Long-term (LT) hydro generation forecasts have been adopted to provide a consistent and stable forecasting approach that avoids the uncertainties and instabilities associated with ST hydro generation forecasts in the context of GRA rate setting procedures, with their extended time periods required from preparing an initial GRA filing to the receipt of final Board approval of a compliance filing. Rates based on short term hydro generation are inherently more volatile; that is, any rate relief offered in 2021 due to excess water could quickly become material rate increases in future years or financial burden to the utility for a risk factor that is beyond its control when water conditions return to "normal" or below.

Experience (including extensive review during the 2017-18 GRA proceedings) has demonstrated the inherent inaccuracy of ST hydro generation forecasts made in the summer / fall of one year as regards water availability in the next calendar year. Outcomes can and do change radically during any given summer period. Although LTA hydro forecasts cannot be retroactively verified, their stability and predictability relative to ST hydro forecasts has been well established.

The Board directed use of actual thermal results for the 2017 test year simply in recognition that these results were already known at the time of the Board's decision in December 2018.

Adoption of the 2021 ST hydro forecast developed around mid-2020 and provided in Table 2.2 of the Application would increase forecast test year hydro generation (and reduce forecast test year thermal generation) by 54.046 GWh; based on the forecast 2021 fuel prices in Table 3.2-1 and the assumed 90% LNG/ 10% diesel fuel mix, the resulting revenue requirement reduction would approximate $9.932 million or 64% of the Application's forecast fuel costs of $15.530 million and 90% of the Application's forecast revenue shortfall (see Table 4.1 of Application). This reduction highlights the extent to which test year forecast fuel costs become subject to high instabilities, with potentially very wide ranging changes, as soon as ST hydro forecasts are considered for GRA rate setting purposes. The ST revenue requirement reduction for 2021 from such a change would establish with certainty the need for similarly large offsetting increases to future GRA revenue requirements simply to restore LTA hydro generation forecast requirements.

REFERENCE: **Application - Overview, Summary of Requested Orders, pages 2 to 6**

ISSUE: **Low Water Reserve Fund (LWRF) Term Sheet**

QUOTE: "Yukon Energy acknowledges that it has been directed in Board Order 2019-08 to review and update the LWRF Term Sheet in this GRA, and to provide any further views on its risk and ratepayer risks that YEC considers relevant. Yukon Energy has been required, given COVID 19 conditions and other factors related to minimizing any bill impacts on ratepayers, to focus first on completion and filing of its 2021 forecast revenue requirement and rates Application. Yukon Energy is working to complete and file an updated LWRF Term Sheet with the Board as soon as feasible."

QUESTION:

a) Without a LWRF term sheet, how is YEC able to determine its LTA thermal generation requirements? Please explain.

b) Without a LWRF term sheet, how is YEC able to determine any transaction or amounts with respect to the LWRF deferral account? Please explain.

ANSWER:

(a)

LTA thermal generation is generated based on the YECSIM long term forecasting model, represented in the application by Table 2.1-1 in Appendix 2.1. Table 2.2 in Tab 2 includes the LTA thermal generation forecast for the test year.

(b)

An updated LWRF term sheet, approved by the Board, is required to determine any transactions or amounts with respect to the LWRF deferral account following the end of the 2021 test year. These transactions do not affect the determination of revenue requirement or rates in this application.

REFERENCE: **Application, page 6; Application, LWRF, Section 3.6.3, Tab 3, pages 3 30 to 3-31**

ISSUE: **Low Water Reserve Fund (LWRF)**

QUOTE: "Yukon Energy has been required, given COVID 19 conditions and other factors related to minimizing any bill impacts on ratepayers, to focus first on completion and filing of its 2021 forecast revenue requirement and rates Application. Yukon Energy is working to complete and file an updated LWRF Term Sheet with the Board as soon as feasible."

QUESTION:

a) Please state when an updated LWRF Term Sheet will be made available. If a precise date is not available, please provide YEC's best estimate.

b) How can the Board or interveners test the reasonableness of the LWRF in the absence of an updated term sheet? Please explain.

ANSWER:

(a) and **(b)**

Yukon Energy is working to provide an updated LWRF Term Sheet in March, along with related LWRF Annual Reports for 2019 and 2020.

An updated Term Sheet is required for determining dollar impacts to the LWRF deferral account when evaluating actual 2021 results as defined by the fund rules. The LWRF Term Sheet, however, does not have any impact on the 2021 GRA revenue requirement forecasts.

REFERENCE: **Application, Tab 2, Table 2-2, page 2-17, lines 13-17; Application, Tab 3, page 3-3, line 2**

ISSUE: **Diesel Generation**

QUOTE: "The increase from 2018 to 2021 reflects higher production and labour costs, including $3.834 million costs for diesel rentals required to meet the N-1 single contingency capacity planning criteria (no diesel rental costs were included in the 2018 approved costs)."

QUESTION:

a) Within the context of forecast reductions in thermal generation from 2020 to 2021 as shown in Table 2-2, why is YEC forecasting an additional $3.834 million for rental of diesel generators?

ANSWER:

(a)

The rental of 15 diesel generator units plus two spare units is required to address the N-1 dependable capacity shortfall, as explained in Section 2.4 of the Application (the specific measurement of the shortfall is addressed at pages 2-14 and 2-15). This requirement is related to the factors noted regarding the N-1 capacity shortfall, and is not related to forecast thermal generation.

REFERENCE: **Application, Section 3.2, Fuel and Purchased Power, page 3-3**

ISSUE: **Thermal Generation Mix**

QUOTE: "The test year long-term average forecasts for hydro generation have been updated to reflect new information, and forecast long-term average thermal requirements for the test years are assumed to be supplied with a combination of 90% LNG and 10% diesel generation, the same ratio as approved in the 2018 GRA."

QUESTION:

a) Please provide the actual thermal generations ratios/percentages for each year since YEC has been utilizing LNG as a fuel source.

b) In regard to the response to part (a), please explain how an LTA of 90% LNG and 10% diesel generation was derived and determined to be accurate for use in this proceeding.

c) Does YEC take on all risk with respect to any changes between actual and forecast results for changes in the thermal generation fuel ratios?

ANSWER:

(a)

Please see Table 1 below that shows actual thermal generations by source and percentages for 2015 (the first year with partial LNG generation) through 2019, and forecast for 2020 and 2021. Table 1 also shows annual thermal generation as a percent of LTA thermal generation, highlighting the extent that annual hydro generation is below or in excess of LTA hydro generation.

Table 1: Thermal Generation for 2015-2021 Years

Annual Thermal Generation - MWh	2015 Actual [2]	2016 Actual	2017 Actual	2018 Actual	2019 Actual	2020 Forecast	2021 Forecast
Diesel Generation	3,574	2,879	4,618	7,186	3,793	18,422	2,951
LNG Generation	1,295	3,251	9,856	30,130	66,065	52,778	27,309
Total Thermal[1]	4,868	6,131	14,474	37,316	69,858	71,199	30,260
Thermal Generation Source - %							
Diesel Generation	73%	47%	32%	19%	5%	26%	10%
LNG Generation	27%	53%	68%	81%	95%	74%	90%
Annaul Thermal % of LTA		58%	103%	119%	276%	103%	36%

Notes:

1 Actual thermal generation reflects actual generation required for maintenance, capital, RFID and all other generation, e.g., peaking. Forecast Actual Generation includes peaking, maintenance (diesel of 0.198 GW.h in 2021, and LNG of 0 MW.h) and capital (0.234 GW.h diesel) requirements reflecting short-term hydro generation forecasts.

2 Partial year generation from LNG in 2015.

(b)

Since LNG was added as a generation source in 2015, Yukon Energy has used a split of 90% LNG and 10% diesel generation in GRA's based on the expected thermal mix applicable to the LTA thermal generation estimates rather than basing the thermal mix on the short-term water conditions that may occur in any specific year. The LTA thermal mix is the ratio applicable to the LTA thermal forecast adopted for rate setting in GRAs.

The 90/10 LNG/diesel ratio was adopted based on expectation that LNG would be heavily used during drought or low water conditions (i.e., LNG share would exceed 90%). This very high usage tends to dominate the long-term thermal generation estimates over all water conditions. That is, while diesel would be used for peaking, emergencies and other specific uses such that diesel's share of thermal in many years with average or higher-than-average water conditions may well significantly exceed 10%, the impact of high LNG use in low water conditions favors the average mix of 90:10 on LTA basis.

This theory is proven out in in Table 1 above; the actual LNG generation was about 53% of the total thermal generation in 2016, increasing to 68% in 2017, 81% in 2018 and 95%

in 2019.[1] This percentage has been below 90% when hydro generation was similar to or in excess of LTA, and was above 90% in 2019 when hydro generation was well below LTA.

As noted, higher LNG generation numbers in 2019 reflect water conditions materially below LTA. For the 2020 full year forecast actual LNG is forecast to be about 74% of the total thermal due to colder-than-normal weather (specifically January 2020 was colder than normal weather) that resulted in high loads with diesel generation being required to supply baseload energy as LNG units were running at max output. For the 2021 test year actual LNG is currently expected to be about 90% of the total thermal.

The 90/10 ratio has been confirmed to be reasonable ratio for the 2021 test year based on actual results for 2018 and 2019 [average for all thermal in 2018 and 2019 is 90% LNG and 10% diesel]. YEC has no reason to believe there should be a change at this time to the 90% LNG/10% diesel for the LTA thermal split purposes under LTA water conditions.

(c)

YEC does not take on all risk with respect to any changes between actual and forecast results for changes in the thermal generation fuel ratios.

The “forecast” 90/10 LNG/diesel fuel mix in each GRA is intended to reflect LTA fuel mix as reviewed in “b” above, and does not forecast actual fuel mix. In contrast, actual fuel mix in any year reflects actual water availability and hydro generation, and can therefore vary materially from the LTA fuel mix.

YEC’s final thermal generation costs for each fiscal year are determined through the LWRF deferral account determinations after the end of the calendar year. YEC’s last LWRF Term Sheet filed in December 2019 set YEC’s final fiscal year expense for the total expected thermal generation (i.e., YEC expense after all transfers) to provide 90% LNG and 10% diesel mix, subject to the constraint (when setting the LWRF based on actual load) that the LNG share of any transfer into or out of the LWRF cannot exceed 100%. In practice, this constraint could result in YEC’s final expense diesel share exceeding 10%.

[1] As noted on page 2-11 of the Application, the numbers slightly inflate diesel share due to inclusion of thermal generation for capital projects and RFID, i.e., LNG share was 83% of net thermal generation excluding capital and RFID loads in 2018 (versus 81% in Table 1) and 97% in 2019 (versus 95% in Table 1).

REFERENCE: **Application, Section 3.2, Fuel and Purchased Power, page 3-5**

ISSUE: **Forecast Thermal Costs – LNG**

QUOTE: "Forecast LNG delivered price to Yukon Energy's Whitehorse thermal facility for the 2021 test year is $0.4824 per litre, which reflects the expected average delivered LNG cost. This forecast for LNG cost is based on the results of a public competitive tender process completed in late 2019 for liquefaction and shipping costs and current market price for commodity value. Yukon Energy forecasts average efficiency for LNG generation of 2.66 kW.h/litre, which is the average efficiency based on actual results for 2019. The resulting forecast LNG cost is $0.1814/kW.h. The approved 2018 LNG price was $0.1467/kW.h."

