of retirement trends cannot be developed. However, a sufficient amount of history can be observed over which a full IOWA curve may be estimated, usually through a period of significant retirement activity. An example of such a stubbed IOWA curve can be found at page IV-8 for Account 473.0 Poles, towers and Fixtures. In the fitting of IOWA curves to accounts without a complete retirement history a significant amount of consideration is given to the discussions with operating staff in order to develop a full life estimate, and to period over which retirement transactions have occurred.

(b) Yes. In the circumstances of limited retirement history, the reasons for the limited history were because the assets have not yet reached an age where it is expected that replacement is necessary.

(c&d) The selected IOWA curves were based on the results of a Retirement Rate Analysis . The process used in the retirement rate analysis is described in the Gannett Fleming report at page II-3. The results of the retirement rate analysis were fit to smoothed IOWA curves using the procedure as described starting at page II-18 of the Gannett Fleming report.

This question asks for the $R^2$ for each of the curves selected. Gannett Fleming is not aware of this terminology for the selection of IOWA curves. One method

commonly used to smooth IOWA curves is based on the development of the sum of the squared differences between the IOWA curves and the results of the retirement rate analysis at each of the aged observation points studied. A statistically developed Best Fit can then be established by choosing the IOWA curve with the smallest amount of squared differences.

As indicated in part (a) of this response, a number of accounts had virtually no retirement experience, and a number of additional accounts had limited retirement experience and developed stubbed curves. In these circumstances the use of statistical fitting methods develops meaningless IOWA curve selections, often as long as many hundreds of years. As such, Gannett Fleming did not rely on such statistical fitting techniques in this study.

## YUB-YECL-25

**Reference:** Depreciation Gannett Fleming Study, Section 7, Attachment 1, pg. 7

**Quote:** The net salvage estimates were based on judgment that incorporated analyses of historical data, a review of policies and outlook with Company management, a general knowledge of the electric industry, and comparisons of the net salvage estimates from studies of other electric utilities.

**Request:**

(a) Upon your review of the company policies, in your opinion, could any changes in policy occur which would extend the life of the assets?

(b) Within your comparison with other electric utilities, where any other northern electric utilities included in the comparison?

**Response:**

(a) No. It should be noted however, that the purpose of the Gannett Fleming interviews is to understand the policy and then determine its impact on average service life, not to evaluate the policy.

(b) Gannett Fleming has recently completed depreciation studies for the NorthWest Territories Power Corporation, Northland Utilities (NWT) Limited, Northland Utilities (Yellowknife) Ltd, and the Yukon Energy Corporation. While these northern utilities were specifically considered, other utilities considered as peers were ATCO Electric, Manitoba Hydro, and BC Hydro.

## YUB-YECL-26

**Reference:** Depreciation Gannett Fleming Study, Section 7, Attachment 1, pg. 32

**Issue:** Underground Conduit

**Quote:** The previously approved estimate for this account was the Iowa 54-R3, has been slightly adjusted to the Iowa 50-R4 to better fit industry retirement trends.

**Request:**

(a) Statistically, how strong is the correlation between the YECL experience and the industry retirement trend? Would another curve provide a better $R^2$?

(b) How does the new curve conform to the expectation of the company's engineering staff?

(c) Which component provides the greatest influence to the survivor curve estimate, historical trend, industry trend, or company expectations? How is the weighting for each component decided?

**Response:**

(a) This account has experienced extremely few retirements. As indicated in the retirement rate analysis presented at page IV-30 of the Gannett Fleming report, only minimal retirements have occurred in this account. The 6,645 retired to date in this account, account for only .038 of the over 17 million of investment. No statistical fit can be made for this level of retirement experience for any IOWA curve.

The following are the IOWA curves used by the peer group of utilities for this account. The recommended IOWA 50-R4 conforms well to this group of peer companies:

- Yukon Energy Corporation 40-R2.5
- NorthWest Territories Power Corporation NTPC 25-R3
- Northland Utilities (NWT) Limited 50-R4
- Northland Utilities (Yellowknife) Limited 50-R3
- ATCO Electric 55-R4
- Manitoba Hydro 45-R3
- BC Hydro 45-SQ

(b) The revised 50-R4 IOWA curve selections was discussed with and agreed to by the engineering and operational staff.

(c) With regard to this account, the average service life was developed by considering the following factors in the order provided below, however no statistical weighting technique was used:

i. Company expectations
ii. Industry trends
iii. Gannett Fleming experience
iv. Historic trend

**YUB-YECL-27**

**Reference:** Gannett Fleming Study, Section 7, Attachment 1, pg. 43

**Issue:** Meters

**Request:**

(a) Please explain why there is no estimated survivor curve for meters.

(b) Explain how a 10-year amortization period for meters was deemed appropriate.

**Response:**

(a) These older technology meters are being replaced over the next few years with new AMR technology. As such, these meters have no average service life remaining. Given the large amount of net book value remaining, YECL has accepted the advice of Gannett Fleming to amortize the net book value as at December 31, 2007 over a period longer than the estimated remaining life in order to minimize the tolling impact of this replacement program. Given this amortized treatment, there is no requirement to develop an IOWA curve for this account.

(b) Over the past 1 to 2 years this type of replacement program for meters has been initiated by many electric distribution utilities. In most cases the issue regarding a large loss on retirement has arisen. It is the experience of Gannett Fleming that a 10 year period is generally accepted as a reasonable period over which to recover this loss in tolls, while not materially impacting level of the toll. While the issue and appropriate amortization period is currently before a number of regulatory Boards, the use of a longer amortization period than the remaining life of the asset group is recommended by Gannett Fleming as a reasonable solution to this issue.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

**YUB-YECL-28**

**Reference:** Return on Rate Base, Application, page 8-2 and schedule 8.4

**Issue:** Other Post Employment Benefit Plans (OPEB)

**Quote:** For these benefits, Yukon Electrical is assessed a percentage of its payroll at a rate calculated for the plan as a whole.

Prior to 2008 only the pension plan was on the cash basis. (Line No. 20-23.)

**Request:**

(a) Please provide 10 years history of actual OPEB paid and the corresponding percentage of payroll.

(b) For the current application, what percentage of payroll is calculated as OPEB?

(c) In Schedule 8.4, are the line 13 charges the payroll assessment for OPEB? Describe what the cash payments represent.

(d) Please explain the dramatic increase in charges from 2006 to 2007 for line 20 in schedule 8.4.

**Response:**

(a) In accordance with Board Order 2008-5, YECL does not believe that information prior to 2003 is required to test the revenue requirement in the test period. However, to be helpful to the Board, YECL has provided the information as follows:

**Other Post Employment Benefit Accrual**
**Continuity Schedule**

| Year | Opening Balance | Accrued | Cash Payments | Year-End Balance | Percent of payroll |
|---|---|---|---|---|---|
| **1999** | - | - | - | - | |
| **2000** | - | (63) | 17 | (46) | *3.14%* |
| **2001** | (46) | (71) | 24 | (93) | *2.99%* |
| **2002** | (93) | (82) | 24 | (151) | *3.15%* |
| **2003** | (151) | (104) | 27 | (228) | *3.77%* |
| **2004** | (228) | (103) | 25 | (306) | *3.44%* |
| **2005** | (306) | (117) | 28 | (395) | *3.70%* |
| **2006** | (395) | (123) | 28 | (490) | *3.71%* |
| **2007** | (490) | (103) | 56 | (537) | *3.02%* |

(b) As Yukon Electrical has proposed to account for OPEB on the cash basis in the test period, a percentage of payroll has not been calculated for the accrual. The cash basis assures that the cash outlay is expensed and therefore an accrual based on a percentage of payroll is not applicable.

(c) For the years 2003-2007, line 13 is an assessment of payroll as outlined in (a) above. For the test years, line 13 is not an assessment of payroll. Line 13 equals the cash payment such that the OPEB liability does not change during the test period.

(d) As explained in Schedule 5.2, Lines 16-19 of the Application, the increase in the defined benefit plan is due to the fact that 27 of pensionable earnings are now required as a result of the actuarial valuation that was completed for the years 2007-2009. Also please refer to YUB-YECL-28(d) Attachment 1.

# Executive Summary

## Valuation Results

The valuation has revealed an unfunded liability of $1,115,400 as at December 31, 2006. This compares to a funding excess of $1,789,300 at December 31, 2003. The two most significant sources of the decline in the funding excess were changes in actuarial assumptions and the absence of employer contributions to the Plan, offset by investment returns greater than assumed.

The employer's portion of the normal actuarial cost has increased over the intervaluation period, from 15.23% of pensionable payroll (after reflecting the January 1, 2005 amendment) to 22.69%. This increase reflects a change in assumptions and the general increasing effect due to aging of the plan membership, leveraged somewhat by the effect of the dollar limit on employee contributions.

## Contributions for 2007 - 2009

The unfunded liability must be funded over a period of not more than 15 years, by special payments made at least quarterly. The *Income Tax Act* would permit the entire amount to be funded immediately. Expressed as a percentage of pensionable earnings, the necessary payments to amortise the unfunded liability ranges from a minimum of 3.83% to a maximum of 12.63%.

Combined with the normal actuarial cost, the employers' contributions for the next three years must fall between 26.52% and 35.32% of their respective members' pensionable earnings.

## Actions Required

A copy of this report must be filed with the Office of the Superintendent of Financial Institutions and the Canada Revenue Agency.

The employers must immediately commence contributions to the Plan, with a retroactive adjustment to January 1, 2007.

The next valuation for funding purposes must be completed no later than December 31, 2009.

## Plan Identification Information

***Retirement Plan for Employees of Canadian Utilities Limited and Participating Companies – Plan 2***

*Registration number with CRA: 0955138*

# 2

# The Valuation Process

## Purpose of the Valuation

This valuation was conducted for the purpose of certifying Plan solvency and ongoing costs as required under the *Pension Benefits Standards Act, 1985*, and for the purpose of certifying ongoing Plan costs as required under the *Income Tax Act*.

The valuation results presented in this report are not intended to necessarily be appropriate for accounting for pension expense in accordance with generally accepted accounting principles, nor are they intended to necessarily be appropriate for use by regulatory agencies other than those charged with regulation of the two statutes indicated above.

## Intended Users of the Report

We were retained by Canadian Utilities Limited to conduct the valuation and prepare this report. It is intended that the principal users of the report will be management of Canadian Utilities Limited and the participating employers, the Superintendent of Financial Institutions and his staff, and the staff of the Canada Revenue Agency.

## Sources of Data

Data are provided to us annually in electronic form by Canadian Utilities Limited as to active members of its registered pension plans as at December 31. These data include dates of birth and hire, accumulated contributions and service, pensionable earnings for the just completed calendar year, and other relevant information. The data also indicates employees who ceased to be active Plan members during the immediate preceding calendar year. Since the data provided encompasses all defined benefit plans sponsored by Canadian Utilities Limited, inter-plan membership transfers are readily apparent.

These data are compared by us to similar data provided the year earlier. Our comparison included checks that all previous members were accounted for, that the principal data elements had not changed, and that salaries had increased by a reasonable amount. We also verified that the data for all individuals appearing in the data for the first time were consistent with them being new Plan members. We also compared our counts of member data records to the manual record tallies provided by Canadian Utilities Limited. Any discrepancies found were reported to Canadian Utilities and satisfactory explanations received.

Data as to inactive members has been accumulated by us for the past several years. Each year we add the members who became inactive during the past year as indicated on the electronic data provided. We were also provided with manual records as to inactive members who had died during the calendar year, and adjusted the previously accumulated data accordingly. We also were provided with electronic data of the amounts actually being paid by Sun Life to existing pensioners and survivors, before and after the upcoming cost-of-living adjustments. This electronic data also reveals changes such as deaths and matrimonial property divisions, which provides a cross-check for the adjustments described above.

We have been supplied with custodial statements prepared by RBC Dexia for the three years ended December 31, 2006. We were also provided with a statement prepared by Canadian Utilities Limited of individuals terminating in 2006, whose benefit entitlements were not paid from the fund until sometime in 2007. This statement formed the basis for adjusting the market value of assets reported by RBC Dexia for outstanding termination payments. Since we are involved in calculating the appropriate amount of asset to be transferred in respect of membership transfers between plans, we are able to utilize information already in our files for outstanding inter-plan transfer payments.

In our opinion, the data upon which this valuation is based are sufficient and reliable for the purpose of this valuation.

## Significant Changes Since the Last Valuation

The last valuation was conducted as at December 31, 2003, with a supplemental solvency valuation conducted as at December 31, 2004. Since then the *Income Tax Act* (ITA) has been amended to increase the maximum pension permitted from registered pension plans. Prior to the amendment, the last scheduled DB limit was the 2005 limit of $2,000 per year of service, with increases to be in line with average wages thereafter. The amendment scheduled additional values of $2,111 in 2006, $2,222 in 2007, $2,333 in 2008 and $2,444 in 2009, with increases thereafter with the average industrial wage. The effect of this Income Tax amendment has been reflected in this valuation.

Not a significant impact

The Plan was amended effective January 1, 2005 to reduce the member contribution rate to 2.8% on earnings up to the YMPE and 4% on earnings above the YMPE, to a maximum of $2,000. This amendment, which had no effect on the Plan's actuarial liabilities was contemplated in the previous valuation.

A new Canadian Institute of Actuaries Standard of Practice For Determining Pension Commuted Values ("CIA Standard") was released in February 2004. The effective date of the new CIA Standard was on February 1, 2005. The new CIA Standard changed the assumptions to be used to value the solvency liabilities for benefits assumed to be settled through a lump sum transfer. The financial impact of the new CIA Standard has been reflected in this valuation.

As part of the funding valuation of CUL Plan 1 as at December 31, 2004, a project was undertaken to review the assumption setting process for both funding and accounting purposes, to harmonize the assumptions where possible, and to reflect the fact that both this Plan and the defined benefit portion of CUL Plan 1 are closed to new entrants. The outcome of this review has resulted in significant changes to the assumptions used for this valuation in comparison to those used three years ago. In particular, the discount rate reflects the expectation that the Plan's funding requirements will eventually become dominated by the solvency rather than going concern model, a situation which is anticipated to arise somewhere around the year 2020. In total, changes in assumptions and methods reduced the Plan's net financial position by about $3.5 million.

lower discount rate as no new entrants plan is dominated by solvency model

After checking with representatives of Canadian Utilities Limited, to the best of our knowledge there have been no events subsequent to the valuation date which, in our opinion, would have a material impact on the results of the valuation.

## Valuation Assumptions and Methods

A detailed explanation of the valuation basis can be found in Appendix B. The following table presents a brief summary of the important assumptions made and actuarial methods employed for this valuation.

| Assumption / Method | Description |
|---|---|
| Long Term Inflation: | 2.50% per annum |
| Discount Rate: | 6.25% per annum initially, then 4.40% starting in 2020 |
| Individual Salary Increases: | |
| Economic Component: | 4.00% per annum for 5 years, 3.50% per annum thereafter |
| Promotion & Merit: | Age graded scale based on Plan experience (1992 Experience Scale) |
| YMPE Increases: | 2.75% per annum |
| Increases in Maximum Benefit: | $2,222.22 per year of service for retirements in 2006 increasing as scheduled in the Income Tax Act to $2,444.44 per year of service in 2009, and thereafter at 2.75% per annum beginning in 2010 |
| Escalation of Pensions: | 2.50% per annum |
| Retirement: | Retirement occurs when age and service sum to 90 years, but not after age 65 or before 55. |
| Mortality: | Males: Uninsured Pensioner 1994 Mortality Table with generational mortality projection from 2004 |
| | Females: Uninsured Pensioner 1994 Mortality Table |
| Terminations: | 100% of Plan experience 1983 through 1985 |
| Proportion Married: | Based on current marital status |
| Spousal Age Difference: | Male partners are 4 years older than female partners |
| Expenses: | None |
| Asset Valuation Method: | Market related method in which recognition of 50% of realised and unrealised capital gains is deferred over a 3 year period |
| Actuarial Cost Method: | Projected Unit Credit Actuarial Cost Method |

In our opinion, the assumptions are, in aggregate, appropriate for the purposes of this valuation. Nevertheless, emerging experience will differ from the assumptions, and the resulting gains and losses will be revealed in future valuations.

# 3

# Financial Position of the Plan

## Going Concern Basis

When conducting a valuation on a going concern basis, we determine the relationship between the respective values of assets and accumulated benefits, assuming the Plan will be maintained indefinitely.

## Financial Position

The results of the valuation as at December 31, 2006, in comparison with those of the previous valuation as at December 31, 2003, are summarised in the following table:

Financial Position — Going Concern Basis

| | 2006.12.31 | 2003.12.31 |
|---|---|---|
| **Actuarial Value Of Assets** | $25,717,100 | $24,537,800 |
| **Actuarial Liabilities** Present value of accrued benefits for: | | |
| Active Members | $16,569,700 | $15,631,500 |
| Retired Members & Survivors | 10,102,600 | 7,010,900 |
| Former Vested Members | 160,200 | 106,100 |
| Total Actuarial Liability | $26,832,500 | $22,748,500 |
| **Funding Excess (Unfunded Liability)** | **($ 1,115,400)** | **$ 1,789,300** |

## Reconciliation of Financial Position

The following table provides an approximate reconciliation of the Plan's current financial position, a unfunded liability of $1,115,400 as at December 31, 2006, to its previous position, a funding excess of $1,789,300 as at December 31, 2003. Because of the way in which the decisions concerning assumption changes came about, this reconciliation reflects the accumulation of three individual years of results, with assumption changes occurring throughout the period.

### Reconciliation of Financial Position

| | | |
|---|---|---|
| Funding Excess at December 31, 2003 | | $1,789,000 |
| Interest on Funding Excess | | 221,000 |
| Employer Contributions less than Normal Cost | | (1,780,000) |
| Plan Experience Different from Assumed, relating to: | | |
| • Investment Income, net of expenses | $2,382,000 | |
| • Economic increases to pensioners | (161,000) | |
| • Salary and YMPE increases | (42,000) | |
| • Termination of employment | 61,000 | |
| • Mortality | (78,000) | |
| • Retirement | 46,000 | |
| • Transfer to and from other Plans | (61,000) | |
| Net Experience Items | | 2,147,000 |
| Changes in actuarial assumptions and methods | | (3,504,000) |
| Data & status changes, other miscellaneous changes | | 12,000 |
| (Unfunded Liability) at December 31, 2006 | | $(1,115,000) |

Rate is 6% to 2020 then 4.5% as dominated by annuity purchases

See page 23 for explanation of changes to assumptions

For mortality people are living longer for example on page 29of 46 of the attachment if you live to 105 you have a better than 50:50 chance to make it to 106. Actually women have an almost 60% chance of making it to 106

## Solvency Basis

When conducting a solvency valuation, we determine the relationship between the respective values of the Plan's assets and its liabilities on a solvency basis, determined in accordance with the *Pension Benefits Standards Act, 1985*. The values of the Plan's assets and liabilities on a solvency basis are related to the corresponding values calculated as though the Plan were wound up and settled on the valuation date. Appendix B contains a discussion of the circumstances under which Plan benefits may be settled on a Plan termination, and the assumptions and methods that would appropriate for determining the solvency position of the Plan as at December 31, 2006.

The following table shows the Plan's current financial position on a solvency basis, as compared to that shown in the supplementary solvency valuation conducted as at December 31, 2004.

Financial Position — Solvency Basis

| | 2006.12.31 | 2004.12.31 |
|---|---|---|
| **Value Of Assets Available for Benefits:** | | |
| Market Value of Assets per Trustee | $26,762,600 | $27,371,000 |
| Transfer (to) from CUL Plan 1 outstanding | 72,900 | (4,472,000) |
| Benefits and other items payable | (99,400) | (19,000) |
| Estimated windup expenses | (50,000) | (50,000) |
| Net Assets Available for Benefits | $26,686,100 | $22,830,000 |
| **Solvency Liabilities** Present value of accrued benefits for: | | |
| Active Members | $ 8,430,500 | $ 7,856,000 |
| Inactive Members: | | |
| Retired Members & Survivors | $11,465,300 | $ 8,914,000 |
| Former Vested Members | 179,700 | 128,000 |
| Total Inactive Members | $11,645,000 | $ 9,042,000 |
| Total Solvency Liability | $20,075,500 | $16,898,000 |
| **Solvency Excess (Shortfall)** | **$ 6,610,600** | **$ 5,932,000** |

The solvency ratio, which is the net assets available for benefits divided by the total solvency liability, is 1.3.

# 4

# Funding Requirements

## Normal Actuarial Cost

The estimated value of the benefits that will accrue on behalf of the active members during 2006, in comparison with the corresponding value determined in the previous valuation as at December 31, 2003, restated to reflect the effect of the January 1, 2005 amendment, is summarised below:

**Employers' Share of Normal Actuarial Cost**

| | 2007 | 2004 |
|---|---|---|
| Actuarial present value of benefits to be earned for service in the next 12 months | | |
| Retirement Benefits | $712,030 | $691,100 |
| Death Benefits | 10,550 | 14,800 |
| Termination Benefits | 7,030 | 6,700 |
| Total Normal Actuarial Cost | $729,610 | $712,600 |
| Expected Employee Contributions | $ 68,990 | $102,400 |
| Employers' share of the Normal Actuarial Cost | $660,620 | $610,200 |
| Expected Annual Payroll | $2,911,460 | $4,033,800 |
| Normal Actuarial Cost as a Percentage of Payroll: | | |
| Employee | 2.37% | 2.54% |
| Employer | 22.69% | 15.13% |
| Total | 25.06% | 17.67% |

The increase in the total normal actuarial cost, expressed as a percentage of payroll, is consistent with the increase in the average age of the Plan membership and the change in actuarial assumptions, while the decrease in the employees' share is due to the effect of the $2,000 contribution limit. The increase in the employers' share of the normal actuarial cost is due to the increase in the total normal actuarial cost, plus the decrease in the employees' share.

## Minimum Employer Contributions

The valuation has revealed an unfunded liability of $1,115,400 as at December 31, 2006. The *Pension Benefits Standards Act, 1985* requires that this unfunded liability be amortized over no longer than 15 years by special payments of at least $114,090 per annum, paid on a quarterly (or more frequent) basis. The solvency ratio as at December 31, 2003 exceeds 1.0, so no additional employer contributions are required in respect of the solvency position of the Plan.

The minimum special payments of $114,090 per annum represent 3.83% of expected 2007 pensionable payroll. Combined with the 22.69% normal actuarial cost, the minimum annual employer contribution over the next three years is 26.52% of pensionable payroll.

## Maximum Employer Contributions

Maximum contributions to the Plan are governed by the provisions of the *Income Tax Act*. Where an unfunded liability exists, the maximum contribution permitted is equal to the normal actuarial cost, plus the full amount of the unfunded actuarial liability.

The unfunded actuarial liability of $1,115,400 represents 12.63% of expected pensionable payroll over the three year period 2007, 2008 and 2009. Combined with the 22.69% normal actuarial cost, the maximum average annual employer contribution over the next three years is 35.32% of pensionable payroll.

## Allocation of Contributions Among Employers

The total contributions to the Plan, when greater than nil, are allocated among the participating employers on the basis of pensionable payroll. That is to say, the contribution rate, if any, is established as a percentage of pensionable payroll for the Plan as a whole, and each participating employer contributions that percentage of the pensionable payroll associated with its own employees.

Final rate set was 27% which is in the range

We understand that Canadian Utilities Limited intends to establish a contribution rate of 28% of pensionable payroll for the three year period until the next valuation, which contribution rate falls between the minimum required rate of 26.52% and the maximum permitted rate of 35.32%.

# Actuarial Opinion

**Actuarial Opinion with Respect to
the Actuarial Valuation as at December 31, 2006
of the Retirement Plan for Employees of
Canadian Utilities Limited and Participating Companies – Plan 2**

OSFI Registration 56344
Canada Revenue Agency 0955138

Based on the results of this valuation, we hereby certify that, as at December 31, 2006:

- the employers' normal actuarial cost for 2007 and subsequent years up to the next actuarial valuation should be calculated as 22.69% of members' pensionable earnings;
- the employers' normal actuarial cost for 2007 is estimated to be $660,600, and member required contributions for 2007 are estimated to be $69,000;
- the Plan would be fully funded on a going concern basis as at December 31, 2006, on the basis of the assumptions and methods described in this report, if its assets were augmented by $1,115,400, which augmentation must be accomplished over a period of not more than 15 years by special payments, made at least quarterly, of at least $114,090 per annum;
- the Plan has a solvency ratio in excess of 1.0 as at December 31, 2006, and would be fully funded were it to be wound up as at the valuation date;
- the next valuation of the Plan must be completed as at a date no later than December 31, 2009, until which time the employers should make contributions of not less than 26.52% and not more than 35.32% of their respective members' pensionable earnings;

- in our opinion,
  - the data on which the valuation is based are sufficient and reliable for the purposes of the valuation,
  - the assumptions are, in aggregate, appropriate for the purposes of determining the funded status of the Plan as at December 31, 2006 on going concern and solvency bases, and determining the minimum funding requirements, and
  - the methods employed in the valuation are appropriate for the purposes of determining the funded status of the Plan as at December 31, 2006 on going concern and solvency bases, and determining the minimum funding requirements.
- this report has been prepared, and our opinions given, in accordance with accepted actuarial practice; and
- all assumptions made for the purposes of the valuation were reasonable at the time the valuation was prepared.

Appendix A

# Plan Assets

## Asset Values at December 31, 2006

The following schedules show how the assets of the Plan are invested. Amounts are taken from the RBC Dexia statements as at December 31, 2006, adjusted for refunds and transfers outstanding.

| | Book Value | Market Value |
|---|---|---|
| **Equities:** | | |
| Canadian | $5,097,605.98 | $8,069,559.68 |
| US | 3,590,483.96 | 3,985,247.28 |
| International | 3,075,443.44 | 4,025,139.40 |
| Accrued Dividends | 13,691.02 | 13,691.02 |
| **Total Equities** | **$11,777,224.40** | **$16,093,637.42** |
| **Fixed Income:** | | |
| Bonds | $5,185,645.98 | $5,327,445.11 |
| Mortgages | 628,644.99 | 629,246.69 |
| Pooled Fixed Income Fund | 3,386,653.13 | 3,394,587.69 |
| Short Term | 1,273,081.91 | 1,273,081.91 |
| Cash and Equivalents | 3,252.32 | 3,252.32 |
| Accrued Interest | 41,341.17 | 41,341.17 |
| **Total Fixed Income** | **$10,518,619.50** | **$10,668,954.89** |
| Pending Trades | 16.04 | 15.82 |
| **Value at December 31, 2006** | **$22,295,859.94** | **$26,762,608.13** |
| Outstanding Benefit Payments | (99,465.42) | (99,465.42) |
| Outstanding Transfer (to) from CUL Plan 1 | 72,923.00 | 72,923.00 |
| **Adjusted Value at December 31, 2006** | **$22,269,317.52** | **$26,736,065.71** |

## Asset Transactions Since Last Valuation

The pension fund transactions for the period from January 1, 2004 to December 31, 2006 are summarised as follows, without adjustment for amounts outstanding at year end:

| | 2004 | 2005 | 2006 |
|---|---|---|---|
| Market Value at January 1 | $25,220,398 | $27,370,803 | $24,728,757 |
| Members' contributions | 113,656 | 78,548 | 71,753 |
| Employers' contributions | 0 | 0 | 0 |
| Net Transfers | 158,228 | (4,605,712) | (306,011) |
| Investment income | 836,335 | 794,677 | 890,471 |
| Net capital gains (losses) | 1,940,407 | 1,778,213 | 2,117,925 |
| Pensions paid | (571,706) | (600,277) | (662,079) |
| Lump-sum refunds | (231,415) | 0 | (2,738) |
| Administration fees | (95,100) | (87,495) | (75,470) |
| Market Value at December 31 | $27,370,803 | $24,728,757 | $26,762,608 |

We have tested the pensions paid, the lump-sum refunds and the contributions for consistency with the membership data for the Plan members who have received benefits or made contributions. The results of these tests were satisfactory.

## Investment Returns

We have calculated the investment return of the funds over the intervaluation period, both on a gross basis and a net after expenses basis. Separate calculations were conducted on book values and market values. The market value and book value calculations used average year end asset values before adjusting for items in transit. The return on actuarial values has been calculated excluding the effect of the change in asset valuation method.

| Based on Average Year End | Gross Return Before Expenses | Net Return After Expenses |
|---|---|---|
| Book Values | 7.08% | 6.75% |
| Market Values | 11.45% | 11.14% |
| Actuarial Values | 10.48% | 10.15% |

Appendix B

# Actuarial Methods and Assumptions

## Actuarial Methods – Going Concern

### Valuation of Assets

For this valuation, we have continued to use an adjusted market value method to determine the actuarial value of Plan assets, but we have revised the adjustment methodology. Under this method, 50% of realised and unrealised capital gains (losses) arising during a given year are recognised immediately and 50% of realised and unrealised capital gains (losses) arising during a given year are spread on a straight-line basis over 3 years. As a result, the asset value produced as at December 31, 2006 recognises the following percentages of the realised and unrealised capital gains (losses) that arose during the past 3 years:

| Gains / Losses Arising in Year | Unrecognised Portion |
|---|---|
| 2006: | 50% of 67% |
| 2005: | 50% of 33% |
| before 2005: | 0% |

In the previous valuation we utilized a similar approach, except that the full amount of realized and unrealized gains and losses were spread over the 3 year period.

The asset values produced by this method are related to the market value of the assets, with the advantage that, over time, the market-related asset values will tend to be more

stable than market values. To the extent that more capital gains than losses will arise over the long term, the actuarial value will tend to be lower than the market value.

The actuarial value of the assets, determined as at December 31, 2006 under the adjusted market value method, is $25,717,100. This value was derived as follows:

**Actuarial Value of Assets as at December 31, 2006**

| | | | |
|---|---|---|---|
| **Market value of assets (net of outstanding items)** | | | **$26,736,066** |
| **(LESS) / PLUS unrecognised capital (gains) / losses** | **(Gain) / Loss** | **Unrecognised Portion** | |
| 2006: | (2,117,925) | 50% of 67% | (709,505) |
| 2005: | (1,778,213) | 50% of 33% | (309,470) |
| **Actuarial value of assets** | | | **$25,717,091** |

## Valuation of Actuarial Liabilities

Over time, the real cost to the employer of a pension plan is the excess of benefits and expenses over member contributions and investment earnings. The actuarial cost method allocates this cost to annual time periods.

For purposes of the going concern valuation, we have continued to use the *projected unit credit actuarial cost method.* Under this method, we determine the actuarial present value of benefits accrued in respect of service prior to the valuation date, including ancillary benefits, based on projected final average earnings. This is referred to as the *actuarial liability*. For each individual Plan member, accumulated contributions with interest are established as a minimum actuarial liability.

The *funding excess* or *unfunded liability*, as the case may be, is the difference between the actuarial value of assets and the actuarial liability. An unfunded liability will be amortised over no more than 15 years through special payments as required under the *Pension Benefits Standards Act, 1985*. A funding excess may, from an actuarial standpoint, be applied immediately to reduce required employer current service contributions unless precluded by the terms of the Plan or by legislation.

This actuarial funding method produces a reasonable matching of contributions with accruing benefits. Because benefits are recognised as they accrue, the actuarial funding method aims at keeping the Plan fully funded at all times. This promotes benefit security, once any unfunded liabilities and solvency deficiencies have been funded.

## Normal actuarial cost

The *normal actuarial cost* is the actuarial present value of projected benefits to be paid under the Plan with respect to service during the year following the valuation date.

The employers' share of the normal actuarial cost is the total normal actuarial cost reduced by the members' required contributions.

The employers' normal actuarial cost has been expressed as a percentage of the members' pensionable earnings to provide an automatic adjustment in the event of fluctuations in membership and/or pensionable earnings.

Under the projected unit credit actuarial cost method, the normal actuarial cost for an individual member will increase each year as the member approaches retirement. Consequently, the normal actuarial cost of the entire group, expressed as a percentage of the members' required contributions, can be expected to increase steadily in the absence of new entrants, with occasional decreases if significant retirements result in a reduction of the average age.

## Employers' Contribution

In summary, the employers' contributions under the actuarial methodology are determined as follows:

**Employers' Contributions**

| With a funding excess | With an unfunded liability |
|---|---|
| Normal actuarial cost | Normal actuarial cost |
| MINUS | PLUS |
| Any funding excess applied to cover the Employers' normal actuarial cost | Payments to amortise any unfunded liability |

The legislative and regulatory context under which the Plan operates will impose constraints upon the degree of contribution adjustment that arises from funding excess and / or unfunded actuarial liabilities.

# Actuarial Assumptions – Going Concern

The actuarial value of benefits is based on economic and demographic assumptions. At each valuation, we determine whether, in our opinion, the actuarial assumptions are still appropriate for the purposes of the valuation, and we revise them if necessary. Emerging experience will nonetheless differ from the assumptions, resulting in gains or losses that will be revealed and considered in future actuarial valuations.

For this valuation, we have used the following assumptions, which are identical to those used in the previous valuation:

## Economic Assumptions

### Long Term Inflation

The general long term rate of price inflation in Canada, as measured by the consumer price index, has only indirect influence on the cost of benefits to be provided by the Plan. Nevertheless, it is useful to state an explicit assumption as to the long term rate of inflation, as a point of reference for developing an internally consistent set of assumptions about other economic events that have a more direct impact on Plan costs.

For this valuation, we have assumed an average rate of price inflation of 2.5% per annum, consistent with the observed difference between the yield rates on long term real and nominal government bonds. In the previous valuation we assumed price inflation of 2.0% per annum.

### Investment Return

The calculation of the actuarial liability involves discounting benefits expected to be paid at various dates in the future back to a common point in time, the valuation date. The discount rate used in this process normally should be based upon the expected rate of return of the underlying Plan assets. This assumption should be selected with regard to the very long term nature of the liabilities of the Plan, and should not be unduly influenced by short term economic conditions.

In setting this assumption, we have observed that as at the valuation date the current asset mix policy would be expected to produce returns of 6.75% per annum, after an allowance of 0.35% for expenses, for as long as the current asset mix policy remains in effect. From this return we have subtracted 0.50% as a margin for adverse future contingencies, resulting in an initial discount rate of 6.25% per annum.

We have also observed that the defined benefit program is closed to new entrants, and eventually the funding requirements under the *Employment Pension Plans Act* will become dominated by the solvency or windup considerations, which in turn are dominated by annuity purchase rates. The rates inherent in annuity purchase rates are not dissimilar from the returns expected from an investment portfolio of long term corporate bonds. Such a portfolio would, at the valuation date, be expected to produce returns of 5.10% before expenses and margin.

For this valuation, therefore, we have assumed an initial discount rate of 6.25% per annum until 2020, at which time solvency considerations are expected to dominate. The assumed discount rate for years beginning in 2020 is 4.40% per annum, after allowing 0.35% for expenses and 0.35% for margin. The previous valuation used an assumption of 6.0% per annum for all years.

If the fund achieves higher investment returns than assumed, gains will be revealed at subsequent valuations. If the fund achieves lower investment returns, losses will emerge.

## Escalation of Pensions

Pensions in payment to individuals who retired with Company consent, and their survivors, are increased each January 2 by an amount determined by the Company, having consideration to the rate of increase in the consumer price index, to a maximum of 3% per annum. For the past several years, the actual increase has been based on the increase in the all Canada consumer price index for August over the previous August. For January 2, 2007, the actual increase was 2.1%, and was reflected in this valuation.

We have assumed that this practice will continue in the future. Therefore, consistent with the assumption of annual inflation of 2.5% per annum, we have assumed that future increases in pensions will occur at the rate of 2.5% per annum. In the previous valuation, the assumption was that pensions would increase at 2.0% per annum.

## Increases in Average Wages and YMPE

The benefits provided under the Plan are affected by the YMPE under the Canada Pension Plan, which grows at the rate of average wage increases in Canada. For this valuation, we have assumed this to be 2.75% per annum, being equal to price inflation plus 0.25% for overall productivity gains. The previous valuation assumed increases of 3.0% per annum.

## Increase in Income Tax Act Maximum

The *Income Tax Act* limits benefits to $2,222.22 per year of service for individuals retiring in 2007. This amount is scheduled to increase to $2,333.33, and $2,444.44 times years of service in 2008 through 2009 respectively, and the *Income Tax Act* contains provisions for the dollar limit to be increased annually by the rate of increase in the average industrial wage, beginning in 2010.

For this valuation we have assumed that the maximum benefit limit will increase at the rate of 2.75% per annum, with the first such increase occurring in 2010. The previous valuation assumed increases of 3.0% per annum from the 2005 level that was then the last scheduled level.

## Individual Salary Increases

An assumption as to individual salary increases is necessary in the valuation since the formula for determining the pension to be received is based on the member's average earnings in his highest 60 months of earnings.

Individual salary increases can generally be considered to result from general economic conditions, plus non-economic factors such as merit and promotion. Observing the higher levels of economic activity, price inflation, and wage growth in the local markets in which the participating employers to this plan operate in comparison to increases in average wages in Canada, we have assumed that in the longer term, the economic portion of salary increases will be 4.00% per annum for five years, 3.50% per annum thereafter. The previous valuation utilized an assumed economic increase of 3.00% per annum.

In addition to the general economic factors, individuals will tend to receive increases as they gain experience, win promotions, and generally progress through the ranks of the organization. For this valuation we have assumed that such merit and promotion increases will be in accordance with the 1992 Experience Scale, with higher increases at lower ages. The following table indicates the rate of promotion and merit increases assumed at sample ages.

| Age | Merit & Promotion | Age | Merit & Promotion |
|---|---|---|---|
| 25 | 6.02% | 40 | 1.07% |
| 30 | 3.08% | 50 | 0.47% |
| 35 | 1.75% | 60 | 0.24% |

## Demographic Assumptions

### Retirement

For this valuation we have assumed that active members will retire when their age and service sum to 90 years, provided that retirement does not occur after 65 or before 55. Individuals who have already attained this condition are assumed to retire immediately.

Retirements earlier than assumed will result in losses to the Fund, while later retirements will result in gains to the Fund. These gains and losses will be revealed in subsequent valuations.

### Mortality

The rates of mortality assumed in a valuation serve two purposes: firstly, to determine what portion of the current membership will survive to retirement age, and secondly, to forecast the remaining lifetime of members once they reach retirement. Typically, the incidence of mortality both before and after retirement is assumed to be in accordance with some appropriate and recently published standard table, such as the Uninsured Pensioner 1994 Mortality Table (UP94).

In conjunction with the overall assumption review project, we consulted the Society of Actuaries studies of group annuity mortality, reflecting the same types of sources as used in the creation of the UP94 table. Those studies indicated that recent female mortality continued to be slightly higher than predicted by the UP94 table, and no improvement in mortality was observed during the study period. The studies did observe improvement in male mortality, but much less than predicted by the AA Scale accompanying the UP94 Table.

Taking the information in these studies into account, we have assumed that female mortality will be in accordance with the UP94 Table without projection, and that male mortality will be in accordance with the UP94 Table with generational projection at approximately half the rate set out in the AA Scale. For technology reasons, we have approximated our male mortality assumption by using the UP94 table with generational projection for mortality improvement using the full AA Scale, but only from 2004.

The previous valuation assumed mortality in accordance with the UP94 Table without projection for either males or females.

The following table shows the assumed number of deaths per 1,000 at selected ages.

**Mortality Rates Per 1,000 Employees**

| Age | Males (in 2007) | Females |
|---|---|---|
| 25 | .69 | .31 |
| 35 | .90 | .51 |
| 45 | 1.63 | 1.05 |
| 55 | 4.49 | 2.47 |
| 65 | 14.98 | 9.23 |
| 75 | 38.36 | 24.39 |
| 85 | 102.38 | 72.84 |
| 95 | 249.69 | 200.23 |
| 105 | 440.59 | 415.18 |

To the extent that deaths occur earlier or more frequently than predicted by the assumed rates, gains will emerge to be revealed at subsequent valuations. Deaths occurring later or less frequently than assumed will result in losses to the Plan and Fund.

## Termination of Employment

In the mid-1980s, a detailed review of termination experience was conducted, from which a table of termination rates by age and gender was developed. In the intervening period we have collected data annually concerning actual termination experience in relationship to the experience table, and adjusted the termination assumption as a multiple of that table in accordance with the trends seen developing in that ongoing data review.

Most recently, actual experience appears to be reasonably well predicted by the unadjusted 1983-85 experience table. We have therefore assumed for this valuation that future terminations will occur at 100% of the rates in the table developed from Plan experience in the period from 1983 – 1985. The previous valuation used 75% of the rates from this same table.

The following table shows the number of terminations assumed per 10,000 employees at each age.

## Termination Rates Per 10,000 Employees

| Age | Male | Female | Age | Male | Female |
|---|---|---|---|---|---|
| 20 | 1,000 | 800 | | | |
| 21 | 800 | 900 | 36 | 350 | 800 |
| 22 | 800 | 900 | 37 | 350 | 750 |
| 23 | 700 | 950 | 38 | 350 | 700 |
| 24 | 500 | 1,050 | 39 | 350 | 600 |
| 25 | 400 | 1,050 | 40 | 300 | 500 |
| 26 | 400 | 1,050 | 41 | 300 | 400 |
| 27 | 400 | 1,250 | 42 | 250 | 300 |
| 28 | 400 | 1,300 | 43 | 200 | 250 |
| 29 | 400 | 1,350 | 44 | 150 | 200 |
| 30 | 400 | 1,300 | 45 | 100 | 150 |
| 31 | 400 | 1,150 | 46 | 80 | 100 |
| 32 | 350 | 900 | 47 | 40 | 80 |
| 33 | 350 | 850 | 48 | 30 | 60 |
| 34 | 350 | 800 | 49 | 20 | 40 |
| 35 | 350 | 800 | 50 | 10 | 20 |

### Proportion Married & Age of Spouse

Because the Plan provides benefits to the spouse of a member in certain circumstances, it is necessary to make assumptions as to the likelihood of a member having a spouse in those circumstances.

For this valuation, we have assumed that any member who currently has a spouse will also have a spouse at retirement or earlier death. Any member who does not currently have a spouse, has likewise been assumed not to have one at retirement or earlier death.

Where a pension has commenced and the spouse's date of birth is known, the actual age of the spouse is used in the valuation. Otherwise, male partners in a marital relationship have been assumed to be 4 years older than the female partner.

### Expenses of the Plan

The discount rate was established after allowing 0.35% per annum for expenses, including both investment management expenses and other administrative expenses that have historically been paid from the fund.

## Actuarial Methods – Solvency

When conducting a solvency valuation, we determine the relationship between the respective values of the Plan's assets and its liabilities on a plan windup basis, determined in accordance with the *Pension Benefits Standards Act, 1985*. The values of the Plan's assets and liabilities on a solvency basis are related to the corresponding values calculated as though the Plan were wound up and settled on the valuation date.

Under the terms of the Plan, as amended effective June 1, 2003, benefits are determined using earnings and service which exclude any earnings earned or service rendered after the date of plan termination.

For this valuation, we have considered that benefits payable to members who have already retired, and their survivors, would be settled by the purchase of appropriate life annuities. Such life annuities are assumed to provide for future increases consistent with the pattern developed over the last several years, but applied as a constant annual rate of increase determined on the basis of market expectations of inflation at the date of windup. We have also considered that benefits payable to members who have terminated employment prior to the valuation date, but not yet commenced to receive a pension, would be settled by a lump sum transfer amount calculated in accordance with Section 3800 of the Canadian Institute of Actuaries Standards of Practice. Benefits to terminated members who are eligible to commence the receipt of a pension would be settled by either method, whichever was more favourable to the member.

With respect to members still employed as at the assumed termination date, we have considered that any such member who would already be already eligible to retire would retire with Company consent, and have benefits settled by annuity purchase as for a member already retired. Any active member not eligible to retire immediately, would be treated as if his or her service had terminated on the valuation date, with full vesting, and be entitled to a lump sum transfer amount as described for inactive members who had not yet commenced receipt of benefits. In either case, the benefit provided to an active member would include any benefit that might arise through the application of the 50% rule.

Finally, we have assumed that any situation resulting in termination of this Plan and requiring the purchase of annuities for retired members would also result in the termination of all or a part of CUL Plan 1, and the resultant purchase of annuities for those retired members. Consequently, we have assumed that annuities for this Plan could be purchased as part of a larger group of related annuities.

## Actuarial Assumptions – Solvency

We have observed that, as at December 31, 2006, the guidance provided by the Canadian Institute of Actuaries is that non-indexed immediate annuities be assumed to be available, priced on a level interest assumption of 4.60% per annum. We have also observed that Section 3800 of the Canadian Institute of Actuaries Standards of Practice implies an inflation rate based on the difference between the interest rates applicable for non-indexed and fully indexed benefits.

The interest rates to be used for pension commuted values under Section 3800 for events occurring in December, 2006 are 4.75% for 10 years and 4.75% thereafter for non-indexed benefits and 2.25% for 10 and 2.25% thereafter for fully indexed benefits. In comparison, the technically implied inflation rate applicable as at December 31, 2006, calculated without the two month lag and before rounding, amounted to 2.28% for 10 years and 2.39% thereafter. We have therefore assumed that indexed annuities could be purchased based on a interest rate of 4.60% (as for non-indexed annuities) less an allowance for indexing of 2.50%.

The following table shows the assumptions that would be made in this valuation for solvency purposes, compared to those made in the going concern valuation.

| Assumption / Method | Solvency Basis | Going Concern Basis |
|---|---|---|
| Escalation of indexed pensions: | 2.50% per annum | 2.5% per annum |
| Interest Rate for lump sum transfers: | 4.75% for 10 years, 4.75% thereafter | 6.25% per annum initially, then 4.40% starting in 2020 |
| Interest Rate for annuity purchases: | 4.60% per annum | 6.25% per annum initially, then 4.40% starting in 2020 |

| Assumption / Method | Solvency Basis | Going Concern Basis |
|---|---|---|
| Mortality: | Uninsured Pensioner 1994 Mortality Table, projected to 2015 | Males: Uninsured Pensioner 1994 Mortality Table with generational mortality projected from 2004<br><br>Females: Uninsured Pensioner 1994 Mortality Table |
| Proportion Married: | Based on current marital status | Based on current marital status |
| Spousal Age Difference: | Male partners are 4 years older than female partners | Male partners are 4 years older than female partners |
| Expenses: | Windup expenses of $50,000 | None |
| Asset Valuation Method: | Market value | Market related method with 50% of realised and unrealised capital gains recognised over a 3 year period |
| Actuarial Cost Method: | Projected Unit Credit Actuarial Cost Method | Projected Unit Credit Actuarial Cost Method |

# Membership Data

## Membership Statistics

The following table shows some of the more important statistics regarding the membership covered by the current and previous valuations.

| | 2006.12.31 | 2003.12.31 |
|---|---|---|
| **Active Members:** | | |
| Number of Males* | 31* | 46* |
| Number of Females | 9 | 10 |
| Number with Spouses | 35 | 49 |
| Average Age | 49.6 | 48.9 |
| Average Pensionable Service | 20.9 | 19.6 |
| Average Prior Year Earnings | $77,317 | $73,950 |
| **Vested Former Members:** | | |
| Number | 4 | 3 |
| Average Age | 50.1 | 49.6 |
| Total Monthly Base Pension | $1,769 | $1,330 |
| **Retired Members & Survivors:** | | |
| Number | 33 | 29 |
| Average Age | 69.9 | 68.6 |
| Total Monthly Base Pension | $58,564 | $48,197 |

* Includes 1 member currently accruing benefits under another plan.

## Membership Changes

The following table shows the changes in active membership since the last valuation:

| | |
|---|---|
| Active Members at December 31, 2003 | 56 |
| New Entrants | |
| Transfers from Other CUL Plan | 6 |
| Retirements | (5) |
| Deaths | |
| Terminations | (3) |
| Transfers to Other CUL Plan | (14) |
| Active Members at December 31, 2006 | 40 |

## Distribution of Active Members Accruing Benefits

Appendix D

# Summary of Plan Provisions

## Introduction

The Predecessor Plan was effective January 2, 1962. On December 31, 1986 the Predecessor Plan was split into three parts, covering employees in the Yukon (Plan 2), the Northwest Territories (Plan 3) and elsewhere (Plan 1). Plan 2A was established effective April 1, 1987 to cover Yukon based employees who had previously been employed by the Northern Canada Power Commission (NCPC).

Effective January 1, 1994, Plan 2 was amended to extend coverage to all current and former members of Plan 2A and Plan 3. Liabilities under Plan 2A and Plan 3 were assumed by Plan 2 in exchange for a transfer of assets.

Effective December 30, 2003, the Plan was extended to cover employees located in Ontario.

This valuation is based on the Plan provisions in effect on December 31, 2006. The following is a summary of the Plan's main provisions in effect on December 31, 2006. It is not intended as a complete description of the Plan.

## Eligibility for Membership

The Plan covers salaried employees based in the Yukon, the Northwest Territories, Nunavut and Ontario upon appointment to permanent staff. This typically occurs after 6 months service. In the event that a salaried employee is not appointed to permanent staff earlier, participation in the Plan will commence upon completion of two years service provided earnings exceed 35% of the YMPE in two consecutive calendar years.

Participation in the Plan is compulsory for all eligible employees who are not participating in another registered pension plan of the employer. Exceptions to compulsory participation can be made on religious grounds.

Currently, all active Yukon based Plan members are employed by Yukon Electrical Company Limited, a subsidiary of ATCO Electric Ltd., all active Northwest Territories based Plan members are employed by ATCO Electric Ltd., and all active Ontario based Plan members are employed by ATCO Power Ltd.

Some individuals who were employed by NCPC immediately prior to April 1, 1987 elected to have their pension benefit entitlements under the PSSA transferred to the Plan. For these members, pensionable service under the Plan includes service that was pensionable under the PSSA. Service with NCPC counts for determination of vested rights whether or not the individual member elected to transfer his PSSA benefit entitlements to the Plan.

## Contributions

Members contribute 2.8% of earnings up to the YMPE and 4.0% of earnings over the YMPE, up to an annual maximum contribution of $2,000. Disabled members and certain executive members are not required to contribute.

The employer is required to contribute whatever additional funds are required to properly fund the benefits promised under the Plan.

## Retirement Dates

### Normal Retirement Date

The normal retirement date is the second day of the month following the month in which age 65 is attained.

### Early Retirement Date

A member may retire early after attaining age 55, provided the member has completed at least 2 years of Plan membership.

### Postponed Retirement

A member who remains employed with the company after age 65 may elect to commence receipt of pension or continue to accrue benefits under the Plan up to the earlier of his actual retirement and age 69.

## Retirement Benefits

### Normal Retirement

The annual pension benefit at normal retirement is equal to:

(a) 1.4% of annual final average earnings up to the YMPE, times years of pensionable service; **plus**

(b) 2.0% of annual final average earnings in excess of the YMPE, times years of pensionable service.

Annual final average earnings are calculated over the 60 consecutive months for which earnings are highest. The YMPE is calculated over the same period.

The formula applicable to members who joined the Plan prior to January 2, 1966 contains other components not described above. However, no remaining active members are affected by those provisions.

### Early Retirement

If a member retires from active service with the consent of the Company, a reduced early retirement benefit is payable, as follows:

(a) if age and service sum to 90 years or more, no reduction applies;

(b) otherwise, the pension payable is equal to the normal retirement pension times a percentage from the following table:

| Age at Retirement | Percentage |
|---|---|
| 64 | 100 |
| 63 | 100 |
| 62 | 100 |
| 61 | 97 |
| 60 | 94 |
| 59 | 88 |
| 58 | 82 |
| 57 | 76 |
| 56 | 70 |
| 55 | 64 |

If retirement is not from active service, or if Company consent is not obtained, an actuarial reduction applies.

Female participants employed prior to June 1, 1972 are entitled to a bridge benefit payable to age 65. However, no active members remain to whom this provision applies.

## Maximum Pension Limits:

The Plan provides that the pension payable at the time of commencement must not exceed the defined benefit limit prescribed under the Income Tax Act, multiplied by years of pensionable service (with service rendered prior to January 1, 1992 limited to 35 years). Reductions to this maximum apply if retirement occurs before age 60, before completion of 30 years service, and before attainment of age and service summing to 80. The maximum provision automatically reflects any increases to the defined benefit limit that occur in the Income Tax Act and Regulations.

## Escalation of Pensions after Retirement:

Pensions in payment to individuals who retired directly from active service with Company consent, and their survivors, are increased each January 2 by an amount determined by the Company, having consideration to the rate of increase in the consumer price index, to a maximum of 3% per annum. For the past several years, the actual increase has been based on the increase in the all Canada consumer price index for August over the previous August.

# Survivor Benefits

## Death Before Retirement

If a member dies prior to becoming fully vested, the member's spouse, or the member's beneficiary if there is no surviving spouse, will receive a refund of the member's contributions with interest.

If a member dies after becoming fully vested, the member's spouse, or the member's beneficiary if there is no surviving spouse, will receive a benefit equal in value to the commuted value of the benefit to which the member would have been entitled had he terminated employment immediately prior to his death, plus any excess of the member's contributions over 50% of that commuted value.

If a member, other than an Ontario based member, with a spouse dies after becoming fully vested and after age 55, the spouse shall receive a benefit equal to that described above, but not less than:

(a) the value of the member's required contributions made prior to January 1, 1987, plus interest; plus

(b) the value of any additional voluntary contributions made by the member, plus interest; plus

(c) the commuted value of the 60% surviving spouse's benefit to which the spouse would have been entitled in respect of service after January 1, 1987 had the member retired on the date of death; plus

(d) a refund of any required contributions made after January 1, 1987, plus interest, which exceed 50% of the commuted value of the deferred pension to which the member would have been entitled in respect of service after January 1, 1987 had he retired on the date of death.

Certain of these amounts must be transferred to the spouse's locked-in RRSP.

## Death After Retirement

The normal form of pension for single employees guarantees a return of the member's own contributions with interest up to retirement date.

For married employees, the normal form of pension provides a continuing survivorship pension to the member's spouse. If retirement occurs prior to July 1, 1987, the spouse's benefit is 50% of the member's benefit. If retirement occurs after July 1, 1987 the spouse's benefit is 60%.

## Termination Benefits

Benefits become fully vested after 2 years of membership.

If termination occurs prior to full vesting, a refund of the member's contributions with interest is made.

If termination occurs after full vesting, the member is entitled to a deferred pension commencing at normal retirement date, or alternatively the commuted value thereof may be transferred to the member's locked-in RRSP. If the member's own contributions exceed 50% of the commuted value of the deferred pension, the excess is available as an additional benefit.

If termination occurs after age 45 but before full vesting, the member may elect to transfer the value of a deferred pension to his locked-in RRSP instead of receiving a lump sum refund. The 50% contribution test does not apply.

Appendix E

# Commuted Value Basis

## Basis for Calculating Commuted Values upon Termination of Employment

**Interest:**

| | |
|---|---|
| First 10 Years | month end value of the nominal rate of interest on 7 year Government of Canada benchmark bond (CANSIM series B14070) in the second calendar month preceding the month in which the computation date falls, converted from a nominal rate compounded semi-annually to an annual effective rate, plus 0.50% and rounded to the nearest multiple of ¼%. |
| Subsequent Years | month end value of the nominal rate of interest on long term Government of Canada benchmark bond (CANSIM series B14072) in the second calendar month preceding the month in which the computation date falls, converted from a nominal rate compounded semi-annually to an annual effective rate, plus half the difference between that rate and the corresponding rate based on the 7 year benchmark bond, plus 0.50% and rounded to the nearest multiple of ¼%. |

| | |
|---|---|
| **Mortality Before Retirement:** | None |
| **Mortality After Retirement:** | UP94 Table projected to 2015, sex distinct rates |
| **Retirement Age:** | Age 65, or actual age if retiring directly from active service |
| **Proportion Married:** | Married at retirement if married at termination |
| **Age of Spouse:** | Actual Age |
| **Calculation Valid for:** | 8 months from date of termination, if increased with interest at the rate applicable for the first 10 years. After 8 months, a new commuted value must be calculated. |

Appendix F

# Employer Certification

With respect to the report on the actuarial valuation of the *Retirement Plan for Employees of Canadian Utilities Limited and Participating Companies – Plan 2*, as at December 31, 2006, I hereby certify that, to the best of my knowledge and belief:

- a copy of the official Plan documents and of all amendments made up to December 31, 2006, were provided to the actuary;
- the membership data provided to the actuary includes a complete and accurate description of every person who is entitled to benefits under the terms of the Plan for service up to December 31, 2006, and
- all events subsequent to December 31, 2006 that may have an impact on the results of the valuation have been communicated to the actuary.

**Reference:** Return on Rate Base, Application, page 8-3

**Issue:** Capital Additions

**Request:**

Please explain and account for the difference between Capital Additions and Expenditures.

**Response:**

Capital Expenditures are capital related disbursements that occur in the fiscal year. The project's associated with these disbursements may or may not be capitalized (rate based) as of December 31. If a project is not capitalized, it remains in work-in-progress.

Capital Additions relate to those projects that are capitalized (rate based) in a given year. The amount capitalized will include expenditures incurred in the year the project was capitalized and may also include expenditures (work-in-progress) relating to a prior year.

For further information please refer to Schedule 9.1 in the Application.

THE YUKON ELECTRICAL COMPANY LIMITED
An ATCO Company

**YUB-YECL-30**

**Reference:** Return on Rate Base, Application, page 8-5, 8-6

**Issue:** Working Capital

**Request:**

Please explain and quantify the increase in inventory from 2006 to 2007. Show inventory values for the years 2005 to 2007 inclusive and for each of the test years 2008 and 2009.

**Response:**

The increase in inventory from 2006 to 2007 as explained on page 8.6 of the application and outlined on Schedule 8.9, represents an increase in the 3 year average. This three year average increased in 2007 as the 2004 inventory amount of 1,289 was replaced with the 2007 inventory amount of 1,849. The increase in inventory from 2004 to 2007 is a result of increased prices during that three year period as well as increased levels of inventory to support projects.

Please refer to YUB-YECL-30 Attachment 1 for inventory values from 2004-2009.

# Yukon Electrical
# Inventory
# 000 s

| | Annual | 3-Year Average |
|---|---|---|
| 2004 | 1,289 | |
| 2005 | 1,474 | |
| 2006 | 1,784 | 1,516 |
| 2007 | 1,849 | 1,702 |
| 2008 | 1,940 | 1,858 |
| 2009 | 2,036 | 1,942 |

**YUB-YECL-31**

**Reference:** Prepared Testimony of Foster Associates Inc., page 13

**Issue:** Cost of Debt

**Quote:** The 2007-2008Q1 average masks the widening spreads over the period. As investors have become more risk-averse, and the outlook for the economy has deteriorated, credit spreads have widened considerably since the end of 2006. (Line No. 350-352.)

**Request:**

(a) The spreads discussed are over similar term Government of Canada bonds. Please provide the change in the bond rate over the same period.

(b) Earlier on page 13, it was indicated that CU Inc. has been able to raise new 30-year debt on average at approximately 120 basis points over a similar term Government of Canada bond during 2007 and the first quarter of 2008. How does that reconcile to the 157 basis point spread at the end of March 2008?

(c) Would the U.S. mortgage crisis have any effect on these spreads?

**Response:**

(a) The indicated spreads referenced at lines 350-352 are relative to the long-term Canada bond yield. The yields on the long-term Canada bond for the period 2006Q1 to 2008Q1 are presented in the table below:

**Average Long-Term Canada Yield**

| | 2006 | 2007 | 2008 |
|---|---|---|---|
| **Q1** | 4.23 | 4.17 | 4.07 |
| **Q2** | 4.54 | 4.35 | |
| **Q3** | 4.21 | 4.45 | |
| **Q4** | 4.07 | 4.21 | |

The bond yields for the sample of A rated Canadian utilities for the same period are presented in the table below:

**Yield for Sample of A Rated Utilities**

| | 2006 | 2007 | 2008 |
|---|---|---|---|
| **Q1** | 5.4 | 5.4 | 5.8 |
| **Q2** | 5.7 | 5.6 | |
| **Q3** | 5.4 | 5.8 | |
| **Q4** | 5.3 | 5.7 | |

(b) The 120 basis points is an average over the entire period referenced. See lines 350 to 354 and Schedule 1 of Ms. McShane's evidence.

(c) Yes, in large part; the U.S. mortgage crisis can be viewed as the trigger for a broad repricing of risk across financial markets. It is unclear whether this bursting of the latest bubble in the market will result in a permanent increase in spreads due to investors being more cautious than they had been since approximately late 2004. Further, spreads are likely somewhat wider than they were in the past due to the elimination of the Foreign Property Rule, which had the effect of keeping domestic bond yield spreads relatively low. While the FPR was in place, institutions like pension funds focused their Canadian content investments on bonds, and their foreign investment on equities. With the FPR no longer in place, Canadian debt issuers will have to compete with yields offered globally.

**YUB-YECL-32**

**Reference:** Prepared Testimony of Foster Associates Inc., page 13

**Issue:** Cost of Debt

**Preamble:** The recent differential between the TransAlta Corporation cost of long-term debt and the CU Inc. cost of long-term debt of approximately 233 basis points provides a perspective on the potential magnitude of the benefits to ratepayers of Yukon Electrical's affiliation with CU Inc. (Line No. 367-370.)

**Request:**

(a) Would you describe TransAlta's core operations as that of a regulated utility?

(b) Would a fully regulated utility present less risk than a non-regulated company?

**Response:**

(a) No.

(b) It depends on the combination of business and financial risk. The cost of debt of TransAlta represents the cost of debt to a company whose combined business and financial risks are such that it has achieved debt ratings in the BBB category. A regulated utility with similar debt ratings would face a similar cost of debt.

**YUB-YECL-33**

**Reference:** Prepared Testimony of Foster Associates Inc., page 14

**Issue:** Cost of Debt

**Quote:** As a true stand-alone entity, Yukon Electrical would not be able to obtain investment grade debt ratings given its small size. (Line No. 370-372.)

**Request:**

(a) Does CU Inc. raise investment grade debt for ATCO Gas, ATCO Electric Ltd., ATCO Pipelines and other affiliates as well as for YECL?

(b) If CU Inc. did not include ATCO GAS and ATCO Pipelines in its portfolio (that is if it was substantially smaller), would it maintain the same investment grade rating?

(c) Incrementally, does YECL contribute to the size CU Inc. and therefore CU Inc.'s ratings benefit from having YECL as part of the portfolio?

**Response:**

(a) Yes.

(b) Ms. McShane cannot state with certainty whether the loss of ATCO Gas and ATCO Pipelines would reduce CU Inc.'s ratings, but in part the credit ratings are a function of its diversification across regulated industry sectors rather than size. If ATCO Gas and ATCO Pipelines were removed, CU Inc. would be operating in the electric utility industry, and thus benefit less from diversification. Consequently, it is likely that its ratings would be lower without ATCO Gas and ATCO Pipelines.

(c) Yes, in principle Yukon Electrical would contribute to the size of CU Inc., and thus provide some small contribution to the size and diversification of the entity which provides its debt. That fact does not detract from the conclusion that on its own, Yukon Electrical would not be able to achieve the low level of debt costs from which it benefits from its affiliation with CU Inc.

**YUB-YECL-34**

**Reference:** Prepared Testimony of Foster Associates Inc., page 14

**Issue:** Compatibility of Capital Structure with Business Risks

**Quote:** The business risks to which investors in a utility are exposed are those that reflect the basic characteristics of the operating environment and regulatory framework that can lead to the failure to recover a compensatory return on, and or the return of, the capital investment itself. (Line No. 380-383.)

**Request:**

(a) For the last 20 years, how many times has YECL or its parent (ATCO Electric Ltd.) not made its regulatory return?

(b) For the past 20 years, how many times has YECL or its parent (ATCO Electric Ltd.) exceeded its regulatory return?

(c) If a company consistently meets or exceeds its regulatory return, does this imply a lower business risk?

(d) If a company consistently meets or exceeds its regulatory return, does this imply a lower regulatory risk?

(e) If a company consistently meets or exceeds its regulatory return, does this imply a lower financial risk?

**Response:**

(a&b) In the last 20 years YECL has not made its regulatory return in 15 years and exceeded the regulatory return in five years.

The regulated return for ATCO Electric is not relevant to the current proceeding.

(c&d) No. Consistently earning the allowed return, as, for example, is possible for some NEB-regulated pipelines operating under a full cost of service method of regulation, does not eliminate longer-term risks. Each year, the risk of earning or not earning the approved return is subject to a large variety of circumstances that are unpredictable for the subject year. The after the fact result achieved does not reduce the risk.

(e) No. The ability to earn the allowed return is not a financial risk. It is a business regulatory risk.

**YUB-YECL-35**

**Reference:** Prepared Testimony of Foster Associates Inc., page 2

**Issue:** Benchmark ROE

**Quote:** However, the benchmark ROE is viewed as below the level consistent with a fair and reasonable return. (Line No. 49-50.)

**Request:**

(a) Please provide any regulatory decision supporting that view.

(b) Please provide other sources that support that view.

**Response:**

(a) The comment was not based on regulatory decisions. Please see lines 949-963.

(b) The following files containing the requested documentation are attached:

## 2007 ROEs Decline to Unprecedented Levels; Ontario Gets Reprieve

### Highlights

- The ugly got uglier – actual 2007 allowed ROEs declined by an average of 0.37% versus the average allowed return on equity for 2006. The average actual allowed return on equity in 2007 is 8.65% versus 9.01% in 2006.
- The announced allowed returns are fully reflected in our diluted EPS estimates over the 2007 and 2008 forecast period.
- Although we believe that the allowed returns established by the automatic adjustment mechanisms set out herein likely violate the Fair Return Standard and are confiscatory, they are in line with expectations and therefore neutral to our outlook.
- Companies with material exposure to these automatic adjustment mechanisms include Canadian Utilities Limited, Pacific Northern Gas, Gaz Metro L.P., Fortis Inc. and TransCanada Corporation. Companies with limited exposure to ROE adjustment mechanisms include: Enbridge Inc., Duke Energy, and TransAlta Corporation.
- There are a number of companies in our coverage universe with no exposure to these automatic adjustment mechanisms: Caribbean Utilities, and Emera Inc. The pipeline and power trusts/limited partnerships in our coverage universe generally do not have a material exposure to these mechanisms.
- On November 23, the Ontario Energy Board abandoned its generic licence amendment proceeding, the purpose of which, among other things, was to codify its approach to determining the allowed return on equity. The Board has also rejected the implementation of an alternative approach to determine the allowed return on equity for Ontario's local electricity distribution utilities. We believe that this alternative approach was seriously flawed and had no basis in reality.
- We rate the units of Fort Chicago Energy Partners, LP, Inter Pipeline Fund, and Northland Power Income Fund Outperform. We also rate the shares of Pacific Northern Gas Ltd., and Caribbean Utilities Co. Ltd. Outperform.
- We remain restricted on the units of Calpine Power Income Fund.

# Table of Contents

A. The Calculations ..... 2

B. Allowed Returns are Confiscatory ..... 5

C. Ontario Gets a Reprieve ..... 7

D. Comparable Equity Securities ..... 9

The allowed rates of return on equity (ROE) for many of the pipeline and energy utility companies in our coverage universe are established by an automatic adjustment mechanism in the fall of each year and are highly dependent on forecast interest rates for the prospective fiscal period. As discussed below, the 2007 allowed ROEs for various jurisdictions have now been established and allowed ROEs, on a cumulative basis, have reached unprecedented lows.

## A. The Calculations

Table 1 sets out the key variables that drive each of the automatic adjustment mechanisms, by regulator.

***Table 1**: Key Input Assumptions*

| Regulator | Year Formula Effective | Month of Consensus Economics | Base GOC Yield | Equity Risk Premium | Adjustment Factor | 2004A ROE | 2005A ROE | 2006A ROE | 2007E ROE | Change 2007 vs. 2006 |
|---|---|---|---|---|---|---|---|---|---|---|
| National Energy Board | 1995 | November | 9.25% | 3.00% | 75% | 9.56% | 9.46% | 8.88% | 8.46% | -0.42% |
| British Columbia Utilities Commission - Terasen Gas (BCGU) | 2006 | November | 5.25% | 3.90% | 75% | 9.15% | 9.03% | 8.80% | 8.37% | -0.43% |
| British Columbia Utilities Commission - Terasen Gas (Centra) | 2006 | November | 5.25% | 4.60% | 75% | 9.65% | 9.53% | 9.50% | 9.07% | -0.43% |
| British Columbia Utilities Commission - PNG West Division/Tumbler Ridge | 2006 | November | 5.25% | 4.55% | 75% | 9.80% | 9.68% | 9.45% | 9.02% | -0.43% |
| British Columbia Utilities Commission - PNG Ft. St. John/Dawson Creek/FortisBC | 2006 | November | 5.25% | 4.30% | 75% | 9.55% | 9.43% | 9.20% | 8.77% | -0.43% |
| Alberta Energy and Utilities Board | 2005 | November | 5.68% | 3.92% | 75% | 9.60% | 9.50% | 8.93% | 8.51% | -0.42% |
| Ontario Energy Board - Enbridge Gas Distribution | 1998 | October | 7.25% | 3.40% | 75% | 9.69% | 9.57% | 8.74% | 8.39% | -0.35% |
| Ontario Energy Board - Union Gas[1] | 1998 | October | 7.25% | 3.55% | 75% | 9.62% | 9.63% | 8.92% | 8.53% | -0.39% |
| Regie de l'energie[2] | 1999 | August | 5.76% | 3.84% | 75% | 9.45% | 9.69% | 8.95% | 8.73% | -0.22% |
| Nova Scotia Utilities and Review Board | | | | Formula Not Presently In Use | | | | | | |
| Island Regulatory and Appeals Commission | | | | | | | | | | |
| Newfoundland and Labrador Board of Commissioners of Public Utilities[3] | 2000 | Oct/Nov | 5.60% | 4.15% | 80% | 9.75% | 9.24% | 8.77% | 8.60% | -0.17% |

Notes:
(1) Issue of Consensus Economics used to calculate allowed ROE has varied.
October stipulated in June 29, 2006 Reasons for Decision re: 2007 Rates.
(2) Excludes 0.57% of Allowed Incentive Return in 2003, 1.51% in 2004, 1.95% in 2005, 0.38% in 2006, and approximately 0.75% in 2007
(3) Return on Equity for Newfoundland Power Inc. Fixed for two-years at 9.75% in decision dated June 20, 2003. Total Return Calculation methodology.
Source: BMO Capital Markets

As set out in Table 1, the allowed ROEs established for the 2007 period are an average of 0.37% lower than in 2006. The primary reason for the decline in allowed return is the precipitous drop in the implied forecast 30-year bond yield arising from: (i) reduction in the underlying Consensus Estimate for 2007 versus 2006 to 4.15% from 4.55%; and (ii) decline in the observed spreads between the 10-year and 30-year government of Canada bond yields, as published in the National Post throughout October of 2006 versus a similar period in 2005, to approximately 7 basis points from approximately 23 basis points.

Tables 2, 3, and 4 highlight the calculation of the allowed 2007 actual ROE for the National Energy Board (NEB), Alberta Energy and Utility Board (AEUB), and the British Columbia Utilities Commission (BCUC). Table 5 highlights our estimate of the allowed return on equity for Enbridge Gas Distribution, as per the automatic adjustment mechanism notionally used by the Ontario Energy Board (OEB). We note that that the OEB, unlike its utility peer group, does not publish or release the calculation for the allowed return for the utilities subject to its purview. We note that the formulas appear to vary between Union Gas and Enbridge Gas Distribution and also between the electricity and natural gas sectors.

## B. Allowed Returns are Confiscatory

We believe on a collective basis, that the allowed returns as established by the formulas highlighted above are confiscatory and likely violate the Fair Return Standard. This standard, as established by Canada's Supreme Court and accepted by the National Energy Board in 1971, states that a fair or reasonable rate of return should:

1. be comparable to the return available from the application of the invested capital to other enterprises of like risk (the comparable earnings standard);
2. enable the financial integrity of the regulated enterprise to be maintained and permit incremental capital to be attracted to the enterprise on reasonable terms and conditions (the financial integrity and capital attraction standards); and
3. achieve fairness from the viewpoint of the customers and from the viewpoint of present and prospective investors (appropriate balance of customer and investor interests).

We believe that regulators have consistently refused to give weight to a number of arguments that would result in higher allowed returns, solely on the basis that to do so would result in higher customer rates.

- The North American capital markets are increasingly integrated and investors have the ability to invest in utility assets north and south of the border.
- There is merit incorporating U.S. market metrics into the analysis and that the Canadian benchmark equity portfolio (the S&P/TSX) may not meet the theoretical requirement for a diversified market portfolio.
- The returns on comparable investments with similar risk, whether they be Canadian or U.S. examples, should be considered.
- The allowed return on equity and deemed equity must satisfy all aspects of the Fair Return Standard and that no part of the Standard has priority.

- The continued reliance on a derived 30-year government of Canada bond yield may not be a relevant proxy for the cost of debt (and/or a proxy for the risk free rate) for two key reasons: (i) the observed and anticipated reduction in the supply of government of Canada securities and the continued conversation in the financial market that the government may cease to issue debt securities at the long end of the curve may result in distortions in the market cost of these securities and thus the observed yields; and (ii) that corporate debt issuers do not have access to the debt capital market at government yield levels.

- No pipeline or energy utility in our regulated coverage universe has issued equity in the last five years to fund, on an unlevered basis, a dollar-for-dollar equity investment in utility rate base. Continued assertions by regulators that utilities have adequate access to capital are not credible with respect to the equity component, as access to equity has not been tested over the ensuing period. For example, On September 16, 2003, Fortis Inc. announced that it planned to acquire the assets of Aquila British Columbia and Aquila Alberta for $1.36 billion, including assumed debt. The company financed the transaction by assuming approximately $689 million of utility debt and issued approximately $170 million of holdco debt, $200 million of holdco preferred shares and new equity of approximately $350 million. Despite the levered nature of the transaction and the prospect for above average rate base growth at the two target utilities, the common shares of Fortis Inc. declined by 5% at the time the transaction was announced and the transaction was initially widely expected to be dilutive until 2006.

- None of the pipeline projects highlighted in our May 24, 2006, report entitled "Exchanging Fire", save and except the Canadian portion of the Southern Access Pipeline (with an approximate cost of $160 million versus an estimated cost to Enbridge of projects currently permitted and/or under way of $8 billion), are expected to earn the National Energy Board multi-pipeline decision return on equity. We note that in many instances, the market-based tolling arrangements with shippers result in a risk profile similar to that of the benchmark pipeline, the TransCanada Mainline pipeline.

- Continued investment in utility rate base by the owners of utilities is not an acquiescence that the allowed return on equity is appropriate and that investment may relate to other obligations including the utility's obligation to be the supplier or supply or last resort and fulfil the obligation to serve, maintain the safe and reliable operation of the utility, and may be fulfilling specific conditions of its operating licence.

- A failure by utility companies to annually litigate the allowed return on equity "formula" does not constitute acceptance of the adequacy of the allowed return. Rather, we believe that the lack of annual litigation reflects the cost of the process, the time required to pursue litigation that detracts from management's ability to focus on the efficient operation of the business and the potential damage to important utility regulatory and customer relationships.

- The evidenciary standard is too high and almost impossible to meet. Moreover, we believe that notwithstanding decisions from the Supreme Court that stipulate otherwise, utility regulators continue to rely heavily on their quasi-judicial and expert status to impose a bare-bones return on equity and drive down the deemed capital structure of

the utility in order to protect customers from prices, without the fear of reconsideration upon appeal. Regulators must establish the cost of equity and deemed equity not because they are experts in this regard, but in order to establish just and reasonable rates. The regulator is not permitted to consider the effects on customers in the determination of the allowed ROE and capital structure, and we do not believe that the regulator is permitted to factor in other policy objectives into its determination of the allowed return on equity; i.e., we do not believe that the regulator is permitted to reduce the allowed return on equity and/or deemed equity for small utility companies in order to encourage consolidation or any other specific policy objective. We believe in these situations, that the inclusion of these other factors in the assessment of cost of equity and designation of deemed equity, unlawfully transfers value to utility ratepayers from its legitimate owner, the utility shareholders.

## C. Ontario Gets a Reprieve

On November 23, the Ontario Energy Board (OEB) issued a notice to participants regarding its Multi-year Electricity Distribution Rate Setting Plan, including the Cost of Capital, 2nd Generation Incentive Regulation Mechanism and Generic Licence Amendment Proceeding. The Board indicated that, pursuant to Staff and Panel recommendations, the Board discontinue its code-based approach (November 17 and November 20, 2006 respectively); that in the interests of achieving a more timely setting of electricity distribution rates for the 2007 rate year, the Board will instead implement its cost of capital and 2nd generation incentive regulation policies by means of guidelines. As a result, the Board discontinued the generic licence amendment proceeding, which was commenced on the Board's own motion.

On November 30, the Board issued a Draft Report on the Board on Cost of Capital and 2nd Generation Incentive Regulation for Ontario's Electricity Distributors and Associated Guidelines. The draft report details the Board's policies on cost of capital and 2nd generation incentive regulation, and draws on the work of Board staff and the input of interest parties since this consultation was initiated in April 2006. Also included are guidelines to assist parties in understanding how the policies will be implemented and information for distributors in preparing their rate applications for the 2007 rate year.

The Draft Report contains the following highlights with respect to the cost of equity capital and deemed capital structure:

- The Board has determined that the current approach to setting ROE will be maintained. The ROE will be determined based on the Long Canada Bond Forecast rate plus an equity risk premium. The Board's current approach has been in place for six years. The consultation process undertaken by the Board included a review of one method that would have required more time and greater costs for its implementation. We also note that the range of ROE produced by this alternative method was unacceptably low; well below the various rates of return discussed previously. The Board concluded that none of the approaches reviewed is better than the Board's current method.
- The Board's method will continue to include an implicit premium of 50 basis points (0.5%) for floatation and transaction costs.

- The current method was established in 1999 as part of a review of cost of capital. The ROE calculated at that time is the starting point for the calculation and is 9.35% (as per Hydro One Network Inc.'s RP-1998-0001 Decision). This formula is $ROE_t$ = 9.35% + 0.75 ($LCBF_t$ – 5.50%). The Long Canada Bond Forecast will use the average of the January consensus forecast of the 10-year Government of Canada bond yield 3 months ahead and 12 months ahead plus the difference between the observed yields on the 30-year Government of Canada bond yield and the 10-year Government of Canada bond yield as published by the Bank of Canada during the month of January (2007).
- No incentive returns for capital investments are appropriate at this time.
- No earnings sharing mechanisms are appropriate for second generation incentive rate making.
- The Board will include an adjustment to rates in 2008, 2009 and 2010 to transition distributors from their existing capital structures to a single deemed capital structure of 40% equity and 60% debt:
  - o For distributors starting at equity of 35%, the equity component will move in equal increments over two years until it reaches 40%.
  - o For distributors starting at equity of 45%, the equity component will move in equal increments over two years until it reaches 40%; and
  - o For distributors starting at equity of 50%, the equity component will move in equal increments over three years until it reaches 40%.

We believe that the following points are relevant about the draft guidelines:

- The current formula is not expected to result in a return on equity that is materially higher than the formulas previously discussed. We reiterate that the existing formulas result in an allowed return on equity that likely violates the Fair Return Standard and we believe them to be confiscatory.
- We are not convinced that a "one-size fits all" capital structure is appropriate and we are concerned that the Board's policy objectives of regulatory efficiency and LDC consolidation are driving force behind the single deemed capital structure approach. This may not be appropriate.
- We are not disappointed by the Board's decision to abandon the Licence Amendment proceeding and the rejection of the alternative approach to determining the return on equity. This latter item was seriously flawed and had no basis in reality. We set out our views on this approach in comments/reports dated June 27, August 8 and September 7, 2006.

**Disclosure Key**

BMO NB uses the following Company Specific Disclosure Key. Please refer to the Company Specific Disclosure section above for specific disclosures applicable to issuers discussed in this report:

1 - BMO NB has provided advice for a fee with respect to this issuer within the past 12 months.

2 - BMO NB has undertaken an underwriting liability with respect to this issuer within the past 12 months.

3 - BMO NB has provided investment banking services with respect to this issuer within the past 12 months.

4 - BMO NB, BMO Capital Markets Corp. or an affiliate beneficially owns 1% or more of any class of the equity securities of this issuer.

5 - BMO NB, BMO Capital Markets Corp. or an affiliate makes a market in this security.

6 - BMO Capital Markets Corp. or an affiliate has managed or co-managed a public offering of securities with respect to this issuer within the past 12 months.

7 - BMO Capital Markets Corp. or an affiliate has received compensation for investment banking services from this issuer within the past 12 months.

8 - BMO Capital Markets Corp. or an affiliate or its officers or partners own options, rights, or warrants to purchase any securities of this issuer.

9 - BMO Capital Markets Corp. or an affiliate received compensation for products or services other than investment banking services within the past 12 months.

10A - This issuer is a client (or was a client) of BMO NB, BMO Capital Markets Corp. or an affiliate within the past 12 months: Investment Banking Services

10B - This issuer is a client (or was a client) of BMO NB, BMO Capital Markets Corp. or an affiliate within the past 12 months: Non-Investment Banking Securities Related Services

10C - This issuer is a client (or was a client) of BMO NB, BMO Capital Markets Corp.or an affiliate within the past 12 months: Non-Securities Related Services

11 - An employee, officer, or director of BMO NB is a member of the Board of Directors or an advisor or officer of this issuer.

12 - A member of the Board of Directors of Bank of Montreal is also a member of the Board of Directors or is an officer of this issuer.

13 - A household member of the research analyst and/or associates who prepared this research report is a member of the Board of Directors or is an advisor or officer of this issuer.

14 - The research analysts and/or associates (or their household members) who prepared this research report directly or beneficially own securities of this issuer: None

**Distribution of Ratings**

| Rating Category | BMO Rating | BMO Universe | BMO I.B. Clients* | First Call Universe** |
|---|---|---|---|---|
| Buy | Outperform | 35% | 45% | 47% |
| Hold | Market Perform | 55% | 48% | 46% |
| Sell | Underperform | 10% | 7% | 7% |

* Reflects rating distribution of all companies where BMO Capital Markets has received compensation for Investment Banking services.

** Reflects rating distribution of all North American equity research analysts.

**Ratings Key**

We use the following ratings system definitions:

OP = Outperform - Forecast to outperform the market;

Mkt = Market Perform - Forecast to perform roughly in line with the market;

Und = Underperform - Forecast to underperform the market;

(S) = speculative investment;

NR = No rating at this time;

R = Restricted – Dissemination of research is currently restricted.

Market performance is measured by a benchmark index such as the S&P/TSX Composite Index, S&P 500, Nasdaq Composite, as appropriate for each company. Prior to September 1, 2003, a fourth rating tier—Top Pick—was used to designate those stocks we felt would be the best performers relative to the market. Our six Top 15 lists which guide investors to our best ideas according to six different objectives (large, small, growth, value, income and quantitative) have replaced the Top Pick rating.

**Dissemination of Research**

Our research publications are available via our web site http://bmocapitalmarkets.com. Institutional clients may also receive our research via FIRST CALL Research Direct and Reuters. All of our research is made widely available at the same time to all BMO NB, BMO Capital Markets Corp. and BMO Nesbitt Burns Securities Ltd. client groups entitled to our research. Please contact your investment advisor or institutional salesperson for more information.

**Additional Matters**

TO U.S. RESIDENTS: BMO Capital Markets Corp. and/or BMO Nesbitt Burns Securities Ltd., affiliates of BMO NB, furnish this report to U.S. residents and accept responsibility for the contents herein, except to the extent that it refers to securities of Bank of Montreal. Any U.S. person wishing to effect transactions in any security discussed herein should do so through BMO Capital Markets Corp. and/or BMO Nesbitt Burns Securities Ltd.

TO U.K. RESIDENTS: The contents hereof are intended solely for the use of, and may only be issued or passed onto, persons described in part VI of the Financial Services and Markets Act 2000 (Financial Promotion) Order 2001.

BMO Nesbitt Burns Inc. and BMO Nesbitt Burns Ltée/Ltd. are Members of CIPF. BMO Capital Markets Corp. and BMO Nesbitt Burns Securities Ltd. are Members of SIPC.

# Perspective on Canadian Gas Pipeline ROEs

February 2008

## Scope

This document outlines key facts and views regarding return on equity (ROEs) on Transmission Pipelines in Canada, with a specific focus on gas pipelines. It has been prepared by the Canadian Energy Pipeline Association (CEPA) to support engagement and discussion of ROE issues amongst CEPA members who are operating natural gas transmission systems and with associated policy makers, regulators and stakeholders.

## Summary

Several Canadian regulatory jurisdictions have in existence similar formulas to determine allowed rates of return on common equity (ROEs) for utility and pipeline assets. While there is merit (eg. efficiency, link to debt markets) in using a formula approach to ROE, the ROEs that result from the current formulas are too low, causing unfair returns. This paper, which is focused on ROEs for natural gas transmission pipelines, provides the facts supporting this position, and other background information to generate discussion on this topic.

The background information provided includes the legal obligation for regulators to provide fair returns on invested capital, the methods that can be used to estimate an appropriate ROE, and the ROE formulas currently in place.

The following facts are presented to support the position that gas pipeline ROEs are too low:

- U.S. and Canadian gas pipelines had similar ROEs at the time ROE formulas came into use, but now U.S. gas pipelines have much higher ROEs, despite a relative increase in the business risk of Canadian gas pipelines;
- U.S. local gas distribution companies (LDCs) had similar ROEs at the time ROE formulas came into use, and now U.S. LDCs have much higher ROEs despite being less risky;
- ROEs contractually negotiated for Canadian pipelines are consistently higher, and the difference is likely greater than can be accounted for by additional risks inherent to negotiated settlements;
- Analysis of Canadian stock market data shows that investors expect higher returns; and
- Since the ROE formulas were originally adopted, capital markets have changed in ways that have led investors to require higher equity returns than those resulting from single-variable ROE formulas.

To assist the discussion, this paper also addresses some common challenges to the assertion that ROEs are too low.

CEPA intends this paper to be complementary to a paper issued by the Canadian Gas Association (CGA) in May 2007. The CGA's paper addresses ROEs from the perspective of

natural gas LDCs. CGA members also have formula-generated ROEs, and suffer from unfair rates of return as a result.

**Background**

Who is the Canadian Energy Pipeline Association (CEPA)?

CEPA represents Canada's energy transmission pipeline companies. Its members transport 97 of Canada's daily crude oil and natural gas production from producing regions to markets throughout Canada and the U.S. CEPA members operate over 20 billion in assets and project 1 billion per year of capital investments over the next 2 decades. Collectively, total assets are projected to double over the next 15 years in order to meet the needs of energy producers and consumers. In order to ensure that the Canadian gas pipeline industry continues to be maintained and expanded to meet these needs, sufficient returns are required on capital invested.

The Fair Return Standard

Regulators allow the recovery of all prudently incurred and reasonable costs required to provide service. These costs include the cost of capital employed, for which regulators are required to provide a fair return. The fair return standard is based on court rulings on cost of capital matters, and has three elements. A return is fair if 1) it enables the utility to attract capital on reasonable terms, 2) maintains the financial integrity of the regulated entity, and 3) is comparable to the returns available to enterprises of similar risk.

The fair return standard is not only a legal requirement but it is also based on sound economic theory. It ensures that necessary regulated systems remain financially healthy and that its investors are compensated appropriately and equitably.

The first two parts of the fair return standard, capital attraction and financial integrity, are related but distinct tests. The capital attraction standard ensures the regulated entity can attract the capital it requires to grow and maintain its system. The financial integrity standard requires that the return allowed be sufficient to assure confidence in the financial soundness of the regulated

entity. In approving a cost of capital, regulators must consider the financial soundness of the regulated entity and the risk that it could be unable to attract capital on reasonable terms. This should have nothing to do with the ownership of the regulated entity. The company which owns the regulated entity may be stronger or weaker financially, and may have more or less difficulty raising capital than the regulated entity would. To address this, regulators follow the stand-alone principle whereby cost of capital decisions are made for the regulated entity as if it were a stand alone company.[i] In other words, the regulator asks how financially sound the regulated entity is and whether it could raise capital on its own; the financial soundness and ability of the parent company to raise capital are irrelevant.

The third part of the fair return standard, that the return be comparable to that of entities with similar risk, has clearly not been met in recent decisions. Too often regulators have used differences between comparators as reasons *not* to compare rather than as considerations in *how* to compare. Regulators have rejected comparison to US pipelines,[ii] oil pipelines,[iii] or to pipelines who have negotiated their rates through settlement agreements.[iv] There are few sources for comparators, and it is circular to compare to other pipelines whose returns are also based on an ROE generated the same way. Thus, where differences exist, the onus is on regulators to exercise reasoned judgment and consider differences while making comparisons. Otherwise, the fair return standard, which legally requires comparisons, is not met.

The fair return standard applies to the overall cost of capital, comprised of the cost of debt and the cost of equity. This paper focuses on ROE because debt rates are rarely contentious, equity ratios have been deemed by Canadian regulators based on individual business risks, and since ROEs are set by formulas which apply to many pipelines.

Methods of Estimating an Appropriate ROE

Setting an appropriate ROE is a challenge that requires regulators to not only understand and measure risk, but to put a price on risk differences based on an understanding of how risk is being priced in the capital market. Academics do not agree on a single method or test to determine an appropriate ROE. They have a number of methods to estimate the cost of capital, each with its own underlying theory and its own unique shortcomings. Estimating an appropriate ROE with any of these methods involves the challenge of gathering an appropriate sample. While the results of all methods have been considered by regulators in the past, the

most recent EUB and NEB decisions have relied primarily or solely on Equity Risk Premium (ERP) based methods.[v, vi]

The methods of estimating cost of capital fall in three broad categories: the Comparable Earnings (CE), Discounted Cash Flow (DCF), and Equity Risk Premium methods. The CE method compares the actual ROEs earned by companies with comparable risk. While this method relies on accounting data which can be affected by accounting concepts such as accruals and gains and losses on sales, it is a straight-forward application of the comparable return standard.

The DCF method is universally accepted in the U.S. and universally given little or no weight in Canada recently. It is based on the constant dividend growth model and the theory that the appropriate cost of equity is the risk-adjusted discount rate applied to dividends to obtain the current value of a stock. The formula is;

$$Price = \frac{Next\ Year's\ Expected\ \ per\ unit\ Dividends}{ROE\ -\ Growth\ \ Rate}$$

This formula is then rearranged to back-out an estimate of the ROE from data on the current stock price, expected dividends, and the projected growth rate. After selecting a sample, the main challenge of this method is determining estimates of future growth rates. These estimates normally rely on economic growth forecasts and dividend growth forecasts published by equity analysts. One advantage of this method is that investors and investment analysts routinely use the formula above in making valuations. The DCF method is also a forward-looking test, unlike most other tests.

The ERP method determines an ROE as the sum of a risk-free rate of return plus a risk premium. The theory is that the risk-free rate of return compensates investors for the time value of money while the risk premium compensates for any additional amount of risk. The Capital Asset Pricing Model (CAPM) is the traditional ERP model, and is represented by the following formula:

$$ROE = RF + \beta \times MRP$$

where RF is the risk-free rate of return, MRP is the market risk premium which is the market-determined price for the average amount of risk, and β is the entity's risk relative to the average market risk. The unique challenge with this CAPM method is estimating β and the MRP through statistical analysis of stock market data.

A relatively new ERP method is the Fama-French model. It is based on evidence that the CAPM model underestimates the return on equity for low beta stocks and for high value stocks (stock with a low market to book ratio).[vii] These biases of the CAPM model would cause an underestimation of the appropriate ROE for a Canadian gas pipeline. To correct for these biases in the CAPM model, the Fama-French model adds variables for company size and company value to the traditional CAPM model. The formula for this method is;

$$ROE - RF = \alpha + \beta_1 SMB + \beta_2 HML + \varepsilon$$

where

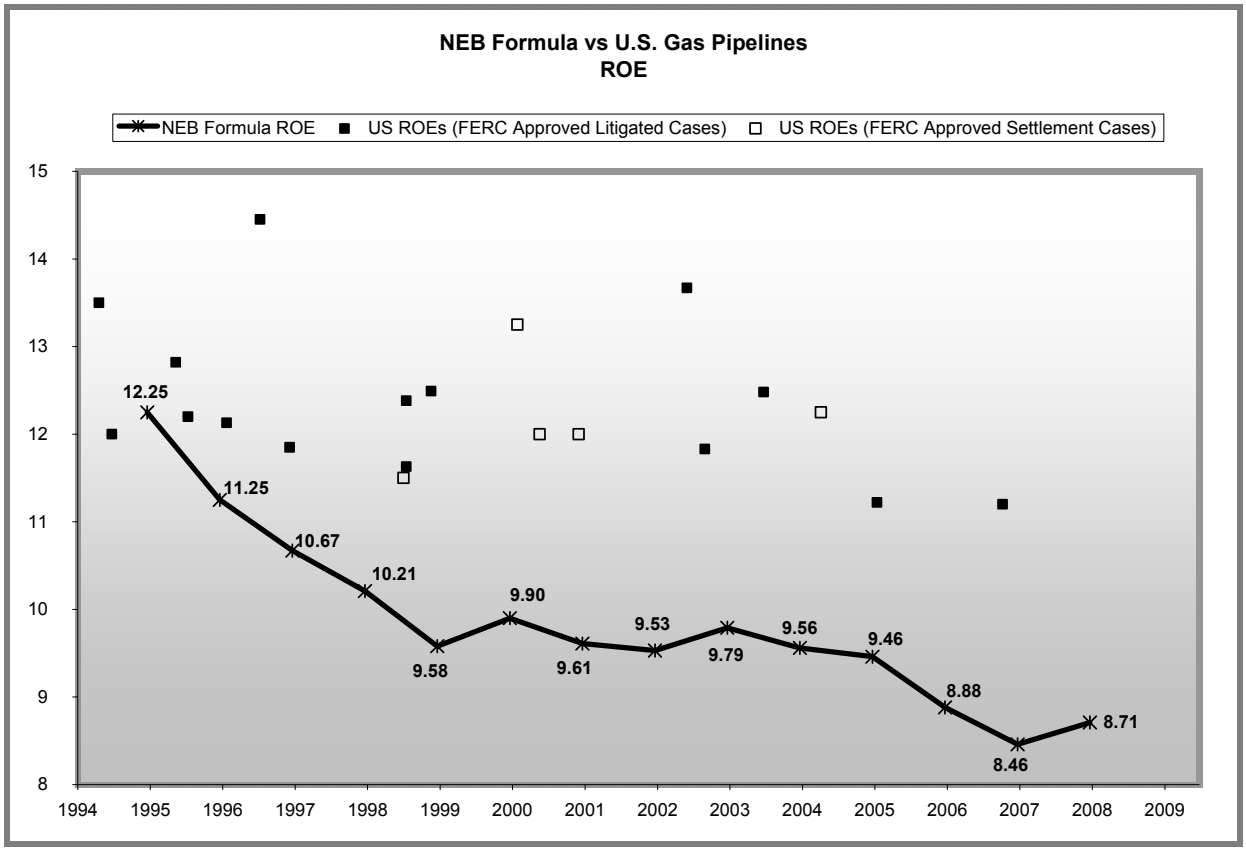
- $\alpha$ is the abnormal returns of the company's stock;
- SMB is the size factor (small market capitalization returns minus big market capitalization returns);
- HML is the book-to-market factor (high B M returns minus low B M returns);
- $\beta_1$ and $\beta_2$ are the respective sensitivities of stock to the SMB and HML risk factors; and
- ε is the diversifiable or firm specific risk.

Another approach to estimating cost of equity that can be combined with these methods is the After-Tax Weighted Average Cost of Capital (ATWACC) method. It is based on the premise that the overall after tax cost of capital is constant over a wide range of capital structures. Based on this premise, either an ATWACC should be approved by the regulator or ROE and capital structure should be considered together, not in isolation, to result in a fair return. ATWACC's are a real-world measure, since businesses consider whether the ATWACC of a project is above or below a hurdle rate of return when considering whether or not to proceed with that project.

There are many methods and variations of methods which can be used to estimate the cost of capital. However, when parties prepare evidence for a cost of capital proceeding, they typically present a method that has been accepted in the past. If new methods are disregarded because they are new, regulators will end up with a very narrow, and possibly outdated view when evaluating cost of capital evidence.

Current ROE Formulas

The British Columbia Public Utilities Commission (BCUC) was the first Canadian regulator to establish a formula ROE and was followed by the NEB and three other provincial regulators. These regulators use virtually identical ERP-based formulas to set approved ROEs each year by adjusting the previous year's ROE by a proportion of the change in the forecast long-term Government of Canada bond yields (a measure of the risk-free rate of return). The table below provides the results of these formulas in 2007 and 2008, which are very similar, and average 8.51 in 2007 and 8.78 in 2008.



**Approved Formula ROEs**

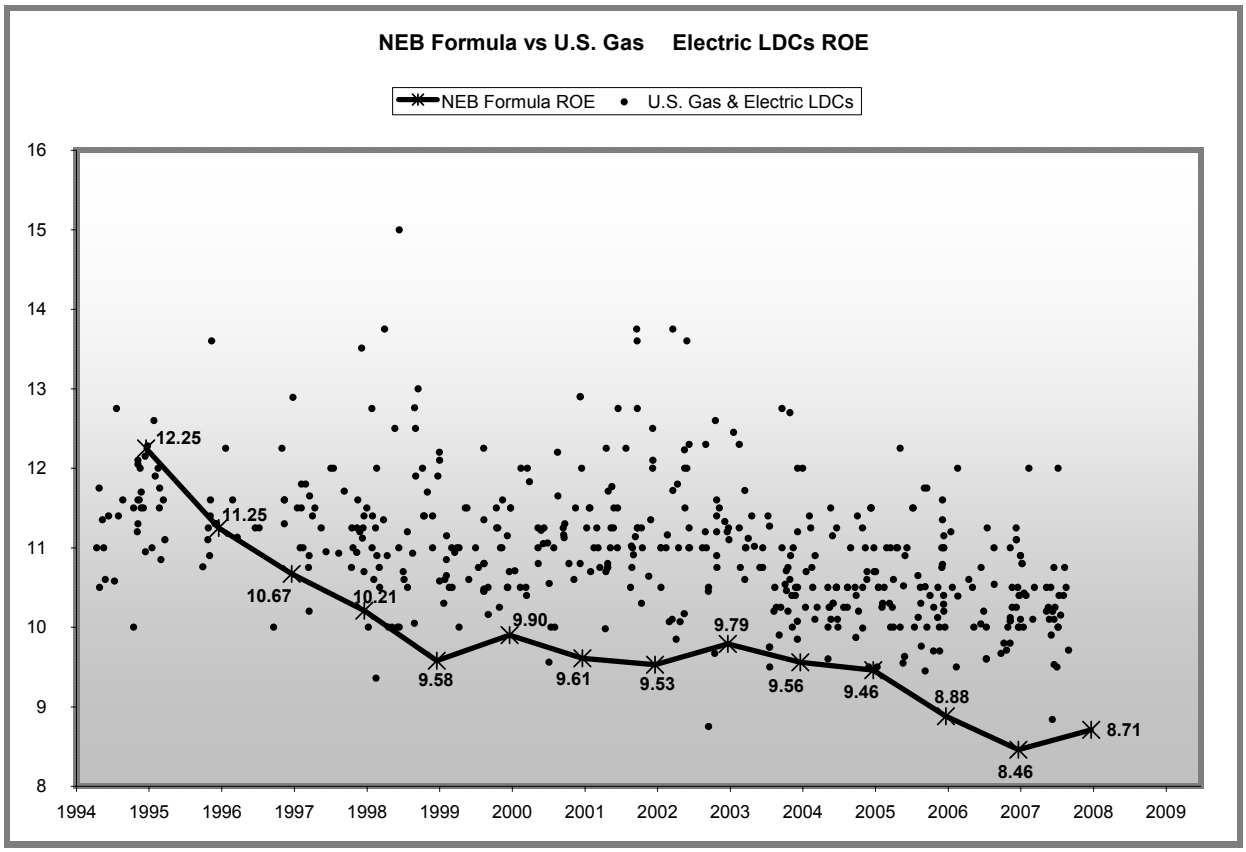
| Jurisdiction | | Formula Implemented | 2007 ROE | 2008 ROE |
|---|---|---|---|---|
| National Energy Board | | 1995 | 8.46 | 8.71 |
| Alberta Energy and Utilities Board | | 2004 | 8.51 | 8.75 |
| British Columbia Utilities Commission | | 1994 | 8.37 | 8.62 |
| Ontario Energy Board | Enbridge | 1997 | 8.41 | not available |
| | Union | 1997 | 8.54 | not available |
| Qu bec r gie de l' nergie for Gaz M tro | | 1999 | 8.76 | 9.05 |

As bond yields have dropped, so have the formula generated ROEs. The ROE in the 1995 base year of the NEB Formula was 12.25 , and has fallen by 379 basis points relative to 2007. The ROE awarded for the 2004 base year of the EUB formula was 9.60 , and has fallen by 109 basis points relative to 2007.

**Growing Gap Relative to U.S. ROEs**

Formula ROEs have dropped in Canada, while gas pipeline ROEs approved by the U.S. Federal Energy Regulatory Commission (FERC) have not, as shown below.

*Source: FERC Decisions*



Over this time period, Canadian pipelines have faced increasing risks as they have entered a competitive age and faced increased supply risk, while U.S. gas pipelines have not faced such structural changes. In any event, it would be difficult to argue that U.S. gas pipelines have experienced an increase in relative risk since 1995.

U.S. gas pipeline ROEs are relevant for comparison. Markets continue to globalize, and investors can now switch their investments between Canada and the U.S. as easily as switching between sectors within the same country. There are also no material differences in fiscal or monetary policy to affect comparability. In other words, higher ROEs are easily available to Canadian investors who invest in U.S. gas pipelines instead of Canadian gas pipelines. Comparison to U.S. regulated entities is logical since they a have similar regulatory model.

Whether subject to Canadian or U.S. FERC regulation, a gas pipeline faces the same long term risk of failing to recover the capital invested.

As mentioned, the FERC uses the DCF methodology to set approved ROEs for gas pipelines. Like all methods, the DCF method includes the challenge of finding an appropriate comparator group. Recent merger and acquisition activity in the U.S. had limited the DCF sample, or proxy group. As a result, the FERC began adding LDCs to its proxy group, and making ROE adjustments to account for the greater risk of pipelines relative to LDCs. The FERC recently issued a Policy Statement proposing that pipelines organized as Master Limited Partnerships ( MLPs ) be included in the proxy group to increase its size.[viii] Based on research by the Interstate Gas Association of America, including MLPs in the sample should tend to increase the ROEs that result from the DCF test.[ix]

The NEB formula ROE has also dropped significantly in relation to the ROEs of U.S. gas and electric LDCs. A recent Concentric Energy Advisors report prepared for the OEB concluded that there are no significant differences that would lead to a difference in investor required returns for Canadian and U.S. LDCs.[x] By extension it can be concluded that U.S. LDCs are less risky than Canadian gas pipelines, since gas pipelines have no franchises and greater supply, market and competitive risk. The figure below shows that the NEB formula return has dropped significantly and is now below the ROEs awarded to U.S. gas and electric LDCs.

*Source: Public Utilities Fortnightly*

A gap has clearly grown between Canadian and U.S. ROEs, which cannot be explained by changes in relative risk.

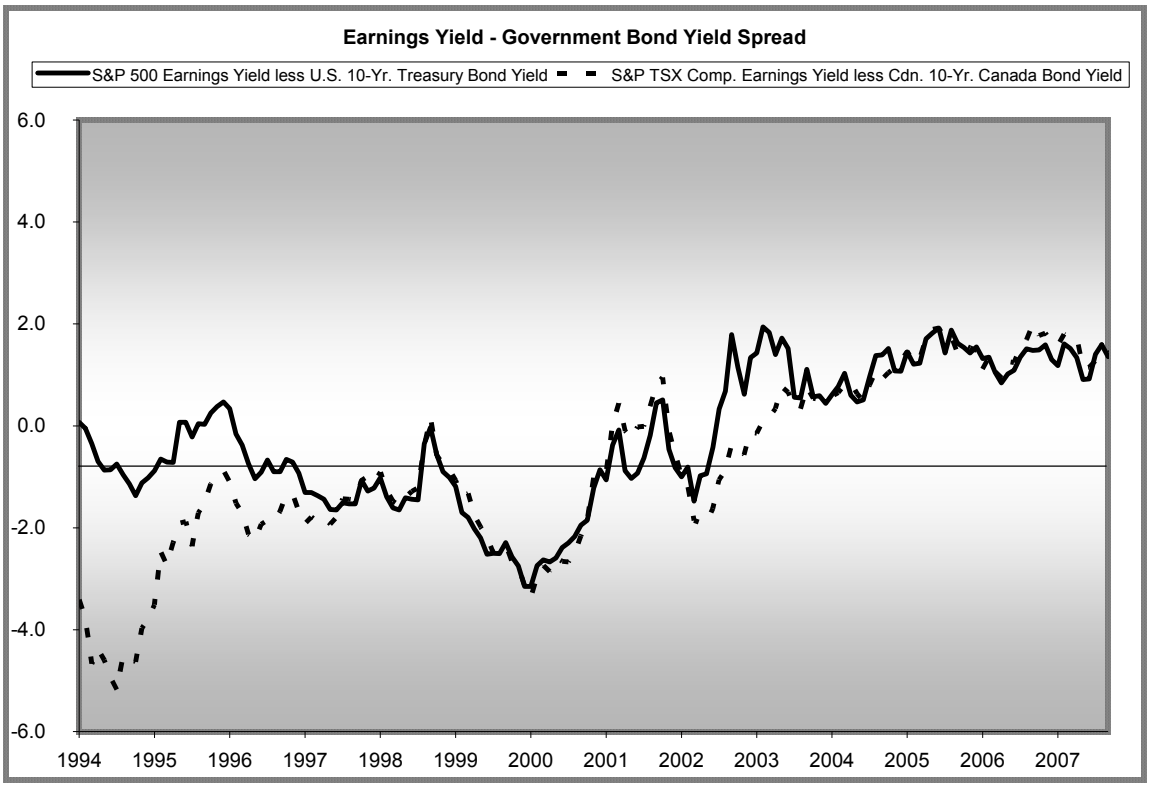
**Gap Relative to Negotiated Canadian ROEs**

Pipelines and their customers often negotiate an explicit ROE for a new or an existing pipeline. These ROEs are invariably higher than the formula ROEs at the time. The ROE negotiated in a single settlement reflects a negotiated trade-off between ROE and other risk factors. However, the fact that all settled ROEs are significantly higher than the alternative formula ROE suggests that pipelines and their customers are able to agree that formula ROEs do not appropriately reflect the cost of equity capital. It is worth noting that for U.S. gas pipelines, the ROEs determined in litigated cases and settlements are very similar, as shown above.

While Canadian pipelines may accept increases in short-term risk in some settlements, this cannot explain a 200 to 400 basis point premium over the formula ROE. The following table shows some negotiated ROEs. ROEs established as a premium to the NEB formula would be reset upon a change in the NEB formula. Note that several of these examples are for oil pipelines, where transportation costs have historically been small in relation to the value of the commodity in comparison to gas pipelines, and where settlements have been more prevalent.

| Pipeline Pipeline Project | ROE |
|---|---|
| Alliance (2000 to 2014) | 11.25 |
| M&NP (2007 settlement) | 13 |
| Trans Mountain (2006 to 2010 Settlement) | 10.75 |
| Alberta Clipper | NEB Formula ROE 225 Basis Points |
| Line 4 Extension | NEB Formula ROE 225 Basis Points |
| Mackenzie Valley | NEB Formula ROE 221 Basis Points |
| Southern Lights | 12 |

The evidence suggests that in Canada, formula returns are a floor for negotiations, and not a level that parties consider a reasonable benchmark. As a result, they affect the returns that are negotiated, as the fall-back to settlement.

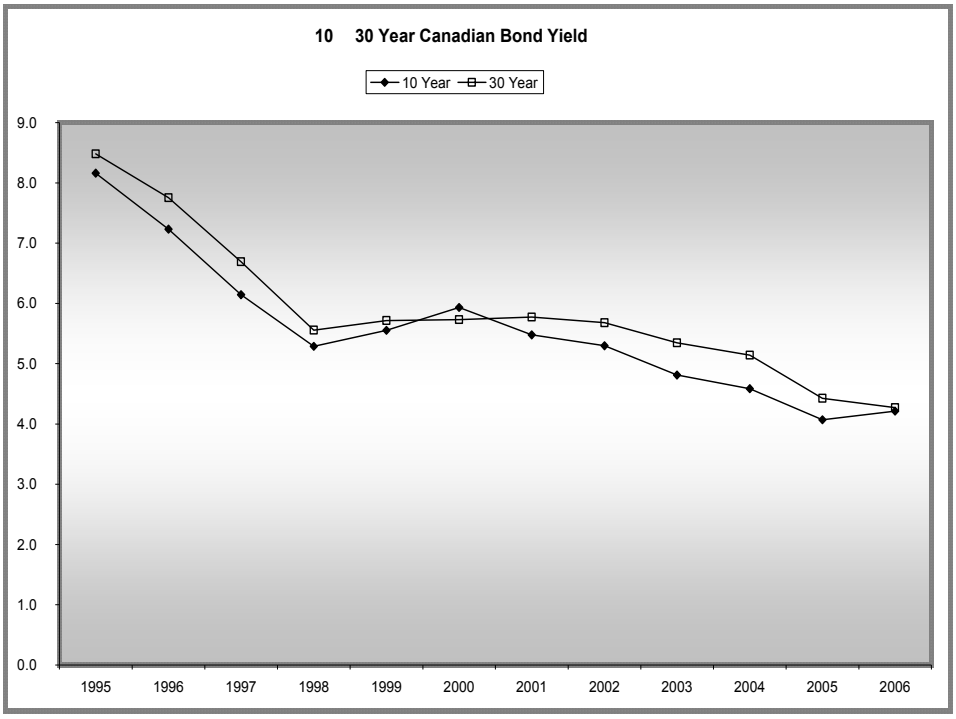


**Analysis of Canadian Stock Market Data**

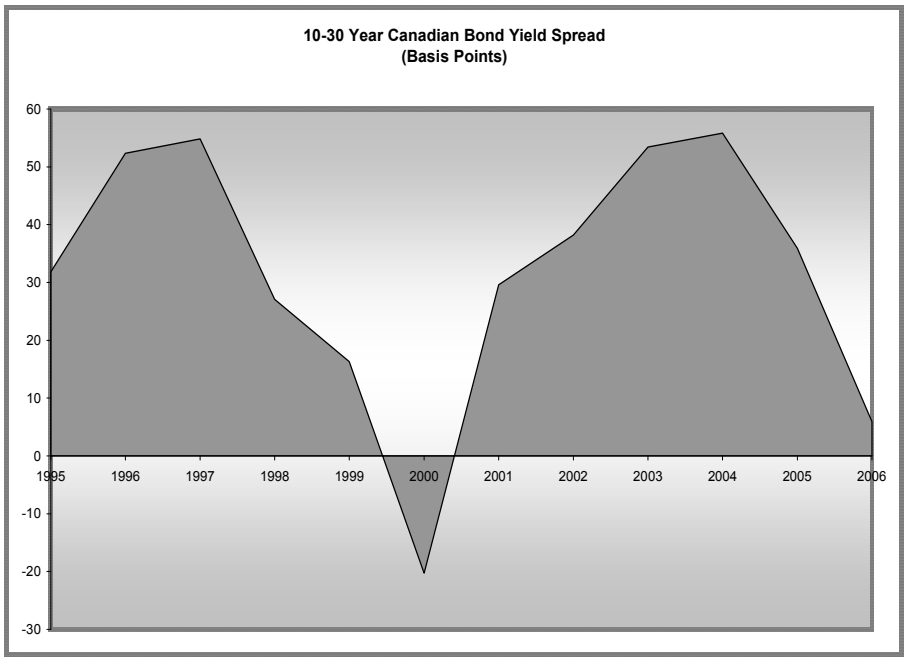
CEPA retained Dr. Stephen Gaske, a cost of capital expert, to conduct an ERP-based analysis as a further indication of whether current formula-based ROEs are reasonable. His analysis, appended to this paper, is a straightforward analysis of two samples of Canadian stocks. His Energy Transportation Sample (consisting of Emera, Enbridge, Fortis, TransCanada, Canadian Utilities, Westcoast and Terasen while still public) has an average equity risk premium over the past 23 years of 7.6 , which results in an 11.88 ROE when added to current long term bond yield. In his opinion, this result appears more reasonable than the ROEs currently produced by Canadian ROE formulas. Dr. Gaske also evaluates equity risk premiums over time, and finds that the moving averages for both samples have been increasing. These results support

CEPA's position that the current formula-based ROEs are too low, and that it is time to open up broader discussion on this topic.

**Changes in Financial Markets**



The ROE required to meet the fair return standard depends on the price investors put on differences in risk and the accessibility of capital, which are determined in competitive capital markets. Its determination is too complex to be captured by any single-variable formula. Capital markets have changed significantly since ROE formulas were established, increasing the returns required by investors. This is visible in the following figure which shows an increasing spread between earnings yields and long-term bond yields since ROE formulas came into use.[xi]



Not only have capital markets changed in ways not captured by ROE formulas, but the one variable they do rely on may no longer be a good measure of the risk-free rate of return. Since the federal government has been reducing the amount of federal debt, and the supply of long

term government bonds has decreased while the economy has been growing, the price of bonds has increased and bond yields have been reduced. Thus, improved government finances have artificially reduced pipeline ROEs.

The following figures show the decline in bond yields and the current low spread between 10 and 30 year bond yields.

It would be a coincidence if a single variable formula set as long as 13 years ago generated a reasonable ROE today. It is equally unlikely that a reasonable return result could be set for the year 2021 with a formula determined today.

**Potential Questions**

In order to advance discussion on this topic, this section addresses some questions that may be raised in response to this paper.

Why have gas pipelines not applied for higher ROEs if they are too low?

Each company has its own motivations, but there are some common reasons. ROE litigation is costly and contentious, and the evidentiary standard may be high given the subjective nature of the matter. Settlements are typically preferred if they result in an increase in ROE relative to the formula result. Settlements allow pipelines and their customers to collaborate on other matters instead of opposing each other in lengthy, adversarial proceedings.

Why does investment continue if the ROE is too low?

As long as a gas pipeline operates, its owners will continually invest to maintain safe operations. Investments are also made to serve new customers. These are long term investments, and are made with the expectation that the returns will be fair over the life of the asset. Expansions and extensions are also required in order to avoid bypass by a competing pipeline, which would undermine the value of the initial investment.

Without an improvement in formula-based returns, Canadian pipeline infrastructure investment is being put at risk, along with the development of Canada's natural resources. If investors begin to lose faith that a regulator will award reasonable returns, they will be less likely to invest in that jurisdiction. It could take many years of corrected action by regulators before investors regain confidence, during which economic development could be impeded.

Why are entities earning formula ROEs purchased for more than book value if ROEs are too low?

Recent purchases above book value have suggested to some that formula-based returns are higher than the cost of capital to investors. Apart from the fact that book values are an accounting construct, there are a number of other reasons investors would pay more than book value for an asset. A few examples are creative financing, expectations of higher returns (either by regulatory change or settlement incentives), and strategic value. There have also been cases where, in hindsight, too much has been paid for a regulated asset.[xii]

Why are stock prices and credit ratings unharmed if ROEs are too low?

There is no gas pipeline in Canada which trades on the stock market as a pure play gas pipeline. They are all held by parent companies with other assets or include other non-regulated assets. Considering the stock prices and debt ratings of a parent company is not consistent with the stand-alone principle described above. While some regulated entities may be rated by credit ratings agencies, these ratings are affected by the credit quality of the parent organization.

Further, there is evidence that the investment community is concerned about the ROEs awarded to gas pipelines, as described in the NEB's 2007 Hydrocarbon Transportation System Assessment:

> Many analysts expressed support for a formulaic approach to determining ROEs because of the transparency, stability and predictability that this method provides. However, a number expressed the view that the ROE resulting from the formula was too low, and contend that they are much lower than regulated ROEs in the U.S. and U.K. While views ranged widely on this issue, some felt that the typically lower ROEs in Canada were not justified by the differences in risk for Canadian companies compared to FERC-regulated pipelines. Some parties suggested it was time for the Board to revisit the ROE Formula.[xiii]

## Conclusion

Canadian gas pipelines are being awarded formula ROEs that result in unfairly low returns. U.S. gas pipelines and LDCs, and Canadian pipelines who settle their returns, have ROEs 200 to 400 basis points higher than formula ROEs. Dr Gaske's conclusion is within this range, based on a simple ERP-based statistical analysis of utility index data. It is no surprise that formulas are unable to track the dynamics of a capital market, which incorporates the expectations of investors based upon all available information. The time has come for stakeholders to engage in discussion on this matter, and to consider the potential consequences of awarding low ROEs for energy infrastructure.

## Endnotes

[i] The EUB describes the stand alone principle as follows: *The Board accepts that the underpinning of the stand-alone principle is that the regulated utility should not be subsidizing its non-utility operations or operations of members of its corporate family, neither should the non-regulated activities subsidize the utility operations"* EUB Decision 2003-061, AltaLink Management Ltd. and TransAlta Utilities Corporation Transmission Tariff for May 1, 2002 April 30, 2004 TransAlta Utilities Corporation Transmission Tariff for January 1, 2002 April 30, 2002 August 3, 2003, p 83.

[iii] NEB Reasons for Decision RH-2-2004 Phase II. TransCanada Pipelines Cost of Capital pp. 68-69. April 2005.

[iv] NEB Reasons for Decision RH-2-2004 Phase II. TransCanada Pipelines Cost of Capital pp. 68. April 2005 EUB Decision 2004-052 Generic Cost of Capital p.27. July 2, 2004

[v] The NEB used to consider the DCF and CE methods, but in the early 1990s shifted to giving most or all weight on the results of the ERP method. The NEB primarily considered a Comparable Earnings evaluation of Canadian industrials in RH-1-78 and RH-1-79. In RH-4-81, RH-3-82, and RH-2-83, the NEB made ROE determinations based on its consideration of all of the evidence presented which included multiple estimation methods. Decision RH-1-84 states The Board is of the view that the determination of an appropriate rate of return on equity involves the use of methods that are subject to the exercise of judgment. The Board made similar comments in RH-2-85, RH-3-86, and RH-1-88 Part II. In the RH-2-89 decision the Board found that the results of DCF test should be given weight in assessing a fair rate of return on equity despite limitations of the approach. In the early 1990's the Board placed the primary weight on the ERP method and placed less weight on the CE and DCF methods (decisions RH-1-91 and RH-2-92). In RH-4-93 the Board put little or no weight on the results of the CE and DCF methods, stating that these tests may prove useful under different economic conditions. In the last NEB ROE decision, RH-2-94, the Board decided to give primary weight to the results of the equity risk premium test.

[vi] The EUB once gave some weight to the results of the DCF test, but most recently placed no weight on the results of the DCF test. From 1990 to 1994, the EUB gave less weight to the results of the DCF method than the ERP method. For instance Decision E94060 states "The Board has in the past found that none of the methods advocated by the expert witnesses necessarily yields or provides a precise measurement of the fair rate of return on equity. However, the Board considers the results of each method helpful in its deliberations The Board has taken note of the caution expressed by each of the expert witnesses respecting the use of the DCF method in today's economic environment. The Board accepts that less weight should be placed on the absolute results of the DCF method under current economic conditions. The EUB moved from less weight to little weight on DCF results in Decision U96001, also because of the effects economic conditions at the time may have had on the results of the DCF test. In the Board's Generic Cost of Capital Decision (Decision 2004-052), the results of the DCF test were given no weight, as the Board was convinced by interveners that the analysts' earnings forecasts used in the development of the DCF estimates have been biased high.

# Risk Premium Analysis
# Dr. Stephen Gaske

Canadian regulators currently set the rate of return on common equity for regulated pipelines by using equity risk premium formula ROEs calculated each year by adding a percentage of the change in yields on Bank of Canada bonds to the previous year's ROE. The risk premium approach explicitly recognizes that pipeline equity is riskier than long term Bank of Canada bonds, and therefore that the expected return on equity should be higher in the pipeline industry than the yield on Bank of Canada bonds. Although there is no doubt about the need for a risk premium, the difficult problem for a regulator is to determine the size of the premium that is required in order for a pipeline to attract capital on reasonable terms. However, just as bond yields change from year to year, the required level of the premium also changes continually in response to (i) changes in the financial market in general, and (ii) to changes in the risks of pipelines in particular.

The formula currently used to estimate ROEs can generally be written:

ROE in Year 2 ROE in Year 1 75 of the change in the forecast bond yield

This formula mechanically adjusts the allowed ROE in response to changes in interest rates. The allowed ROE moves up and down at 75 of the change in the forecast bond yield. As a result, the size of the risk premium is adjusted each year by an amount equal to -25 of the change in the bond yield. The mechanical adjustment in the size of the risk premium is designed to make a rough adjustment for changes in the financial market in general by assuming that the risk premium is greater when interest rates are relatively low and that a smaller risk premium is required when interest rates are relatively high. While this might be a reasonable representation of how the required risk premium is likely to react in the short run to changes in financial market conditions (for which changes in the interest rate is intended to be a rough proxy), there is nothing in this formula that allows the risk premium to adjust in the long run if the relative risks of pipelines change over time. Consequently, it may be necessary to re-calibrate the formula periodically.

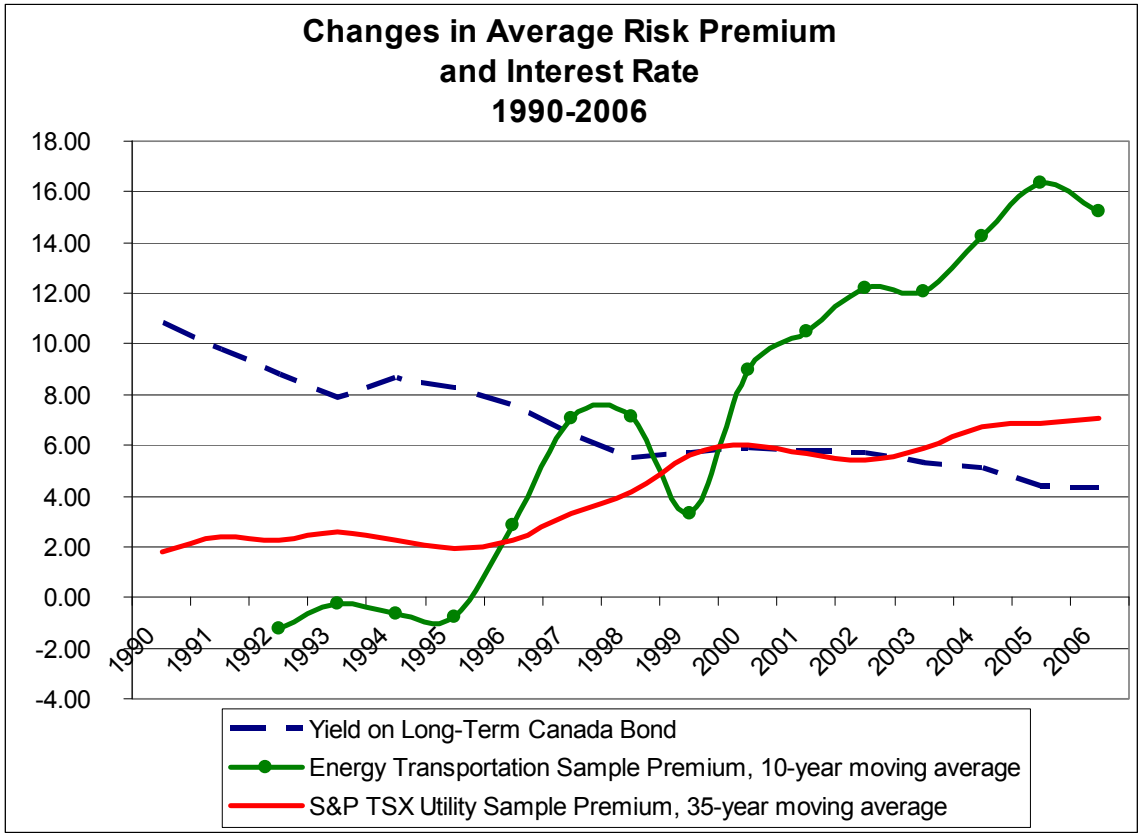
To test whether the current formula is reasonably accurate, and to determine whether the required risk premium may have changed significantly through the years, this analysis reviews bond yields and market returns on utility common equity for various time periods during the 51 year period 1956-2006. Market returns on common equity were evaluated with two indices:

1. The S&P TSX Capped Utilities Index (S&P TSX Utility Sample), for which data are available for the 1956-2006 time period. The S&P TSX Utility Sample currently consists of Algonquin Power Income Fund, ATCO Ltd., Canadian Utilities Limited, Emera Inc., Energy Savings Income Fund, EPCOR Power L.P., Fortis Inc., Northland Power Income Fund, TransAlta Corp., and TransAlta L.P.

2. A sample with a focus on corporations with pipeline or other energy transportation assets (Energy Transportation Sample). The Energy Transportation Sample is a better proxy for gas pipelines since it does not include less relevant utility companies (those that are primarily energy retailers or power producers), and includes pipeline companies not includes in the S&P TSX Utility Sample (Enbridge, TransCanada, and, for years in which they were traded, Westcoast and Terasen). Therefore the Energy Transportation Sample consists of Emera, Enbridge, Fortis, TransCanada, Canadian Utilities, Westcoast and Terasen. Data for this sample is only available starting in 1983.

The Total Returns used in these two indices are calculated each year by dividing the dividends plus changes in stock price during the year, by the stock price at the beginning of the year. Both indices are constructed using the assumption that all dividends are reinvested in the company.

Risk premiums were calculated each year by subtracting the Bank of Canada bond yield from the Total Return experienced by each stock sample.



The Energy Transportation Sample experienced an average risk premium of 7.6 percent between 1983 and 2006. The S&P TSX Utility Sample experienced an average risk premium of 5.12 percent over the period 1956-2006, and 9.53 percent over the period 1983-2006. These results are shown in Exhibit 1, and summarized in the Table below:

**Average Total Returns and Risk Premiums**

| | Long Term Canada Bond Yield | Energy Transportation Sample | | S&P TSX Utility Sample | |
|---|---|---|---|---|---|
| | | Total Return | Risk Premium | Total Return | Risk Premium |
| 1983-2006 Average | 7.95 | 15.55 | 7.60 | 17.48 | 9.53 |
| 1956-2006 Average | 7.68 | not available | not available | 12.79 | 5.12 |

When evaluating pipelines, the Energy Transportation Sample should be a better indicator of required returns than a broader sample. Consequently, the 7.6 percent average risk premium for pipelines should be a better estimate of the required risk premium than risk premiums calculated for the S&P TSX Utility Sample. Adding the 4.28 percent bond yield from 2006 to the 7.6 percent risk premium would produce an allowed rate of return of 11.88 percent. This is hardly an excessive rate of return, and appears to be far more reasonable than the ROEs currently resulting from Canadian ROE formulas.

Analysis of both indices suggests the required risk premium has increased significantly since the 1990's. The chart below shows the moving averages of the risk premiums for both indices, which have increased while the yield on long term bonds has decreased.

# Exhibit 1
# Total Returns and Risk Premiums

| | | Energy Transportation Sample | | | S&P TSX Utility Sample | | |
|---|---|---|---|---|---|---|---|
| Year | Yield on Long-Term Canada Bond | Annual Return | Risk Premium | 10-Yr. Moving Average Premium | Annual Return | Risk Premium | 35-Yr. Moving Average Premium |
| 1956 | 3.63 | | | | 0.17 | -3.46 | |
| 1957 | 4.11 | | | | -3.43 | -7.54 | |
| 1958 | 4.15 | | | | 9.81 | 5.66 | |
| 1959 | 5.08 | | | | 0.21 | -4.87 | |

## Investment Conclusion

- The recent broad market rally from September 21 lows likely signals the start of a new bull market phase and as such has significant implications for pipeline and utility stocks. In the near term, we expect a consolidation of recent market gains during which pipeline and utility stocks may outperform again; however, we would use this as an opportunity to trim exposure to the group. We would focus remaining exposure on those companies with the best potential earnings growth and, in particular, those that effectively use performance-based regulation and strategic acquisitions and increase the proportion of nonregulated assets and operations in their business mix.

**Figure 1. Sector Performance Relative To Broader Indices**

Prices as of market close November 30, 2001.
Source: Starquote.

- November saw the markets rally and the start of a rotation into more cyclical stocks. As a result, the pipelines and utilities underperformed the TSE in November; while the TSE 300's total return was 8.0%, that of the utilities was virtually zero, and the pipelines was negative 1.3%. Contributing to the underperformance was the back-up in long Canada bond yields, which have risen by approximately 40 basis points from recent lows. Pipeline and utility stocks are highly *negatively* correlated with long Canada bond yields. Figure 1 shows the relative performance of the sector to broader indices from the September 21 low, and figures 2 and 3 show individual company performance in November and year-to-date. The sector underperformed in the month, even after accounting for the dividend yield, as shown in Figure 4.

*See page 2 for state/provincial restrictions.*

- The shock of the failure of Enron and the uncertainty about any possible domino effect has put pressure on the stock prices of energy merchants and may continue to overhang the sector, and potentially the broader market, until the situation is clearer. We note, however, that all of the companies in our universe have indicated that they do not have any direct material exposure to Enron. We expect that other marketers should be able to step in and fill the gap left if EnronOnline were to be permanently turned off, although we are less certain of the duration and magnitude of any reduced liquidity and resultant increased volatility in the power and gas markets.

- Over the next 12 months, as an economic recovery unfolds, there will likely be upward pressure on short- and long-term interest rates. At the same time, a recovery will continue to diminish the defensive appeal of these stocks and highlight the better relative growth prospects of more cyclical or economically sensitive sectors. As well, we continue to have valuation concerns about the distribution utilities, which are trading at about a 2.1-multiple-point premium and a 90-basis-point yield discount compared to U.S. comparables with similar growth rates and risk profiles (see Table 1).

**Table 1. Canadian Valuation Premium**

| | 2002 P/E | Dividend Yield |
|---|---|---|
| Canadian Gas & Electric Utilities | 13.9 | 4.4% |
| U.S. Gas & Electric Utilities | 11.8 | 5.3% |

Source: CIBC World Markets.

- **TransAlta** (TA – Buy) A recession will reduce industrial power demand, which will likely prolong recent weakness in electricity prices; however, with most of TA's output contracted long term and at fixed prices, our recommendation has been premised on expectations of growth in TA's generation portfolio and the enhanced returns achievable from its Alberta generation assets in a deregulated environment. With its dividends providing about a 4.3% yield, the stock now offers excellent income and downside protection while preserving the longer-term upside. In the mean time, the weaker balance sheets of some of its competitors may facilitate acquisition opportunities.

- **Enbridge** (ENB – Buy) has demonstrated the strongest and most consistent EPS growth of the sector. It is benefiting from incentive regulation at Consumers Gas, from the recently completed Midcoast Energy acquisition, and from rising oil production in Western Canada, which will boost demand for its oil pipeline. Confidence in the latter outcome is heightened by customers' recent requests that Enbridge proceed with the third phase of the Terrace expansion. We believe that the recent purchase of 25% of the Spanish energy transportation company (CLH) indicates the increasing contribution and strength of Enbridge's international operations.

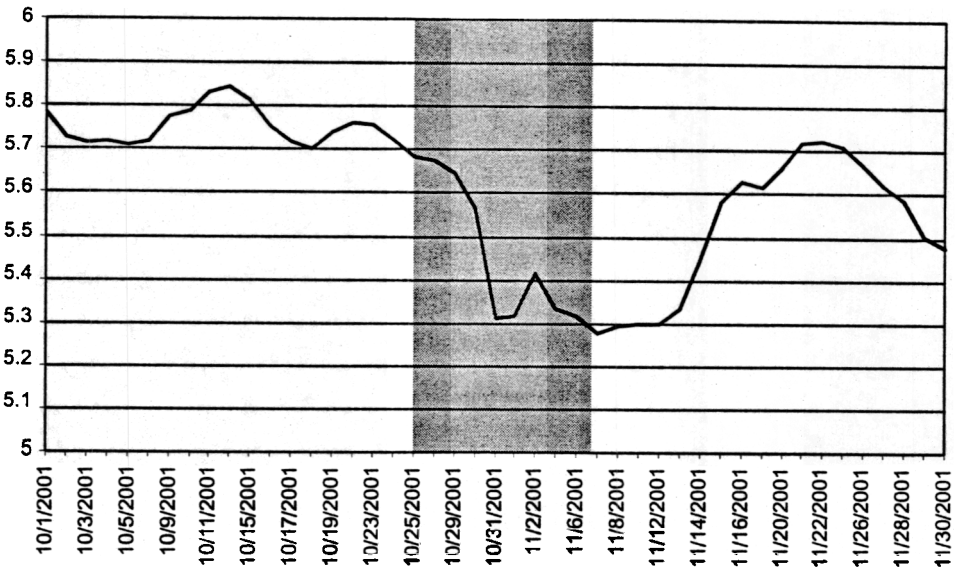
## Multi-Pipeline ROE Determined

The return on equity (ROE) adjustment mechanism approved in the National Energy Board's (NEB) multi-pipeline (MPP) cost-of-capital decision can now be calculated, as the November Consensus Forecast of government bond yields has been published. Based on our calculation shown in Table 2, the MPP ROE should be 9.53% for 2002 versus 9.61% in 2001. Last month we estimated the ROE to be 9.65%, but anticipated that the forecasted bond yields would fall; we have therefore already incorporated a lower ROE into our company valuation models.

**Table 2. National Energy Board ROE**

| | November Calculation | Our High-End Estimate Last Month |
|---|---|---|
| Feb 2002 Gov't. 10-yr. Bond | 4.90 | 5.10 |
| Nov 2002 Gov't. 10-yr. Bond | 5.40 | 5.50 |
| Avg. 2002 Gov't. 10-yr. Consensus | 5.15 | 5.30 |
| Spread – 30-yr. and 10-yr. Can. Gov't. Bonds | 0.48 | 0.48 |
| Forecast 2002 30-yr. Bond | 5.63 | 5.78 |
| Forecast 2001 30-yr. Bond | 5.73 | 5.73 |
| Difference X 0.75 | (0.08) | 0.04 |
| 2001 Approved ROE | 9.61 | 9.61 |
| ***2002 Approved ROE*** | ***9.53%*** | ***9.65%*** |



Source: Bloomberg, Consensus Economics, NEB, CIBC World Markets.

On November 9, we reduced our earnings estimates for Fortis after the Newfoundland Board of Public Utility Commissioners reduced the allowed return on equity for Newfoundland Power to 9.05% — the lowest return awarded to any Canadian utility. This return was based on a snapshot bond-yield formulaic approach to determining rates (as opposed to the NEB's consensus forecast approach). The snapshot was of Canada bond yields in the last five days of October and the first five days of November, and this time period is shaded in Figure 6.

The magnitude of the reduction in the case of Newfoundland Power illustrates the flaw in using a brief snapshot of existing rates rather than a forecast of rates that are expected to persist during the upcoming year. More importantly, however, it shows the shortcoming of the formula approach itself. Mechanically tying allowed returns on equity to long bond yields is an approach that is simple for regulators to apply; however, in recent years, with a steady decline in bond yields, it has produced-allowed returns that are out of sync with the cost of capital, and returns that are being achieved with comparable nonregulated companies or regulated returns that are achievable in the U.S.

In our view, the return produced by the Newfoundland Board of Public Utility Commissioners and that produced by the NEB formula, increases the significance of applications by TransCanada PipeLines to the NEB and by Consumers Gas to the Ontario Energy Board (OEB) for an increase in allowed returns. It will be important for investors to watch these proceedings closely.

## Sector's Direct Exposure To Enron Very Limited

We are not changing our earnings estimates, target prices, or ratings, for companies in our universe as a result of their counterparty exposure to Enron. Last month we noted that companies in our universe had reassured us that they did not have any material exposure to Enron, and more recently, companies have once again reassured us that the direct exposure is immaterial (we estimate less than 1% of revenues); however, there is lingering uncertainty about the possibility of a domino effect in the energy trading markets. We expect that other marketers should be able to step in and fill the gap if EnronOnline were to be permanently turned off, although we are less certain about the duration and magnitude of any reduced liquidity and resultant increased volatility in the power and gas markets.

Companies trading in EnronOnline are typically subject to a "master agreement" that provides for netting out of the contracts, and Table 3 summarizes approximate net positions. Enron bought the future output of one of TransAlta's generating plants (in a contract worth approximately $294 million), but this contract is guaranteed by the Alberta provincial balancing pool. Enron also has contracted for firm capacity on TransCanada's pipelines, but the company believes that if one shipper were to default, that this would be absorbed by the other system's shippers and not the company's shareholders.

**Table 3. Summary Of Exposure To Enron**

| Company | Net Position | Disclosure of Net Impact | Est. % Revenue |
|---|---|---|---|
| Enbridge Inc. | Payable to Enron | approximately $9 mln. USD (through Midcoast acquisition) | 0.31% |
| TransAlta | Neutral | payable and receivable of US$10 mln. nets out | 0.02% |
| TransCanada PipeLines | NA | "not material" – company declined to define "material" | NA |

Source: Companies, CIBC World Markets.

We believe that the competition will attempt to step in and fill the gap Enron is sure to leave. An industry publication on November 30 suggested that JP Morgan Chase and Citibank were in serious talks on November 29 to take over all or part of Enron's multi-hundred-billion-dollar notional book of trading positions. It is expected that the banks would primarily warehouse existing contracts as they wind down over the next decade or so, but could potentially continue over-the-counter (OTC) commodities derivatives trading at a lower level. Creditors with recourse to nontrading assets, however, would perhaps contest the potential bailout. We note that other trading platforms such as Intercontinental Exchange (ICE), while stretched in the shorter term, could step in to provide liquidity.

## Recent Sector Activity

### Enbridge Expands Into Europe

On November 26, Enbridge announced that it had signed a letter of intent to purchase 25% of the common shares of Spanish transportation company Compañía Logistica de Hidrocarburos CLH, S.A. (CLH) for approximately C$530 million. That same day, we published our favourable views on the transaction, namely that it would be immediately accretive to earnings, that it was in line with both the corporate and international strategies, and that it created options for future partnerships with large integrated oil companies. We increased our 2002 and 2003 EPS estimates slightly, and retained our target price of $50 and our Buy rating.

### Companies Sign On To Alaska Highway Pipeline

On November 15, six U.S. and three Canadian companies announced the signing of a memorandum of understanding to develop a proposal for the Alaska Highway pipeline, which they expect to put before Alaska North Slope producers by year end. The Canadian companies are TransCanada, Westcoast, and Foothills.

This has not changed our investment outlook for companies in our universe, as we note that the producers, not the pipeline companies, will drive the decision as to which route and which partners make most economic sense for Northern Gas. Furthermore, gas delivery is not expected before 2008. We also note that the large number of proposed LNG projects could provide 7 Bcf/day to 8 Bcf/day of supply by 2010 and keep gas prices in the range of US$3.00/Mcf to US$3.50/Mcf. At this price, it will be difficult for Alaska gas to compete via the highway route. For example, Enbridge estimates the transportation cost alone of the highway route at US$2.39/Mcf and the over-the-top route at US$2.07/Mcf.

### TransCanada Mainline Tolls And Tarriffs Approved

As expected, the NEB has approved TransCanada's 2001 and 2002 Mainline tolls and tariff application, which was based on an agreement supported by the bulk of TransCanada's customers. The agreement fixes most of the elements of TransCanada's Mainline revenue for 2001 and 2002, and retains TransCanada's immunity from volume fluctuations. Yet to be decided is the cost of capital that TransCanada will be allowed to recover in each year. This will be the subject of a hearing that will begin in February. We are maintaining our $21.00 target price and Hold rating.

### Milestone Completed In Duke Acquisition Of Westcoast

On November 21, an announcement was made by Westcoast that Duke Energy has received approval from the British Columbia Utilities Commission (BCUC) to acquire indirect control of the public utilities owned wholly or in part by Westcoast Energy and regulated

by the BCUC, namely Pacific Northern Gas, Pacific Northern Gas (N.E.), Centra Gas British Columbia, and Centra Gas Whistler.

Duke and Westcoast also announced that they had received a request for additional information and documents from the Federal Trade Commission (FTC) review of the proposed acquisition of Westcoast Energy by Duke Energy. This request is routine and the companies do not expect the request to have a material impact on the timing of the consummation of the proposed acquisition. If the acquisition arrangement is approved by Westcoast Energy's common shareholders and option-holders, subsequent to the B.C. Supreme Court and finally the other conditions of closing being satisfied or waived, the companies expect the acquisition will be completed during Q1/2002.

### Ontario Government Considers Not-For-Profit Option For Hydro One

We note the recent media buzz around the proposal to create a not-for-profit structure for Hydro One. The province is considering all options, including one that could raise up to $14 billion in bonds — approximately $5 billion of which would be available (after repaying Hydro One's existing debt and equity investors) to pay down part of the Old Ontario Hydro's $21 billion in stranded debt. Before this month, the prevailing options were thought to be either the outright sale to another utility company or an initial public offering (IPO) to private investors and stock exchange listing. The not-for-profit option is purported to result in $2 billion – $4 billion more in initial stranded debt retirements.

Hydro One management is opposed to the not-for-profit option, not so much for the lack of ability to use employee share options as incentives, but more for the ramifications for its strategy to become a major player in the North American electricity market. Under this option it would likely not have to pay taxes, which American transmission companies would likely argue was an unfair competitive advantage for Hydro One. Also, without financial flexibility, Hydro One might have fewer resources to invest in new connections to the North American power grid, which could result in the Ontario power market becoming less fully integrated with the North American grid. At first blush this would lower electricity prices in Ontario, if excess energy is bottled up in Ontario. Over the longer term, however, the cost to consumers could increase if inadequate transmission capacity discouraged construction of sufficient generation to meet growing demand.

Some of the province's largest electricity consumers appear to favour the not-for-profit option based on the assumption that this would reduce the special levy on consumption to pay off the stranded assets. For example, currently the levy is approximately 15% of electricity consumed for large consumers such as Dofasco. We believe that this view is erroneous as the levy would not be reduced until the stranded debt is fully defused or repayed. Moreover, there is no assurance that the levy would end significantly earlier as higher up front proceeds from the bond issue could be offset in the long run by lower provincial income tax payments.

Environmentalist groups' responses have been mixed—with some in favour and others opposed.

We favour privatization, as we believe that all stakeholders would be best served over the longer term. While large industrial consumers think they might benefit in the short term through a reduced stranded debt levy, over the longer term the isolation of the Ontario power market and probable broader under investment in new technologies could drive prices up. We believe that agency issues both on the economic as well as environmental front would be mitigated if management were to be accountable to shareholders and not the broad taxpayer base through the government.

The Ontario power market is expected to be deregulated by May 2002, and we believe that a for-profit transmission company could best serve this market. Power companies feel that way as well. TransAlta recently stated that it would not invest further in Ontario until there was more certainty and clarity around deregulation in the province. Bruce Power publicly stated its belief that a private transmission company would have a more efficient, robust, and reliable infrastructure. We note that we are in good company, as Alan Greenspan, the U.S. Federal Reserve chairman, spoke on November 14 to the U.S. Chamber of Commerce about the importance of increased flexibility in electricity transmission and market forces in balancing supply and demand. He cited the need for a vibrant energy policy to foster long-term economic growth, which we believe applies to Ontario as well.

### Hydro One To Partner In Merchant Transmission Line Under Lake Erie

Hydro One seems to be operating with the expectation that it will be privatized, as it is acting on its mandate to competitively connect to markets outside Ontario. On November 27, Hydro One and TransEnergie U.S., a subsidiary of Hydro-Quebec, proposed the construction of a 975-MW merchant power line under Lake Erie that could be ready for commercial service by the summer of 2004. The proposed line would be high-voltage direct current (HVDC), enabling power to flow in both directions and originate at a substation not far from the 3,920-MW and coal-fired Nanticoke generation complex, and terminate at one of two substations, either in Ohio or Pennsylvania. Because it would be a merchant line, funding would come from the sale of transmission rights and not impact the cost of transmission within Ontario.

Although Hydro One has 17 interconnections with other systems, congestion in the past led to price spikes in the U.S. Midwest markets in the summers of 1998 and 1999. Ontario typically experiences demand peaks in the winter and is capable of exporting demand south of the border in the summer. Advocates of the new line argue that not only will the new connection increase reliability within the Ontario system, it will also encourage the growth of new generation within Ontario and spur interest in outside generators to send power into the province.

### Ontario Electricity Deregulation On Schedule

Deregulation of the retail markets is progressing as scheduled, with the December 14, 2001 deadline for several applications by distributors and wholesale market participants approaching. By that date, distributors must forward a self-certification and market readiness submission to the OEB. Wholesale market participants must file fully executed participant and connection agreements, as well as proof of secure exchange of information capabilities with the IMO. Furthermore, codes, rules, and regulatory approvals are due by the middle of December[1]. This will trigger the market readiness recommendation and government consultation phase, which is due to be completed in mid-January[2].

---

This milestone will define operation of the wholesale and retail markets, including the following: 1) market rules of the IMO–administered markets; 2) IMO market manuals, technical standards, and interfaces; 3) retail settlement and other OEB codes and standards, including structures of the various rates to be approved by the OEB, and 4) approvals by the OEB of individual rate applications.

2 The OEB and the IMO will advise the Minister of Energy, Science and Technology regarding the readiness of the market participants under the current schedule based on: 1) the readiness of individual market participants; 2) the stability of both wholesale and retail market design, as confirmed in relevant design testing; 3) the readiness of the IMO market systems; and 4) results of self-certification filings by licensed distributors.

## Third-Quarter Results

Earnings season came to a completion with the release of Caribbean Utilities' earnings on November 20. Table 4 highlights actual and forecast Q3 EPS for 2001 and actual EPS for 2000. Detailed commentary is available in our Research Highlight for each company, generally published one business day after the earnings reporting date.

**Table 4. Third-Quarter EPS Results**

| | Report Date | Actual 2001 | Our Estimate | Consensus Estimate | Actual 2000 |
|---|---|---|---|---|---|
| Enbridge | November 8 | $0.42 | $0.46 | $0.47 | $0.28 |
| TransCanada PipeLines | October 30 | 0.34 | 0.34 | 0.34 | 0.32 |
| Westcoast Energy | October 21 | 0.46 | | 0.20 | 0.22 |
| ATCO | November 1 | 0.82 | 0.73 | NA | 0.74 |
| BC Gas | November 8 | (0.58) | | (0.39) | (0.34) |
| Canadian Utilities | October 31 | 0.65 | 0.63 | 0.63 | 0.64 |

**Insights You Can Count On**

Briefing March 2004

# Electricity Restructuring
# Opening Power Markets

**About the Electricity Restructuring Series**
This briefing is the fifth in a series that highlights key learnings from the experience of North American and U.K. electricity restructuring initiatives over the past decade. The briefings focus on the impacts of public policies in the areas of economic regulation, air quality and climate change on investment in electricity generation and transmission, and on trade across regions.

Investment is needed in transmission capacity. Electricity in Canada and the United States has become a North American phenomenon, with growing volumes of exports and imports between the two countries. The result is a highly interconnected, complex continental network—one that is flexible in responding to fluctuations in demand and supply, but is more vulnerable in the event of a major failure.

Yet challenges exist to getting investment. North America's evolving electricity sector must find ways to raise the level of investment in order to strengthen the transmission infrastructure. This briefing suggests possibilities, while outlining why investment is needed and identifying some of the obstacles.

## INVESTMENT IS NEEDED

Under-investment in critical infrastructure cannot be sustained. Witness the Aug. 14 blackout. Its cascading nature underscored the need not only for a more resilient electricity infrastructure, but also for a less brittle system overall.

New demands due to trade, combined with an aging system, have created congestion on transmission lines. This congestion has given rise to an untenable situation with respect to reliability, and constitutes a barrier to electricity trade. In fact, the lack of adequate transmission has become a bottleneck to the development of generation in several areas. An inadequate infrastructure not only threatens electricity reliability; it also contributes to volatility in electricity prices and higher prices for consumers in constrained zones.

Transmission lines are strained and overtaxed, largely because investment in continental transmission capacity has stagnated while network congestion has increased. The North American Electric Reliability Council (NERC)

reported in 2002 that the number of power deals that could not be fulfilled due to transmission constraints quintupled, from 300 in 1998 to 1,500 in 2002.[1] This has created local market power problems and has complicated the operation of wholesale power markets. The grid, in its grim condition, requires upgrading that is estimated to be in the order of $50 billion US.

And money isn't the only issue. Arguably, there are imperfections in transmission governance arrangements that further erode the effectiveness of the transmission infrastructure. The transmission system remains fragmented, with too many system operators relying on incompatible scheduling, transmission pricing and emergency management mechanisms.[2]

Making transmission improvements comprises only one element among many in moving towards the objective of meeting future power needs. Nevertheless, facilitating transmission investment is an important objective, since transmission is currently the factor that most limits the supply of electricity in North America.

Given the deficiencies of the current infrastructure, investment is clearly required to accommodate cross-border exchanges and to ensure the reliability and security of electricity.

**Improving transmission is vital—but we must do more to meet North America's power needs, including removing obstacles to investment.**

However, investors who are considering the transmission sector in North America face increased risks. Why? In a nutshell, the sector lacks sufficient commercial incentives and potential rewards to balance new risks. We need to remove barriers and address disincentives to transmission investment either through regulatory mechanisms or market signals, particularly as markets continue to integrate.

## CHALLENGES FOR INVESTMENT

A number of regulatory issues and uncertainties are limiting investment in new transmission capacity.

### PLANNING

A lack of integrated and co-ordinated planning for transmission between jurisdictions exists. The focus on regional supply has limited the expansion of the transmission system; in general, the main problem lies in insufficient regional integrated planning. Moreover, the cumbersome procedures for finding sites and obtaining permission for new facilities deter investors. Multiple authorities are responsible for planning and building new facilities, and investors must endure long lead times before obtaining regulatory approval.[3] For example, three years' lead time is the current estimate to attain the necessary approval for transmission line work in the Pacific Northwest Economic Region. The "not in my back yard" factor is a particular challenge for investors in planning for, and obtaining, suitable new corridors.

**The electricity sector suffers from a lack of integrated and co-ordinated planning for transmission.**

### REGULATED RATES

Investors are discouraged by limitations on the regulated cost recovery for transmission upgrading. Transmission companies are simply not seeing favourable risk/return ratios on their investments, and know that they can realize better returns in the United States, where regulated rates of return are much higher. Rates of return to Canadian firms for transmission projects are around 9 to 10 per cent, well below the 13 to 14 per cent available to U.S. companies.[4] These lower rates discourage investment in Canadian utilities. Moreover, investors are additionally deterred by the fact that existing cost-of-service rates do not reflect the economic value of the transmission grid.[5]

### FINANCING

Obtaining desired levels of financing is also problematic. Following the Enron bankruptcy and the ensuing loss of market credibility, it has become more difficult for energy companies to get credit for working capital and to finance their investments. And the upshot is that companies have been curtailing or exiting energy trading and marketing, and energy trading activity is down more than 70 per cent in the United States.[6] In turn, there is a lack of financing to pursue projects,[7] which has reduced the incentive to pursue new infrastructure projects or new transmission connection technologies.

### REGULATORY UNCERTAINTY

Several regulatory factors combine to create an unfavourable investment climate in the electricity sector:

- Changes in market restructuring policies in both Canada and the United States are ongoing.
- In light of the continuing attempts to create an even playing field in the wholesale power supply market through non-discriminatory access, there is indecision as to how transmission systems should be operated.[8]
- With increased regionalization, it is unclear who will own and operate the grid in the future. Despite regionalization, the authority to improve the grid remains with individual states and provinces. And, as the blackout demonstrated, key industry decision-makers are unsure of their regulatory options during emergencies or market events.[9]

## ENCOURAGING INVESTMENT

Encouraging investment increasingly preoccupies the industry as a whole. The Canadian Electricity Association (CEA) has estimated that about $150 billion in investment will be required in the electricity sector over the next 20 years, either to replace aging capacity and infrastructure or to add to what already exists. And the industry will be relying on private capital for much of this future investment.[10]

**To secure the substantial sums that will be required by the electricity sector over the next 20 years, several investment challenges must be overcome.**

Key players have been pushing politicians for regulatory reform to encourage investment in transmission. For example, the Edison Electric Institute has urged the U.S. Congress to update federal laws that restrict critically needed investment in the power transmission system. The CEA, along with the Canadian Gas Association, is urging multi-jurisdictional efforts to improve the investment climate in Canada.

Ideally, a multifaceted approach should be designed to overcome investment challenges. This section presents five key elements that such an approach should encompass.

### RATES OF RETURN AND DEPRECIATION

As the CEA has pointed out, investors must see reasonable rates of return on their capital.[11] Specifically, the CEA contends that rates of return should recognize the value that the transmission grid plays in the economy. Rates should include clear signals on congestion and losses to transmission users, and should encourage technological innovation.

Increases in regulated rates of return on infrastructure projects would provide better incentives for building transmission. Rate improvements could assist in enhancing the security and reliability of the overall electricity system by attracting new investment to reduce congestion, increase import/export capability, add capacity and support competitive markets. A more secure and reliable system would engender greater competition for infrastructure contracts and could lead to lower costs for such work and lower consumer prices.

The CEA has issued a call for substantially higher capital cost allowance (CCA) rates to reflect the economic life of depreciating assets and to permit expansion. “Given steadily growing demand and long lead times to plan and bring new supply and infrastructure on-line, a decision on CCA rates is urgently needed to allow utilities to build out infrastructure equivalent to approximately 35 per cent of existing capacity over the next two decades.”[12]

It is important that Canada’s rates be competitive with those of the United States so that both countries can maintain a solid pace of transmission infrastructure improvement.

Furthermore, the risk profile of new transmission facilities is generally greater than that for existing facilities. These greater risks—and the lack of regulatory recognition of these risks—may make utilities reluctant to pursue investment. Regulators should therefore recognize these additional risks when setting rates.[13]

Maintaining competitive rates is a necessary, but not a sufficient, condition for investment, however. It is important to improve rates in Canada, but, given that U.S. transmission companies are not investing adequately either, there are clearly other issues that must be addressed in order to get the investment that is so evidently needed.

## PLANNING

The blackout prompted serious thought about planning, and the merits of regionalization. The U.S. Federal Energy Regulatory Commission (FERC) has argued that the blackout demonstrated the need for regional co-ordination and planning, and for national standards. FERC's regional transmission organization (RTO) system aims to formalize the regional planning process and efficiently manage the growth of the transmission system.[14] Standard Market Design (SMD), an attempt at standardization and regionalization, may boost infrastructure investment. SMD is a federal plan to standardize all U.S. wholesale power markets. The FERC proposal calls for a single set of market rules that would eliminate the differences between regional electricity markets. FERC views these differences as barriers that limit the ability of energy users to get access to lower-cost power resources.[15] The current energy bill delays SMD until 2007.

**The Aug. 14 blackout underscored the need for planning, although differences of opinion exist as to how best to proceed.**

Some states and provinces have chosen a different interpretation of the blackout, regarding it as an indication that they should isolate themselves on the grid to avoid problems. However some experts, such as Connie Hughes, Chair of the Ad Hoc Committee on Critical Infrastructure for the U.S. National Association of Regulatory Utility Commissioners, argues that there is no reason for breaking down power and energy trade between countries.[16] Although critics of regionalization view it as an infringement on state and provincial rights, integrated planning will likely work more effectively under a regionalized RTO system.

## LOCATIONAL MARGINAL PRICING

Locational marginal pricing (LMP) is a market-pricing approach used to manage the efficient use of the transmission system. LMP sets prices specific to location. It aims to manage congestion by pricing electricity higher in locations where congestion exists, thus providing a precise market-based method for pricing electricity that includes the cost of congestion. By doing so, LMP also indicates where investment in new transmission facilities is most needed. LMP has been recognized as a significant improvement on flawed congestion management and uniform pricing systems.[17]

Some electricity markets have adopted or are adopting LMP: Pennsylvania New Jersey Maryland (PJM ISO) implemented LMP in 1998; New York (NY ISO) in 1999; New England (ISO-NE) in 2003.[18] And it appears to be advantageous; transmission investments are now being proposed in congested zones in these three jurisdictions.[19] Furthermore, FERC is promoting LMP as a means of managing electric transmission congestion. It is the proposed pricing model for many of the RTOs.[20]

LMP could help dissolve "load pockets"[21] and allocate scarce transmission resources more efficiently. Specifically, LMP provides better information for investment decisions by:

- identifying congested areas;
- producing transparent prices that assist investment analysis;
- helping to account for the value of upgrades to the system; and
- assisting in comparing the value of "competing" investment options.

LMP also supports efficient regional planning.

Despite the potential advantages of LMP, it is a complex approach that is not without its own challenges. Using pricing to provide incentives for expansion creates an inherent conflict—it lessens the motivation for transmission companies to deal with congestion, as they may be able to collect more revenues when it exists. To address this concern, New York State auctions the rights to recover congestion revenues to entities that do not control the grid.[22]

Realistically, LMP must be regarded as a necessary feature of a successful system, but not as a solution in itself. Ideally, LMP should be a complementary part of a larger suite of mutually reinforcing tools, both market and regulatory, that, acting together, improve the reliability and efficiency of a power system.[23]

## MERCHANT TRANSMISSION

Another option to improve transmission capacity is to permit "merchant" transmission lines. These are projects, usually involving direct current lines, financed by private sector interests to export power over long distances and across borders on a fee-for-service basis. AltaLink is advocating merchant transmission lines, as is its American parent, Trans-Elect, Inc. Merchant

transmission lines have the potential to alleviate transmission congestion issues. Moreover, several merchant transmission projects and long-distance transmission line projects have been proposed as means of connecting more "environmentally friendly" forms of power, such as hydro and wind, to their markets.

However, as a new industry, merchant transmission is unproven.[24] Investment in it is therefore more likely to play a significant role in addressing transmission constraints over the longer, rather than the shorter, term.

**RELIABILITY STANDARDS**

Electricity reliability, which had long rested on the back burner of political priorities, was quickly marched to the forefront this summer. The blackout, was, of course, the catalyst. It exposed the fact that the current system for maintaining reliability—which is based on standards with which utilities voluntarily comply—is no longer effective. The introduction of competition in wholesale electric markets has eroded the incentive for voluntary action. Now, more than ever, the electricity market needs mandatory standards, along with financial consequences for non-compliance.

NERC is developing a single set of reliability standards to replace its existing operating policies and planning standards. The new standards will address planning and operations, and will include compliance measures for each standard.[25] Legislation on this issue is being considered as part of the national energy bill before the U.S. Congress. Among the bill's measures is a plan to make reliability standards mandatory.[26] The bill has been on hold, but the Senate will conduct a second vote in January 2004. FERC Chairman Pat Wood recently announced that while federal legislation setting electric reliability requirements is the best fix for grid problems, FERC can act to boost reliability if Congress fails to pass a bill.[27]

Canada is in favour of the creation of a self-regulating organization tasked with ensuring reliability. With members from both Canada and the United States, this entity would develop, implement and enforce consistent reliability standards for the interconnected North American electricity grid, while respecting the jurisdiction of sovereign regulatory bodies.[28] The former Natural Resources Minister, Herb Dhaliwal, stated that Ottawa would consider bringing in mandatory reliability standards for power grid operators that could discipline those that do not toe the line.[29]

## CANADIAN CHOICES IN A NORTH AMERICAN MARKET

The transmission system across Canada is not as strained as in the United States. Therefore, the urgency to improve transmission capacity in Canada is not as strong. However, considerable concern exists over the lack of interprovincial trade. North–south transmission capacity exceeds east–west capacity since infrastructure has developed on the basis of historical market demand.

**Exhibit 1**
North American Electricity Trade Is Bright

The single most significant energy trading relationship in the world is between Canada and the United States. Cross-border trade in electricity has been growing dramatically largely due to legislation in the United States, which, over the past 25 years, has encouraged the trading of electricity between and within jurisdictions. Over the last few years, it has also been bolstered by the North American Free Trade Agreement. A more integrated North American electricity market has meant increased integration of regional markets through regional transmission organizations (RTOs) and contractual arrangements.

In 1996, the U.S. Federal Energy Regulatory Commission (FERC) mandated open access for non-discriminatory electricity transmission that led to state and provincial reforms, such as the creation of wholesale trading. FERC imposed some reciprocity conditions upon foreign applicants that required them to open their transmission power grid along the lines adopted for the U.S. wholesale market. Then, in 1999, FERC ordered the creation of Regional Transmission Organizations (RTOs) by December 2001 to better co-ordinate planning; this invited Canadian utilities that buy from or sell electricity to the United States to participate.

Canada dominates U.S. electricity imports—in fact, we actually dominate U.S. *energy* imports. And the United States is increasingly relying upon Canadian energy supplies; almost 100 per cent of American electricity imports come from Canada.[1] Notably, for example, imports of power from BC Hydro arguably prevented California from experiencing widespread blackouts during the 2001 power crisis.[2] However, transmission investment has not kept pace with electricity demand or with generation investment over the past 15 years.

North–south transmission capacity continues to exceed east–west, and there are no strong signs of growth in inter-regional trade in North America. Baseline projections from the Energy Modeling Forum in the United States validate this trend.

American-owned companies continue to be active in Canada, especially in the deregulated provinces of Alberta and Ontario. Canadian companies, such as TransEnergie, Fortis, TransAlta and NS Power, are increasingly active in the U.S. market.

Given its integrated nature, a continental electricity sector appears to be here to stay.

1 This is according to Canada's most recent trade statistics (2001). Lawrence Martin, "Elbowing aside Brian's legacy," *The Globe and Mail*, June 4, 2003, p. A17.

2 Michael Den Tandt, "Energy-hogging U.S. can't stay sore at us forever," *The Globe and Mail*, April 3, 2003, p. B2.

3 Prices and Emissions in a Restructured Electricity Market, Energy Modeling Forum, Stanford University, May 2001.

The north–south trading of electricity supplies (particularly exports to the United States from Quebec, Manitoba and British Columbia) has been more prevalent, economical and effective than east–west transmission. While cross-border electricity trade is growing, inter-regional trade is not necessarily increasing. Trade is hindered by the fact that Canadian provinces tend to function as silos, with little interprovincial co-operation and extensive interprovincial barriers.

**Strengthening east–west electricity trade could bring many advantages to Canada.**

In light of the desire in Canada for better flow of electricity among provinces, it is incumbent upon us to explore the viability of strengthened east–west electricity trade in Canada.[30] Additional transmission infrastructure is needed to allow sources of generation, some of which are distant from major demand centres, to be brought to market. While most provinces are interconnected with their immediate neighbours, possible further development of east–west lines, notably those between Ontario and Manitoba, and Ontario and Quebec, must be further examined. A major study about transmission expansion in Canada is underway.[31] There may be significant costs to expanding east–west transmission in Canada, but there might also be environmental benefits. For example, if an Ontario–Manitoba line could supply some capacity to replace coal-fired generation in Ontario (consistent with Canada's climate change and Ontario's energy policies), then it may make good sense as a policy objective.[32]

Strengthening interprovincial links may assist in securing the long-term provincial supply needs, such as in the case of the Ontario–Manitoba link. Additionally, developing an east–west grid could be considered to be an investment in the future and an exercise in nation building.

Canada's priorities must be addressed within the context of the North American electricity market. The U.S. regulatory framework exerts strong influence over Canadian decisions regarding cross-border commercial activity in electricity. Within each country, measures can be taken to bolster integration, but regulatory policy must be co-ordinated across North America.

In moving forward with competitive electricity markets, there are sound reasons to enhance Canada–U.S. and interprovincial transmission transfer capability. But, in making decisions on how to proceed, Canada needs to carefully evaluate the merits and drawbacks of the U.S.-driven initiatives. If, as FERC proposes, membership in RTOs becomes essential for power trading in North America, then there will be significantly stronger reasons for Canadian membership in them. Canada is already facing decisions about joining RTOs, and it should pay particular attention to analyzing the advantages and disadvantages of joining with states in regional relationships.

Canada should also be aware that any decision to adopt SMD would affect not only the functioning of RTO markets, but also the roles of the independent market operators and system operators. The standardization of markets and the introduction of independent transmission providers would change the nature of the market, along with the players themselves. SMD could provide market safeguards and facilitate continental trade. But Canadian companies must carefully balance the potential competitiveness benefits that they could derive from SMD against the loss of independence that it would bring.

Canadians should also bear in mind that policy and regulation designed for the American situation may have unintended impacts on us and on our bilateral relationship. For instance, both the augmented continental movement of electricity and decisions regarding transmission capacity could have implications for competitiveness.[33] Thus, there is a need for ongoing Canada–U.S. dialogue and for building stronger relations, with the objective of minimizing cross-border discrepancies. Ergo, now might be an opportune time for Canada to examine the extent of its involvement with NERC. Moreover, in setting harmonized market rules, regulators should aim to accommodate jurisdictional realities.

## MOVING AHEAD WITH OPEN ELECTRICITY MARKETS

Adequate transmission capacity is vital to an efficient electricity market. To strengthen the North American transmission grid, players in the Canadian electricity

sector—regulators, investors, politicians and policy-makers—must make a number of decisions on key issues. In particular:

- In supporting transmission investment, the Canadian electricity sector must consider how best to prepare for an increasingly regionalized electricity system in North America.
- Utilities, transmission companies and system operators should consider the extent of their involvement and their roles in integrated planning.
- Canadian regulators should decide whether improved rates of return on invested capital and CCA rates would result in desired investment activity.
- Regulators should resolve whether LMP could provide additional incentives for new transmission investment and, at the same time, also support regional planning.
- In light of the pending U.S. energy legislation regarding mandatory reliability standards, governments must decide on the possible benefits of forming a new self-regulating reliability organization for North America.