QUESTION:

a) Please explain why a 2020 competitive tender process was not used to determine the forecast delivered price.

b) Please provide a breakdown and reasons for the increase in LNG costs from $0.1467/kWh to $0.1814/kWh.

c) Please explain why only a 2019 average efficiency was used for LNG generation.

d) Please include the fuel price forecasts for LNG and diesel from the Part 3 LNG proceeding in 2014 and compare with actuals.

ANSWER:

(a)

The competitive tender process completed in 2019 was for 4 supply years commencing in 2020 and subject to minimum supply volumes. Prices for liquefaction and transport are locked in for each year based on the winning bid. Commodity price fluctuates based on an established market reference (NGX Alberta).

(b) and **(c)**

Please see Table 1 that provides a breakdown of LNG fuel cost components for 2017/18 GRA and 2021 GRA. The LNG fuel cost increase is mostly due to increase in transportation costs. Based on the competitive tender process completed in 2019, the prices for liquefaction remain unchanged from 2021 through 2023 [excluding the commodity price which fluctuates based on market price], while transportation cost reduces in 2023 by about 27% compared to the cost for 2021 [reduces to $0.159/l in 2023 compared to $0.218/l as shown in table below].

Table 1: LNG Fuel Cost Comparison

	2017/18 GRA $/L	2021 GRA $/L
Liquifaction [inc. commodity cost]	$0.228	$0.264
Transportation	$0.149	$0.218
	$0.377	$0.482
Efficiency, kW.h/litre	2.57	2.66
LNG fuel cost, $/kW.h	$0.1467	$0.1814

Fuel efficiency for LNG and diesel for the 2021 GRA is in each case based on actual average results for 2019, which is the last full year with actual information at the time of filing of the application. The fuel efficiency for LNG improved from 2.57 kW.h/litre in 2017/18 GRA to 2.66 kW.h/litre in 2021 GRA. The forecast average efficiency of 2.66 kW.h/litre is the average efficiency based on actual results for 2019.

(d)

The Application for an Energy Project Certificate and An Energy Operation Certificate Regarding the Whitehorse Diesel-Natural Gas Conversion Project [LNG Part 3 application] filed on December 9, 2013 assumed LNG fuel cost at $0.135/kW.h, including commodity cost at $0.038/kW.h, liquefaction costs at $0.053/kW.h and transportation cost at $0.044/kW.h.

The transportation cost in the application assumed that the LNG haul from Calgary with A-Train with a cost of $5.16/MMBtu which was based on a cost estimate of $4.37/MMBtu plus approximately 18% increase for potential underutilization of equipment for initial YEC requirements from Calgary.

During the interrogatory process, YEC provided an update to the transportation costs to reflect the need to secure LNG from FortisBC's LNG facility, higher assumed fuel consumption per mile for the haul, higher hourly labour costs, increased unload time at Whitehorse, and reduction in assumed operating days per year.[1] YEC's update to YUB-YEC-1-4 filed March 27, 2014 estimated LNG delivered costs from the FortisBC LNG facility in 2015 at $0.156/kW.h assuming Tridem units for transportation.

For the 2021 GRA forecast cost of liquefaction is $0.082/kW.h plus $0.017/kW.h commodity cost and $0.082/kW.h transportation cost. In 2021 GRA the combined cost for liquefaction and commodity at $0.099/kW.h compared to $0.091/kW.h in LNG Part 3 application and $0.089/kW.h in 2017/18 GRA; while transportation cost increased to $0.082/kW.h in 2021 GRA compared to $0.044/kW.h in LNG Part 3 application and $0.058/kW.h in 2017/18 GRA.

The diesel fuel cost in the LNG Part 3 application was $0.246/kW.h compared to $0.2633/kW.h in 2017/18 GRA and $0.2051/kW.h in 2021 GRA. As indicated in the 2021 GRA application the diesel fuel prices are as of July 1, 2020 and reflect lower fuel prices during 2020 in response to oil market conditions and COVID-19.

[1] Response to YUB-YEC-1-44 during the review of the Application for an Energy Project Certificate and An Energy Operation Certificate Regarding Whitehorse Diesel-Natural Gas Conversion Project.

REFERENCE: **Application, Section 3.2, Fuel and Purchased Power, page 3-6**

ISSUE: **Purchase Power Costs**

QUOTE: "The purchase cost for the IPPs in 2021 is assumed at $0.1583/kW.h based on the latest approved thermal fuel cost for YEC in its 2017/18 GRA. Total IPP purchase cost is forecast at $0.314 million for 2021." (footnote removed)

QUESTION:

a) Why are the purchase costs from intermittent IPPs in 2021 based on the forecast thermal fuel cost for YEC?

b) Given the IPPs currently in place, is the expected purchase of 1.983 GWh of energy likely to occur? Please explain why or why not.

c) Has there been discussion of variable rates for IPPs that would recognize the increased value of winter generation?

ANSWER:

(a)

Purchase prices applicable to IPPs are set according to applicable Standing Offer Rules. The footnote removed from the quote explained that Standing Offer Rules, Section 42(a) state that "the Base Fuel Price is to be equal to the YEC's average blended fuel price per kWh for thermal generation most recently approved by the YUB before the date on which the EPA takes effect." Accordingly, the purchase price for the IPPs in 2021 is assumed as stated in the above quote.

Furthermore, section 3(2) of OIC 2019/25 as provided in Tab 11 of the Application provides the same direction regarding the price paid by YEC for a kWh of electricity under an on-grid electricity purchase price agreement; Section 4 (subsections 1 and 3) provide for annual increases in the price in subsequent years at 50% of any increase in the CPI. Section 2(1) of OIC 2019/25 directs that, in setting rates, the Board must allow the utility

to recover specific costs which include the cost of purchasing electricity under an electricity purchase agreement.

(b)

YEC is not able to confirm that the forecast 2021 IPP purchase of 1.983 GWh of energy is likely to occur. The first IPP project did not get completed in November 2020 as forecast in the IPP agreement and as assumed in the Application. YEC has no control or responsibility as regards when each of the two forecast IPP projects commences production in 2021, or whether any other potential IPPs may be able to advance their plans to commence production later in 2021.

(c)

The concept seasonal IPP rates was discussed in earlier Yukon government policy papers related to potential IPP development. Current policy directions on IPP pricing for Standing Offer Program projects do not include any provision for lower prices to apply during summer periods.

REFERENCE: **Application, page 5 and Section 3.6.2, Defined Benefit Pension Deferral Account, page 3-29**

ISSUE: **Stabilization Mechanisms**

QUOTE: From page 5:

"Defined Benefit Pension Deferral Account: Approval of defined benefit pension plan deferral account as set out in Section 3.6.2 that captures variances in contributions to the defined benefit pension plan from the cost included in the test year revenue requirements as a result of the required annual actuarial evaluations."

From page 3-29:

"Yukon Energy is required to file updated actuarial valuation reports on an annual basis with valuation reports determining the required funding for the next year. The actual contributions for the year can vary from the forecast depending on market conditions and the performance of the pension plan assets. The proposed deferral account protects both the utility and ratepayers from variances in required contributions over the amounts included in test year revenue requirement. For the 2021 test year, the defined benefits pension plan cost is $0.720 million."

QUESTION:

a) Please prepare a high-level outline of YEC's history (including the relevant timeline and events) with respect to any previous use or request to use a defined benefit pension deferral account.

b) Please explain why the "similar deferral account … approved for [ATCO Electric Yukon] AEY by Board Order 2014-06" should apply in the circumstances of YEC. Please identify the similarities and differences between the "similar deferral account" approved for AEY in 2014 and the defined benefit pension deferral account proposed by YEC in the current GRA.

c) Please clarify if the "required annual actuarial evaluation" was submitted by YEC and, if so, provide a reference to where details of the evaluation can be found in the current application. If not submitted, please provide the "required annual actuarial evaluation".

d) Please provide historical details of YEC's "defined benefits pension plan cost" for the years 2018-2020 on an approved and actual basis in comparison to YEC's forecast 2021 cost of $0.720 million. Please include any details respecting current service payments from special payments.

e) Given there is an annual actuarial evaluation conducted, on what basis would there be variances in required contributions over the amounts included in the test year revenue requirement that would support deferral treatment as necessary?

f) What circumstances have changed recently such that YEC now considers a defined benefit pension deferral account necessary?

g) Please provide details addressing both the requirement for and the specific mechanics of YEC's proposed defined benefit pension deferral account including proposals for a future true-up of the same.

ANSWER:

(a)

YEC has not previously requested nor used a defined benefit pension deferral account.

(b)

While YEC has not specifically reviewed the terms and conditions governing the AEY pension plan, YEC believes the risks are similar based on the fact that the YEC plan was inherited from ATCO as part of the termination of the management contract in 1997. Of note, the YEC DB plan was closed to new members in 2001 while we understand the ATCO plan continues to be available to new hires. Irrespective of that fact, the risks from market fluctuations and the resultant impact on funding exists if the plan is closed or not.

(c)

Please see Attachment 1. Note this attachment is not the formal actuarial valuation from 2020 (see Attachment 2); however, YEC, as an IFRS-compliant public entity, uses IAS 19 as guidance for pension funding. Attachment 1 is the actuarial estimate of funding required

for 2020 based on IAS 19. YEC is seeking a deferral account to accumulate differences from GRA approved funding v. future directions.

(d)

Fiscal Year	Pension Cost	
2018	$657,984	Approved
2018	$678,600	Actual
2019	$605,900	Actual
2020	$720,200	Forecast (per GRA)
2020	$741,300	Actual

(e)

The GRA process essentially locks in the pension recovered from rates whereas the funding requirements vary every year and the variance is beyond the utility's ability to control.

(f)

As noted in the AEY application, current OSFI guidance has created a situation where actuarial valuations are essentially required every year (unless solvency calculations exceed 120%). This required has increased funding volatility year over year.

(g)

As discussed above, YEC is seeking a deferral account to absorb the differences between the IAS 19 pension expenses as directed by the plan actuary. The accumulated differences will be reviewed by the YUB at each GRA and balances will be refunded or collected as necessary.

REFERENCE: **Application, Section 3, Revenue requirement**

ISSUE: **YEC Revenue Requirement**

QUOTE: Please revise Table 3.1, Table 3.3, Table 3.4, Table 3.5, Table 3.8, and Table 3.9 to include 10 years of historical information on both an approved and actual basis commencing with the year 2012.

QUESTION:

a) Please revise Table 3.1, Table 3.3, Table 3.4, Table 3.5, Table 3.8, and Table 3.9 to include 10 years of historical information on both an approved and actual basis commencing with the year 2012.

ANSWER:

(a)

Please see YUB-YEC-1-36 Attachment 1 for requested information.

Table 3.1
Yukon Energy Revenue Requirement
($000)

	2012 Approved	Actual 2012	2013 Approved	Actual 2013	Actual 2014	Actual 2015	Actual 2016	Actual 2017	2018 Approved	Actual 2018	Actual 2019	Forecast 2020	Forecast Existing 2021	Forecast Proposed 2021

REFERENCE: **Application, Section 3.3, Non-Fuel Operating and Maintenance (O&M) Expenses, pages 3-7 and 3-8**

ISSUE: **Non-labour and labour inflation rates**

QUESTION:

a) Please clarify if YEC applied or used an inflation rate (or escalation factor) in arriving at its forecast non-labour O&M expenses for the year 2021. If confirmed, please provide all support for the non-labour inflation rate used in YEC's 2021 forecast amounts (for example, provide excerpts from the most recent Yukon Economic Outlook documentation) and identify which non-labour O&M expenses the inflation rate was applicable to. If not confirmed, please explain YEC's method for forecasting its non-labour O&M expenses for the year 2021.

b) Please provide the actual 2018-2020 non-labour inflation rates experienced by YEC.

c) Please provide the actual 2020 labour inflation rate experienced by YEC and clarify whether the labour costs shown on Table 3.3 (page 3-7) and included in the forecast 2020 costs of $12,727 reflect this inflation rate.

d) Please clarify if any collective bargaining agreements that will be settled in 2021 for the fiscal period 2020 are expected to be applied retroactively to January 2020 or some other date and, if so, explain if and how YEC has accounted for this anticipated future liability for regulatory purposes.

e) Please confirm YEC's statement that the "forecast 2020 and 2021 labour rates include estimated economic increments of 2%" means that 2019 actual labour costs were inflated by 2% to arrive at 2020 forecast labour costs, followed by 2020 forecast labour costs being inflated by an additional 2% to arrive at 2021 forecast labour costs. If not confirmed, please fully explain how the increments of 2% were applied.

f) Please explain why a labour inflation rate of 2% remains reasonable for either of the years 2020 or 2021 given the current economic conditions surrounding the COVID-19 pandemic. Please clarify whether YEC's forecast labour inflation rate of

2% is consistent with Yukon Economic Outlook documentation. If so, please provide the relevant excerpts from the most recent Yukon Economic Outlook documentation for each of the years 2020 and 2021.

g) Please identify any additional costs or savings experienced by or actively sought by YEC during 2020 as a result of the current economic conditions surrounding the COVID-19 pandemic.

h) Referring to the response to part (g) above, are any additional costs or savings experienced by or actively sought by YEC during 2020 as a result of the current economic conditions surrounding the COVID-19 pandemic anticipated to continue into the year 2021? If so, please identify and quantify the additional costs or savings to YEC for the year 2021.

ANSWER:

(a)

YEC does not use a general inflation factor in arriving at its non-labour O&M forecasts. YEC budget owners are given a blank template and they build up a budget based on their experience, knowledge and expectations in the upcoming year. Budgets are submitted to Finance and Senior Management, where they are vetted and adjusted as necessary.

(b)

As stated in (a), YEC did not use inflation rates in 2018-2020.

(c)

The actual 2020 labour inflation rate has not been determined due to the ongoing collective bargaining agreement process applicable to the period commencing January 1, 2020. YEC expects this process to be completed in late 2021. The 2020 labour costs shown on Table 3.3 of $12,727 reflect an assumed inflation rate of 1.75% plus 0.25% for other costs resulting from the collective bargaining process (e.g., performance increments) for a total estimated annual increment of 2.00%.

(d)

As stated in response (c), YEC has assumed a total economic increment of 2.00% resulting from the collective bargaining process. The collective bargaining process is for the period commencing January 1, 2020, so YEC will calculate any differences in amounts owing to/from employees retroactively, and adjust 2021 labour expense for this difference (assuming the collective bargaining process is completed in 2021). There will be no retroactive application of settled amounts into 2020.

(e)

The statement is confirmed.

(f)

Historically, YEC has benchmarked CBA annual increments against other local public entity increases (e.g., Yukon Government, Yukon Hospital Corporation, Yukon University, etc.). It is worth noting that the arbitrator has agreed with these benchmarks in each of the last three CBA settlements. Yukon Economic Outlook documentation has historically not been the basis for YEC economic increases decided by the arbitrator, so YEC does not consider this applicable.

(g)

Significant additional costs as a result of the current economic conditions surrounding the COVID-19 pandemic are included as RFID. Savings as a result of the current economic conditions surrounding the COVID-19 pandemic include significantly reduced travel costs for YEC employees.

(h)

YEC expects there to be both costs and savings that as a result of the current economic conditions surrounding the COVID-19 pandemic continue into the year 2021. The amount is not determinable.

REFERENCE: **Application, Section 3.3, Non-Fuel Operating and Maintenance (O&M) Expenses, pages 3-8 and 3-9**

ISSUE: **Labour Costs (Section 3.3.1)**

QUOTE: "Table 3.4 shows that the total position count is forecast to increase by 9.90 positions since 2018 approved to 2021 test year.

At the historic staff level, employees were finding it difficult to keep pace with increased demands, more so as additional assets are added and increasing burden for planning and executing capital works. In recent years overtime hours have increased creating additional workload and adverse effect for the existing employees which in turn resulted in an increase in employee turnover. The increase in employee turnover has increased the recruiting and relocation costs for the forecast years."

"To combat the above issues, YEC is forecasting an increased employee complement. The increase in employee complement has resulted in significant decrease in forecast overtime costs for 2021. Also, the increased employee complement in 2019 through 2021 is due to an effort, where possible, to do more work internally as opposed to hiring outside consultants and contractors. YEC has made a conscience effort to limit increases to only those areas where required as reviewed below."

QUESTION:

a) Please update Table 3.4 to include YEC's actual employee complement as of December 31, 2020. Please include an explanation for any variances between YEC's 2020 forecast 97.86 employee complement and 2020 actual employee complement.

b) In light of the current economic conditions surrounding the COVID-19 pandemic, does YEC anticipate an increase or decrease in employee turnover in 2021?

c) Please provide YEC's employee turnover (number of employees resigned or retired) and vacancy rate on an actual basis for the years 2018-2020 and forecast basis for the years 2020 and 2021.

d) Please prepare a table quantifying the "recruiting and relocation costs for the [2020 and 2021] forecast years" and compare these amounts to the recruitment and relocation costs experienced by YEC on an actual basis for the years 2018-2020.

e) Please prepare a table quantifying the "forecast overtime costs for [2020 and] 2021" and compare this amount to the overtime costs (including both O&M and capital related) experienced by YEC on an actual basis for the years 2018-2020.

f) Please prepare a table quantifying the costs of outside consultants and contractors on an actual basis for the years 2018-2020 and on a forecast basis for the years 2020-2021. In the response, please ensure that the type of consultant and contractor work being performed on behalf of YEC has been identified. (For example, the cost of the consultant and contractor work as related to O&M, capital, administrative, regulatory or other).

ANSWER:

(a)

Table 1 below represents Employee Complement History as presented in the Application updated for Actual 2020 results.

Table 1: Employee Complement History

	2018 Approved	Actual 2018	Actual 2019	Forecast 2020	Actual 2020	Proposed 2021
President	4.16	5.14	4.82	4.01	4.01	4.16
First Nation Relations	-	-	-	-	0.50	1.00
Communications, Cust. Acctg.	1.00	1.00	1.00	3.10	3.10	4.60
Human Resources & Info. Mgmt.	5.25	5.27	5.34	5.32	5.30	5.25
Resource Planning and Environment	5.00	5.00	5.75	5.51	5.93	7.05
Finance, Cust. Acctg. & Purchasing	16.79	16.89	17.24	13.54	13.56	14.79
Operations	44.50	46.58	47.12	48.75	48.30	49.25
Engineering Services	15.00	13.03	15.16	15.63	15.72	15.50
Health & Safety	2.00	2.00	2.00	2.00	2.00	2.00
Total	93.70	94.91	98.44	97.86	98.41	103.60

There are no significant variances from Forecast 2020 to Actual 2020. The largest variance of 0.50 is in First Nation Relations. YEC added this position to its Employee Complement effective July 1, 2020; however, as of December 31, 2020, this position remains vacant.

(b)

YEC does not forecast turnover and has no basis to assess the impact of the global pandemic on the job markets that YEC is active in. YEC continues to plan and execute recruitment efforts consistent with prior years.

(c)

YEC's employee turnover (number of employees resigned or retired) on an actual basis for the years 2018-2020 is summarized in Table 2 below:

Table 2: Employee Turnover: 2018-2020

2018	5
2019	9
2020	6

YEC does not have a specific employee turnover forecast for 2021.

YEC's vacancy rate on an actual basis for the years 2018-2020 and forecast basis for the years 2020 and 2021 is summarized in Table 3 below:

Table 3: Vacancy Rate: 2018-2020

Year	**Vacancy Rate**
Actual 2018	-6.05
Actual 2019	-9.91
Actual 2020	-9.30
Forecast 2020	-3.00
GRA 2021	-5.00

(d)

Recruiting and relocation costs are summarized in Table 4 below:

Table 4: Recruiting and Relocation Costs

	Actual	Forecast
2018	$ 190,319.04	
2019	$ 334,005.84	
2020	$ 311,044.72	$ 279,080.00
2021		$ 211,260.00

(e)

Overtime costs are summarized in Table 5 below:

Table 5: Overtime Costs

	Actual	Forecast
2018	$ 901,416	
2019	$ 938,858	
2020	$ 992,155	$ 735,768
2021		$ 760,960

(f)

The costs of outside consultants and contractors on an actual basis for the years 2018-2020 and on a forecast basis for the years 2020-2021 is summarized in Table 6 below:

Table 6: Costs for Outside Consultants and Contractors

($M)	Admin	O&M	Capital
2018 Actual	1.375	2.965	17.900
2019 Actual	1.358	2.520	17.124
2020 Actual	1.523	3.869	31.654
2020 Forecast	1.575	2.831	
2021 Forecast	1.532	2.942	

Capital project forecasts are not done on a cost-element basis, so we are unable to provide a forecast for Capital outside consultants and contractors.

REFERENCE: **Application, Section 3.3.1, Non-Fuel Operating and Maintenance (O&M) Expenses, pages 3-8 to 3-13**

ISSUE: **Labour Costs (Section 3.3.1)**

QUESTION:

a) Please clarify how many employees will report to YEC's proposed "1.00 position increase in 2021 due to … a Vice President, First Nation Relations." (page 3-10)

b) Please confirm whether "Yukon Energy's 5-Year Strategic Plan, published in 2019, confirmed YEC's commitment to establishing mutually beneficial and strategic partnerships with Yukon First Nations governments" (page 3-9) and is intended to be subject to testing in the current GRA. If confirmed, please explain fully why this is the case.

c) Please explain whether it is YEC's understanding that it is responsible for fulfilling consultation obligations where they arise with respect to potential impacts on s. 35 rights (Section 35 of the Constitution Act, 1982).

d) Please elaborate on YEC's new position (Vice President, First Nation Relations) and how it will expand YEC's current ability to move projects forward.

e) Given that the name for the "Finance, Customer Billing/Accounting and Purchasing" category (page 3-11) continues to reference the words "Customer Billing/Accounting," please clarify whether any "Customer Billing/Accounting" personnel remain in the originating group after the 2020 transfer of 2.10 positions to the "Communications, Customer Accounting" (page 3-10) category.

f) Referring to the categories identified in Table 3.4 (page 3-8) and including the proposed "1.00 position increase in 2021 due to the addition of a new full-time position, Senior Communications Advisor" (page 3-10), please clarify how many communication personnel in total will be employed by YEC and in which Table 3.4 category or categories these employees reside.

g) Please clarify the role of YEC's communication personnel in relation to YEC's internal versus external communication requirements.

h) Please quantify how many external communication issues, such as customer complaints, were submitted to YEC for resolution during each of the years 2018-

2020. Of these submissions, please quantify how many were resolved in each year by YEC and how many were forwarded to the YUB for resolution.

i) With respect to YEC's Resource Planning and Environment category, please clarify what is referred to as the "backlog of planning work designation for completion" (pages 3-10 and 3-11) for which YEC has proposed to add a two-year resource planning engineer position to assist with. In the response, please also clarify which capital projects have been delayed as a result of the referenced planning work backlog.