In moving ahead on these issues, we cannot forget to encourage new technologies. They will increase the capacity and efficiency of existing networks and reduce line losses,[34] and will be vital in making grid capacity improvements sustainable.

**Exhibit 2**
Current Initiatives

- A report for the Federal-Provincial-Territorial Electricity Transmission Working Group was recently completed. The "Regional Electricity Transmission Grid Study" discusses current transmission constraints and barriers to transmission and generation development.
- The Canadian Electricity Association (CEA) has recently published recommendations for an integrated North American electricity market, specifically aimed at enhancing cross-border electricity trade. Interestingly, these proposals are similar to those put forth by the U.S. Federal Energy Regulatory Commission (FERC). The CEA measures include:
  - increased participation in RTOs (regional integration);
  - increased focus on harmonizing market rules;
  - enhancement of cross-border and interprovincial transmission transfer capability; and
  - co-ordination of critical infrastructure protection.[1]
- Ontario has recently formed the Electricity Conservation and Supply Tax Force.
- The May 2002 U.S. National Transmission Grid Study (NTGS), published by the U.S. Department of Energy, highlights many of the legacy transmission issues in the country and proposes 50 specific recommendations.[1]
- The North American Energy Working Group (NAEWG) report—*North America—Regulation of International Electricity Trade* is an overview of federal regulations in Canada, the United States and Mexico with respect to the authorization of the construction and operation of international power lines, and the authorization of electricity exports and imports.

[1] Canadian Electricity Association, *Canadian electricity and the economy—The Integrated North American Electricity Market: Enhancing Opportunities for Cross Border Trading and Environmental Performance* (Toronto: Canadian Electricity Association, 2003).

Finally, to effectively address the current challenges preventing required investment in transmission infrastructure, a strategic and forward-looking Canadian plan must form part of a focused North American approach.

30 Alternative options for improving transmission capacity include improving north–south links or boosting generation capacity in centres that require it.

31 The Regional Electrical Transmission Grid Study in Canada.

32 Given the cost of natural gas, expanding gas-based generation stations may be more expensive than getting hydro (e.g., from Manitoba), even with high transmission charges.

33 In the cases of some U.S. regions undergoing restructuring, a key motivation has been a desire to obtain lower-cost power for consumers. One source has been hydro power from Canada.

34 Transmission line losses—power lost due to wire resistance—are a function of distance transported from generator to demand.

**The Electricity Restructuring Series**

Canadian governments and industries, particularly the energy sector and its major customers, are concerned with understanding the impacts of policy choices and market trends. The Electricity Restructuring Series aims to provide insights for public policy makers and business leaders. Members of the Conference Board's Energy Policy Centre have provided guidance and direction for research. This briefing is the fifth of six in the series.

1. Curbed Enthusiasm for Electricity Reform
2. Electricity Restructuring: Acting on Principles
3. Electricity Restructuring: Securing Clean Power
4. Electricity Restructuring: Letting Prices Work
5. Electricity Restructuring: Opening Power Markets
6. Electricity Restructuring: Improving Policy Coherence

## About The Conference Board of Canada

The Conference Board of Canada is the foremost independent, not-for-profit applied research organization in Canada. We help build leadership capacity for a better Canada by creating and sharing insights on economic trends, public policy issues and organizational performance. We forge relationships and deliver knowledge through our learning events, networks, research products and customized information services. Our members include a broad range of Canadian organizations from the public and private sectors. The Conference Board of Canada was formed in 1954, and is affiliated with The Conference Board, Inc. that serves some 3,000 companies in 67 nations.

# I. INTRODUCTION[1]

Canada and the United States have almost hundred-year histories of regulating investor-owned utilities. This shared experience is different from almost all of the rest of the world, where the appearance of investor-owned (i.e., private) utilities came only with the privatization wave of the late 20th century. The regulatory laws, mechanisms and institutions in those other countries are new—and in many cases untested. But longstanding regulatory institutions in Canada and the US have for decades been helping to provide safe and adequate services to the public at reasonable prices while ensuring that the companies involved remain "going concerns" with sufficient credit worthiness to attract the capital needed to maintain and expand their facilities.

Over the past decade, however, a significant difference has appeared in the regulatory practices between Canada and the US. In an effort to improve regulatory efficiency, Canadian regulators—first in British Columbia, then more widely—moved away from the case-by-case approach to determining the fair return on equity (ROE) for utility rate making purposes. Canadian regulators adopted generic, formula-based approaches to deriving the admittedly elusive fair ROE. US regulators in the 1980s and 1990s made two tries at generic, formula-based approaches to setting the ROE (one at the federal level and one in the State of New York), but, in the end, did not abandon their longstanding, case-by-case methods that rested on two existing and long-accepted financial theories.

The apparent efficiency of bypassing case-by-case evidentiary proceedings with a generic formula may have foretold a new and more efficient method of deriving regulated rates generally—except for one thing. The current Canadian generic ROE formula appears to have created a persistent divergence between allowed gas utility returns in Canada and the US. Since 1998, ROEs used to make regulated tariffs have been, on average, 100 to 150 basis points lower than in the US. That is, in dozens of evidentiary proceedings since 1998, US regulators have allowed their companies to set tariffs reflecting ROEs that were on average substantially higher than for their Canadian formula-driven ROE counterparts.

The purpose of this report is to analyze the root causes of this disparity between Canadian and US ROEs that has apparently been propelled—either directly or indirectly—by the Canadian ROE adjustment formula. Since the "appropriate" level of ROE is driven by the risk/return requirements of those utility investor-owners, the obvious question is whether Canadian utilities face sufficiently less risk than their US counterparts. Conversely, we investigate whether the difference in allowed returns for ratemaking is merely a symptom of a structurally inflexible formula rather than an indicator of underlying risk differences. If it is the latter, then Canadian regulators have indeed streamlined rate cases for the better. If the former, then perhaps the formula has had unintended consequences and is in need of updating better to reflect the market's judgment on the cost of equity of regulated Canadian utilities.

---

[1] This report was written by NERA's Kenneth Gordon, Special Consultant and former Chairman of the Department of Public Utilities Massachusetts and the Public Utility Commission in Maine and Jeff D. Makholm, Senior Vice President. They were supported by Ryan Knight at NERA.

It is important to state at the outset how we approach examining this divergence We cannot automatically presume that the burden falls on Canadian regulators to justify the persistently lower average ROEs than those granted by their US counterparts. Nevertheless, it is the group of Canadian regulators that changed course in the last decade, led by those regulators using the generic formula for streamlined regulatory procedures. Those regulators in the US who failed to find a suitable way to streamline their ROE procedures continued on the former path common to both Canadian and the US regulation—to examine anew, in every tariff case, expert evidence on ROE for the company in question for the relevant period of time. We do not believe that either Canadian or US regulators would consider the results of those case-by-case evidentiary procedures to be biased on a large scale. They are perhaps expensive, time consuming or overwrought—but not biased. Therefore, it is natural—and again to us justifiable—to subject the new Canadian generic formula to the test of bias. If we find that Canadian and US utilities face comparable operating environments and risk to investors, then it is natural to question the efficacy of the new Canadian formula approach to the ROE, not the traditional path US regulators still hold. It is therefore not prejudgment that prompts us to examine underlying justifications for the new and lower Canadian ROEs, but practicality. We do not question whether US regulators (or Canadian regulators up to the adoption of the new formula) were incapable of deriving "just and reasonable" tariffs. What we do question is whether, based on underlying risk factors, the new Canadian generic ROE formula can do likewise.

Canadian regulators have acknowledged in rate cases that a disparity exists between Canadian and US allowed ROEs, but have not concluded whether or not the disparity warrants action.[2] For example, the regulator in Quebec, the Regie de l'Energie, stated in 2007, "[i]n the Regie's view, even though rates of return allowed in the United States are clearly higher on average than those allowed in Canada, the evidence does not make it possible to conclude that there is any prejudice to or unfair treatment of the distributor.... The evidence does not make it possible to compare the overall differences that may exist in the institutional, economic and financial contexts of the two countries and their impact on the opportunities they provide for investors." [3]

Unfortunately, nothing surrounding the required ROE for the purpose of making regulated tariffs is an easy discussion. Unlike the other elements of tariff setting (operating costs, maintenance costs, administrative expenses or the interest rates on utility bonds) the ROE is not directly observable. The required ROE is a function of investor *expectations*. Those expectations remain complex functions of how investors believe that price regulation, along with the utility's other circumstances, will work to allow them a return on the capital that they devote to serving the public. Given the complexity associated with discussion of the fair ROE, this report will examine the root of the post-1998 differences in permitted ROEs. Those differences stem either from corresponding differences in risk in Canada versus the US or from more banal causes relating to the operation of the generic ROE formula itself vis-à-vis investors' genuine risk-driven expectations.

---

3 Regie de l'Energie, *Decision: Application to Modify the Tariffs of Gaz Metro Ltd*. D-2007-116 (2007) §4.1.10.

The report concludes that the regulatory environments in Canada and the US are highly similar and directly comparable. Since the world's first utility commission regulatory statute was written in the US in 1907 in Wisconsin, that general form has been widely copied in all states and provinces in Canada and the US.[4] These two national jurisdictions thus share a common heritage that is quite different, for example, from the newly-privatized regulatory jurisdictions in the rest of the world. Those jurisdictions overseas regulate their investor-owned utilities on an institutional basis quite different than in Canada and the US—two countries that share the longest, largest and most unencumbered trade border in the world. It is thus a fair question to compare and contrast Canadian and US utilities with each other to examine how their regulators deal with them and, in particular, derive the ROEs used to set their regulated tariffs.

**Section II** contains our Executive Summary. In **Section III**, we examine the evident divergence between allowed returns in Canada and the US that propels this study. In **Section IV**, we compare the methods used for setting base ROEs in Canada to the case-by-case methods still used by US utility regulators, despite two highly visible attempts to create generic formulas there. In **Section V**, we examine the sources of risk for regulated utilities and any apparent differences between investor-owned utilities in Canada and the US that might, in principle, explain the wedge in ROEs that has appeared since 1998.

[4] That statute was drafted by John R. Commons, a professor of economics at the University of Wisconsin and 10 years later the President of the American Economic Association.

# II. EXECUTIVE SUMMARY

In the introduction to this report, we stated that we do not automatically presume that the burden falls on Canadian regulators to justify the persistently lower ROEs allowed relative to their US counterparts. First, those numbers may not fairly gauge the treatment of Canadian gas distributors on the part of regulators. Second, those ROEs may combine with other aspects of Canadian financial markets or regulatory procedures that do not generalize to the US. Third, the relative ROEs may reflect business, regulatory, or financial risk differences for Canadian gas distributors versus their US counterparts.

Taking these elements into account, however, it is our opinion that the generic Canadian formula itself should be the subject of scrutiny. The formula works like an "autopilot" for setting new Canadian ROEs that uses long bonds as the only contemporary gauge of financial markets—instead of directly targeting equity costs. If the new autopilot has been setting a different course than the case-by-case "human" pilots that previously characterized Canadian ROE, and still characterize US ROE setting, then the autopilot should bear the burden of showing that it is not biased. We cannot conclude going in that the group of independent regulators setting their own ROEs on a case-by-case basis are the ones to be exhibiting a bias.

**Figure 1** in our report, showing a marked split in the allowed ROEs in Canada and the US, demands the examination of three issues regarding the meaning and comparability of the relative ROEs before the question of whether the Canadian formula has exhibited a bias in recent years can be addressed:

- We explain that under both Canadian and US regulatory methods, the ROE is the measure of cost of capital that enters the formula to make "just and reasonable" rates. It is the measure of compensation allowed for the capital that investors devote to the service of the public *at the time rates are set*. What happens afterward—in other words, what the utilities actually achieve in profitability—is a different matter. The actual returns reflect many things including management effectiveness, sales growth, the weather, macroeconomic considerations, changes in capital costs, etc. But regulatory treatment of investor-owners is tightly bound to the ROE. We conclude that allowed ROE is the proper metric for comparison.

- We find that the regulatory institutions and customs for setting regulated prices for investor-owned Canadian and US utilities are very alike. That is, in accounting, administrative procedures, regulatory legislation, and basic constitutional protections of private property, little or nothing separates the average Canadian from the average US regulatory jurisdictions, unlike newly-privatized utilities in new regulatory jurisdictions overseas, where regulatory institutions are young (and largely untested),. There are of course differences in regulatory treatment from province to province and from state to state. But we find generally that there is no persistent difference in regulatory legislation or rule making between Canada and the

US.[5] As such, the cost of equity capital is comparable between the two countries as long as the risk of gas distributors is the same or similar on both sides of the border.

- We examine the definition of risk to investors of placing their capital at the use of the public, for which the ROE provides compensatory payment. We look at how those risks could be different in Canada versus the US. What we find is that the basic sources of risk—regulatory, business and financial—are comparable with respect to both jurisdictions. Objective and disinterested analyses of the relative risks between Canadian and US utilities are rare, but what we have found points to no smaller risks in Canada. As such, we conclude that there is no objective evidence showing that business or regulatory risks are sufficiently lower in Canada to account for the divergences shown in **Figure 1**.

With this analysis, our conclusion is inescapable. The Canadian ROEs produced by the generic Canadian ROE formula are biased downward. The formula has, since its inception, ridden on autopilot the declining Canadian long-bond interest rates (the cost of a kind of debt) with no independent check on the cost of equity. The generic Canadian formula might not always be biased, and indeed in an era of stable interest rates and equity markets it may have held a true course for many years. But is has been overtaxed by the relatively unprecedented decline in interest rates since the late 1990s. The uncorrected, un-calibrated formula—not risk differences or inherent Canadian regulatory differences—has driven the divergence between observed Canadian and US ROEs.

The manifest remedies are either to return to "human" pilots (representing case-by-case ROE determinations) or re-calibrate the Canadian generic formula by re-examining the current relationship between the contemporaneous cost of debt and gas utility equity. Given the similarity in the jurisdictions, the institutions of regulation and capital markets, it would be useful in our opinion to employ both Canadian and US gas utility equities in such an analysis, along with both of the main cost of equity models (DCF and CAPM). Without a new calibration, it is likely that as long as the interest rates in Canada and the US remain low, the generic ROE formula will continue to fly off course—essentially treating Canadian utility investors unfairly and slowly taxing their financial health in this era of low interest rates.

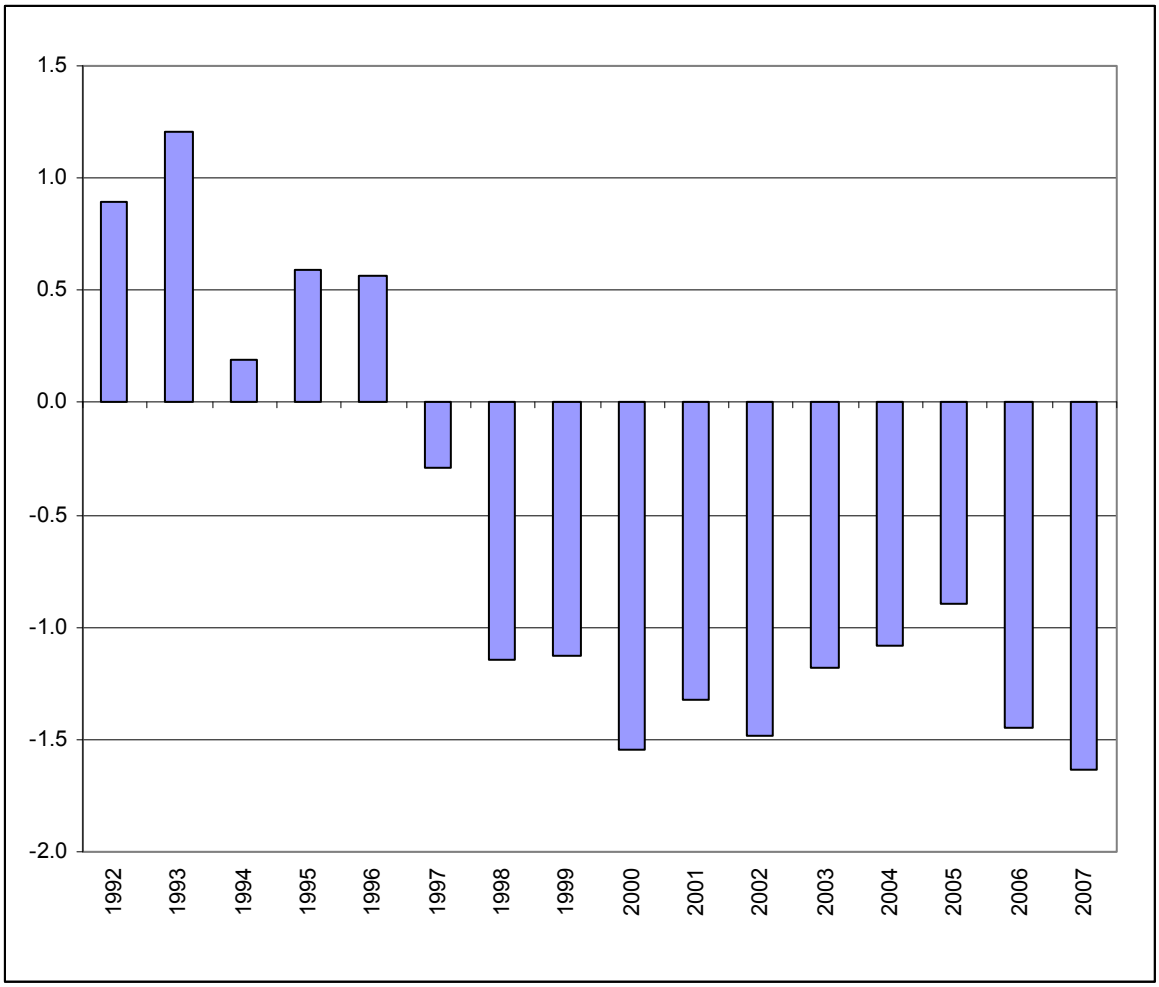
---

[5] If one threw all 63 federal and provincial/state regulatory statutes (13 for Canada, 51 from the US) into one pile with all the names blacked out, we would challenge anyone to sort them into a Canadian or US pile based on their content alone.

# III. AN EVIDENT DISPARITY IN CANADIAN AND US ALLOWED RETURNS

This report is propelled by the need to examine the persistent gap between the allowed returns on equity for ratemaking purposes between Canadian and US regulators.[6] This section examines what the divergence is and where it comes from. It examines whether the ROE figures in Canada and the US are both a reasonable and comparable metric for determining effective regulatory control over profitability in both countries, and also describes how the Canadian ROE formula works.

There are two key questions. First, does the divergence mean anything? Is the ROE (as opposed to earned returns) the right metric for comparison? Second, are the economies comparable enough (given differences in taxes, etc.—everything but regulatory risk) to permit ROE comparisons.



## A. The Divergence between Canadian and US Allowed Returns for Ratemaking

**Figure 1** shows that Canadian allowed returns were, at one time, higher than those allowed in the US, but that this changed during 1997. Since then, Canadian allowed returns have been markedly lower than those in the US.

**Figure 1** was compiled using data submitted by members of the Canadian Gas Association (CGA) for Canada and data gathered from Regulatory Research Associates for the US. The CGA submitted data for 8 Canadian LDCs, although data were not available for every LDC for every year. The number of rate case decisions for US LDCs for which Regulatory Research Associates data were available varies from 10 in 1999 to 42 in 1993. The data used to construct Figure 1 is presented in **Table 1** below.

[6] It is important to keep in mind that "allowed returns" (i.e., ROE) means the rate of return equity, permitted in a rate case proceeding, to form a component of regulated prices. It does not refer to an attempt by regulators to control the return on capital actually earned by utilities once those rates are set. Ratemaking in Canadian and US jurisdictions is generally a *prospective* exercise.

**Figure 1: Allowed Return Average Differential (Canada-US) for Gas Distribution Utilities, 1992-2007**

Source: Canadian Gas Association, Regulatory Research Associates.

- **Figure 1** was generated by subtracting the average allowed US ROE from the average allowed Canadian ROE for each year. This differential for Canada ranges from 121 basis points above US ROEs in 1993 to 164 basis points below in 2007. Starting in 1997, the differential has been consistently negative; indicating that, over the past decade, average allowed US ROEs are higher on average than those in Canada. These average allowed ROEs for both countries are presented on **Table** 1.

**Table 1: Canada-US Average Allowed Return Differential, 1992-2007**

| | Canada | US | Difference |
|---|---|---|---|
| 1992 | 12.88 | 11.98 | 0.89 |
| 1993 | 12.58 | 11.37 | 1.21 |
| 1994 | 11.44 | 11.24 | 0.19 |
| 1995 | 12.03 | 11.44 | 0.59 |
| 1996 | 11.68 | 11.12 | 0.56 |
| 1997 | 11.01 | 11.31 | -0.29 |
| 1998 | 10.38 | 11.52 | -1.15 |

By the simple metric of average ROEs in Canada and the US, a clear disparity has emerged. This disparity was the subject of a recent report by Concentric Energy Advisors, which examined the disparity between Ontario LDCs and US LDCs in particular. The Concentric Report concludes that Canadian ROEs were more sensitive to the drop in bond yields over this period than were US ROEs.[7] Further, the Concentric Report suggests that this sensitivity arose through the adoption of an automatic adjustment mechanism that explicitly ties Canadian ROEs to long-bond prices.[8]

## B. Is Allowed ROE the Proper Metrics for the Comparison of the Treatment of Utilities by their Regulators?

A threshold question is whether the figures in Table 1 mean anything in terms of assessing regulatory treatment in Canada versus the US. That is, given the unique economic and financial contexts of each country, are ROEs structurally different such that an allowed return in the Canada does not mean the same thing as an allowed return in the US?

Three issues arise in answering this question. First, is the ROE the proper metric, as opposed to the return that the utilities in question have actually achieved during the period of time the rates were in effect? It is a question that arises often in comparison of ROEs. Second, does capital flow freely between countries? If capital does not flow between countries, allowed returns are

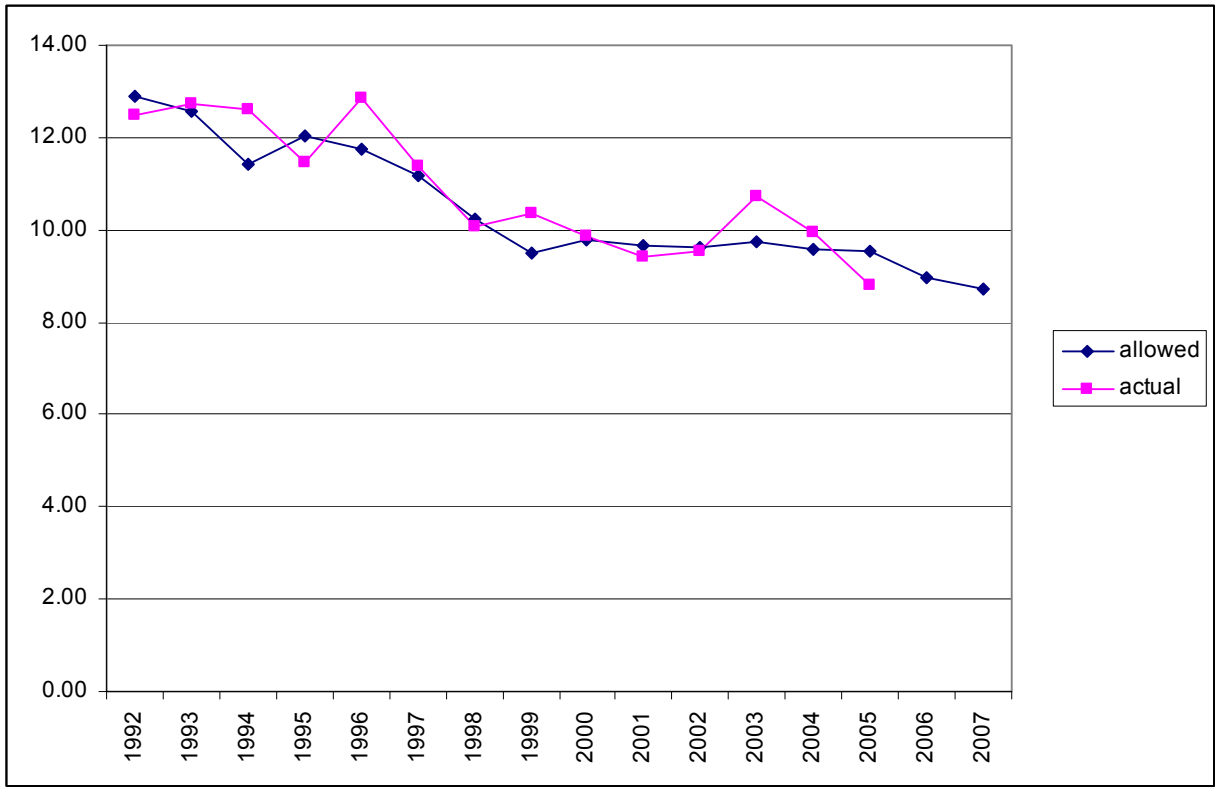
[7] Concentric Energy Advisors, "A Comparative Analysis of Return on Equity of Natural Gas Utilities," prepared for Ontario Energy Board (2007). p. 2.

[8] *Id.*, p. 56.

likely to not be comparable as capital costs would reflect strictly national macroeconomic considerations. Third, given the distinct tax and financial environments, such as differences in country-specific interest rates, are allowed returns similar indicators in both Canada and the US? This section examines these issues in turn.

## 1. Allowed ROEs versus Achieved Returns

Is the allowed ROE the proper metric, or are the returns that the utilities in question have actually achieved during the period of time the rates were in effect the relevant indicator? We readily conclude that the answer is yes: allowed ROEs are the proper metric. Both in Canada and the US, the general manner of regulatory control is for regulators to set *reasonable rates* and then allow utilities to do the best they can to make a business and earn a reasonable return against those rates. That is to say, utilities in Canada and the US are not cost-plus businesses that can appeal to cover costs after the fact. Utilities are not confined to any particular return. There are admittedly exceptions (which we consider idiosyncrasies) to this general statement—but the character of ratemaking control in both countries is prospective.



For over a century, both in Canada and the US, the pull between private enterprise and the public welfare has been settled just this way: regulators deem the return to be considered "just and reasonable" and the private utility subsequently does its best to profit—until such time as the regulator or the utility request that the question of the forward-looking just and reasonable rates should be adjudicated again.

It follows that if the ratemaking mechanisms defined by regulatory legislation and rulemaking (*i.e.*, how costs are added together and then divided by measured sales to form the rate) are the same in Canada and the US, then the allowed ROEs are directly comparable. After the fact, some utilities may profit more than others (*e.g.*, those in fast-growing service territories versus slow-growing ones).[9] Or there may be some times when it is easier than others for utilities to profit (*i.e.*, when capital costs are generally falling rather than rising against a fixed set of just and reasonable rates). But with the commonality of ratemaking mechanisms in Canada and the US, the role of the allowed ROE is the same. Hence, its comparability across jurisdictions is proper.
If ratemaking procedures and operating conditions are comparable in Canada and the US, there would be no reason to expect utilities in either country would regularly earn more than the allowed ROE. **Figure 2** shows that, as we would expect, given our review of the mechanisms of rate regulation in Canada, earned returns have been both above and below allowed returns in

[9] There is a comparison between returns for Canadian and US regulated pipelines, offered in NEB RH-2-2004 by CAPP (the Canadian Associate of Petroleum Producers) that might seem to suggest a persistent success in achieved returns for Canadian companies versus their US counterparts (although we have not looked closely into the sources or particular reasons for those results reported by CAPP). We note, however, that these are returns obtained by federally-regulated interstate pipeline companies, not local gas utilities. Those pipeline companies do not have the public service obligations or stable customer base of distribution companies, and they are not informative to the comparison of the Canadian versus US *utility* ROEs. *See:* NEB, *Reasons for Decision* RH-2-2004 Phase II (2005), Figure 5-1.

Canada since the inception of the formula. In our experience, this pattern of allowed versus actual ROEs, reflecting occasional average divergences, is characteristic of utilities in the US as well.

**Figure 2: Allowed versus Earned Returns For Gas Distributors in Canada, 1992-2007**

Source: Canadian Gas Association

We show **Figure 2** merely as a way of dealing again with the statement that earned returns—an *ex post* measure of utility performance against a fixed set of "just and reasonable rates"—is not exceptional in Canada. There is nothing, to us, in **Figure 2** that removes the reasonable use of **Figure 1** as a reason to question whether Canadian ROE methods lately have been causing a divergence in the fair return between Canada and the US.

## 2. Capital Flows

There is no doubt that Canada and the US can experience unique macroeconomic conditions (interest rates, inflation, GDP growth, etc.). That said, Canada and the US share the longest, largest and most open trade border in the world. There has not been a shot fired in anger across this border since 1812. Canada-US trade is open, with few import or export taxes or tariffs.

Energy trade in North America is governed by the North American Free Trade Agreement (NAFTA), the Canada-US Free Trade Agreement (FTA), and the General Agreement on Tariffs and Trade (GATT). Among other things, NAFTA has "provided the building block for the emergence of a cooperative North American market for energy goods."[10]

Today, there are:

- 35 cross-border natural gas pipelines between the US, Canada, and Mexico.
- 22 cross-border oil and petroleum product pipelines.
- 51 cross-border electric transmission lines.

These facilities physically bind Canada and the US together.[11] This physical integration is matched by capital market integration as well. Since deregulation of the wellhead price of natural gas (1985 in Canada, 1981 in US), trade in this "increasingly significant sector" would be based on "internationally-recognized, non-discriminatory market access principles."[12] With competitive markets for the gas commodity and for transport capacity, shippers can negotiate for gas supplies and pipeline space on transmission systems in both Canada and the US, searching for the most economical mix of commodity and transport costs. The situation between Canada and the US is remarkable—unlike many parts of the world, where pipelines are not built if it means passing through other countries.

There does appear to be a preference for domestic investment, especially by pension funds and other "trustee investments," which could result in segmented capital markets. However, many Canadian firms are cross-listed on US exchanges—including Enbridge. As identified by the Concentric report, US investors do play a significant, albeit less prominent, role in the capitalization of Canadian utilities.[13] To the extent that the trustee investments in Canadian utilities represent a structural barrier to investing outside the country, then the cross-border equity investments from the US are a marginal source of funds.[14] Furthermore, some Canadian utilities and their parent companies engage in business in the US and abroad, indicating that utility companies are not regionalized.

One test of the comparability of allowed utility returns is the cost of capital for non-utility firms in Canada and the US. It may be that there are structural differences in the cost of capital

[11] *Id.*, p. 34.

[12] *Id.*, p. 10.

[13] Concentric, s*upra* note 4 p. 50.

[14] Under the efficient markets hypothesis, the marginal investor sets the price for a security. To the extent that this hypothesis holds, it may be that US investors are leading the valuation of Canadian firms. *See:* Ibbotson, R.G. and G.P. Brinson, *Global Investing: The Professional's Guide to the World Capital Markets*, McGraw-Hill: New York (1993), p. 37-41.

between Canada and the US that would result in a categorically lower cost of capital for Canadian firms, reflecting a lower opportunity cost of investment for Canadian utilities.

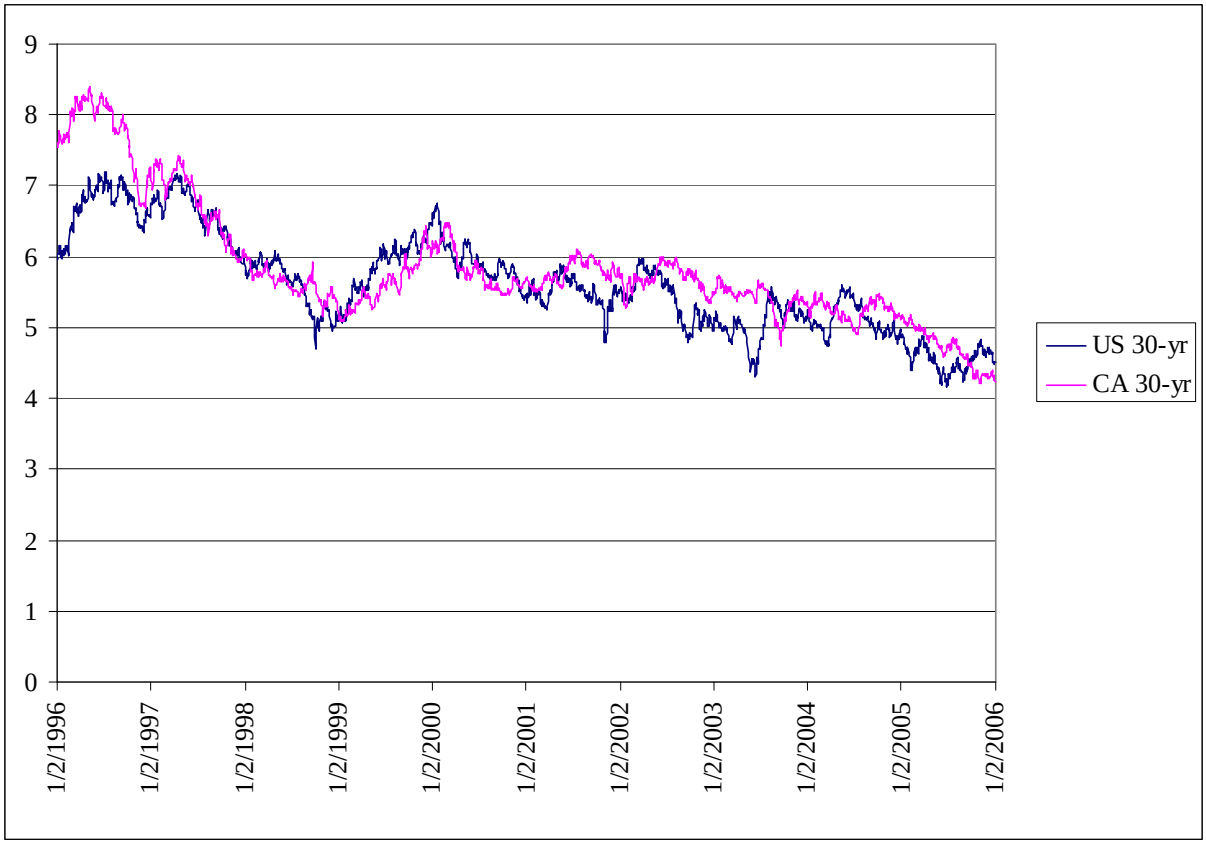
In an attempt to address this question, a 2007 study by researchers at the Bank of Canada estimated a cost of capital 30-50 basis points *higher* for Canadian firms than US firms, all else equal. The study estimated cost of capital based on a forward-looking, discounted cash flow (DCF) analysis of Canadian and US firms from 1988 to 2006.[15] This study takes into account forward-looking investor expectations, and is evidence that the cost of capital does not appear to be categorically lower in Canada.

## 3. Tax Differences

Differences in tax laws have been proposed in some previous discussions about the differences in recent Canadian and US allowed returns as a potentially confounding factor in Canada-US comparisons. Tax rates facing Canadian and US investors are indeed different, both for domestic and cross-border investments. However, it is the practice of Canadian and US regulators to set allowed ROEs on a pre-tax basis, permitting income taxes for the utility, as such, to enter the ratemaking formula as a pass through expense in permitted rates.[16] In other words, income taxes are treated in both jurisdictions as a measurable expense when grossing up the pre-income-tax ROE to calculate a post-income-tax figure for use in setting consumers charges. Therefore, as the income tax treatment is similar, if the institutional, financial and economic risk environments are comparable, ROEs are comparable as well, regardless of differences in taxation.

## 4. Macroeconomic Interest Rates

If interest rates forecasts are substantially lower in Canada, the apparent disparity in allowed returns may simply be a byproduct of lower underlying capital cost rates, and there may be no difference in the relevant fair ROE awarded by Canadian and US regulators.



As **Figure 3** shows, interest rates have been in rough parity since the beginning of the divergence, and US long-bond yields were even below Canada's for much of the time. This would indicate that macroeconomic interest rates are not driving the divergence since 1998 (although they may account for some of the positive divergence before that time), given that US interest rates have been both above and below Canada's rates during the period of interest.

## C. The Source and Form of the New Canadian ROE Methods

Beginning in 1994, Canadian regulators—first some, then others—have adopted automatic adjustment mechanisms for setting the ROE in utility rates based on a fixed spread with observed movements in Canadian interest rates on long bonds. In these jurisdictions, the ROE is automatically adjusted annually based on movements in long-term bond forecasts.

The approach used by the NEB, Ontario, Quebec and Alberta is to establish a "benchmark" ROE that is applied to all utilities, with individual business risks taken into account when the capital structure is "deemed."[17] The generic ROE is then adjusted annually as follows:

[17] Capital structures are "deemed" in Canada based on relative business risk. An LDC with more business risk will be deemed a higher equity ratio in its capital structure to raise the overall weighted average cost of capital. This contrasts with the US, where LDCs are predominantly allowed to choose their capital structure within a band of reasonableness.]

1. The forecast yields on 3 and 12 month out 10-year Canadian bonds are obtained from the most recent forecast by Consensus Economics.

2. These two forecasts are then averaged.

3. To get an estimate for a 30-year forecast, the result is adjusted to reflect the actual spread between 10-year and 30-year bonds in the previous month as reported in *The Financial Post*.

4. This estimated 30-year forecast is subtracted from the previous years' forecast.

5. The difference is multiplied by 0.75.

6. The new ROE is previous years' ROE plus (minus) the result.

Some provinces may use a slightly different adjustment, but the process is largely similar. The ROE adjustment is shown in Equation 1.

$$ROE_t = ROE_{t-1} + .75(Forecast_t - Forecast_{t-1}) \quad \textbf{(1)}$$

Using this formula, the following rates would result from a benchmark ROE of 12 percent based on interest rates of 8 percent if interest rates were to fall.

**Table 2: Hypothetical Formula-Based ROEs**

| Bond forecast | Allowed ROE |
|---|---|
| 8.00 | 12.00 |
| 7.00 | 11.25 |
| 6.00 | 10.50 |
| 5.00 | 9.75 |
| 4.00 | 9.00 |
| 3.00 | 8.25 |

The formula approach was first introduced in British Columbia in 1994 before being adopted by Manitoba and the NEB in 1995. Ontario adopted the NEB approach for 1997, and was followed by Quebec in 1999. Finally, Alberta adopted formula adjustments in 2004.

**Table 3: Major Jurisdictions Implementing Formula-Based ROEs**

| Regulator | Jurisdiction | Case ID | Year |
|---|---|---|---|
| British Columbia Utility Commission (BCUC) | British Columbia | Decision in the Matter of Return on Common Equity, June 10, 1994 | 1994 |
| National Energy Board (NEB) | Federal | Reasons for Decision re: RH2-94 Cost of Capital, March 1995 | 1995 |
| Public Utilities Board of Manitoba (PUBM) | Manitoba | PUB Order 49/95 | 1995 |
| Ontario Energy Board (OEB) | Ontario | Draft Guidelines on a Forumla-Based Retun on Common Equity for Regulated Companies | 1997 |
| Regie de l'Energie | Quebec | D-99-11 | 1999 |
| Alberta Energy Utilities Board (EUB) | Alberta | 2004-052 | 2004 |

The 0.75 adjustment factor arose out of the 1995 NEB formula decision. The formula is based on the historical observation that allowed returns tend to move in the same direction as long-term bond yields. There was a desire to protect utility customers from high bond yields and shareholders from low bond yields, so the NEB decided to weight the ROE movement by 0.75 times the change in bond prices. Previously, Manitoba had used a 0.8 adjustment, while British Columbia made one-to-one adjustments if bond prices moved outside of a certain band.

Before the formula can be applied, a base ROE must be calculated. The benchmark ROE may be arrived at in a variety of ways, and is set in a manner similar to the setting of ROEs in the US. Equity risk premium (ERP) analysis, capital asset pricing model (CAPM) analysis and, less often, comparable earning analysis are all taken into consideration. Notably, the DCF method is given little to no weight, for a variety of reasons. For example, the NEB has acknowledged that the DCF test is theoretically sound, but raised concerns about practical difficulties.[18]

Not all major Canadian jurisdictions had implemented formula-based ROEs when US and Canadian returns began to diverge. However, the jurisdictions retaining case-by-case analyses seemed to set ROEs in a manner that was highly sensitive to changes in the bond markets.[19] One could therefore view the "formula" jurisdictions as price leaders who set the standard for following the decline in bond prices in the setting of returns.

---

[18] NEB, Reasons for Decision RH-2-94 (1994) §2.5.

[19] See, Alberta Energy and Utilities Board (EUB), *Canadian Western Natural Gas Co. Ltd. 1997 Return on Common Equity and Capital Strucutre and 1998 General Rate Application*, Decision 2000-9 (2000). On page 65, the EUB states, "[t]he Board notes that interest rates and bond yields have significantly declined during the time frame… Consequently, this significant reduction in interest rates will have a major impact on the determination of a fair return for a utility."

The unique feature of the Canadian ROE formula is that is sets a gap between Canadian long bonds and the fair ROE, as shown in **Figure** 3. The only reason that the ROE does not move in lock step with the long bond is the *notion* that the spread grows/shrinks with the move in the bond, by a quarter of the bond's movement. We say "notion" purposely, because the formula's tie between long bonds and ROE is not based on financial evidence on the contemporaneous spread between what the market requires as a return on bonds as opposed to a return on equity investments in Canadian utilities.

This last point bears emphasis. For those jurisdictions that have adopted the formula shown in Equation 1, or those jurisdictions led by those who do, the only new evidence determining ROE in utility rate cases is the movement in long-bond interest rates. Nothing in the application of the formula, as a factual matter, attempts to gauge contemporaneous equity cost rates. Rather, the formula adjusts ROEs based on the historical observation that allowed ROEs move in the same direction as bond yields.

In this fashion, the Canadian formula diverges from attempts in the US to streamline cost of capital proceedings by implementing a generic formula for the cost of capital. There have been two highly visible attempts to do such a thing in the US, by the Federal Energy Regulatory Commission (FERC) in the late 1980s and by the New York Public Service Commission (NYPSC) in the early 1990s.[20] In both of those cases, the target of the generic formulae was the cost of equity, using contemporaneous market information with theoretical models designed specifically to gauge equity costs.

Neither the FERC nor the NYPSC methods ultimately resulted in an abandonment of a case-by-case examination of the cost of equity. The FERC methods have streamlined somewhat the construction of the "proxy groups" for gathering market information on similarly-situated regulated firms and have basically set the form of the theoretical formula for combining stock yields plus analyst growth rates (in the "yield plus growth" or DCF formula). Those streamlines aside, the FERC generally dropped its pursuit of a generic formula by about 1992 over legal concerns that a company-specific record must support the finding of a fair return. The FERC since has not departed from a case-by-case examination of the cost of equity. The NYPSC formula, for its part, was created after a multi-month process costing some millions of dollars. It, too, centered on a formula for deriving the cost of equity (rather than the long bond rates plus a pre-determined spread), but it was never adopted formally by the NYPSC.

## IV. THE TRADITIONAL CASE-BY-CASE METHODS OF CANADIAN AND US REGULATORS

Rate cases in the US are relatively standardized affairs. This is not to say that US commissions never err in their decisions, that all commission decisions are objective or that rate cases are

[20] FERC Order 442 *Generic Determination of Rate of Return for Public Utilities*, Docket No. RM85-19-000; New York Public Service Commission, *Generic Financing Proceeding*, *Case* No. 91-M-0509.

never protracted battles. Property rights and US regulation are continually evolving and have only reached their current state through experimentation and judicial rebuke.

In an attempt to relieve the regulatory burden the FERC intended to move to a generic ROE approach in the 1980s with Orders 420, 442 and 461, and similar efforts were made by the NYPSC and the Federal Communications Commission (FCC) in telecommunications. However, the generic ROE pursued in these cases was never applied extensively and fell into disuse. US ROEs are now determined the same way they have always been determined: through discounted cash flow (DFC) analysis that examines a comparable group similar to the utility in question.

US gas utilities generally do not generally undergo annual rate cases.[21] Rather, the ROE stands until either the utility requests a rate case or the commission judges that conditions have changed enough to warrant a re-examination of rates. To streamline rate cases, commissions have objectivity standards that include the need for a theoretical justification of the methods used and all subjective decisions are justified in the public record. These standards help to ease contention in rate cases and limit the discussion to manageable issues.

In this section we will explore the methods used for rate setting in a case-by-case environment. We begin with the most popular method in the US, the DCF, before examining the CAPM and other ERP methods. Finally, we discuss the role of capital structures in case-by-case ratemaking.

## A. Discounted Cash Flow (DCF) or Yield Plus Growth

The most popular method used to determine the ROE among US regulatory commissions is to determine what future stream of common dividends investors expect on a case-by-case basis using discounted cash-flow (DCF) analysis. Its popularity is a function of its ease of use and comprehension by finders of fact not necessarily particularly versed in financial theories. At its most fundamental level, the DCF method endeavors to compute the cost of equity capital by summing the two sources of equity investor returns—the "yield" portion (meaning the dividend yield with respect to the stock price) and the "growth" portions—the rise in the stock price that investors expect to see. In a world of complicated ratemaking formulae and financial theories, it is no surprise that "yield plus growth" has an intrinsic appeal, particularly when there are many sorts of similar utilities by which to gauge the sum of these two common-sense factors that make up the ROE. The formal statement of the DCF methodology grew out of Professor Myron J. Gordon's work on stock valuation models, which was first published in complete form in 1962.[22]

Part of the DCF formula that may not appeal to analysts and regulators is the growth rate expected by investors. That growth rate is inherently inscrutable, and in small capital markets

---

[21] California has annual adjustments to rates, but that is a unique US jurisdiction and not in any way an indicator of what happens in the rest of the country. The tortured experience associated with the lead up and aftermath of the California energy crisis of 2000-2001 continues to cast regulatory procedures there in a unique light.

[22] *See* Gordon, M.J. *The Investment, Financing and Valuation of the Corporation* (Homewood, IL: Richard D. Irwin Inc., 1962; reprint, Westport, CT: Greenwood Press, Publishers, 1982).

(such as many utility jurisdictions overseas), it is very hard to gauge investor expectations and thus to apply the DCF model. But in the US, where the model retains its great popularity, a robust industry of independent stock market analysts helps greatly. Both in print and on the web, disinterested estimates of utility growth rates are readily available to assist in the calculation of DCF-derived ROE figures. Combining these publicly-available growth rate estimates with the availability of a number of similar-risk companies, in "proxy groups," allows regulators to enjoy the stabilizing influence of the law of large numbers in setting the ROE.[23] For practical-minded regulators looking for stable, understandable and objective evidence, its popularity is no surprise.

DCF analysis involves making selections at two key stages: first, the analyst selects a specific "proxy group" of utilities facing similar risks and then selects the various of inputs such as the growth rate. Many of the practical concerns of Canadian regulators over these selections have been addressed in US jurisdictions, and the regulatory burden of case-by-case ratemaking has been lightened by establishing consistent selection criteria at each stage. One concern unique to Canadian jurisdictions, however, is the applicability of proxy groups that contain US utilities.

Given the degree of capital market integration, the degree of cross-border gas trade, and the international presence of several Canadian LDCs, we believe that a proxy group that includes US utilities facing similar risks would be appropriate for Canadian utilities. We will examine in Section IV whether the risks facing Canadian utilities are, in fact, comparable to those facing US utilities but, so long as Canadian regulators are attentive to potential macroeconomic divergence, we see no economic or financial factor that would confound the use of proxy groups that include US utilities.

## B. Equity Risk Premium (ERP) and the Capital Asset Pricing Model (CAPM)

Equity risk premium (ERP) analysis is based on the observation that it is more risky to hold equity than bonds. Assuming that investors are risk adverse, they will require a higher return to hold assets with higher risk. Equity returns therefore carry a premium over bond returns. If risk-free bond yields could be identified and the equity premium could be estimated, the cost of capital will result.

There are a wide variety of methods for estimating the cost of capital along these lines, the most popular of which is the capital asset pricing model (CAPM). The CAPM formula itself is rather straightforward. Its components are: (1) the risk free rate of return; (2) the market rate of return; and (3) the beta. These inputs are combined to estimate the ROE.

---

[23] In practical terms, the "law" describes the stability of a random variable, with repeated sampling. That is, given a sample of independent and identically distributed random variables, the sample average will approach and stay close to the true population average as the size of the sample increases. This is a long way of saying that the ROE results from a "proxy group" sample of similar utilities are more representative of the actual ROE than the ROE for a single company alone.

$$ROE = Risk\text{-}Free\ Rate + \beta(Market\ Return) \quad \textbf{(2)}$$

Despite this algebraic simplicity, there are different methods to obtain each of these components and to compute the required rate of return. The effects of choosing one method over another can substantially change the required cost of capital. Because CAPM, with the exception of the beta term, does not have the "law of large numbers" properties in a comparable group that the DCF has, there is less reason to focus primarily on a comparable group rather than the utility in question, especially when the beta is significantly different from that of the proxy group.

The practical elements of the CAPM formula are full of contention. For example, the beta term relates the movement in an individual company stock price compared with that of the entire market for stocks. Greater relative movement vis-à-vis the market means a higher beta. Those betas published by investment analyst houses (such as *Value Line*, Merrill Lynch or others) make use of an adjustment procedure that moves "raw" betas toward 1.0. The "adjusted" published betas are generally the ones used by US regulators when they make reference to the CAPM.

The other area of contention is the market return—defined as the premium that the market for equities demands as a spread on the risk free rate. Market risk premiums are not published, but have to be derived. Some are based on historical achieved returns and others try to gauge investor expectations on future equity returns not unlike those who perform a DCF analysis. In rate case application of the CAPM, there is always dissension among interested parties regarding the size of the market risk premium, as its choice directly affects the level of "just and reasonable" rates. Practical-minded regulators wrestle with this issue.

- Despite these areas of contention, one benefit of the use of the CAPM is that the theory upon which it rests provides a relatively clear method for gauging the effect of increased leverage, or "gearing," on the cost of equity. It is well known in both financial theory and in practical investment circles that a high proportion of debt in the capital structure adds financial risk to the business risk facing a company—and raises both the cost of debt and equity. The CAPM model provides a theoretical method to compute the effect of different gearing on the ROE.[24] Indeed, in some prominent cases in the US, the this method has been used as the basis for regulators to grant higher equity costs to adjust for the use of greater gearing levels as deemed prudent by the regulator.[25]

[24] For the theoretical formula regarding the relationship between betas (and hence equity costs) and gearing, see: Copeland, T.E., and Weston, J.F., *Financial Theory and Corporate Policy, Third Edition*, Addison-Wesley, Reading, Massachusetts (1988), p. 457.

[25] For example, in the aftermath of the electricity utility restructuring in Texas, the Public Utility Commission there approved a 50 basis point "financial risk" premium to the cost of equity for all electricity distributors in the state to reflect its desire that the utilities all move toward a higher amount of debt in their capital structures (60 percent) reflecting the spin-off of their generating function. *See* Public Utility Commission of Texas, *Order No. 42: Intermin Order Establishing Return on Equity and Capital Structure*, Docket No. 22344 (2000).

CAPM is often used in US rate cases, but it is almost never used as the sole determinant of the cost of equity capital.[26] The judgment required in selecting parameters for the CAPM is no less significant than the judgment required for judicial use of the DCF, and the CAPM lacks the "central tendency" properties of DCF that smooth the results to yield a more reliable estimate.

## C. Capital Structure

Modern financial theory suggests that there is a relatively wide zone of reasonableness for capital structures, with capital structures within that zone producing about the same cost of capital.[27] In the US, a utility's management is therefore granted a measure of discretion as to the type of capital raised. Having a solid level of financial integrity can provide rate stability and other benefits to customers, and commissions are reluctant to interfere with a utility's capital structure unless it is pushing the bounds of reasonableness.

In the US, the projected actual capital structure ratios of the utility at the time that new rates would go into effect are used to calculate a pre-tax weighted-average cost of capital. Because the rate proceeding will set rates to be charged for service in future periods, it is appropriate to base the capital structure components on the best available estimates for the period of time in which the rates will be in effect. Furthermore, the actual degree of leverage has important implications for ratemaking, as higher leverage raises financial risk and therefore the cost of capital.

Financial risk is the portion of total corporate risk over and above basic business risk that results from using debt.[28] Because equity investors are the residual claimants after the payment of debt, the cost of equity increases with higher debt ratios (*i.e.* with higher leverage). As a company increases the portion of debt in its capital structure, investors perceive a greater chance that there will not be sufficient returns available after the payment of fixed charges. Both the Modigliani-Miller theory, a the basis for the field of finance, and empirical tests of the theory confirm this inextricable link between capital structure and the cost of equity.[29]

The total cost of capital is therefore U-shaped with respect to capital structure. High equity percentages raise the WACC, but the WACC also increases at high debt percentages as investors seek higher returns on equity due to the increased financial risk.

---

[26] One jurisdiction in our experience, Oregon, for some time in the 1990s and into the mid 2000s appeared to use the CAPM as the sole method for finding the ROE. It stopped that seemingly sole reliance in 2001. *See* Public Utilities Commission of Oregon, Order No. 01-777 (2001).

[27] *See* Morin, R., *Utilities' Cost of Capital*, PUR, Arlington, VA 1984, p. 268.

[28] Brigham, E.E., *Financial Management, Theory and Practice, Third Edition*., The Dryden Press, Chicago (1982), p. 861.

[29] *See* Copeland, T.E. and Weston, J.F., *Financial Theory and Corporate Policy, Third Edition*., Addison-Wesley, Reading MA (1988), Chapters 13 (theory) and 14 (empirical evidence and applications).

Hypothetical capital structures have been used in the US when it was judged that utilities were deviating from reasonable capital structures by either employing too much debt or equity in an effort to raise overall returns. Hypothetical capital structures may also be used if the utility is owned by a parent company that faces markedly difference risks from those faced by utilities and therefore carries a capital structure that would be inappropriate for a utility.

In such cases, the capital structure of a comparable group of utilities is used, on the basis that comparable groups' capital structures reflect the opportunity costs facing investors, satisfying the comparable investment standard. Very rarely would a capital structure be "deemed" in the US without consulting a comparable group and addressing why the actual capital structure chosen by the management is inappropriate.

# V. RELATIVE RISK FOR CANADIAN AND US GAS UTILITIES

The previous two sections of this paper described how Canadian and US regulators have derived the ROE. This section investigates whether there is any justification for concluding that lower (higher) risks for utilities in Canada (the US) justify ten years of divergent returns.

In this section, then, we first examine more carefully which risks matter to utility investors. We then examine the practical boundaries to those risks for regulated utilities in Canada and the US and upon what legal and procedural foundations those risks rest. Finally, we examine whether there is any evidence available that allows us to conclude that the divergence in Table 1 stems from any persistently lower risk in Canada for gas distributors than that level we observe in the US.

## A. What Risk Matters to Utility Equity Investors?

Any discussion of risk in the context of utilities invites controversy. Much of this, in our opinion, comes from a *colloquial* as opposed to a *technical* definition of risk in the context of ROE. In setting a fair compensation for investors in the ROE, the risks that matter are the ones for which those investors require compensation. Colloquially, all would agree that predicting the weather is *risky*, but to the extent that over time weather conforms tightly to averages, the rates set on average weather patterns carry no particular risk to investors' ability to recoup their cost of capital. That is to say, *weather risk* is not the same as *ROE risk*. For a natural monopoly gas utility whose costs are geared to serving customers with whatever local weather conditions exist, the weather does not stand between them and recouping their funds—and is not properly a part of the ROE.

Weather is merely one example of the need to focus on technical risk definitions in gauging the fairness of the ROE. While the cost of service may differ between US and Canadian utilities based on their distinct geographies and other factors, both can expect the opportunity to earn a fair rate of return that is based on the returns to an investment of comparable risk.

### 1. Regulatory Risk

The risk that a gas LDC faces is inherently intertwined with regulation. Gas LDCs are a natural monopoly—the only thing standing between an LDC and monopoly profits is regulation. The greatest risk to an LDC is the risk that the regulator will not allow the utility to recover prudent costs—including the cost of capital—in a timely manner.

## 2. Business Risk

The business risk faced by LDCs in Canada does not significantly differ from those in the US. There are forward-looking risks facing investors that are somewhat independent from regulatory risk. These risks are limited, however, as a utility has the right to call for a rate case if significant events (such as a recession) damage its ability to earn a reasonable return on its invested capital without an increase in prices—a recourse obviously not available to unregulated firms. Business risk is therefore an interaction between regulatory risk and the business environment and many business risks can be lessened, modified or even eliminated through various regulatory practices.

Forward-looking business risks include:

- *Long-Lived Assets*. Gas LDCs in Canada and the US connect to a multitude of consumers. Therefore, distributors are the ones charged with the planning of upgrades to networks that in many cases are decades old. The need for major expenditures to provide safe local service do not always follow rate case schedules, so there is often a lag between investments in long-lived assets and recovery of those costs in rates. Such risks in the cost of planning and engaging in ongoing local network maintenance are the same in both Canada and the US, and both utilize deferral accounts to mitigate this risk.

- *Risks of service interruptions*. Major or minor service interruptions are generally the responsibility of the distributor—as are the costs of remedying outages. Cracked gas mains, storm damage to electricity wires and sub-stations, are all the responsibility of the distributor, which can try to plan for—but cannot guarantee—the collection of all costs that are incurred.

- *Adequacy of depreciation*. The depreciation allowance included in distribution company rates is an estimate based on historic experience. Depreciation allowances may not consider economic obsolescence resulting from unanticipated technological change or potential large capital additions. As such, there is a risk that utility plant will be under-depreciated, and changes in technology or regulation may cause shareholders to bear the result of inadequate depreciation.

- *Risk of technological bypass*. Gas LDCs in Canada and the US are at risk of customers bypassing the network by switching fuels or adopting alternate technologies. If bypass is significant there is no guarantee that the remaining rates will be adjusted to recover the cost of abandoned or excess capacity.

- *Risk of the competitiveness of rates*. While LDCs are entitled to recover their actual, prudently-incurred cost of doing business, gas LDCs in Canada and the US are at risk for the continued viability of the overall business. Competitive pressures from distributed generation or alternate fuels could create a situation in which allowed revenues are not competitively viable.

- *Risk of timeliness and adequacy of allowed revenue levels*. Gas LDCs in Canada and the US face the need to increase distribution rates as costs increase. It is expensive and difficult to file for a small rate increase. Utilities would absorb such costs until they become large enough to justify the cost of a rate filing.

### 3. Financial Risk

Apart from the regulatory and business environments facing an LDC, investors face financial risk as well. Financial risk is the risk associated with carrying debt in the capital structure. Debt return (i.e., interest payments) are contractual obligations. Up to a point, raising utility funds with debt provides for a less expensive way to provide the capital needed to provide services to customers. But with greater proportions of debt, the risk that those interest payments will not be "covered" increases, and with it both the interest rate demanded by lenders and the return required by equity investors. This effect on required rates of return is well established and widely known.

Financial risk is generally taken into account in setting ROEs in US rate cases. To the extent that a regulated firm's capital structure mimics those of a group of its regulated peers, no adjustment is necessary for financial risk. One the other hand, if there is a difference between the firms in question and their peers, then an adjustment to reflect the differential financial risk may be necessary (as happened in a noteworthy case for all of the regulated electric distributors in Texas—where a 50 basis point premium for the ROE was permitted to reflect the regulator's desire for the distribution-only utilities to take on more debt).[30]

The question of financial risk appears to often be obscured in Canada, where the generic ROE is provided for all utilities in a jurisdiction, leaving the issues of financial risk to be deal with in a specific deemed capital structure to address the risks of a particular distributor.

## B. What are the Practical Boundaries to Regulatory Risk?

With any investor-owned utility, the regulator and the utility have reciprocal obligations that are generally well recognized. That is, the utility operates the service and provides the capital needed to maintain and expand the facilities that allow the public to be adequately served. For its part, the regulator provides a stable regulatory environment, oversees the adequacy of services, and offers the utility a reasonable opportunity to earn a return on its investments.

[30] See Texas PUC, *Generic Issues Associated with Applications for Approval of Unbundled cost of Service Rates Pursuant to PURA §39.21 and PUC Subst. Rule §25.34*4, Docket No. 22344.

Among its various duties, a key role for regulators is to signal, credibly, to investor-owned utilities' investors how their investments will be recovered in regulated charges.[31]

Such regulation is described in the economic literature as a "form of long-term contracting."[32] Canada and the US have proven over 100 years of natural gas regulatory history that they are able to honor the "long-term contract." The exact form of this long-term contracting has evolved throughout this history as regulators pushed against the regulatory boundaries, were reprimanded by courts, were given new direction through legislative action, and were chaired by individuals of various political inclinations as new executives were elected.

In mature regulatory jurisdictions with strong legal and administrative histories, such as Canada and the US, the regulatory compact represents a concatenation of: (1) strong primary legislation; (2) credible, comprehensive and transparent administrative procedures for making regulatory decisions and adjudicating disputes; (3) accounting regulation specifically designed for utility ratemaking; and (4) clear pathways for reliable judicial review of regulatory decisions. Newer regulatory jurisdictions around the world that do not have comparable bodies of regulatory precedent routinely use explicit contracts to express such principles.

## 1. Strong Primary Legislation

Canadian regulatory legislation is effectively very similar to that in the US, although Canada does not have all of the judicial precedent regarding the constitutional protection of private property that characterizes the US. Canada's regulatory compact is based instead on common law and "fundamental justice" but nevertheless does appear to be comparable the US in practice.[33] The US Constitution, especially the fifth and fourteenth amendments, provides the foundation that supports those protections in the US.

In Canada and the US, Supreme Court interpretations of this primary legislation define the legal limitations on regulators' ability to take action on charges that may damage the value of utility investors' property. The best known case is that of *Federal Power Commission v. Hope Natural*

---

[31] This mutuality of obligations is sometimes called the "regulatory bargain" or "regulatory compact," but those are merely convenient labels for how governments and investors have traditionally worked out how the public will be adequately served by private companies.

[32] Professor Oliver E. Williamson, an authority on the economics of transactions and regulation, noted that "[a]t the risk of oversimplification, regulation may be described contractually as a highly incomplete form of long-term contracting in which (1) the regulatee is assured an overall fair rate of return, in exchange for which (2) adaptations to changing circumstances are successively introduced without the costly haggling that attends such changes when parties to the contract enjoy greater autonomy." Williamson, O.E., *The Economic Institutions of Capitalism*, Free Press, New York (1985), p. 347. See also Victor Goldberg, Regulation and Administered Contracts, *Bell Journal Of Economics*, Vol. 7 (Autumn 1976): p. 426-448.

[33] Canada's equivalent to the US 14th Amendment, Section 7 of the Charter of Rights and Freedoms, states: "[e]veryone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice." As a relatively recent act, it remains to be seen exactly how "fundamental justice" will be interpreted but it has thus far been interpreted as more than simple procedural rights.

*Gas*, in which the Supreme Court set a standard for determining "just and reasonable" returns, a standard that has stood the test of time.[34] Canada and the US share a remarkably similar regulatory mandate and their "fair and reasonable" standards for utilities returns are almost identical. Indeed, Canada's *Northwestern Utilities v. City of Edmonton* anticipated the landmark US *Hope* case by fifteen years. Both established the opportunity cost of capital as the relevant standard by which utilities' returns should be judged.

The Supreme Court of Canada stated in *Northwestern Utilities*:

> The duty of the Board was to fix fair and reasonable rates; rates which, under the circumstances, would be fair to the consumer on the one hand, and which, on the other hand, would secure to the company a fair return for the capital invested. By a fair return is meant that the company will be allowed as large a return on the capital invested in its enterprise (which will be net to the company) as it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise…[35]

In the *Hope* decision, the US Supreme Court, by a vote of five to three, set a new standard for determining "just and reasonable" returns for investor-owned utilities.

> The return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and attract capital.[36]

In *Bluefield*, an earlier case leading up to the *Hope* decision, the US Supreme Court defined the proper rate of return as follows:

> A public utility is entitled to such rates as will permit it to earn a return on the value of the property which it employs for the convenience of the public equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings which are attended by corresponding risks and uncertainties...[37]

In setting required revenues, a utility's returns would henceforth be measured by investors' possible earnings on alternative enterprises of similar risk. The Supreme Courts thus ruled that a utility's investments were safe from seizure (*i.e.*, a "taking") if regulators set charges to award returns consistent with investors' opportunity cost of

[34] *Federal Power Commission v. Hope Natural Gas*, 320 US 591 (1944).

[35] *Northwest Utilities v. City of Edmonton*, S.C.R. 186 (NUL 1929).

[36] *Hope,* 320 US 591, 603 (1944).

[37] *Bluefield Waterworks & Improvement Co. v. Public Service Commission of the State of West Virginia et al.*, 262 US 679, 693 (1923). The *Hope* and *Bluefield* decisions refer to two Constitutional Amendments. The Fifth Amendment, as interpreted by the Court, gave the Court jurisdiction over Congress in such matters. The Fourteenth Amendment, under the Court's interpretation, gave it similar jurisdiction over the States.

capital. These limitations on the discretion of regulators were not academic exercises. For the purposes of the future gas market, the *Hope* and *Northwest Utilities* decisions were critical. They sharply limited investor or shipper uncertainty regarding the ability of regulators to act in a manner that would damage the value of the assets that investors would devote to regulated enterprises.

## 2. Credible, Comprehensive and Transparent Administrative Procedures

Predictable regulatory or tariff-making practices are unlikely without a clear set of administrative procedures that bind the way that the independent regulators conduct their business. Canada and the US both provide stability to their utility investors through strong administrative procedures.

An important tenet of Canadian administrative practices is the common law right to procedural fairness. The Supreme Court of Canada has held that judicial and quasi-judicial bodies, but also other administrative decision makers, must follow common law principles of procedural fairness that include the right to be heard and the right to be judged impartially. [38]

The 1946 Administrative Procedures Act guides regulatory procedures in the US. Similar to Canada, it requires regulators to hold hearings, warn participants of impending rule changes, to allow participation in regulatory proceedings from the affected parties and to accept evidence (subject to cross-examination in those hearings). The late US Senator Daniel Patrick Moynihan explained that:

> The APA rests on a constellation of ideas: government agencies should be required to keep the public informed of their organization, procedures, and rules; the public should be able to participate in the rule-making process; uniform standards should apply to all formal rule-making and adjudicatory proceedings; and judicial review should be available in certain circumstances. Taken together with the Freedom of Information Act, an amendment to the APA that was enacted in 1966 and added to in 1974, 1986, and 1996, the APA was intended to foster more open government through various procedural requirements and thus to promote greater accountability in decision making.[39]

These are precisely the elements of "due process" in the administration of regulation. Indeed, the legal inquiries that resulted in the Administrative Procedures Act arose out of the general judicial concern (arising in the US in the 1930s) that regulating prices of investor-owned companies *at any level* represented a potentially unconstitutional taking of private property. That

---

[38] An important decision with regard to procedural fairness was *Nicholson v. Haldimand-Norfolk Reg. Police Commrs.*, where the Supreme Court of Canada significantly extended the rights to procedural fairness to non-judicial administrative decision makers and solidified the right to justification for a decision. *Nicholson v. Haldimand-Norfolk Reg. Police Commrs*., [1979] 1 S.C.R. 311.

[39] Daniel Patrick Moynihan, *Secrecy: The American Experience* New Haven, Conn: Yale University Press, 1998, p. 157.

potential unconstitutionality, it was rightly thought, could only be prevented if a specific framework was applied for assuring the due process of regulatory decisions.

While Canada does not have an exact equivalent to the U.S. Administrative Practices Act of 1946, it does have an umbrella of provincial statutes, the charter(s) of the administrative decision maker(s), and the protection of common law, which includes previous interpretations as well as foundational justice and the founding principles of the constitution.[40] Through these channels, Canadian administrative procedures are equally well-established and effective as US procedures.

## 3. Accounting for Utility Ratemaking

The goals of effective and efficient regulation can be frustrated without a consistent, credible, and sustainable set of regulatory accounts. Strict accounting standards (*i.e.*, the Uniform System of Accounts) rarely leave US or Canadian energy utilities and their regulators in major dispute over basic financial issues (like profitability, depreciation expenses or the admissibility of particular costs).

Strong and transparent accounting standards were established over half a century ago in Canada and the US, but such is not the case in other, supposedly "mature" jurisdictions. For example, a major component of the reviews of British Gas conducted in recent years by both Ofgas (the gas regulatory body before Ofgem was created) and the Monopolies and Mergers Commission concerned basic accounting and finance items in an environment with no regulatory accounting standards.[41] This confusion in the UK over British Gas's rate of profits on its capital stock and the depreciation allowed on billions of pounds sterling of transportation assets represents a major risk to utility investors that is absent in Canada and the US. Canadian and US accounting standards would never leave major assets in question, as was the case in the UK and elsewhere following privatization.

## 4. Reliable Judicial Review

Effective limits on regulatory authority in systems with well functioning regimes come from the judiciary and other paths of appeal. In both Canada and the US, the fundamental legal limitations on the ability of regulators to take actions that damage the holdings of utility investors (in some way or another) come from well-known Supreme Court decisions. The Courts in both countries have found that the property rights of investors in regulated companies,

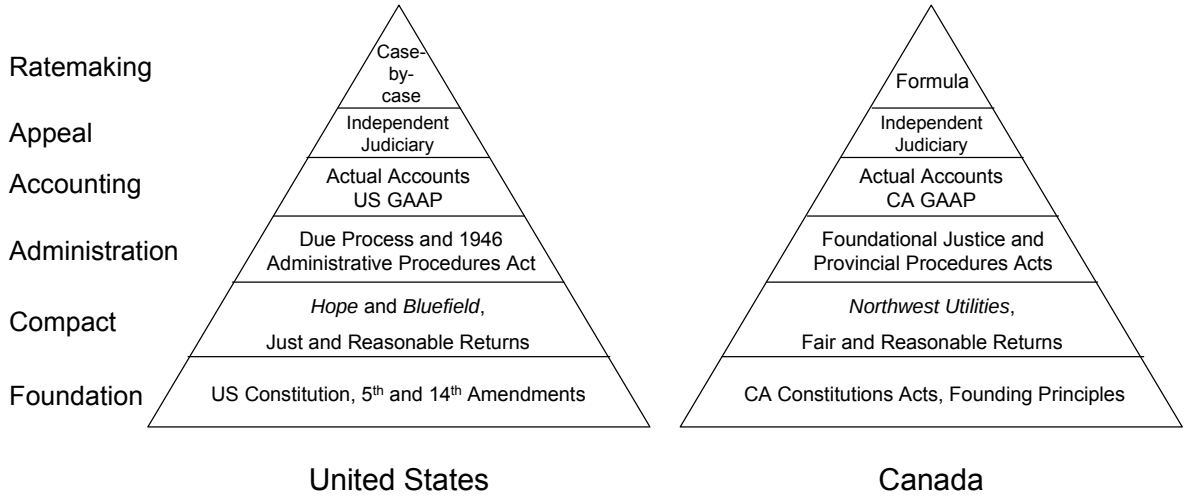
---

[40] The provincial administrative practices acts include: *Statutory Powers Procedure Act*, R.S.O. 1990, c. S.22 (Ont.); *Administrative Procedures Act*, R.S.A. 2000, c. A-3 (Alta.); *Administrative justice, An Act respecting*, R.S.Q. c. J-3 (QC).

[41] *The Economist* has referred to UK regulatory accounting as a "fiddly bit of guesswork." (See: "Don't you just love being in control?" *The Economist*, May 18th, 1996.)

as well as the rights of the customers they serve, require strict regulatory attention to invested capital.

## C. What are the Elements of Canadian vs. US Regulatory Risk?



While Canada and the US share a credible regulatory environment, the exact regulatory foundations are admittedly not identical. However, the differences that do exist are more procedural than fundamental. The two jurisdictions engage in roughly the same practices, although they may go by slightly different names or receive more or less attention. The differing levels of attention does not imply that some practices are superior to others; rather, these differences arise from the dates the practices were implemented, the procedures used to handle the practices, and the emphasis placed on various practices in regulatory proceedings.

These principles are generally true of all regulatory jurisdictions in the US and Canada. Both equity investors and lenders generally give funds to utilities with the reasonable expectation the principles of obligations to be provided with a fair return will be honored. Even though the particular utility statutes may vary from jurisdiction to jurisdiction, and even though regulatory commissions may have different policies and precedents in different jurisdictions, investors anticipate the basic bargain between them and their regulator (who represents the public) will apply to their investments.

From the constitutional foundation through to administrative practices, accounting practices and judicial review, Canada and the US have virtually indistinguishable regulatory environments—so much so that the US *Hope* and *Bluefield* decisions are even cited in Canadian rate cases.[42] **Figure 4** illustrates the regulatory pyramid in Canada and the United states.

[42] See, for example, Alberta's *Generic Cost of Capital* decision, where the EUB stated, "[t]he Board concurs that the above decisions [*Northwestern*, *Hope*, and *Bluefield*] are the most relevant judicial authorities with respect to the establishment of a fair return for regulated utilities." Alberta Energy and Utilities Board, *Generic Cost of Capital* Decision 2004-052 (2005), p. 13.

**Figure 4: Elements of Recent ROE Regulation in the US and Canada**

Regulation in Canada and the US is founded on strong primary legislation that protects the rights of citizens. The constitution of Canada is an amalgam of codified acts and uncodified traditions and conventions.[43] The Constitutions Act, 1982 established a Charter of Rights and Freedoms, the Canadian equivalent to the US Bill of Rights. While the Charter extends many protections to Canadian citizens, including the right to "foundational justice," this Charter does not explicitly include the protection of property rights. A significant difference in the regulatory foundations is the strong constitutional protection of property rights in the United States afforded by the 5th and 14th amendments.

The regulatory compact in both countries is shaped by judicial decisions and includes the right to earn a "fair return" on investment, as determined by the opportunity cost of capital, which is termed the "comparable investment" standard. While the phrase, "regulatory compact," is not used as often in Canada as in the US, the concept is there. Indeed, the decisions that shape the US compact are cited in Canadian rate cases, and the Canadian decisions are widely recognized as establishing an effective compact that is very nearly identical to that of the US.[44]

While Canada does not have a single, federal administrative practices statue, administrative practices are highly refined in Canada and afford at least as much protection to investors as does the United States. The Canadian common law protection—enhanced by the introduction of foundation justice in the Charter of Rights and Freedoms and provincial administrative

---

[43] The Preamble to the Constitution Act, 1867 states that the provinces shall have, "a Constitution similar in Principle to that of the United Kingdom."[43] This has been interpreted as stating that the practices of the United Kingdom that were common before the creation of the constitution form part of the Canadian constitution—for example, the practice of an independent judiciary has been constitutionally guaranteed under this argument. See *Provincial Judges Reference* [1997] 3 S.C.R. 3.

[44] Morin, R.A. *New Regulatory Finance*, Vienna, Virginia: Public Utilities Reports (2006), p. 12.

procedures acts—equals the US standard of due process and the Administrative Procedures Act of 1946 in its protection of investors' rights.

In both Canada and the US, regulatory accounting is sufficiently refined that actual accounts are used for ratemaking without contention, avoiding the regulatory conflicts that surround benchmarked costs or replacement value accounting. The right to use actual costs for intraprovincial/intrastate regulation comes from provincial and state statutes. While some provinces have "fair value" mandates and are not required to use book values, they do so nonetheless.[45] This is similar to the US, where five states have "fair value" statues but have defined fair value to be the book value, so it is a difference without a distinction.

There is a perception that Canadian judiciaries are reluctant to interfere with the decisions of utility regulators. However, US judiciaries also do not overturn regulatory decisions without a clear reason to do so, and judicial rebuke is the exception rather than the rule in the US. Most important is that clear pathways for appeal exist in both countries and appeals are conducted in a manner such that, should major grievances be raised, the judiciaries are capable of reaching a reasonable decision.

Canada and the US share similarly mature regulatory compacts, supported by well-established accounting, administrative and appellate procedures. They are unique in their advanced regulatory environment based on credible, actual accounts. The greatest risk-determinant for utilities, regulatory risk, is comparable in Canada and the US.

## D. Does the Continued Ability to Raise Capital for Canadian Utilities Indicate that All is Well?

**Figure 1** drove this examination of the foundations of the regulatory procedures and risk. It shows that the allowed ROE was persistently lower in Canada that in the US over the previous decade. To the extent that this divergence is found not to be the result of different Canadian regulatory practices or lower regulatory risk vis-à-vis the US, but the result of the use of Canada's formula, an obvious question arises: would this cause investors to withhold funds from Canadian utilities?

In other words, is there any evidence that the Canadian utilities whose returns make up **Figure 1** have been unable to raise funds? If the generic Canadian ROE formula rests too heavily on long bonds and ignores genuine equity capital costs, the most manifest evidence that this is detrimental would show up in a difficulty for those companies in raising new capital. Conversely, does the continued ability of these Canadian utilities to provide adequate services in and of itself refute any possibility that the formula-based ROE is biased or inadequate?

---

[45] The use of actual accounts in Canada was upheld in *B.C. Electric Co.*, where the court established that the book value of prudently incurred costs could be used to provide a fair return, despite a statute requiring that appraisal value be used. *B.C. Electric Co. Ltd. v. Public Utilities Commission et al.* (1957) 13 D.L.R. (2d) 589 (BCCA).

We conclude that as a practical matter the answers to these questions are no. Absence of evidence that Canadian utilities subject to the formula are barred from the market for funds does not constitute evidence that those ROEs are adequate in the market.

There are times in the not-so-recent past when persistently inadequate returns have appeared for utilities in general. During two periods of high inflation in the 1970s and 1980s, US utilities faced wholly inadequate returns. Inflation, coupled with the need to construct new generation and transmission capacity, ruined the ability of traditional regulatory procedures to provide utilities with a reasonable prospect of earning an adequate ROE. In short, the traditional methods of regulating rates, using a test year, created a lag in the ability to recoup ongoing, inflated, costs that visibly affected the financial health of utilities.

Evidence that the utilities were suffering was clear in the stock markets, as utility stocks slid in relation to their book values. During both periods, it was common for utility stocks to be trading below the equity book value of utility investments (roughly the equity "rate base"). When this happened, any new equity raised by these utilities would "dilute" the equity of existing shareholders—basically providing a subsidy to new equity investors from old ones.[46] Such a subsidy could not continue forever, as it would doom an investor enterprise. As it happened, however, the problem—as highly visible as it was—was only relatively temporary.

No equity investors would willingly sell proportional rights to the future returns on the equity rate base for a discount—but they did so during this period anyway. Why? Given their overriding obligations to provide safe, adequate and reliable service to customers, they had effectively no choice in the matter. Inflation pushed up the cost of new funds to the extent that it reflected a subsidy from existing shareholders, but nothing during the years of high inflation left utilities off the hook regarding their own responsibilities to serve the public.

Fixing the problem required either a change in regulatory procedures to deal with high inflation (for example, using inflation accounting like in European or Latin American countries), or an end to high inflation itself. When inflation dropped in the US, utilities returned to business-as-usual. The prospect of high inflation is still a risk to which utilities have generally no defense except a strong belief that the central bank will work to prevent its recurrence.[47] But in no fashion was the continued investment in US utility infrastructures in the 1970s and 1980s evidence that the ratemaking formula wasn't damaging investor interests in periods of high inflation.

Similarly, the evidence that Canadian investors continue to provide safe, adequate and reliable service to their consumers cannot be taken as evidence, in and of itself, that the formula-based returns reflected in **Figure 1** are fair. The utilities in Canada are a mixture of closely-held subsidiaries (without traded stocks of their own) and publicly-traded firms. If the ROEs based

---

[46] See: Morin, R.A., *New Regulatory Finance*, Public Utilities Reports, Inc., Vienna, Virginia (2006), p. 364; and Hymay, L.S., *Americas Electric Utilities: Past, Present and Future*, Public Utilities Reports, Arlington, Virginia (1985), p. 262.

[47] Of course, bankruptcy is a defense against persistent confiscatory regulatory treatment, but that has only appeared rarely in the US, and then only in conjunction with other idiosyncratic events.

on the formula are unfair, it would be, in our opinion, beyond practical measures to try to discern objectively, as a separate matter, how it damaged the interest of investors. By its very nature the market's cost of equity is not easily and objectively measurable—which is precisely why regulators and analysis use indirect formulae like the DCF and CAPM. Reverse-engineering the effect of the Canadian generic formula is not a practical and objective possibility to measure the effect it has had on utility equity investments in Canada since around 1998.

## Executive Summary

**The meaning of the Fair Return Standard (FRS)** Canadian governments responded to the growth of the gas business and the potential for abuse of dominant position in it by placing utilities under the jurisdiction of administrative tribunals. In theory, the extent of this regulation is unlimited. In practice it is constrained by the Constitution Act and by Common Law.

The Supreme Court in *Northwestern Utilities Ltd v. Edmonton* [1929] S.C.R. 186 (Northwestern) defined the scope of the utilities' right to price their product and their right as a result to a fair return. The Court stated "By a fair return is meant that the company will be allowed as large a return on the capital invested in its enterprise (which will be net to the company) as it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise". This definition remains in full legal effect today.

A fair rate of return to the corporation is paramount and is all that can be considered in arriving at a fair rate. In the unrealistic situation that a fair return worked a hardship on the consumer, the choices before government to provide relief are unlimited but they should not lower the fair rate of return. Indeed the Federal Court of Appeal (FCA) in *TransCanada PipeLines v. Canada National Energy Board* 2004 F.C.A. 149 confirmed that a fair return need not be modified out of deference to its impact upon customers.

As the operations of regulated utilities have become larger and more complicated, the courts have developed the view that a selected board of experts could deal more effectively with the rules of rate making than could the courts on appeal. Therefore, as long as the board in question acted within their jurisdiction, a successful appeal was unlikely. Notwithstanding the breadth of discretion afforded a regulator in establishing just and reasonable rates, the mutuality of interest between utilities and their customers nevertheless requires that a fair return be provided for the services rendered. The legal framework governing the determination of that fair return is the "Comparable Return Standard". It does not mandate any particular approach to that fair return.

**The application of the FRS** The current generic approach by Canadian regulators to gas utility rates of return on equity (ROE) awards pursuant to the FRS evolved after a long period in which regulators applied informed judgment to extensive evidence about a variety of tests. During that period, differing weights were given to the results but, with the exception of one jurisdiction and one test[1], none was ever permanently discarded. Over the years however, greatest reliance came to be placed on the equity risk premium (ERP) model.

With the passage of time, the phenomenon of successive protracted proceedings, eliciting similar evidence, stimulated the search for a generic approach. From the mid-1990's Canadian regulators accreted around the concept of an ROE for a benchmark utility based on an ERP over a risk-free rate, the resulting base-year award then being adjusted

annually by a predetermined automatic mechanism. This is the essence of the generic ROE, now adopted for the regulation of that component of all major gas pipeline and distribution utilities' revenue requirements.

**The results of regulators' current application of the FRS** The number and duration of rate proceedings has been significantly reduced and in certain jurisdictions the way has been paved for long-term settlements, some of which have made provision for sharing of efficiency gains between customers and owners.

The Canadian approach to return matters stands in strong contrast to that in the USA, with which Canada shares the long tradition of cost of service utility regulation. There, in accordance with essentially similar jurisprudence, the fairness of return on investment is evaluated against the opportunity cost of capital.

While settlements are also common in the USA, American regulators have not pursued the generic ROE approach but instead maintain case by case reviews, emphasize the important role of informed judgment, entertain a variety of evidence, but tend to the discounted cash flow method (DCF) as the default mechanism for their fair return findings.

In the NEB generic ROE era, no new pipelines have applied for tolls based on that determination of ROE. Instead, new projects such as Alliance, Emera Brunswick, Maritimes and Northeast, and Mackenzie Valley have all come before the Board with negotiated tolls based on significantly higher ROEs. This suggests that the NEB's generic ROE is insufficient to attract capital to greenfield gas pipeline projects.

**The implications of this application of the FRS** The now-universal generic ROE approach by Canadian regulators of major gas utilities has created some regulatory economies. But unfortunately its mechanistic character suspends for lengthy periods the previously-valued application of informed judgment to the results of alternative methods of achieving the FRS required by Canadian jurisprudence in ROE awards.

A wide and unprecedented gap has developed between Canadian gas utility ROEs and those of USA utilities and of North American low risk industrials. This is factual ground for concluding that the FRS, essentially the opportunity cost of capital needed to ensure financial integrity and capital attraction, is no longer being achieved by the generic ROE approach.

Canadian regulatory convergence on the generic ROE may however inhibit its necessary reappraisal because particular regulators may be reluctant to break ranks with the group and because the consensus around an approved generic ROE is widely supported by stakeholders[2], for reasons of regulatory efficiency and short term economic self-interest.

It would be helpful if, at the same time as specific cases occasionally come before individual regulators[3], some further studies of general relevance were to be carried out. For example, examination is recommended of the results, *ex post*, of the generic approach

in terms of the comparability of the resulting returns with non-utility and utility comparators and of the fundamentals of the present design including the choice of the risk-free rate; the appropriate measurement of the risk-premium; the adjustment mechanism; and the place of the DCF model which is accepted by the great majority of North American regulators.

## Introduction

The Canadian Gas Association (CGA) Discussion Paper "Return on Equity: Allowed Returns for Canadian Gas Utilities"[4], highlighted the importance of a "fair return" in supporting investments for the long term strength of the nation's natural gas grid. The paper went on to summarize the origins and evolution of Canada's "fair return standard". The paper noted that Canadian gas utilities are not now receiving allowed returns comparable with those of U.S. gas utilities or low-risk unregulated companies. As a result, Canadian utilities, it stated, are treated unfairly and may be inhibited from offering a robust optimal system that would provide the highest quality of service today and would be properly oriented towards a sustainable energy future.

Against that background, the Association asked the present authors, who had provided advice in the drafting of the Discussion Paper, to expand on some of the issues raised in it, particularly the identified need for the policy community and regulators to ensure that allowed returns remain fair and appropriately reflect the significant changes in their foundational elements such as comparable earnings.

In response, the authors provide here an examination of the meaning of the FRS in jurisprudential terms, discuss its application by Canadian regulators over the decades, review the results of the convergence since the mid-1990s on a generic approach to returns on equity and consider the implications of that approach for the future health of Canada's gas utility businesses. As to the application of the FRS, regulators have received thousands of pages of evidence and written hundreds summarizing it, providing their views and setting out their reasons for decision. Our discussion is necessarily a selective and summary one. However, we hope not to have omitted any point of fundamental significance.

## 1. The Jurisprudential Meaning of the Fair Return Standard

**The inception of utility regulation in Canada** The introduction of utility regulation by governments was grounded in the view that the activity had evolved into a number of sufficiently large corporations operating in a business characterized by natural monopoly and therefore capable of exerting market power to the detriment of consumers.

History demonstrated a number of methods of control available to the authorities. In response to concerns about the monopoly power wielded by Standard Oil, the United States introduced anti-trust legislation which led to its massive restructuring into a number of smaller corporations, forcing increased competition. The result was re-organization of their position from virtual dominance of the sector to competition among the newly formed corporations. Similar experience occurred in diminishing the dominant areas in steel and railroads.

Canada, because of its size in terms of population and domestic product, chose to remove the actual or feared problem of monopolies in the utility field either by use of legislative regulation or by Crown ownership.

In the context of regulation, some economists express the view that a regulator serves as a surrogate for competition in terms of the regulated company's potential dominance of a particular activity. While this may not be a complete explanation of the public purpose, it is a useful analogy. The pertinent and difficult question is what should these regulated companies be entitled to charge their retail, commercial and industrial customers so as to ensure safe and modern service in exchange for a fair return on shareholders' capital?

**Regulatory responsibility conferred on administrative tribunals** The history of the natural gas industry is a relatively short one: it is only in the early part of the 20$^{th}$ century that independent commercial use started to visibly develop.

As privately-owned utilities started to evolve into fewer but larger companies capable of exerting market power, the response of Canadian governments was utility regulation under which administrative tribunals were given the jurisdiction to regulate private utility companies falling under their mandate. By and large, however, Crown-owned utilities were not regulated in the conventional way since their corporate governance was taken to be enlightened by the government's perception of the pubic interest of the day.

The recognition of the value of natural gas as a legitimate alternative to electricity and fuel oils as an energy source, and the need for such control, raised a number of regulatory and constitutional issues.

As a preliminary point, it is obvious that the constitutional division of powers dictated by sections 91 and 92 of the *British North America Act* divided the regulatory responsibility between the Federal and Provincial governments. This is a separate subject, capable of

extensive comment, but it is sufficient for this paper to say intra-provincial activity fell to the Provincial Legislatures and extra-provincial activity to the Federal Parliament.

**Constraints on the extent of regulation** In Canada, the extent to which governments choose to regulate is theoretically unlimited. The absence of property rights for corporations makes them vulnerable to draconian legislation, if our governments so choose. However, the courts have recognized Common Law rights that co-exist with the Canadian Charter of Rights and Freedoms. Expropriation without compensation offends the Common Law rights of persons and corporations and is unknown to have occurred in Canada except for some unusual circumstances during war time.

The full reach and restraint by the Constitution Act or Common Law as they affect persons and corporations is beyond the narrower scope of this paper. It is sufficient to state that the rights are real, recognizable and enforceable.

**Jurisprudence concerning utility rates—the fair return standard** The important test of the prices or rates to be paid by consumers of natural gas supplied by a public utility has been established by our highest court, the Supreme Court of Canada (SCC). The Court confirmed the right of the companies to price the product within the confines of a fair rate of return on investments for the shareholder.

The SCC defined the scope of that right in 1929 and it remains in full legal effect today. It is consistently referred to and followed. The right to a fair return, and what it is, was defined by the SCC in *Northwestern Utilities Ltd. V. Edmonton,* [1929] S.C.R. 186 where Mr. Justice Lamont stated:

> "The duty of the Board was to fix fair and reasonable rates; rates which, under the circumstances, would be fair to the consumer on the one hand, and which, on the other hand, would secure to the company a fair return for the capital invested. By a fair return is meant that the company will be allowed as large a return on the capital invested in its enterprise (which will be net to the company) as it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise".

The importance of maintaining safe and reliable service requires a fair return as defined by Mr. Justice Lamont. The consumer has grown accustomed to a high standard in the delivery of gas services. Humanly, they are used to both the high quality of product and service. Equally human, they balk at rate increases while knowing that to avoid deterioration in service, timely increases are necessary.

**"Fair return" vs. fairness to the consumer** While it has not yet happened, if providing a fair return to utilities as defined by the courts results in hardship for the consumer, how should it be resolved? The greater good is served by the application of Mr. Justice Lamont's definition. The language found in most legislation refers to words such as rate fair to the corporation and consumer. Fairness to the consumer in that sense is redundant. A fair rate of return to the corporation is paramount and is all that can be

considered in arriving at a fair rate. The fair rate by logic alone should be deemed of necessity fair to the consumer.

That a fair rate of return would be a hardship on the consumer is practically unrealistic. It is academic and an unlikely result. An increase in rates is always unwelcome. If the rate rose to a hardship, some government intervention should be expected or the regulator may adjust the rate design while still ensuring the provision of a "fair return" to the utility. The point is that there are choices for relief, such as subsidies or a rate design short of lowering the fair rate of return. If hardship is the consequence of a fair return, nonetheless, the fair return must be set. Failure to do so over time will, as we have collectively seen, lead inevitably to the deterioration of, and in the extreme case, the failure of service and supply.

The Federal Court of Appeal (FCA) recently restated the principles of a fair return in *TransCanada PipeLines v. Canada National Energy Board* 2004 F.C.A. 149, where it confirmed the logic of Mr. Justice Lamont's definition by confirming that the fair return need not be modified out of deference to its impact upon customers. A fair return assures the opportunity to earn a level of profit equal to a comparable return from business of similar risk, although flexibility by which the ultimate tolls are designed may mitigate clear hardship or unfairness to consumers. However, by definition, a fair return should not result in these consequences.

Consumers and those outside the industry frequently forget or never considered that while utilities are by law always entitled to a fair return, it is a limited blessing in that higher earnings in buoyant times are not available to the utilities. There are no windfall profits such as may arise in other parts of the energy sector. It is only logical that the other side of that equation applies and a fair rate of return must also be allowed in less prosperous economic times.

**Judicial review of regulatory awards** The right to a fair return is one foundation of utility jurisprudence. Of concern is the growing development of the law that demonstrates a reluctance of the courts to review regulatory awards.

Until the 1930s, judicial review was more common as the courts viewed it their role to protect the public's interest. However, as Canada's industrial base grew and the operation of regulated utilities became both larger and more complicated, the view developed that a selected board of experts could deal more effectively with the rules of rate-making than the courts so long as the board in question acted within their jurisdiction, a successful appeal was unlikely.

The concept of judicial review was more elaborately defined by the SCC in *Pushpanathan v. Canada (Minister of Citizenship and Immigration),* [1998] 1 S.C.R. 982, where in summary it held that judicial review was identified by three tests. First, was the decision reasonable, second was the decision patently unreasonable and finally was the decision correct in law. It was only the latter, correct in law test, which receives a judicial welcome. It is the present law that a decision by the board must, if a question of

law be correct any other finding or decision of the board must be patently unreasonable before judicial review is available.

The human concern by applicants of regulatory boards is the question of bias and fairness. A board that is neither can mouth the established fair return definition but not accept the applicant's facts. It is obvious that a fair return is dependant on the facts accepted by the Board and, except in extreme circumstances, the courts will not interfere. For fairness to occur dictates good faith by all participants.

Notwithstanding the breadth of the discretion afforded a regulator in establishing just and reasonable rates, the mutuality of interest between utilities and their customers nevertheless requires that a fair return be provided for the services rendered. The term just and reasonable does not displace the common law standard, rather it supports it (NWL 1929; TCPL 2004; see also *Ottawa Electric Railway Co. v. Nepean Township* (1920), 605 S.C.R. 216 at QL5, 11-12; *Chastain v. British Columbia Hydro and Power Authority* (1972), 32 D.L.R. (3d) 443 (C.C.S.C.) McIntyre J. at p. 454-456; *Re City of Dartmouth* [1976], N.S.J. No.457, 17 N.S.R. (2d) 425, MacKegan C.J. at QL para 11). As the Federal Court of Appeal most recently expressed it, failure to observe the fair return standard would result in tolls that are not just and reasonable. In some cases, the courts confirmed that the fair return need not be modified out of deference to its impact upon customers.

**Conclusion** Accordingly, it can be seen that the legal framework governing the determination of a fair return is the "Comparable Return Standard". It does not mandate any particular approach to the determination of a fair return. The courts have recognized the regulators' expertise in this area as superior to their own. What pervades the courts' approach to the determination of a fair return, however, is the mutuality of interest as amongst utilities and their customers in tying the availability of a fair return to the long term viability of the utility in providing the essential monopoly services our society requires.

The latitude given boards to set rates includes the ability to rely on a formula. It is unlikely that any one formula can fit all rates. A decision by a board that distorts fair return by the application of a formula that achieves that result poses the obvious risk of being incorrect at law and subject to judicial revision on that ground, a result any board would seek to avoid.

## 2. Application

**The place given to the Lamont decision** In their decisions on ROE[5], Canadian gas utility regulators[6] have seldom made explicit reference to the Lamont decision (Lamont). There have been important exceptions. Thus, in its seminal first decision on TransCanada's rates, the National Energy Board (NEB) in 1971 stated that it had been guided by relevant jurisprudence, as well as by its understanding of the [NEB] Act and then cited the "fair return" portion of the Lamont decision[7], followed by other now familiar cases, Canadian and American. Then, some 30 years later, in dealing with an application for review and variance of its 1995 decision on Cost of Capital[8], the Board noted that the applicant had cited Lamont and it went on to summarize the key elements of that decision, stating that in considering the legal framework associated with the determination of a fair return, the Board had looked at both prior judicial and Board consideration of the issue[9]. That 2002 decision was the subject of an application for review and variance and, in addressing the fair return standard, the Board in 2003 examined its legal obligations and again cited Lamont along with other Canadian and American jurisprudence[10]. Finally, in dealing in 2005 with an application for new tolls, the Board summarized the evidence and provided its views on the legal framework for determining a fair return, giving attention to Lamont and other cases[11]. The Alberta Energy and Utilities Board[12] (EUB, Alberta Board) in its landmark July 2004 decision on the Generic Cost of Capital, as part of its consideration of the legislative and judicial framework, examined relevant decisions, Canadian and American, starting with Lamont[13].

**Lamont is present, whether explicitly so or not** Despite the scarcity of specific references, it is nevertheless reasonable to assume that, while acting in accordance with their respective legislative mandates, all Canadian regulators in making ROE awards to gas utilities have recognized the jurisprudence relating to fair return, and specifically the Lamont decision, whether they have said so or not. In addition to the Lamont test of "comparable investment" or opportunity cost of capital, drawing on American jurisprudence[14], regulators have concluded that, in order for a return to be fair, it must also meet the tests of "capital attraction" and "financial integrity"[15]. In this connection, the Régie de l'Énergie du Québec (Régie) has in several decisions accepted the view that the cost of capital must be evaluated on the basis of the fundamental principle of the market opportunity cost of capital and that the rate of return must allow the regulated entity to assure and maintain its capacity to attract funds under reasonable conditions[16]. In other cases, intervenors have drawn regulators' attention to the Lamont text[17]. In still others, the regulator has referred obliquely to the objectives of fairness and capital attraction[18].

**The traditional approach to ROE determinations** Prior to the mid-1990's, the practice of Canadian gas utilities was to make rate applications, often every one or two years[19], generally requiring re-determination of their ROEs as one component of the total revenue requirement that could be recovered in rates. In these proceedings, as the Ontario Energy Board (OEB) has noted, four main approaches were traditionally used by experts

to establish a fair ROE. The Comparable Earnings Test (CE), Discounted Cash Flow (DCF) test, Capital Asset Pricing Model (CAPM) and Equity Risk Premium (ERP) test [20], are all used in varying degrees to formulate an opinion regarding a fair return to investors for the test year. Parties, the OEB observed, have generally relied on a combination of these models to establish a utility's ROE. In a combined approach, the OEB and experts before it have assigned different weights to the results of the various tests in order to give more significance to those models which they consider to be the most relevant[21].

Within the compass of what must be a relatively short paper, it is impossible to trace the outworking of this approach by each of the Canadian gas utility regulators. However, successive NEB Reasons for Decision respecting TransCanada PipeLines' rates illustrate how this approach was followed by one regulator over the quarter century to 1994.

That Board, like others, was careful from the start to point out that "The final conclusion as to what is enough but not too much in the way of return is not precisely supportable on a mathematical basis."[22] "Many tests and techniques for assisting the process of reaching a just decision have been used" the Board said "but no single test is conclusive, nor is any group of them definitive: whatever tests may be used, in the last analysis the adjudicating body can not escape the responsibility of exercising judgment as to what, in a stated set of circumstances, is a just and reasonable return or rate of return, or what is a range of justness and reasonableness of return or rate of return."[23] Such reference to the necessity of the exercise of judgment in making return awards is a recurring theme in Canadian regulatory decisions over the years.[24]

**Diversity of tests applied in the traditional approach** Reverting to the NEB's practice, in the early years of the Board's "active" regulation of TransCanada's tolls, comparable earnings appear to have been at the centre of its attention. Thus: "The Board concludes, based primarily on the comparable earnings analysis of Canadian industrials which are reasonable alternative investment opportunities for the applicant's shareholders, that a return of…is appropriate for the test year…"[25] In an oil pipeline rate case about this time, there was applicant evidence "…that statistics relating to US utilities and industrials deserve perhaps a greater weight in the assessment of the current cost of equity capital than similar Canadian statistics." The Board however disagreed and expressed the belief that "…far greater weight should have been given to Canadian data…Accordingly the Board was particularly interested in the statistics presented relating to Canadian industrials…"[26] and concluded "…that the cost of equity should be equal to or slightly less than the opportunity cost of investment in such companies."[27]

By 1978, the evidence put before the Board included CE and DCF tests, the latter to measure "capital attraction", but additionally the beginnings of the ERP approach appeared. The applicant, TransCanada, was cited to the effect that "…a reasonable ROE could also be inferred from an examination of the yield differentials maintained in the past between long term bonds and those of an equity nature in the regulated industry".[28]

However, in that particular case, the Board again stated that it paid particular consideration to "…the CE of Canadian industrials which it believes to be representative of reasonable alternative investment opportunities for the applicant's shareholders."[29]

**Over time, the ERP becomes the focus** By 1981, intervenor evidence was being filed before the NEB and it related to the DCF method while the applicant relied primarily on the CE test[30]. However, within a couple of years something of a pattern had been established that was to last until the mid-1990s with the applicant and one intervenor filing CE, DCF and ERP evidence while gas-producer intervenors were focussing their efforts on the DCF approach.[31] In assessing this spectrum of evidence, the NEB tended over time to place at first "slightly more" reliance on ERP, to find inherent distortions in the CE data that it received and to be concerned about the results of the DCF test. By the time of the last rate hearing prior to the generic cost of capital proceeding, the Board found that "…in the light of recent and prevailing financial market conditions, neither the DCF test nor the CE test currently yield reliable results…" Accordingly these tests were given little or no weight in the Board's decision" and instead the Board was of the view that "…the ERP was the primary measure of investors' required returns in the circumstances of this case." However, the Board was careful to state its view that these tests (CE, DCF) may prove useful under different economic conditions.[32]

This era during which Canadian regulators determined ROE awards by reviewing evidence from multiple tests and applying their own judgment was summarized for the British Columbia Utilities Commission (BCUC, the BC Commission) in evidence and referred to by the Commission in a 2006 decision[33] as follows:

> "The evidence is that up to the 1960s the principal methodology to determine fair rates of return was CE, as, according to Dr. Booth, the DCF method and the ERP method which was derived from the CAPM, were developed in the 1960s. By the 1980s all three methodologies were in use in Canada. In the early 1990s capital markets in Canada fell into considerable turmoil, causing DCF and CE to give unreliable results, which resulted
> in the ERP becoming the main, if not the sole, methodology used by regulatory bodies in Canada to establish fair rates of return…The DCF and CE methods have never managed to restore themselves to favour in regulatory bodies' eyes...In the United States the DCF and CAPM methods got their start in the 1970s and have survived nearly unchanged as the primary rate of return methods, with the DCF the virtual default method in practically all U.S. regulatory jurisdictions."[34]

**Search for a generic approach to ROE** The context for the search by Canadian regulators for a generic approach to ROE was characterized by: frequent rate applications; repetitive evidence, often provided by the same expert witnesses, on the three principal tests; growing disenchantment with the CE and DCF tests; and increasing reliance on the ERP approach. That search was led by the BC Commission which "…was the first regulatory agency in Canada to examine the applicability of a generic, formula-based approach to setting a natural gas or electric utility ROE as a means of improving the efficiency and effectiveness of the regulatory process."[35]

**British Columbia** In its June 1994 decision resulting from that search,[36] the BC Commission expressed the view that the DCF test was of little use in the present economic climate, that CE raised a circularity problem when it was based on utilities data and that primary reliance should be placed on risk premium tests, with CE and DCF as checks. The Commission's view was that generic hearings produce cost savings and better quality of evidence because a variety of experts are gathered at a single point in time. This view has been borne out by the subsequent experiences of, for example, the Alberta Board and the NEB.

**National Energy Board** When the NEB reported its generic return decision nine months later in March 1995, it found that CE was only useful as a check, that there were practical limitations on the DCF method and that most experts gave primary weight to the ERP, which the Board also did. Annual adjustments in the resulting ROE were to be in a ratio of 0.75 of the forecasted change in the yields of Government of Canada long-term bonds (long Canadas).[37] The NEB later referred to this as "the RH-2-94 formula".

**Manitoba** Two months after that, the Manitoba Board Public Utilities Board (Manitoba Board, MPUB) decided a gas distributor rate case, prior to which the applicant had proposed a mechanical formula to adjust the Board's then-currently allowed ROE. The Board approved a spread, effectively an ERP, between long Canadas and the ROE for the distributor and an adjustment factor of 0.80 of the change in the underlying long Canada bond yields.[38]

**Ontario** The OEB has since 1997 followed its own guidelines on a formula-based return on common equity for utilities under its regulation.[39] The initial setup involved establishing a just and reasonable return applicable to each of the Ontario local distribution companies. This base comprised a forecasted yield on long Canadas for the test year to which was added an appropriate premium. The primary methodological approach to be used in evaluating the appropriate risk premium was the ERP. The annual adjustment factor proposed was 0.75 of the difference between the forecasted long Canadas yield and the corresponding forecasted yield for the immediately preceding year. The OEB gave three reasons for adopting the formula approach to ROE. The first was regulatory efficiency, already mentioned. The second was the weight of experience of other Canadian jurisdictions which had reviewed the issue and adopted a formula-based ERP. The third was that it may provide a first step towards formulaic rate making such as incentive rates.[40]

**Alberta** Alberta was the fifth jurisdiction to adopt a generic approach, which was done by a decision of July 2, 2004. The award for 2004 was based on the CAPM estimate, which the Alberta Energy and Utilities Board (Alberta Board, EUB) found was supported by no less than seven other methods examined in evidence while the Board did not put any weight on four other methods, including DCF and CE.[41] In this connection it is worth noting that the Board took the position that the CE test is not equivalent to the (Lamont) comparable investment test. The Board observed that the CE test measures actual earnings on actual book value of comparable companies, however it does not

measure the return "…it would receive if it were investing the same amount in other securities possessing an attractiveness, stability and certainty equal to that of the company's enterprise."[42] This conceptual concern was one of the reasons the Board gave to place no weight on the CE test. Nevertheless, the Board did consider that there may be other measures of comparable investments that should be considered in establishing an appropriate ROE. It went on to examine eight possible ones.[43] [44] As to the adjustment mechanism, the Alberta Board concluded that an adjustment to the generic ROE based on 0.75 of the change in forecasted long-Canada bond yield would be appropriate, beginning in 2005.[45]

**Québec** The Régie has since its decision D-99-11 of 10 February 1999 respecting a rates application by Gas Métropolitain, applied a *de facto* generic ROE based on the CAPM model with an annual adjustment equal to 0.75 of the forecasted change in the risk-free return.[46] This approach was reconsidered in 2007: the ERP was adjusted marginally upwards on the assessment that Gaz Métropolitan's risk had increased compared to that of the benchmark distribution utility. The adjustment mechanism was to be left unchanged through 2009. In the 2007 proceeding, the applicant introduced as an alternative to CAPM, for the first time in Canada, the Fama-French model, which is used in the financial industry, but so far used only once in the United States in the regulatory context and never before in Canada.[47] Even though the two models differ, the objective of both is to estimate the return an investor expects to earn on an investment in securities having a certain risk. The main difference between the two approaches is in the method used to express that risk which, the applicant contended, Fama-French does better than CAPM for utility-type businesses. The Régie however did not retain the Fama-French model for establishing the rate of return in this decision: the Régie considered that the application of that model to regulated enterprises has not been sufficiently examined to date to be used as a basis for fixing the rate of return of a distributor.[48]

**The generic approach reviewed and reconfirmed** Two of the regulators who pioneered the generic ROE with automatic adjustment mechanism (AAM)—the BC Commission[49] and the NEB[50]—subsequently reviewed their decisions of the mid-1990s. After again receiving and reviewing much expert testimony, in the NEB case on two separate occasions (2002, 2005), the established methodology was reconfirmed by both. Indeed, one considered that "It is clear the ERP methodology is the "gold standard" for Canadian regulators..." and stated that "…the Commission Panel will give primary weight to its application and results…"[51]

**A new test rejected** TransCanada recommended in the RH-4-2001 NEB proceeding that the Board adopt an After Tax Weighted Average Cost of Capital (ATWACC) methodology to establish a fair return for its mainline. This was a new methodology as far as the NEB was concerned and it rejected it, just as the Régie was in 2007 to reject the Fama-French test, and it reaffirmed the ERP.[52] [53]

**Legal obligation to apply the FRS?** In its consideration of the application for review of its 2002 decision (RH-R-1-2002), the NEB refuted the assertion of TransCanada that the Board "is required by law to apply the comparable investment, financial integrity and capital attraction standards to determine a fair return for the Mainline" as an overstatement of the law on this issue. The Board went on to note that in its decision which was under review (RH-1-2002), it had agreed that the three components of the FRS, along with the balancing of customer and investor interests should be attributes of a fair return. The Board further noted the statement it had made in RH-1-2002 that these principles are reflected in the various accepted methodologies to establish cost of equity capital, such as the ERP approach, which is the basis of the RH-2-94 Formula and that no one took issue with this statement. In the Board's view, it was implicit that the application of a test that reflects these standards would result in a return that meets these standards. Therefore, the Board did not have to state explicitly that the resulting return would meet the comparable investment, financial integrity and capital attraction standards. The Board stated that an express finding, such as was sought by TransCanada, which discharges the fundamental legal obligation of the regulator is not necessary when the standards that must be met are imbedded in the methodology used to determine the return. The Board also considered that there is no legal obligation to use an FRS, comprised of the comparable investment, financial integrity and capital attraction standards to determine tolls. Rather, in normal circumstances, a fair return established by the Board should meet those three elements. This, the Board stated, was accomplished through the methodology that was used to determine the return.[54] This issue was revisited in depth by the NEB in RH-2-2004, Phase II, which followed the decision of the FCA in TCPL v. NEB. The Board stated that it "…also agrees with TransCanada that the case law establishes that it is the overall return on capital to the company which ought to meet the comparable investment, financial integrity and capital attraction requirements of the fair return standard."[55] The Board went on to say that it is not required to meet the FRS by subscribing to any particular methodology or solely by examining evidence on overall return (TCPL had suggested neither). It concluded that it would ensure that each element going into the traditional methodology is "reasonable", then "…uses its judgment to ensure that the resulting return is a fair return in accordance with the legal requirements." [56] In summary, the NEB in RH-2-2004 Phase II accepted that the law requires application of the FRS, including the comparable investment, capital attraction and financial integrity standards, in determining the overall return, but does not stipulate any particular methodology for doing so.

**Risk-free rate critiqued** The applicant before the BC Commission in 2006 stated, in the words of the Decision, that "the theoretical CAPM assumes that the risk-free rate is uncorrelated with the return on the market. However, the application of the model typically assumes that the return on the market is highly correlated with the risk free rate, that is, that the equity market return and the risk-free rate move in tandem. Similarly, an ROE formula that is predicated on a close tracking between the allowed return and the risk-free rate assumes the risk-free rate and the return on the market are highly correlated. The theoretical CAPM calls for using a risk-free rate, whereas the typical application of the model in the regulatory context employs a long term government bond yield as a

proxy for the risk-free rate. Long-term government bond yields may reflect various factors that render them problematic as an estimate of the "true" risk-free rate, including:

> the yield on long-term government bonds reflects the impact of monetary and fiscal policy;
> yields on long-term government bonds may reflect shifting degrees of investors' risk aversion; and
> long-term government bond yields are not risk-free; they are subject to interest rate risk."[57]

This critique of the risk-free rate and the relationship of market returns to that rate, although recorded by the Commission, was not responded to in the Commission's decision.

**Convergence among Canadian gas utility regulators** Recent years have seen a rapid and complete convergence among the five Canadian utility regulators who have major gas distribution and transmission entities under their jurisdictions. All now base their ROE awards essentially on judgments as to an appropriate base year ROE for a benchmark utility. In every case, this base year award uses a risk free rate plus an ERP with, in some cases, an allowance for flotation costs. Subsequent annual adjustments are made mechanically on the basis of 0.75 of the changes in the forecasted long Canadas yields.[58]

**Insofar as incumbent utilities are affected, the generic ROE plus AAM is entrenched in Canadian regulatory practice—**Canadian regulators have in the last dozen years affirmed and reaffirmed the generic ROE based essentially on the ERP methodology as the sole method of awarding and, through the associated AAM, varying the returns on equity for gas utility investors. This position has withstood several review applications and one appeal to the courts. In one important case, as a result of a negotiated settlement, it cannot be reopened before 2012.[59]

**Contrast with American practice** This Canadian situation stands in sharp contrast with that in the USA with which Canada shares the tradition of cost of service utility regulation where the fairness of return on investment is evaluated against the opportunity cost of capital.[60] There, only two commissions undertook what turned out to be lengthy, expensive and ultimately unsuccessful searches for a generic solution. There is a longstanding seeming disinterest on the part of the American regulatory community in pursuing this search. Instead, where rate cases are not settled, U.S. regulators continue to rely on the application of judgment to multiple test results[61] with DCF as the default mechanism[62].

### 3. Results from the mid-1990s

**The number and duration of rate proceedings involving ROE evidence significantly reduced** In the period 1971-1994 inclusive, the NEB in respect of only one company, TransCanada, averaged one rate proceeding every 18 months. It is likely that, with TransCanada having now settled its tolls for the period 1 January 2007 through 31 December 2011, the similar hearings in the period 1995-2011 will turn out to have averaged one per eight years. Similar regulatory efficiencies affecting a large number of utilities, electric as well as gas, are being found by the principal provincial jurisdictions.

**In some jurisdictions, the way paved for long-term settlements of rate matters** The NEB's experience again furnishes an example. The Board's decision on a generic rate of return may have been a factor enabling TransCanada[63] and Westcoast Energy[64] to achieve their first multi-year negotiated settlements of remaining toll and tariff matters. Note that one of the objectives of both settlements was "to maintain ("or improve", in the case of TransCanada) the financial integrity…" of the pipeline company.[65] [66]

Regarding the Alberta Board, on the one hand a month after bringing down its Generic Cost of Capital decision in July 2004 approved NOVA Gas Transmission Ltd's (NGTL) application to commence negotiated settlement discussions. These eventuated in a settlement of all revenue requirement issues, return on equity being treated as a flow-through item, for the three-year maximum period allowed by the Board, commencing 1 January 2005.[67] On the other hand, prior to the implementation of the ROE formula, Northwestern Utilities and ATCO Electric both negotiated settlements. Since the introduction of the formula there have been no long term settlements other than NGTL.

The BC Commission has approved a Settlement Agreement for Terasen Gas for 2004-2007, incorporating a Performance-Based Rate Plan,[68] and subsequently approved its extension for 2008-2009.[69]

As to pipelines under the NEB's jurisdiction, two points are notable. First, settlements of toll issues have been the norm for oil pipelines since the mid-1990's. Second, all new oil and gas pipelines have applied for tolls, based on settlements, where the ROE exceeds that generated by the Board's generic formula, often by a generous amount.

**Transmission utilities' incentive agreements have provided for efficiency gains and sharing of those gains between customers and utility owners** Annual or biennial adversarial proceedings relating to ROE are for transmission businesses now a thing of the past. This may have encouraged and enabled parties to settlement negotiations to build-in to the resulting agreements features that encourage these pipelines to search for efficiencies with the prospect of retaining for the investor a share of those efficiencies. All of the negotiated settlements mentioned in the previous paragraph incorporate such features in one form or another. In a degree, these shared savings mechanisms have cushioned the impact of declining ROEs resulting from the application of the generic ROE decisions in an environment of declining bond yields. For example, in the letter to

shareholders accompanying TransCanada's 1996 Annual Report, the management commented that there had been a one per cent decline in the rate of return on common equity allowed by the NEB in 1996. The letter went on to say "That one per cent represented a reduction in 1995 earnings of about $21 million that had to be made up. A substantial part of it came from discretionary revenue earned under an incentive agreement reached late in 1995 between TransCanada and its customers. Incentive regulation allows TransCanada to share in discretionary revenues and cost savings."[70] This cushioning effect may be available to some pipelines on a continuing basis, but in a regulatory context its results must not be seen as an element of a fair return. Fair return relates to the opportunity cost of capital. Earnings from incentive agreements are rewards for extraordinary cost-savings and for entrepreneurship in devising service offerings that create value for which shippers are willing to pay. As the Federal Court of Appeal reminded in the 2004 TransCanada decision,[71] the fair return must be determined independently of its impact upon resulting customer rates.

**But Canadian and U.S. regulators' ROE practices are now widely divergent after decades of essentially parallel approaches** Canadians have converged on the generic approach using essentially anticipated risk-free rates plus ERP and adjusting by a ratio to anticipated changes in risk-free rates. In the U.S., the federal and one state commission attempted to regularize the ROE component of rate cases, but failed to do so. One commentator has stated that "Efforts to make the process objective and mechanical are futile as an administrative and practical matter."[72] Instead, where cases are litigated, commissions continue to refer to the legal standards set by the landmark U.S. Supreme Court decisions in Bluefield and Hope. The regulators receive and access data from quantitative financial models and apply informed judgment in order, as the California Pubic Utilities Commission (CPUC, California Commission) has put it, to arrive at "An ROE set at a level commensurate with market returns on investments having comparable risks, and adequate to enable a utility to attract investors to finance the replacement and expansion of a utility's facilities to fulfill its public utility obligations."[73] Moreover, U.S. regulators: have continued to accept evidence that depends in large part on data about other U.S. gas and electric companies' returns; have had at least some regard to short term bond rates; and in some cases have stated a consistent practice to moderate changes in the ROE relative to changes in interest rates in order to increase the stability of ROE over time.[74]

**And Canadian gas utility ROEs have fallen significantly below those of American ones and below those of low risk North American industrials** Historically, the ROEs of Canadian gas local distribution companies (LDCs) have approximately matched those in the U.S. industry. Since the inception of the generic ROE approach by Canadian regulators, the returns enjoyed by Canadians have fallen increasingly and significantly (up to 150 bp) below those of these comparables. This result arises despite the fact that independent analysis shows that business risks faced by LDCs in Canada do not significantly differ from those in the U.S.; that the greatest risk-determinant for utilities, regulatory risk, is comparable in Canada and the U.S.; and that tax differences do not matter to the comparison of Canadian and U.S.[75] [76]

**ROEs for greenfield interprovincial and international pipelines** In the "generic ROE era" it has become the practice for new pipelines subject to NEB jurisdiction to apply for tolls that have been the subject of prior negotiation with shippers. Typically, these tolls reflect ROEs about 300 or more basis points higher than incumbent pipelines, such as Foothills, TCPL, TQM and Westcoast, receive under the generic ROE.[77] Two points arise. First, this practice suggests that the NEB's generic ROE is insufficient to attract capital needed for greenfield projects. Second, one wonders whether this *de facto* vintaging of ROEs in the Canadian interprovincial and international pipeline sector breaches a fundamental principle of fairness.

## 4. Implications

**On the one hand, the generic ROE has created regulatory economies and encouraged the search for other efficiencies in the sector** The frequency of adversarial proceedings leading to ROE awards has been greatly reduced with consequent public and private savings. The generic ROE may have encouraged negotiated settlements of remaining rate issues, which typically incorporate elements of incentive rate-making encouraging efficiencies in investment and operations. Some utilities may have been able in this way to partially compensate for the low ROEs resulting from the application of the generic formula. However where that may have happened, it has been at the expense of greater risks by the utilities. Even with the presence of incentive features, there is no assurance that settlements will result in a "fair return" being earned each year of the settlement and over its lifetime, which could be as much as five years. The scope to achieve efficiencies while ensuring high quality of service may be exhausted and the overall return may fail to meet the fairness standard.

**On the other hand, the generic ROE approach is mechanistic and necessarily suspends the further application of regulatory judgment for extended periods, marking a sharp break with past practice**

- It was not uncommon in the past for regulators to expressly reject mechanistic approaches to ROE awards and stress the importance of judgment.[78] The initial generic decisions and any subsequent reviews, like the annual or biennial rate cases that preceded them, were based on careful assessment of much evidence and the application of informed regulatory judgments.

- However, once decisions are taken on a generic process, including the now universal AAM, the further application of judgment as to whether the FRS is being attained is suspended.[79] In principle, as the Alberta Board has observed, parties are free at any time to petition the regulator to consider a review of the adjustment formula in which, in Alberta, the petitioning party would bear the onus of demonstrating a material change in facts or circumstances from the evidence filed in its generic proceeding to merit a review of the formula.[80] In practice, the party's freedom to petition can be circumscribed for periods as long as five years as a result, for example, of a settlement agreement, a term which can therefore cover one or more economic cycles.

**It would appear from work done prior to [81] and parallel with [82] this review that the FRS may not have been achieved on an ex-post basis** This important conclusion is suggested by the comparison of Canadian gas LDCs' ROEs and the ROEs of U.S. gas utilities and North American low risk industrials, already referred to. It seems reasonable as an aspect of the industry oversight expected of regulators that, especially after a change as fundamental as the generic ROE, they would assess that change in terms of

whether the results required *ex ante* by the FRS have in fact been achieved *ex post*, with particular regard to the opportunity cost of capital. Such an examination by regulators is particularly warranted because the generic ROE plus AAM effectively prevents regulated entities from routinely presenting evidence and argument as to whether *ex post* the resulting ROEs have indeed reflected opportunity pricing of the cost of capital and achieved other objectives of the FRS which the generic regime is intended prospectively to do.[83]

**Two fundamental features driving ROE changes and arguably driving the "wedge" between Canadian LDC returns and others, namely the risk free rate and the AAM ratio appear to deserve critical examination**

- On the first point, as noted in Section 2 above, while one applicant has critiqued the risk-free rate, the regulator involved (the BC Commission), although summarizing the applicant's concerns, did not respond to them. It is not difficult, for instance by reading the Bank of Canada's periodic comments on factors influencing rates to find reasons to question why LDC ROE's should be directly linked to bond rates.[84]

- On the second point, the AAM ratio of 0.75 (and the 0.80 chosen initially by one regulator) had some empirical support in the proceedings leading to the respective initial generic decisions. Also it received principled support by the applicants in a number of proceedings. However it appears not subsequently to have been critically evaluated in terms of the behaviours of equity returns of comparable unregulated sectors in relation to changing bond yields in the dozen years since the earliest Canadian generic ROE decisions.

- Regarding U.S. LDC returns, the work of Concentric Energy Advisers for the OEB has shown a much lower coefficient of regression (0.46) between U.S. ROEs and long bonds compared to Ontario ROEs (0.86): in other words, that is for every one percentage point change in interest rates, the Ontario ROEs change by 86 basis points while U.S. ROEs change by 46 basis points.[85]

**The generic, mechanistic ROE including the AAM may require some reconsideration, if the FRS is to be achieved on a going forward basis**

The work carried out by Concentric for the OEB and by National Economic Research Associates (NERA) for the CGA identifies concerns that sow a doubt as to the ability of the present design of the generic ROE to continuously meet the fair return standard. It is indisputable that this bold and widely-welcomed initiative of Canadian regulators has entrained and encouraged valuable public and private efficiencies. However, in exchange, the generic ROE has reduced the opportunities, present in previous practice, to periodically exercise oversight of this critical element in the revenue requirement, review the results of a variety of tests, apply informed judgments to them, and recalibrate their ROE awards in conformity with their understanding of the FRS. Even though regulators are willing to entertain applications for review of the generic approach, it remains that

there are necessarily fewer examinations of the relevant data to ensure the generic formula plus the AAM continues to produce end results which meet the FRS.

Examination of the results of the generic approach, ex-post, suggests that, in an environment where interest rates have been, first, falling and then stabilizing at low levels, the generic ROE plus an AAM that tracks changes in expected bond yields in a ratio of 0.75 may have pulled ROEs down excessively in relation to the FRS and that, in the judgement of Concentric, "This may require consideration of additional qualitative and financial metrics in making the ROE determination."[86] In other words, what was found to be "fair and reasonable" or "just and reasonable" by careful examination of multiple tests and the appropriate exercise of informed judgment, may no longer be so after successive adjustments by admittedly-simple AAMs taking place in continuously changing economic and business conditions.

**The remarkable convergence among Canadian gas utility regulators may be an obstacle to reappraisal of the ERP plus AAM approach to the generic ROE**

The NEB in dealing with TransCanada's Fair Return Application dated 6 June 2001, centred on a novel After Tax Weighted Average Cost of Capital (ATWACC) approach, stated: "In summary, in the Board's view, the lack of regulatory precedent is not a barrier to the adoption of a new approach to regulation. However, in the absence of such precedent and in the absence of any support from stakeholders for the proposed change (meaning to the ATWACC approach—authors), the Board's analysis of the proposal should show a clear benefit to be derived from the new approach when compared with previous acceptable approaches."[87] As already noted, the Régie in 2007 was similarly faced with a novel approach proposed by Gaz Métroplitan, the Fama-French model which, according to the evidence, had never before been used in Canada and only once in the USA. The Régie decided not to retain Fama-French as a method of fixing the ROE because it had not been sufficiently examined to date to be used as a basis for fixing the rate of return of a distributor.[88]

In view of the foregoing, it is reasonable to pose the questions "Is there likely to be regulatory precedent and stakeholder support for initiatives by the gas utility industry for review of and change in the generic ROE?"

As to "regulatory precedent", it may not be easy for any Canadian regulator to "break ranks" with the rest, particularly after several have relatively recently reviewed their generic ROE practices and decided against major changes to them. Having taken place, regulatory convergence may be a powerful disincentive even for needed changes.

As to "stakeholder support", it appears that Canadian gas utility stakeholders are continuing in their virtually unanimous support of the respective regulators' established approaches. In the environment of generally-declining bond yields, the present design of the generic ROE has worked to the short-term economic advantage of industrial users, residential consumers, producers and shippers. This has generated an attitude, common in the regulatory world, of "what we have we hold". As long as the provision of safe and adequate service does not seem to be immediately at risk, this attitude is likely to

continue. Broad stakeholder support for major revisions favourable to the utilities seems unlikely to materialize so long as utilities seem able to attract capital and avoid impairing their financial integrity. It appears doubtful, however, that the FRS is satisfied by these considerations alone if the end result is unfair relative to returns available from investments in companies of similar risk.

**Desirable next steps** It would be helpful if, at the same time as specific cases occasionally come before individual regulators,[89] some further studies of general application were to be carried out. It is not the purpose of this paper to propose an alternative framework for ROE determination. However, any reconsideration should clearly take place against the background of an *ex post* examination of the results of the generic approach in terms of the comparability of the resulting returns with non-utility and utility comparators. It must include the fundamentals of the present design, namely the choice of the risk-free rate, the appropriate measurement of the risk premium and the adjustment mechanism. And it cannot exclude consideration of the place of the DCF model, given its acceptability to a majority of North American regulators. Finally, in an era of North American economic and business integration, the question must be asked "Can Canadian gas utilities successfully compete for capital if their regulators continue to award lower returns on generally thinner equity shares than those enjoyed by the American industry?"

Absent such a reconsideration and consequent adjustment, in an environment of continuing very low interest rates and bond yields, the present generic ROE formula alone may not be protecting the public interest in the provision by incumbent utilities of a robust, flexible natural gas delivery structure financially strong to support future sustainability of our energy economy.

## ENDNOTES

[1] The jurisdiction is Alberta. The test is the traditional comparable earnings one. See under heading 2 "Application", subheading "Alberta" on page 16.
[2] The word "stakeholder" has become an undefined term of art, particularly in NEB decisions on applications reflecting negotiated settlements, where it may be used as a synonym for parties to those settlements. In this paper, by "stakeholders" are meant parties, other than utility managements and shareholders, who have an economic interest in gas utility rates or tolls and who routinely take part in related regulatory proceedings and in settlement discussions. In this definition, depending on the nature of the utility, "stakeholder" can mean gas producer; shipper; exporter; industrial, commercial or residential consumer; or provincial government.
[3] An example may be the application to the NEB by Gazoduc TransQuébec & Maritimes (TQM) for Cost of Capital for 2007 and 2008, revised filing December 18, 2007, the first such application by that company since 1994. However, because of the complexity of the issues involved in this application and because of language considerations, a longer than normal hearing process is required. The hearing is presently scheduled to commence 23 September 2008, which means that a decision on this hearing would not be released until early 2009. See National Energy Board letter to TQM of 22 January 2008, file OF-Tolls-Group1-T201-2007-03 01.
[4] *Return on Equity: Allowed Returns for Canadian Gas Utilities*. A Discussion Paper Developed by the Canadian Gas Association. Summer 2007. 20 pages in bilingual format.
[5] The Lamont decision relates to "…a fair return…on the capital invested in its enterprise…" (S.C.R., 1929, page 193). However, the costs of debt and any preferred shares, assuming they are prudently incurred, are usually taken as a cost to be flowed directly through to rates via the cost of service. The ROE is therefore the salient variable in the fair return on the (total) capital invested in the enterprise. The discussion in this paper relates entirely to regulators' awards for the return on the owners' equity investment. It does not extend to consideration of what those awards mean in terms of return on the total capital invested by the utility in question even though, and the authors acknowledge this, the entire focus of the Lamont decision is on return on the total capital.
[6] By "Canadian gas utility regulators" is meant the relevant regulatory boards and commissions of Alberta, British Columbia, Canada, Manitoba, Ontario and Quebec.

[8] NEB, RfD, TransCanada et al. Cost of Capital. RH-2-94, March 1995.
[9] NEB, RfD, TransCanada PipeLines Limited. Cost of Capital (Fair Return Application of 6 June 2001). RH-4-2001, June 2002, pages 8-12.
[10] NEB, RfD, TransCanada PipeLines Limited. Review of RH-4-2001 Cost of Capital Decision. RH-R-1-2002, February 2003, Chapter 3: Fair Return Standard, pages 6-12.
[11] NEB, RfD, TransCanada PipeLines Limited. Cost of Capital. RH-2-2004 Phase II, April 2005, Chapter 2 Legal Framework for Determining a Fair Return, pages 8-20. In this context, the NEB noted the finding of the Federal Court of Appeal in TransCanada's unsuccessful appeal of the Board's 2002 decision. The Court, the Board stated, found that the impact of any resulting toll increases on customers is not a relevant consideration in the determination of the required rate of return on equity.
[12] Since January 1, 2008 the economic regulatory functions of the former EUB in respect of investor-owned and certain municipally-owned utilities are being exercised by the Alberta Utilities Commission (AUC).
[13] Energy and Utilities Board (EUB), Decision 2004-052, Generic Cost of Capital, July 2, 2004, Section 3.2 Relevant Judicial Decisions, pages 12-13.
[14] The principal American Supreme Court decisions are *Bluefield Water Works & Improvement Company vs. Public Service Commission of The State of West Virginia et al 262 U.S. 679 [1923]* (Bluefield) and *Federal Power Commission et al vs. Hope Natural Gas Co., 320 U.S.591* [1944] (Hope). They are cited by the NEB in RH-1-70 (op.cit.) at 6 – 8 and 6 – 9, RH-4-2001 (op.cit.) at page 8 and RH-2-2004 (op.cit.) at pages 14-16.

[15] This is borne out by the Alberta Board in EUB Decision 2004-052 (op.cit.) where after quoting from Northwestern, Hope and Bluefield, it stated at page 13 that "The Board notes that no party took issue with the general consensus that in order for a return to be fair, it must meet the tests of "comparable investment", "capital attraction" and "financial integrity" described in the above decisions.

[16] « La Régie accepte…que l'évaluation du coût des capitaux propres sur base présumée doit reposer sur le principe fondamental du coût d'opportunité de marché des capitaux propres…La Régie est d'avis que le taux de rendement accordé au Distributeur doit lui permettre d'assurer et de maintenir sa capacité d'attirer les fonds à des conditions raisonnables » Source : Régie de l'Énergie du Québec. Hydro-Québec. D-2003-93. 2 mars 2003, à la page 70. The same principles had earlier been expressed in Régie de l'Énergie du Québec. Hydro-Québec. D-2002-95. 30 avril 2002, à la page 163. These were admittedly electric utility cases, however since the Régie uses essentially the same methodology to determine its ROE awards for Québec gas utilities, it is reasonable to suppose that it does so in pursuit of the same principles of opportunity cost of capital and capital attraction as it applies to the electrical sector.

[17] Manitoba Public Utilities Board Act. Centra Gas Manitoba Inc. General Rate Application. Order No. 99/07, July 27, 2007, page 65.

[18] Ontario Energy Board (OEB) Compendium to Draft Guidelines on a Formula-Based Return on Common Equity for Regulated Utilities (OEB Compendium). Chapter 2: Current OEB Approach, page 2, which reads in part "The Board's objective in setting the rate of return on rate base is to ensure that the utility is provided with a fair return which enables it to meet its obligations and maintain its capability of attracting capital".

[19] By way of example, TransCanada PipeLines averaged one such application to the NEB per 18 months in the period 1971-1994 inclusive.

[20] The NEB in RH-4-2001 (op.cit.) at page ix (Glossary of Terms) characterizes the ERP method as a family of models that includes CAPM and ECAPM (Empirical Capital Assets Pricing Model). See also RH-4-2001 page 48, second paragraph.

[21] OEB, op.cit.

[22] NEB, RH-1-70 op cit, page 6 – 6.

[23] NEB, op cit, pages 6 – 2 and 6 – 3.

[24] The application of informed judgement is similarly a constant in American regulators' decisions in utility rate cases. Consider the following from the California Commission's December 15, 2005 Decision 05-12-043 on the Test Year 2006 Return on Equity for the Major Utilities (Pacific Gas and Electric [PG&E], Southern California Edison [SCE] and San Diego Gas and Electric [SDG&E]). At page 23, the Commission stated "In the final analysis, it is the application of informed judgment, not the precision of financial models, which is the key to selecting a specific ROE estimate. We affirmed this view in D.89-10-031, which established ROEs for GTE California, Inc. and Pacific Bell, noting that we continue to view the financial models with considerable skepticism." The Commission then uses the term "informed judgment" eight times in respect of its own decision-taking. As a matter of interest the resulting ROE awards for 2006 were, for PG&E 11.35%; for SCE 11.60%; and for SDG&E 10.70%.

[34] This statement is from an article by Dr. Jeff D. Makholm in Public Utilities Fortnightly, May 15, 2003, pages 12-18, "In Defense of the 'Gold Standard'". The fuller context is as follows: "The fair rate of return became a hotly contested issue in the early 1970s…The DCF and CAPM methods got their start at this time and have survived nearly unchanged as the primary rate of return methods, with the DCF the virtual default method in practically all U.S. regulatory jurisdictions." (Makholm, page 14, column 1).

[35] OEB, op cit, page 8.

[36] BC Utilities Commission, Decision in the matter of Return on Common Equity, BC Gas Utility et al, June 10, 1994, see especially pages 17-18.

[37] NEB, RfD, RH-2-94, TransCanada et al, Cost of Capital, March 1995.
[38] Manitoba Public Utilities Board Act, Order No.49/95, May 5, 1995 in an application by Centra Gas Manitoba Inc. The Manitoba Board in that decision reserved the right to require a full ROE hearing prior to the 1997 test year as a result of unusual or significant changes in the economy. However such a hearing did not take place. Centra Gas Manitoba was acquired by Manitoba Hydro, a provincial crown corporation, in 1999 and the ROE was subsequently replaced by a provision for a net income as part of Centra's costs, the allowed net income would not exceed the allowed return on equity under the Rate Base/Rate of Return methodology—see Manitoba Public Utilities Board Act, Order No. 103/05, July 12, 2005 in an Application by Centra Gas Manitoba Inc, page 40.
[39] OEB, Draft Guidelines on a Formula-Based Return on Common Equity for Regulated Utilities, March 1997 (not page numbered).
[40] OEB, Compendium, op cit, page 24, Section 5.1 Rationale for Draft Guidelines, Rationale for Adopting Formula ROE.

[50] NEB RfDs in TransCanada PipeLines Limited: Cost of Capital. RH-4-2001, June 2002; RH-R-1-2002, Review of RH-4-2001 February 2003; Cost of Capital. RH-2-2004 Phase II, April 2005. The RH-R-1-2002 decision was unsuccessfully appealed to the Federal Court of Appeal by TransCanada PipeLines (2004 FCA 149).
[51] BC Utilities Commission, op cit, page 52. Note that, while intending to give primary weight to the application and results of the ERP method, the Commission stated that it would need to apply judgment to the evidence before it.
[52] NEB RfD, TransCanada PipeLines Limited, RH-4-2001, pages 45-56.
[53] It may be noted that the EUB in Decision E99099, 1999/2000 Electric Tariff Applications, 25 November 1999 decided to "use both the traditional method and a modified ATWACC as tools to arrive at the fair return for (a number of electric utilities) with primary weight placed on the traditional method." (see page 328). The ATWACC evidence, which was accepted by the EUB with some modifications to its results, was submitted by the same witness (Dr.Vilbert) whose methodology and results were rejected by the NEB in RH-4-2001.
[54] NEB RfD, RH-R-1-2002, op cit, pages 11-12 Legal Obligation to use the FRS.
[55] NEB RfD, RH-2-2004, op.cit., page 19.
[56] Ibid.
[57] BCUC, Decision in Terasen et al, March 2, 2006, page 46.
[58] The degree of convergence as reflected in the annual ROE awards is remarkable. Thus, for year 2008 the range of ROEs is only about 50 basis points (bp) with La Régie at 8.91% (Gaz Métro) and the OEB at 8.39% and the EUB, NEB and the BCUC in the middle of the range with 8.75%, 8.71% and 8.62% respectively. Contrast this with the spread of 65 bp in the awards by one American regulator to three utilities for one year (footnote 25).
[59] The case is TransCanada's Canadian mainline. The negotiated settlement of March 2007 relates to the period 2007-2011 inclusive and provides that, during the Term, TransCanada will not pursue litigation of the NEB RH-2-94 ROE formula on behalf of… its Mainline System—see TransCanada PipeLines,

Application to the NEB, March 14, 2007: Application for Approval of a Negotiated Mainline Tolls Settlement and 2007 Mainline Tolls. Page 5 of 13, item 19. This Negotiated Settlement was approved by the NEB on 31 May 2007 by Order TG-06-2007.

[60] American regulators routinely cite their legal standard for fair return, essentially the Bluefield and Hope cases which are sometimes referred to also by Canadian regulators (examples: Alberta Board, NEB, see pages 11-12 above). The California Commission does so in the following terms in case D-05-12-043 (Test Year 2006 Return on Equity for the Major Energy Utilities) "The legal standard for setting the fair rate of return has been established by the United States Supreme Court in the Bluefield and Hope cases. The Bluefield decision states that a public utility is entitled to earn a return upon the value of its property employed for the convenience of the public and sets forth parameters to assess a reasonable return. Such return should be equal to that generally being made at the same time and in the same general part of the country on investments in other business undertakings attended by corresponding risks and uncertainties. That return should also be reasonably sufficient to assure confidence in the financial soundness of the utility, and adequate, under efficient management, to maintain and support its credit and to enable it to raise the money necessary for the proper discharge of its public duties. The Hope decision reinforces the Bluefield decision and emphasizes that such returns should be sufficient to cover operating expenses and capital costs of the business. The capital cost of business includes debt service and stock dividends. The return should also be commensurate with returns available on alternative investments of comparable risks.

[61] A sampling of relatively recent cases finds that the California Commission received and used DCF, CAPM and MRP evidence in case D-05-12-043 (see footnote 24), the Illinois Commerce Commission accepted DCF and CAPM evidence in a September 2005, once-in-a-decade decision on Northern Illinois Gas Company's rates; the New York Public Service Commission (NYPSC) received CAPM, CE, DCF and ERP evidence, found CE and ERP not to be particularly useful, and gave a 50/50 weighting to CAPM and DCF in a 2007 National Fuel Gas rate case (Case 07-G-0141).

[62] See above, text page 15 and footnote 34.

[63] NEB, Letter Decision, RH-2-95, December 1995. The TransCanada settlement covered the period 1 January 1996 through 31 December 1999.

[64] NEB, RfD, Westcoast Energy Inc., RH-2-97, Part II, August 1997. The Westcoast settlement covered the period 1 January 1997 through December 31, 2001.

[65] NEB, Compilation of Key Documents Related to the Board's RH-2-95 Decisions, TransCanada, June 1996, page 19, sub Article 1, item 1.2, v).

[68] BCUC Order G-51-03 of 29 July 2003 for the initial term.

[69] BCUC Order G-33-07 of 23 March 2007 for the extension.

[70] "TransCanada PipeLines. Annual Report, 1996. Letter to Shareholders, page 4, final paragraph.

[71] Supra, page 9.

[72] Makholm, Jeff D., op cit, page 18, column 1.

[73] CPUC, D-05-12-043 on Test Year 2006 Return on Equity for the major energy utilities, Findings of Fact, paragraph 16.

[74] It is acknowledged that the Canadian "0.75 ratio" to forecasted changes in long Canadas has this effect.

[75] National Economic Research Associates (NERA). Allowed Return on (Gas Utility) Equity in Canada and the United States: An Economic, Financial and Institutional Analysis. Ken Gordon, Jeff Makholm, Wayne Olsen, November 2007. Tax differences are dealt with on page 13, business risk on pages 24-25 and regulatory risk on pages 25-32.

[76] Concentric Energy Advisors concluded for the OEB that "(6) On the whole, there are no evident fundamental differences in the business and operating risks facing Ontario utilities as compared to those facing U.S. companies or other provinces' utilities that would explain the difference in ROEs." See Concentric op. cit., Section VII Conclusions and Summary of Findings, paragraph (6) on page 57.

[77] *Alliance Pipeline Ltd* (Alliance) filed on 31 October 2007 its normal annual toll revisions to become effective 1 January 2008 The NEB filing ID is A16816. Alliance noted that the filed-for tolls reflect a base return on equity of 12%, subject to an incentive adjustment, on a deemed capital structure that provides for 30% equity. These are the same numbers as appeared in Alliance's original certificate application to the

NEB which was approved in November 1998 in GH-3-97. At the time of writing, Alliance's 2008 tolls are still interim.
*Emera Brunswick Pipeline Company Ltd*. reached a negotiated agreement for a monthly fixed toll that would cover all fixed charges including an equity return typically in the 11 to 14 percent range. NEB RfD Emera Brunswick Pipeline Company Ltd., GH-1-2006, May 2007, Section 7.1 Tolls and Tariffs, page 76
*Mackenzie Valley Gas Pipeline*, Section 3.1 of the August 2004 application in GH-1-2004 which is still under consideration presents toll principles that include a deemed capital structure based on 30% equity and an ROE equal to the NEB multi-pipeline ROE plus 2.21% for the initial 10 years, see page 3-4
*Maritimes and Northeast Pipeline* filed on 28 December 2007 a negotiated toll settlement for the calendar year 2008 which embodies an allowed ROE of 11.66 per cent on a deemed equity of 31.18%. NEB filing ID A17299.

[78] The seminal NEB decision in TransCanada's first rate application, RH-1-70 of December 1971 contains some important language relating to both points.
First, as to mechanistic approaches, the Board stated at page 6 – 6 "The final conclusion as to what is enough but not too much in the way of return, and rate of return, is not precisely supportable on a mathematical basis. If it were, one computer and a few programmers could replace all the regulatory boards in North America and dispense undeniable justice instantaneously."
Second, as to the exercise of judgment, the Board said at pages 6 – 2 and 6 – 3 that "Many tests and techniques for assisting the process of reaching a just decision have been used, but no single test is conclusive nor is any group of them definitive: whatever tests may be used, in the last analysis the adjudicating body can not escape the responsibility of exercising judgment as to what, in a stated set of circumstances, is a just and reasonable return or rate of return, or what is a range of justness and reasonableness of return or rate of return." These early comments by the NEB in a sense echo the view expressed by the SCC in Lamont where, in 1929 S.C.R., at page 199, the Court stated "The question of a fair rate of return on a risky investment is largely a matter of opinion, and is hardly capable of being reduced to certainty by evidence, and appears to be on one of the things entrusted by the statute to the judgment of the Board."

[79] Note that, in applying its automatic mechanism to adjust the rate of return on common equity, the BCUC initially advised the affected companies that it had "…reviewed the performance of the automatic mechanism to adjust the rate of return…and has determined that the mechanism has performed favourably." (Letters L-61-96, December 2, 1996; L-73-97 of December 2, 1997; L-89-98 of December 4, 1998). After 1998, however, the references to review and to favourable performance were dropped and the annual notification letters now simply state that "…the Commission has determined that the current ROE automatic adjustment mechanism results in an allowed return of…" (example: Letter L-93-07 of November 22, 2007). Essentially the same approach is followed by the EUB (Example: Order U2007-347 of 30 November 2007) and NEB (Example: Letter of 29 November 2007, File OF-TollsGen-RRCE 02).

[80] EUB Decision 2004-052, July 2, 2004, page 34.

[81] CGA op cit, Section 3: Maintaining a Fair Return, pages 14-17.

[82] NERA, op cit, particularly pages 7 – 11.

[83] Note that the EUB, in giving its reasons for establishing a standardized approach for setting an ROE, stated "An applicant is also free to apply to the Board to review the ROE formula in the manner provided for in this Decision. Even without an application by a particular party, the ROE formula will be subject to review in certain circumstances and in any event will be considered for review after five years." See EUB, Decision 2004-052, op.cit., page 8.

[84] A scan of Bank of Canada published comments for the past few years points to the following as rate-affecting monetary policy factors: economic growth; utilization of economic capacity; demand on the economy, domestic and export; inflation rates and inflation risks; U.S. economy and major sectors; global economy and major components EU, Japan, China; global markets, including commodity markets (e.g. energy), and their balances; Canada/USA exchange rates and the influence on the Canadian economy; cost of credit to firms and households; state of financial markets, Canada and abroad. These notes are based mainly on reading the Bank of Canada's semi-annual Monetary Report and Update available online at http://www.bank-banque-canada.ca/en/mpr/mpr_previous.html.

[85] Concentric Energy Advisors. A Comparative Analysis of Return on Equity of Natural Gas Utilities. Prepared for the OEB. June 14, 2007, pages 18-19. Concentric correctly point out that, "…as interest rates

have declined dramatically in Canada in the past ten years, one would expect the OEB formula to yield accordingly lower authorized ROEs. The formula, however, is symmetrical, and ROEs will most likely recover at a faster rate in Ontario than in the U.S., when interest rates begin to rise. In fact, if interest rates continue to steadily rise, the OEB adjustment formula could surpass and yield higher results than historical data suggest U.S. authorized returns would reach under the same circumstances."

[86] Ibid, page 57, last sentence in item 5.

# FOREWORD

The National Energy Board (the NEB or the Board) is an independent federal agency whose purpose is to promote safety and security, environmental protection and efficient energy infrastructure and markets in the Canadian public interest[1] within the mandate set by Parliament in the regulation of pipelines, energy development and trade. The NEB is an active, effective and knowledgeable partner in the responsible development of Canada's energy sector for the benefit of Canadians.

The Board's main responsibilities include regulating the construction and operation of interprovincial and international oil and gas pipelines, as well as tolls and tariffs. Another key role is to regulate international and designated interprovincial power lines. The Board also regulates the imports of natural gas and the exports of natural gas, oil, natural gas liquids (NGLs) and electricity. Additionally, the Board regulates oil and gas exploration and development on frontier lands and offshore areas not covered by provincial or federal management agreements. In its advisory function, the Board provides energy information and advice by analyzing information about Canadian energy markets obtained through regulatory processes and monitoring.

This report marks the third year that the Board has provided an assessment of the Canadian hydrocarbon transportation system. This report utilizes data from various publicly available sources which are collected and monitored by Board staff in addition to throughput data supplied by the pipeline companies. The Board also benefited from discussion with members of the investment community with respect to capital markets. Prior to the release of this report, a draft was sent to the Canadian Energy Pipeline Association (CEPA), the Canadian Association of Petroleum Producers (CAPP), and the Canadian Gas Association (CGA) for comment. Other parties such as the Industrial Gas Users Association (IGUA) also expressed interest and provided comment on the issues and aspects of information in this report. A listing of all organizations that provided comment or information in the production of this report is shown in Appendix 1. Comments by all parties were taken into consideration in the preparation of this report.

Any comments on the report or suggestions for further analysis can be directed to:

Henry Mah
Applications Business Unit
National Energy Board
Telephone: (403) 299-3690
Email: hmah@neb-one.gc.ca

If a party wishes to rely on material from this report in any regulatory proceeding, it can submit the material as can be done with any public document. In such a case, the material is in effect adopted by the party submitting it and that party could be required to answer questions on it.

Information about the NEB, including its publications, can be found by accessing the Board's website: http://www.neb-one.gc.ca.

1 The public interest is inclusive of all Canadians and refers to a balance of economic, environmental, and social interests that changes as society's values and preferences evolve over time.

# INTRODUCTION

Energy is essential to our daily lives. The ability of the pipeline transportation system to deliver energy, in the form of natural gas, natural gas liquids (NGLs), crude oil, and petroleum products is critical to Canada's economic well-being. In 2006, approximately $110 billion worth of products was moved through Canadian pipelines to markets at home and in the U.S. The cost in 2006 of providing these transportation services is estimated to be around $4.7 billion, not including the fuel costs paid by shippers on natural gas pipelines. This was accomplished by infrastructure that is mostly invisible to consumers and that operates safely with minimal environmental impact.

Canadians depend on this infrastructure for a safe, reliable, and efficient energy supply. The 45 000 kilometres (km) of natural gas and oil pipelines regulated by the NEB are a crucial element in Canada's hydrocarbon transportation system (Figures 1 and 2). These include large-diameter, cross-country, high-pressure natural gas pipelines, low pressure crude oil and oil products pipelines, and small-diameter pipelines.

In line with its mandate to promote safety and security, environmental protection and efficient energy infrastructure and markets in the Canadian public interest, the Board has identified five goals which articulate its purpose and core directives[2]:

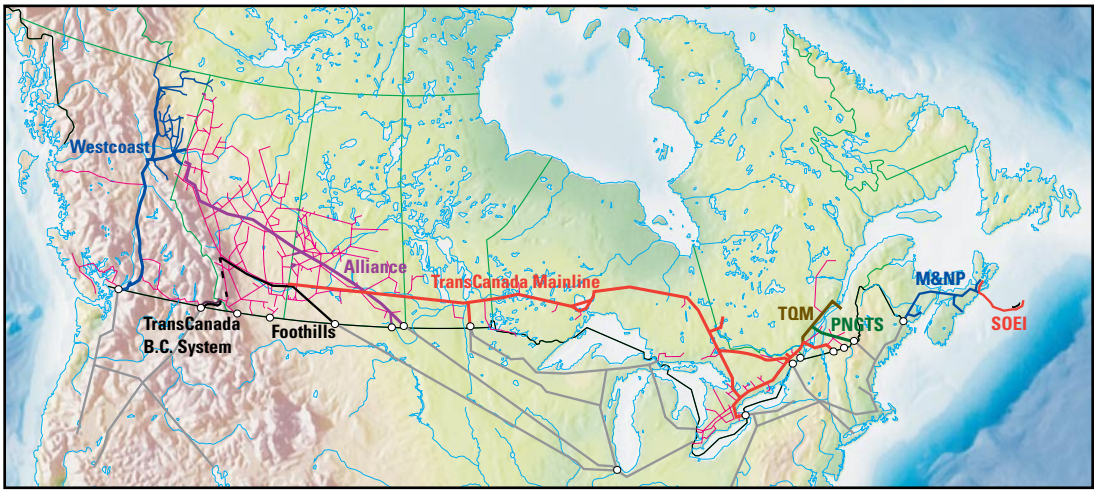
1. NEB-regulated pipelines and activities are safe and secure, and are perceived to be so.
2. NEB-regulated facilities are built in a manner that protects the environment and respects the rights of those affected.
3. Canadians benefit from efficient energy infrastructure and markets.
4. The NEB fulfills its mandate with the benefit of effective public engagement.
5. The NEB delivers quality outcomes through innovative leadership and effective support processes.

To determine whether the goals are being achieved, the Board has established various measures and a system of monitoring for each goal. Each year, the Board also issues various reports that discuss these different aspects of Canadian energy infrastructure and activities. This report focuses largely on aspects of Goal 3, and provides an update on the Board's assessment on how well the Canadian hydrocarbon transportation system is working. This report marks the third consecutive year for this assessment and utilizes the system of monitoring and measurements for the performance of the transportation system that was established in previous years. For the hydrocarbon transportation system to function efficiently and effectively, it must operate in a safe and environmentally acceptable manner, which relates to Goals 1 and 2. The Board also reports annually on safety, integrity, and environmental performance of NEB-regulated pipelines in a companion report that was published in March 2007, which may be found at http://www.neb-one.gc.ca/safety/SafetyPerformanceIndicators/index_e.htm.

2 NEB Strategic Plan 2007-2010

**FIGURE 1**

***Gas Pipelines Regulated by the NEB***



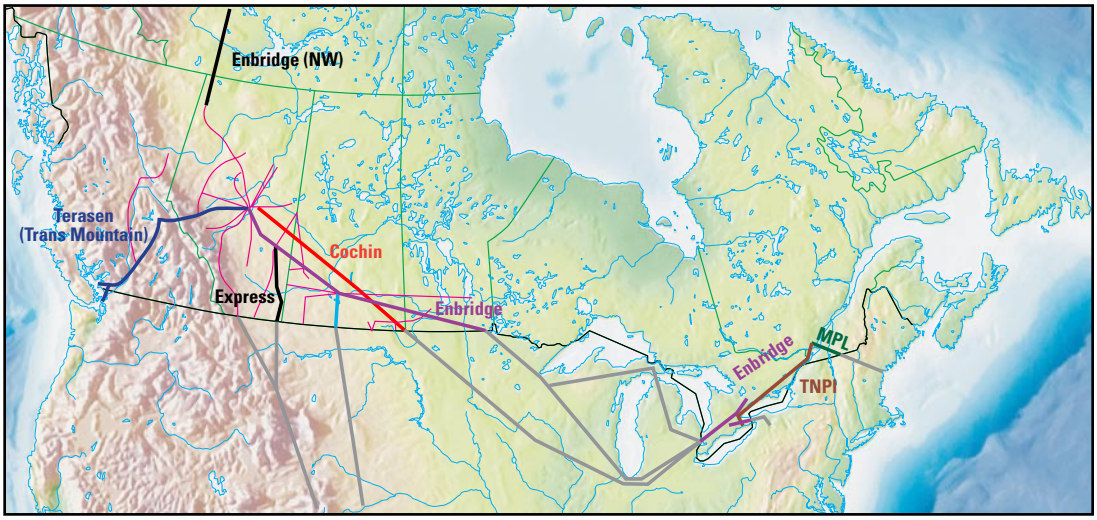


**FIGURE 2**

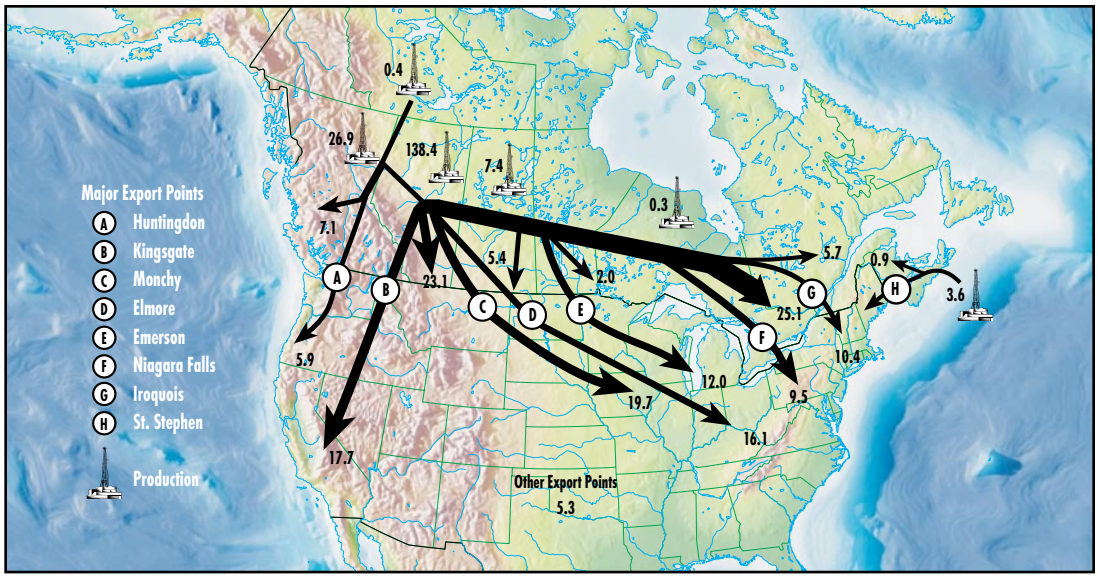
***Oil Pipelines Regulated by the NEB***

The Board believes that the following outcomes are important characteristics of a well functioning hydrocarbon transportation system:

- There is adequate pipeline capacity in place to move products to consumers who need them;
- Pipeline companies provide services that meet the needs of shippers at just and reasonable prices; and,
- Pipeline companies have adequate financial strength to attract capital on terms and conditions that enable them to effectively maintain their systems and build new infrastructure to meet the changing needs of the market.

In general, an efficient hydrocarbon transportation system will have an ability to respond on a timely basis to changing market conditions. This may entail adjustments to pipeline capacity or enhancement of pipeline services.

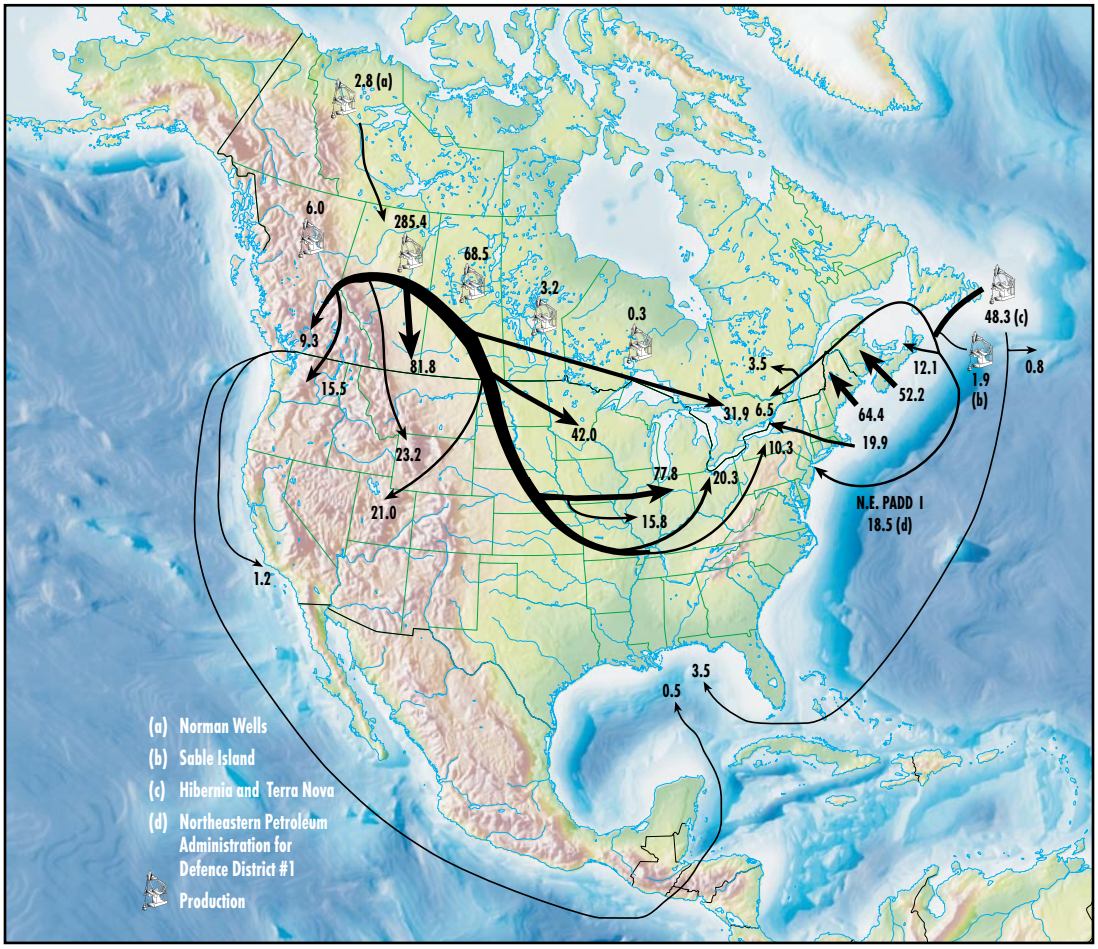


To assess the extent to which these outcomes are achieved, the Board uses publicly available data for Group 1 regulated companies and Express Pipeline Limited Partnership (Express), the largest Group 2 company.[3] These companies represent the major NEB-regulated pipelines and provide a good view of the overall functioning of the hydrocarbon transportation system. In addition, the Board used throughput and capacity information received from the pipelines; discussions with members of the investment community; and input from the users of NEB-regulated pipelines. Although the majority of information presented in this report is an update and assessment for 2006; where available, 2007 information is also provided. A listing of the companies regulated by the NEB, as of December 31, 2006, can be found in Appendix 2.

This report should not be viewed as a regulatory decision. In this report the Board is not making a determination on regulatory matters such as the appropriate rate of return on equity that should be earned by pipeline companies. The factors used to assess the functioning of the transportation system are not necessarily the same as those which are applied in a regulatory proceeding.

Figures 3 and 4 provide an overview of the supply and disposition of natural gas and crude oil in Canada. More information on the supply and disposition of energy in Canada can be found in the Board's Energy Overview report, published in May 2007, which may be found at http://www.neb-one.gc.ca/energy/EnergyReports/index_e.htm#energy_overview.

**FIGURE 3**



***2006 Supply and Disposition of Natural Gas (Billion Cubic Metres)***

3 For the purpose of the Board's financial regulation, pipeline companies are divided into two groups, Group 1 and Group 2. Major oil and gas pipeline companies are designated as Group 1 and are generally actively regulated by the NEB. All other NEB-regulated pipelines are designated as Group 2 and are subject to a lighter degree of regulation.

**FIGURE 4**

C H A P T E R T W O

# ADEQUACY OF PIPELINE CAPACITY

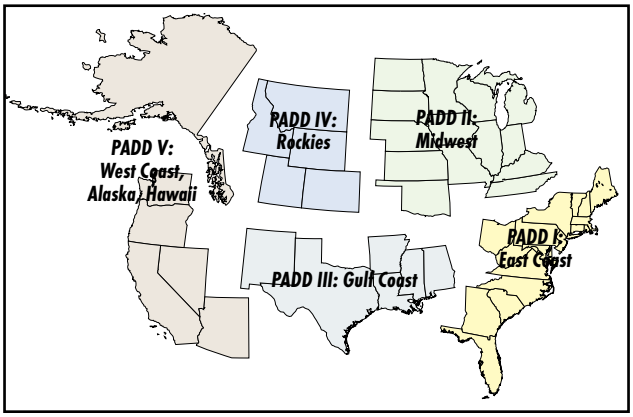
A key measure of an energy market's operational efficiency is the ability of its pipeline system to adequately transport crude oil, refined products, natural gas and natural gas liquids (NGLs) from producing to consuming regions.

This section will examine the following factors to assess the current adequacy of pipeline capacity:

1. price differentials compared with firm service tolls for major transportation paths;
2. capacity utilization on pipelines; and
3. the degree of apportionment on major oil pipelines.

The Board has generally taken the view that some excess capacity on a pipeline is desirable. This may result in higher tolls for shippers; however, the costs associated with inadequate pipeline capacity can be far greater. Substantial revenue loss for producers and governments can result when producers are unable to move their oil and gas to market. In addition, excess capacity allows shippers the flexibility to access the appropriate markets with the right product, thereby maximizing their revenues.

For example, in the case of oil transportation, if there is inadequate pipeline capacity to transport crude oil to the West Coast (PADD V), producers have the option of transporting crude oil to Ontario, PADD II (Midwest), southern PADD II (Cushing, Oklahoma), PADD III (U.S. Gulf Coast) or PADD IV (Rockies). As well, during periods when refineries are in turnaround (maintenance) in any of these locations, producers can deliver crude oil volumes to other markets, providing there is adequate pipeline capacity.



## 2.1 Price Differentials

### *Price Differentials and Natural Gas Firm Service Tolls*

When there is adequate pipeline capacity between two market hubs, commodity prices will be connected and the price differential will be equal to, or less than, the transportation costs between the two points. As long as the price differential is less than the toll plus fuel, the market is indicating that there is adequate pipeline capacity between the two pricing points. In a market with adequate capacity, suppliers would generally direct their product to the

**FIGURE 5**

***Petroleum Administration for Defense Districts***

market that nets the highest revenue back to the seller, thereby meeting that region's need for energy. Where inadequate capacity exists, the product cannot get to market, resulting in higher prices for downstream consumers or lower prices to producers, creating a higher differential in price between the two end points.

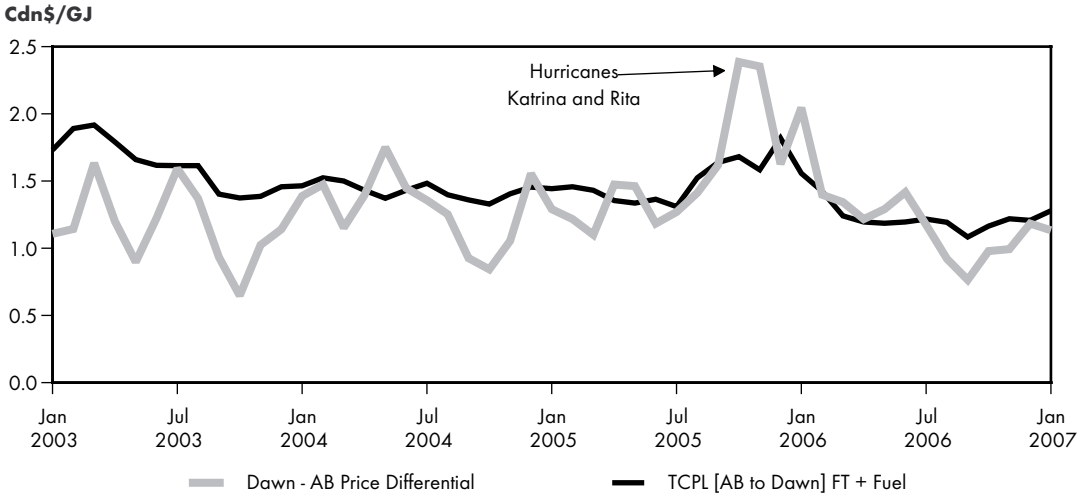
In order to use price differentials as an indicator on the adequacy of pipeline capacity, there must be reasonably good pricing data available. Two examples of price differentials compared with firm service tolls are provided below – one for transportation on TransCanada PipeLines Limited Mainline (TransCanada or TCPL) and one for transportation on Westcoast Energy Inc. (Westcoast).