j) With respect to YEC's Resource Planning and Environment category, please clarify if YEC's "2020 10-Year Renewable Electricity Plan" (pages 3-10 and 3-11) is intended to be considered by the Board in the current GRA. If confirmed, please explain fully why this is the case. Please provide a reference to where YEC's Electricity Plan has been provided in its application; otherwise, please submit a copy of the report in response to this IR.

k) With respect to YEC's Resource Planning and Environment category, please identify the priority initiatives recommended in the "2020 10-Year Renewable Electricity Plan" (pages 3-10 and 3-11) which YEC has proposed to address by adding a senior project manager. In the response, please also quantify how many employees are currently engaged in any of the priority initiatives and whether any are proposed to now report to the new senior project manager.

l) Please explain whether procurement personnel have historically been within the "Finance, Customer Billing/Accounting and Purchasing" group and provide the quantity of employees responsible for procurement in that or any other group up to the year 2020. Will YEC's proposed "1.00 position increase … of a new full-time position, Procurement Administrator" (page 3-11) result in less work for those employees previously responsible for procurement work up to the year 2020? If so, please explain where has YEC incorporated the incremental benefits of hiring a full-time procurement administrator in its revenue requirement.

m) In relation to YEC's procurement activities, please provide quantifiable evidence that YEC has experienced "increased workload in the department due to greater volume of high dollar projects" (page 3-11) during each of the years 2018-2020 on an actual basis.

n) In relation to YEC's procurement activities, please explain why there are "increasingly complex contracting strategies for some capital projects, including the additional requirements of the First Nation procurement policy, which has increased the complexity and administrative support required for large project

procurement." (page 3-11) In the response, please confirm that it is the Yukon Government First Nation Procurement Policy being referred to, whether that policy applies to Yukon Energy, and also identify the additional requirements of YEC to follow that policy.

o) In relation to YEC's procurement activities, please explain and provide context with respect to "the need to allow departmental management to concentrate on policy renewal and development and education for client managers new to YEC." (page 3-11).

p) In relation to YEC's operations, please confirm that the "1.00 position increase in 2018 due to the addition of a new full-time position, Maintenance Mechanic to address additional responsibilities (e.g., LNG assets)" was contemplated in YEC's original LNG project business case. If confirmed, please provide a reference to the business case where an increase in employee complement was identified as being required.

q) In relation to YEC's operations, please provide the per cent increase over 2020 actual plant operator personnel that the total 1.75 position increase in plant operators will represent. (page 3-12)

r) In relation to YEC's engineering services, please confirm that the "1.00 position increase in 2020 … of a new full-time position, Electric Engineer" (page 3-12) occurred on an actual basis during the year 2020.

s) Please provide YEC's capital to maintenance allocation ratios on an actual basis for the years 2018-2020. (page 3.13)

ANSWER:

(a)

YEC is not proposing any direct reports to this position at this time. The VP will be the primary liaison with First Nations and will work through other departments as required depending on the nature of the issue (e.g., planning, engineering, operations, finance).

(b)

In this context, the reference to the 2019-24 strategic plan was intended to demonstrate the Corporation's commitment to working with First Nations. It is self-evident that YEC

owes a duty to Yukon First Nations as a landowner and further, as a legal obligation under various treaty agreements.

(c)

YEC is not directly responsible for fulfilling the Crown's duty to consult and accommodate Yukon First Nations with respect to a potential impact on s. 35 rights. However, the Crown has given effect to its duty to consult, in part, through the framework established under YESAA, and YEC has duties as a proponent under that framework, including statutory consultation obligations, with respect to the environmental and socio-economic assessment of YEC projects. In addition, in certain circumstances, YEC may have further consultation duties arising directly under the provisions of Yukon First Nation Final Agreements (e.g., under Specific Economic Measures provisions included in Chapter 22).

(d)

Any significant project that occurs in the Traditional Territory of a Yukon First Nation requires the proponent to engage and consult with that First Nation. In YEC experience, the consultation process is most effective when an established relationship already exists with the affected First Nation. The Vice President First Nation Relations will be responsible for establishing and maintaining relationships with First Nations in Yukon Energy's service area. As well, when a project is identified, the Vice President will lead the negotiations of the benefits agreements thereby capitalizing on the relationship.

(e)

No Customer Billing/Accounting personnel remain in the group after the 2020 transfer. To be clear, certain aspects of customer accounting is retained by the core Finance group (e.g., account reconciliation, cash management) but staff who are responsible for direct interactions with customers, account set up and maintenance, bill preparation and distribution, account collection, etc. have transferred out of Finance.

(f)

There will be two communication personnel in total employed by YEC and both are in the category labelled Communications, Cust. Acctg.

(g)

Yukon Energy communications personnel are responsible for developing and delivering the Corporation's external communications and supporting company-wide internal communications on key topics and projects. The latter can include writing and reviewing company-wide messages, presentations, campaigns and other collateral.

(h)

Yukon Energy does not track all external issues and complaints in one central repository. External issues and complaints are addressed and actioned by individual departments, as required. Yukon Energy is not aware of how many external issues or complaints were forwarded to the YUB.

In terms of specifics, YEC offers the following as indicative of increased work load:

- Weekly briefings for the Minister and YDC started in Q4 2019 and have continued since.

- We started tracking the number of media calls, Ask Steph (online) emails and social media comments/questions we receive in 2020.
    - 84 media calls were received in 2020;
    - 44 Ask Steph inquiries in 2020;
    - More than 200 questions and comments on Facebook and Twitter in 2020;

- Table 1 below highlights the impact of additional duties with respect to increased communications involvement in capital works and customer service.

Table 1: Allocation of Manager of Communications Time, 2018-2020 (Year-to-date)

Year	Communication Admin.	Customer Billing Admin.	Capital
2018	99.24%	0.0%	0.76%
2019	66.43%	0.0%	33.57%
2020	44.13%	15.53%	40.34%

Additionally, as a one-position department with critical responsibilities during unplanned events, the Manager Communications is effectively on call 24/7, 365 days a year. The extra position will help provide an additional resource for this important function.

(i)

The general challenge is that YEC is unable to advance concurrently, as required, all of its projects given limited internal planning resources. The planning projects which are currently designated for completion include the ones listed below. It's difficult to clarify which projects have been delayed due to insufficient internal resources – all projects tend to be adversely impacted in this situation, and YEC has had to address delays in dealing with almost all of the active projects listed below. The concern looking forward is that the upcoming work requirement is expected to be even more challenging than that experienced to date.

- Aishihik Generating Station Water Use 25 Year License Renewal;
- Whitehorse Rapids Generating Station Water Use License Renewal;
- Mayo Generating Station Water Use License Renewal;
- Diesel Retirement Replacement;
- Southern Lakes Storage;
- Mayo Lake Storage Enhancement Project;
- Battery Energy Storage System;
- Pumped Storage;
- Southern Lakes Transmission Line; and
- Demand Side Management Programs.

(j)

YEC's "2020 10-Year Renewable Electricity Plan" is intended to be considered by the Board in the current GRA in that it is included as a deferred cost Regulatory project added to rate base, as disclosed in Section 5.3.2 of the Application (page 5-26) as well as in Table 5.5. The Plan, however, generally addresses project planning for development beyond the 2021 test year. Please see CW-YEC-1-36(a) Attachment 1 for a copy of the 10-Year Renewable Electricity Plan.

(k)

YEC anticipates the Senior Project Manager will lead the completion of the Southern Lakes Transmission Line and Pumped Storage projects (each of which remain in WIP in 2021). Current employees are engaged on these projects on an ad hoc basis given limited resource capacity, and the focus on securing federal funding before advancing either project. YEC does not anticipate any employees will report to the new senior project manager.

(l)

Procurement personnel have been within the "Finance, Customer Billing/Accounting and Purchasing" group for many years (i.e., > 10 years). The number of full time equivalent employees responsible for procurement in the group for year 2020 is 3.5. The addition of the Procurement Administrator will not result in less work for other staff. YEC recognized that the volume of purchasing was exceeding the capacity of the department to the point where some projects were delayed due to backlogs in procurement. As well, procurement volumes have increased (see (m) below) and other managerial tasks were not being addressed on a timely basis (see (o) below).

(m)

See Table 1 below for the volume of purchase orders processed at YEC back to 2018, demonstrating the greater volume of high dollar projects.

Table 1: Volume of Purchase Orders: 2018 to 2020

Fiscal Year	Count of PO Number	Sum of Originating Subtotal
2018	586	27,855,025.96
2019	630	33,480,891.75
2020	765	62,313,928.33

(n)

YEC has had to address, or is addressing, a number of complex procurements. This includes the following examples:

- BESS – new technology both for YEC and the Canadian industry, international vendors, long lead time;
- EAM – software acquisition, high dollar, US vendor, acquisition of licences implementation and post-go live support; and
- MMTP – high dollar, large number of contracts, federal funding requirements, large FN components.

YEC approved a First Nation Procurement Policy in 2016, although implementation has occurred gradually since that time. YEC was aware that YG was working on a similar policy since 2019. While YEC is not obligated to follow YG policy, the shareholder expects that our policy approach should not materially diverge from YG.

(o)

The department includes one manager who has responsibility for providing supervision and leadership to the team. In addition, this position is responsible for advising management on complex transactions, conducting market research, developing and maintaining long-term vendor relationships, policy update/development, procurement system access and functionality and training for client staff.

With respect to procurement policy, there is a recognized need to adapt current policy for external factors e.g., Canadian Free Trade Agreement, YG FN Procurement Policy. As

well, policies are over 10 years old and need to be updated for industry best practice and general improvement for efficiency and effectiveness.

Training is becoming a critical issue as YEC has experienced significant turnover in recent years. While the company has been successful at attracting skilled replacements, it is normal for new project managers to require training on the specific rules of procurement at YEC. Prior to the addition of an additional position, the manager was required to participate in the preparation and management of procurement processes to the point there was no time available to other matters as described.

(p)

The "1.00 position increase in 2018 due to the addition of a new full-time position, Maintenance Mechanic to address additional responsibilities (e.g., LNG assets)" was not specifically contemplated in YEC's original LNG project business case. The position was required to address the workload of all generation assets based on the workload at that time, which changed from the time when the LNG business case was prepared. The process to justify the additional position was done using a spreadsheet that assigned annual tasks at each facility. This process determined the staff complement against the work. The latest iteration of the work indicated a deficit in mechanical trades staff. With the addition of the LNG facility there was an obvious lack of person hours to complete the suggested maintenance.

(q)

The 1.75 position increase represents a 16% increase in plant operators.

(r)

Confirmed.

(s)

YEC's capital to maintenance allocation ratios on an actual basis for the years 2018-2020 is provided in Table 2 below:

Table 2: Capital to Maintenance Allocation Ratios

	Capital	Maintenance
2018	14.7%	85.3%
2019	16.0%	84.0%
2020	18.2%	81.8%

REFERENCE: **Application, Section 3.3.2, Production, pages 3-13 and 3-14**

ISSUE: **Production Costs – Diesel Rentals**

QUOTE: "Diesel rentals [cost increase of $3.834 million over 2018 approved GRA]: Costs of mobile diesels to address dependable capacity shortfalls (see Tab 2, section 2.4) is forecast to increase to $3.834 million in 2021 as compared to actual 2018 costs of $1.048 million and no costs included as part of 2018 Approved costs. Forecast mobile diesel costs are based on negotiated contracts with the vendor."