Figure 6 shows the basis differential between Alberta and the Dawn delivery point compared with the TransCanada firm service toll between the two points, including fuel costs. The price differential between Alberta and the Dawn delivery point is generally below the total cost of transportation (firm transportation plus fuel) via the TransCanada pipeline connecting these two markets. This indicates that pipeline capacity is adequate between these locations. As indicated by the variation in the price difference between the two locations, natural gas pricing is very responsive to relatively small changes in flow or demand. Times of exceptional natural gas demand in eastern markets, such as the summer heat waves of 2005 and 2006 that produced a strong demand for natural gas-fired power generation for air conditioning in eastern markets, or reduced supplies from the Gulf of Mexico in the months following hurricanes Katrina and Rita (August 2005 to January 2006), have resulted in short term increases in the price differential. Conversely, mild weather and ample gas in storage can moderate the price differential and the demand for gas and transportation services such as occurred in the autumn of 2006 and the early part of the 2006/2007 winter heating season.

Figure 7 shows the price differential between Compressor Station 2 on the Westcoast system and the export point at Huntingdon/Sumas compared with the firm service toll for transportation between the two locations (T-South or Southern Mainline), including fuel costs. Since January 2003, except for the peak winter months in recent years, the price differential has been lower than the cost of transportation, indicating that there has been adequate capacity in place. Overall, the comparison of price differential and natural gas firm service tolls shows that pipeline capacity between these markets is adequate at most times. However, natural gas pricing is volatile. Short-term increases in the price differential have been observed in recent years as a result of changes to market conditions such as,

**FIGURE 6**

***Dawn – Alberta Price Differential vs. TransCanada Toll and Fuel***



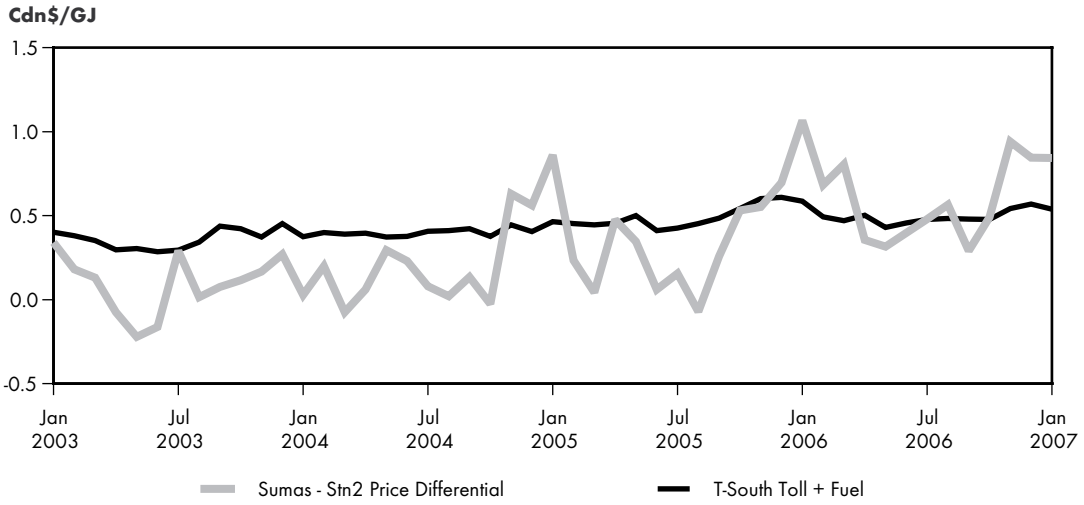


**FIGURE 7**

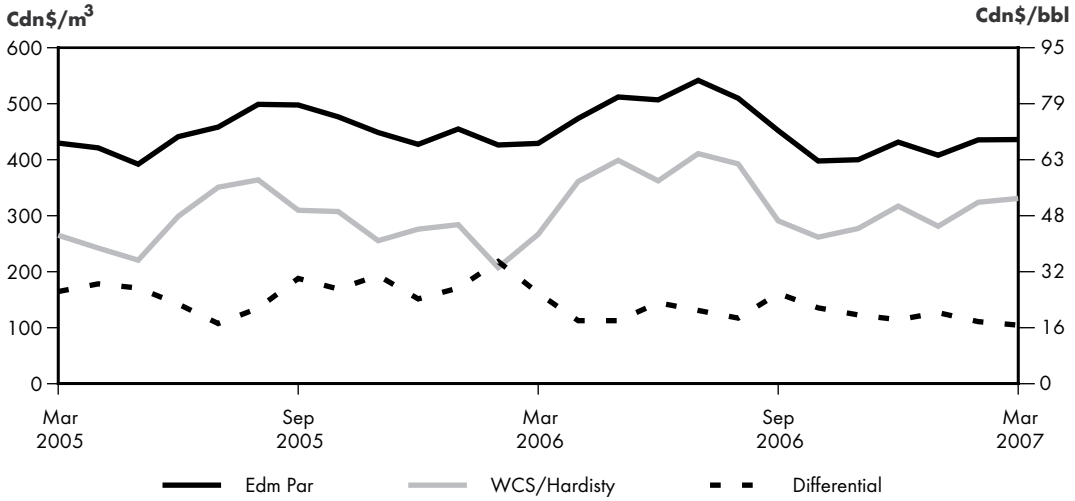
***Sumas – Station 2 Price Differential vs. Westcoast T-South Toll and Fuel***

hurricane-induced supply disruptions in the United States, unpredictable weather-related demand, and availability of other transportation options during such periods.

Overall, the comparison of price differentials and natural gas firm service tolls shows that pipeline capacity between these markets is adequate at most times. In general, the price differential between pricing points has been slightly lower than the cost of pipeline transportation (tolls) and fuel. However, natural gas prices can fluctuate in response to weather and can impact both price differential and pipeline fuel costs. Pipeline tolls tend to be more constant. Figures 6 and 7 both indicate occasions where the price differential exceeded transportation (toll) and fuel costs. These events proved to be temporary, and gas flows and prices moderated.



### *Price Differentials and Tolls on Oil Pipelines*

The price differentials for crude oil are determined by a number of factors, including availability of pipeline capacity, supply and demand fundamentals, seasonality and the grade (quality) of crude oil. Price differentials are increasingly becoming an issue on oil pipelines because of increasing production from the oil sands. Oil sands crude oil is a heavier bitumen blend and has limited market access because it requires specially equipped refineries to process it into useable refined products. This limited access exerts downward pressure on heavy crude oil prices and widens the light-heavy differential during certain times of the year. Historically the discussion on price differentials have been exclusive to heavy crude oil; however, with increased production of upgraded bitumen or light synthetic crude oil - the price differential between synthetic crude oil, Canadian light crude oil, and other crude oil supplied to U.S. refineries is becoming an increasingly important issue. Largely as a result of increased synthetic crude oil production and limited pipeline capacity to downstream markets, price discounts have also been observed for Canadian synthetic and light crude oil.

Figure 8 illustrates the light-heavy differential as indicated by the difference in the price of Edmonton Par light crude oil and Western Canadian Select (WCS), a heavy crude oil blend that is priced at Hardisty, Alberta. As illustrated, the differential between them has been wide and volatile during the time period shown; however, there has been a narrowing trend since September 2006. In the first quarter 2007, the light-heavy differential was 27 percent. In particular, in the month of March, the light-heavy differential narrowed to its lowest level since August 2004. There are two main reasons

**FIGURE 8**

***Canadian Crude Oil Prices and Differential***

for this narrowing; one is the Syncrude upgrader expansion, which is processing more bitumen, up to 350 Mb/d per day from 240 Mb/d in 2006; the second is the Spearhead and Mobil pipeline reversals which are transporting almost 200 Mb/d of crude oil south of Chicago to as far as the U.S. Gulf Coast. Typically, during the summer months, the differential narrows because of an increase in seasonal demand for heavier crudes for the production of asphalt.

## 2.2 Capacity Utilization on Major Routes

Where adequate pricing data is not available at major receipt and delivery locations on pipeline systems, another measure of adequate capacity comes from directly comparing the throughput or flow on the pipeline with its capacity. The Board monitors capacity utilization for most of the large pipelines it regulates.

The following figures show pipeline average monthly throughput compared with capacity for some of the largest NEB-regulated pipeline systems, including the TransCanada Mainline, Foothills Pipe Lines Ltd. (Foothills), TransCanada B.C. System, Westcoast, Alliance Pipeline Ltd. (Alliance), Trans Québec & Maritimes Pipeline (TQM), Maritimes & Northeast Pipeline (M&NP), Enbridge Pipelines Inc. (Enbridge), Kinder Morgan Canada's Terasen Pipelines (Trans Mountain) Inc. (TPTM), Express and Trans-Northern Pipeline Inc. (TNPI).

### *Natural Gas*

Figure 9 compares the average monthly throughput on the TransCanada Mainline (which is approximately equal to the amount of gas flowing east on the Mainline from Saskatchewan) to the capacity of TransCanada's prairie line. This comparison illustrates that there has consistently been capacity in excess of throughput volumes over the time period shown. The excess capacity even persisted through the period of July 2005 to July 2006, which included two hotter-than-normal summers that produced strong demand for natural gas for power generation in eastern markets, and greater demand for Canadian gas due to production losses in the U.S. stemming from the late summer hurricanes of 2005.

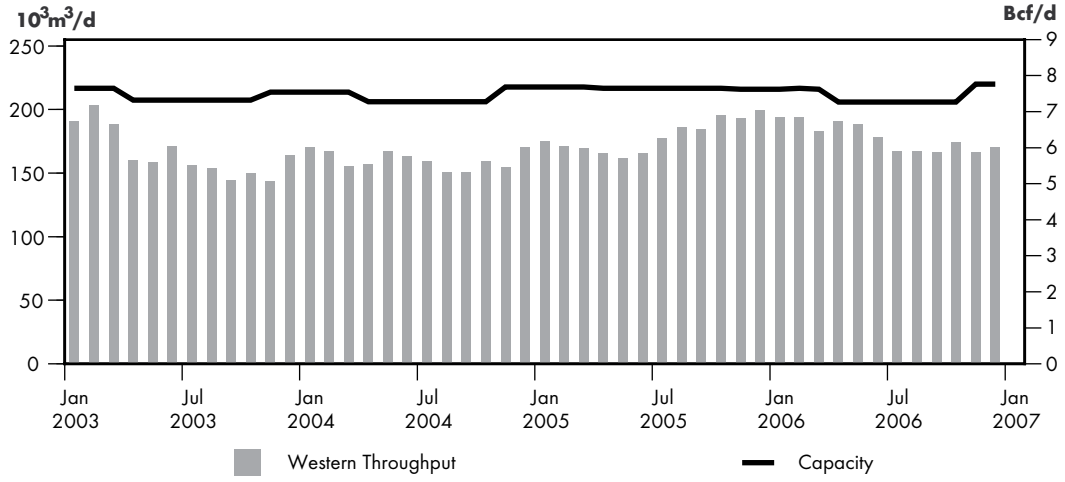
On the eastern part of the TransCanada system, a number of expansions occurred in 2006 or are proposed for 2007 which are directed towards reducing bottlenecks to connect additional supply from Dawn and to access growing markets in Eastern Canada and the U.S. Northeast.

Overall, the indicator shows that there has been adequate pipeline capacity to move volumes to eastern markets. Excess capacity, which averaged 1.4 Bcf/d over the past four years, provided the impetus for the TransCanada Keystone Pipeline project. In this initiative, TransCanada proposes to transfer Line 100-1 of the Mainline to TransCanada Keystone Pipeline GP Ltd. for conversion to oil service. This transfer and conversion, if approved, could result in an annual average capacity reduction on the Mainline of approximately 0.5 Bcf/d. The Board approved the facilities transfer on 9 February 2007, however the TransCanada Keystone application for the construction of the requested oil facilities is still before the Board.

The volumes shown in Figure 10 are the average monthly throughput on TransCanada's Foothills Pipeline (Sask.) compared with capacity. This pipeline transports western Canadian gas supply to

**FIGURE 9**

***TransCanada Mainline Throughput vs. Capacity***



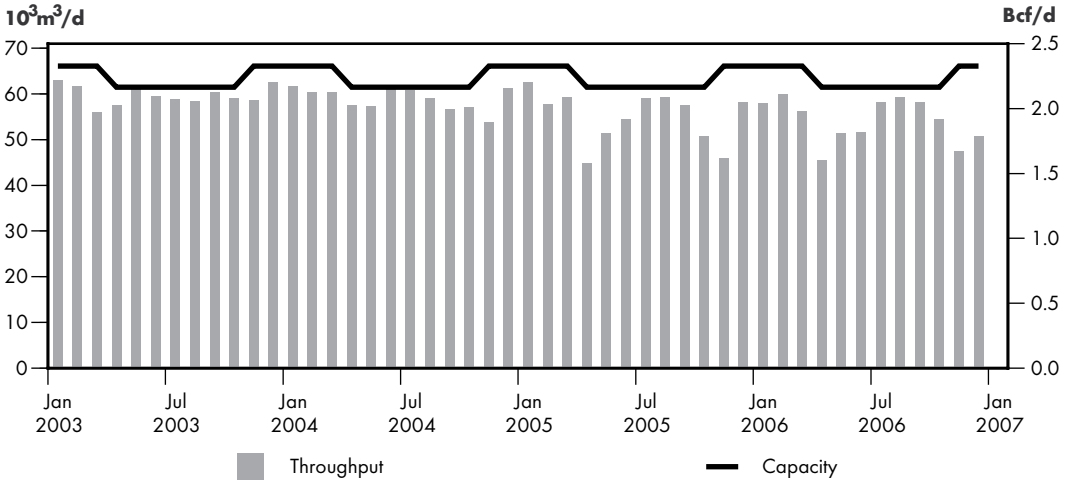


**FIGURE 10**

***Foothills Pipeline (Sask.) Throughput vs. Capacity at Monchy***

markets in the U.S. Midwest through a connection with the Northern Border Pipeline Ltd. (Northern Border) at Monchy, Saskatchewan. The Foothills (Sask.) throughput has displayed distinct seasonal patterns in recent years, with annual average capacity utilization running at 88 percent in 2006, down from an average of 94 percent in 2003. Throughput on the Foothills Pipeline (Sask.) runs fairly close to capacity in both the winter and the summer months to meet winter heating demand and to meet summer demand for power generation and storage injection. Throughput subsequently declines in the low-consumption spring and autumn months.

Figure 11 compares the average monthly throughput on Westcoast's Southern Mainline with the capacity on this system between Station 2 and the export point at Huntingdon/Sumas. This figure shows the seasonal nature of throughput on the Southern Mainline with higher volumes being transported during the peak winter months and less during the summer. Contributing factors to the low flows on Westcoast during 2006 and recent years include greater competition with production from the U.S. Rockies region for markets in the U.S. Pacific Northwest, mild winter weather, and increased hydro power generation in B.C. and the U.S. Pacific Northwest.

Figure 12 shows the average monthly capacity and throughput on the TransCanada B.C. System, which primarily serves California. The annual average capacity utilization in 2006 was 64 percent, slightly higher than in previous years. There exists spare capacity on this pipeline to export gas through Kingsgate, B.C. California market players have transportation options enabling them to access supply from the Rocky Mountains, San Juan and Permian basins, in addition to the Western Canada Sedimentary Basin (WCSB). This supply competition has reduced imports from the WCSB at Kingsgate.

Figure 13 shows the average monthly throughput on the Alliance system relative to physically available capacity. Alliance offers approximately 1.325 Bcf/d of firm service capacity, and makes any additional capacity available to its contracted shippers pro rata as Authorized Overrun Service (AOS). Available AOS levels are determined on a daily basis and may be used at the cost of fuel only. The total available capacity is variable, depending on such factors as ambient temperature and compressor unit availability (as influenced by maintenance schedules). Alliance's total available capacity has essentially been fully utilized since the commencement of service, with all available firm service contracted on a long-term basis.

**FIGURE 11**

***Westcoast Mainline Throughput vs. Capacity***

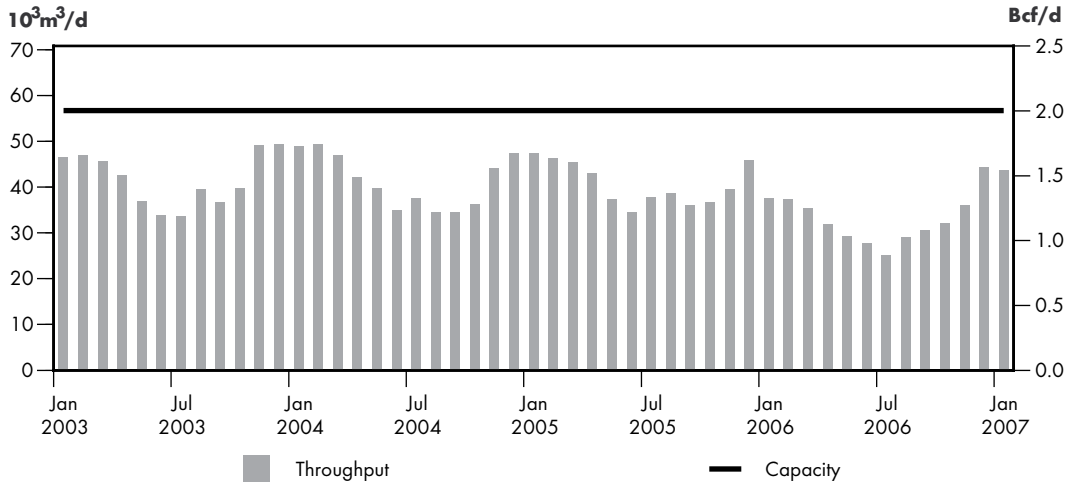

Figure 14 compares the average monthly throughput and capacity on the TransQuébec & Maritimes system (TQM) which delivers gas from the TransCanada Mainline at Saint-Lazare, Quebec to Québec City and the East Hereford export point in Quebec (New Hampshire state border). More volumes are transported during winter months, highlighting the use of natural gas for heating in this region and the seasonal nature of the throughput on this pipeline. With average annual capacity utilization of around 60 percent, there has historically been spare capacity on this pipeline, particularly in summer months. However, with the limited compression on the system needed to meet TQM's delivery pressure at the East Hereford export point, the available spare capacity is very sensitive to the actual load distribution on the pipeline. In 2006, TQM undertook a system expansion to serve an incremental demand arising from the construction of a new gas-fired power plant in Quebec.

Figure 15 compares the average monthly capacity and throughput on the M&NP pipeline. The annual average capacity utilization has declined from about 92 percent in 2002 to an average of about 68 percent in 2006. The reduction in this pipeline's capacity utilization stems from declining natural

**FIGURE 12**

***TransCanada B.C. system Throughput vs. Capacity at Kingsgate***

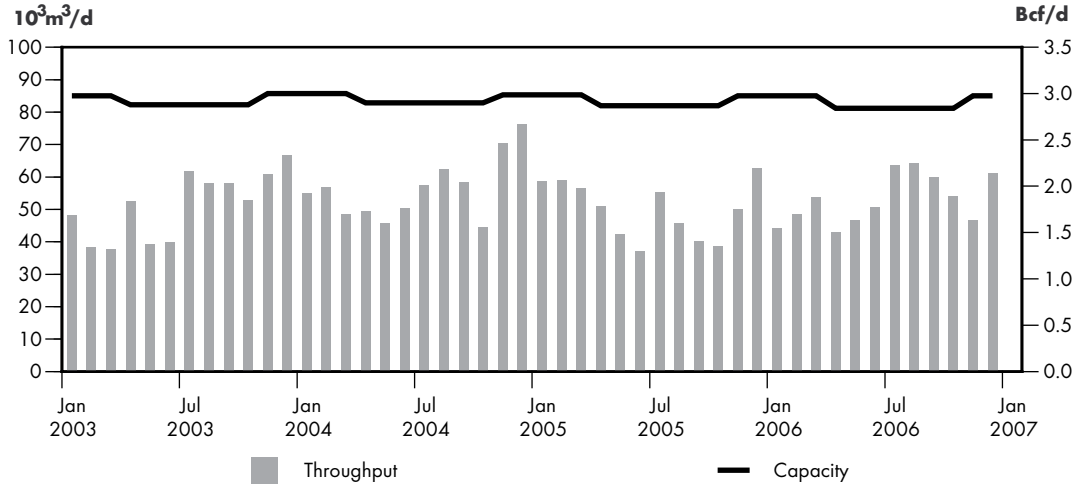

**FIGURE 13**

***Alliance Throughput vs. Capacity***

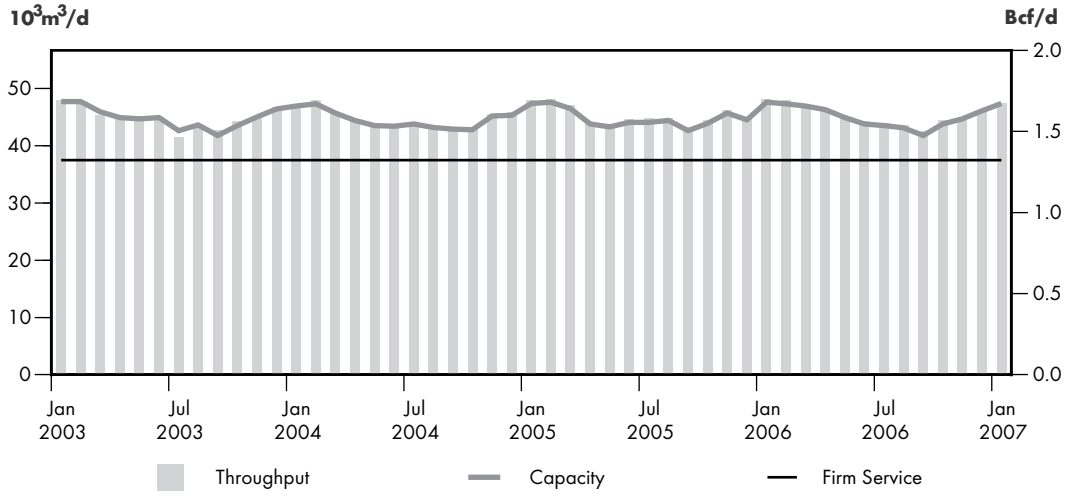

**FIGURE 14**

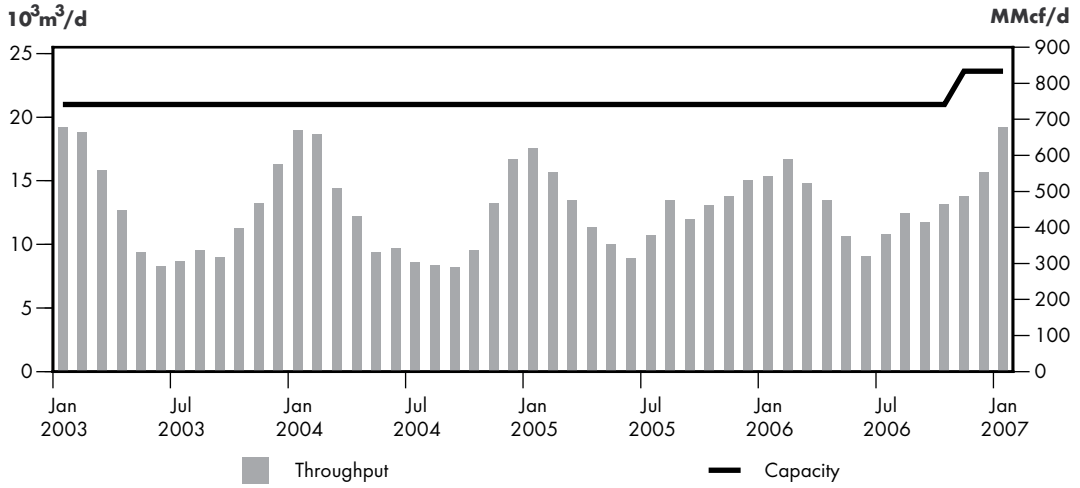
***Trans Québec and Maritimes Throughput vs. Capacity***



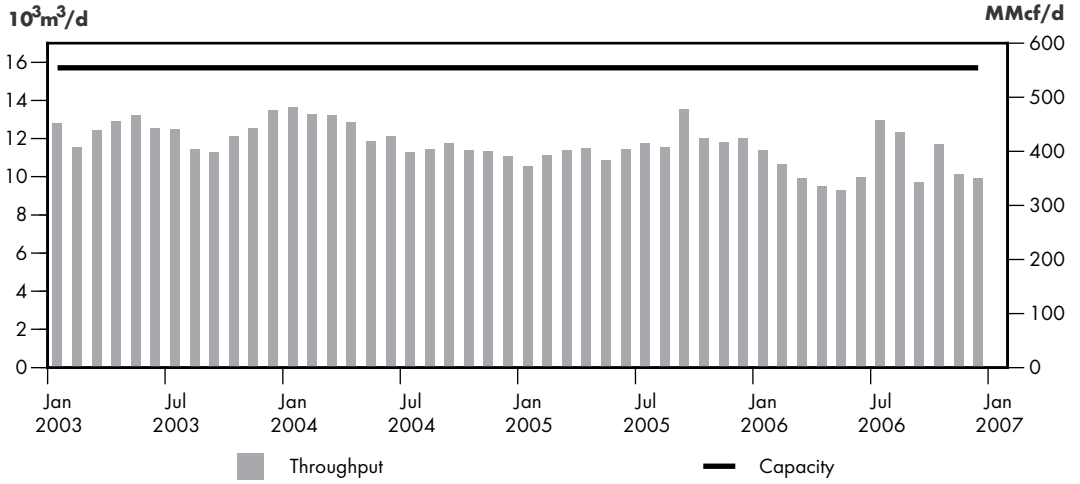


**FIGURE 15**

***Maritimes and Northeast Pipeline Throughput vs. Capacity***

gas production from offshore Nova Scotia. Variations in throughput are primarily related to changes in gas supply as the export demand for gas destined to northeastern U.S. markets is consistently strong. In late 2006, additional compression at the offshore platform was installed to boost deliverability. In addition, a couple of gas supply projects are being considered in the region with the potential to supplement supply.

### *Oil*

Determining the capacity and throughput on an oil pipeline can be complex as there are many factors to be considered: the type of product, product mix, type of batching and pipeline configurations.

The Enbridge system originates in Edmonton, Alberta and extends east across the Canadian prairies to the U.S. border near Gretna, Manitoba where it joins with the Lakehead system in the U.S. It is the largest crude oil pipeline in the world and the primary transporter of crude oil from western Canada to markets in eastern Canada and the U.S. Midwest. The Enbridge system also connects

with pipelines that deliver crude oil to Cushing, Oklahoma and the U.S. Gulf Coast. The system consists of many lines transporting crude oil, NGLs and refined petroleum products. Figure 16 illustrates Enbridge throughput versus capacity. In 2006, Enbridge transported roughly 247 000 $m^3/d$ (1.6 MMb/d) of crude oil, petroleum products and NGLs. In the first quarter 2007, Enbridge operated at about 85 percent of capacity. Since the third quarter of 2006, many of its lines have been operating at or near full capacity with some lines in apportionment (see Section 2.3).

Terasen Pipelines (Trans Mountain) Inc., owned by Kinder Morgan, transports crude oil and refined petroleum products from Edmonton, Alberta west to locations in British Columbia, Washington State and offshore. TPTM's current capacity, assuming some heavy crude oil, is 35 700 $m^3/d$ (225 Mb/d). The pipeline has been operating at or near capacity for several years and on many occasions has been under apportionment (See Section 2.3). Figure 17 shows two capacities for the TPTM pipeline; one assumes no shipments of heavy crude oil and the other assumes 15 percent heavy crude oil. When heavy crude oil is shipped, it reduces the capacity of the pipeline. On average, in 2006, 15 percent of TPTM's crude oil receipts at Edmonton were heavy crude oil. In the second quarter of 2007, the TPTM Pump Station Expansion is expected to be in-service. It will add an additional 5 600 $m^3/d$ (35 Mb/d) of capacity.

In February 2006, TPTM applied to the NEB to loop a 158 km segment of its pipeline, extending from Hinton, Alberta to a location near Rearguard, British Columbia. The Project would increase capacity by 6 360 $m^3/d$ (40 Mb/d). An oral public hearing was held in August 2006 and the Board approved the application in October. The targeted in-service date is the fourth quarter 2008.

In the first quarter of 2007, TPTM operated at approximately 77 percent of capacity (see Figure 17). Despite operating at below its nameplate capacity of 285 Mb/d, TPTM was under apportionment in January and February of 2007. Growing oil sands production, strong demand from refiners in Washington State and continuing growth in crude oil shipments off the Westridge Dock are contributing to apportionment on the TPTM system. As well, in the summer of 2006, a temporary shutdown of the Prudhoe Bay field in Alaska, because of pipeline corrosion, resulted in increased throughput on the TPTM pipeline.

During the past several years, Express has been operating at capacity. Despite a major expansion in 2005 that added 16 000 $m^3/d$ (100 Mb/d), bringing the capacity to 44 900 $m^3/d$ (280 Mb/d) there has

**FIGURE 16**

***Enbridge Pipeline Throughput vs. Capacity***

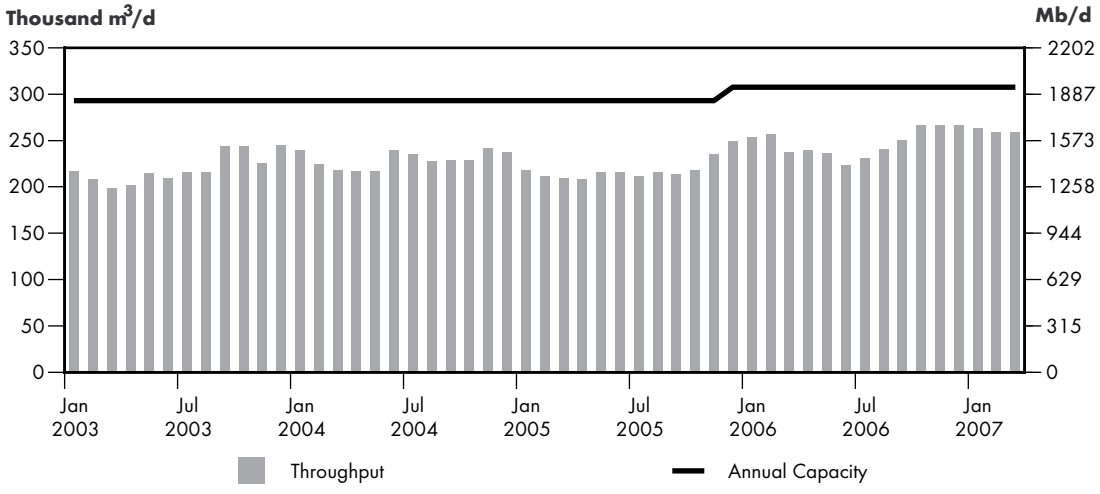

**FIGURE 17**

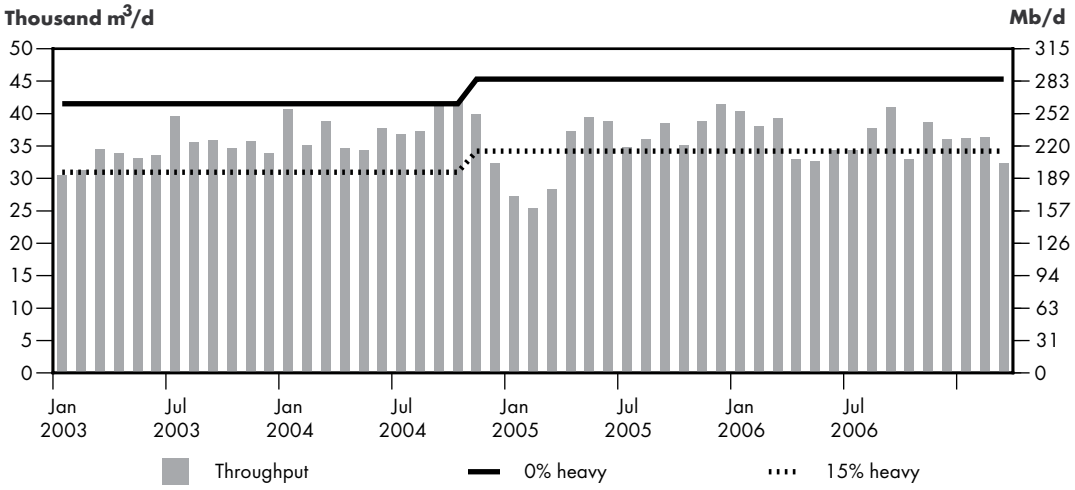
***Teresen Pipelines Trans Mountain (TPTM) Throughput vs. Capacity***



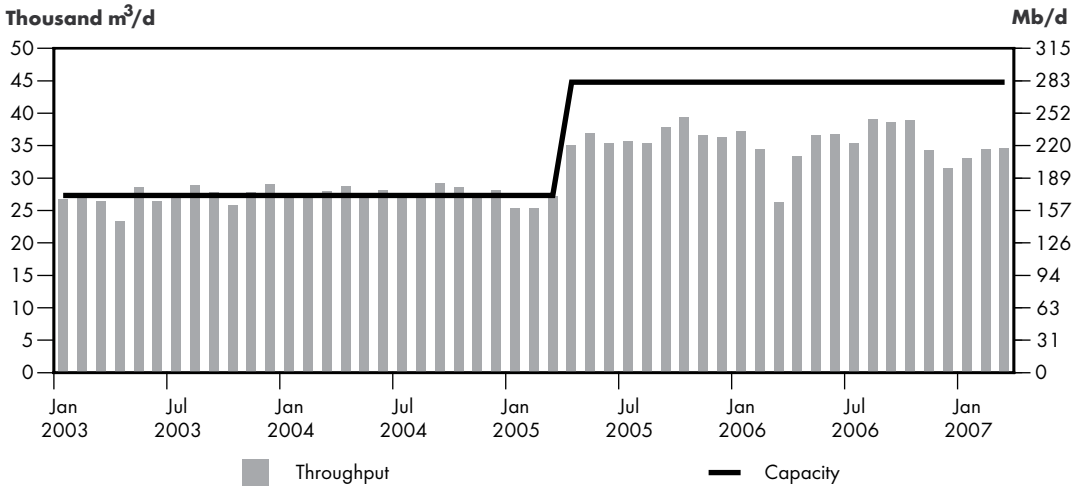


**FIGURE 18**

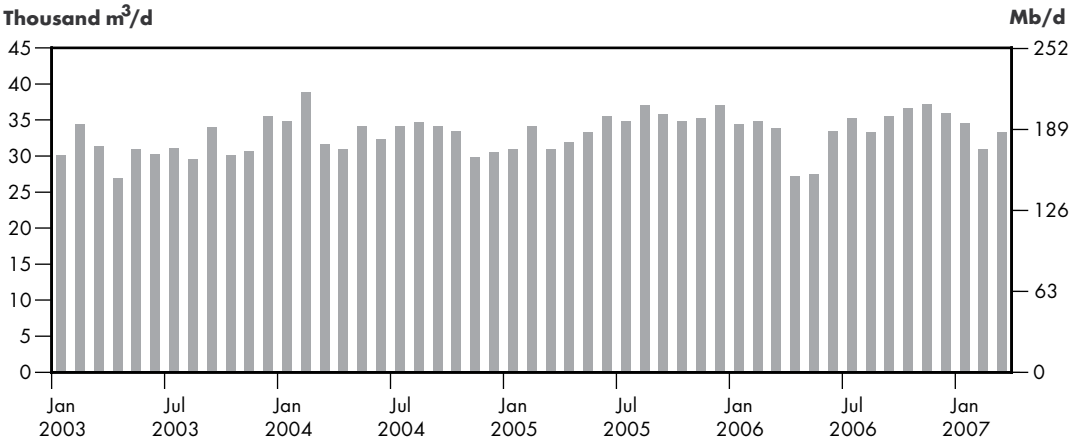
***Express Throughput vs. Capacity***



been apportionment on the pipeline in 2006. Express is the only crude oil pipeline in western Canada that operates under long-term take-or-pay agreements with its shippers for a majority of its capacity.

In the first quarter 2007, Express operated at approximately 76 percent of capacity (Figure 18). Crude oil shipments have been reduced at Hardisty on the Express pipeline because of continuing apportionment downstream on the Platte Pipeline in the U.S.

Trans-Northern Pipelines Inc. is a refined petroleum products pipeline. The pipeline transports refined petroleum products west from Montreal to north Toronto and operates bi-directionally between Toronto and Oakville, Ontario. TNPI also transports refined products from Imperial Oil Limited's (Imperial) refinery in Nanticoke, Ontario west to Toronto. In the first quarter of 2007, TNPI throughput averaged 33 000 $m^3/d$ (208 Mb/d) of petroleum products. The pipeline is generally operating at capacity.

**FIGURE 19**

***Trans-Northern Pipelines Inc. Throughput***

During the first quarter 2007, there was a fire at Imperial's refinery located in Nanticoke. This resulted in the refinery ceasing operations and a subsequent gasoline and diesel shortage in southern Ontario and Quebec. TNPI throughput was reduced during this period.

Calculating TNPI's capacity is difficult due to multiple delivery locations and the different capacities on each line segment.

## 2.3 Apportionment

Oil pipelines typically operate as common carriers. Common carriers require shippers to nominate their volumes for delivery into a pipeline on a monthly basis without a contract for pipeline capacity. When shippers nominate more oil or oil products in a given month than the pipeline can transport, shippers' volumes are apportioned (reduced) based on the tariff in effect. Apportionment can be caused by factors such as growing supply, increased demand, pipeline reconfigurations and refinery maintenance. There are a few pipelines in Canada that operate all or part of the pipeline with long-term shipper take-or-pay agreements, including Express, Enbridge Line 9 and TNPI.

Some recent apportionment levels for Enbridge, TPTM and Cochin are discussed below.

### *Enbridge*

Enbridge's Lines 3 and 4 are dedicated to transporting heavy crude oil and Line 2 transports light crude oil. Historically, Lines 2 and 4 were heavy crude oil lines; however, following the Line 2/3 line swap in the fourth quarter 2005, Line 2 transitioned from a heavy crude oil line originating at Hardisty, Alberta to a light crude oil pipeline originating in Edmonton. In addition, Line 3 made the transition from a light crude oil pipeline originating at Edmonton to a heavy crude oil pipeline originating at Hardisty. This swap resulted in a net heavy capacity increase of 39 000 $m^3/d$ (246 Mb/d) and a corresponding decrease of light capacity of 18 400 $m^3/d$ (116 Mb/d). This added some much needed capacity to accommodate growing heavy crude oil output from the oil sands.

Table 1 indicates apportionment and throughput from August 2006 to March 2007. In the fourth quarter 2006, throughputs were very high on the Enbridge system and there was apportionment on Lines 5, 6 and 14. There has not been apportionment on the Enbridge system in the first quarter 2007; however, many of the Lines have been either fully subscribed or operating at maximum capacity.

**TABLE 1**

***Enbridge Apportionment***

| | Aug-06 | Sep-06 | Oct-06 | Nov-06 | Dec-06 | Jan-07 | Feb-07 | Mar-07 |
|---|---|---|---|---|---|---|---|---|
| Apportionment | 0% | 0% | 0% | 0% | 8%* | 0% | 0% | 0% |
| Throughput ($10^3m^3$/d) | 240.7 | 251.0 | 266.3 | 266.8 | 266.7 | 263.6 | 258.9 | 259.7 |

* Lines 5, 6 and 14

Capacity is also constrained due to a downstream bottleneck at Superior, Wisconsin because the capacity out of Superior is 230 000 $m^3$/d (1.4 MMb/d), less than the up to 300 000 $m^3$/d (1.9 MMb/d) that Enbridge can deliver to that destination.

Enbridge throughput fell slightly in the second quarter 2006 as a result of outages at two oil sands plants. In the third quarter 2006, throughput increased reflecting capacity expansions and increases in oil sands production. In addition, competitively priced western Canadian crude oil displaced some import volumes that would typically be delivered to the Sarnia area on Enbridge's Line 9. It is expected that increasing production from the oil sands in 2007 could contribute to further apportionment on Enbridge.

Enbridge's Line 9 has a capacity of 38 150 $m^3$/d (240 Mb/d) and transports crude oil from Montreal, Quebec to refineries located at Nanticoke and Sarnia, Ontario. There was no apportionment on Line 9 between August 2006 and February 2007. Shipments on Line 9 have been trending downward, particularly since the closure of Petro-Canada's refinery in Oakville in the second quarter of 2005. In 2006, the reduction in throughput was a result of maintenance activity at Imperial's Sarnia refinery in the second quarter and an increase in deliveries of more competitively priced western Canadian crude oil.

In January 2007, Enbridge Pipelines (Westspur) Inc. applied to the National Energy Board pursuant to section 52 of the *National Energy Board Act* (NEB Act), for the Alida, Saskatchewan to Cromer, Manitoba Capacity Expansion Project. The Enbridge Westspur pipeline was built in 1956 as an oil trunkline to transport crude oil. The pipeline also transports NGL from a gas processing plant in Steelman, Saskatchewan. Westspur interconnects with the Enbridge export lines at Cromer where the crude oil accesses the downstream markets.

The project proposes to construct a new 60 km, 168.3 mm (6 inch) pipeline to transport NGL from Alida to Cromer and convert the existing pipeline from its current NGL service to crude oil. Capacity on the existing line would increase from 25 000 $m^3$/d (157 Mb/d) to 34 600 $m^3$/d (218 Mb/d)

***Terasen Pipelines (Trans Mountain) Inc.***

Apportionment on TPTM is calculated separately for domestic destinations, export destinations and Westridge Dock destinations (as shown in Table 2 as Domestic, Export and Dock). Apportionment between August 2006 and March 2007 reflects continuing increases in oil sands supply and strong demand for Canadian crude oil in the Washington State area. In addition, increases in heavy crude oil shipments, result in a decrease in the capacity on the TPTM system. With weakness in the price of West Texas Intermediate (WTI) and discounting of Canadian crude oil because of over-supply in the Cushing area, coupled with a lack of take away capacity in that region, producers may increasingly look to the higher priced west coast and offshore markets for improved netbacks.

**TABLE 2**

***TPTM Apportionment***

| | Aug-06 | Sep-06 | Oct-06 | Nov-06 | Dec-06 | Jan-07 | Feb-07 | Mar-07 |
|---|---|---|---|---|---|---|---|---|
| Apportionment | | | | | | | | |
| Domestic | 0% | 8% | 0% | 14% | 35% | 22% | 10% | 0% |
| Export | 0% | 0% | 0% | 0% | 12% | 0% | 0% | 0% |
| Dock | 0% | 0% | 0% | 0% | 0% | 0% | 0% | 0% |
| Throughput ($10^3m^3$/d) | 37.6 | 41.0 | 32.9 | 38.6 | 35.9 | 36.2 | 36.3 | 32.4 |

In April 2006, the NEB approved a request from Kinder Morgan Inc. to include a Westridge Dock Premium in the TPTM tariff to allocate capacity to the Westridge Dock. In the Board's decision, it directed Kinder Morgan to set up a deferral account for any premiums received and refund the money to toll payers in the following calendar year. The Board directed Kinder Morgan to publish the aggregate bid premium information on a quarterly basis; and, it approved the extension of the bid premium process until the start-up of the pump station expansion (PSE).

### *Cochin*

In January 2007, Kinder Morgan Energy Partners purchased the remaining approximately 50 percent of Cochin Pipeline that they did not already own from BP Canada Energy Company (BP). Prior to the purchase, BP operated the pipeline and owned a slight majority stake.

The Cochin pipeline is the largest and longest NGL pipeline in Canada. In the past, it has transported propane, ethane, ethylene and butane, although no butane has been shipped since 2002. Ongoing maintenance work on the pipeline has affected the available capacity; however, (Table 3) there has not been apportionment on Cochin since summer 2005 when the pipeline was forced to unexpectedly shutdown for immediate repairs.

Since March 2006, Cochin has operated at a voluntary pressure reduction due to a defect found in the U.S. portion of the pipeline. This pressure restriction, not to exceed 900 psi, applies to the entire line from Fort Saskatchewan, Alberta to Windsor, Ontario and is in effect through at least to the fall of 2007. Ethylene shipments, because of its high vapour pressure, have been suspended until further notice.

Cochin also announced on 8 February 2007 that it would be suspending delivery of ethane effective 31 March 2007, while the company evaluates its pipeline integrity issues and the related capital expenditures. Cochin will continue to ship propane to all destinations on its system. Shippers were also informed that the pipeline would operate at reduced pressure through at least Fall 2007. With only propane in the line, the average capacity is expected to be around 9 500 to 11 100 $m^3$/d (60 Mb/d to 75 Mb/d). Once the pressure restrictions are lifted, capacity is likely to return to 16 700 $m^3$/d (105 Mb/d).

## 2.4 Chapter Summary

Overall, the examination of throughput and capacity on NEB-regulated natural gas pipelines in section 2.2 shows that pipeline capacity is adequate across the country although there may be occasions of short-term limitation at some points depending upon markets, storage and seasonal shifts. The demand for natural gas varies seasonally and, as a result, the flow of natural gas and utilization of some Canadian pipelines can be variable. Where available, the use of storage helps to reduce the variation in flows and allows pipeline capacity to be used more efficiently and at more stable utilization levels.

Although natural gas supply from new sources continue to be added to supplement declining conventional supply from the WCSB, growing demand within Western Canada has resulted in some excess capacity on pipelines transporting gas from the region. The existence of some excess capacity has provided suppliers with the flexibility to access markets of their choice at most times. Natural gas pipeline projects in 2006 were mainly directed towards providing connection to new supplies and addressing bottlenecks in the market area.

While capacity utilization indicators show that there was spare capacity on some oil and petroleum products pipelines in 2006, this was partially due to facility outages reducing the amount of crude oil or products to be transported. Despite operational challenges in the oil sands industry in early 2006, bitumen production levels have increased over the previous year as problems were rectified and new expansions were brought on-line. The production growth in the oil sands and continued strong demand in the U.S. has resulted in very high utilization of capacity on Canadian oil pipelines. In addition, a slight recovery in conventional crude oil production in western Canada, North Dakota and PADD IV are challenging pipeline systems that operate at close to capacity and are in apportionment at times. Overall, growing oil sands production has kept the utilization and demand for oil pipeline capacity very high.

In the past, the lack of excess pipeline capacity and available markets to process heavier crude oil has resulted in the light-heavy price differential widening as illustrated in Figure 8. In the first quarter 2006, the differential widened to 42 percent. However, this has not been the case in 2007, where the differential has narrowed to a two and a half year low reflecting the effect of additional markets accessed through the Syncrude upgrader expansion and the Spearhead and Mobil pipeline reversals which deliver western Canadian crude oil to Cushing and the U.S. Gulf Coast, respectively. This should provide continuing strength to heavy crude oil prices through the summer as demand will increase in response to the upcoming asphalt season.

# LOOKING AHEAD – PROPOSED PIPELINES

## 3.1 Natural Gas

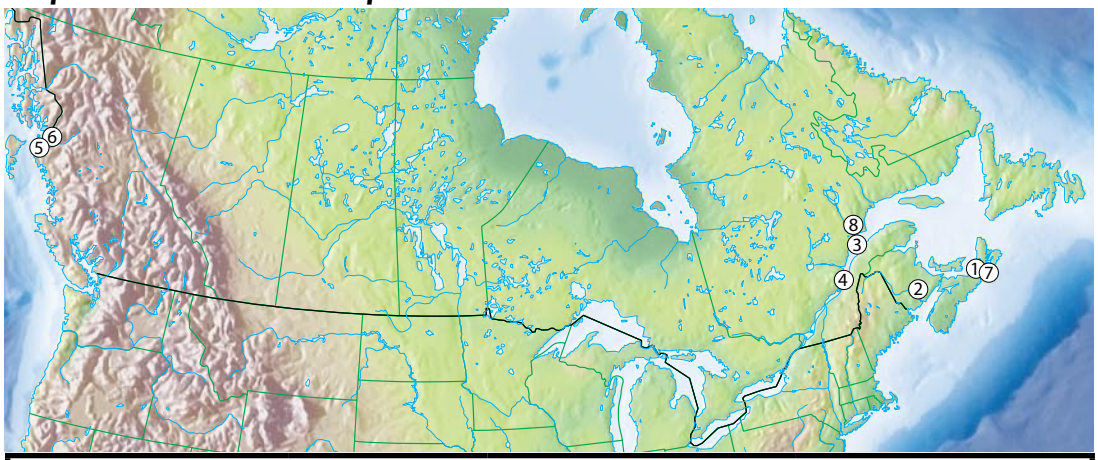
In the coming years, it is expected that demand for natural gas in North America will continue to outpace the growth in North American domestic supplies. In Canada, natural gas supply from new sources such as frontier regions, LNG, and coalbed methane will be increasingly required to supplement declining supply from conventional sources from the WCSB and Sable Island to meet growing demand. In addition, increased consumption for oil sands development in Alberta, and electricity generation in Ontario, are expected to drive significant incremental Canadian requirements for natural gas. The Canadian oil sands projects are a large and growing market for natural gas in both the generation of electricity and steam. Steam is used for in situ oil production and to upgrade bitumen into synthetic blends. In addition, new gas-fired electrical generation will likely be needed to help displace the use of existing coal-fired electricity generation in Ontario.

Although there were few newly announced natural gas pipeline projects in 2006, there was notable progress in several of the natural gas pipeline projects reported last year. Table 4 below, summarizes the announced proposals on NEB-regulated pipelines. These projects reflect the industry's expectations regarding changes in natural gas supply and demand in coming years, and the industry's outlook on the potential adjustments in Canadian pipeline infrastructure in order to:

- connect incremental gas supply from new sources in the north or from new terminals for receiving liquefied natural gas;
- expand pipeline capacity to growing markets in eastern Canada and the U.S. Northeast; and
- transfer pipeline assets from gas service where adequate capacity may exist, to oil transportation service where demand and value for new capacity is higher.

### *Liquefied Natural Gas*

A key supply source for North America is expected to be the rapidly developing global LNG market. Proven reserves of natural gas worldwide are about 20 times larger than the proven natural gas reserves of North America. While economies of scale advances in liquefaction and transportation have enabled the use of LNG as a cost competitive source of gas supply in North America, those cost efficiencies are starting to be lost to higher input and construction costs. In anticipation of growing natural gas requirements in North America, there are numerous proposals to expand existing U.S. terminals and construct new LNG receiving facilities, including several proposed projects in Canada as summarized in Figure 20.



## TABLE 4

### *Canadian Natural Gas Pipeline Proposals — 2006*

| Pipeline | Location | Capacity Increase (Bcf/d) | Proponents' Estimated Completion Date | Market Impacted |
|---|---|---|---|---|
| TransCanada PipeLines Limited – 2007 Eastern Mainline Expansion | Ontario, Québec | 0.377 | Late 2007 | Central Canada Northeastern U.S. |
| TransCanada Pipelines Limited and TransCanada Keystone GP Ltd. | Saskatchewan, Manitoba | -0.5 | 2009/10 | Transfer and conversion of gas pipeline assets to oil transportation service |

## FIGURE 20

### *Proposed Canadian LNG Projects*

| Location | Terminal | Company | Capacity (Bcf/d) | Proposed on Stream Date |
|---|---|---|---|---|
| 1. Goldboro, Nova Scotia | Maple LNG | 4 Gas BV and Suntera Canada Ltd. | 1.0 | 2009 |
| 2. Saint John, New Brunswick | Canaport LNG | Repsol YPF and Irving Oil | 0.8 | 2008 |
| 3. Rivière-du-Loup, Quebec | Gros Cacouna LNG | Petro-Canada and TransCanada Pipelines Ltd. | 0.5 | 2009 |
| 4. Québec City, Quebec | Rabaska | Gaz Métro, Enbridge and Gaz de France | 0.5 | 2009 |
| 5. Ridley Island, British Columbia | WestPac LNG | WestPac Terminals Inc. | 0.3 | 2009 |
| 6. Emsley Cove, British Columbia | Kitimat LNG | Gavelston Energy | 0.6 | 2010/11 |
| 7. Point Tupper, Nova Scotia | Statia LNG | Statia Terminals Canada Partnership | 0.5 | n/a |
| 8. Saguenay, Quebec | Énergie Grande-Anse | Saguenay Port Authority and Énergie Grande-Anse Inc. | 1.0 | n/a |

However, there is uncertainty around the number of LNG terminals that will be built in Canada as well as the potential effects that imported LNG will have on gas markets and the pattern of natural gas flow. The Canaport LNG facility in Saint John, New Brunswick is currently under construction and is scheduled to start service in 2008. Additional pipeline connections will also be required in most cases to connect the proposed LNG receiving terminals to existing natural gas pipeline infrastructure and natural gas markets.

These potential changes in Canada's natural gas supply and demand have important implications to both existing pipeline transportation systems and proposed new pipeline and LNG projects. Facilities which connect significant new supply from new sources such as the North and LNG or significant changes in regional demand (e.g. oil sands in Alberta and electricity generation in Ontario) will have the potential to influence markets and alter the utilization and gas flow on existing pipelines. In turn, these changes may impact the tolls and associated costs in using those pipelines. For example, introduction of new gas supply in Eastern Canada could result in greater utilization or flow reversals in regional pipelines and may also affect the flow of supply from traditional sources and pipelines. Similarly, greater demand in Alberta or Ontario can also alter the flow and availability of natural gas to adjacent regions.

In addition, the expected introduction of LNG close to Canadian markets has heightened the awareness of potential issues related to gas quality. Consequently, pipelines will need to work closely with their customers to establish gas quality standards and monitoring processes to ensure compatibility with existing equipment and end-use operation.

## 3.2 Oil

The expected growth in oil sands production is an increasingly important consideration to the pipeline industry as it determines which incremental markets to serve and how to expand the pipeline system efficiently since not all refineries are able to process a full range of crude oil types. Proposed refinery expansions and new construction in eastern Canadian are located close to the major petroleum product markets in the U.S. Northeast and have access to foreign crude oil supplies in addition to east coast offshore production. Other refineries in central Canada and the United States are proposing modifications which will enable them to process the heavier crude oil from oil sands production.

Looking to the future, the NEB expects that Canadian crude oil production will continue to increase, placing greater demands for transportation capacity to connect new supply and markets. Consequently, there are a number of proposals to provide additional pipeline capacity to transport crude oil and to provide additional supplies of diluent required to support growing oil sands operations. This additional pipeline capacity could enhance access to markets and increase market penetration. The North American demand for oil and refined products is also expected to increase, triggering a number of proposals for refinery expansions and the construction of new refineries in Canada and in the United States.

Table 5 provides a summary of the numerous proposals to expand or construct new oil pipeline capacity in Canada. These reflect the industry's outlook on growing oil sands production and the need for additional pipeline capacity to enhance market access. These proposals include pipelines to transport western Canadian crude oil to the west coast for delivery to Washington State and offshore markets, to the U.S. Midwest and southern PADD II and to the U.S. Gulf Coast (PADD III), and to provide new sources of diluent required for growing oilsands production. It is estimated that these pipeline projects comprise over $23 billion in spending.

**TABLE 5**

***Announced and Proposed Canadian Oil Pipelines and Expansions***

| Pipeline | Potential Filing Date | Capacity Increase (Mb/d) | Proponents' Estimated Completion Date | Market |
|---|---|---|---|---|

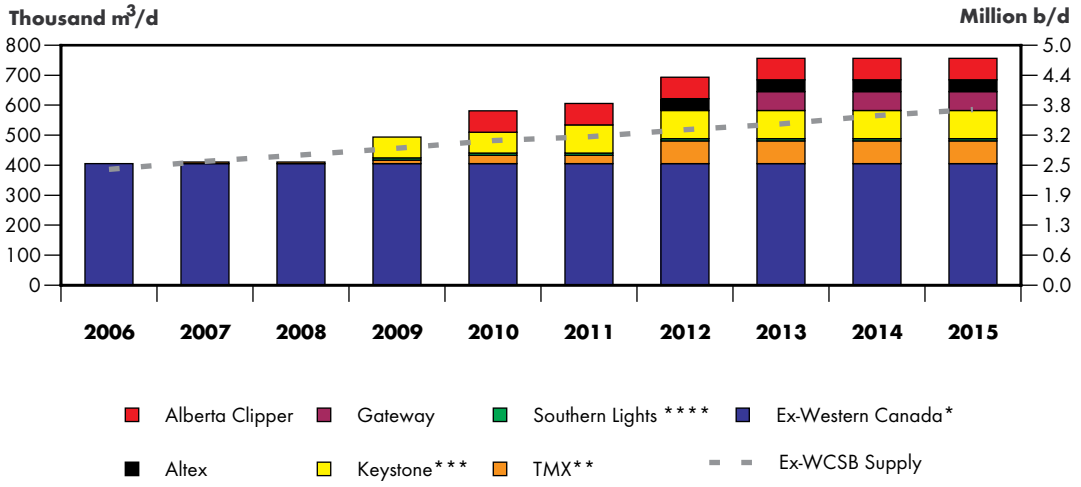
| Phase II | | 148 | 2009 | |
| Phase III Extension | | 47 | N/A | |



In the past year, the Board has also approved two crude oil pipeline related applications. In October 2006, the Board approved an application filed by TPTM to loop a portion of its pipeline between Hinton, Alberta and Rearguard, British Columbia. The project will increase capacity by 6 360 $m^3/d$ (40 Mb/d). It is expected to be in service by third quarter 2008.

In June 2006, the Board received an application by TransCanada PipeLines Limited and TransCanada Keystone Pipeline GP Ltd. to transfer a portion of TransCanada's natural gas pipeline and associated facilities to crude oil service. The Keystone Project is a proposal to convert existing natural gas facilities in Canada and to construct a new crude oil pipeline in the U.S. to transport crude oil from Hardisty, Alberta to Patoka, Illinois. It would have a capacity of 69 000 $m^3/d$ (435 Mb/d) and is expected to be in-service in 2009 if approved. The Board approved the facilities transfer on 9 February 2007; however the TransCanada Keystone application for the construction of new oil facilities is still before the Board.

Looking beyond 2006, Figure 21 illustrates the NEB's forecast of crude oil production and the anticipated pipeline capacity available to transport crude oil and products from Western Canada on existing and proposed new facilities. This chart highlights that oil pipeline capacity is expected to be very tight in the next few years. It is expected that apportionment will occur in the fourth quarter 2007 and that this may be an issue for the next 18 months. As indicated by the figure, between now and 2009 crude oil pipelines out of Western Canada are expected to operate at capacity. The upstream industry is working together with pipeline companies to develop initiatives to reduce the impacts and/or eliminate apportionment. In 2009, TPTM would have an additional 12 000 $m^3/d$ (75 Mb/d) of capacity with its pumping station expansion and the looping; Southern Lights could add an additional 7 500 $m^3/d$ (47 Mb/d) to the Enbridge system from Cromer, Manitoba; and Keystone could be in-service if its application were approved by the Board.

**FIGURE 21**

***Proposed Oil Pipeline Projects & NEB Forecast of Crude Oil Production***

* Total current crude oil pipeline capacity out of the WCSB assuming maximum heavy oil volumes.

** Pump Station expansion of 35 Mb/d by 2007 and looping 40 Mb/d by 3Q2008. TMX North would expand capacity by an additional 400 Mb/d but is not shown here.

*** Keystone could be expanded by 155 Mb/d and extended to Cushing, Oklahoma by 4Q2010

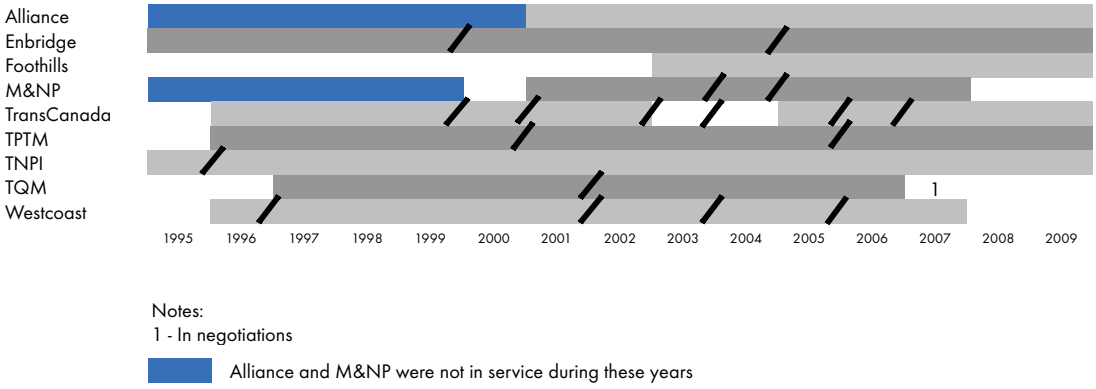
**** Net crude oil capacity increase of 47 Mb/d by 4Q2008

# PIPELINE TOLLS & SHIPPER SATISFACTION

The Board utilizes a number of indicators to assess whether pipeline companies are providing services that meet the needs of shippers at stable and reasonable prices (tolls). This includes monitoring the stability of pipeline tolls as indicated through year-to-year variations in a benchmark toll for each of the major NEB-regulated pipelines; and direct shipper feedback received through response to the NEB's annual survey on pipeline services and via formal complaints. In addition, the frequency and acceptance of negotiated toll settlements, and the development of new or enhanced pipelines services are important indicators that there is alignment between the interest of pipeline companies and their shippers.

Historically, revenue requirements have been established using cost of service methodology, with some components for the return on and of invested capital. The revenue was then assigned to various rate categories and cost drivers for conversion into unit rates, or tolls. The revenue requirement and the toll setting methodology were matters for adjudication before the Board.

## 4.1 Negotiated Settlements



To improve the effectiveness of the regulatory process, the Board has supported the use of negotiated settlements since the mid-1980s as an alternative to toll hearings. In September 1988, the Board issued its first Guidelines for Negotiated Settlements. These guidelines were subsequently updated in August 1994 and revised again in June 2002 to provide flexibility when addressing contested settlements. With increasing use of negotiated settlements, adversarial hearings before the Board on tolls are becoming less frequent. Most of the pipeline companies still rely on cost of service methodology as a framework for the negotiated settlements.

As shown in Figure 22, all of the major pipelines regulated by the Board were operating under negotiated settlements during 2006. In late 2006, M&NP and its shippers successfully negotiated a one-year toll settlement for 2007. TransCanada has also recently negotiated a five-year settlement for 2007 to 2011 that was approved by the Board in May 2007. TPTM negotiated another five-year deal with its shippers for the years 2006 to 2010. TQM is currently operating under interim tolls which are based on a five-year settlement which expired on 31 December 2006. TQM is in discussion with its shippers regarding tolls for 2007 and future years. Westcoast Transmission and its shippers are currently in the second year of a two-year settlement for 2006 and 2007.

These negotiated settlements have resulted in a reduction in the regulatory burden for parties, both in terms of the time spent in hearings and the associated costs. They have also contributed to a better alignment of interests between pipeline companies and their shippers.

**FIGURE 22**

***Negotiated Settlements Timeline***

Notes:
1 - In negotiations

Alliance and M&NP were not in service during these years

## 4.2 Pipeline Tolls Index

Stable and reasonable tolls are a key area of concern for users of the transportation and an indicator of the system's efficiency. The Board tracks year-to-year variations in tolls; the section below describes movements in the benchmark toll for each of the major pipelines it regulates (e.g., TransCanada's Eastern Zone toll or Westcoast's T-South Export toll). Under cost of service regulation, pipeline tolls can vary from year-to-year for various reasons. For example, a significant expenditure to modify or expand a system to meet shippers' needs could increase or decrease toll levels depending on the specific circumstances. Falling throughput or contract demand leading to lower capacity utilization could lead to a significant toll increase.

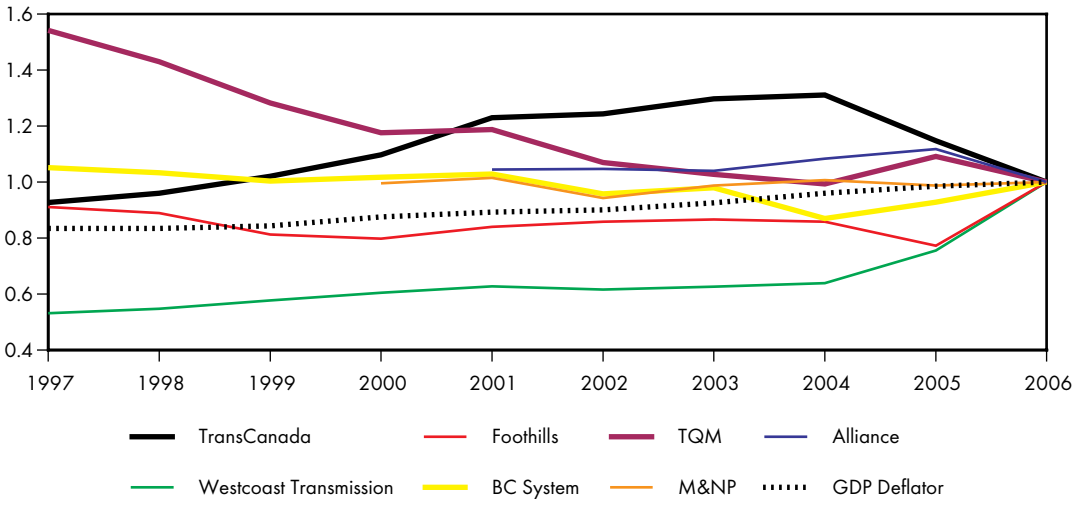
### *Natural Gas Pipeline Tolls*

Figure 23 shows indexes of benchmark tolls[4] for TransCanada's Mainline, Westcoast Transmission, Foothills, the TransCanada B.C. System (B.C. System), TQM, M&NP, Alliance, and the GDP deflator[5] all normalized to the year 2006.[6]

The increase in TransCanada's benchmark toll between 1997 and 2004 is mainly attributed to a large amount of decontracting on the Mainline during that period, particularly after the startup of the Alliance pipeline in 2000. This toll tracked the GDP deflator fairly closely from 2001 to 2004. However, in 2005 and 2006 the toll fell, primarily due to increased contract demand: it remains below the level that it was in 2000.

Westcoast's tolls were relatively flat until 2004, when this toll increased by over 15 percent due to decontracting of firm services. Further reductions in volumes in 2006 caused a further 32 percent increase in 2006 tolls.

4 The benchmark tolls are: TransCanada Eastern Zone; Westcoast T-South Export; Foothills Zone 9; B.C. System Postage Stamp; TQM Saint Lazare to Trois-Rivières; M&NP Postage Stamp; and Alliance monthly demand toll.



5 The implicit GDP deflator for 2006 is an estimate using actual data for the first half of the year and data estimated by Informetrica for the second half of the year.

6 Differing pipeline distances add to the challenges in comparing tolls between individual pipelines. Some normalization is required. Here the tolls are normalized only with respect to their own changes over time. The year of normalization is arbitrary; the most recent was selected as some tolls are only available for more recent years.

**FIGURE 23**

***NEB-Regulated Natural Gas Pipeline Benchmark Tolls***

**Normalized to 2006 = 1.00**

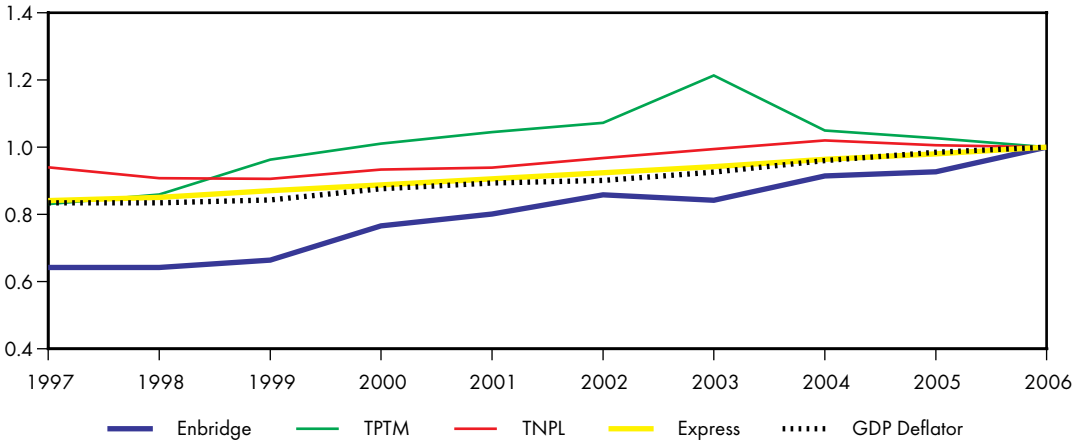
TQM's benchmark toll is below the 1997-1999 levels. This lower level is partly due to the Portland Natural Gas Transmission System (PNGTS) extension in 1999, which increased throughput over 30 percent from 1998. Foothills benchmark toll dropped in 1999 as a result of a cost-effective expansion of its system, but has increased in 2006 due to lower volumes and the end of the ten year period in 2005 for the deferred tax payback.

The B.C. System benchmark tolls in 2006 were close to the 1997 level. An (over 10 percent) increase in throughput volumes from 2003 reduced the 2004 benchmark toll on the B.C. System. M&NP and Alliance's benchmark tolls have been relatively constant since beginning operations at the end of 1999 and 2000 respectively.

### *Oil Pipeline Tolls*

Figure 24 presents indexed values for the benchmark tolls of Enbridge, TPTM, TNPI, Express and the GDP deflator, normalized to the year 2006.[7]

Enbridge's benchmark toll has risen fairly steadily over the period, growing at a faster pace than the GDP deflator, except for a drop in 2003. The tolls increased the most in 2000, 2004 and 2006. Under its negotiated settlement, Enbridge was able in the following year to recapture the revenue shortfall attributable to the lower throughput. The 2004 increase was primarily due to operating at lower capacity utilization with throughput not filling a recent capacity expansion. Higher fixed costs were spread across relatively lower volumes resulting in higher tolls.



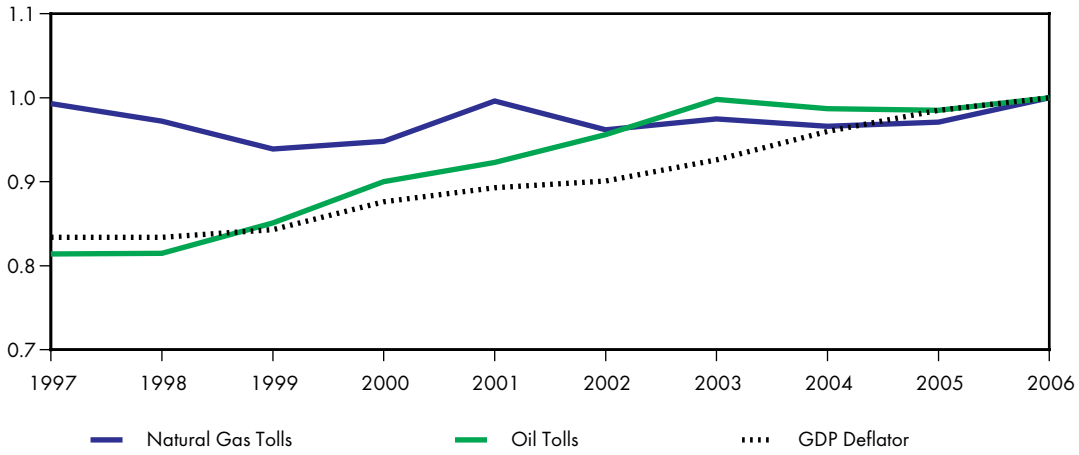
TPTM's benchmark toll rose steadily from 1997 to 2003 but fell in the last three years. The large 1999 increase was due to throughput forecasts. During TPTM's first incentive toll settlement, tolls were calculated on forecast volumes. In 1999 the throughput forecast was 17.9 percent lower than the 1998 forecast, which lead to a corresponding increase in the benchmark toll. In 2004, the benchmark toll dropped, primarily due to the disposition of deferrals for 2003 higher revenue. TNPI and Express's benchmark tolls moved roughly in line with the GDP deflator from 1997 to 2006.

7 The benchmark tolls are: Enbridge Edmonton to International Border near Chippewa; TPTM Edmonton to Burnaby; TNPI Oakville to Montreal; and Express 15-year.

**FIGURE 24**

***NEB-Regulated Oil Pipeline Benchmark Tolls***

**Normalized to 2006 = 1.00**



* Enbridge Toll does not include terminal and tankage fees.

**FIGURE 25**

***Oil and Natural Gas Pipeline Benchmark Tolls***

**Normalized to 2006 = 1.00**

### *Comparison of Gas and Oil Pipeline Tolls*

Figure 25 presents the GDP deflator with simple averages of the gas and oil benchmark pipeline tolls indices (reported in Figures 23 and 24).[8] From 1997 to 2006, average natural gas pipeline tolls have been relatively flat despite the rise in the GDP deflator. Over the same period, oil pipeline tolls increased but the net increase over the period has matched the GDP deflator. Throughput volumes have been the primary driving factor in variations during the period.

8 No adjustments are made for the relative volume, capacity or length of the individual pipelines.

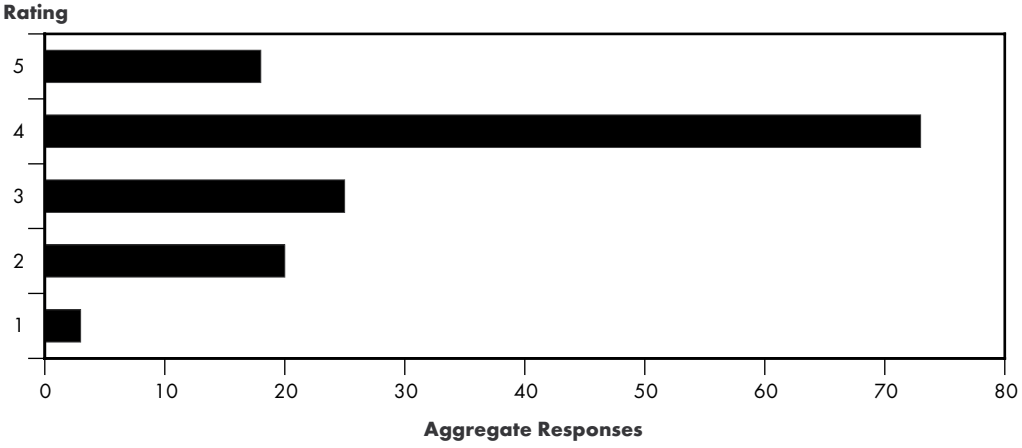
## 4.3 Shipper Satisfaction

### *4.3.1 NEB Pipeline Services Survey*

The Board conducted its third annual Pipeline Services Survey in early 2007 to obtain direct feedback from the shippers of major NEB-regulated pipeline and midstream companies on the quality of service provided by those pipelines. The Board also used this survey to obtain feedback from shippers on the Board's regulatory performance with respect to tolls and tariffs.

To conduct this year's survey, the Board used a web-based survey tool, called Inquisite, which was sent to shippers directly via e-mail. For each survey received, shippers completed one response which reflects their company's corporate views on the services provided by the pipeline and midstream company being surveyed and on the services provided by the Board. The overall response rate for the survey was 27.0 percent, which was lower than last year's rate of 33.5 percent. The number of surveys sent out this year was 523, approximately 100 more than last year.

After analyzing the survey responses, the Board published a summary of the aggregate results on its website. They included the industry average and distribution of responses for each question and a summary of major themes. In addition, the Board provided each company and its shippers with detailed company-specific results including the average rating and distribution of responses for each question as well as the verbatim comments received from shippers, with the names of the respondents excluded.



Appendix 3 provides the aggregate scores on all survey questions. For the complete report on the aggregate results, refer to www.neb-one.gc.ca/Publications/Survey Results.

*Pipeline Services*

Figure 26 shows the aggregate results for the survey question that asked shippers to rate their satisfaction with the overall quality of service provided by their pipeline/midstream companies over the last year (1 indicates "very dissatisfied" and 5 indicates "very satisfied"). The industry average score of 3.60 was slightly higher than the score of 3.57 in last year's survey. Sixty-five percent (65%) of the respondents gave their company a rating of satisfied or very satisfied on overall quality

**FIGURE 26**

***Shipper Satisfaction on Pipeline Quality of Service***

of service, compared to 58 percent last year. Based on these results, the Board is able to conclude that shippers again appear reasonably satisfied with the services provided by pipeline/midstream companies.

The three areas where shippers indicate that pipeline and midstream companies are doing very well are:

- Timeliness and accuracy of invoices and statements;
- Physical reliability of pipeline operations; and
- Satisfaction with transactional systems.

The three areas where shippers believe that companies could improve the most are:

- Reducing the level of transportation tolls or midstream charges;
- Exhibiting an attitude of continuous improvement and innovation; and
- Ensuring that settlements or tariff arrangements work well.

***Feedback on the Board***

The 2007 survey indicated that approximately 59 percent of shippers are either satisfied or very satisfied with the Board's performance with creating an appropriate regulatory framework and 55 percent of shippers are either satisfied or very satisfied with the Board's processes to resolve disputes. Both of these results were lower than in the 2006 survey. Two areas for improvement noted by shippers were for the Board to build its internal capacity to serve Canadians better and to provide effective regulatory processes that are more accessible to stakeholders and yield more timely decisions. Both of these areas are addressed in the Board's 2007-2010 Strategic Plan, which can be found at www.neb-one.gc.ca/AboutUs/strtgcpln2007_2010_e.htm.

### 4.3.2 Formal Complaints

If shippers are unable to resolve concerns with the pipeline, they can bring a formal complaint to the Board. The complaint would then be dealt with through appropriate dispute resolution, a formal complaint process or, in some cases, the parties may be able to negotiate a solution to the concern. There was only one formal shipper complaint during the past year which involved the Board.

***Several shippers on Cochin Pipe Lines Ltd. (Cochin)***

In December 2006, Cochin filed for new rates to become effective 1 January 2007. The new rates reflected increases ranging from 91 to 580 percent across both Regular Volume Rates and Incentive Volume Rates and included a new toll segment from Detroit, Michigan to Windsor, Ontario. The Board received 11 letters from Cochin's shippers and interested parties indicating concern with the magnitude and timing of the rate increases. Shortly thereafter, Cochin initiated settlement discussions with its shippers and, in February 2007, filed a negotiated settlement and letters of support from many of its shippers. Following further negotiations with one opposing shipper, Cochin advised that it and the shipper had reached a resolution of the outstanding issue. Cochin's toll settlement was subsequently approved by the Board in May 2007.

### 4.3.3 *Service Enhancements*

On an ongoing basis pipelines may propose modifications to their services as circumstances and needs of their customers change or innovative ideas are brought forward. Normally, the pipeline and its shippers will discuss and agree upon proposed service enhancements in their tolls task force prior to submission to the Board and ultimate adoption. However, if the task force is unable to agree on the service, a party may still bring the issue directly to the Board.

*Coral Energy Canada Inc. (Coral)*

Coral applied to the Board to modify the Firm Transportation Risk Alleviation Mechanism (FT-RAM) pilot, a service enhancement proposed by TransCanada for its long haul contracts on the Mainline. In February 2006, The Board approved Coral's application which sought to extend FT-RAM credits to short-haul contracts held by the same shipper, which when combined with a long-haul contract forms a continuous long-haul on the TransCanada Mainline. The Board subsequently also approved amendments supported by an unopposed tolls task force resolution to extend the FT-RAM pilot project for an additional year.

*TransCanada*

In May 2006, TransCanada applied to the Board for approval of two new services on its Mainline, designed to meet the fluctuating demands of new gas-fired electric generation in Ontario. The Board has approved the implementation of these services; Firm Transportation - Short Notice (FT-SN) and Short Notice Balancing (SNB) and the proposed tolling method for FT-SN. However, the Board directed TransCanada to develop an alternate tolling method for SNB service.

*Westcoast*

After lengthy discussions with the Toll and Tariff Task Force on the possible decontracting on transmission facilities, Westcoast and its customers agreed to the following firm service enhancements, which were subsequently approved by the Board in RHW-1-2005 and implemented in 2006:

- Term differentiated rates (offering lower rates for longer term commitment) were taken up by about 25% of eligible volumes starting in January 2006.
- Authorized Over Run service which provides firm service customers with access to additional capacity at a higher priority than interruptible service was successfully utilized during a scheduling constraint in late 2006.
- Cross-corridor crediting was implemented on the various corridors on Westcoast's T-North system in 2006.

Moreover, to address periodic imbalance management issues, Westcoast, in collaboration with its shipper community, proposed a Supply Imbalance Management Strategy that was unanimously supported by its Toll and Tariff Task Force, and is expected to be implemented in 2007.

## 4.4 Chapter Summary

The following observations are made in this chapter:

- Shippers are able to resolve the majority of their tolling issues of interest with pipelines through the negotiated settlement process;

- Pipeline tolls have been relatively stable on average, although particular regional situations may cause greater variability in some areas;
- Based on responses to the NEB Pipeline Services survey; shippers again appear reasonably satisfied with the services provided by pipeline/midstream companies.
- There are few formal service complaints; and
- Development of pipeline service enhancement continues.

The Board concludes that pipeline companies are providing services that meet the needs of shippers at stable and reasonable prices (tolls). Shippers are also reasonably satisfied with the role played by the Board itself, with some suggestions incorporated into the Board's own planning.

# PIPELINE FINANCIAL INTEGRITY AND ABILITY TO ATTRACT CAPITAL

Pipeline companies must have adequate financial integrity to attract capital on reasonable terms and conditions to effectively maintain their systems and build new infrastructure to meet the market's evolving needs. The following sections review and discuss a number of the factors relevant to these areas, starting with the area over which the Board has the most direct influence.

## 5.1 Common Equity

A common equity ratio is defined as the percentage of common equity in a company's capital structure. This ratio is often used to evaluate a company's financial risk. Higher common equity ratios increase the likelihood of a company being able to meet its obligations.

### *Deemed Common Equity Ratios*

The Board approves a deemed common equity ratio for the Group 1 pipeline companies that it regulates.[9] When the Board approves a Group 1 pipeline company's tolls for a specified time period, it typically also approves a return on equity (ROE) and deems a common equity ratio for the regulated entity. Alternatively, some Group 1 pipeline companies successfully negotiate a comprehensive tolls settlement with their shippers, which may include capital structure and return on equity. In this instance, the Board still considers the overall settlement. Given the extent of negotiated settlements, many of the equity ratios have been determined by negotiation among the parties involved. Through this mechanism, the Board has influence over the operating profitability and financial risk of some Group 1 pipeline companies.

**TABLE 6**

***Deemed Common Equity Ratios (Percent)***

| | 2002 | 2006 | 2007 |
|---|---|---|---|
| Alliance | 30 | 30 | 30 |
| Foothills | 30 | 36 | 36 |
| M&NP | 25 | 25 | 29.27 |
| TQM* | 30 | 30 | 30 |
| TransCanada B.C. System | 30 | 36 | 36 |
| TransCanada Mainline | 33 | 36 | 40 |
| Westcoast Transmission | 30 | 35 | 36 |

* TQM's common equity ratio was specified in its negotiated settlement that expired on 31 December 2006.