QUESTION:

a) Please provide all quantitative evidence demonstrating a competitive supply for YEC's diesel rental costs on an actual basis for the period 2018-2020.

ANSWER:

(a)

2018/19

- YEC ran one-year public competitive tender process for 6 – 2 MW diesel generators for placement at Whitehorse Rapids Generation Station for the winter heating season (approximately 5 months).

- Two bids were received:

Vendor	Quote
Trinity Power	$1,860,059
Finning Canada	$1,557,881

- A contract was awarded to Finning Canada.

2019/20

- YEC ran a three year public competitive tender process for up to 8 – 2 MW units for the season; annual renewals are at the discretion of YEC.

- Three bids were received; one bid was deemed non-compliant and was therefore excluded from the price evaluation:

Vendor	Quote
United Rentals	$3,706,685
Finning Canada	$1,913,234

- Due to additional generation risk from low water in Mayo, YEC elected to rent one additional 2 MW unit.

2020/21

- Based on forecast model, 17 – 2 MW units required for 20/21 heating season.

- 10 units placed in WRGS under the unit rates per 19/20 RFP; 7 units were placed in Faro through a contract extensions with Finning Canada; unit rates for Faro units were based on market conditions at the time.

REFERENCE: **Application, Sections 3.3.3 and 3.3.4, Non-Fuel Operating and Maintenance (O&M) Expenses, pages 3-14 to 3-16**

ISSUE: **Transmission and Distribution Brushing Allocations**

QUOTE: "The major portion of the transmission cost variance relates to changes in the annual brushing cost requirements and changes in the allocation of brushing budgets between transmission and distribution lines. Table 3.6.1 provides further details on the brushing allocations." (pages 3-14 and 3 15)

"The fluctuation results from changes in brushing allocations between transmission and distribution lines. Table 3.6.1 provides further details on the brushing allocations." (page 3-16)

QUESTION:

a) Please identify and fully explain all reasons for the changes in "brushing allocations between transmission and distribution lines" noted by YEC and referenced in the above quotes.

b) Referring to Table 3.6.1 (page 3-15), please explain why YEC's 2019 Actual brushing costs were almost exclusively related to transmission brushing activities (98%) as compared to a more typical 78-85% (transmission related) as observed for the other years identified in the table.

ANSWER:

(a)

Brushing allocation is determined based on priority, planned work on infrastructure, vegetation outage stats and growth rate.

(b)

The high allocation of funding in 2019 can be directly attributed to the transmission line refurbishment (TLR) project where site access was a priority.

REFERENCE: **Application, Section 3.3.5, General Operation and Maintenance, pages 3-16 and 3-17**

ISSUE: **General Operation and Maintenance**

QUOTE: "Labour costs are forecast to decrease by $0.017 million in 2020 from 2018 approved. Total forecast costs in the non-labour General O&M categories in 2021 are $0.172 million higher than approved 2018 costs of $1.219 million. Transportation expenses are forecast to increase $0.051 million (10%) in 2021 over 2018 approved. Maintenance of Company Owned Properties is expected to increase $0.090 million (18%) in 2021 over 2018 approved. SCADA Communication expenses are forecast to increase by $0.031 million (15%) in 2021 under 2018 approved."

QUESTION:

a) Please provide variance explanations for all per cent changes between 2018 approved and 2021 forecast costs noted by YEC in the above quote.

b) Please respond to part (a) on the basis of changes between 2020 and 2021 forecast costs.

c) Please detail any measures to be taken by YEC to control or reduce its overall general operation and maintenance costs in 2021.

ANSWER:

(a)

Labour costs are forecast to decrease primarily due to a reduction in time allocated to Communications. Transportation expenses are forecast to increase primarily due to insurance and maintenance of an aging and larger fleet. Maintenance of Company Owned Properties is expected to increase primarily due to increased rental of land and buildings. SCADA Communications expenses are forecast to increase due to an increase in the cost of communication rentals.

(b)

Labour costs are forecast to increase primarily due to an increase in time allocated to Fleet. Transportation expenses are forecast to increase primarily due to resumption of more normal activities as the first half of 2020 was low due to decreased travel resulting from the Covid-19 pandemic. Maintenance of Company Owned Properties is expected to decrease primarily due to an overall general reduction in various Whitehorse costs. SCADA Communications expenses are forecast to remain consistent with 2020.

(c)

YEC has an intense budget process where budget owners build a budget based on a blank template. Budgets are scrutinized by Finance, Senior Management and the board of directors. Budgets are adjusted as considered necessary.

REFERENCE: **Application, Section 3.3.6, Administration, pages 3-17 and page 3-18**

ISSUE: **Administration Costs**

QUESTION:

a) Please detail any measures taken by YEC to control or reduce its overall administration costs forecast for 2021.

b) Please clarify whether YEC's forecast increase in general administration expense related to new asset management software was contemplated in any related business case and, if so, please provide a reference to the cost benefit analysis conducted in that business case.

c) Please clarify why YEC's general administration expense forecast for 2021 is anticipated to increase over 2020 forecast costs given the explanation for the increase between 2018 and 2021 costs as noted in part (b) above.

d) Please explain why YEC's Board of Directors expenses have not decreased given restrictions related to the COVID-19 pandemic and requirements to conduct meetings virtually.

e) Please quantify the number of Board of Directors meetings held during the year 2020 on an actual basis and forecast for the year 2021.

f) Please describe the nature of and reason for any training proposed for YEC's Board of Directors.

ANSWER:

(a)

YEC has an intense budget process where budget owners build a budget based on a blank template. Budgets are scrutinized by Finance, Senior Management and the Board of Directors. Budgets are adjusted as considered necessary.

(b)

The business case is reviewed in YUB-YEC-1-64, and includes consideration of managing ongoing software management costs. The estimated ongoing annual costs start in 2021 and are used in the business case and NPV calculations.

(c)

The primary reason for the increase in general administration expense for 2021 over 2020 are the costs related to the new asset management software as noted in part (b), as the system is to be implemented in 2021.

(d)

Travel cost was not a significant cost of the Board of Directors budget prior to the pandemic; therefore, there is no significant savings on this budget due to pandemic restrictions.

(e)

In 2020, YEC had 14 Board meetings and 24 Committee meetings. Of the 14 Board meetings, 5 were scheduled and the other 9 were Special Meetings. YEC has scheduled 4 quarterly meetings, 2 special meetings for strategic planning and business plan approval for 2021. There is a possibility that additional unscheduled meetings will be required for time sensitive issues.

(f)

YEC's Board of Directors are looking at focusing their training on finance and oversight for the Audit Committee (and possibly expanding to the full Board) for 2021. This is based on the outcome of a Director Evaluation that was completed in 2020 and identified oversight of financials and strategic priorities as a key focus area for the Board.

REFERENCE: **Application, Section 3.3.7, pages 3-18 to 3-20**

ISSUE: **Insurance and Reserve for Injuries and Damages (RFID)**

QUOTE: "Yukon Energy's costs for insurance in 2021 are forecast to increase by $0.392 million (38%) above approved 2018 costs of $1.031 million, and are based on the completed 2020 annual renewal process. Costs in 2020 increased due to mid-year market rate adjustments (overall rate increase of 25% on commercial package) and increased insured asset value. Costs in 2021 increase primarily due to a full year impact of the 2020 rate increase [most of the costs for the 2021 fiscal year are already locked by the insurance policy renewables in 2020 due to insurance year cycle differences from YEC's fiscal year]. The market rate increases experienced by YEC as part of 2020 renewals are consistent with peer utilities in Canada."

"The large expense in 2020 reflect works required in Whitehorse hydro generation facility penstock [about $0.730 million], Whitehorse LNG Unit #2 [$0.4 million], LNG Vapourizer [$0.3 million] and other small projects. In 2021 test year, YEC is forecasting annual costs of $0.411 million."

QUESTION:

a) Please provide the availability statistics for each of the LNG units by year since inception.

b) In light of your response to part (a), please comment on the reliability of each of the LNG units.

c) Please clarify whether the insurance year or renewal cycle has changed for either YEC or its insurance company from those used in prior GRAs.

d) Please clarify whether YEC examined alternative insurance coverage from other providers in order to keep insurance cost increases to a minimum. Please explain all resources and alternatives YEC examined.

e) Please provide further details for each of the respective LNG-related RFID claims comprising the $1,598 thousand Forecast 2020 annual cost as noted in Table 3.11.1.

f) Please clarify whether YEC follows a policy for processing of claims against its RFID account and, if so, please provide the policy or a reference to the most recent version of the RFID policy by which YEC is guided.

g) Please explain the rationale for amortizing the $2,121 thousand Forecast 2020 RFID balance over a period of five years, as opposed to any other period of time.

h) Please explain why YEC did not include 2020 forecast RFID charges in its determination of a 10-year average annual charge as shown in Table 3.11 (page 3-19).

i) Please revise Table 3.11 and Table 3.11.1 to include an Actual 2020 column that incorporates a 10-year average annual charge that incorporates 2020 actual (annual charge) information.

ANSWER:

(a)

Please see Attachment 1 to this response.

(b)

Most of the issues with the LNG units relate to valve recession on the cylinder heads. YEC is running the third version of the cylinder heads, as the OEM attempts to resolve the problem. The majority of the costs associated with the valve recession have been covered by the OEM.

In late Q4 2020, WG1 had a generator fault, the stator will need to be rewound. In Q2 2020 WG2 had extensive damage as a result of a valve failure.

(c)

Neither the insurance year nor renewal cycle has changed. Insurance periods start approximately mid-year.

(d)

During 2020, YEC directed its broker to conduct a full marketing effort for YEC's property insurance policy. The insurers on the program were selected in order to obtain the lowest rate while still providing adequate coverage. Rate increases were compared with industry peers to validate the market conditions experienced by YEC.

(e)

Further details for each of the LNG-related RFID claims are as follows:

- **LNG Vapourizer – [$0.3 million] –** Three failures of the shell and tube heat exchangers in the LNG storage and re-gas package significantly increased the risk of failure of the vapourizer coil. This work involved the replacement of the coils with an improved design in order to avoid an unexpected lengthy outage of the LNG facility.

- **LNG Unit #2 [$0.4 million] –** An exhaust valve failure in one of the cylinder heads of LNG unit #2 resulted in damage to 16 power cylinders as well as two turbo chargers. The extensive damage resulted in a complete block replacement, with a portion of the costs being covered by the OEM.

(f)

The RFID Policy was most recently filed with the YUB as Appendix 3.1 in the 2012-13 General Rate Application. Annual appropriation was updated by the YUB as per Board Order 2018-10 as part of the 2017-18 General Rate Application.

(g)

Amortization of the RFID opening balance over five years was selected as that is what the YUB approved in the 2017-18 GRA.

(h)

YEC did not include 2020 forecast RFID charges in its determination of a 10-year average annual charge as shown in Table 3.11 as this Table reflects 'actual' charges, not 'forecast'.

(i)

2020 actual RFID costs are not yet finalized due to ongoing 2020 year-end accounting procedures.

REFERENCE: **Application, Section 4.4.2, pages 4-6 to 4-8**

ISSUE: **VGC and Alexco Fixed Charge**

QUOTE: "Board Order 2018-04 also directs YEC to submit a limited scope application to amend the firm mine rate within 60 days of the Transmission Facilities Development Operation Date (Paragraph 57). The Transmission Facilities Development Operation Date is forecast to occur in late November 2020/early December 2020 when the Transmission Facilities Development comes into service, connecting the McQuesten Substation with a substation at Mayo. Yukon Energy's limited scope application to the Board to be filed when this development comes into service is described in Appendix 4.3 based on forecast costs and YEC's approved 2018 GRA cost of capital."

"The interim Fixed Charge for 2021 will also be subject to adjustment and Board review and approval as part of YEC's 2021 GRA. YEC understands that the final Transmission Facilities Fixed Cost and an adjusted Fixed Charge for VGC Group and Alexco for 2021 will be determined subsequently based on YEC's final compliance filing as approved for the 2021 GRA (including actual costs as then known for the relevant new facilities) and also based on adjustments as required after 2021 year end to reflect actual MWh loads of VGC Group and Alexco and any adjustments as needed for actual costs as then known for the relevant new facilities."

QUESTION:

a) Please clarify what YEC is requesting from the Board in the above quotes. Specifically, is YEC asking the Board to approve an interim Fixed Charge for 2021 in the current proceeding and to determine the final Fixed Charge in a separate application to be filed within 60 days of the Transmission Facilities Development Operation Date?

ANSWER:

(a)

YEC is not asking the Board to approve the Fixed Charge for 2021 at this time.

The amended Transmission Facilities Fixed Cost application and related interim Fixed Charge are required to be filed within 60 days of the Transmission Facilities Development Operation Date, i.e., the date that YEC provides to VGC Group to confirm that the Transmission Facilities Development has been completed and is in service to deliver Grid Electricity to the Mine Facilities through the Mine Facilities Spur (all terms as defined in the approved VGC Group PPA). This application, which is required to establish at that time the adjusted Fixed Charge related to the amended Transmission Facilities Fixed Cost, exists separate from the 2021 GRA application, and was therefore assumed not to be part of the 2021 GRA application.

The Transmission Facilities Development Operation Date has been delayed to March 2021. YEC therefore now expects to file the amended Transmission Facilities Fixed Cost application in March 2021, requesting an interim Fixed Charge adjustment effective May 1, 2021 in order to establish a necessary rate adjustment for VGC Group and Alexco as soon as feasible. This filing will be based on the 2020-2021 to date forecast costs of the new facilities and YEC's approved 2018 GRA cost of capital at 4.82%, i.e., these initial adjustments do not include any changes related to YEC's 2021 GRA proposed cost of capital.

The Transmission Facilities Fixed Cost and Fixed Charge for 2021 related to the completed Transmission Facilities Development will be updated once the STATCOM is commissioned and final costs are available, which will not occur until late 2021 after the GRA is scheduled to be finalized. After the 2021 year end, adjustments will be made as required by Section 7.7(c)(ii) of the approved VGC Group PPA to reflect actual 2021 MWh loads of VGC Group and Alexco.

REFERENCE: **Application, page 5-23**

ISSUE: **Section 5.3.1.2, Demand Side Management**

QUOTE: "The context within which Yukon Energy has approached Demand Side Management (DSM) has materially changed since the Board made the following DSM related determination in Board Order 2018-10 (paragraph 482):

> The Board is not persuaded that YEC should continue to operate DSM projects. YEC has indicated the benefits of expanding the program and submitted that its programs have met or exceeded key performance indicators. However, the Board notes that the Yukon government has DSM incentive programs in place, and the Board is of the view that it is better to leave DSM projects to government, rather than having ratepayers fund these projects. For these reasons, the Board is of the view that continuation of DSM programs by YEC is not necessary.
>
> Since that determination the Yukon Government has put in place a Climate Change policy initiative called "Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy" which emphasizes the importance of DSM as a valuable resource to reduce the Yukon's energy and capacity requirements. As part of that policy the government fully expects Yukon Energy to pursue a cost-effective DSM program.
>
> Pursuant to this policy initiative and the Government's expectations, and further given DSM remains a cost-effective means of reducing energy and capacity requirements, Yukon Energy has included in the proposed 2021 rate base the expenditures for the programs and activities as reviewed below. (footnotes removed)

QUESTION:

a) What is meant by the statement "the context within which Yukon Energy has approached Demand Side Management (DSM) has materially changed"?

b) Given your response in part (a), how should the Board evaluate whether there is a "material change" in the context (i.e., circumstances) since Board Order 2018-10 was issued?

c) To the extent that the content of discussions can be disclosed, please describe Yukon government discussions with YEC regarding the DSM programs YEC has applied for in this proceeding, particularly in light of the Board's finding in paragraph 482 of Appendix A of Board Order 2018-10 that the continuation of DSM programs by YEC was not necessary. Please also summarize any discussions on scope, quantum, and timing of the applied-for DSM programs.

d) Please explain to what extent policy directions stated by Yukon Government in the climate change policy initiative "Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy" are binding on the Yukon Utilities Board. If these directions are not binding, please explain how the Yukon Utilities Board should consider those policy directions in its review of YEC's applied-for DSM programs.

e) Please explain why policy initiatives supported by Yukon Government should be funded by ratepayers through their utility bill, as opposed to through government supported initiatives such as taxation or other means. In addition, please provide YEC's view on how the two options might differently affect low-income households.

f) Please explain how YEC considered rates and rate base provisions of the Public Utilities Act in its proposal for demand-side management. In your response, please specifically identify how the DSM programs are the property of a public utility used or required to be used to provide service to the public.

g) On November 19, 2020, the Court of Appeal of Yukon heard an appeal regarding Board Order 2019-05 (in which the Board dismissed YEC's request to review Board Order 2018 10) in relation to DSM costs. What impact, if any, is there on the Board's consideration of the applied-for DSM costs in this proceeding given that the outcome of the Court of Appeal of Yukon's decision on the appeal remains outstanding?

h) Please explain YEC's management decision to include the DSM policy initiatives in the current application rather than in its next GRA? Please explain why these initiatives are required to be completed in 2021.

ANSWER:

(a) through **(f)**

Since the last rate application, the Yukon Government released a climate change strategy – "Our Clean Future: A Yukon strategy for climate change, energy and a green economy". More specifically, YG drafted the action below in the policy:

> 53. Direct the Yukon Utilities Board to allow Yukon's public utilities to pursue cost-effective capacity demand-side management measures.

This is a material change to how YEC approached DSM. The YG has clearly stated that DSM is a valid supply option for Yukon utilities and that they expect YEC to actively consider and implement prudent DSM programs. They also indicated their intention to direct the YUB to support cost-effective programs administered by YEC and AEY.

In keeping with action item number 53 the YG enacted OIC 2021-16.

OIC 2021/16 directs the Board to include in rates provision to recover costs that a public utility (i.e., YEC or AEY) reasonably incurs to provide or participate in a demand side management program.

Based on YG's DSM policy and also considering growth in electrical load on the system, Yukon Energy DSM planning was undertaken; this planning includes coordination with the Yukon government's DSM programs to meet the overall policy objectives in a cost effective manner.

DSM program costs of Yukon Energy have been approved by the Board in the past as deferred costs that are included in rate base, consistent with the rate and rate base provisions of the *Public Utilities Act ("PUA")*. The Board can continue to deal with these costs in the future in the same manner.

(g)

YEC notes the Court of Appeal ruled on this proceeding on February 5, 2021 and the appeal was dismissed. The Court of Appeal proceeding including the decision does not affect the 2021 GRA Application as none of the costs that were covered by the appeal are included in this Application.

(h)

As stated above, YG has publicly confirmed its support for utility-driven DSM programming and further they indicated that they expect YEC to undertake such programing. Based on YG's clear expectation (now confirmed by OIC 2021/16) and with the knowledge that a significant capacity shortfall exists on the Yukon integrated system, YEC believed it was timely and prudent to include these programming costs in the 2021 application.

REFERENCE: **Application, Section 5.3.1.2, page 5-23, line 14**

ISSUE: **Effect of DSM on Energy and Capacity Requirements**

QUOTE: "Since that determination the Yukon Government has put in place a Climate Change policy initiative called "Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy" which emphasizes the importance of DSM as a valuable resource to reduce the Yukon's energy and capacity requirements. As part of that policy the government fully expects YEC to pursue a cost-effective DSM program." (footnote removed)

QUESTION:

a) Please provide any analysis or research compiled by YEC, or its program partners, that supports the conclusion that DSM can reduce Yukon's energy and capacity requirements.

b) Please provide any analysis YEC, or its program partners, has carried out examining the effect of YEC's DSM projects to date on the energy and capacity requirements for YEC and the associated cost savings compared to the costs of the DSM programs.

c) Please comment on the potential effects on rates should DSM programs administered by YEC lead to a significant decline in energy sales. In particular, please provide YEC's view of whether it is possible for ratepayer-funded DSM programs to lead to increased rates as a result of declining energy sales.

d) Please provide the results of any analysis carried out by YEC, or its program partners, with respect to the ability of seasonal pricing to reduce peak energy and capacity demand. If YEC has not carried out any such analysis, please explain why.

ANSWER:

(a) and **(b)**

Yukon Energy in partnership with ATCO Electric Yukon and Yukon Government completed a DSM Program Portfolio which was filed with the Yukon Utilities Board as part of AEYs 2013-2015 GRA. This included a Conservation Potential Review, Market Characterization, Implementation Plan, and Evaluation Measurement and Verification Plan. The Conservation Potential Review was updated for Yukon Energy's 2016 Resource Plan. DSM programs were again shown to be a cost effective resource and were included in the recommended portfolio. These studies concluded the DSM can cost effectively reduce Yukon's energy and capacity requirements.

A portion of the residential programs presented in this portfolio were launched to the Yukon public. Progress reports and evaluations of the energy and capacity savings as well as cost effectiveness of these programs in accordance with the filed Evaluation Measurement and Verification Program were conducted and filed with the YUB. These reports and evaluations clearly demonstrated DSM as a cost-effective energy and capacity resource.

In Order 2014-06, the Board applied four standard cost-effectiveness measures for DSM costs (collectively, the "InCharge Programs Prudency Measures"), namely the total resource cost test (TRC), the program administration cost test (PAC), the rate-impact measure test (RIM), and the participant cost test (PCT).[1] Program elements of the residential non-government DSM portfolio that passed all four cost-effectiveness measures for 2014 and 2015 were approved by the Board.

Evidence provided by Yukon Energy in the 2017/18 GRA indicated that the Approved InCharge Programs met InCharge Programs Prudency Measures endorsed by the Board in Order 2014-06 and were rate neutral for ratepayers. Specifically, Approved InCharge Program development and delivery was reviewed in the 2017/18 Application at page 5-39 and 5-40. Figure 5-1 at page 5-40 provided a summary of energy savings and costs, updated to the end of 2016 which noted that the programs achieved an overall RIM ratio of 1.1 (1.0 shows the program is neutral from a utility rate impact perspective), and achieved a very high PCT ratio (3.0) and high PAC ratio (9.4), demonstrating that the

[1] See Order 2014-06, Appendix A at pp. 94, 100-101.

programs are very beneficial to program participants and to utilities. Table 5-1 also showed that the program achieved a high TRC ratio (3.1), showing that it also compares well against other electricity resource options.

Evidence provided by Yukon Energy in the 2017/18 GRA also showed that the Approved InCharge Programs elements were evaluated by a third party evaluation advisor in 2015 and 2016 which confirmed that the expenditures met or exceeded the above-noted InCharge Programs Prudency Measures key performance indicators. The following were specifically noted:

- The response to UCG-YEC-1-40 in that proceeding, provided the 2015 Interim Evaluation Report by ICF Marbek; and the 2015-16 Evaluation Report by ICF Marbek (actuals to end of July 2016).