Table 6 shows the deemed common equity ratio for some NEB Group 1 pipeline companies through adjudication or negotiation. TransCanada, Westcoast Transmission, B.C. System, and Foothills have increased their deemed common equity ratios between 2002 and 2006. The market considers these increases to be credit positive, lowering the financial risk of the pipeline companies.

9 A deemed common equity ratio is a notional capital structure used for rate-making purposes that may differ from a company's actual capital structure.

*Return on Common Equity*

Return on equity is commonly used to assess the operating profitability of a company. Financial markets define ROE as net income divided by common equity.

For NEB-regulated pipeline companies, ROE is the return on the equity portion of the rate base that is approved by the Board and is determined either through adjudication or negotiation. A higher ROE is typically preferred by investors.

Annually, the Board establishes an approved-ROE following the method outlined in RH-2-94. It is applicable to pipelines that the Board regulates, except those that have Board approved alternative rates. Achieved ROEs can vary from NEB-approved levels for various reasons, such as incentives, profit-sharing mechanisms and cost reductions.

Table 7 shows the achieved ROE for several NEB-regulated pipeline companies from 2002 to 2006 along with the ROE approved by the NEB in accordance with the RH-2-94 Formula[10]. As per their respective negotiated settlements, Enbridge, TPTM and Trans-Northern are not required to submit their Financial Surveillance Reports to the NEB, which would include achieved ROEs. Therefore, these pipeline companies are not included in Table 7. Other companies are included in Table 8, but are not subject to the RH-2-94 Formula ROE: Alliance and M&NP have negotiated ROEs with their shippers,[11] and Westcoast's Field Services Division is financially regulated on a complaint basis as described in the Framework for Light-handed Regulation (RHW-1-98). Fees for gathering and processing services are negotiated individually with shippers. TransCanada and TQM have negotiated settlements which use the RH-2-94 Formula as a basis and allow incentives causing some variations from the Formula rate.

The RH-2-94 Formula produced an ROE of 8.88 percent for 2006, falling each year since 2003 because of low interest rates. From 2002 to 2006, for pipeline companies subject to the RH-2-94

**TABLE 7**

***Achieved ROEs and the RH-2-94 Formula ROE (Percent)***

| | 2002 | 2003 | 2004 | 2005 | 2006 |

* excluding CWIP (construction work in progress) and, in the case of Transmission, deferrals.

10 The formula used to determine the ROE for certain NEB-regulated pipelines, established in the RH-2-94 Proceeding, and later amended to eliminate rounding.

11 The settlements were subsequently approved by the Board. Alliance's settlement sets its ROE at 11.25 percent over this period. M&NP has a base return on equity of 12 percent for 2007; up to and including 2006 their base rate was 13 percent, with incentive potential.

**FIGURE 27**

***Variance from NEB-Approved ROE for the Years 2001 to 2006***

Source: NEB Surveillance Quarterly and Annual Reports. Includes TransCanada Mainline and B.C. System, TQM, Westcoast Transmission system, and M&NP, as well as Foothills and Alliance which earn precisely their allowed ROE.

Formula ROE, only the TransCanada B.C. System has failed to earn an ROE at or above the Formula return in each year.

Most pipelines have, or have proposed, negotiated settlements. Three settlements have allowed ROEs that are different than the Formula ROE: Alliance, M&NP, and Trans-Northern. In the case of Alliance and M&NP, the ROE was fixed for an extended period. Other settlements use the RH-2-94 Formula as the allowed ROE and many of these settlements provide varying degrees of incentives to enable pipelines to earn more than the Formula ROE. As a result of the various incentives, most Group 1 pipelines have achieved actual ROEs that are greater than allowed ROEs. With the low interest rate environment, the RH-2-94 Formula produces an ROE of 8.46 percent for 2007.

Figure 27 charts the difference between achieved ROEs and NEB-approved ROEs for the TransCanada Mainline, the B.C. System, TQM, the Westcoast Transmission system, and M&NP. Also Foothills and Alliance are included; by their settlement their achieved ROEs equal their approved ROEs. From 2001 to 2006, pipeline companies (included in Figure 27) have met or exceeded their NEB-approved ROEs 86 percent of the time. The stability and predictability of returns is positive for both bondholders and equity investors. It also highlights that these pipeline companies, in many cases, have been able to meet or outperform approved levels through cost reductions, incentives and profit sharing mechanisms.

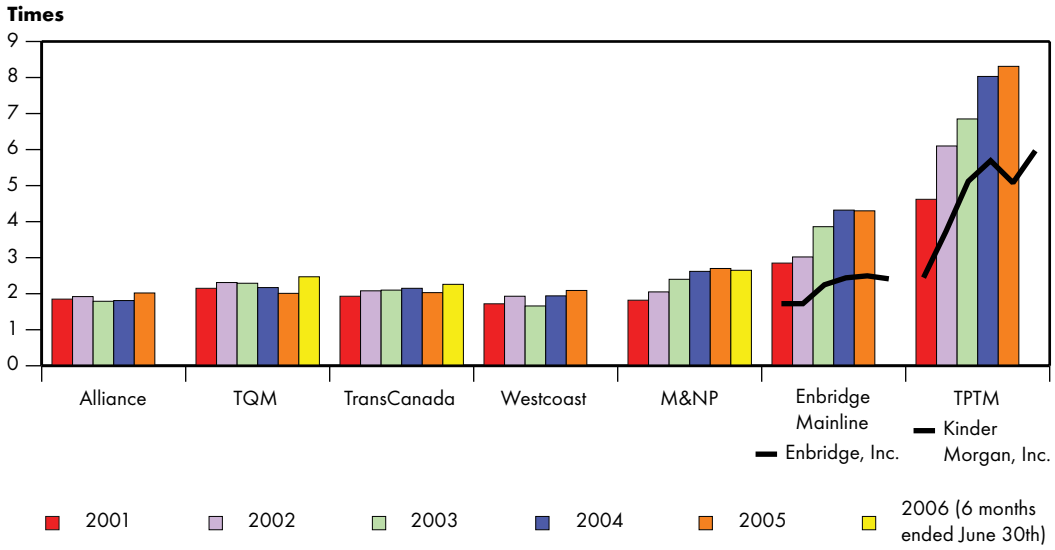
## 5.2 Financial Ratios

Financial ratios, based on financial statement information, can be useful in describing a company's performance and financial integrity. A financial ratio is most meaningful when the ratio of a particular company is compared with a benchmark or industry standard over time. A variety of ratios can be used to evaluate a company's liquidity, operating performance, growth potential, and risk. However, care must be exercised in the collection and interpretation of financial ratios. Reported financial information often pertains to a parent company, and includes non-regulated assets and/or assets from different industries.

The following sections specifically outline and discuss some ratios relating to the financial risk of certain companies with NEB-regulated pipelines.

Financial risk is the risk inherent in a company's use of debt and other obligations that have fixed payments. It differs from business risk which is the risk attributed to the nature of a particular business activity and for pipelines typically includes supply, market, regulatory, competitive and operating risks. Financial risk increases as the proportion of debt increases in relation to shareholders equity. An increase in debt may obligate a company to make more and larger fixed payments in the future. From a bondholder's perspective, a company with above average financial risk could have problems making interest payments. From an equity holder's perspective, a company's level of debt coverage gives some indication of the sustainability and value of the equity, and possible ability to pay dividends.

A company's financial risk can be described by ratios such as interest and fixed-charges coverage and cash flow-to-total debt and equivalents.



### *Interest and Fixed-Charges Coverage Ratios*

An *interest coverage ratio* describes a company's ability to make interest payments and repay its debt obligations. It is defined as Earnings Before Interest and Taxes (EBIT) divided by interest charges. The metric presented below is similar: the *fixed-charges coverage ratio* describes the ability to make interest payments as well as other types of fixed payments a company is obligated to make. It is defined as earnings before interest, fixed charges and taxes divided by fixed-charges, including interest. Higher ratios indicate a higher likelihood that the company will be able to meet its obligations and, if all other things are equal, could indicate that it has unused borrowing capacity.

The fixed-charges coverage ratios for some NEB-regulated pipeline companies, as calculated by the Dominion Bond Rating Service (DBRS), are shown in Figure 28. Complete data are not available consistently for all companies: the Enbridge Mainline is shown in the block data, the consolidated company Enbridge Inc. is shown as the line. TPTM information was not available on a stand-alone

**FIGURE 28**

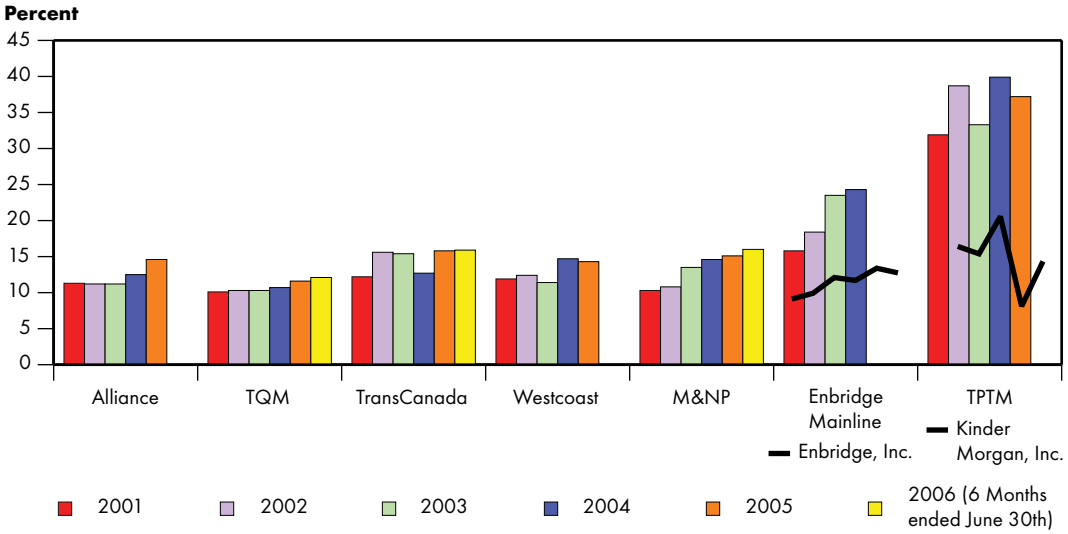
***Fixed-Charges Coverage Ratios***

Source: DBRS

N.B. There was no fixed-charges coverage ratio reported for Enbridge (Mainline) in 2006.

basis for 2006: the overlay line shown is its new owner, Kinder Morgan Inc. The average fixed-charges coverage ratio for the companies for which data is available is 2.42, which is a 6 percent increase year-over-year for those companies.[12]

No company saw its 2006 fixed-charges coverage ratio lower than its 2001 levels. From 2001 to 30 June 2006, the fixed-charges coverage ratio for the five natural gas pipeline companies shown increased modestly from a little under 2 times to around 2.2 by 2006. The two oil pipelines (Enbridge (Mainline) and TPTM, in each case representing the oil pipelines business unit) had higher ratios, which increased more rapidly. TPTM's fixed-charges coverage ratio has been higher, primarily due to a deemed common equity ratio of 45 percent (larger than its peers), which means it carried less debt, and had lower fixed payments. The continuing increases in fixed-charges coverage ratios for all companies is one metric signaling a decrease in the pipeline companies' financial risk, when considered as a group.



### *Cash Flow-to-Total Debt and Equivalents Ratio*

The cash flow-to-total debt and equivalents ratio is another way of describing a company's ability to meet its debt obligations and fixed payments. It is defined as operating cash flow divided by total debt and debt equivalents. Again, higher ratios indicate an increased likelihood of a company being able to meet its obligations and indicate that it has greater borrowing capacity.

The cash flow-to-total debt and equivalents ratio for some NEB-regulated pipeline companies, as calculated by DBRS, are shown in Figure 29. As earlier noted, this ratio is not available for the pipeline units. The average cash flow-to-total debt and equivalents ratio for these companies was 14.2 percent for the partial year ending June 2006, a slight increase from the year before.[13] TPTM's cash

**FIGURE 29**

***Cash Flow-to-Total Debt and Equivalents Ratios***

Source: DBRS

N.B. There was no fixed-charges coverage ratio reported for Enbridge (Mainline) in 2005 and 2006.

12 This average includes only Alliance, M&NP, TransCanada and Enbridge Inc.; this group had a simple average of 2.28 in 2005 and 1.93 in 2001. In last year's report, the average of 3.22 cited included other pipelines, such as TPTM.

13 The ratio is heavily influenced by the availability of TPTM data. In the 2006 report, the average ratio was 17 percent including data available for TPTM. Without TPTM the ratio was much more modest. Using only the companies which have data available this year, the average is 14.2 for 2006, slightly up from 14.0 for 2005 and up notably from 10.0 in 2000.

flow-to-total debt and equivalents ratio was higher than its peers for the same reason that its fixed-charges coverage ratio was higher.

On average, the cash flow-to-debt and equivalents ratio for these pipeline companies has grown by more than 20 percent from 2000 to 2006. The increase has been steady without any noteworthy periods of deterioration. The increase in this coverage ratio, and the consistent increase in cash flow-to-total debt and equivalents support the observation from the fixed-charges coverage that, on average, these pipeline companies' financial risk has been decreasing.

## 5.3 Credit Ratings

In Canada, pipeline credit ratings are determined by three independent credit rating agencies, Dominion Bond Rating Service (DBRS), Standard & Poor's (S&P), and Moody's. In general, credit ratings provide an assessment of the probability that a debt issuer will live up to its obligations and as such are an indication of the financial integrity of the rated company. Credit ratings assigned to a company generally reflect the consolidated operations of the entire company and not solely the regulated portion. Consequently, the credit rating for companies such as Enbridge, TransCanada and Westcoast that have both regulated and non-regulated operations may be influenced by its non-regulated operations. In addition, the credit ratings may be influenced to some extent by a parent company. Credit ratings are somewhat subjective in that a company's ratings are the expert opinion of the credit rating agency, which may result in different ratings by different agencies. See Appendix 4 for a comparison of the rating scales for DBRS, S&P, and Moody's.

*DBRS*

In assigning a credit rating to a particular company, DBRS attempts to consider all meaningful factors that could impact the risk of maintaining timely payments of interest and principal in the future. The key credit considerations will vary industry by industry; however, some of the common factors that are considered for most ratings are: core profitability, asset quality, strategy and management strength, and the financial and business risk profile.

For pipelines, the following specific factors are also considered in deriving the credit ratings: regulatory factors, competitive environment, supply and demand considerations, and regulated versus non-regulated activities. The credit ratings for most Group 1 pipeline companies shown in Table 8

**TABLE 8**

***DBRS Credit Rating History***

| Pipeline | 2002 | 2003 | 2004 | 2005 | 2006 | Current |
|---|---|---|---|---|---|---|
| Alliance | A(low) | A(low) | A(low) | A(low) | A(low) | A(low)/Stb |
| Enbridge Pipelines | A(high) | A(high) | A(high) | A(high) | A(high) | A(high)/Stb |

| TransCanada | A | A | A | A | A | A/Stb |
| Trans Mountain | A(low) | A(low) | A(low) | A(low) | repaid | repaid |
| Trans-Northern | NR | NR | NR | A(low) | A(low) | A(low)/Stb |
| Westcoast[2] | A(low) | A(low) | A(low) | A(low) | A(low) | A(low)/Stb |

1 Senior secured
2 Unsecured debentures
NR Not rated

indicates that the ratings have remained stable from 2002 to the present, varying from A(low) to A(high), and there have been no recent rating changes.

***Standard & Poor's***

An S&P credit rating reflects a borrower's capacity and willingness to meets its financial commitments on a timely basis. S&P bases its ratings on the overall creditworthiness of a consolidated company. Therefore, the rating of a wholly-owned subsidiary, in the absence of meaningful ring-fencing measures, generally reflects the creditworthiness of the parent.

In S&P's rating methodology, a company rated 'A' has strong capacity to meet its financial commitments but is somewhat more susceptible to the adverse effects of changes in circumstances and

economic conditions than companies in higher-rated categories. A company rated 'BBB' has adequate capacity to meet its financial commitments. However, adverse economic conditions or changing circumstances are more likely to lead to a weakened capacity of the company to meet its financial commitments.

The rating histories for several Group 1 pipeline companies are provided in Table 9. The table illustrates that the ratings have remained stable from 2002 to the present, varying from 'BBB+' to 'A-'. There have been two recent rating changes. First, the credit rating on the long-term debt of Westcoast Energy Inc. was upgraded to 'BBB+' in January 2007 from 'BBB', which had been in place since February 2004. The rating change was based on the ownership change at the parent company level that occurred effective 2 January 2007 when Duke Energy Corporation completed the spin-off of its natural gas business (including Westcoast) to Spectra Energy Corporation, a new publicly traded company. Second, in April 2007, S&P revised its outlook on TranCanada from 'negative' to 'stable'. The negative outlook on TransCanada's credit rating had been in place since December 2002, and was initially associated with TransCanada's acquisition of a significant interest Bruce Power in February 2002. S&P noted that TransCanada's recent acquisition of ANR and its investment in the Keystone oil pipeline project provide a stabilizing offset to the declining rate base and lower return on equity from its traditional business.

Both DBRS and S&P have expressed an opinion at various times that the ROE awarded through the RH-2-94 Formula and the deemed equity ratios awarded by the Board are low by international standards. Nonetheless, the ratings assigned by these credit rating companies indicate that NEB-regulated companies are all rated investment grade.

**TABLEAU 9**

***S&P Credit Rating History***

| Pipeline | 2002 | 2003 | 2004 | 2005 | 2006 | Cote actuelle |

| Westcoast[2] | A/Stb | BBB+/Stb | BBB+/Stb | BBB/Watch/Neg | BBB/Stb | BBB+/Stb |

1 Senior secured
2 Unsecured debentures

*Moody's*

Moody's credit analysis focuses on the fundamental factors and key business drivers relevant to an issuer's long-term and short-term risk profile. The foundation of Moody's methodology rests on two basic considerations:

- The risk to the debt holder of not receiving timely payment of principal and interest on the specific debt security.
- A comparison of the level of risk with that of all other debt securities.

Like S&P, Moody's focuses its ratings on the overall creditworthiness of the consolidated entity. In so doing, Moody's measures the ability of an issuer to generate cash in the future, thus its primary focus is on the predictability of future cash generation. This determination is built on an analysis of the individual issuer and of its strengths and weaknesses compared to those of its peers worldwide. An examination of factors external to the issuer is also conducted, including industry- or country-level trends that could impact the entity's ability to meet its debt obligations. Of particular concern is the ability of management to sustain cash generation in the face of adverse changes in the business environment.

The rating histories for several Group 1 pipeline companies are provided in Table 10. All of Moody's ratings placed the pipelines in the investment grade category, specifically rated 'medium grade' to 'upper-medium grade'.

There has been one recent rating change by Moody's. In March 2007 Moody's downgraded the ratings on the senior unsecured debt of Enbridge Inc. one notch to Baa1 from A3.[14] Moody's stated that the one notch downgrade was based on concerns relating to the company's weak financial profile, the complexity of its organizational and capital structure, and the scope and financial impact of the company's substantial organic growth plans.

## 5.4 Comments by the Investment Community

Access to capital market is necessary for pipeline companies to maintain and, potentially, expand their systems as the needs of the transportation market changes. Board staff met with credit rating analysts, equity analysts, and suppliers of capital such as insurance and pension funds to discuss their views on the ability of NEB-regulated pipeline companies to access capital markets as well as their views on transportation markets and the current regulatory environment in Canada.

**TABLE 10**

***Moody's Credit Rating History***

| Pipeline | 2002 | 2003 | 2004 | 2005 | 2006 | Current |

1 Unsecured debentures
2 Senior secured

14 Enbridge Inc. is the parent company of Enbridge Pipelines Inc., which owns the Enbridge Mainline. Unlike DBRS and S&P, Moody's does not rate the debt issued by Enbridge Pipelines Inc.

There was a consensus among parties that there is substantial liquidity in both domestic and export global capital markets. Solid economic growth in recent years, low interest rates, the accumulation of capital in pension funds and the ability of private equity funds to borrow large sums at low rates from finance companies were among the reasons cited for the current situation, which was characterized as 'a lot of money chasing too few assets'. Regulated businesses, along with infrastructure and real estate, were seen as particularly attractive investments. It was noted that the federal tax changes made in October 2006 with respect to income trusts and increases in the dividend tax credit also increased demand for shares of dividend paying companies like financials, utilities and pipelines, at least temporarily.

Given this environment, there was agreement that NEB-regulated pipelines have not had difficulty accessing equity or debt markets. The parent companies of TransCanada PipeLines Limited and Enbridge Pipelines Inc. recently went to the equity market and collectively raised more than $2 billion. Both companies have also had substantial debt issues recently. However, some parties expressed concern that on a stand-alone basis the regulated entities themselves might have difficulty attracting capital given low ROEs. Others felt that the regulated entities would be able to attract capital but that the terms under which they did so may be more costly than for the consolidated entity.

Again this year the investment community noted that price-to-earnings ratios of utilities in Canada have been higher than those in the U.S. because of large energy infrastructure investment opportunities, a more stable regulatory environment and global interest in Canadian stocks. While there is currently substantial liquidity, it was noted that capital markets could change and this could happen very quickly and result in considerable volatility.

Many analysts expressed support for a formulaic approach to determining ROEs because of the transparency, stability and predictability that this method provides. However, a number expressed the view that the ROE resulting from the formula was too low, and contend that they are much lower than regulated ROEs in the U.S. and U.K. While views ranged widely on this issue, some felt that the typically lower ROEs in Canada were not justified by the differences in risk for Canadian companies compared to FERC-regulated pipelines. Some parties suggested it was time for the Board to revisit the ROE Formula.

## 5.5 Chapter Summary

The observations made in this chapter may be summarized as follows:

- Fixed-charges and cash flow-to-total debt and equivalents coverage ratios have increased since 2001;
- Deemed common equity ratios have increased since 2001;
- Achieved ROEs have in most cases been greater than or equal to their NEB-approved levels since 2001;
- Approved ROEs have been predictable, but declining and may now be too low;
- Credit ratings continue to be investment grade; and
- The investment community views NEB-regulated companies as having access to capital markets at this time of significant liquidity, but noted that market conditions can change rapidly and that on a stand-alone basis the regulated entities themselves may have difficulty attracting capital given current ROEs.

In general, these observations signal that, currently pipelines companies have adequate financial strength to attract capital on reasonable terms and conditions.

# CONCLUSIONS

Based on the criteria identified in the Introduction to this report, the Board believes that the Canadian hydrocarbon transportation system continues to work effectively.

1. **There is adequate capacity in place on existing natural gas pipelines.** The price differentials and capacity utilization charts indicate that most NEB-regulated gas pipelines have some excess capacity, even during the peak winter season. The existence of some excess capacity out of the WCSB has provided suppliers with the flexibility to access markets of their choice at most times. Proposed pipeline projects are mainly directed towards providing connection to new supplies or addressing bottlenecks in the market area.

   **Capacity remains very tight on oil pipeline systems.** While the capacity utilization indicators show that there was spare capacity on some of the pipelines in 2006, this was partially due to facility outages reducing the amount of crude oil or products to be transported. It is likely that export crude oil pipelines out of Western Canada may experience periods of apportionment by the fourth quarter 2007, and this may continue for the next 18 months. As indicated by Figure 21, no significant pipeline capacity is expected to be added between now and 2009. The industry and the pipeline companies are working together to develop a number of initiatives to reduce and/or eliminate the impacts of apportionment.

   The number of announced and proposed pipeline and expansions, and the transfer of under-utilized gas pipeline facilities on the TransCanada Mainline to transportation of crude oil, illustrates that the hydrocarbon transportation systems are responding and have the ability to make adjustments to pipeline capacity as market conditions change.

2. **Shippers continue to indicate that they are reasonably satisfied with the services provided by pipelines.** Once again, shippers rate the physical reliability of pipeline operations highly and express the most concern around the level of pipeline tolls.

3. **NEB-regulated pipeline companies are financially sound and have been able to attract capital on reasonable terms and conditions.** While it is recognized that some of the data and indicators reviewed are for the consolidated operations of pipeline companies, the investment community views NEB-regulated companies as having access to capital markets at this time of significant liquidity. However, the investment community also noted that market conditions can change rapidly and that on a stand-alone basis the regulated entities themselves may have difficulty attracting capital given current ROEs.

As identified in Chapter 3, there are a significant number of pipelines proposed to ensure that the Canadian transportation system has sufficient capacity to deliver the additional volumes of oil and natural gas to serve new and growing markets. The challenge for the pipeline transportation industry is to put appropriate capacity in service corresponding with changes in production and market requirements. For this to happen there must be adequate and predictable lead times to achieve

sufficient market support from amongst competing proposals, obtain regulatory approvals, arrange financing, mobilize labour and materials, and construct facilities.

A key component and ongoing challenge from the NEB's perspective is to provide, in a timely manner, a fair and effective process that does not distort the market place investment decisions. This may involve ongoing efforts to coordinate regulatory activities with other jurisdictions and to provide clear regulatory processes with predictable timelines. New investment can be frustrated when unexpected regulatory hurdles create delays or unpredictable timelines which may introduce uncertainty from changing supply and market conditions and business risk. Further, unnecessary construction delays, for both expansions and new pipelines, can be costly to both energy consumers and producers as the development of new supplies is constrained. Given the large capital outlay and the long-term nature of these investments, market participants seek to ensure that the optimal decisions are made.

The Board recognizes that this report represents only a snapshot in time and does not include a comparison with or to pipeline transportation systems in other jurisdictions. As part of its mandate, the Board will continue to monitor the effectiveness of the transportation system and will continue to meet with parties to gain an understanding of all perspectives on this issue. The Board welcomes feedback on the measures and conclusions in this report and also welcomes suggestions for improvements to future reports.

The Board thanks those companies and organizations that directly or indirectly provided the information found in this report, including those that actively participated in the Pipeline Services Survey.

# PIPELINE SERVICES SURVEY

## Aggregate Results

Below are the aggregate responses for each question in the survey. Respondents were asked to rate their satisfaction with the services they receive on a scale of 1 to 5, where 1 indicates "Very dissatisfied" and 5 indicates "Very satisfied". See the Board's website for the complete details

1. How satisfied are you with the physical reliability of the pipeline company's operations?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 18 | 12 | 74 | 31 | 3.79 |

2. How satisfied are you with the quality, flexibility and reliability of the pipeline company's transactional systems (nominations, bulletin boards, reporting, contracting, etc)?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 0 | 24 | 16 | 75 | 22 | 3.69 |

3. How satisfied are you with the timeliness and accuracy of the pipeline company's invoices and statements?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 7 | 7 | 14 | 75 | 31 | 3.87 |

4. How satisfied are you with the timeliness and usefulness of operations information (outages, available capacity, scheduled maintenance, flows, etc) provided by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 3 | 17 | 21 | 79 | 19 | 3.68 |

5. How satisfied are you with the timeliness and usefulness of commercial information (tolls, service changes, new services, contract information, etc) provided by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 7 | 13 | 34 | 70 | 15 | 3.53 |

6. How satisfied are you with the degree to which the pipeline company demonstrates an attitude of continuous improvement and innovation?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 10 | 30 | 36 | 51 | 11 | 3.17 |

7. How satisfied are you with the accessibility and responsiveness of the pipeline company to shipper issues and requests?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 9 | 22 | 32 | 54 | 21 | 3.41 |

8. How satisfied are you that the pipeline company works towards fair and reasonable solutions when resolving issues?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 20 | 37 | 54 | 19 | 3.44 |

9. How satisfied are you with the suite of services offered by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 13 | 40 | 67 | 10 | 3.49 |

10. How satisfied are you with the level of this pipeline company's tolls in relation to the transportation services your company receives?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 7 | 26 | 42 | 53 | 4 | 3.16 |

11. How satisfied are you with the collaborative processes (negotiations or task force meetings) utilized by this pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 11 | 16 | 38 | 45 | 14 | 3.28 |

12. How satisfied are you that the current negotiated settlement agreement or tariff arrangements work well to provide fair outcomes?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 11 | 8 | 47 | 52 | 5 | 3.26 |

13. How satisfied are you with the OVERALL quality of service provided by the pipeline company over the last calendar year?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 3 | 20 | 25 | 73 | 18 | 3.60 |

14. On an overall basis, has the pipeline company's quality of service in the last year:

| | | |
|---|---|---|
| Improved | 18 | 13% |
| Remained the Same | 100 | 72% |
| Decreased | 20 | 15% |
| **Total** | **138** | **100%** |

15. What are the things that this pipeline company does well?

16. What are the things that this pipeline company could do better?

17. How satisfied are you that the NEB has established an appropriate regulatory framework in which negotiated settlements for tolls and tariffs can be reached?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 10 | 39 | 67 | 9 | 3.52 |

18. When toll and tariff matters are not resolved through settlement, how satisfied are you with the Board's processes to resolve disputes?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 6 | 39 | 53 | 7 | 3.49 |

19. What could the Board be doing to improve its processes through which tolls and tariffs are determined?

# DEBT RATING COMPARISON CHART

This chart provides a comparison of the rating scales used by Dominion Bond Rating Service (DBRS), Standard and Poor's (S&P), and Moody's when rating long-term debt.

Standard & Poor's also provides a Rating Outlook that assesses the potential direction of a long-term credit rating over the intermediate to longer term. A 'Positive' outlook means that a rating may be raised; a 'Negative' outlook means that a rating may be lowered; and a 'Stable' outlook means that a rating is not likely to change.

| Credit Quality | DBRS | S&P | Moody's |
|---|---|---|---|
| **Investment Grade** | | | |
| Superior / High grade | AAA | AAA | Aaa |
| | AA (high) | AA+ | Aa1 |
| | AA | AA | Aa2 |
| | AA (low) | AA- | Aa3 |
| Good / Upper Medium | A (high) | A+ | A1 |
| | A | A | A2 |
| | A (low) | A- | A3 |
| Adequate / Medium | BBB (high) | BBB+ | Baa1 |
| | BBB | BBB | Baa2 |
| | BBB (low) | BBB- | Baa3 |
| **Non-Investment Grade** | | | |
| Speculative | BB (high) | BB+ | Ba1 |
| | BB | BB | Ba2 |
| | BB (low) | BB- | Ba3 |
| Highly Speculative | B (high) | B+ | B1 |
| | B | B | B2 |
| | B (low) | B- | B3 |
| Very Highly Speculative | CCC | CCC | Caa1 |
| | CC | CC | Caa2 |
| | C | C | Caa3 |
| | D | D | Ca |
| | | | C |

Note: DBRS and S&P ratings in the CCC category and lower also have subcategories "high/+" and "low/-" and the absence of "high/+" and "low/-" designation indicates the rating is in the "middle" of the category.

# FOREWORD

The National Energy Board (the NEB or the Board) is an independent federal agency whose purpose is to promote safety and security, environmental protection and efficient energy infrastructure and markets in the Canadian public interest[1] within the mandate set by Parliament in the regulation of pipelines, energy development and trade. The NEB is an active, effective and knowledgeable partner in the responsible development of Canada's energy sector for the benefit of Canadians.

The main functions of the NEB include regulating the construction and operation of pipelines that cross international or provincial borders, as well as tolls and tariffs. Another key role is to regulate international power lines and designated interprovincial power lines. The NEB also regulates natural gas imports and exports, oil, natural gas liquids (NGLs) and electricity exports, and some oil and gas exploration on frontier lands, particularly in Canada's North and certain offshore areas. In addition, the Board provides energy information and advice by collecting and analyzing information about Canadian energy markets through regulatory processes and monitoring.

This report, the second of its kind, provides an assessment of the Canadian hydrocarbon transportation system. To do so, it brings together data from various publicly available sources that was collected and monitored by NEB staff as well as throughput data supplied by the pipeline companies. The Board also benefited from discussion with members of the investment community with respect to capital markets and emerging issues. Prior to the release of this report, a draft was sent to the Canadian Energy Pipeline Association (CEPA) and the Canadian Association of Petroleum Producers (CAPP) for comment. Comments provided by CAPP and CEPA were taken into consideration in the preparation of this report.

Any comments on the report or suggestions for further analysis can be directed to:

Karen Overli

Email: koverli@neb-one.gc.ca

If a party wishes to rely on material from this report in any regulatory proceeding, it can submit the material as can be done with any public document. In such a case, the material is in effect adopted by the party submitting it and that party could be required to answer questions on it.

Information about the NEB, including its publications, can be found by accessing the Board's website: http://www.neb-one.gc.ca.

[1] The Canadian public interest is all Canadians and refers to a balance of economic, environmental and social interests that change as society's values and preferences change.

# INTRODUCTION

Energy is essential to our daily lives. The ability of the pipeline transportation system to deliver this energy in the form of natural gas, natural gas liquids (NGLs), crude oil and petroleum products is critical to Canada's economic well-being.

Canadians depend on a safe, reliable and efficient energy supply. The 45 000 kilometres (km) of interprovincial and international pipelines regulated by the NEB are a crucial element in Canada's transportation and distribution system (Figures 1 and 2). These systems include large-diameter, cross-country, high-pressure natural gas pipelines, low-pressure crude oil and oil products pipelines, and small-diameter pipelines.

Pipelines have a well-deserved reputation as the safest and most energy-efficient method of moving vast amounts of fuel from producers to consumers. In 2005, approximately $120 billion worth of products flowed through Canadian pipelines to markets at home and in the U.S. The cost in 2005 of providing these transportation services is estimated to be around $5 billion, not including fuel costs paid by shippers on natural gas pipelines. This was accomplished by infrastructure that is mostly invisible to consumers and that operates with a low rate of failure and minimal environmental impact.

To assist in the delivery of its mandate and to ensure that the Board's regulatory oversight provides value to Canadians, the Board developed five goals:

1. NEB-regulated facilities and activities are safe and secure, and are perceived to be so.
2. NEB-regulated facilities are built and operated in a manner that protects the environment and respects the rights of those affected.
3. Canadians benefit from efficient energy infrastructure and markets.
4. The NEB fulfills its mandate with the benefit of effective public engagement.
5. The NEB delivers quality outcomes through innovative leadership and effective processes.

Each year, the Board issues various reports that focus on different aspects of Canadian energy markets. This report, which assesses how well the Canadian hydrocarbon transportation system is working, pertains largely to Goal 3. However, for the system to function efficiently and effectively, it must operate in a safe and environmentally acceptable manner, which relates to Goals 1 and 2. Outcomes related to safety and the environment are discussed in a companion document, the Board's report, *Focus on Safety and Environment, a Comparative Analysis of Pipeline Performance.*

This report should not be read as a regulatory document. In this report, the Board is not making a determination on regulatory matters because the factors on which the functioning of the transportation system is assessed are not necessarily the same as those considered in a regulatory proceeding.

For the hydrocarbon transportation system to work well, the Board believes the following three outcomes should be achieved:

1. there is adequate pipeline capacity in place to move energy products from producers to consumers;
2. pipeline companies are providing services that meet the needs of shippers at reasonable prices; and
3. pipeline companies have adequate financial integrity to attract capital on terms and conditions that enable them to effectively maintain their systems and build new infrastructure to meet the changing needs of the market.

An efficient hydrocarbon transportation system needs to have the ability to be expanded on a timely basis when changing market conditions require new pipeline capacity. In order for expansion to occur in the time frame required, two things should occur. First, pipeline companies must have ready access to financial markets on reasonable terms and conditions. In addition, the regulatory process must be timely and predictable, while allowing a fair opportunity for all affected parties to provide input prior to a decision on an application being made.

In this report, the Board provides an assessment of the ability of pipeline companies to access capital on reasonable terms and conditions. The Board does not, however, provide an assessment of the efficiency and effectiveness of its regulatory processes. The Board reports on a number of regulatory efficiency measures in its *Annual Report to Parliament* and in the annual *Departmental Performance Report* that are submitted to the Treasury Board, both of which are public documents. This report, in the discussion of the Pipeline Services Survey (see Section 2.3.1), does provide information on shippers' perceptions of the Board's regulatory process. The Board recognizes that there is the potential to improve the means by which regulatory effectiveness and efficiency is measured and will be consulting with stakeholders on this topic.

For the Board's financial regulatory purposes, pipeline companies have been divided into two groups, Group 1 and Group 2. Major oil and gas pipeline companies are designated as Group 1 and are actively regulated by the NEB. All other NEB-regulated pipeline companies are classified as Group 2 companies and are subject to a lighter degree of regulation. A listing of companies regulated by the Board, as of 31 December 2005, can be found in Appendix 4.

**FIGURE 1**

***Gas Pipelines Regulated by the NEB***

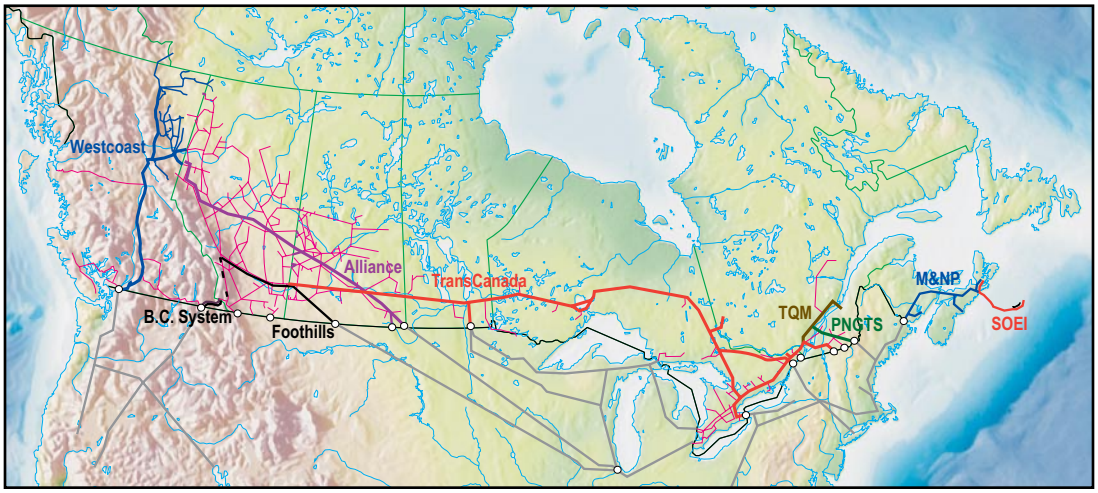

FIGURE 2

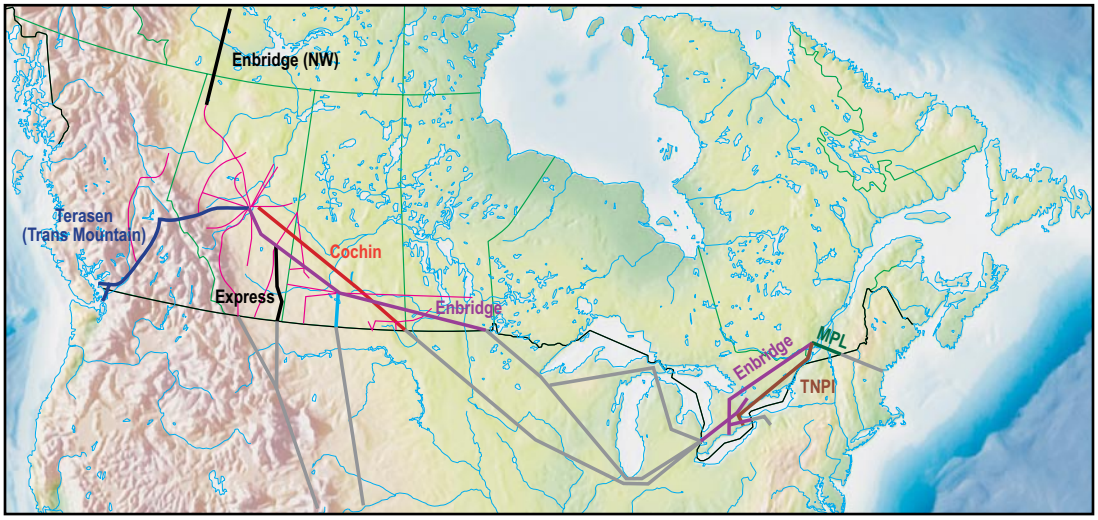
***Oil Pipelines Regulated by the NEB***



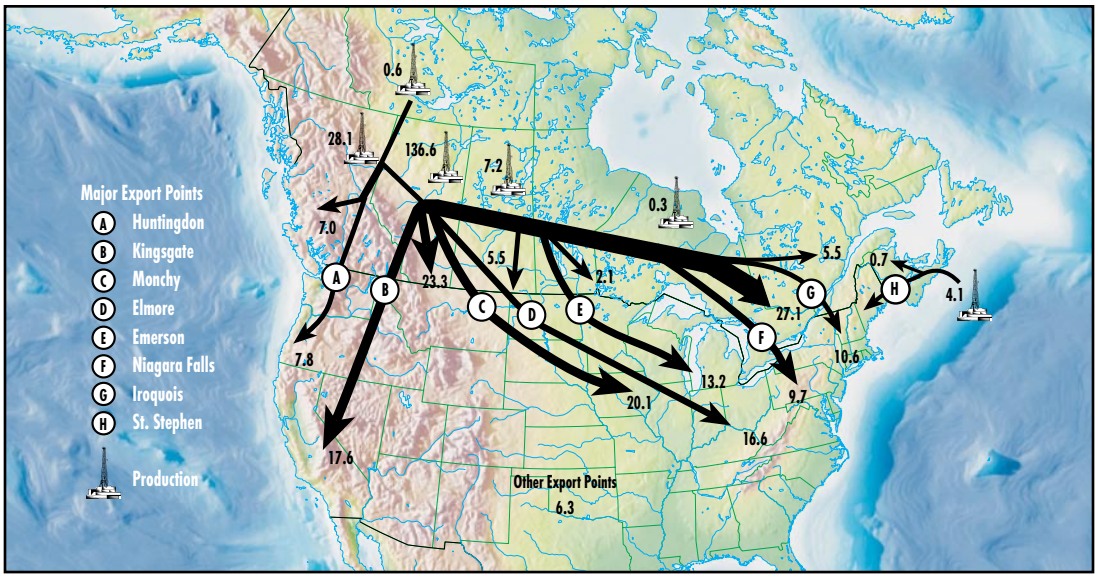


FIGURE 3

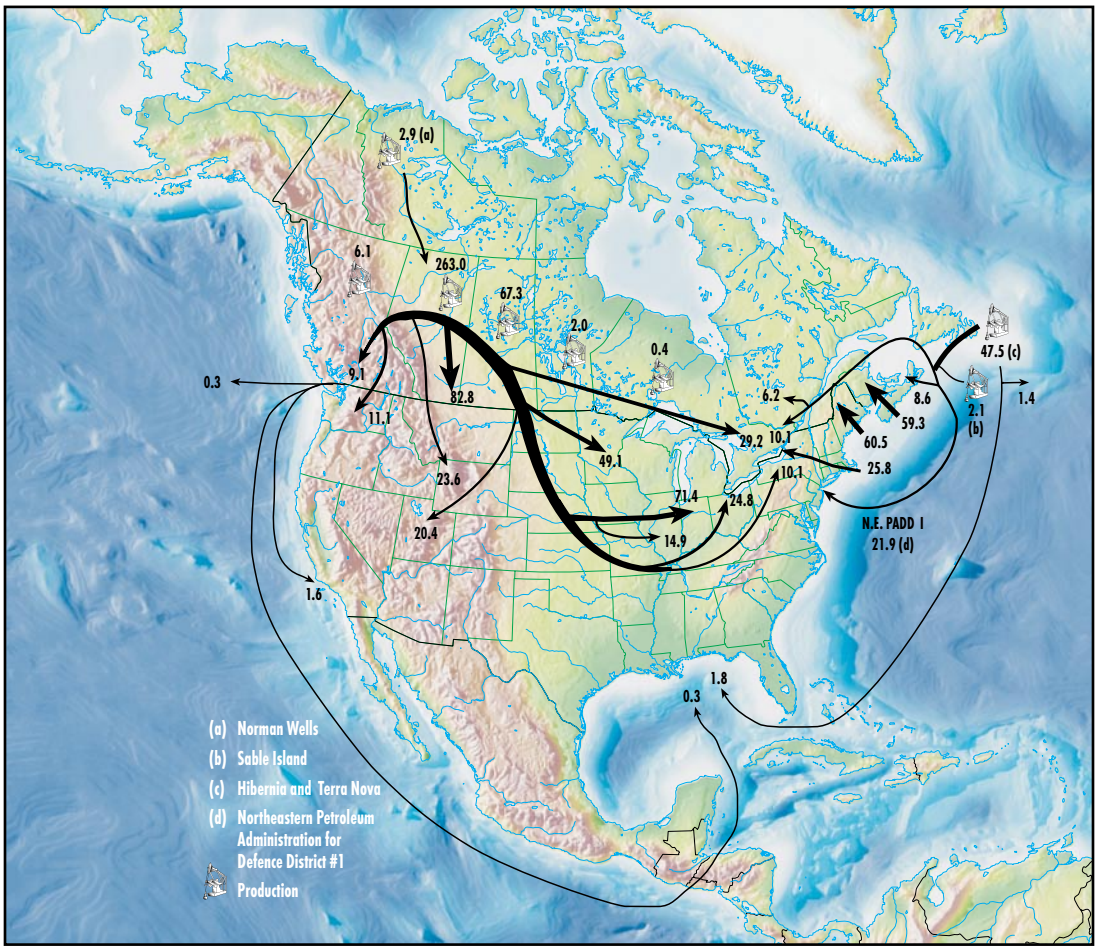
***2005 Supply and Disposition of Natural Gas***



Publicly available data for Group 1 companies and Express Pipeline Limited Partnership (Express), the largest Group 2 company, was used to assess the extent to which the three outcomes identified by the Board are being achieved. These companies represent ownership of the majority of the Canadian hydrocarbon transportation system regulated by the NEB and the data from these companies provides a good view of the overall functioning of the hydrocarbon transportation system.

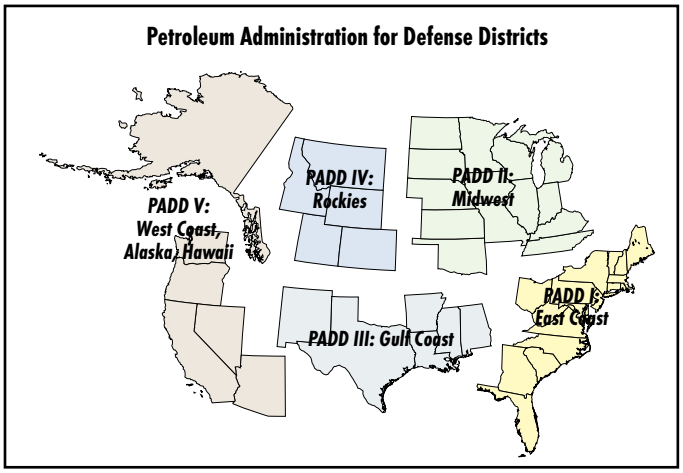
More detailed information can be found in the Board's 2005 Annual Report.

**FIGURE 4**

***2005 Supply and Disposition of Oil***

# THE CANADIAN HYDROCARBON TRANSPORTATION SYSTEM

## 2.1 Adequacy of Pipeline Capacity



A key measure of an energy market's operational efficiency is the ability of its pipeline system to adequately transport crude oil, refined products, natural gas and NGLs from producing to consuming regions.

This section examines the following factors to assess the current adequacy of pipeline capacity:

1. price differentials compared with firm service tolls for major transportation paths;
2. capacity utilization on pipelines; and
3. the degree of apportionment on major oil pipelines.

The Board has generally taken the view that some excess capacity on a pipeline is better than not having enough. Higher tolls for shippers are a cost of having excess pipeline capacity; however, the costs associated with not having enough pipeline capacity are generally greater. Substantial revenue is lost when producers are unable to move their oil or gas to market. Not only is it important to have some excess capacity, but flexibility with sufficient access to the right markets or for the right type of product is also important.

When there is inadequate pipeline capacity to transport crude oil to the West Coast and PADD V (West Coast) producers have the option of transporting crude oil to Ontario and PADD II (Midwest) or PADD IV(Rockies). In addition, when refineries are in turnaround (maintenance) in Ontario and PADD II, crude oil volumes can be delivered to the West Coast and PADD V or PADD IV providing there is pipeline capacity.

The importance of having adequate pipeline capacity in place is highlighted by the fact that the value of natural gas and oil transported in NEB-regulated pipelines far exceeds the cost of service on those pipelines.

### 2.1.1 Price Differentials and Natural Gas Firm Service Tolls

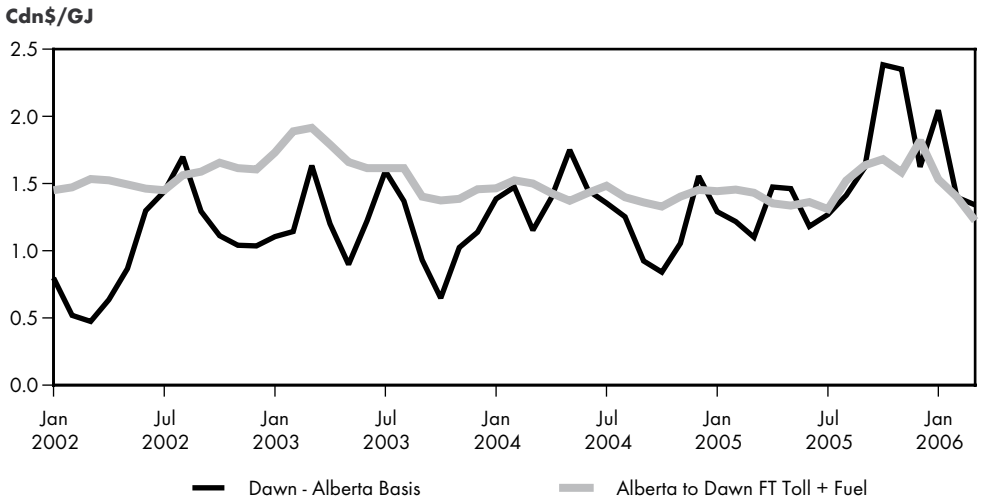
When there is adequate pipeline capacity between two market hubs, commodity prices will be connected and the price differential will be equal to, or less than, the transportation costs between the two points. As long as the price differential is less than the toll plus fuel, the market is indicating that there is adequate pipeline capacity between the two pricing points. Conversely, when there is inadequate pipeline capacity between two market points, the basis, that is the differential in price between the two end points, will exceed the cost of transportation. In a market with adequate capacity, sellers would generally direct their product to the market that nets the highest revenue back to the producer, thereby meeting that region's need for energy. Where inadequate capacity exists, the product cannot get to market and the price differential persists, resulting in higher prices for consumers and lost revenues for producers.

In order to use price differentials as a measure of the adequacy of pipeline capacity, there must be reasonably good pricing data available. Two examples of price differentials compared with firm service tolls are provided below – one for transportation on TransCanada PipeLines Limited (TransCanada or TCPL) and one for transportation on Westcoast Energy Inc., carrying on business as Duke Energy Gas Transmission (Westcoast).

Figure 5 shows the basis differential between the Alberta border and the Dawn delivery point compared with the TransCanada firm service toll between the two points, including fuel costs. The basis between the Alberta border and the Dawn delivery point is generally below the total cost of transportation (firm transportation plus fuel) via the TransCanada pipeline connecting these two markets. This indicates that pipeline capacity is adequate between these locations. As indicated by the variation in basis between the two locations, natural gas pricing is very responsive to relatively small changes in flow or demand. The short-term increase in the basis differential between September 2005 and January 2006 was a result of increased demand for supply from other basins when gas supplies from the Gulf of Mexico were reduced due to hurricanes Katrina and Rita. Cold weather early in the winter also affected demand. In addition, after the hurricane-induced gas price increase, the cost of fuel for use in the pipeline compressors also increased temporarily. Very mild weather and reduced demand in response to higher prices has since moderated flows and the demand for gas and transportation.

**FIGURE 5**

***Dawn – Alberta Basis vs. TransCanada Toll and Fuel***



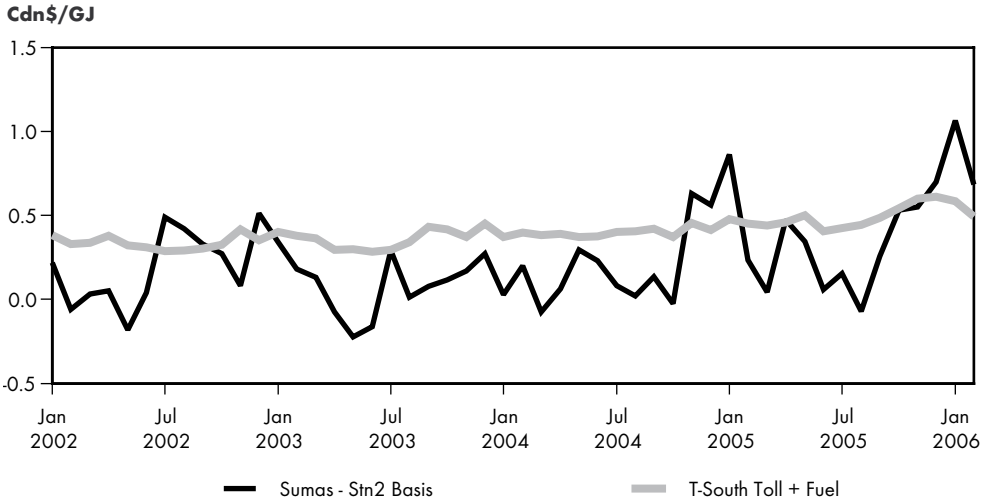


Figure 6 shows the basis between Compressor Station 2 on the Westcoast system and the Sumas export point compared with the Westcoast firm service toll between the two points (T-South or Southern Mainline), including fuel costs. Since January 2002, except for a few months, the basis has been lower than the transportation costs indicating that there has been adequate capacity in place since that time.

**FIGURE 6**

***Sumas – Station 2 Basis vs. Westcoast T-South Toll and Fuel***

Note: 2006 - interim term-differentiated toll (5 or more years service).

Overall, the comparison of price differentials and natural gas firm service tolls shows that pipeline capacity between these markets is adequate at most times. In general, the basis between pricing points has been slightly lower than pipeline transportation and fuel costs. However, natural gas pricing is volatile. Hurricane-induced supply disruptions in the Gulf of Mexico and erratic weather impact both basis and pipeline fuel costs. Figures 5 and 6 both indicate times where the basis exceeded transportation and fuel costs. These events proved to be temporary, and gas flows and prices moderated.

### *Price Differentials and Tolls on Oil Pipelines*

The major drivers of price differentials, amongst other things, are availability of pipeline capacity, competition, supply and demand, seasonality and the grade (quality) of crude oil. Price differentials are increasingly becoming an issue on oil pipelines because of the increase in bitumen blend crude oil supply from the oil sands. Limited access to markets, particularly those with refineries that process heavy crude oil, exerts downward pressure on heavy oil prices and widens the light-heavy differential.

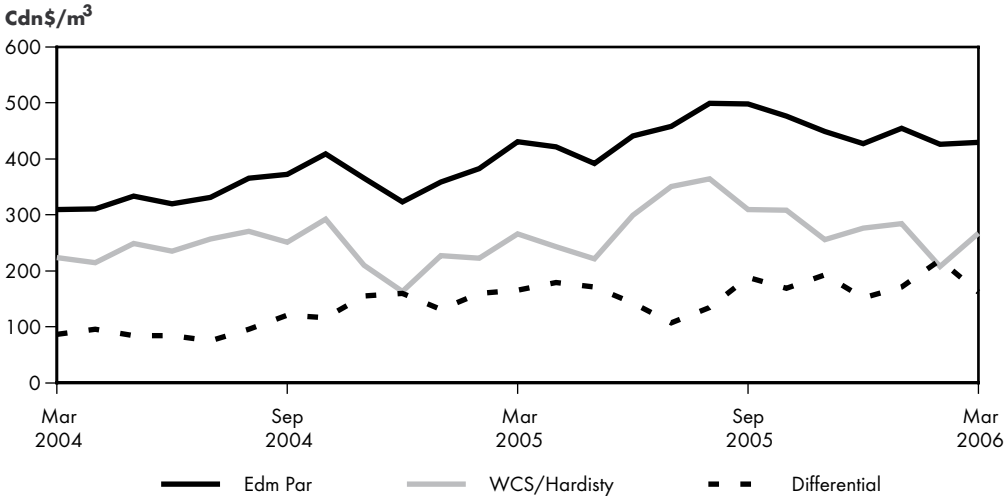

Figure 7 illustrates the wide light-heavy differential as indicated by the difference in price of Edmonton Par light crude oil and Western Canadian Select (WCS), a heavy crude oil. As shown, the average differential has been increasing during the time period shown and in recent years has averaged about 30 percent over the course of a year. Notably, in the first quarter of 2006, the price of heavy crude was, on average, 42 percent less than the price for light crude oil (the light-heavy differential).

Typically, the differential is narrower during the summer months due to the additional demand for heavier crude oil for use in the production of asphalt for paving.

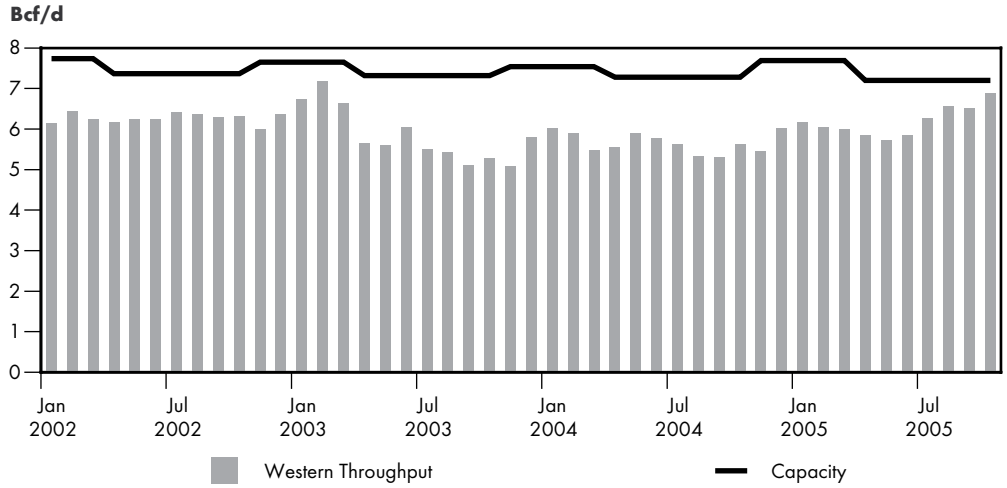
Differentials have also widened as a result of supply growth from the oil sands, pipeline constraints and a lack of refinery capacity to process heavier crude oil. Wide light-heavy differentials reduce heavy oil producers' netbacks and at extreme levels could possibly result in some oil sands projects being uneconomic. Recently, the differential has narrowed because of increased market access with the delivery of western Canadian crude oil to Cushing, Oklahoma through the Spearhead Pipeline and into the U.S. Gulf Coast through the reversed Mobil Pipeline.

**FIGURE 7**

***Canadian Crude Oil Prices and Differential***

### 2.1.2 Capacity Utilization on Major Routes

Pricing data is available for a number of injection and delivery points on pipeline systems. Even where this data is not available, another measure of adequate capacity is obtained by comparing throughput with capacity. The Board monitors capacity utilization for most of the large pipelines it regulates.



The following figures show pipeline average monthly throughput compared with capacity for some of the largest NEB-regulated pipeline systems, including the TransCanada Mainline, Foothills Pipe Lines Ltd. (Foothills), TransCanada B.C. System, Westcoast, Alliance Pipeline Ltd. (Alliance), Trans Québec & Maritimes Pipeline (TQM), Maritimes & Northeast Pipeline (M&NP), Enbridge Pipelines Inc. (Enbridge), Kinder Morgan Canada's Terasen Pipelines (Trans Mountain) Inc. (TPTM), Express and Trans-Northern Pipeline Inc. (TNPI).

*Natural Gas*

Figure 8 compares the average monthly throughput on the TransCanada Mainline (which is approximately equal to the amount of gas flowing east on the Mainline from Saskatchewan) to the capacity of TransCanada's prairie line. It demonstrates that while the prairie line has been operating at between 70 to 80 percent of capacity since April 2003, the volumes have increased in recent months. These higher volumes reflect increased eastern demand for Canadian gas due to last year's hot summer weather and reduced gas supplies (since September) from the Gulf of Mexico following the late summer hurricanes. Overall, the indicator shows that there has been adequate pipeline capacity to move volumes to eastern markets.

**FIGURE 8**

***TransCanada Mainline Throughput vs. Capacity***

The volumes shown in Figure 9 are the average monthly throughput on TransCanada's Foothills Pipeline (Sask.) compared with capacity. This pipeline connects with Northern Border Pipeline Ltd. (Northern Border) and Monchy, Saskatchewan to flow gas to the U.S. Midwest. While the Foothills (Sask.) capacity utilization has been running at an annual average of about 94 percent since 2002, there was some decline in the spring of 2005. The lower volumes were due to a period of unsold firm capacity on the connecting Northern Border pipeline, stemming from low seasonal demand and high storage levels.

**FIGURE 9**

***Foothills Pipeline (Sask.) Throughput vs. Capacity at Monchy***

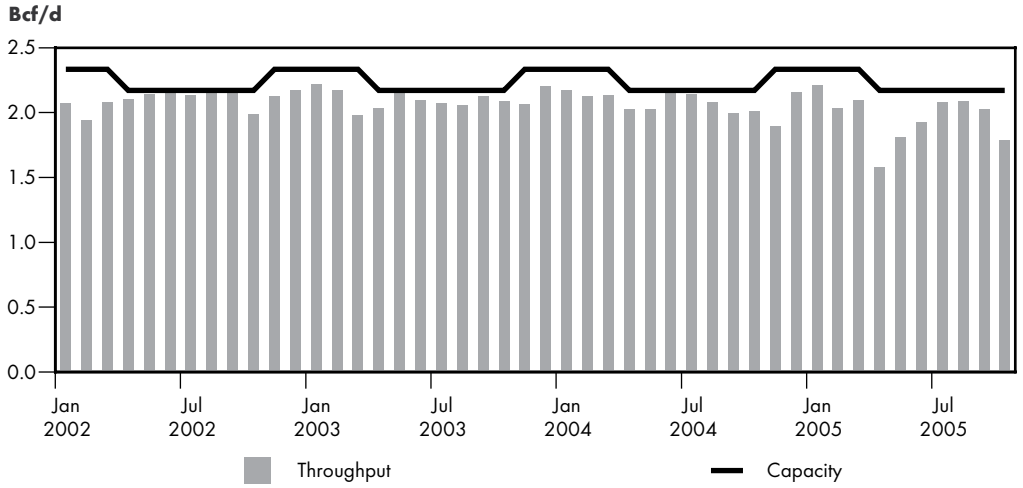


Figure 10 compares the average monthly throughput on Westcoast's Southern Mainline with the capacity on this system between Station 2 and the Sumas export point. This figure shows the seasonal nature of throughput on the Southern Mainline with higher volumes being transported during the peak winter months and less during the summer. One of the major contributors to low flows on Westcoast is the competition with production from the U.S. Rockies region which also has access to the U.S. Pacific Northwest market via Williams' Northwest Pipeline system. A warm winter and increased hydro power generation in British Columbia and the U.S. Pacific Northwest reduced gas flows on this pipeline in early 2006. In fact, the peak flow levels were lower than normal, as was the duration of the winter peak.

FIGURE 10

***Westcoast Mainline Throughput vs. Capacity***

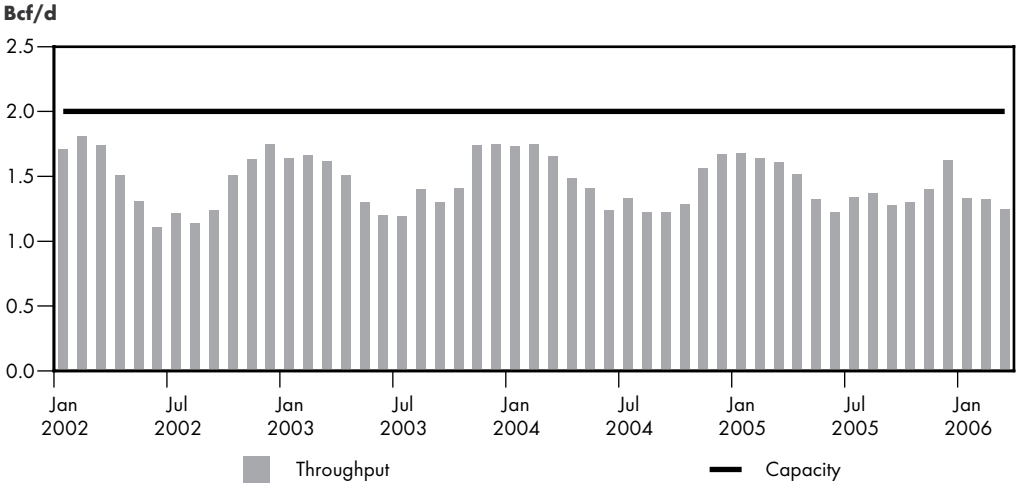

Figure 11 shows the average monthly throughput and capacity on the TransCanada B.C. System. The annual average capacity utilization dropped from about 77 percent in February 2002 to about 60 percent in March 2006, and there is spare capacity on this pipeline to export gas through Kingsgate. In California, which is the B.C. System's primary market region, market players have transportation options enabling them to access supply from the Rocky Mountains, San Juan and Permian basins, in addition to the Western Canada Sedimentary Basin (WCSB).

FIGURE 11

***TransCanada B.C. System Throughput vs. Capacity at Kingsgate***

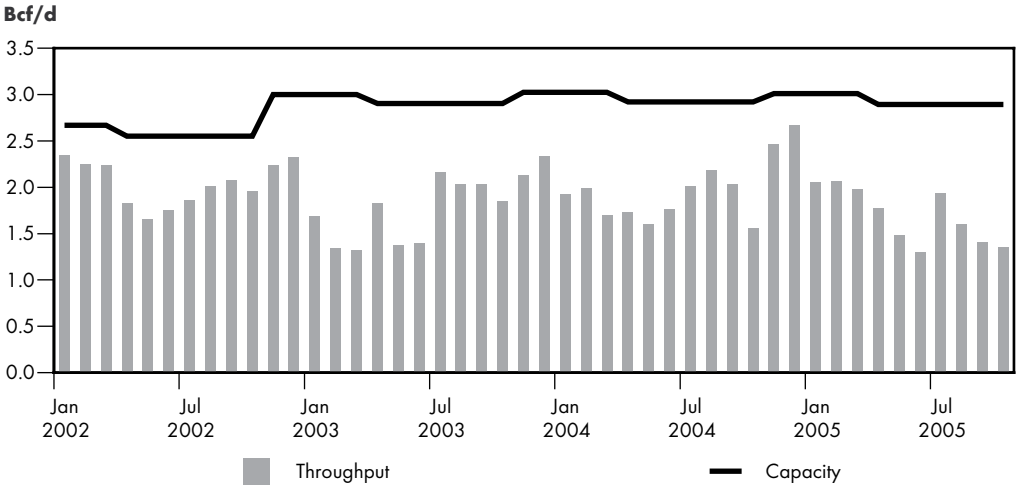

Figure 12 shows the average monthly throughput on the Alliance system relative to physically available capacity levels. Alliance offers approximately 37 534 $10^3m^3/d$ (1.325 Bcf/d) of firm service capacity, and makes any additional capacity available to its contracted shippers pro rata as Authorized Overrun Service (AOS). Available AOS levels are determined on a daily basis and may be used at the cost of fuel only. The total available capacity is variable, depending on such factors as ambient temperature and compressor unit availability (as influenced by maintenance schedules). Alliance's total available capacity has essentially been fully utilized since the commencement of service, with all available firm service contracted on a long-term basis.

FIGURE 12

***Alliance Throughput vs. Capacity***

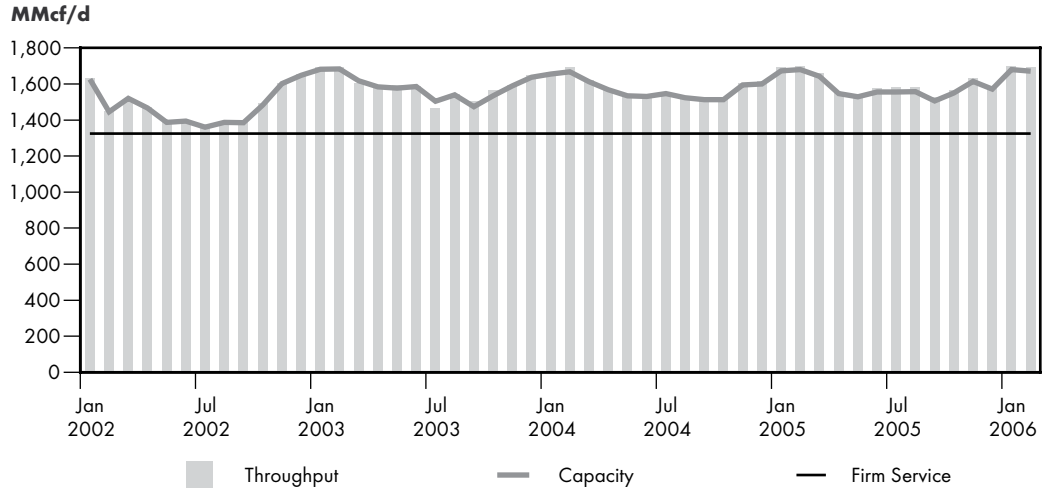

Figure 13 compares the average monthly throughput and capacity on TQM. This figure shows the seasonal nature of the throughput on this pipeline, with more volumes being transported during the peak winter months. With the annual average capacity utilization of around 60 percent, there is spare capacity on this pipeline which delivers gas between the TransCanada Mainline, connecting TQM at Saint-Lazare on the Ontario and Québec border, and TQM's endpoints at Saint-Nicolas (south shore of Québec City) and East Hereford (New Hampshire state border). However, with the limited compression on the system needed to meet TQM's delivery pressure at the East Hereford export point, the available spare capacity is very sensitive to the actual load distribution along the pipeline. Higher system utilization in 2005 reflects increased exports at East Hereford due to reduced gas supplies from the Gulf of Mexico following the late summer hurricanes.

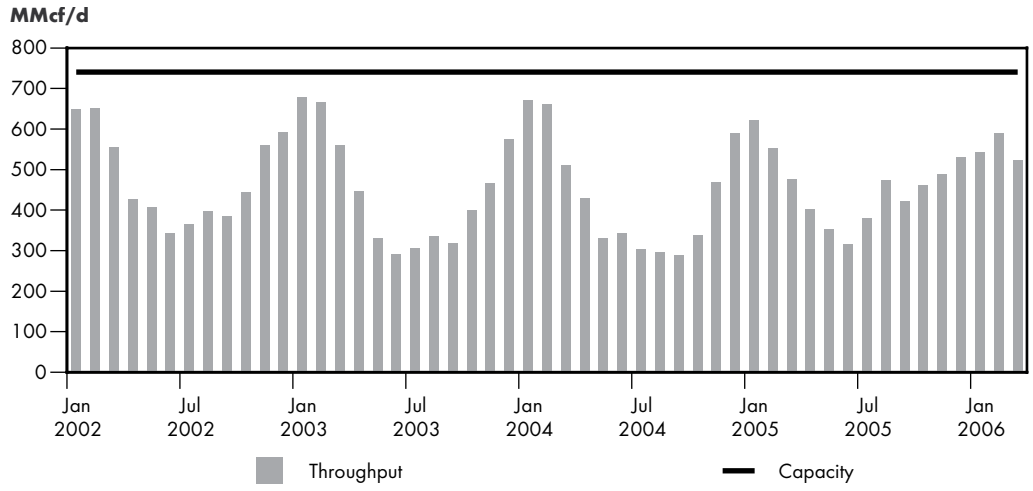
FIGURE 13

***Trans Québec & Maritimes Throughput vs. Capacity***



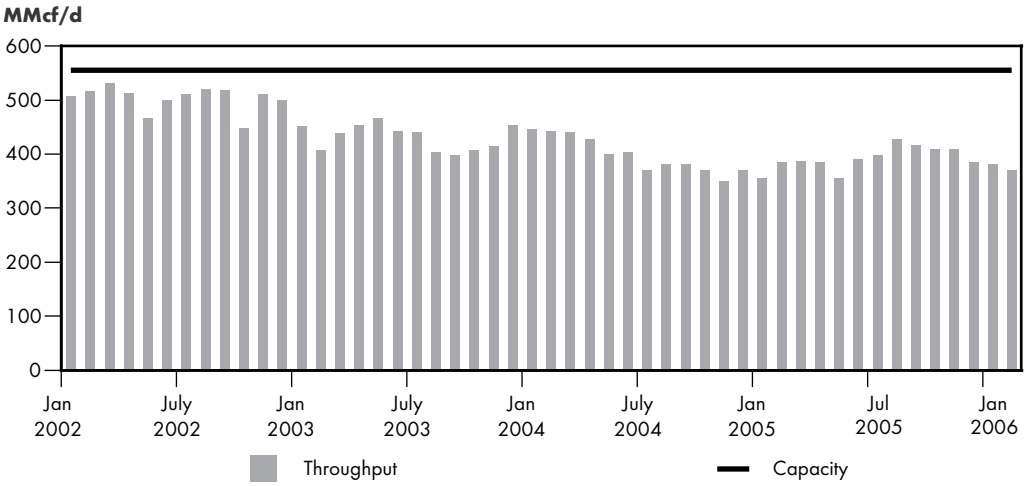


Figure 14 compares the average monthly throughput on the M&NP pipeline with its capacity. The annual average capacity utilization has been declining from about 92 percent in 2002 to an average of about 70 percent in 2005. The drop in this pipeline's utilization stems from declining natural gas production from Nova Scotia's Sable Offshore Energy Project. The variations in throughput are primarily related to changes in gas supply.

FIGURE 14

***Maritimes & Northeast Pipeline Throughput vs. Capacity***

Although the Dawn-Parkway corridor is not regulated by the NEB, it is a key link between the Dawn hub and growing markets in eastern Canada and the U.S. Northwest. Last year the Ontario Energy Board (OEB) approved Union Gas' Phase 1 Expansion, expected to be in service by November 2006. This year, Union filed an application with the OEB for its Phase 2 Expansion. If approved, the expansion is expected to be in service by 1 November 2007. Market demand for capacity in this corridor is expected to remain robust due to the liquidity of Dawn as a transactional trading point given its market reach.

### *Oil*

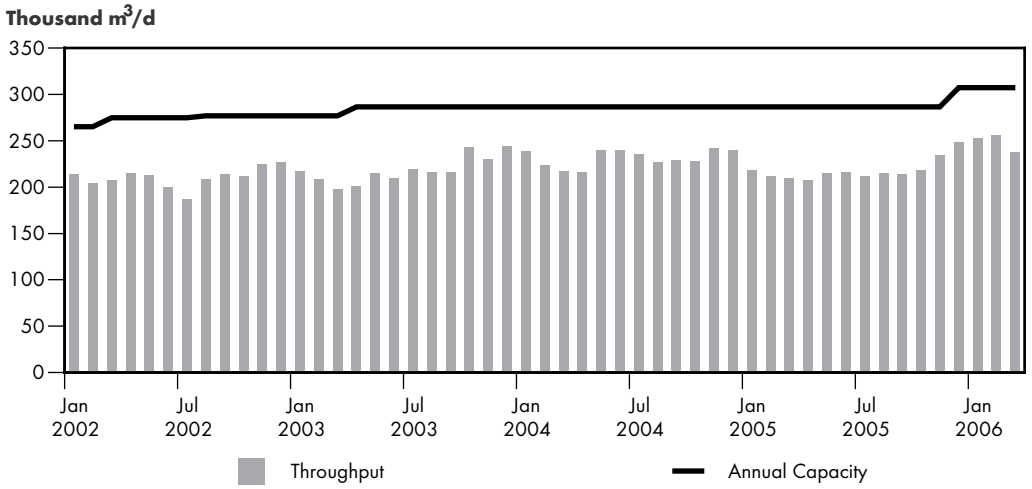
Determining the capacity and throughputs on an oil pipeline can be complex as there are a number of factors to be considered: the type of product, product mix, type of batching, pipeline configurations and bottlenecks.

The Enbridge system originates in Edmonton, Alberta and extends east across the Canadian prairies to the U.S. border near Gretna, Manitoba to join the Lakehead system in the U.S. It is the largest crude oil pipeline in the world and the primary transporter of crude oil from western Canada to markets in eastern Canada and the U.S. Midwest. The system consists of several lines transporting crude oil, NGLs and refined petroleum products. Figure 15 illustrates Enbridge Mainline throughput versus capacity for all lines. In 2005, Enbridge transported roughly 224 600 $m^3/d$ (1.4 million barrels per day) of crude oil, petroleum products and NGLs. In the first quarter of 2006, Enbridge operated at around 80 percent of capacity (Figure 15). Certain lines, particularly Lines 3 and 4, which transport heavy oil, have been operating at or close to full capacity, with some apportionment (see Section 2.1.3).

In November 2005, Kinder Morgan purchased Terasen Inc., owner of the Trans Mountain pipeline system. This purchase made Kinder Morgan a major oil pipeline player in Canada. TPTM's current capacity, assuming some shipments of heavy oil, is 35 700 $m^3/d$ (225 Mb/d). The pipeline has been operating at or near capacity for several years and on many occasions has been under apportionment (see Section 2.1.3). However, the capacity indicated in Figure 16 is 45 300 $m^3/d$ (285 Mb/d). This higher capacity assumes no heavy crude oil shipments. On average, particularly in the last two years, 20 percent of TPTM's crude oil receipts at Edmonton are heavy and because of the increased viscosity, pipeline capacity was reduced to 35 700 $m^3/d$ (225 Mb/d).

FIGURE 15

***Enbridge Pipeline Throughput vs. Capacity***



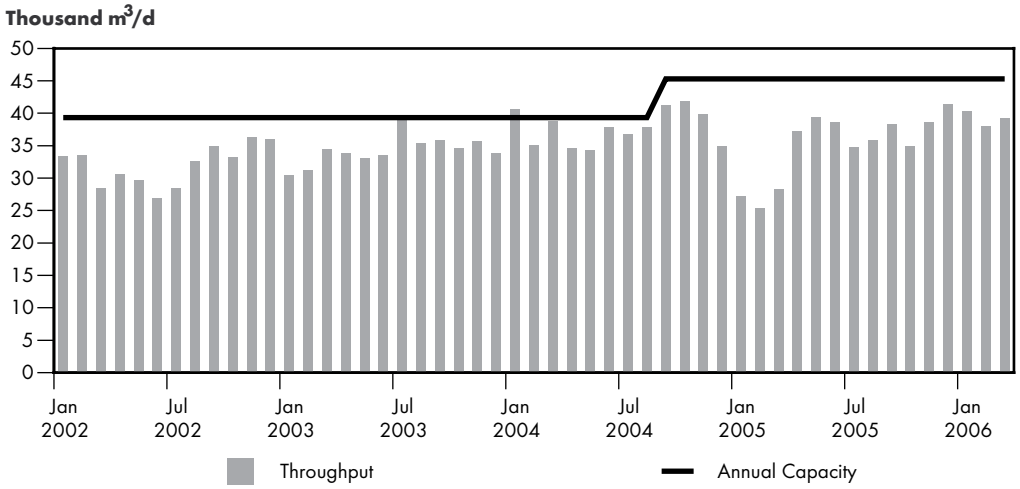


FIGURE 16

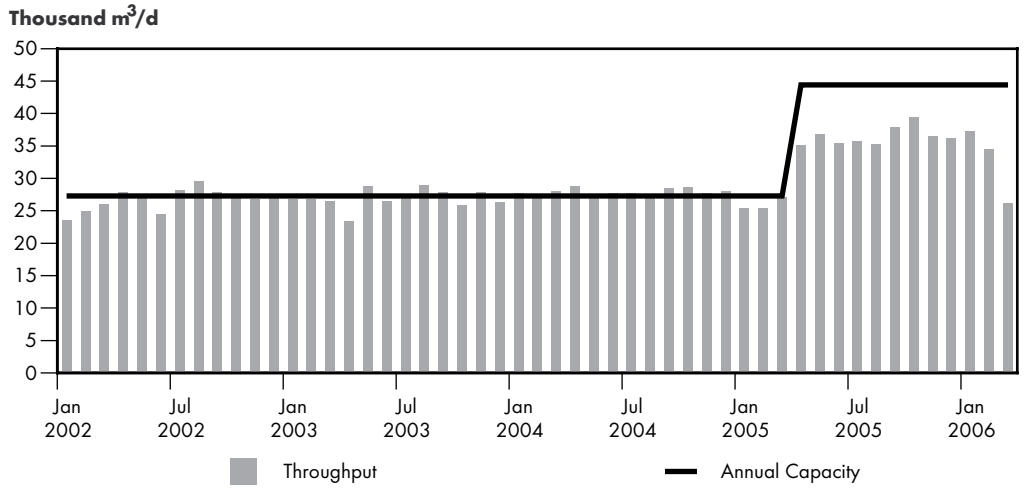
***TPTM Throughput vs. Capacity[2]***

On 5 July 2005, Terasen applied to the NEB for a capacity increase of 5 600 $m^3/d$ (35 Mb/d). It was approved on 10 November 2005 and the in-service date is April 2007.

In the first quarter of 2006, TPTM operated at approximately 86 percent of capacity (see Figure 16). Though the system did not operate at capacity, TPTM was under apportionment in January, February and March of 2006. Many factors contributed to this apportionment, including growing oil sands supply coupled with increased demand from Washington State refiners and crude oil shipments off the Westridge Dock.



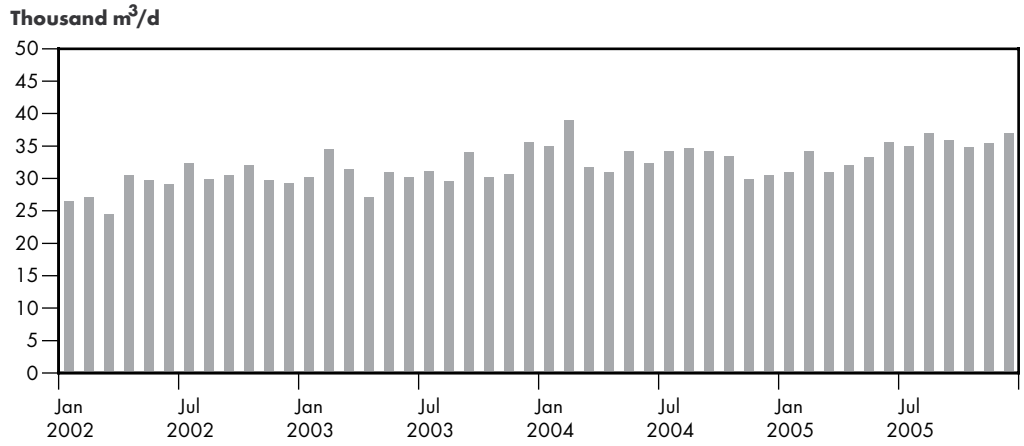
During the past several years, Express has been operating at capacity. In April 2005, Express completed its 17 600 $m^3/d$ (100 Mb/d) expansion, bringing the total capacity to 44 900 $m^3/d$ (280 Mb/d). Express is the only crude oil pipeline in western Canada that operates under long-term take-or-pay agreements with its shippers for the majority of its capacity.

2 Capacity shown is light crude oil only (0% heavy).

In the first quarter of 2006, Express operated at approximately 73 percent of capacity (Figure 17). Throughputs were reduced in March 2006 due to apportionment on the Platte Pipeline system in the U.S.

FIGURE 17

***Express Throughput vs. Capacity***



TNPI is a refined petroleum products pipeline. Historically, the pipeline system extended from Nanticoke, Ontario to Montreal, Quebec serving petroleum industry terminals along the route. In 2003, TNPI applied to the Board to increase the line capacity between Montreal and Farran's Point, Ontario from 10 500 $m^3/d$ (66 150 Mb/d) to 21 000 $m^3/d$ (132 300 Mb/d) and to reverse the direction of flow between Farran's Point and Metropolitan Toronto from a west-to-east direction to an east-to-west direction.

The Board approved TNPI's application to reverse the line and to accept take-or-pay obligations from Petro-Canada and Ultramar for 91 percent of the capacity. The remaining 900 $m^3/d$ or nine percent of the capacity from Farran's Point to Toronto is available for spot shipments.

The expansion and the reversal, which took place in November 2004, were a response to declining shipments on the TNPI system and the closure of Petro-Canada's refinery in Oakville, Ontario. Increased deliveries from Montreal on TNPI serve markets in Ontario formerly served by Petro-Canada's Oakville refinery and by Ultramar by rail from Quebec (Figure 18).

FIGURE 18

***Trans-Northern Pipelines Inc. Throughputs***

Calculating TNPI's capacity is difficult due to multiple delivery locations and the different capacities on each line segment.

### 2.1.3 Apportionment

Oil pipelines normally operate as common carriers, although pipelines such as Express, Enbridge Line 9 and TNPI operate with long-term shipper take-or-pay agreements. Common carriers require shippers to nominate their volumes for delivery into a pipeline on a monthly basis without a contract for the pipeline's capacity. When shippers nominate more oil or oil products in a given month than the pipeline can transport, shippers' volumes are apportioned (reduced) based on the tariff set out by the pipelines. Apportionment can be caused by factors such as growing supply, increased demand, pipeline reconfigurations and refinery maintenance. Some recent apportionment data for Enbridge, TPTM and Cochin is shown below.

*Enbridge*

Historically, Lines 2 and 4 were dedicated to the transportation of heavy crude oil and Line 3 was dedicated to the transportation of light and medium crude oils. In the third quarter of 2005, Enbridge completed the Terrace Phase III expansion project to facilitate the growth in heavy crude oil. By converting Line 2 from heavy to light service and Line 3 from light to heavy service, it increased its heavy capacity by 39 000 $m^3$/d (245 700 b/d and reduced its light capacity by 18 400 $m^3$/d (115 920 b/d).

As illustrated in Table 1, Line 4 was under apportionment once between August 2005 and February 2006. In February, each shipper was required to reduce its volume, resulting in a three percent reduction. There are a number of factors that caused the apportionment: increased throughput from the oil sands, apportionment on the Platte system in the U.S., increases in conventional production in North Dakota for injection at Cromer, Manitoba and Clearbrook, Minnesota; pipeline reconfiguration; and refinery maintenance.

Enbridge's Line 9 has a capacity of 38 150 $m^3$/d (240 000 b/d) and transports oil from Montreal, Quebec to Sarnia, Ontario. In contrast to last year, there was no apportionment on the line between August 2005 and February 2006. This was partly due to increased volumes of western Canadian light conventional crude oil being processed in Ontario refineries.

**TABLE 1**

| Throughput ($10^3m^3$/d) | 104.3 | 103.4 | 102.4 | 113.0 | 90.4 | 113.9 | 111.0 |

*Terasen Pipelines (TransMountain) Inc.*

Apportionment on TPTM is calculated separately for domestic destinations, export destinations and Westridge Dock destinations (as shown in Table 2 as Domestic, Export and Dock). Apportionment in November 2005 through to March 2006 reflects increased volumes associated with expansion in the oil sands and the higher market demand for Canadian crude. In addition, heavy crude oil volumes also increased during this time limiting capacity on the TPTM system. With improving market economics TPTM is delivering increasing volumes of western Canadian crude oil into Washington

State refineries as well as for export over the Westridge Dock which contributed to apportionment at both of these locations.

Following three notices of motion and an oral argument heard on 11 April 2006, the Board released its Decision approving the inclusion of a premium in the Tariff as a means of allocating capacity to the Westridge Dock. Further information can be found in the Board's letter decision dated 12 April 2006 and MH-2-2005.

**TABLE 2**

***TPTM Apportionment***

*Cochin*

The Cochin pipeline is the largest and longest NGL pipeline in Canada. It transports propane, ethane, ethylene and butane, although no butane has been transported since 2002. Ongoing maintenance work on the pipeline has affected the available capacity. The lower throughput volumes and apportionment in September 2005 was caused by unexpected downtime required for immediate repairs. Because ethylene was already in the pipeline, there was no flexibility to transport larger volumes of other products (ethylene has a higher vapour pressure than propane and ethane and reduces the capacity of the pipeline).

Effective 7 March 2006, Cochin suspended the transportation of ethylene until at least the fall of 2007 due to a defect found in the U.S. portion of the pipeline and went on a voluntary pressure restriction. The pressure is not to exceed 900 psi and applies to the whole line from Fort Saskatchewan, Alberta to Windsor, Ontario. Without ethylene in the pipeline, propane and ethane shippers are not expected to face apportionment. The average capacity will be around 10.3 to 11.9 $10^3m^3/d$ (64 890 b/d to 79 970 b/d). Once the pressure restrictions are lifted, capacity is expected to return to 17.5 $10^3m^3/d$ (110 250 b/d).

### 2.1.4 Summary of the Adequacy of Pipeline Capacity

Overall, the examination of throughput and capacity on NEB-regulated natural gas pipelines shows that pipeline capacity is adequate across the country although there may be limitations at some points depending upon markets, storage and seasonal shifts. The demand for natural gas varies seasonally and, as a result, the flow of natural gas through some Canadian pipelines can be variable as well.

[3] Line 4 was the only line on the Enbridge system out of western Canada that was apportioned during this period.

Where possible, the use of storage helps to reduce the variation in flows and allows pipeline capacity to be used more efficiently with higher annual capacity utilization.

Oil pipeline capacity, however, is tight and is expected to remain tight through 2008, even with the current expansions underway (Figure 28). This is being driven by increases in crude oil supply from the oil sands and in conventional production in North Dakota and PADD IV. In the first quarter of 2006, the price of heavy crude oil was, on average, 42 percent less than the price of light crude oil. This compares to a more typical light/heavy differential of around 30 percent. The light/heavy differential is typically wider during the winter months, reflecting reduced demand for asphalt and lower gasoline demand. However, the size of the differential in the first quarter reflects pressures building from an increase in supply, in this case from the oil sands, pipeline constraints and lack of refinery capacity to process heavier crude oil. Recently, the differential has narrowed as a result of market extension into Cushing, Oklahoma and the U.S. Gulf Coast through the Spearhead Pipeline and the Mobil Pipeline, respectively.

## 2.2 Pipeline Tolls

### *2.2.1 Pipeline Tolls Index*

Another indicator of a hydrocarbon transportation system's efficiency is whether pipeline companies are providing services that meet the needs of shippers at stable and reasonable prices (tolls). One of the factors the Board uses to analyze this is year-to-year variations in a benchmark toll for each of the major pipelines it regulates (e.g., TransCanada's Eastern Zone toll or Westcoast's T-South Export toll). Under cost-of-service regulation, pipeline tolls can vary from year-to-year for various reasons. For example, a significant expenditure to modify or expand a system to meet shippers' needs could increase or decrease toll levels depending on the specific circumstances. Falling throughput or contract demand leading to lower capacity utilization could lead to a significant toll increase. The following sections review variations and trends of some NEB-regulated pipeline tolls since 1997.

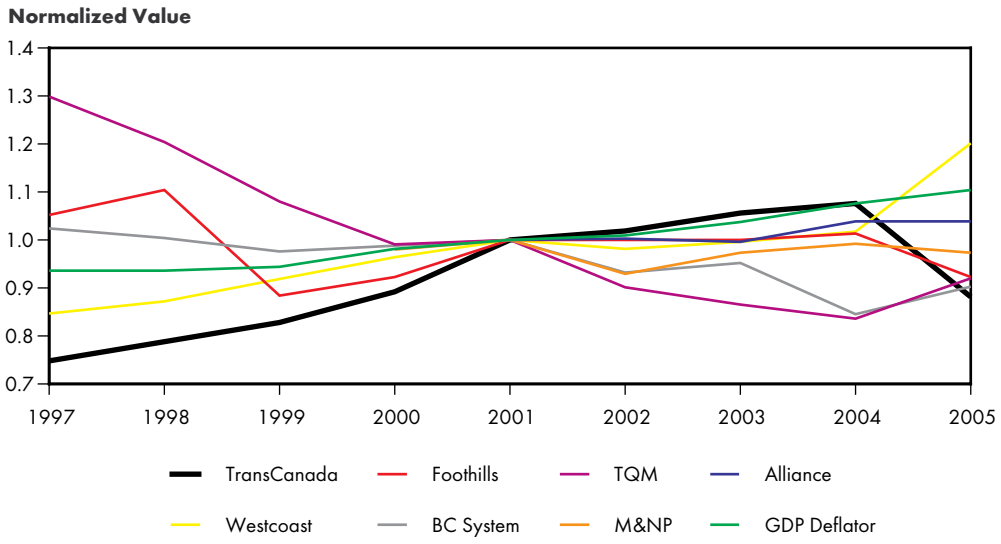
*Natural Gas Pipeline Tolls*

The benchmark tolls[4] for TransCanada's Mainline, Westcoast, Foothills, the TransCanada B.C. System (B.C. System), TQM, M&NP, Alliance, and the GDP deflator[5] normalized to the year 2001 are shown in Figure 19.

The increase in TransCanada's benchmark toll between 1997 and 2004 is mainly attributed to a large amount of decontracting on the Mainline during that period, particularly after the startup of the Alliance pipeline in 2000. This toll tracked the GDP deflator fairly closely from 2001 to 2004. However, in 2005 the toll fell, primarily due to increased contract demand and is below the level that it was in 2000.

Westcoast's tolls have increased moderately except for two years, 2000 and 2005. In 2000, Westcoast's benchmark toll increased more than 10 percent from the previous year primarily due to a large amount of non-routine pipeline integrity costs and in 2005, this toll increased by over 15 percent due to decontracting of firm services.

[4] The benchmark tolls are: TransCanada Eastern Zone; Westcoast T-South Export; Foothills Zone 9; B.C. System Postage Stamp; TQM Saint Lazare to Trois-Rivières; M&NP Postage Stamp; and Alliance monthly demand toll.



[5] The GDP deflator for 2005 is an estimate using actual data for the first half or the year and data estimated by Infometrica for the second half of the year.

The B.C. System, Foothills and TQM's benchmark tolls were lower in 2005 than in 1997. The B.C. System's benchmark toll decreased in 2004 primarily because of an increase in throughput volumes (over 10 percent) from 2003. Foothills benchmark toll dropped in 1999 as a result of a cost-effective expansion of its system. TQM's benchmark toll has decreased since 1997, although it increased somewhat in 2005. The decline was due, in part, to the Portland Natural Gas Transmission System (PNGTS) extension in 1999, which increased throughput over 30 percent from 1998.

M&NP and Alliance's benchmark tolls have been relatively constant since beginning operations at the end of 1999 and 2000 respectively.

FIGURE 19

***NEB-Regulated Gas Pipeline Benchmark Tolls***

### *Oil Pipeline Tolls*

The benchmark tolls for Enbridge, TPTM, TNPI, Express and the GDP deflator, normalized to the year 2001[6], are shown in Figure 20.

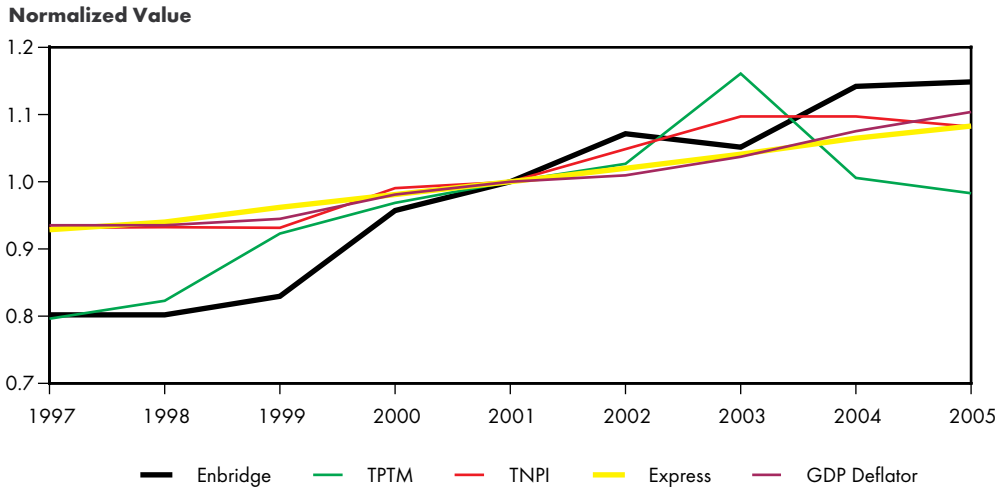
Enbridge's benchmark toll has risen fairly steadily over the period, growing at a faster pace than the GDP deflator, except for a drop in 2002. The tolls increased the most in 2000 and 2004. The increase in 2000 was due to unforeseen lower throughput levels in the previous year. Under its negotiated settlement, Enbridge was able, in the following year, to recapture the revenue shortfall due to the lower throughput. The 2004 increase was primarily due to operating at lower capacity utilization as a result of throughput not filling a recent capacity expansion. Higher fixed costs were spread across relatively lower volumes resulting in higher tolls.

TPTM's benchmark toll rose steadily from 1997 to 2003 but fell in the last two years. There was a large increase in 1999 due to low forecast throughput. During TPTM's first incentive toll settlement, tolls were calculated on forecast volumes. In 1999 the throughput forecast was 17.9 percent lower than the 1998 forecast, which lead to a corresponding increase in the benchmark toll. In 2004, the benchmark toll dropped primarily due to the disposition of 2003 deferrals for higher revenue. TNPI and Express's benchmark tolls moved in line with the GDP deflator from 1997 to 2005.

6 The benchmark tolls are: Enbridge Edmonton to International Border near Chippewa; TPTM Edmonton to Burnaby; TNPI Oakville to Montreal; and Express 15-year.

FIGURE 20

***NEB-Regulated Oil Pipeline Benchmark Tolls***



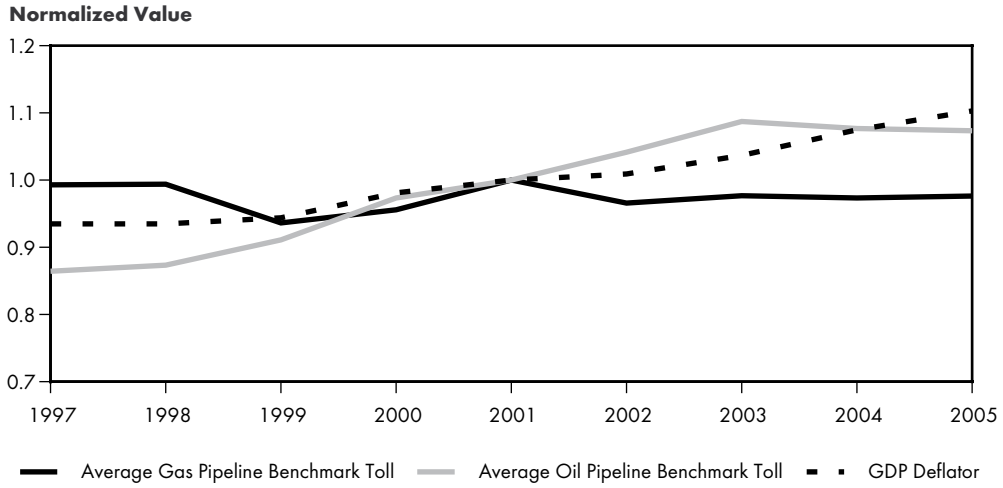


FIGURE 21

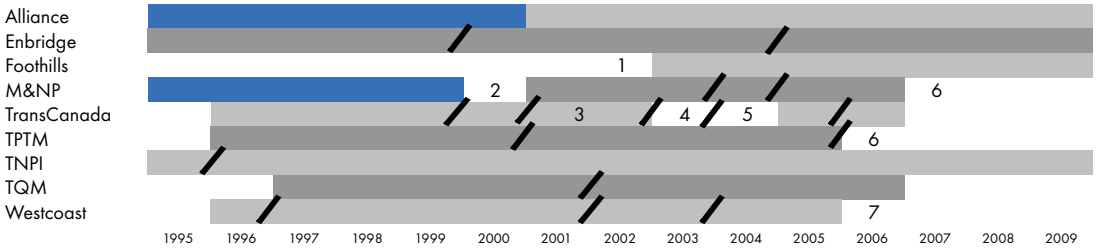
***Oil and Gas Pipeline Benchmark Tolls***

### *Comparison of Gas and Oil Pipeline Tolls*

The average gas and oil benchmark pipeline tolls (reported in Figures 19 and 20) and the GDP deflator are graphed in Figure 21. From 1997 to 2005, oil pipeline tolls increased on average more than gas pipeline tolls, whereas gas pipeline tolls experienced more variation than oil pipeline tolls.



## 2.2.2 Negotiated Settlements

To improve the effectiveness of the regulatory process, the Board has supported the use of negotiated settlements as an alternative to toll hearings since the mid-1980s. In September 1988, the Board issued its first *Guidelines for Negotiated Settlements*. These guidelines were subsequently updated in August 1994 and revised again in June 2002 to provide flexibility when addressing contested settlements.

Most of the major Group 1 companies have successfully negotiated multi-year settlements with their shippers. Beginning in 1995, the Board approved a succession of multi-year settlements. These agreements generally included incentives to reduce costs and provisions to share savings between the pipeline company and its shippers. Several of these multi-year settlements have been renegotiated upon their expiry. For example, Enbridge Pipelines has negotiated three consecutive five-year settlements covering the period 1995 to 2009. Similarly, TPTM and TQM have had two successive five-year settlements and are in the process of renegotiating new ones. Refer to Figure 22 which shows, for each pipeline company, the years that were covered by negotiated settlements.

**FIGURE 22**

***Negotiated Settlements Timeline***

Notes:
1 - Foothills is regulated under an actual cost of service methodology
2 - RH-1-2000 Hearing for tolls from 1 December 1999 to 30 September 2000
3 - RH-1-2001 Hearing to consider contested settlement for 2001 and 2002 tolls
4 - RH-1-2002 Hearing for 2003 tolls
5 - RH-2-2004 Hearing for 2004 tolls
6 - In negotiations
7 - Westcoast and its shippers have negotiated a 2-year settlement
Alliance and M&NP were not in service during these years

Negotiated settlements have contributed to a significant reduction in the regulatory burden for all parties with less time spent participating in hearings and a corresponding reduction in costs associated with the hearing process. This may be somewhat offset by the increased time spent by pipeline companies and their shippers in task force meetings. Parties note that the greater use of task forces and settlements has increased the collaboration between pipeline companies and shippers and resulted in a better alignment of interests.

Some settlements have included various innovative performance mechanisms such as incentives for cost control and performance improvement standards. Examples of the latter include the service standards in Westcoast's 1997–2001 settlement and the service and reliability metrics in Enbridge's 2005–2009 incentive agreement.

Negotiated settlements have also increased the length of period for which tolls are set. Rather than annual toll proceedings, a number of agreements have terms of five years or longer, which provides greater predictability and stability.

## 2.3 Shipper Satisfaction

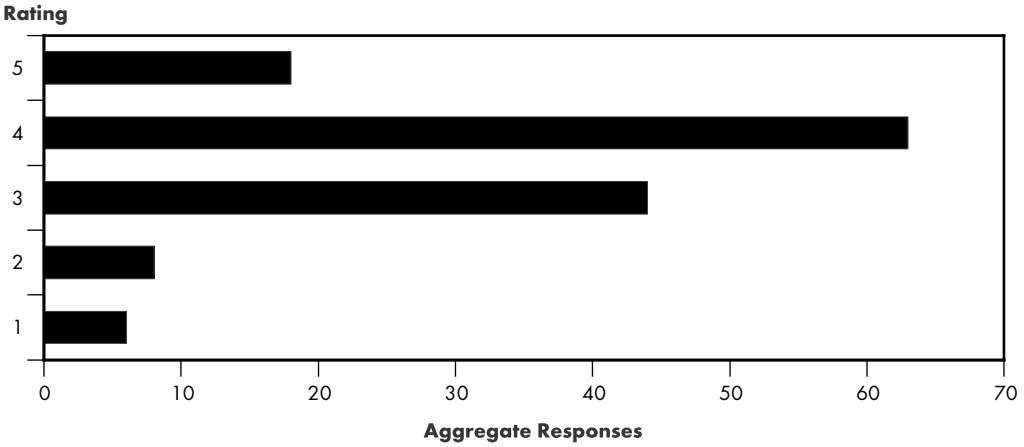
### 2.3.1 *NEB Pipeline Services Survey*

The Board conducted its second Pipeline Services Survey in early 2006 to obtain direct feedback from the shippers on the level of service provided by major NEB-regulated pipeline companies. The Board also uses this survey to obtain feedback from shippers on the Board's regulatory performance with respect to tolls and tariffs.

This year, the Board used a web-based survey tool to send the survey directly to shippers via e-mail. Shippers were sent one survey for each pipeline the shipper utilized during the past year. Each survey asked the shippers to provide their company's corporate views on the services provided by the pipeline being surveyed and on the services provided by the Board. The overall response rate of 33.5 percent was a significant improvement over last year's rate of 23 percent.

After analyzing the survey responses, the Board published a summary of the aggregate results on its website. They included the industry average and distribution of responses for each question and a summary of major themes. In addition, the Board provided each pipeline company and its shippers with detailed company-specific results. These results include the pipeline company's average rating, distribution of responses for each question as well as the verbatim comments received from shippers, excluding the names of the respondents.

The Board follows up on the survey results, including feedback on the Board, by meeting with pipeline companies and shippers.



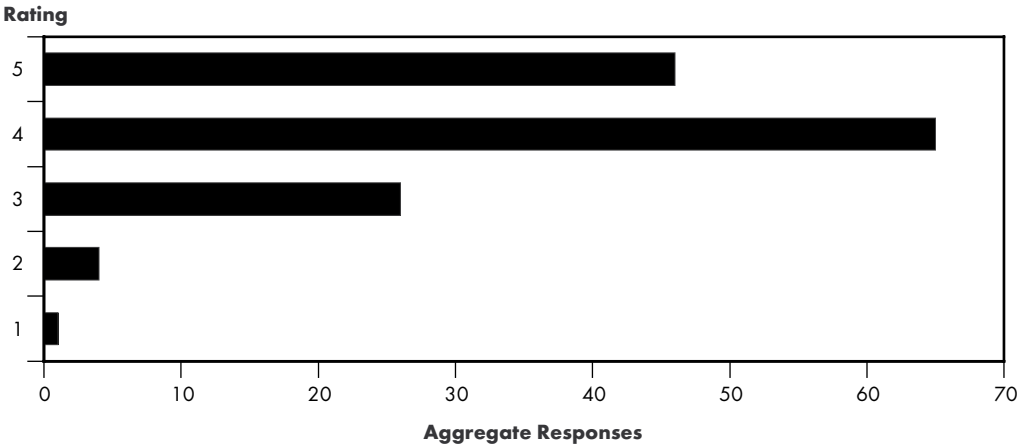
Appendix 2 provides the aggregate scores on all survey questions. For the complete report on the aggregate results, refer to www.neb-one.gc.ca/Publications/SurveyResults.

*Pipeline Services*

Figure 23 shows the aggregate results for the survey question that asked shippers to rate their satisfaction with the overall quality of service provided by their pipeline companies over the last year (1 indicates "very dissatisfied" and 5 indicates "very satisfied"). While the average score of 3.57 was lower than the score of 3.78 in last year's survey, shippers still appear reasonably satisfied with the services provided.

FIGURE 23

**Overall Quality of Service**



The three areas where the pipeline companies rated the highest were the same areas as in last year's survey, as demonstrated by the scores on the following questions:

1. How satisfied are you with the physical reliability of the pipeline company's operations?
2. How satisfied are you with the timeliness and accuracy of the pipeline company's invoices and statements?
3. How satisfied are you with the timeliness and usefulness of operations information (outages, available capacity, scheduled maintenance, flows, etc.) provided by the company?

The high level of satisfaction with the physical reliability of pipeline operations indicates that energy products are reliably being delivered to markets (see Figure 24).

**FIGURE 24**

***Physical Reliability of Operations***

The three areas where shippers believe that pipeline companies could improve the most are very similar to the areas in last year's survey. The questions where the pipeline companies rated lower were:

1. How satisfied are you that this pipeline company's tolls are competitive?
2. How satisfied are you with the degree to which the pipeline company demonstrates an attitude of continuous improvement and innovation?
3. How satisfied are you with the collaborative process (negotiations or task force meetings) utilized by this pipeline company?

*Performance of the Board*

The survey also indicated that approximately two-thirds of shippers are either satisfied or very satisfied with the Board's performance in creating an appropriate regulatory framework and with the Board's processes to resolve disputes. While this was a slight improvement over the previous year's survey, shippers did identify areas where the Board could improve its processes and performance.

### 2.3.2 Formal Complaints

If shippers are unable to resolve concerns with the pipeline, they can bring a complaint to the NEB. It can then be dealt with through appropriate dispute resolution (ADR), through a formal complaint process or the parties may continue to negotiate towards resolution. There were two shipper complaints this past year requiring a formal process before the Board:

*Abitibi Consolidated Company (Abitibi) and Boise White Paper, L.L.C. (Boise)*

Centra Transmission Holdings Inc., a Group 2 company, applied to the Board to increase its tolls. Subsequently two shippers, Abitibi and Boise wrote to the Board requesting additional time to examine Centra's application. The Board subsequently initiated a written process to deal with the matter. The Board approved Centra's application for increased tolls, subject to certain amendments. Additional information can be found in the Board's Reasons for Decision RHW-3-2005.

*Petro-Canada Oil and Gas (PCOG)*

PCOG applied to the Board requesting the issuance of an order requiring Westcoast to grant the permanent firm service relocation of PCOG's Transportation North Long Haul firm service without the requirement to extend its existing service agreement by two years. On 4 May 2006, the Board issued its decision on PCOG's application. The Board found that the practice of requiring a term extension does not constitute unjust discrimination and that permanent relocation may be considered a service. The Board was also of the view that not enough information concerning the appropriate level of consideration was included in the submissions. The Board directed Westcoast to bring the matter of permanent firm service relocation and the appropriate level of consideration back to the Board after discussion with the Tolls and Tariff Task Force. Further, the Board advised that PCOG's term extension, if any, will reflect the final Board decision in this matter. Additional information can be found in the Board's file, 4775-W005-1-17.

### 2.3.3 Service Enhancements

Pipeline companies modify their services on an ongoing basis as circumstances change or innovative ideas are brought forward. Normally, the pipeline or its shippers bring these proposed service enhancements to their tolls task force for discussion and review prior to submission to the Board and ultimate adoption. This past year, for example, Westcoast applied to the Board to introduce firm service enhancements of term differentiated rates and authorized over run service in Zones 3 and 4 and cross corridor crediting in Zone 3. The Board approved Westcoast's application. More information can be found in the Board's Reasons for Decision RHW-1-2005.

If the task force is unable to resolve the issue, a party may bring the issue directly to the Board. This past year, one such enhancement was brought to the Board and subsequently approved.

*Coral Energy Canada Inc. (Coral)*

Coral applied to the Board to modify the Firm Transportation Risk Alleviation Mechanism (FT-RAM) pilot, a service enhancement proposed by TransCanada for its Mainline. The Board approved Coral's application and directed TransCanada to modify its Mainline Transportation Tariff to reflect this decision. Additional information can be found in the Board's Reasons for Decision RHW-2-2005.

### 2.3.4 Summary of Shipper Satisfaction

This past year, it was found that shippers are reasonably satisfied with the services provided by the pipeline companies and the Board's performance in creating an appropriate regulatory framework and the Board's processes to resolve disputes. For both the pipeline companies and the Board, shippers identified areas for improvement in service. Areas of improvement for the pipeline companies are outlined in the previous section. Shippers also noted that the Board could improve its processes through which tolls and tariffs are determined by streamlining those processes and actively engaging stakeholders so that it better understands

the market context in which it makes decisions. The Board is taking this feedback into consideration. For example, in its Strategic Plan for 2006 – 2009 the Board identified the objective for its regulatory processes to be efficient, seamless and responsive to all stakeholders.

## 2.4 Pipeline Financial Integrity and Ability to Attract Capital

In order for a hydrocarbon transportation system to be efficient, pipeline companies must have adequate financial integrity to attract capital on reasonable terms and conditions. This enables them to effectively maintain their systems and build new infrastructure to meet the market's evolving needs. The following sections review and discuss a number of the factors used to assess these areas.

### 2.4.1 *Financial Ratios*

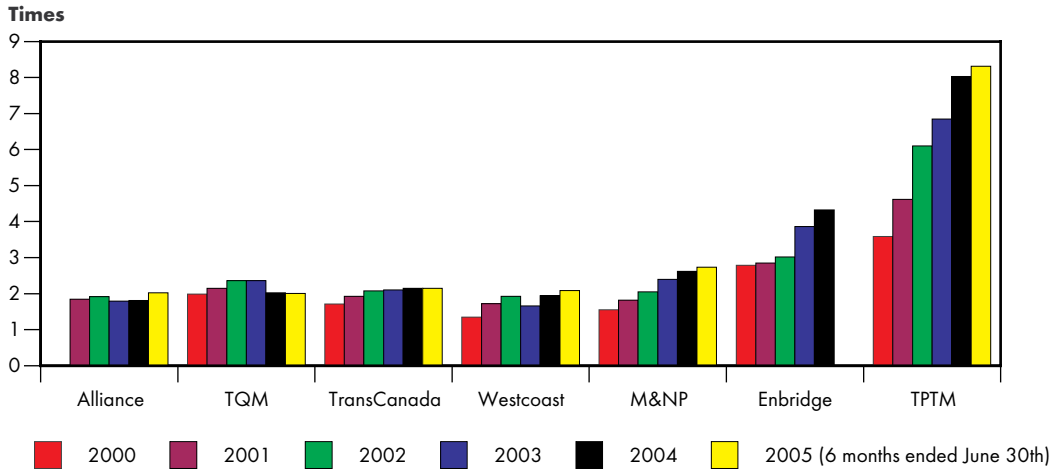
Financial statement information can be used to create financial ratios that are used for assessing a company's performance and financial integrity. Evaluating a financial ratio is most meaningful when the ratio of a particular company is compared with a benchmark or industry standard over time. These ratios can be used to evaluate a company's liquidity, operating performance, growth potential, and risk. However, care must be exercised in the collection and interpretation of financial ratios. Some reported financial information may pertain to a parent company, which may include non-regulated assets and/or assets from different industries.

The following sections specifically outline and discuss some of the ratios used to assess the financial risk and operating profitability of certain NEB-regulated pipeline companies. The final section outlines and discusses some NEB-approved financial ratios.

*Financial Risk*

Financial risk is the risk inherent in a company's use of debt and other obligations that have fixed payments. It differs from business risk which is the risk attributed to the nature of a particular business activity and, for pipelines, typically includes supply, market, regulatory, competitive and operating risks. Financial risk increases as the proportion of debt increases in relation to shareholders equity. An increase in debt may obligate a company to make more and larger fixed payments in the future. From a bondholder's perspective, a company with above average financial risk could have problems making interest payments. From an equity holder's perspective, a company's level of financial risk gives some indication of its financial viability.

Ratios used to evaluate a company's level of financial risk include interest coverage, fixed-charges coverage, and cash flow-to-total debt and equivalents.



*Interest and Fixed-Charges Coverage Ratios*

An interest coverage ratio assesses a company's ability to make interest payments and repay its debt obligations. It is defined as Earnings Before Interest and Taxes (EBIT) divided by interest charges. A fixed-charges coverage ratio also assesses the ability to make interest payments and repay debt obligation; however, it also takes into consideration other types of fixed payments a company is obligated to make. It is defined as EBIT less other fixed-charges divided by interest and other fixed-charges. Higher ratios indicate an increased likelihood that the company will be able to meet its obligations and may indicate that it has unused borrowing capacity.

The fixed-charges coverage ratios for some NEB-regulated pipeline companies, as calculated by the Dominion Bond Rating Service (DBRS), are shown in Figure 25. The average fixed-charges coverage

FIGURE 25

***Fixed-Charges Coverage Ratios***

Source: DBRS

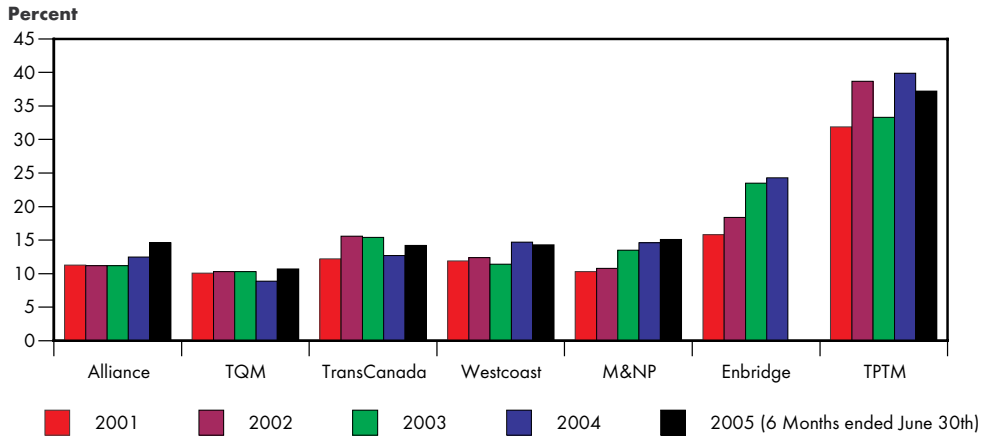
N.B. There was no fixed-charges coverage ratio reported for Enbridge in 2005.

ratio for these companies for the six months ending June 2005 is 3.22 times. TPTM's fixed-charges coverage ratio is higher, primarily due to a deemed common equity ratio of 45 percent (larger than its peers), which means it carries less debt and, therefore, has lower fixed payments.

From 2000 to 30 June 2005, the fixed-charges coverage ratio for these pipeline companies increased on average by 49 percent[7]. This growth was primarily driven by M&NP, Enbridge and TPTM. No company saw its fixed-charges coverage ratio decline from its 2000 level. The consistent increases in fixed-charges coverage ratios is one metric signaling a decrease in these pipeline companies' financial risk, when considered as a group.

### *Cash Flow-to-Total Debt and Equivalents Ratio*

The cash flow-to-total debt and equivalents ratio is another way of assessing a company's ability to meet its debt obligations and fixed payments. It is defined as operating cash flow divided by total debt and equivalents. Again, higher ratios indicate an increased likelihood of a company being able to meet its obligations and indicate that it has greater borrowing capacity.



The cash flow-to-total debt and equivalents ratios for some NEB-regulated pipeline companies, as calculated by DBRS, are shown in Figure 26. The average cash flow-to-total debt and equivalents ratio for these companies was 17.68 percent for the 6 months ending June 2005. TPTM's cash flow-to-total debt and equivalents ratio was higher than its peers for the same reason that its fixed-charges coverage ratio was higher.

On average, the cash flow-to-debt and equivalents ratio for these pipeline companies has grown by 20 percent from 2000 to 2005. The increase has been steady without any noteworthy periods of deterioration. Similar to the fixed-charges coverage ratio, the consistent increase in cash flow-to-total debt and equivalents ratios is another metric which signals that, on average, these pipeline companies' financial risk has been decreasing.

[7] Historically, Enbridge's fixed-charges and cash flow-to-debt and equivalents ratios were much higher than the average of the other pipeline companies in Figures 20 and 21. Since these ratios were not provided for Enbridge in 2005, the pipeline company average for 2005 and the percentage increase since 2000 and 2001 respectively, may be biased downward.

FIGURE 26

N.B. There was no cash flow-to-total debt and equivalents ratio reported for Enbridge in 2005.

## *Operating Profitability*

### *Return on Common Equity*

ROE is commonly used to assess the operating profitability of a company. ROE is defined as net income divided by common equity. For NEB-regulated pipeline companies, this is the return on the equity portion of the rate base that is approved by the Board. A higher ROE is typically preferred by both bondholders and, even more so, by equity investors.

Table 4 shows the achieved ROE for several NEB-regulated pipeline companies from 2000 to 2005 along with the NEB-approved ROE in accordance with the RH-2-94 Formula[8] (RH-2-94 Formula ROE). Alliance, Enbridge, M&NP and TPTM are not subject to the RH-2-94 Formula ROE as they have all negotiated an ROE with their shippers[9]. As per their respective negotiated settlements, Enbridge and TPTM are not required to submit their achieved ROE to the NEB. Therefore, neither of these pipeline companies are included in Table 4. Westcoast's Field Services Division is also not subject to the ROE formula as it is under light-handed regulation[10]. Its tolls for gathering and processing services are negotiated individually with shippers.

From 2000 to 2005, most pipeline companies subject to the RH-2-94 Formula ROE have consistently had ROEs in the mid-to-high nine percent range (except for Westcoast Transmission which has achieved higher ROEs). The RH-2-94 Formula ROE for 2006 is 8.88 percent.

### *NEB-Approved Ratios*

When the Board approves a Group 1 pipeline company's tolls for a specified time period, it typically also approves a ROE and deems a common equity ratio for the regulated entity. Therefore, the Board has influence over the operating profitability and financial risk of some Group 1 pipeline companies.

8 Formula used to determine the ROE for certain NEB-regulated pipelines, established in the RH-2-94 Proceeding, and later amended to eliminate rounding.

9 These pipelines settlements are subsequently approved by the Board.

10 Light-handed regulation is essentially regulation on a complaint basis with rules. Additional information can be found in RHW-1-98.

TABLE 4

***Achieved ROEs and the RH-2-94 Formula ROE (Percent)***

| | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 |
|---|---|---|---|---|---|---|
| Alliance | 11.21 | 11.25 | 11.25 | 11.25 | – | – |
| Foothills | 9.90 | 9.61 | 9.53 | 9.79 | 9.56 | 9.46 |
| M&NP | 13.80 | 14.20 | 12.95 | 12.31 | 13.75 | 14.31 |
| TQM | 9.96 | 10.21 | 9.80 | 10.21 | 9.84 | 9.92 |

## *NEB-Approved Return on Common Equity*

NEB-approved ROEs have great influence over the ROEs that are actually achieved. Achieved ROEs can vary from NEB-approved levels for various reasons, such as incentive and profit sharing mechanisms and cost reductions over the year.

Figure 27 charts the difference between achieved ROEs and NEB-approved ROEs for TransCanada, B.C. System, TQM, Westcoast Transmission system, and M&NP[11]. Enbridge and TPTM are not required to submit their achieved ROEs to the Board as per their negotiated settlements. Westcoast Field Services is not included as it is subject to light-handed regulation. Foothills and Alliance are not included in Figure 27 as neither is able to over- or under-perform on ROE in accordance with their respective cost-of-service methodologies.

FIGURE 27

***Achieved and NEB-Approved ROE for the Years 1999 to 2005***

11 TransCanada, B.C. System, TQM and Westcoast Transmission system have NEB-approved ROEs subject to the RH-2-94 Formula ROE, whereas M&NP has a NEB-approved ROE of 13 percent.

From 1999 to 2005, pipeline companies (included in Figure 27) have met or exceeded their NEB-approved ROEs 85 percent of the time. This stability and predictability of their operating profitability is positive for both bondholders and equity investors. It also highlights that these pipeline companies, in many cases, have been able to meet and outperform approved levels through cost reductions, incentive and profit sharing mechanisms.

*NEB-Approved Deemed Common Equity Ratios*

A common equity ratio is defined as the percentage of common equity in a company's capital structure. This ratio is often used to evaluate a company's financial risk. Higher common equity ratios increase the likelihood of a company being able to meet its obligations. The Board approves a deemed common equity ratio[12] for most of the Group 1 pipeline companies that it regulates.

**TABLE 5**

***Deemed Common Equity Ratios (Percent)***

| | 2000 | 2006 |
|---|---|---|
| Alliance | 30 | 30 |
| Foothills | 30 | 36 |
| M&NP | 25 | 25 |
| TQM | 30 | 30* |
| TransCanada | 30 | 36 |
| B.C. System | 30 | 36 |
| Westcoast Transmission | 30 | 31* |

* TQM and Westcoast Transmission's 2006 deemed common equity ratios are interim.

Table 5 shows the deemed common equity ratio for some NEB Group 1 pipeline companies. TransCanada, Westcoast Transmission, B.C. System and Foothills have had their deemed common equity ratios increased between 2000 and 2006. These increases are credit positive and lower the financial risk of the pipeline companies.

### 2.4.2 Credit Ratings

In Canada, pipeline credit ratings are determined by three independent credit rating agencies: DBRS, Standard & Poor's (S&P), and Moody's Canada Inc. (Moody's). A comparison of the rating scales for DBRS, S&P and Moody's can be found in Appendix 1. Credit ratings, like stock prices, generally reflect the consolidated operations of the entire company and not solely the regulated portion. Thus, using these ratings as an accurate measure of the creditworthiness of a NEB-regulated pipeline owned by a company with both regulated and non-regulated operations, such as TransCanada and Enbridge, must be interpreted with some care. In addition, credit ratings are somewhat subjective in that a company's ratings are the expert opinion of the credit rating agency, which may result in different ratings by different agencies.

*Dominion Bond Rating Service*

In assigning a credit rating to a particular company, DBRS attempts to consider all meaningful factors that could impact the risk of maintaining timely payments of interest and principal in the future. While key considerations will vary from industry to industry, some of the common factors considered for most ratings are: core profitability, asset quality, strategy and management strength, and financial and business risk.

The following factors are also important considerations in deriving the credit ratings for pipelines and electric and gas utilities: regulatory factors, competitive environment, supply and demand considerations, and regulated versus non-regulated activities. DBRS credit ratings for several NEB-regulated pipeline companies are shown in Table 6. As indicated, these ratings have remained stable from 2000 to the present, varying from BBB (high) to A (high).

[12] A deemed common equity ratio is a notional capital structure used for rate-making purposes that may differ from a company's actual capital structure.

***Standard & Poor's***

A credit rating from S&P reflects its current opinion of a company's overall capacity to pay its financial obligations. S&P bases its ratings on the overall creditworthiness of a consolidated company. Therefore, the rating of a wholly-owned subsidiary, in the absence of meaningful ring-fencing measures, generally reflects the creditworthiness of the parent. S&P's opinion may also apply to specific financial obligations.

In S&P's rating methodology, a company rated "A" has strong capacity to meet its financial commitments but is somewhat more susceptible to the adverse effects of changes in circumstances and economic conditions than companies in higher-rated categories. A company rated "BBB" has adequate capacity to meet its financial commitments. However, adverse economic conditions or changing circumstances are more likely to weaken the company's capacity to meet its financial commitments.

S&P credit ratings for several NEB-regulated pipeline companies are shown in Table 7. This table indicates that these ratings have been relatively stable from 2000 to the present, ranging from BBB (stable) to A (negative).

Both DBRS and S&P have, at various times, expressed an opinion that the ROE awarded through the RH-2-94 Formula and the deemed equity ratios awarded by the Board are low by international standards. Notwithstanding these comments, the ratings assigned by both of these agencies for the NEB-regulated companies are all investment grade.

***Moody's***

Moody's credit analysis focuses on the fundamental factors and key business drivers relevant to an issuer's long-term and short-term risk profile. The foundation of Moody's methodology rests on two basic questions:

1. What is the risk to the debt holder of not receiving timely payment of principal and interest on this specific debt security?
2. How does the level of risk compare with that of all other debt securities?

Like S&P, Moody's credit rating is its current opinion of a company's overall capacity to pay its financial obligations and focuses its ratings on the overall creditworthiness of a consolidated entity. In so doing, Moody's measures the ability of an issuer to generate cash in the future. This determination is built on an analysis of the strengths and weaknesses of the individual issuer compared with those of its peers worldwide. Moody's also takes into consideration factors external to the issuer, including industry or nation-wide trends that could impact the entity's ability to meet its debt obligations. Of particular concern is the ability of company management to sustain cash generation in the face of adverse changes in the business environment.

The rating histories for several NEB-regulated pipeline companies are provided in Table 8. All of Moody's ratings place these pipelines in the investment grade category, ranging from "medium grade" to "upper-medium grade".

**TABLE 6**

***DBRS Credit Rating History***

| Pipeline | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 | Current |

### 2.4.3 Comments by Investment Community

As noted previously, pipeline companies must be able to access capital markets to maintain and, potentially, expand their systems as the needs of the transportation market change. Board staff met with credit rating analysts, equity analysts (sell-side analysts), and suppliers of capital such as insurance and pension funds (buy-side analysts) to discuss their views on the ability of NEB-regulated pipeline companies to access capital markets, as well as their views on transportation markets and the current regulatory environment in Canada. This section reflects the views expressed in those meetings.

All parties expressed the view that there was no problem accessing debt markets at this time. In fact, utilities frequently enter the market to refinance their debt and, given the current liquidity in the markets, they have been able to do so at favourable spreads relative to government bonds.

Several analysts noted that Canadian regulation, including the ROE formula approach, provides transparency, predictability and stability, which are seen as highly beneficial. However, a number of analysts felt that the ROE generated by the NEB ROE formula and the formulas of other Canadian regulators were "a little too low" and not supportive of dividend growth or credit metrics. Although most analysts felt that utilities have good access to equity markets, the current level of ROEs was seen by some as impeding this access. As there has been, in most cases, adequate pipeline capacity from the WCSB in recent years, the ability of pipeline companies to access equity markets has not been significantly tested.

Many equity analysts publish their assessments of various companies for investors. Most of the analysts currently rate major NEB-regulated pipeline companies in the "Hold" or "Buy" categories. A number of equity analysts commented that where they have "Buy" ratings on Canadian utility stocks, they tend to reflect the prospects of the companies' non-regulated businesses. A number of analysts also noted that companies have reduced costs and taken other steps to support corporate profit and dividend growth for several years, and they questioned how long this can continue.

It was noted that pipeline stocks are part of the interest-sensitive segment of the equity market and as such, low interest rates have been positive for valuations and the price-to-earnings ratio. The price-to-earnings ratios of Canadian utilities have been higher than their U.S. and European counterparts. The reasons given for this difference included greater growth opportunities in Canada given oil sands, northern gas, power infrastructure development, a more stable regulatory environment, as well as strong foreign interest in Canadian stocks in general.

### *2.4.4 Summary of Pipeline Financial Integrity and Ability to Attract Capital*

The financial information and observations by the investment community are summarized as follows:

- Fixed-charges and cash flow-to-total debt and equivalents coverage ratios have increased since 2000.
- Deemed common equity ratios have increased since 2000.
- Achieved ROEs have, in most cases, been greater than or equal to their NEB-approved levels between 1999 and 2005.
- Achieved ROEs have been stable and predictable.
- Credit ratings continue to be strong.
- The investment community is of the view that NEB-regulated companies should have no problems accessing the capital markets at this time.

These observations signal that, currently, NEB-regulated pipelines have adequate financial integrity to attract capital on reasonable terms and conditions.

## 2.5 Proposed Pipelines

Many proposals to expand pipeline capacity or build new pipeline systems have been announced, applied for or recently approved. These include gas pipelines to growing markets in Canada and the U.S. and pipelines to ship western Canadian crude oil to the West Coast for delivery to Washington State and offshore markets, the U.S. Midwest and southern PADD II and the U.S. Gulf Coast (PADD III). More specifically, these project proposals include:

- new pipelines connecting northern gas supplies to existing gas infrastructure;
- natural gas expansions in the east to facilitate market development in eastern Canada and the U.S. Northeast; and
- pipeline laterals connecting existing infrastructure to proposed LNG receiving terminals in Nova Scotia and New Brunswick; and
- oil pipeline expansions and new pipeline proposals to facilitate the expected growth in the next decade in oil sands production.

*Natural Gas*

In the coming decade, demand for natural gas in North America is expected to exceed the growth in North American domestic supplies. In Canada, there are two sectors of growth that bear noting: oil sands projects in Alberta and electricity generation in Ontario.

The Canadian oil sands projects are a large and growing market for natural gas. Today, these projects consume about 0.7 Bcf/d. Natural gas is used to generate power, generate steam for in situ oil production and upgrade bitumen into synthetic blends. Gas demand for oil sands is expected to more than double to perhaps 2 Bcf/d over the next decade depending on the number of oil sands projects that proceed and the technology used.

In addition, Ontario's policy to remove 7 500 MW of coal-fired electrical generation by 2009 may require significant supplies of natural gas for power generation While refurbishment of existing nuclear generation and the addition of renewable power sources may meet part of the requirement, it is possible that new electrical generation will primarily be fired by natural gas.

Table 9 summarizes currently announced Canadian natural gas pipelines and expansion proposals.

**TABLE 9**

***Announced Canadian Natural Gas Pipelines and Expansions***

| Pipeline | Location | Capacity Increase (Bcf/d) | Proponents' Estimated Completion Date | Market to be Served |
|---|---|---|---|---|
| TransCanada PipeLines Limited – 2006 Eastern Mainline Expansion | Ontario, Québec | .310[13] | Late 2006 | Central Canada, Northeastern U.S. |
| TransCanada PipeLines Limited– 2007 Eastern Mainline Expansion | Ontario, Québec | .377[14] | 2007 | Central Canada, Northeastern U.S. |
| Mackenzie Gas Pipeline | Mackenzie Delta, Northwest Territories to Alberta | 1.2 | 2011 | North America |
| Maritimes & Northeast Pipeline – Brunswick Pipeline | New Brunswick | 0.75 | 2008 | Atlantic Canada, Northeastern U.S. |

13 TCPL Eastern Mainline Expansion: Montreal/North Bay Shortcut to Iroquois delivery point.

14 TCPL Eastern Mainline Expansion: Montreal/North Bay Shortcut to Les Cèdres (148 MMcf/d), Philipsburg Extension to Philipsburg (12 MMcf/d) and Kirkwall/Niagara Line to Chippawa (217 MMcf/d).

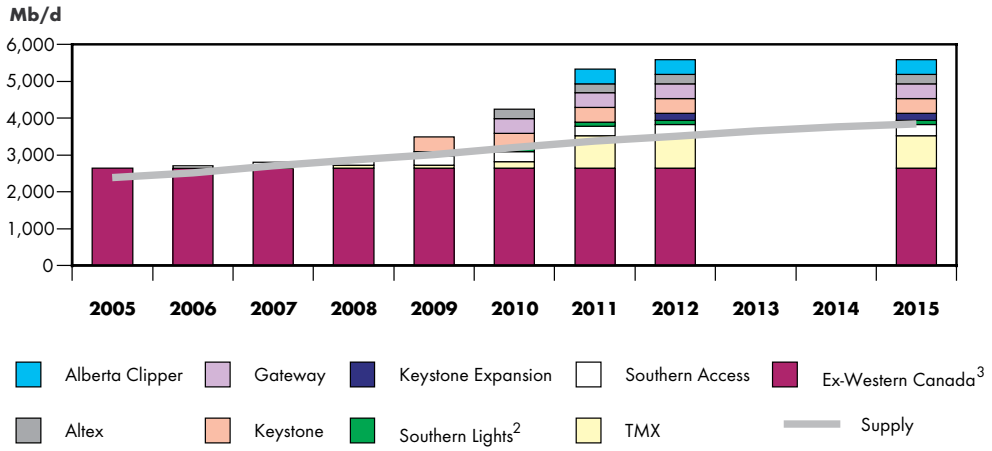
### *Liquefied Natural Gas*

A key supply source for North America is expected to be the rapidly developing global LNG market. Proven reserves of natural gas worldwide are about 20 times larger than the proven natural gas reserves of North America. Furthermore, advances in liquefaction and transportation technologies have lowered the unit cost of LNG by 30 percent over the past decade, enabling the use of LNG as a cost competitive source of gas supply in North America. In anticipation of growing natural gas requirements, expansions of some existing U.S. terminals and numerous new receiving facilities have been proposed, including sites in Canada as shown in Table 10.

However, there is uncertainty around the number of LNG terminals that will be built in Canada as well as the potential effects that imported LNG will have on gas markets and the pattern of natural gas flow. As discussed above, pipeline laterals will be required to connect LNG receiving terminals to existing natural gas pipeline infrastructure in order to deliver the gas to market.

**TABLE 10**

***Proposed Canadian LNG Terminals***



| Terminal | Company | Location | Capacity (Bcf/d) | Proponents' Estimated Completion Date | Market to be Served |

1 The 700 mb/d includes the existing capacity of 300 mb/d and the capacity additions from TMX2 and TMX3.

*Oil*

High crude oil prices and strong global demand are key drivers in the expansion of the oil sands. In this regard, many proposals to expand existing pipelines or build new facilities have been announced. Figure 28 shows that pipeline capacity out of western Canada could be tight in 2008.

Table 11 illustrates announced and potential expansions by Canadian pipelines. Additional details about these proposals are found in the EMA entitled *Canada's Oil Sands Opportunities and Challenges to 2015: An Update*, released in June 2006.

The proposals for pipeline expansion and construction of new pipelines indicate that the market is responding to increases in supply and demand.

## 2.6 Emerging Issues

While the transportation system is currently working well, there are a number of challenges facing the industry.

The demand for natural gas in North America is expected to increase by about two percent per year over the next decade. Conventional sources of supply for natural gas in North America are not likely to meet the increased demand. LNG is the fastest growing fuel source worldwide, and LNG's market share in North America is estimated to grow to about 15 percent within the decade. Although there is uncertainty around the number of LNG terminals that will be built in North America and the potential effects that imported LNG will have on the supply, demand and pattern of natural gas flow, LNG could become an important component of gas supply in Canada.

The construction of LNG terminals could have implications for existing pipeline transportation systems. For some pipelines, such as the TransCanada Mainline, this could result in volumes from the WCSB being displaced. For others, such as PNGTS and M&NP on the east coast, there is the possibility of higher capacity utilization on their systems. Direction of flow and toll design may also be affected. The PNGTS pipeline system has the potential for backhauls or reversal to import gas into Canada. There are also possibilities for expansion, reversals or backhauls in Quebec on TQM. Northern gas projects such as the Mackenzie Valley Pipeline or a pipeline from Alaska, if approved, and constructed, would also affect flows on existing systems.

If the expected increase in natural gas demand for power generation in Ontario materializes, it will impact the balance of supply and demand and consequent gas flows. The impact of this power generation on pipeline infrastructure will depend on the total amount of generation built and its location. New pipeline services may also be required to satisfy the needs of the power generation customers.

The expected growth in oil sands production is forcing industry to address questions such as which incremental markets to serve and how to expand the pipeline system to access them efficiently. Options include expanding existing systems and constructing new systems to access new markets in the U.S. and/or Asia. Given the large capital outlay and the relative irreversibility of the investment, market participants want to ensure that the optimal decisions are made.

There is concern in industry and in the financial community about the potential for insufficient pipeline capacity, particularly oil capacity, and conversely, the potential for excess capacity if too many projects go ahead. Other issues include the financial implications of increasing levels of competition among oil pipelines and the manner in which the regulatory process would unfold if numerous competing applications come before the NEB.

The challenge for the pipeline transportation industry is to have appropriate pipeline capacity in service to correspond to increases in production and growing market needs. For this to happen, there must be recognition of adequate lead times to achieve sufficient market support from amongst competing proposals, obtain regulatory approvals, arrange financing, mobilize labour and materials, and construct. A key component is that the regulatory process continues to be fair and effective with clear timelines and clear requirements.

Some of the above-noted issues will be settled among market participants; others may be examined in formal proceedings before the Board. The Board will continue to consult with stakeholders and seek input if and when any regulatory initiatives are pursued.

# CONCLUSIONS

In the Introduction to this report, the Board identified its assessment criteria. Based on these criteria the Board continues to believe that, at the present time, the Canadian hydrocarbon transportation system is working effectively.

1. **There is adequate capacity in place on existing natural gas pipelines.** The basis differentials and capacity utilization charts show that most NEB-regulated gas pipelines have some excess capacity, even during the peak winter season. Some excess capacity out of the WCSB and the unprecedented high prices for energy has provided producers with the flexibility to access markets of their choice at most times. However, there are constraints at the market end of some pipelines as indicted by expansions currently underway.

   **Capacity is tight on oil pipeline transportation systems.** While the capacity utilization charts show that there is spare capacity on some of the pipelines, additional capacity is required to meet the growing demand, provide flexibility and enhance market penetration. The need for additional capacity is best shown by the number of announced and proposed pipelines and expansions.

2. **Shippers continue to indicate that they are reasonably satisfied with the services provided by pipeline companies.** The results of the NEB Pipeline Services Survey again rate the physical reliability of pipeline operations very highly, while satisfaction with toll competitiveness was again identified as the area where shippers most had concerns.

3. **NEB-regulated pipeline companies are financially sound** and able to attract capital on reasonable terms and conditions. While it is recognized that some of the data and indicators reviewed is for the consolidated operations of pipeline companies, discussion with the investment community indicated that, at this time, NEB-regulated pipeline companies should have no difficulty raising capital. Extensive investment will be required in the future to provide needed infrastructure and the financing for those facilities will depend upon the characteristics of the projects and the financial markets at that time.

As identified in Section 2.5 there are a significant number of proposals to build or expand Canadian pipelines to deliver additional volumes of oil and natural gas to growing markets. Some of these proposals may be competing for the same sources of supply and perhaps the same markets.

The challenge from the NEB's perspective is to provide, in a timely manner, a fair and effective process that does not distort the market place investment decisions. This may involve coordinating with other jurisdictions. Investors desire clear regulatory processes with predictable timelines. New investment can be frustrated when timelines stretch out and unexpected regulatory hurdles materialize during the process. Further, unnecessary construction delays, for both expansions and new pipelines, can be costly to both energy consumers and producers as the development of new supplies is constrained.

The Board recognizes that this report is only a snapshot in time and does not include a comparison with or to pipeline transportation systems in other jurisdictions. As part of its mandate, the Board will continue to monitor the effectiveness of the transportation system and will continue to meet with parties to gain an understanding of all perspectives on this issue. The Board welcomes feedback on the measures and conclusions in this report and also welcomes suggestions for improvements to future reports.

The Board thanks those companies and organizations that directly or indirectly provided the information found in this report, including those that actively participated in the Pipeline Services Survey.

## Debt Rating Comparison Chart

This chart provides a comparison of the rating scales used by DBRS, S&P and Moody's when rating long-term debt.

| Credit Quality | DBRS | S&P | Moody's |
|---|---|---|---|
| **Investment Grade** | | | |
| Superior/High grade | AAA | AAA | Aaa |
| | AA (high) | AA+ | Aa1 |
| | AA | AA | Aa2 |
| | AA (low) | AA- | Aa3 |
| Good/Upper Medium | A (high) | A+ | A1 |
| | A | A | A2 |
| | A (low) | A- | A3 |
| Adequate/Medium | BBB (high) | BBB+ | Baa1 |
| | BBB | BBB | Baa2 |
| | BBB (low) | BBB- | Baa3 |
| **Non-Investment Grade** | | | |
| Speculative | BB (high) | BB+ | Ba1 |
| | BB | BB | Ba2 |
| | BB (low) | BB- | Ba3 |
| Highly speculative | B (high) | B+ | B1 |
| | B | B | B2 |
| | B (low) | B- | B3 |
| Very highly speculative | CCC | CCC | Caa1 |
| | CC | CC | Caa2 |
| | C | C | Caa3 |
| | D | D | Ca |
| | | | C |

Note: DBRS and S&P ratings in the CCC category and lower also have subcategories "high/+" and "low/-," and the absence of "high/+" and "low/-" designation indicates the rating is in the "middle" of the category.

S&P's also provides a Rating Outlook that assesses the potential direction of a long-term credit rating over the intermediate to longer term. A "Positive" outlook means that a rating may be raised; a "Negative" outlook means that a rating may be lowered and a "Stable" outlook means that a rating is not likely to change.

## Pipeline Services Survey Aggregate Results

Below are the aggregate responses for each question in the survey. Respondents were asked to rate their satisfaction with the services they receive on a scale of 1 to 5, where 1 indicates "Very dissatisfied" and 5 indicates "Very satisfied". See the Board's website for the complete details.

1. How satisfied are you with the physical reliability of the pipeline company's operations?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 1 | 4 | 26 | 65 | 46 | 4.06 |

2. How satisfied are you with the quality, flexibility and reliability of the pipeline company's transactional systems (nominations, bulletin boards, reporting, contracting, etc.)?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 1 | 4 | 26 | 65 | 46 | 4.06 |

3. How satisfied are you with the timeliness and accuracy of the pipeline company's invoices and statements?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 9 | 10 | 24 | 60 | 36 | 3.75 |

4. How satisfied are you with the timeliness and usefulness of operations information (outages, available capacity, scheduled maintenance, flows, etc.) provided by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 12 | 37 | 73 | 16 | 3.60 |

5. How satisfied are you with the timeliness and usefulness of commercial information (tolls, service changes, new services, contract information, etc.) provided by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 7 | 43 | 69 | 17 | 3.59 |

6. How satisfied are you with the degree to which the pipeline company demonstrates an attitude of continuous improvement and innovation?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 8 | 29 | 62 | 31 | 10 | 3.04 |

7. How satisfied are you with the accessibility and responsiveness of the pipeline company to shipper issues and requests?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 14 | 19 | 39 | 49 | 17 | 3.26 |

8. How satisfied are you that the pipeline company works towards fair and reasonable solutions when resolving issues?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 19 | 47 | 49 | 11 | 3.30 |

9. How satisfied are you with the suite of services offered by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 17 | 51 | 55 | 10 | 3.37 |

10. How satisfied are you that this pipeline company's transportation tolls are competitive?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 14 | 29 | 45 | 38 | 11 | 3.02 |

11. How satisfied are you with the collaborative processes (negotiations or task force meetings) utilized by this pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 8 | 12 | 51 | 42 | 8 | 3.25 |

12. How satisfied are you that the current negotiated settlement agreement or tariff arrangements work well to provide fair outcomes?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 7 | 11 | 48 | 47 | 6 | 3.29 |

13. How satisfied are you with the OVERALL quality of service provided by the pipeline company over the last calendar year?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 8 | 44 | 63 | 18 | 3.57 |

14. On an overall basis, has the pipeline company's quality of service in the last year:

| | | |
|---|---|---|
| Improved | 19 | 13% |
| Remained the Same | 110 | 78% |
| Decreased | 13 | 9% |
| **Total** | **142** | **100%** |

15. What are the things that this pipeline company does well?

16. What are the things that this pipeline company could do better?

17. How satisfied are you that the NEB has established an appropriate regulatory framework in which negotiated settlements for tolls and tariffs can be reached?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 7 | 7 | 30 | 72 | 8 | 3.54 |

18. When toll and tariff matters are not resolved through settlement, how satisfied are you with the Board's processes to resolve disputes?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 3 | 7 | 23 | 54 | 4 | 3.54 |

19. What could the Board be doing to improve its processes through which tolls and tariffs are determined?

# FOREWORD

As part of its regulatory mandate, the National Energy Board (the Board or NEB) continually monitors energy and transportation markets to ensure that Canadians derive the benefits of economic efficiency. To further assist in its monitoring efforts, the Board identified a need in its *2004-2005 Report on Plans and Priorities* to implement a performance measurement system for pipeline tolls and tariffs, including the financial health of the pipeline industry.

This report provides an assessment of how the Canadian hydrocarbon transportation system is currently functioning and sets out the framework the Board will use for future assessments.

The data contained within this report is based on publicly available information collected and monitored by NEB staff. In identifying some of the emerging issues around the transportation system, the Board also benefited from discussions with members of the investment community. A draft of the report was sent to the Canadian Energy Pipeline Association and the Canadian Association of Petroleum Producers for comment prior to its release.

Any comments on the report or suggestions for further analysis can be directed to:

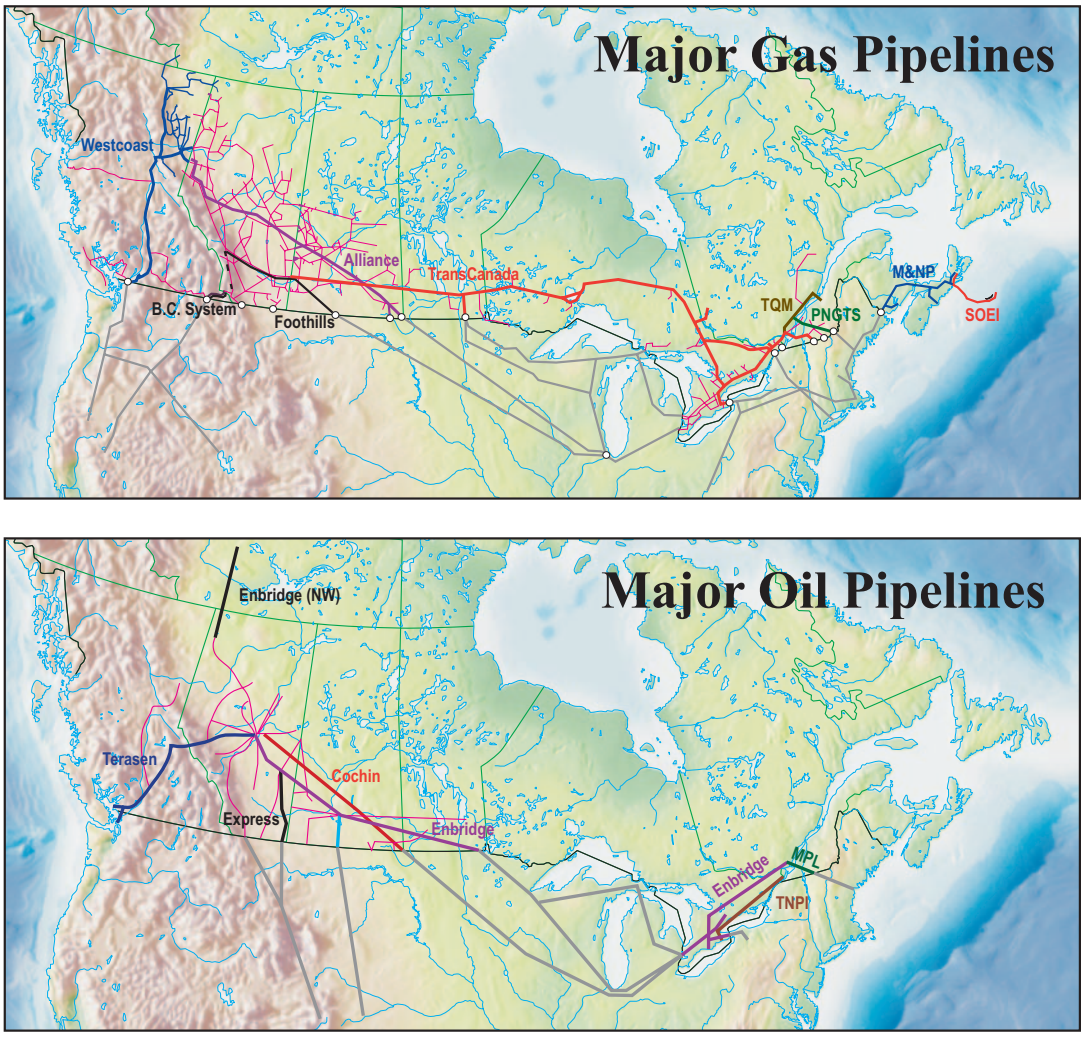
# INTRODUCTION

The Canadian hydrocarbon transportation system moves over $100 billion in petroleum products and natural gas to Canadians and export markets each year. In 2004, energy export revenue was almost $59 billion, accounting for about 15 percent of total Canadian exports. Energy is essential to our daily lives and the ability of the pipeline transportation system to reliably and efficiently deliver this energy is critical to our country's economic well-being. The Board regulates the physical and financial operations of pipelines that cross interprovincial boundaries and the international boundary.

The Board has developed five corporate goals to ensure that its regulatory program provides value to Canadians. The third goal is that "Canadians derive the benefits of economic efficiency". To determine whether this goal is being achieved, the Board monitors energy and transportation markets for evidence that they are working well.

Each year the Board issues various Energy Market Assessment reports that focus on different aspects of Canadian energy markets. This is the first time that the Board has issued a report that focuses on the functioning of the Canadian hydrocarbon transportation system.

This report is similar to the Board's other market monitoring reports and its intent is to assess how well the Canadian hydrocarbon transportation system is working and to outline a system to monitor and measure the performance of the transportation system from year to year. This report should not be read as a regulatory document, like a Reasons for Decision. In this report, the Board is not making a determination on regulatory matters such as the appropriate rate of return on equity that should be earned by pipeline companies. Thus, the factors on which the functioning of the transportation system is assessed are not the same as those which are applied in a regulatory proceeding.



For the transportation system to work well, the Board believes that the following three outcomes should be achieved:

1. there is adequate pipeline capacity in place to move products to consumers who need them;
2. pipeline companies are providing services that meet the needs of shippers at reasonable prices; and
3. pipeline companies have adequate financial strength to attract capital on terms and conditions that enable them to effectively maintain their systems and build new infrastructure to meet the changing needs of the market.

To assess the extent to which these outcomes are being achieved, the Board used publicly available data for Group 1 regulated companies (see Figure 1). This group comprises the major pipeline companies that are subject to ongoing regulatory oversight by the Board. As these companies represent a major part of the Canadian transportation system, the data from these companies provides a good view into the overall functioning of the transportation system.

**FIGURE 1**

***Gas and Oil Pipelines Regulated by the National Energy Board***

# THE CANADIAN HYDROCARBON TRANSPORTATION SYSTEM

## 2.1 Adequacy of Pipeline Capacity

A key measure of the efficient operation of energy markets is that there is adequate pipeline capacity to transport crude oil, refined products, natural gas and natural gas liquids from producing regions to market areas.

This section examines the following factors to assess the current adequacy of the pipeline capacity:

- price differentials compared with firm service tolls for major transportation paths
- capacity utilization on pipelines; and
- the degree of apportionment on major oil pipelines.

The Board has generally taken the view that it is better to have some excess pipeline capacity than to have inadequate capacity. While there are costs associated with having excess capacity in terms of higher tolls for shippers, the costs associated with insufficient pipeline capacity are generally greater. When there is inadequate take-away capacity, natural gas or oil production is shut-in or shipped to less attractive markets, resulting in foregone revenues for producers, foregone royalty revenue for governments, higher commodity prices for downstream consumers, an inefficient allocation of supply and a negative signal to investors in the upstream sector. The assurance that adequate capacity is available to serve various market regions provides a strong incentive to invest in exploration and development.

Further, some excess capacity in the system provides flexibility in the market. For example, when gas demand and prices are high in California because of poor hydro-electric conditions, Canadian producers would like to move gas to that market. When cold weather strikes the U.S. Northeast and prices in that market increase, the existence of some spare capacity allows producers to swing supply to that market, meeting consumers' needs and helping prices to stabilize.

The importance of having adequate pipeline capacity in place is highlighted by the fact that the value of natural gas and oil transported in NEB-regulated pipelines far exceeds the cost of service on those pipelines (e.g., in 2004 the value of products transported was approximately $100 billion compared with $4.5 billion for the cost of providing transportation service).

### *2.1.1 Price Differentials and Firm Service Tolls*

One measure of adequacy is based on the principle that, if adequate capacity exists, the price differential (or basis) between two points on a pipeline should be equal to or less than the cost of

transportation. As long as the price differential is less than the firm service toll plus fuel, the market is demonstrating that there is adequate pipeline capacity between the two pricing points. When there is inadequate pipeline capacity between two market points, the basis will exceed the cost of transportation. In a market with adequate capacity, sellers would generally redirect their product to the higher price market, thereby meeting that region's need for energy. Where inadequate capacity exists, the product cannot get to market and the price differential persists, resulting in higher prices for consumers and lost revenues for producers.

In order to use this measure, there must be reasonably good pricing data available. Two examples of price differentials compared with firm service tolls are provided below; one for transportation on TransCanada PipeLines Limited (TransCanada or TCPL) and one for transportation on Westcoast Energy Inc. (Westcoast).

Figure 2 shows the basis between the Alberta border and the Dawn delivery point compared with the TransCanada firm service toll between the two points, including fuel costs. The fact that the basis is consistently lower than the firm service toll demonstrates that there generally has been excess capacity available on TransCanada since at least January 2001, although it appears that capacity between these two points has firmed up during the summer months since July 2002.

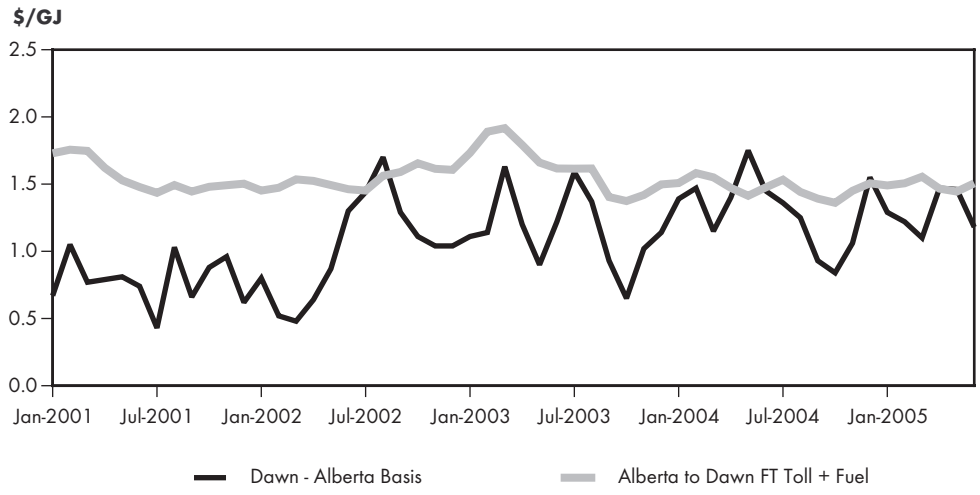


Figure 3 shows the basis between Compressor Station 2 on the Westcoast system and the Sumas export point compared with the Westcoast firm service toll between the two points (T-South or Southern Mainline), including fuel costs. Except for a few months, the basis has been lower than the transportation costs since February 2001, which indicates that there has been adequate capacity in place since that time[1].

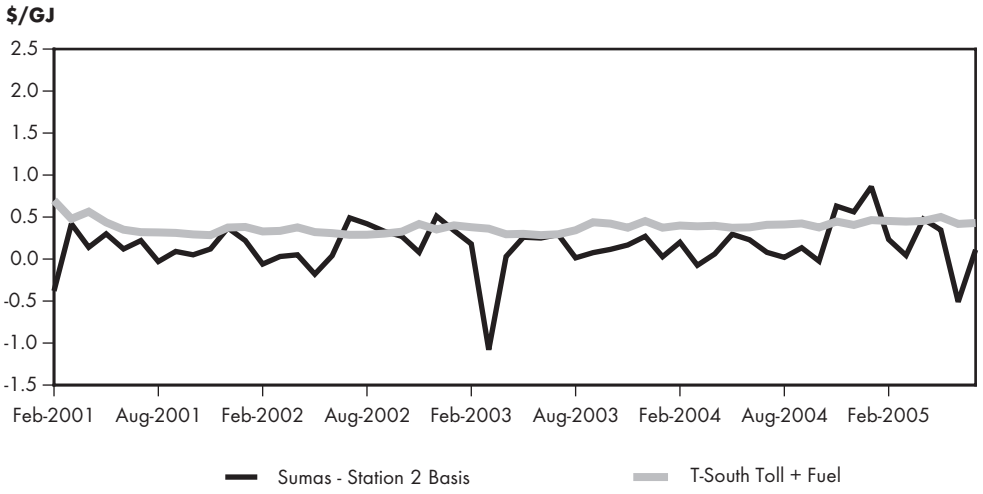
*Dawn-Parkway Corridor*

Although there is inadequate pricing data available, there is evidence that capacity is tight on the Dawn-Parkway corridor of the Union Gas system. After the close of a binding open season in December 2004, Union signed contracts with 22 parties for an expansion of its system between Dawn and Parkway. Following the consideration of Union's facilities application, the Ontario Energy Board

**FIGURE 2**



***Dawn - Alberta Basis vs. TransCanada Toll and Fuel***

1 The negative price differential at March 2003 may be a data anomaly.

FIGURE 3

***Sumas - Station 2 Basis vs. Westcoast T-South Toll and Fuel***

approved the expansion which is expected to be in service by November 2006. While not regulated by the NEB, this corridor is a key link between the Dawn hub and markets in eastern Canada and the U.S. Northeast.

### 2.1.2 *Capacity Utilization on Major Routes*

Where good pricing data is not available at major injection and delivery points on a pipeline system, another measure of adequate capacity is to monitor pipeline throughput compared with capacity. Capacity utilization is monitored for most large pipelines regulated by the Board.

The following figures show pipeline average monthly throughput compared with capacity on some of the largest pipeline systems regulated by the NEB, including TransCanada, Westcoast, Alliance Pipeline Ltd. (Alliance), Enbridge Pipelines Inc. (Enbridge), Terasen Pipelines (Trans Mountain) Inc. (Terasen (TMPL)) and Express Pipeline Limited Partnership (Express).

The volumes shown on Figure 4 are average monthly throughput[2] on the TransCanada Mainline and are approximately equal to the amount of gas flowing east on the Mainline from Saskatchewan. These volumes are compared with the design capacity of TransCanada's prairie line. Figure 4 shows that since April 2003, the prairie line has been operating at between 70 to 80 percent of capacity.

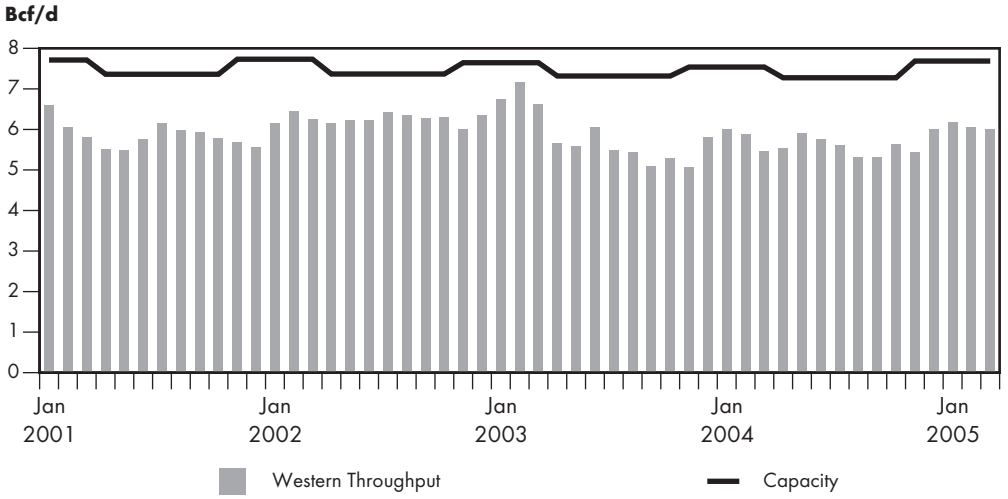
Figure 5 shows the average monthly throughput on Westcoast's Southern Mainline compared with capacity between Station 2 and the Sumas export point. This figure shows the seasonal nature of throughput on the Southern Mainline with more volumes being transported during the peak winter months and less volumes being transported during the summer months.

In Figure 6, throughput on Alliance's system is compared with the firm service contracted capacity of 37,534 $10^3m^3/d$ (1,325 MMcfd) and physical capacity, which has been calculated as the sum of the contracted capacity and capacity made available for Authorized Overrun Service (AOS). As shown, Alliance's capacity has been virtually 100 percent utilized since the commencement of its operations because of the high contract level and the offering of AOS, priced at only the cost of fuel, which has filled any additional capacity.

2 Daily fluctuations in throughput are not shown on the figure.

**FIGURE 4**

***TransCanada Mainline Throughput vs. Capacity***



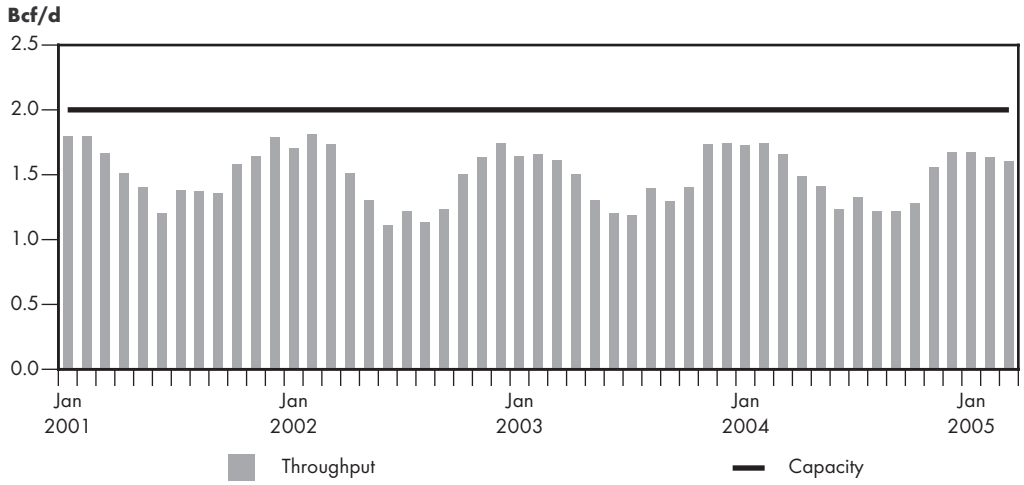


**FIGURE 5**

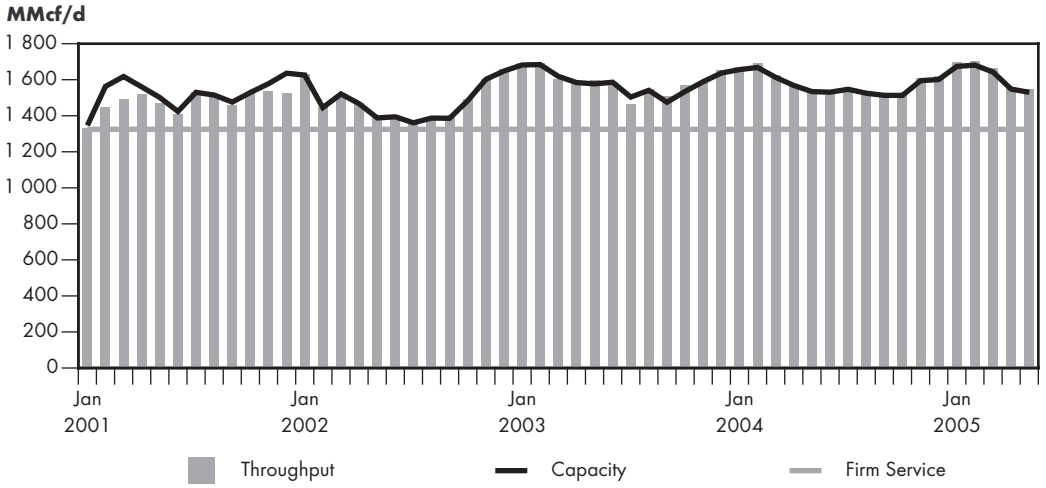
***Westcoast Mainline Throughput vs. Capacity***

It is somewhat difficult to assess utilization of the Enbridge system because it consists of several lines, most of which are dedicated to carrying specific grades of crude oil or natural gas liquids. As shown in Figure 7, since January 2001 Enbridge's mainline has been operating, on an overall average, at levels as low as 68 percent of capacity and as high as 86 percent of capacity. In the first quarter of 2005, Enbridge's mainline was operating at around 74 percent of capacity. Certain lines, particularly Lines 4 and 9 have been operating at or close to full capacity, with some apportionment (see section 2.1.3).