- The evaluation reports were based on the Evaluation, Measurement and Verification Plan filed with the YUB as an attachment to YUB-YECL-26(a) during AEY's 2013-15 GRA[2].

- The energy savings and coincident peak demand reduction that have resulted from the Approved InCharge Program were outlined in Table 2 of both the 2015 and 2015/16 Evaluation reports.[3]

- The response to YUB-YEC-1-80 (d) and (e) in YEC's 2017-18 GRA noted that the cost benefit analysis provided by ICF Marbek was reviewed and approved by an independent evaluator (Econoler).

Reference to further supporting documentation that supports the conclusion that DSM can reduce Yukon's energy and capacity requirements are provided below:

- Demand Side Management Plan including Program Portfolio, Conservation Potential Review, Market Characterization and Working Group Guidelines. http://yukonutilitiesboard.yk.ca/pdf/YECL_2013-15_GRA_Part_2-_DSM_plan.May_27,_2013.pdf

(c)

The RIM test as reviewed in Board Order 2014-06 (see response to (a) and (b) above) recognizes and addresses the possibility that DSM programs may lead to significant decline in energy sales that result in increased rates. As reviewed in response to (a) and (b) above, Yukon Energy DSM programs were previously confirmed to pass the RIM test and were rate neutral for ratepayers.

YEC anticipates that the targets for its ongoing DSM programs will emphasize capacity-focused reductions rather than energy reductions. Capacity savings directly result in a reduced requirement for temporary diesel rental units. These savings, in combination with the fuel savings from any related energy savings, are expected to outweigh any potential rate impacts driven by the reduction of sales.

(d)

YEC is aware that seasonal pricing can be an effective tool to reduce peak energy and capacity demand. However, YEC has not proceeded with undertaking any detailed analysis or assessments regarding implementation of seasonal pricing as a DSM measure. As such, no analysis can be provided at this time.

While the 2017/18 GRA included forecast costs for a time-of-use rate structure and smart grid study to assess the potential for a time-of-use rate structure and associated smart grid – YEC did not proceed with undertaking this work. More specifically, in Order 2018-10 the Board found that "YEC has not provided information that persuades the Board that a study on smart grid and time-of-use rates is useful or needed. Accordingly, the Board directs YEC to remove any forecast expenditures and cost recovery related to this project in its compliance filing to this decision."

Seasonal or time of use rates would drive a need to consider impacts on cost of service (new rates/rate classes would require adjustments to COS study and alter results – including possibly seeking to distinguish "winter" costs from "summer" costs); and YEC would also need to consider the ability to implement a seasonal rate structure within rate policy environment established by OIC 1995/90 and OIC 2018-220.

REFERENCE: **Application, Tab 5, pages 5-1 to 5.6-1**

ISSUE: **Accuracy of Capital Project Forecasting**

PREAMBLE: The Board wishes to evaluate the accuracy of YEC's project cost and timeline forecasting and YEC's ability to control project costs.

QUESTION:

a) For all projects brought before the Board in YEC's 2008-09 GRA, 2012 GRA, 2016-17 GRA and 2017-18 GRA, please provide a table showing the original forecast cost and completion date provided to the Board and the final cost and completion date.

b) Based on the information provided in response to part (a), please comment on the accuracy of YEC's cost and timeline forecasts.

ANSWER:

(a)

Please see Table 1 that shows original forecast cost and completion dates for major projects (with forecast GRA cost more than $1 million) at the time projects were initially proposed to be included in rate base for the three YEC GRAs during this time period (2008/09 GRA, 2012/13 GRA and 2017/18 GRA), as well as actuals costs and completion dates for these projects. In preparing this response YEC focused on major projects as they represent most of the PP&E capital investments as well as providing the possibility for review in the time available for responding to these IRs. For example, for the 2021 test year about 91% of total PP&E capital spending is for major projects [91% for 2008 test year, 47% for 2009 test year, 77% for 2012 test year, 70% for 2013 test year, 64% average for 2017-2018 test years].

Please note that the cost information in column A is based on YEC's GRAs as requested and will vary from the forecasts included in Part 3 applications, where applicable.

The costs in columns A and C are before contributions.

Table 1: Major Projects Included in 2008/09, 2012/13 and 2017/18 GRAs [cost before contributions]

sub total	**76,946**		**76,039**		
Total All Three GRAs	**312,646**		**314,590**		

Notes:

1. 2008/09 GRA also included a project to purchase Minto diesels at a cost of $3.190 million. However, pursuant to the YUB's direction (para 207, Order 2009-08) the Minto diesels were removed from ratebase for the test years.
2. In 2012/13 GRA, page 5-9 YEC noted that "Yukon Energy is still attempting to resolve a number of issues including final deficiency work with the contractor which may impact costs but after the $5 million contribution from the Yukon Government, the present estimate of the net rate base cost is approximately $8.8 million." Please also see 2021 GRA, Appendix 5.1, page 5.1-8.
3. 2012/13 GRA, page 5-21 shows total projected cost at $3.24 million. On that page YEC noted that the timing and scope of subsequent roll-outs will be dependent in part on the work done in Roll-Out #1. The cost of $3.24 million included a portion of the project with $2.486 million cost to be completed in 2012 and additional spending of $0.750 million in 2012 and 2013 years. The project was partially completed in 2012 at a cost of $2.486 million and remaining work through 2017 at total cost at $0.495 million.
4. 2017/18 GRA included T&D - Breaker Replacements at a cost of $1.350 million. As reviewed on page 5-16 of the 2021 GRA Application replacement of 5 medium voltage (34.5kV) breakers in YEC substations S150(4) and S176(1) was completed with a cost of $0.798 million, including $0.688 million spending in 2018. Separately, replacement of 7 high voltage (138kV) breakers in YEC substations at Aishihik Faro, Riverside and Takhini with cost of $2.260 million was completed in 2019. The $1.278 million spending in column C reflects spending of $0.688 million for the first project and $0.479 million for the second project as shown in Table 5.2-1.

(b)

Table 1 shows varying outcomes for different projects, as would be expected. Overall, however, the capital cost and timeline forecasts in these three GRAs were reasonably accurate.

1. **Capital costs –** Overall, actual major project capital costs across the three GRAs were 100.6% of the capital costs included in the GRA rate base forecasts, i.e., actuals were very close to GRA forecast.
    a. Actual results as a percentage of forecast varied by GRA, from 105.7% for the 2008/09 GRA to 98.8% for the 2017/18 GRA.
    b. Results are affected by many projects already being completed or largely completed at the time of GRA filing. However, the largest project in the table (Mayo B) was also basically completed within the budget forecast before construction commenced. The spread in actual results as a percentage of forecast for different projects ranges from 70% (Hydro Unit #WH4 Overhaul) to 151% (Mayo Head Gate Repairs).

2. **Completion dates –** 13 of 20 (65%) of the major projects in Table 1 were completed on or before the forecast completion year in the GRA, and another (Enterprise System) had its major component completed on schedule and the balance completed at less than forecast cost; together, these 14 projects accounted for over 96% of the final completion costs for all projects in Table 1.

ISSUE: **Costs for Capital Works Projects Greater Than $1 Million**

PREAMBLE: In this section of its application, YEC outlined the costs for Capital Works projects greater than $1 million as follows:

- For the LNG Third Engine Project, YEC indicated that it spent $3.156 million in 2017, $5.008 million in 2018 and $0.097 million in 2019.

- For the N-1 Capacity Shortage Whitehorse Thermal Rental Site Infrastructure Project, YEC indicated it spent $0.227 million in 2018 and $1.070 million in 2019.

- For the N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure Project, YEC indicated a forecast of $2.037 million in 2020.

- For the Mayo – McQuesten Transmission Line Upgrade Project, YEC indicated it spent $0.501 million in 2019, indicated a forecast of $20.000 million in 2020 (offset by a $15.274 million contribution) and indicated a forecast of $11.200 million in 2021 (offset by a $8.4 million contribution).

- For the McQuesten Substation Project, YEC indicated it spent $0.123 million in 2018 and $11.496 million in 2019 (offset by a $10.688 million contribution).

- For the Transmission Line Refurbishment Project, YEC indicated it spent $4.272 million in 2019.

- For the Transmission Line Refurbishment – L178 Project, YEC indicated a forecast of $1.3 million in 2021.

- For the Breaker Replacement Program Project, YEC indicated it spent $0.479 million in 2018 and $1.781 million in 2019.

- For the Replacement of the P125 Head Gate Project, YEC indicated it spent $0.093 million in 2019, indicated a forecast of $2.300 million in 2020 and indicated a forecast of $3.500 million in 2021.

- For the WH2 Uprate Project, YEC indicated it spend $3.044 million in 2019, indicated a forecast of $1.693 million in 2020 and indicated a forecast of $7.300 million in 2021.

- For the WH4 Uprate – Servomotor Replacement Project, YEC indicated it spent $0.052 million in 2018, $0.079 million in 2019, indicated a forecast of $0.400 million in 2020 and indicated a forecast of $1.000 million in 2021.

YEC stated it reflected these costs in Table 5.2.1 in its application, found from pages 5-32. It is not clear how YEC allocated these costs over the previous years and how it plans to allocate these costs in its forecasted years.

QUESTION:

a) Please provide a cost breakdown for the projects provided in the preamble. More specifically, provide the activities conducted (or the activities YEC forecasts to conduct) and the cost amount allocated to each activity.

ANSWER:

(a)

Please see the following tables that provides cost breakdown by major activities for each project listed in the preamble. Due to nature as well as the stage of the projects [actuals vs forecast] the key activities are not the same for all projects.

Please note that the following tables reflect updated costs for 2020 based on preliminary actuals and/or forecasts for 2021:

- Table 6: N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure reflects project preliminary actual costs. Please see response to CW-YEC-1-26 (b) that provides explanation for higher actual costs.

- Table 7: Mayo – McQuesten Transmission Line Upgrade Project reflects project preliminary actual costs for 2020 [$3.014 million lower than the forecast] and updated 2021 forecast [$0.422 million lower than the forecast in the application].

- Table 8: Replacement of the P125 Head Gate Project reflects project preliminary actual costs for 2020 [$0.342 million lower than the forecast] as well as change in scope for the project. The original scope of the project included work on WH1, WH2 and WH3 headgates with total project cost at $5.893 million, including about $3.5 million in 2021 for WH1 and WH3 headgates. YEC has now postponed work on WH2 and WH3 headgates to 2022 and 2023, respectively. The revised cost in Table 8 reflects removal of cost estimate for WH2 and WH3 headgates.

- Table 9: WH2 Uprate Project reflects project preliminary actual costs for 2020 [$0.827 million lower than the forecast] and updated 2021 forecast [$1.046 million higher than the forecast in the application].

- Table 10: WH4 Uprate – Servomotor Replacement Project reflects project preliminary actual costs for 2020 [$0.146 million lower than the forecast].

Yukon Energy will reflect updated projects costs in the compliance filing.

Please also note that McQuesten Substation Project was built by Victoria Gold Corporation and transferred to YEC, therefore, YEC does not have cost breakdown by activities.

REFERENCE: **Application, Tabs 5.2.1.1 and 5.2.1.2, pages 5-5, 5-7 and 5-8**

ISSUE: The LNG Third Engine, N-1 Capacity Shortage Whitehorse Thermal Rental Site Infrastructure and N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure projects.