Terasen (TMPL) was operating at near capacity in 2003-04, with apportionment in January and March 2004. Given the high utilization rate, expected rising demand for pipeline space related to expected production growth in the oil sands, and increased shipments of heavy crude oil, Terasen (TMPL) applied in December 2003 for a 4 300 $m^3/d$ expansion. The Board approved this expansion and it went into service in September 2004. In the first quarter of 2005, Terasen (TMPL) operated at approximately 60 percent of capacity, mainly because of refinery turnarounds on the west coast (see Figure 8).

**FIGURE 6**

***Alliance Throughput vs. Capacity***



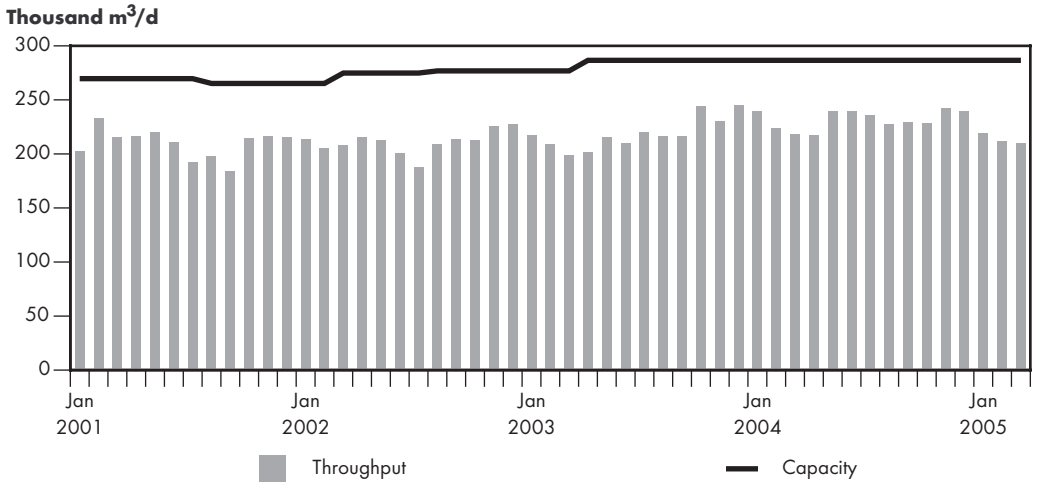


**FIGURE 7**

***Enbridge Pipeline Throughput vs. Capacity***

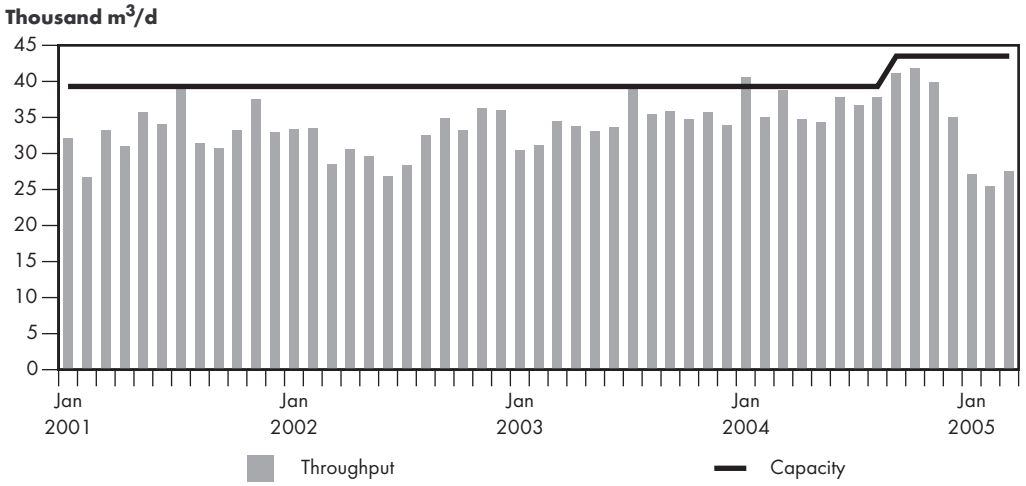
Express Pipeline Limited Partnership has been operating at full capacity for several years; at times exceeding 100 percent of its rated capacity (see Figure 9). On 1 April 2005, an expansion of 17 100 $m^3/d$ was completed. Unlike Enbridge or Terasen (TMPL), Express primarily operates with long-term financial commitments with its shippers. Given that shippers have financially committed to the system, they will tend to use their available space on Express before shipping on other systems.

### 2.1.3 Apportionment

Oil pipelines operate for the most part as common carriers. On common carriers, shippers nominate their desired volumes for delivery into the pipeline on a monthly basis and have no contractual rights to the pipeline's capacity. Lack of adequate pipeline capacity occurs when shippers nominate more oil or oil products for transport than the pipeline can carry that month. When this happens, each of the shippers that nominate volumes is allotted or "apportioned" a share of the available capacity based on the capacity allotment agreement for each pipeline. Some recent apportionment data for Enbridge, Terasen (TMPL) and Cochin Pipe Lines Ltd. (Cochin) are shown below.

**FIGURE 8**

***Terasen (TMPL) Throughput vs. Capacity***



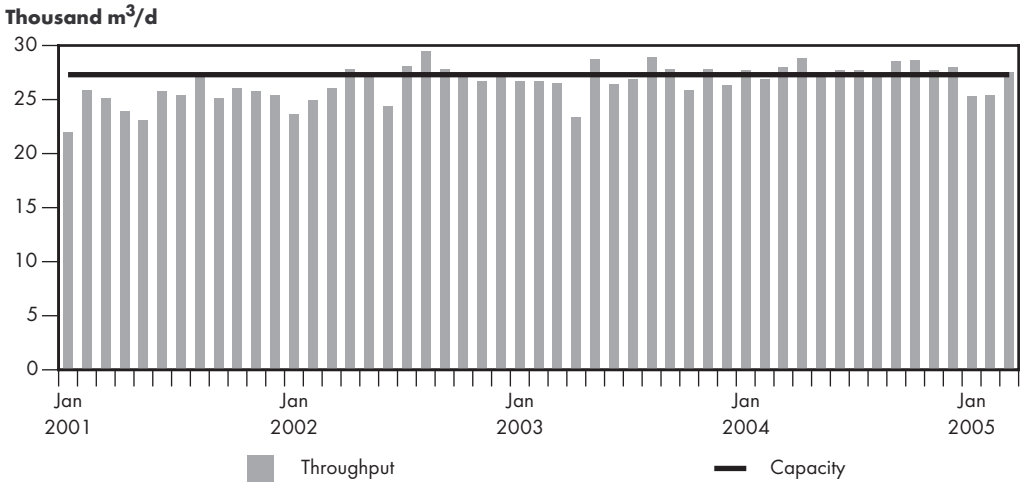


**FIGURE 9**

***Express Throughput vs. Capacity***

## *Enbridge*

Enbridge's Line 2 and 4 are dedicated to the transportation of heavy crude oil, while Line 3 is dedicated to light and medium crude oils. In the first quarter of 2005, Line 4 was either marginally over subscribed or fully subscribed. In the third quarter of 2005, Enbridge is planning to switch service in Lines 2 and 3, thereby increasing heavy capacity by 39 000 $m^3/d$.

Enbridge's Line 9 has a capacity of 38 150 $m^3/d$ and transports oil from Montreal to Sarnia. As shown in Table 1, apportionment has occurred fairly frequently on this line. One reason for this apportionment is increased shipments of crude oil produced from the Hibernia and Terra Nova fields which have high wax content and decreases operating capacity. Another reason is that foreign crude oil has been attractively priced and imports have been high in several months.

**TABLE 1**

***Enbridge Apportionment***

| Line 9 Apportionment | 21% | 18% | 0% | 0% | 4% | 10% | 0% | 0% |

**TABLE 2**

***Terasen (TMPL) Apportionment***

| | Sep-04 | Oct-04 | Nov-04 | Dec-04 | Jan-05 | Feb-05 | Mar-05 | Apr-05 |
|---|---|---|---|---|---|---|---|---|
| Apportionment | 24% | 14% | 14% | 0% | 0% | 0% | 0% | 13% L<br>62% D |
| Throughput ($10^3m^3/d$) | 41.2 | 41.8 | 39.8 | 34.9 | 27.2 | 25.4 | 28.3 | 37.2 |

### *Terasen (TMPL)*

On Terasen (TMPL), apportionment is calculated separately for volumes delivered to land-based and Westridge Dock destinations (shown as L and D respectively in Table 2). Apportionment in September through November 2004 was attributed to land-based nominations that were due to increased demand as well as maintenance on the system that reduced available capacity. Even with the capacity expansion that was completed in September 2004, there was apportionment in November due partly to greater demand by Washington State refiners. From December 2004 to March 2005, throughput fell and there was no apportionment for those months. The April 2005 apportionment of 13 percent for land-based volumes likely reflects increased nominations from the Washington refineries following plant turnarounds. The 62 percent apportionment for the Westridge Dock could reflect increased test shipments of heavier type crude oils.

As a result of periods of apportionment on Terasen (TMPL) since 2003, two applications have been filed with the Board. One is from Chevron Canada Limited (Chevron) for an order designating Chevron's refinery at Burnaby, B.C. as a priority destination for unapportioned delivery of crude oil from Edmonton. The second application was filed by Chevron Standard Limited, Neste Canada Inc. and Chevron for an order designating Chevron's refinery at Burnaby, B.C. as a priority destination for the unapportioned delivery of iso-octane from Edmonton.

### *Cochin*

The capacity on Cochin is dependent on the type of product that is transported in the line and the time of year. Propane, ethane, ethylene and field-grade butane can all be transported on the line but the amount of ethylene nominated in a month affects the capacity. When there is a large amount of ethylene in the line, the capacity is reduced significantly. Cochin is still on pipeline restrictions since a rupture on the U.S. portion of the pipeline and a subsequent fire in 2003.

There was no apportionment in the first quarter of 2005, but pressure restrictions continue to limit capacity on Cochin. Apportionment is anticipated to occur between June and September 2005 due to a scheduled line shut-down for hydro-testing.

**TABLE 3**

|---|---|---|---|---|---|---|---|---|
| Apportionment | 32% | 0% | 0% | 5% | 0% | 0% | 5% | 0% |
| Throughput ($10^3m^3$/d) | 7.4 | 11.4 | 11.0 | 10.3 | 12.3 | 8.7 | 7.6 | 9.4 |

*Wascana Pipeline*

As operator of the Wascana Pipeline, PMC (Nova Scotia) Company received notice that the Bridger Pipeline would not be able to accept deliveries of crude oil from Wascana south of the first Bridger Pipeline pump station at Poplar, Montana because of integrity concerns. As a result of this constraint on the U.S. side, Wascana has been operating at greatly reduced rates. The Bridger Pipeline is currently investigating and repairing a large number of anomalies that were identified on its system. While it is still too early to determine with any certainty when the Bridger Pipeline will return to normal operation, the company's target is the end of August 2005.

## 2.2 Index of Pipeline Tolls

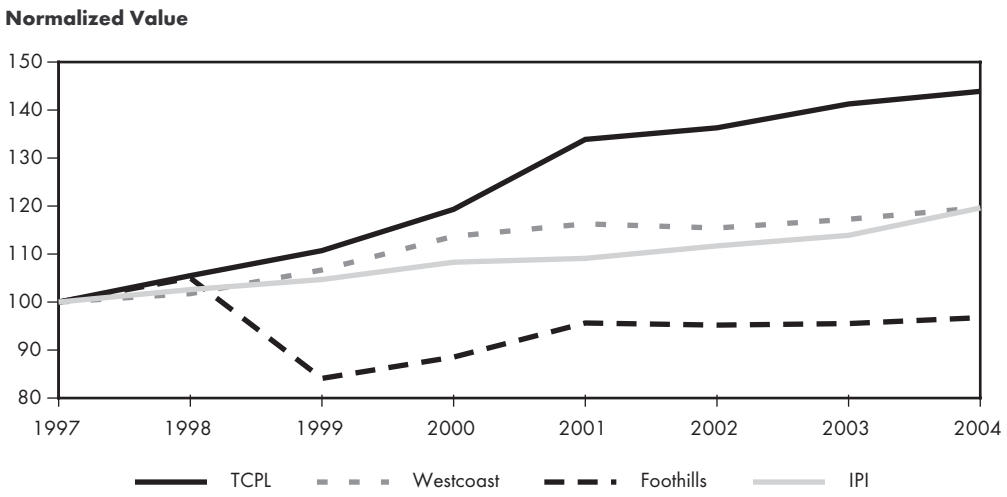
Another indicator of the efficiency of the transportation system is whether pipeline companies are providing services that meet the needs of shippers at stable and reasonable prices. The Board assesses this by analyzing the change over time in a benchmark toll for each major pipeline (e.g., TransCanada's Eastern Zone toll or Westcoast's T-South export toll). Given the nature of cost of service regulation, pipeline tolls may increase simply because a major capital project was undertaken to meet shippers' needs. Nonetheless, if a benchmark toll increases sharply, it could indicate an issue in transportation markets (e.g., falling throughput or contract demand).

*Gas Pipelines*

Figure 10 compares the tolls for TransCanada, Westcoast and Foothills Pipe Lines Ltd. (Foothills) with the Implicit Price Index (IPI), Non-residential structures[3], normalized to the year 1997.

The increase in TransCanada's Eastern Zone toll between 1997 and 2001 is mainly attributed to the large amount of decontracting on the Mainline during that period, particularly after the startup of the Alliance pipeline in 2000. The toll has been tracking the IPI fairly closely since 2001.

In 2000, Westcoast's T-South export toll increased over 10 percent from the previous year primarily because of non-routine pipeline integrity costs. The export toll began moving more closely to the IPI in 2001.



After declining in 1999 as a result of a cost-effective expansion of its system, Foothills' Zone 9 tolls have remained fairly stable. In addition, Maritimes & Northeast Pipeline's (M&NP) tolls have been relatively constant at around $0.66-68/GJ since it began operations in 2000 and Alliance's tolls have remained flat at $0.77/GJ since it began operations in 2001.

3 Statistics Canada suggested this index as being a suitable index for pipeline services.

Statistics Canada - CANSIM Series v3840577 - Table 384-0036: Implicit price indexes, Gross Domestic Product (GDP), PEA; Canada; Business gross fixed capital formation, non-residential structures (Index, 1997=100)

**FIGURE 10**

***Gas Pipeline Tolls and the Implicit Price Index (Normalized to the Year 1997)***

## *Oil Pipelines*

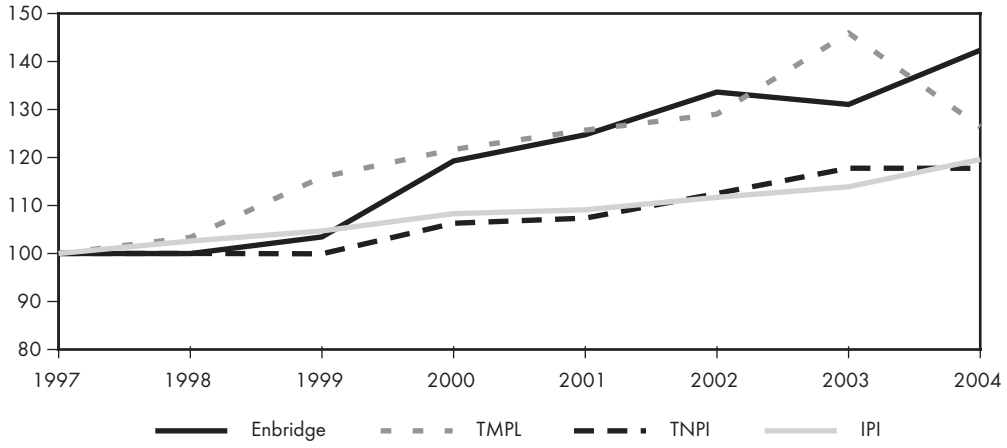


Figure 11 below shows benchmark tolls for Enbridge, Terasen (TMPL) and Trans-Northern Pipelines Inc. (TNPI) compared with the IPI, Non-residential structures, normalized to the year 1997.

In 2000, Enbridge's tolls (Edmonton to International border) increased because throughput levels were unexpectedly low in 1999. Under its negotiated settlement, Enbridge was able to recapture the shortfall in the ensuing years. The increase in 2004 tolls was mainly because Enbridge was operating at approximately 80 percent capacity utilization, as throughput has not filled recent capacity expansions. The full fixed costs are spread across lower volumes, resulting in higher tolls.

In 1999, Terasen (TMPL)'s tolls (Edmonton to Burnaby) increased because of low forecasted throughput (the 1999 forecast was 17.9 percent lower than the 1998 forecast and the toll is calculated based on forecast throughput). In 2004, Terasen (TMPL)'s tolls decreased, mainly because of the

**FIGURE 11**

***Oil Pipeline Tolls and the Implicit Price Index (Normalized to the Year 1997)***

disposition of 2003 deferrals for higher revenue and lower costs and slightly higher throughput starting in October 2004.

TNPI's tolls (Oakville to Montreal) have generally moved in tandem with the IPI since 1997.

## 2.3 Shipper Satisfaction

Shipper satisfaction is also another key measure of the efficiency of the transportation system. The Board uses the following tools to measure shipper satisfaction with the services they receive from pipeline companies:

- an annual survey;
- feedback through informal discussions with shippers and other stakeholders; and
- formal complaints filed with the Board.

### *2.3.1 NEB Pipeline Services Survey*

In June 2004, the Board established an annual Pipeline Services Survey to obtain direct feedback from the shippers of ten major NEB-regulated pipeline companies on the level of service provided by those companies. The survey was also used to obtain feedback on the Board's performance in implementing its regulatory role with respect to tolls and tariffs.

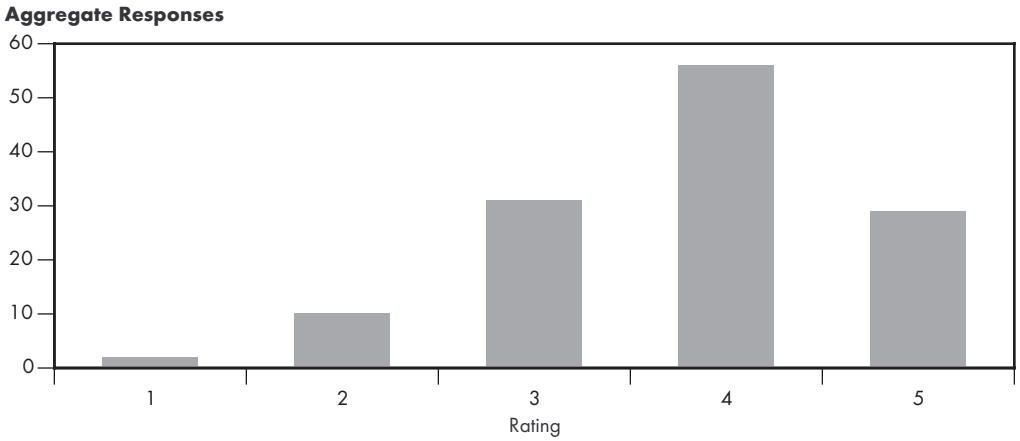
In January 2005, the first Pipeline Services Survey was administered. Companies sent the survey to each of their active shippers, who then returned their responses directly to the Board. The overall response rate to the survey was 23 percent.

After analyzing the survey responses, the Board published a summary of the results in aggregate. The aggregate results include the industry average and distribution of responses for each question and a summary of any major themes or trends. In addition, the Board provided each pipeline and those shippers that participated in the survey with detailed company-specific results. Those results included the pipeline company's average rating and distribution of responses for each question and the verbatim comments received from shippers, with the source of those comments removed.

Figure 12 shows the aggregate results for the first survey question, which asked shippers to rate the overall quality of service provided over the last year (1 indicates "very dissatisfied" and 5 indicates "very satisfied"). The figure shows that shippers, on average, are reasonably satisfied with the services provided by pipeline companies[4].

The survey results indicated that shippers believe the pipeline companies are doing well in the following areas:

- physical reliability of operations;
- timeliness and accuracy of invoices and statements; and
- timeliness and usefulness of operations information.



The areas where shippers believe that pipeline companies could improve the most are:

- make tolls more competitive;

4 The industry average is the average of all responses across all pipelines.

FIGURE 12

***Overall Quality of Service (Industry Average, 3.78)***

- exhibit an attitude of continuous improvement and innovation; and
- work towards fair and reasonable solutions when resolving issues.

Appendix 2 provides the aggregate scores on all survey questions. For the complete report on the aggregate results, go to www.neb-one.gc.ca/Publications/ and look under Survey Results.

### 2.3.2 *Informal Monitoring*

Informal monitoring involves face-to-face discussions between NEB staff and pipeline companies, shippers, provincial regulators and other stakeholders, such as members of the investment community. It enables NEB staff to seek views on industry issues and concerns, including pipeline performance and perceptions about regulatory processes. These discussions also provide the Board with an opportunity to gauge the efficiency of transportation systems and can provide an early signal of the need for leadership in some areas of economic regulation[5].

Some examples of comments received from stakeholders during informal monitoring meetings included:

- Where possible, tolls should be set for multiple years (e.g., three to five years) at a time. This practice would provide cost savings, more toll certainty and avoid re-examining the same material over and over. Some shippers stated that an NEB policy statement would encourage this outcome (similar to what the Federal Energy Regulatory Commission does with its *Notice of Proposed Rulemakings*). This suggestion was supported by a number of members of the investment community.
- A mechanism is needed for the Board to hear shipper concerns on a regular basis. With negotiated settlements, shippers feel that the Board gets little information on their concerns.

5 The Board is, of course, bound by its Code of conduct not to discuss any matter with outside parties that is currently a matter before the Board in a regulatory proceeding. See the Board's Web site for a copy of the Code of conduct.

### 2.3.3 *Formal Complaints*

The number and nature of formal shipper complaints to the Board is another indicator of how satisfied shippers are with pipeline services. A sizeable number of complaints could indicate that a problem needs to be addressed. There have only been a few complaints filed in the last two years that have required a formal process before the Board.

## 2.4 Pipeline Financial Viability and Ability to Raise Capital

The final measure of the efficiency of the transportation system is the financial strength of the pipeline companies. This section looks at the financial viability of several NEB-regulated pipeline companies and their ability to raise capital on reasonable terms and conditions to invest in infrastructure. To undertake this assessment, the following factors are examined: financial ratios, credit rating reports and equity analyst assessments.

As noted in the Introduction, it is not the intention of this report to assess factors that would be examined in a regulatory proceeding on cost of capital such as the comparable earnings standard or the capital attraction standard. Rather, the purpose of this report is to provide a broad assessment as to whether the Canadian transportation system is working and one factor in that regard is whether it is able to efficiently expand to meet the needs of producers and end-use customers.

### 2.4.1 *Financial Ratios*

Financial ratios are useful indicators of a company's performance and financial situation. They can be used to evaluate a company's liquidity, operating performance, growth potential and risk. Evaluating financial ratios is most meaningful when the ratios for a particular company are tracked over time or compared with industry benchmarks. Care must always be exercised in collecting and interpreting financial ratios for pipeline companies given that some financial information pertains to their larger parent companies which may include non-regulated assets.

Some key ratios used to assess the financial viability of pipeline companies include interest coverage ratios, funds from operations to total debt, return on equity (ROE) and total debt to equity. A few of these ratios are discussed below.

*Interest Coverage Ratios*

Interest coverage ratios measure how many times interest payments could be made with a company's earnings before interest expenses and income taxes are paid. From a bondholder's perspective, interest coverage is an indicator of whether a company could have problems making its interest payments. From an equity holder's perspective, this ratio helps to give some indication of the short-term financial viability of the company.

One formula used to determine the coverage of interest is Earnings Before Interest and Taxes (EBIT) divided by Annual Interest Expense. Another coverage ratio that focuses on cash flows rather than accounting income is funds from operations (FFO) interest coverage. FFO interest coverage data are not included in this report.

A higher coverage ratio is typically better for both bondholders and equity investors. From a bondholder's perspective, a high coverage ratio indicates a low probability that the firm will fail to

meet its interest obligations in the near term. For stock investors, a high ratio indicates that a company is relatively solvent.

Table 4 shows the EBIT interest coverage ratios for Group 1 pipeline companies as calculated by the Dominion Bond Rating Service (DBRS). Most interest coverage ratios are in the 2-3 times range, except for Terasen (TMPL) which has a coverage ratio many times higher than its peers. The reason for this higher ratio is primarily because of Terasen (TMPL)'s common equity ratio of 45 percent, which means it carries less debt. Table 4 also shows that the coverage ratios for most companies are stable or improving over time.

DBRS notes that interest coverage ratios for Canadian pipelines are often lower by 1.0 to 1.25 times than those for U.S. pipelines. It cites the following factors as contributing to these lower coverage ratios:

- lower allowed returns on equity (typically 200 basis points);
- lower allowed deemed common equity ratios of 30 percent to 35 percent in Canada; and
- flow-through tax accounting in Canada versus the normalized method in the U.S. (which allows for the recovery of deferred income taxes in tolls).

Despite the lower coverage ratios as noted by DBRS, none of the major NEB-regulated companies has had a problem servicing their debt obligations.

### *Return on Equity*

Return on Equity (ROE) is a common measure of financial performance and is frequently used when evaluating and comparing companies. The ROE a company earns can be expressed financially as net income divided by common equity. However, for NEB-regulated pipeline companies, this ratio is expressed as the return on the equity portion of the rate base that is approved by the Board.

Table 5 shows the actual ROE for several Group 1 pipeline companies from 1999 to 2004 along with the NEB-approved ROE in accordance with the RH-2-94 Formula[6]. Alliance, Enbridge, M&NP and Terasen (TMPL) are not subject to the NEB-approved ROE as they all have negotiated a different

**TABLE 4**

***EBIT Interest Coverage Ratios***

| | 2000 | 2001 | 2002 | 2003 |
|---|---|---|---|---|
| Alliance | - | 1.85 | 1.92 | 1.85 |
| Enbridge | 2.80 | 2.84 | 3.02 | - |
| Foothills | 2.16 | 2.16 | 2.39 | 2.41 |

| Westcoast Field Services | - | - | 13.62 | 14.87 | 6.76 | 11.63 |
| Westcoast Transmission | 11.68 | 12.68 | 15.84 | 13.44 | 12.93 | 10.28 |
| NEB RH-2-94 Formula | 9.58 | 9.90 | 9.61 | 9.53 | 9.79 | 9.56 |

Source: DBRS (Enbridge, Terasen); NEB Surveillance and Annual Reports (all others); dash indicates not available

ROE with their shippers[7]. Also, Westcoast's Field Services Division is not subject to the formula as its tolls for gathering and processing services are negotiated individually with shippers.

The ROE numbers for Enbridge and Terasen (TMPL) have been taken from their DBRS Credit Rating reports as those companies currently do not file NEB surveillance reports. As such, the numbers are somewhat higher than one would normally expect and might include some non-regulated income in the calculations (e.g., Terasen (TMPL)'s income includes $6 to $7 million annually of dividend income from its parent, Terasen Inc.). The complete details of these credit rating reports should be read before comparing the ROE for Enbridge and Terasen to the other companies listed in Table 5.

### 2.4.2 Credit Ratings

In Canada, credit ratings are determined by three independent credit rating agencies, DBRS, Moody's and Standard & Poor's (S&P). See Appendix 1 for a comparison of the rating scales for DBRS and S&P. Credit ratings, like stock prices, generally reflect the consolidated operations of the entire company and not solely the regulated portion. Thus, the use of credit ratings as an accurate measure of the performance for a regulated pipeline owned by a company that has both regulated and non-regulated operations, such as TransCanada and Enbridge, has to be interpreted with some care. In addition, credit ratings are somewhat subjective in that the rating imposed on a company is the expert opinion of an investment analyst, which may result in different ratings by different firms.

*DBRS*

In assigning a credit rating to a particular company, DBRS attempts to consider all meaningful factors that could impact the risk of maintaining timely payments of interest and principal in the future. While the key considerations will vary industry by industry, some of the common factors that are considered for most ratings are: core profitability; asset quality; strategy and management strength; and financial and business risk profile.

7 Negotiated ROE for Alliance is 11.25 percent and for M&NP is 13.0 percent.

For pipelines, electric and gas utilities, the following factors are also important considerations in deriving the credit ratings: regulatory factors, competitive environment, supply and demand considerations, and regulated vs. non-regulated activities.

The credit ratings for the Group 1 pipeline companies shown in Table 6 indicate that the ratings have remained stable from 1999 to the present. Alliance has improved from BBB(high) to A(low).

*Standard & Poor's*

An S&P credit rating is a current opinion of a company's overall financial capacity to pay its financial obligations. S&P bases its ratings on the overall creditworthiness of the corporation. Therefore, the rating of a wholly-owned subsidiary company, in the absence of meaningful ring-fencing measures, generally reflects the creditworthiness of the parent. This opinion focuses on the company's capacity and willingness to meet its financial commitments as they come due and may also apply to specific financial obligations. The rating histories for several Group 1 pipeline companies are provided in Table 7.

In S&P's rating methodology, a company rated 'A' has strong capacity to meet its financial commitments but is somewhat more susceptible to the adverse effects of changes in circumstances and economic conditions than companies in higher-rated categories. A company rated 'BBB' has adequate capacity to meet its financial commitments. However, adverse economic conditions or changing circumstances are more likely to lead to a weakened capacity of the company to meet its financial commitments.

**TABLE 6**

***DBRS Credit Rating History – Senior and Subordinated Debt***

| | 1999 | 2000 | 2001 | 2002 | Current |
|---|---|---|---|---|---|
| Alliance | BBB(high) | BBB(high) | A(low) | A(low) | A(low) |
| Enbridge | A(high) | A(high) | A(high) | A(high) | A(high) |
| M&NP | A | A | A | A | A |
| Terasen (TMPL) | A(low) | A(low) | A(low) | A(low) | A(low) |
| TQM | A(low) | A(low) | A(low) | A(low) | A(low) |
| TransCanada | A | A | A | A | A |
| Westcoast | A(low) | A(low) | A(low) | A(low) | A(low) |

**TABLE 7**

***S&P Credit Rating History***

| | 2000 | 2001 | 2002 | 2003 | 2004 |
|---|---|---|---|---|---|
| Enbridge | A/Stable | A-/Negative | A-/Negative | A-/Stable | A-/Stable |
| Terasen (TMPL) | BBB+/Stable | BBB+/Stable | BBB+/Watch Neg | BBB/Stable | BBB/Stable |
| TQM | BBB+/Stable | BBB+/Stable | BBB+/Stable | BBB+/Stable | BBB+/Stable |
| TransCanada | A-/Stable | A-/Stable | A-/ Watch Neg | A-/Negative | A-/Negative |
| Westcoast | A-/Negative | A-/Stable | A/Negative | BBB/Stable | BBB/Positive |

Each of these agencies has expressed an opinion at various times that the ROE awarded through the RH-2-94 Formula and the deemed equity ratios awarded by the Board are low by international standards. Nonetheless, the ratings assigned by the credit rating agencies indicate that NEB-regulated companies are all within investment grade.

### 2.4.3 *Access to Capital Markets*

As mentioned in the Introduction, pipeline companies must be able to access capital to expand and maintain their systems to adequately meet the evolving needs of the marketplace.

The most straightforward test of a pipeline company's ability to finance new capacity is market evidence of their ability or inability to finance major new construction. However, there has not been much pipeline construction in the last few years because natural gas production from the Western Canada Sedimentary Basin (WCSB) has hit a plateau and adequate pipeline capacity is in place. While there has been some recent expansion of oil pipeline capacity, no really large investments have been made. Thus, the question to ask is whether or not pipeline companies would have any difficulty in financing new projects when they arise.

To answer this question, the Board met with credit rating agencies, suppliers of capital and equity analysts in the investment community to discuss their views on the ability of Canadian pipelines to access capital markets, their general criteria for assessing NEB-regulated pipelines, and their views on the current regulatory environment in Canada.

On the primary question of access to capital, all of the organizations consulted indicated that Canadian pipelines should have no difficulty raising capital at reasonable cost at this time. For example, they believed that there should be no major challenges in financing a pipeline such as the Mackenzie Valley natural gas pipeline or additional oil pipelines to carry growing production from the oil sands. It was noted by some that debt issues for Canadian pipelines have traditionally been very attractive, in part because of the secure regulatory environment. The organizations consulted were generally of the view that a debt issue would be favourably received by the market.

With respect to attracting equity, some investment analysts noted that a major equity issue at the current ROE awarded by the NEB could be more problematic. They noted that recent projects, such as Alliance and M&NP, have been based on a higher equity return. It was noted by some that incumbent pipelines are at a disadvantage if they have to raise capital at the existing ROE. Others were of the view that greenfield projects are riskier and simply require a higher ROE to attract the equity investment. It was recognized that the Board has approved the higher ROEs that have been necessary to support greenfield pipelines such as Alliance and M&NP.

### 2.4.4 *Other Comments by the Investment Community*

Credit rating agencies and pension funds are primarily concerned about the predictability of cash flows to support debt and dividend payments. In this regard, the Board's RH-2-94 Formula is viewed positively because it improves predictability. Most of the companies with whom the Board met stated that they would like to see arrangements that provide certainty over multi-year periods because annual toll hearings introduce uncertainty and can distract pipeline management from focusing on other important aspects of their business. They also would like to see tolls and tariffs in place at the start of a fiscal year because interim toll situations increase uncertainty.

Pension fund administrators expressed the view that the Board should 'protect' credit ratings because downgrades could be very costly to bondholders. They noted that Canadian bonds are an important revenue source for Canadian pension funds and that a downgrade could require them to sell a large percentage of their bonds at discounted prices. On the other hand, some groups were of the view that the Board should not be overly concerned about maintaining a 'target' credit rating for a pipeline; investment grade ratings should be adequate.

It was noted by some that the business environment for the traditional Canadian gas pipelines has become somewhat riskier since the construction of the Alliance pipeline and the slowdown in the growth of gas production. Accordingly, they believe that basic financial parameters in the Board's regulatory scheme should be improved[8]. Finally, a number of parties expressed concern that the Board does not have adequate rules to ensure financial protection ('ring-fencing') of a regulated utility and concern was expressed that cash could be drained from a pipeline company if its parent were to experience severe financial difficulties.

### *2.4.5 Assessments by Equity Analysts*

Several equity analysts regularly publish their assessments of various companies for investors. The Board reviews these assessments for the consolidated operations of pipeline companies as they provide some useful information on their financial viability and outlook for the future. As with credit ratings, equity analysts generally focus on companies that have stand-alone share offerings and, in many cases, these offerings include non-regulated as well as regulated businesses. While observations vary from analyst to analyst and from company to company, most NEB-regulated pipelines have been rated in the 'hold' or 'buy' categories over the last year, indicating that this sector of the investment community does not have any significant concerns about their short-term prospects.

8 In its RH-2-2004 Phase II Reasons for Decision dated April 2005, the Board approved an increase in TransCanada's deemed common equity ratio from 33 percent to 36 percent.

# Conclusions and Emerging Issues

## Conclusions

Based on the chosen measures, the Board believes that the Canadian hydrocarbon transportation system is working very well at the present time.

Currently, **there appears to be adequate natural gas pipeline capacity in place on existing systems**, especially since production from the WCSB has levelled off over the last few years. The existence of some excess capacity out of the WCSB has provided producers with the flexibility to access their market of choice and the value of natural gas exports hit a record high of $26.5 billion in 2004. There are some constraints in the system east of Dawn, Ontario but this has not to date caused any prolonged problems in delivering adequate volumes to the marketplace to meet the needs of consumers.

**Overall, there is adequate capacity on the oil pipeline transportation system** and all types of oil produced in the WCSB are being delivered to markets within and outside Canada. However, capacity on some systems has been tight, notably on Terasen (TMPL). This has been illustrated by the need for Terasen (TMPL) to apportion shippers in recent months and by Chevron's request for priority destination status for its Burnaby refinery. Canadian oil producers also appear to believe that there is a need to improve access to heavy crude oil markets in the U.S. Inadequate access to refineries designed to run heavier crudes appears to have been a contributing factor to the recent high heavy/light price differentials for Canadian crudes. This need for improved access has been illustrated by the Canadian industry's support for the reversal of two U.S. pipelines to Cushing, Oklahoma and the U.S. Gulf Coast to allow growing oil sands production to penetrate new markets.

Based on the results from the NEB Pipeline Services Survey, **shippers are reasonably satisfied with the services provided by pipelines** (overall rating of 3.78 out of 5). In particular, physical reliability of pipeline operations was rated very highly by shippers, indicating that products are reliably delivered to markets. There are, however, a few areas where some work is required on the part of the pipeline companies to improve service, including:

- making tolls more competitive;
- exhibiting an attitude of continuous improvement and innovation; and
- working collaboratively towards fair and reasonable solutions to resolve issues.

The financial assessment indicates that **NEB-regulated pipeline companies are financially sound**. However, it is recognized that some of the data and indicators reviewed are for the consolidated operations of pipeline companies. While pipeline companies have not had to raise large amounts of capital in recent years, the Board's survey of the investment community revealed that it believes that

pipeline companies should have no difficulty in raising capital to finance most major new projects at this time.

The Board recognizes that this report is a snapshot in time and does not include a comparison, for example, with pipelines in other jurisdictions. The Board considers this report as a first step in assessing the effectiveness of the hydrocarbon transportation system in Canada. The Board will continue to monitor the effectiveness of the system and will continue to meet with parties to gain an understanding of all perspectives on the transportation system. The Board welcomes feedback at any time on the measures and conclusions in this report and welcomes suggestions for improvements to future reports.

## Emerging Issues

While the transportation system is currently working well, there are a number of emerging challenges facing the industry.

To meet the needs of producers and users, the transportation system must be able to adapt to the changing needs of the market over time and expand to attach new sources of supply. This can be particularly challenging for the pipeline sector because investments tend to be "lumpy" and, given the long life of the assets, investors have to be reasonably assured of the existence of supply and markets over a long time period. Clearly, the longer the time period over which an investment is recovered, the greater the possibility that market circumstances will change.

The potential for market change over time is highlighted by the uncertainties around the number of liquefied natural gas (LNG) terminals that will be built in North America and the potential effects that imported LNG will have on the supply and demand balance and on the pattern of natural gas flows. For example, the construction of LNG terminals in Quebec could have important implications for the flow pattern on TransCanada and TQM and could impact the toll design of the system.

Another event that could impact the supply and demand balance and consequent gas flows is the significant potential gas requirement for power generation that will be driven by Ontario's policy to remove 7 500 MW of coal-fired capacity from its system. Although the refurbishment of existing nuclear generation might meet part of the requirement for the displaced coal, there will likely be a significant volume of new natural gas-fired generation to enter the system. The exact impact of this incremental generation on natural gas pipelines will depend on the total amount of generation awarded and the location.

On the oil side of the market, the expected growth in production from the oil sands is posing tough choices for the industry regarding which incremental markets to access and how to expand the pipeline system. Options include expansion of existing systems and construction of new systems to access new markets in either or both the U.S. and Asia. Given the large capital outlay and the relative irreversibility of the investment decision, market participants want to ensure that the optimal decisions will be made.

From a regulatory perspective, the challenge is to provide a fair and effective process that does not distort the investment decisions that should optimally be made in the marketplace. Investors in new pipelines desire clear regulatory processes with predictable timelines. New investment can be frustrated when timelines stretch out and unexpected regulatory hurdles materialize during the process. Unnecessary delays in construction of new systems that are in the public interest can result in increased costs to energy users as development of new supplies are constrained.

The flattening of natural gas production from the WCSB and construction of the Alliance pipeline has created challenges for a number of the older systems that are experiencing a sharp decline in the long-term contracts on their systems. Natural gas is still being moved on these systems, but many shippers prefer to rely on short-term services to maximize their flexibility. Under the traditional cost of service approach, the remaining firm shippers have to bear the load of recovering the fixed costs in the form of rising tolls. While the erosion of long-term contracts has not yet vitiated the cost of service framework, new toll design structures may need to be considered to effect a fair sharing of costs and to maintain the competitiveness of these systems.

Lastly, having regard to the financial viability of the pipeline companies, there is interest in the investment community and amongst shippers in working towards multi-year frameworks for the establishment of tolls on more pipeline systems. A multi-year framework would provide more certainty for all parties and reduce the burden associated with continual negotiations and regulatory proceedings. While the Board is committed to working towards a framework which reduces regulatory uncertainty, it recognizes that it may be difficult to structure a multi-year framework that will meet the needs of all parties when the market context is expected to change considerably in the next few years. The investment community would also like to see tighter regulatory rules regarding parent-affiliate dealings in order to protect the cash flows of the regulated entities.

Some of these issues will be settled amongst parties, others may be examined in formal proceedings before the Board, and others may be amenable to potential regulatory actions outside of the hearing process. The Board will continue to consult with stakeholders on these issues and seek input if and when any regulatory initiatives are pursued.

# DEBT RATING COMPARISON CHART

This chart provides a comparison of the rating scales used by DBRS and S&P when rating long-term debt.

| Credit Quality | DBRS | S&P |
|---|---|---|
| Superior | AAA | AAA |
| | AA high | AA+ |
| | AA | AA |
| | AA low | AA- |
| Good | A high | A+ |
| | A | A |
| | A low | A- |
| Adequate | BBB high | BBB+ |
| | BBB | BBB |
| | BBB low | BBB- |
| Speculative | BB high | BB+ |
| | BB | BB |
| | BB low | BB- |
| Highly Speculative | B high | B+ |
| | B | B |
| | B low | B- |
| | CCC | CCC |
| | CC | CC |

Ratings in the Adequate category and above are considered Investment Grade.

Standard & Poor's also provides a Rating Outlook that assesses the potential direction of a long-term credit rating over the intermediate to longer term. A 'Positive' outlook means that a rating may be raised; a 'Negative' outlook means that a rating may be lowered; and a 'Stable' outlook means that a rating is not likely to change.

# Pipeline Services Survey Aggregate Results

The results below are the aggregate responses from shippers on several major NEB-regulated pipeline companies. See the Board's Web site for the complete details.

1. How satisfied are you with the OVERALL quality of service provided by the pipeline company over the last calendar year?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 2 | 10 | 31 | 56 | 29 | 3.78 |

2. What are the things that this pipeline company does well?
3. What are the things that this pipeline company could do better?
4. How satisfied are you with the physical reliability of the pipeline company's operations?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 2 | 9 | 12 | 53 | 52 | 4.13 |

5. How satisfied are you with the quality, flexibility and reliability of the pipeline company's transactional systems (nominations, bulletin boards, reporting, contracting, etc.)?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 5 | 9 | 32 | 51 | 27 | 3.69 |

6. How satisfied are you with the timeliness and accuracy of the pipeline company's invoices and statements?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 3 | 9 | 19 | 49 | 38 | 3.93 |

7. How satisfied are you with the timeliness and usefulness of *operations* information (outages, available capacity, scheduled maintenance, flows, etc.) provided by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 5 | 9 | 24 | 61 | 26 | 3.75 |

8. How satisfied are you with the timeliness and usefulness of *commercial* information (tolls, service changes, new services, contract information, etc) provided by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 1 | 11 | 34 | 65 | 16 | 3.66 |

9. How satisfied are you with the degree to which the pipeline company demonstrates an attitude of continuous improvement and innovation?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 8 | 21 | 46 | 38 | 11 | 3.19 |

10. How satisfied are you with the accessibility and responsiveness of the pipeline company to shipper issues and requests?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 19 | 28 | 51 | 18 | 3.46 |

11. How satisfied are you that the pipeline company works towards fair and reasonable solutions when resolving issues?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 24 | 32 | 42 | 12 | 3.26 |

12. How satisfied are you with the suite of service options (FT, IT, backhaul, etc.) offered by the pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 3 | 6 | 33 | 47 | 15 | 3.63 |

13. How satisfied are you that this pipeline company's transportation tolls are competitive?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 9 | 14 | 55 | 39 | 4 | 3.12 |

14. How satisfied are you with the collaborative processes (negotiations or task force meetings) utilized by this pipeline company?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 6 | 8 | 47 | 45 | 7 | 3.35 |

15. How satisfied are you that the current negotiated settlement agreement or tariff arrangements work well to provide fair outcomes?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 7 | 9 | 43 | 49 | 9 | 3.38 |

16. How satisfied are you that the NEB has established an appropriate regulatory framework in which negotiated settlements for tolls and tariffs can be reached?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 5 | 7 | 35 | 51 | 16 | 3.58 |

17. When toll and tariff matters are not resolved through settlement, how satisfied are you with the Board's processes to resolve disputes?

| 1 | 2 | 3 | 4 | 5 | Average |
|---|---|---|---|---|---|
| 4 | 11 | 33 | 38 | 13 | 3.46 |

18. What could the Board be doing to improve its processes through which tolls and tariffs are determined?

19. Additional comments

**YUB-YECL-36**

**Reference:** Prepared Testimony of Foster Associates Inc., page 15

**Issue:** Maintenance of Creditworthiness Financial Integrity

**Quote:** While NRG is somewhat smaller (assets of approximately 9 million) than Yukon Electrical, it would be of reasonably similar business risk to Yukon Electrical. (Line No. 413-414.)

**Request:**

Compare and contrast the business risks between YECL and NRG.

**Response:**

NRG is a very small gas distribution utility (2007 rate base of approximately 10 million) serving approximately 6,500 customers in a rural area southeast of London, Ontario. Its largest community served has a population of approximately 7,000. Union Gas, the neighboring gas distributor, has a rate base of more than 4 billion and over 1 million customers. While YECL is larger than NRG in both customers and rate base, comparatively both are very small relative to their Canadian peers.

From an economic diversity perspective, both economies are characterized by relatively low diversity. NRG's service area is dominated by the agricultural sector, while the economy in and surrounding Yukon Electrical's service area is characterized by mining and public administration. Approximately 85 of NRG's gross margin is from the residential and commercial sectors, compared to 100 of Yukon Electrical's gross margin.

NRG receives gas supply through Union Gas, which in turn has access to gas supplies from diversified suppliers in Western Canada and the U.S. through two major pipeline systems. Yukon Electrical's power supply is largely from Yukon Energy.

With respect to the regulatory environment generally, the Ontario Energy Board, which regulates NRG, is considered to be even-handed and reasonable in its approach. There is no specific element of the regulatory environment that would distinguish the OEB's

regulation of NRG from the YUB's regulation of Yukon Electrical. Both NRG and Yukon Electrical are regulated on the basis of forward test years and have access to deferral and variance accounts. For example, NRG has a purchased gas variance account which provides for pass-through of differences between forecast and actual gas costs; Yukon Electrical has similar protection for variances between forecast and actual purchased power costs.

**YUB-YECL-37**

**Reference:** Prepared Testimony of Foster Associates Inc., page 16

**Issue:** Business Risk

**Quote**: Second, no regulator can bind his successors and thus guarantee that investors will be compensated for longer-term risks in the event they are incurred in the future. (Line No. 437-439.)

**Request:**

(a) Is it common for utilities such as YECL to request deferral accounts to mitigate some of the business risks faced by the utility?

(b) In the event of future risk, does anything prevent a utility from making an application before its regulator to cover those risks?

(c) If such risks are just and prudent, would a utility include compensation for those risks in its revenue requirement?

**Response:**

(a) Yes, for costs that are beyond the control of management.

(b) No, however, there is no guarantee that the regulator will approve the requested deferral account or the recovery of the costs in the deferral account. As well, there is no assurance that the regulatory process could be completed and a related decision rendered in a fashion that would cover the full risk involved.

(c) Yes, the required return would include compensation for risks that are just and prudent and that are borne by shareholders.

**YUB-YECL-38**

**Reference:** Prepared Testimony of Foster Associates Inc., pages 16 to 22

**Issue:** Regulatory Risk

**Quote:** The regulatory framework in which a utility operates is, next to the basic demand risks, the most significant aspect of risk to which shareholders in a regulated firm are exposed. The financial community is very conscious of the regulatory environment, as highlighted in reports of both bond rating agencies and investment analysts. (Line No. 456-459.)

**Request:**

(a) Does YECL face a higher regulatory risk than the typical electricity distribution utility in Canada?

(b) From a regulatory perspective, is an integrated utility considered more risky than one that is not integrated?

(c) In general, does an integrated utility face more business risk than one that is not integrated? If so, provide third party references.

(d) What was the last capital structure, return on debt and return on equity approved for Northland Utilities (Yellowknife) Limited?

(e) What was the last capital structure, return on debt and return on equity approved for Northland Utilities (NWT) Limited?

(f) Do FortisBC, FortisAlberta, or ATCO Electric serve any communities with populations that range from 10 to 300?

(g) Do EPCOR Utilities and ENMAX in Alberta only serve one community?

**Response:**

(a) No.

(b) In principle, one would expect vertically integrated and wires utilities to be provided a similar ability to recover a fair return on and of their investment. However, there are two distinguishing factors: (1) vertically-integrated utilities in the aggregate, particularly those with relatively high costs of generation, continue to face some possibility that the industry will be restructured and their existing generation will face competition; (2) vertically-integrated utilities which are required to construct significant new generation face higher risks of cost disallowances than pure wires utilities.

(c) Yes. As stated in its September 2006 report on vertically integrated utilities, S&P states On Standard & Poor's business profile scale (where '1' is excellent and '10' is vulnerable), vertically integrated utilities generally have satisfactory business profiles of '5' or '6' ..We view a company that owns regulated generation, transmission, and distribution operations, as positioned between companies with relatively low-risk transmission and distribution operations and companies with higher-risk diversified activities on the business profile spectrum. What typically distinguishes one vertically integrated utility's business profile score from another is the quality of regulation and management. The document is attached in response to YEC-YECL-40(g) as YEC-YECL-40(g) Attachment 1.

(d) Decision 12-2005 (August 2005) reflected an overall negotiated settlement including the issues of capital structure and return on equity. The parties agreed to an equity ratio of 39.60 for 2005 and 39.57 for 2006 and an equity return of 10 for both years. The agreed-to cost of debt, which was not specified in the settlement, was 6.12 for both years. NUY has applied for a common equity ratio of 47.5 and an ROE of 9.6 for the 2008-2010 test years.

(e) Decision 9-2006 (March 2006) established an equity ratio of 39-40 and an equity return of 9.5 for test years 2005 and 2006. The costs of debt for each of the two test years, not specified in the decision, were, respectively, 6.47 and 6.51 . NWT has applied for a common equity ratio of 50 and an ROE of 9.6 for the 2008-2010 test years.

(f) Ms. McShane does not have the specific information requested for FortisAlberta and FortisBC, but given the location of the two utilities, it is likely that both serve some communities of that size. However, FortisAlberta serves 175 total communities and a total of over 450,000 customers; the largest 10 communities have a combined population of over 250,000. FortisBC serves a total of 155,000 customers (109,000 direct and 46,000 indirect customers). The largest two communities served have a total population in excess of 200,000. ATCO Electric serves approximately 200,000 customers in Alberta and 245 communities; the largest three of those communities have a total metro area population in excess of 150,000.

(g) EPCOR Utilities and ENMAX serve the communities of Edmonton (population approximately 750,000) and Calgary (population approximately 1 million), respectively.

**YUB-YECL-39**

**Reference:** Prepared Testimony of Foster Associates Inc., page 23

**Issue:** Common Equity Ratio

**Preamble:** Table 3 shows common equity ratios for Canadian electric utilities. The evidence shows that for those utilities (transmission and distribution) with rated debt (2006) common equity ratio of between 43.4 and 44.5 was evident. The same table showed for utilities with rated debt that were integrated, the common equity ratio was 40.5 .

**Request:**

(a) Does this table indicate that integrated utilities present less business risk than non-integrated utilities?

(b) Would the fact that YECL is an integrated utility offset or mitigate some of the business risk?

**Response:**

(a) No, one cannot draw that conclusion. The actual capital structures of individual companies are not necessarily consistent with the level of business risk. It is necessary to look at other factors, including debt rating and the impact of diversification of the consolidated operations. For example, Nova Scotia Power, an integrated electric utility, has an actual common equity ratio of 40 , but is only rated BBB by S&P. Toronto Hydro, which is a distribution only utility, has a higher common equity ratio of 42.5 , and had an S&P debt rating of A- when the testimony was prepared. Toronto Hydro was subsequently upgraded to A rating in June 2008.

(b) No, as indicated in response to YUB-YECL-38(c) integrated electric utilities are considered to be riskier than utilities that are purely wires (distribution and or transmission) utilities.

## YUB-YECL-40

**Reference:** Prepared Testimony of Foster Associates Inc., page 24

**Issue:** Business Risk of NTPC

**Request:**

(a) Quantify the higher business risks faced by NTPC versus those of YECL?

(b) Please reconcile the approved equity ratio of NTPC of 48.86 with the opinion that the equity ratio should be approximately 56-57

**Response:**

(a) The analysis of business risk is largely qualitative; there are no formulas which permit the quantification of differences in business risk for companies with no equity market data. In Ms. McShane's judgment, NTPC's higher business risks warrant a common equity ratio approximately five percentage points higher than that of Yukon Electrical.

(b) In her November 2006 testimony on behalf of NTPC, Ms. McShane concluded that, at the forecast capital structures, the incremental risk premium for NTPC relative to a benchmark utility would be no less than 50 basis points, based on differences in costs of debt between A and BBB rated utilities. The PUB adopted Ms. McShane's minimum 50 basis point incremental equity risk premium at the forecast 2007 08 common equity ratio of 48.86 . The 56-57 equity represents the increase in the actual common equity ratio that would be required to eliminate the 50 basis point incremental risk premium adopted by the PUB. Since the 50 basis point incremental risk premium adopted by the PUB represented the minimum required, it follows that the estimated 56-57 equity ratio represents the minimum ratio required to equate NTPC to a benchmark utility..

**YUB-YECL-41**

**Reference:** Prepared Testimony of Foster Associates Inc., page 25

**Issue:** Business Risk

**Quote:** Yukon Electrical would be viewed as facing higher business risks than the typical Canadian utility. (Line No. 658-659.)

**Request:**

How would the business environment faced by YECL compare with that of the maritime utilities? Please compare and contrast the business risks.

**Response:**

As noted at lines 626-631, Two of the smaller investor-owned primarily electric distribution utilities that would be considered the closest comparators to Yukon Electrical of the Canadian electric utilities with rated debt (Maritime Electric and Newfoundland Power) both have target actual common equity ratios of 45 . While they are the closest comparators, both are significantly larger and face lower business risk than Yukon Electrical. The business risk factors are set out below.

Newfoundland Power:

Newfoundland Power is a much larger utility than Yukon Electrical (refer to Table 1 of Ms. McShane's evidence), and serves over 85 of customers in the province. Its customer base is largely residential (Newfoundland and Labrador Hydro serves the large industrial customers) and the customer base is stable, exhibiting relatively slow but steady growth. The franchise area is divided into eight separate (but connected) areas on the Avalon Peninsula Highway, including St. John's, a city of over 100,000, and three other areas with populations in excess of 20,000. The economy is relatively undiversified and growth in the economy exhibits volatility; the three major industries are resource-based: the fishery, pulp and paper and oil and gas. The utility competes with fuel oil, but electricity has both a price and regulatory advantage. Newfoundland Power attaches approximately 90 of new home construction for heating load. Its power supply comes largely from Newfoundland and Labrador Hydro (90 ); while it owns

some of its own generating capacity, the dispatch of that capacity is coordinated with that of Newfoundland and Labrador Hydro. Supply from Newfoundland and Labrador Hydro is approximately 80 hydro-electric and the remainder thermal. Newfoundland Power has a weather normalization clause that protects its revenues from variability arising from weather volatility. It also has a revenue stabilization mechanism that allows for the pass through of purchased power and fuel costs. The regulatory framework is supportive and provides a relatively high degree of assurance that Newfoundland Power will recover the allowed return.

Maritime Electric:

Maritime Electric serves the entire province of Prince Edward Island. It has over four times as many customers as Yukon Electrical and over three times the sales (in KwH). Close to 80 of its sales are to residential and small commercial customers. Its service area includes two major population areas, Charlottetown and Summerside. The Conference Board of Canada expects Prince Edward Island to experience the highest population growth in the Atlantic Provinces, due to in-migration, which will underpin strong growth in the consumption of services. Of all the Atlantic Provinces, the demographic trends are the most positive for Prince Edward Island. The economy is characterized by agriculture, food processing, tourism, aerospace, and transportation equipment industries. Competitive pressures are minimal; fuel oil is used for heating and there is no natural gas available to the island. The utility purchases most of its energy under contracts with New Brunswick Power (86 ) and on island wind facilities (13 ). The island location exposes it to the risk of supply interruption; however, the utility owns some on-island facilities as back-up. The utility operates with an Energy Cost Adjustment Mechanism that provides for pass-through of actual energy costs. The operating environment (weather) is less extreme than either the Avalon Peninsula of Newfoundland or the Yukon. The regulatory framework in Prince Edward Island is supportive.

With respect to Nova Scotia Power, Yukon Electrical would face less risk. Nova Scotia Power is a much larger utility than Yukon Electrical (460,000 customers, including the cities of Halifax with a metro area population of 370 thousand, and a rate base of close to 3 billion). It has a higher direct exposure to industrial customers (in the pulp and paper industry) than Yukon Electrical. Nova Scotia Power has limited competitive threats given its location. It faces environmental risks due to the nature of its generation portfolio (coal and oil) and, at present, risks related to recovery of variances between

actual and forecast fuel costs as it has no fuel cost adjustment mechanism, although the regulator has approved the implementation of such a mechanism in principle.

## YUB-YECL-42

**Reference:** Prepared Testimony of Foster Associates Inc., page 26

**Issue:** Incremental Equity Risk Premiums

**Quote:** If the capital structure for each of the utilities in Table 4 above were adjusted to eliminate the incremental equity risk premiums, the allowed equity ratios would be approximately 46-47 . (Line No. 687-689.)

**Request:**

(a) In the case of FortisBC, does this imply that the 0.40 risk premium would equate to a 6-7 incremental equity thickness?

(b) In the case of Newfoundland Power, does this imply that the 0.15 risk premium would equate to a 1.5-2.5 incremental equity thickness?

(c) With respect to U.S. utilities and the rates charged to their customers, is the higher equity thickness somewhat mitigated by the lower income tax rates?

**Response:**

(a&b) Yes. The range of 46-47 is an approximation of the average equity ratio of the electric utilities listed in Table 4 that would be consistent with elimination of the incremental equity risk premium relative to a benchmark utility. The estimations were made assuming (1) each utility is taxable, and under two theories: (a) the before and after tax costs of capital remain unchanged as the capital structure changes; and (b) the after-tax cost of capital declines as the debt ratio rises; and, (2) income taxability has no impact on the cost of capital. Some of the utilities are not taxable, and for those that are, the benefit of the tax deductibility of interest in the case of utilities flows to ratepayers, not shareholders. In the second scenario, there is no impact of the deductibility of income tax on the cost of capital. In all cases, the cost of equity declines as the equity ratio rises, but at different rates of decline. The table below summarizes the results.

| | **Taxable: Average of Theory 1 and 2** | **Non-taxable** |
|---|---|---|
| Alberta Taxable Distributors | 37 | 37 |
| FortisBC | 45 | 47 |
| Maritime Electric | 58 | 61 |
| Newfoundland Power | 46 | 47 |
| Northwest Territories Power | 56 | 58 |
| Nova Scotia Power | 46 | 49 |
| Ontario Electric Distributors | 40 | 40 |
| Yukon Energy | 47 | 49 |
| **Average** | **47** | **48** |
| **Median** | **46** | **46** |

The calculations are provided in YUB-YECL-42(a&b) Attachment 1.

(c) No. A recent report by the US Tax Foundation (March 2008) indicates that the combined US federal and state corporate income tax rate is higher than the equivalent Canadian tax rate in all but 4 states.

## Taxable

| | |
|---|---|
| COST OF DEBT | 0.0615 |
| Tax Rate | 0.295 |

| Current Debt Ratio | Current Equity Ratio | Moving to Debt | Moving to Equity |
|---|---|---|---|

**YUB-YECL-43**

**Reference:** Prepared Testimony of Foster Associates Inc., page 29-32

**Issue:** Coverage Ratios

**Request:**

Please confirm that the FFO Interest Coverage, the FFO Total Debt and the EBIT interest coverage ratios for YECL (at a common equity ratio of 47.5 ) is higher that those for Canadian utilities as indicated in Table 8 and higher than those compared in Table 4. If confirmation cannot be made, explain and indicate those Canadian utilities which have higher ratios based on the most recent decisions affecting those utilities.

**Response:**

Please note that the numbers on Table 10 (which summarizes the average EBIT Coverage Ratios) should be re-ordered to match the source schedule, Schedule 2. The coverage ratios cited from this table in lines 836-837 of Ms. McShane's testimony should be corrected to match the revised Table 10.

Table 10 should be as follows:

**Table 1**

| Electric Utilities with Rated Debt | Ratings DBRS Moody s S P | EBIT Interest Coverage (2004-2006) |
|---|---|---|
| Canadian Electric Utilities: | | |
| All | A Baa1 A- | 2.6X |
| Transmission & Distribution | A Baa1 A- | 2.7X |
| Integrated | A(low) Baa2 BBB | 2.5X |
| U.S. A-rated Electric | na A2 A | 3.6X |

It is confirmed that the indicated ratios for Yukon Electrical are higher than the averages that would be calculated for the utilities in Table 4 and the averages that were presented

for Canadian utilities in Table 8 (FFO Interest Coverage and FFO Debt) and Table 10 (EBIT Coverage).

However, as stated at page 30, lines 797-802, with respect to FFO Interest Coverage, an FFO Interest Coverage ratio for Yukon Electrical in the range of 4.2X to 4.7X would be higher than the achieved ratios of other Canadian transmission and distribution utilities (3.8X), which would be reasonable given Yukon Electrical's higher business risk. However, at a 52.5 equity ratio, the ratio would be similar to, but still lower than, the average FFO coverage ratios achieved by the low risk (A rated) U.S. electric utilities (4.9X).

There are a number of individual utilities which have ratios similar to or higher than those indicated for Yukon Electrical at 47.5 equity. These companies and their ratios are found on Schedule 2, page 1 of 2, which was the source schedule for Tables 8 and 10. The actual ratios reflect the experienced performance of those companies, not the specific outcomes of regulatory decisions. It is the actual financial performance which is important in assessing the reasonableness of the ratios for Yukon Electrical, as it is actual performance which determines debt ratings.

**YUB-YECL-44**

**Reference:** Prepared Testimony of Foster Associates Inc., page 33-35

**Issue:** Debt Rating Agency Commentary

**Request:**

Comments were submitted regarding the lower return and thinner equities experienced by Canadian utilities in contrast to U.S .and global peers. Is this a reflection of the higher business risk of the U.S. electric utilities?

**Response:**

No. It is unlikely that the debt rating agencies would have referenced the lower equity ratios and ROEs relative to their U.S. peers had they concluded the differences were justified by differences in risk. A relatively recent study commissioned by the Ontario Energy Board, Concentric Energy Advisors, A Comparative Analysis of Return on Equity of Natural Gas Utilities , June 14, 2007, compared the risks of Canadian and U.S. gas distributors as well as the capital markets in the two countries.

The study concluded,

> . Taken as a whole, U.S. gas utilities are not demonstrably riskier than Canadian gas utilities.

and,

> As a result of the interplay between the Canadian and U.S. markets, Canadian utilities compete for capital essentially on the same basis as utilities in the U.S. In the current market environment, no fundamental differences were identified that would indicate a significant difference in investor required returns between the two markets.

At the May 2008 CAMPUT Conference, Concentric Advisors reported in its presentation that they had prepared a similar study on behalf of Hydro One Inc. and the Coalition of Large Distributors, completed March 2008, comparing Canadian and U.S. electric utilities, and that their conclusions corroborated the results of the earlier study.

**YUB-YECL-45**

**Reference:** Capital Additions; Application, page 9-1, 9-2

**Issue Sub-Issue:** Expenditures

**Quote**: System Performance Projects (Line No. 17.)

Life Extension Projects (Line No. 1.)

System Replacement Projects (Line No. 4.)

Forced Projects (Line No. 8.)

**Preamble**: The Board wishes to better understand the basic principles underlying YECL's distribution improvement project categorization.

**Request:**

(a) How are the acceptable levels determined in respect of System Performance Projects?

(b) Please offer a detailed explanation as to how new feeder increase the life cycle of the distribution system.

**Response:**

(a) Yukon Electrical's operations group meets on a weekly basis with engineering staff to discuss the past weeks system performance. Of priority at these weekly meetings are all unplanned distribution outages or events which cause supply disruptions to customers. Events are recorded and trends are identified, ie reoccurring failures of specific feeders, transformers or services. Trends are then investigated by researching the causes; supporting information may be available by reviewing Service Interruption Report. Depending on the cause of the outages a determination is made to either immediately make corrections to the equipment or if the asset upgrades can be put into the capital budget cycle.

In addition Yukon Electrical compares the characteristics of its system to those identified by CEA, the Canadian Electrical Code, Territorial codes, AEUC's and feedback from Electrical Protection agencies to ensure that things such as voltage standards are in compliance. Yukon Electrical also reviews safety bulletins and feedback from its standards group to implement recommended or mandated changes required on the electrical system.

Line Patrols, planned programs and customer feedback also provide guidance as to whether the power system is operating in the way that it should and in a way that meets customer's service requirements.

(b) A new feeder from a specific substation or point of delivery has the potential to extend the life of an existing feeder by eliminating the need to perform potential upgrades. The new circuit can potentially off load the existing circuit thus reducing the need to upgrade and increase conductor size. This off loading and reduction in current also has a positive impact on line losses. It may also have the potential to create an alternate source or feed for a specific area by creating a loop feed, elimination of a radial feed or only one source of supply. A balanced system will extend the life of equipment and reduce the number of equipment failures.

**YUB-YECL-46**

**Reference:** Capital Additions; Application, page 9-5

**Issue Sub-Issue:** 2006 Capital Expenditures

**Request:**

(a) When were the current Canadian mandatory standards and codes, that are referred to in the 2006 Capital Expenditures related to Generation plants, and upon which the work is justified, last updated? (page 9-5)

(b) Please provide a more in-depth explanation in regard to the greater than 1.2 million that was spent in Distribution New Extensions category of 2006 capital expenditures. What types of projects are in this amount, which makes up more than half of the 2,433,000 dollars that are shown? (page 9-6)

(c) In respect of the older YECL underground system (30 years) that is in place, i.e. Tummel Road to Vanier Rebuild (Phase I), is this system still a radial feed type of system? If so, why has YECL not taken steps to construct an alternate feed? Over the intervening 30 years and in consideration of current standards, has YECL considered replacement of the live-front transformers, considering the risk to linemen working on the apparatus? (page 9-8)

(d) Considering the make up the Whitehorse O H system (Justice Centre to Whitehorse Star), i.e. the pre-1969 vintage of certain poles, and the fact that the system was in violation of current electric codes, what were the key driver to correct the failings when installing u g versus correcting an already deficient O H system? Why was this not corrected sooner? (page 9-9)

**Response:**

(a) Attached are a number of the generation standards relating to generation plants referenced by Yukon Electrical (YUB-YECL-46(a) Attachment 1). Typically the last set of digits of the document number (in the attachment) indicate the year of the most recent update of that code.

(b) Please refer to YUB-YECL-46(b) Attachment 1 for a listing of the 2006 New Extensions.

(c) The system is now a loop feed, providing an alternate feed in the event of a cable failure. The live front transformer and other hazards in this area have been eliminated with new construction that meets current operating and safety standards. Other potential operational hazards have been identified and will be eliminated in future capital projects as Yukon Electrical continues to reinvest in the distribution infrastructure. In the meantime, Yukon Electrical operations personnel are trained to continue to identify and address all risks as part of their job plans.

(d) Yukon Electrical has and continues to rebuild infrastructure based on the criteria detailed on page 9-2 of the Application. While structures met code clearances years ago at the time of their construction, clearance code requirements have changed resulting in existing structures not meeting today's standards. Prior to reconstruction to today's standards, Yukon Electrical's journeymen lineman manage operations and maintenance risk through the company's job planning process. In the particular case of Justice Centre to the Whitehorse Star, this work was planned in conjunction with the First Avenue conversion to minimize overall costs and minimize complexity of operation.

Please refer to listing on pages 9-11 and 9-12 of the Application.

**YUB-YECL-48**

**Reference:** Capital Additions; Application, page 9-16

**Issue Sub-Issue:** 2008 Capital Expenditures

**Request:**

(a) Please provide a description of the projects that make up other projects valued at 677.5 thousand, or greater than half of the 1-million forecast total. (page 9-16)

(b) Please provide greater detail in how the other project total of almost 1 million was arrived at in respect of Distribution New Extensions. (page 9-17)

(c) In respect of the Distribution Improvements for 2008, is the work to be completed by YECL or is the work to be contracted out? Please provide a detailed explanation and delineation on a project-by-project basis. (page 9-18)

(d) With respect to the work that is necessary to connect Pelly Crossing with the WAF, was the engineering and design work completed by YECL? If not, please describe the process to undertake bids for engineering, design and handover of the completed intertie project. (page 9-18)

(e) Please provide details regarding how energized line poles become anchored to trees as an accepted practice. Please provide a copy of YECL's heavy loading standards and compare these standards with those of northern Alberta and British Columbia. Is the heavy loading in relation to customer load or northern snow loads, or a combination of both? (page 9-18)

(f) When were the Yukon Electrical heavy loading standards, referred in the Marsh Lake 9L Reliability Fix Phase 1 Squanga Distribution Improvement, last updated? (page 9-19)

(g) Do the lines contained in the Yukon Electrical Tie between First Avenue and Sixth Avenue present a risk to YECL personnel or contradictions to current electrical codes? (page 9-19)

(h) Please provide further detail into the other projects (distribution Improvements) that total 1 million. (page 9-20)

(i) Is the Pine Street Whitehorse Street and Sentinel Lighting project to be done in conjunction with other city public works projects? Has the City of Whitehorse asked that the lighting be undertaken and built to the newer standards? (page 9-20)

(j) Please provide details in regard to the operational efficiencies attendant with the implementation of AMR. What are the other features and benefits of this AMR technology referred to in Meters? Please provide a cost-benefit analysis that was done prior to YECL's decision to proceed with the implementation of AMR. Quantify the operational efficiencies in terms of reduced costs to YECL customers. (page 9-21)

(k) Please provide the details for the North 60 New Billing System, the business case and cost benefit analysis. (page 9-17)

**Response:**

(a) Please refer to YUB-YECL-48(a) Attachment 1 for a listing of the 2008 Generation projects.

(b) Please refer to YUB-YECL-48(b) Attachment 1 for a listing of the 2008 Distribution New Extension projects.

(c) 2008 Distribution Improvements work will be completed by a combination of Yukon Electrical and contractor crews. Yukon Electrical has the capacity for one line construction crew that will be supplemented by three line contractor crews during the peak summer fall construction season.

Yukon Electrical has a good understanding of the projects that it will be undertaking in the upcoming year. Yukon Electrical reviews the type of projects it is required to construct, the number of projects it has to construct and at the complexity of the work. Yukon Electrical will then allocate the work to its own line crew or its contractor crews. During our peak construction season, generally from May 15$^{th}$ to November 15$^{th}$, depending on ground conditions, Yukon Electrical will engage up to 3 contract line crews. Our practice is to award the projects based on one of 3 criteria if practical, tender or firm price, unit rate, or hourly rate. Ultimately our objective is to obtain fair and reasonable value for the

work at hand; the benchmark for this is how the labor and equipment price compares to the estimated project cost. Yukon Electrical will undertake projects with its own crew that are deemed complex, provide development opportunities for apprentices and new journeymen as well as customer sensitive work. This promotes a better understanding for employees of how the system is configured and operates not only in Whitehorse but throughout Yukon Electrical's service area. Completion of this more challenging work also prepares and develops our staff for future stand by and power restoration responsibilities as well as the roll of Operators in Charge of the high voltage electrical system as specified in; Yukon OH&S Safety Regulations Part 9, Electrical Protection Act & Electrical Utilities Code.

(d) The interconnection has been designed by Yukon Electrical's Professional Engineer and has been designed in accordance with Yukon Electrical's construction standards. Please note interconnection line is approximately 1 km long.

(e) Anchoring Guying to a tree is not an acceptable standard or Yukon Electrical's practice in normal operating and power restoration situations. However, in extreme circumstances and in an effort to avoid greater consequential damages, such as an extended after hours power outage or ultimately conductor sagging to unsafe ground clearances, it is a reasonable short term solution. The current practice requires that a permanent repair be completed as soon as it is reasonably practicable.

The heavy loading design referred to on (9-18) is a standard recently adopted by Yukon Electrical from the ATCO Electric construction standards. In summary, it is a type of power line construction utilized where conductors and structures are frequently subjected to excessive icing, frost or snow loading build up. Some of the basic enhancements of this construction are larger wire with more internal steel reinforcement, longer laminated or possibly steel cross arms and shorter spacing between structures. Ultimately the design is engineered to withstand more weight and react more effectively when snow and ice build up starts to clear from the lines or when it is being manually forced off by linemen.

(f) The heavy loading standards in use were created in Alberta in about 2000 and were first applied in Yukon in about 2002. These standards are reviewed on an

on going basis by ATCO Electric's standards group as well as Yukon Electrical's Supervising Engineer.

(g) The existing lines were constructed to acceptable standards and the electrical codes of the early and mid 1960. By today's standards, deficiencies exist in both standards. Risks to our staff when working on these facilities are identified as part of Yukon Electrical's job planning process and barriers deployed to eliminate the hazards.

(h) Please refer to YUB-YECL-48(h) Attachment 1 for details on 2008 System Improvement Projects.

(i) The replacement of this portion of lighting was initiated by Yukon Electrical's annual infrastructure patrols. The lighting on Pine Street is pre 1975 and is not up to present day standards. This reinvestment in infrastructure will have painted standards replaced with the current galvanized standard deployed at TAC lighting levels (Transportation Association of Canada) http: www.tac-atc.ca english pdf roadlight.pdf , it will also include underground cabling for these constructed to the new ducted standard rather than direct buried.

(j) Please refer to the business case in YUB-YECL-15(c) Attachment 1.

(k) Please refer to the business case in YUB-YECL-16(b) Attachment 1.

**YUB-YECL-49**

**Reference:** Capital Additions; Application, page 9-22

**Issue Sub-Issue:** 2009 Capital Expenditures

**Request:**

(a) When did the YUB approve the Yukon Energy 20-Year Resource Plan? With respect to the community of Carcross, please provide a table illustrating electrical load for the period 2003 through 2007. Please provide evidence that YECL either agreed to or endorsed the YEC 20-Year Resource Plan. (page 9-23)

(b) How many YECL communities remain to be converted or upgraded to GE Fanuc standard? (page 9-23)

(c) How long has the standard been in place whereby an isolated community requires a 110 back-up if the largest unit is out of service? Please provide detail regarding total project costs that would see a 500 kW modular unit installed and when would the total project be completed. (page 9-23)

(d) Please confirm that the dollars spent on upgrading Old Crow's PLC would incorporate future generator expansion alluded to in (c). (page 9-24)

(e) Please provide detail regarding the 1.7 million of other projects forecast for 2009. (page 9-24)

(f) Please provide a detailed explanation regarding the process that YECL uses in order to determine the magnitude of its miscellaneous pole replacement forecast? (page 9-25)

(g) What is meant by miscellaneous pole replacements? (page 9-25)

(h) Approximately what percentage, using numbers of street lights as a reference point, use wire in conduit in lieu of direct buried U G cabling? (page 9-26)

(i) Please describe the difference between miscellaneous street light projects and other projects. (page 9-26)

(j) Please describe the logistics and the time that it will take to convert 13,200 conventional meters to AMR, considering that it took YECL's sister company (ATCO Electric) 12 years to convert approximately 178,000 meters to AMR in Alberta. How much of the 3.9 million is forecast to be spent in 2009? (page 9-27)

(k) Please provide greater detail in respect of the 150 thousand that is projected to be spent on the new Old Crow Bunkhouse. Please provide detail in respect of the upgrading to meet current legislation. Please show a cost-benefit analysis reflecting the difference between replacement and repair. (page 9-28)

**Response:**

(a) It is Yukon Electrical's understanding that the YUB provided recommendations to the Justice Minister regarding the 20 Year Resource Plan put forward by Yukon Energy (YEC). The report of the YUB was submitted to the Minister January 15, 2007.

In YEC's 2007 annual report in the President's message it states Yukon Energy's primary focus this year was to proceed with some of the major initiatives laid out in our 20- year resource plan. The plan addresses our major electrical generation and transmission needs from 2006 until 2025 and was **approved last year by the Yukon Utilities Board (YUB).**

In the report filed with the Minister by the YUB on page 11 of 55 and page 12 of 55, it states:

> *"YEC's criterion respecting communities to the WAF or MD grids, which states that any location with a load large enough to justify a diesel of about 1MW or more should be considered as a preferred location for new diesel units, is a criterion for deciding where to locate new units rather than a planning criterion to decide if new units are needed or not. Therefore, the Board has no concerns with YEC adopting this criterion."*

Carcross Taigish is the only community of Yukon Electrical that meets the above mentioned criterion and Yukon Electrical believes that adding the generator will enhance reliability for customers in the Carcross and Tagish area.

Below is the information showing the peak demand on the Carcross Tagish system since 2003:

Carcross Substation

| | |
|---|---|
| 2003 | 748 KW |
| 2004 | 835 KW |
| 2005 | 864 KW |
| 2006 | 921 KW |
| 2007 | 864 KW |
| 2008 | 1025 KW |

Loads having increased such that they are expected to peak consistently over 1MW on a go forward basis.

(b) To date, 5 communities remain to be upgraded to the GE Fanuc standard. They are: Beaver Creek, Destruction Bay, Old Crow, Teslin and Stewart Crossing.

(c) It is Yukon Electrical's understanding that the guideline of 110 back up with the largest unit unavailable was obtained from Northern Canada Power Commission prior to 1987. Northland Utilities also uses this criteria and it has been previously approved by its regulator.

The costs for Old Crow new generator are forecasted at 100k for pad, 50k for switch mod and tie to grid-generators, 600k for generator, and 200k transportation to retrofit the existing plant. The additional costs forecast in 2010 are approximately 800k.

(d) An upgraded PLC will have increased memory allowing for more inputs and outputs.

(e) Please refer to YUB-YECL-49(e) Attachment 1 for details on 2009 System Improvement Projects.

(f&g) On an annual basis, service personal identify structures (poles) throughout the service areas which warrant replacement. Structures identified vary in type and location as well as cost to replace. Generally replacement is justified by the age and condition of the structure. Replacement can however also be justified for other reasons: i.e. poles are damaged by vehicles, equipment, rodents, erosions and lighting. Structures may be working poles, poles that are climbed by service personal often and are damaged by the climbing spurs. On occasion, poles are replaced due to a change in the surrounding terrain such as a driveway that has been added or upgraded creating a ground clearance violation.

The pole replacement budget is determined through line patrols and pole testing. The reference to miscellaneous is that replacement can be as a result of many causes and occur in a variety of locations.

(h) All new sub surface construction and rebuilds since 2002 have been designed and constructed with ducted feeds vs. direct bury. Yukon Electrical has not conducted a study to determine how much of its street light cable is in duct however we would estimate that it would be less than 20 in the Whitehorse area.

(i) Miscellaneous would refer to individual or smaller groups of lights being replaced due to damage or excessive deterioration. The scope of larger projects such as Pine and Mountainview are typically known projects that tend to involve a complete street or drive rebuild and is refurbished inclusive of all underground power supply, cable and ducting.

(j) Based on Yukon Electrical's multiple team installation plan, it anticipates approximately 120 days or approximately 6 months will be required to install the AMR meters. 3.9 million has been forecast to be spent in 2009.

(k) The existing building is a trailer unit. The building's bathroom facilities, windows and emergency exits do not conform to current national building codes. With the extensive deconstruction and reconstruction needed to more than 60 of the building as well as the fresh water and septic systems, consideration was given to the down time of the accommodations. It was also noted that on site refurbishing or stick build is challenging for a number of reason such as availability of qualified trades people, materials and services. A prefabricated building would have a considerably shorter turn around time and adequately

meet our employee's needs and comply with the national building codes. Yukon Electrical also consulted with the Vuntut Gwitchin First Nation Development Corporation in regard to the construction work. They stated they could not entertain our request for a construction crew. Consideration was also given to alternate accommodations, however, the availability of a bed and breakfast or a hotel was very limited. Furthermore, just by the nature of our work, 24 7 accommodations are very important as our employees are dispatched from Whitehorse to respond to trouble calls in the community. It is very important that responding staff have a muster location with the basic essentials when deployed. It should also be noted that this same accommodation is used for our regular scheduled service trips to Old Crow and to accommodate construction crews when projects warrant.

## DISTRIBUTION

| **TOTAL - NEW EXTENSIONS** | **2,962,000** |

Detailed on page 9-24 of Application

**YUB-YECL-50**

**Reference:** Income Tax; Application, page 10-1

**Request:**

(a) Please provide income tax expense for the years 2003-2005 inclusive.

(b) Does YECL have any knowledge that territorial or federal tax rates may change during the forecast period? If so, please provide such knowledge.

(c) How has YECL accounted for changes in tax rates (either federally or territorially) during the years 1997 to 2007?

**Response:**

(a) The income tax expense was:

2003 1,357,000

2004 1,240,000

2005 1,328,000

(b) As outlined on page 10-2 of the Application, Yukon Electrical is forecasting the Federal tax rate to drop during the test period from 19.5 in 2008 to 19.0 in 2009. There are no forecasted changes to the territorial rate of 15.0 .

(c) Yukon Electrical uses the enacted tax rates in place to calculate each year's tax expense.