QUOTE: From page 5-5 of the Application:

"The LNG Third Engine Project provides a third natural gas-fired generation unit of approximately 4.4 MW at the Whitehorse thermal plant to help address the existing dependable capacity shortfall in a cost effective manner. YEC is required to provide sufficient dependable winter capacity to meet the single contingency capacity reliability criterion, i.e., there is no acceptable "do nothing" option given the need to maintain reliable service, and permanent solutions (rather than relying on temporary options such as mobile diesel) are needed to address an ongoing and growing dependable capacity shortfall." (footnote removed)

From page 5-7 of the Application:

"The [N-1 Capacity Shortage Whitehorse Thermal Rental Site Infrastructure Project] involved the design of infrastructure to accommodate temporary rented thermal generators at Whitehorse substation to address the capacity shortfall projected under the N-1 for 2018/19 and 2019/20 winters.

In winter 2018/19 six temporarily rented 1.8 MW units were installed in the proximity of S150 Whitehorse Rapids Substation. The 2019 project included installation of two additional temporarily rented 1.8 MW units in the area between P126 Whitehorse Diesel and S150 Whitehorse Substation. The project scope included … installation support temporary seasonal diesel power generators to meet seasonal N-1 load requirements and assist with meeting winter system peaks. Total project cost was approximately $1.298 million."

From pages 5-7 to 5-8 of the Application:

"The [N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure] involves the design and installation of temporary rental site electrical infrastructure at Faro (870S) to ensure YEC can continue to meet its N 1 capacity planning requirements … The project is expected to be completed in 2020 at an estimated budget of $2.037 million. The project is on track for a mid-November 2020 in service date."

QUESTION:

a) Please provide the studies that were conducted showing the N-1 capacity criterion was being violated prior to the development of the LNG Third Engine, N-1 Capacity Shortage Whitehorse Thermal Rental Site Infrastructure and N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure projects.

b) Please provide the studies that were conducted to show that these projects met the N-1 capacity criterion.

c) Given that the LNG Third Engine Project was required as a permanent solution to meet the N-1 capacity criterion, please explain why YEC carried out the Whitehorse Thermal Rental Site Infrastructure and Faro Thermal Rental Site Infrastructure projects, which installed temporary infrastructure.

d) Given that the Whitehorse Thermal Rental Site Infrastructure and Faro Thermal Rental Site Infrastructure projects involve temporarily rented generators and temporary electrical infrastructure, please explain if YEC plans to implement a permanent solution in the future to meet the N-1 capacity criterion. For example, will the Battery Energy Storage System project discussed on page 5.1-5 of the Application replace the need for these projects?

e) Please provide an update on the Faro Thermal Rental Site Infrastructure Project, which had an in-service date of November 2020. Additionally, please indicate whether work was carried out by YEC staff or consultants. If external consultants were hired, please explain the competitive process that was followed.

ANSWER:

(a), **(b)**, **(c)**, and **(d)**

Section 2.4 of the Application provides details on the determination of the N-1 dependable capacity shortfall for 2021 and other years, including the criteria established in this regard in YEC's 2006 Resource Plan, updates carried out since that time, and the 2016 Resource Plan assessment of the N-1 capacity shortfall that emerged at that time and was forecast to grow until material new dependable capacity was developed. In January 2020, YEC experienced record peak demands which increased forecast capacity requirements.

As summarized at page 2-15 of the Application, under the N-1 dependable capacity criterion the N-1 capacity shortfall in 2021 without rented diesels is forecast at 25.75 MW after including the LNG Third Engine new dependable capacity of 4.2 MW. Provision of 27 MW of rented diesels using the referenced diesel rental infrastructure at Whitehorse and Faro is shown to result (in combination with the LNG Third Engine) with a surplus of dependable capacity of approximately 1.25 MW for 2021. In summary, both the LNG Third Engine and the rental diesels with related infrastructure were needed to meet the N-1 capacity criterion in 2021.

YEC's recent 10-Year Renewable Electricity Plan at Figure 17 and Table B3 provides a Base Case forecast of the substantial annual N-1 capacity shortfall absent diesel rentals that grows to 50 MW by 2035/36 with existing, committed and planned resources that include the Battery Energy Storage System, Diesel Replacement and DSM program projects. This updated resource plan includes proposed future renewable generation projects (i.e., Atlin Hydro Expansion Project and Tutshi- Moon Pumped Storage) that would provide permanent dependable capacity to remove this N-1 capacity shortfall (see summary at Table D1 of the plan). For a copy of this plan, please see Attachment 1 to CW-YEC-1-36(a). Even with this permanent solution, the diesel rental infrastructure will continue to enable back-up diesel rental capability if required.

(e)

The Faro rental site was commissioned and in service December 1, 2020.

The construction of the site was primarily carried out by YEC staff. Construction support was provided through existing vendor service contracts.

Engineering design and support was provided through an RFQ process, with the lowest price qualified bidder awarded the contract.

REFERENCE: **Application, Tab 5.2.1.3, pages 5-8 to 5-10**

ISSUE: **The Mayo-McQuesten Transmission Line Upgrade Project**

QUOTE: From page 5-8 of the Application:

"The Mayo – McQuesten Transmission Line (MMTL) project involves the construction of a new 138 kW framed transmission line from the Mayo to McQuesten substations as well as the installation of electronic voltage support equipment (Statcom) at Stewart Crossing South substation that will improve overall reliability and power quality in the system. The [Mayo – McQuesten Transmission Line Upgrade Project] transmission will initially be operated at 69 kV.

The existing 69 kV transmission line from Mayo to Keno constructed by the Northern Canada Power Commission (NCPC) in 1951 is at end of life and in need of replacement. The transmission line has experienced both reliability and power quality issues with an increasing number of outages on the line affecting customers on a system wide basis. Key requirements under the VGC Group PPA include development of the McQuesten Substation plus new transmission to replace the existing 69 kV facilities between at least Mayo and McQuesten by approximately summer of 2020." (footnote removed)

From page 5-9 of the Application:

"Later stages will proceed only when loads in the area justify increasing the operating voltage to 138 [kV], and when additional federal funding becomes available … Increased power transfer/ capacity will also support economic development in central Yukon, as well as connection of renewable energy sources such as hydro, wind and solar."

"Effects assessment and stakeholder engagement development activities for all project stages were undertaken in 2015 and 2016. As reported during the 2017-18 GRA, all project permits were in place, including the land use permit, access permits and highway permits. No

additional permitting was anticipated to be required." (footnote removed)

From page 5-10 of the Application:

"Decommissioning of the old 69 kV line is expected to occur between November 2020 and December 2020. Substation construction at Stewart Crossing commenced in August 2020 and is expected to be completed by June 2021. An order has been placed for the Statcom and it is in manufacturing. Statcom delivery is expected to occur by August 2021, with installation in September 2021 and commissioning completed by October 2021."

QUESTION:

a) Please provide the reliability criteria YEC utilizes in assessing the viability of its electric system (e.g. the thermal limit ratings and acceptable voltage range on transmission lines).

b) Please provide and explain the studies that were conducted to show that the existing 69 kilovolt (kV) transmission line had reliability and power quality issues. For example, did YEC carry out a contingency analysis that showed this line exhibited reliability criteria violations?

c) Please explain how often YEC carried out studies and assessed the reliability of the existing 69 kV transmission line in the past.

d) Please explain why YEC proposed to install STATCOM in this project. Were any other alternatives to STATCOM explored (e.g. static VAR compensators or synchronous condensers)? If other alternatives were explored, please provide the costs of these alternatives and the reasons these alternatives were dismissed.

e) Please provide the number and duration of outages experienced on the line in the last 10 years, on a per annum basis, and the costs incurred due to these outages.

f) Please provide and explain the studies that were conducted to show the Mayo-McQuesten Transmission Line Upgrade Project resolved reliability and power quality concerns.

g) Please explain if any other alternative solutions were proposed and explored. If applicable, please provide and explain the studies conducted on these alternatives and provide the costs of these alternatives.

h) Given that YEC plans to operate this new line initially at 69 kV and future load will need to justify an operating voltage of 138 kV, please explain why YEC considered it prudent to spend capital on infrastructure designed for 138 kV.

i) Please explain if there were any concerns brought up during stakeholder engagement sessions and if there are any outstanding concerns to date.

j) Please provide details on the selection process of contractors for this project, including how contracts were awarded for this project.

k) Based on the information provided in page 5-10 of the Application, please provide an update on the project. For example, did YEC decommission the old 69 kV line?

ANSWER:

(a)

Attachments 1 this response provides Transmission Line Design Criteria Stewart to Keno Transmission Project 138 kV Transmission Lines which is relevant to the MMTL Project. Attachment 2 provides YEC L170 Transmission Line – Clearance and Structural Evaluation Criteria" – this document defines YEC's evaluation criteria for all structures, and is also relevant to the MMTL project.

(b), **(c)** and **(e)**

As noted in Tab 5, Section 5.21.3 of the Application, a new line from Mayo to the Keno City region is required at this time to replace the end of life existing 69 kV line constructed in the 1950's. This line is in poor condition and there has been a significant degradation in

reliability. This was reviewed previously during the 2017 VGC Group PPA proceeding and the 2017/18 GRA[1], and is also supported by data collected from inspections.

In the early 1990s, Yukon Energy noted that the line was significantly deteriorated and needed to be rebuilt or abandoned due to safety and reliability concerns;[2] however, at the time a rebuild could not be justified due to the closure of UKHM. As an alternative, minimal capital improvements were undertaken at that time to maintain the line and ensure continued service to existing non-industrial customers;[3] and over the past 15+ years transmission line repairs have been required on an ongoing basis to address reliability concerns.

More specifically, the Stewart- Keno Transmission Line Project Proposal filed with YESAA in 2015 noted[4]:

> Transmission line repairs have been required over the past fifteen years to address ongoing reliability concerns. Line reliability has also become a more significant issue and line outages have increased, affecting customers on the Integrated Grid (including local customers as well as customers as far away as Dawson City and Whitehorse). For example, outages on the Mayo to Keno line have increased from 4 outages in 2012, to 6 outages in 2013, to 19 outages in 2014 to 20 outages (to the end of Q3 2015) – outages for 2015 are forecast to be 27. Further, in 2011, 35% (or 188 of 535) of the structures on L250 failed the test and treat assessment undertaken at that time and were considered unsafe to climb, limiting the maintenance work that can be safely undertaken on these structures. The

[1] See for example, YEC's 2017 VGG Group PPA Application, section 4.3; and 2017/18 GRA Section 5.3.1.1; and response to YUB-YEC-1-78.

[2] The Yukon Energy 1992 Resource Plan notes "This line was built in 1952 with untreated native poles, which have long since rotted at ground level. Virtually every pole on this line has been stubbed (a small pole attached at ground level) or cribbed (a rock filled culvert or container added) over the last forty years. The line was identified as a severe safety hazard for Company employees and the general public."

[3] In its 1992 Resource Plan, Yukon Energy noted that "it was recognized for many years, by both NCPC and YEC, that the Mayo-Elsa-Keno City transmission line urgently needed to be either re-built or abandoned." At the time, it was noted that "this project just could not continue to be deferred indefinitely," and "essential work had to be performed to ensure the safety of the line." The option of abandoning the transmission line was considered and discarded at the time for the following reasons: (1) Additional loads are also supplied from this line, via Keno City, CBC and NWTel tower sites, Silver Trail Lodge and a number of YTG Highways heat traces in culverts; and (2) The cost of diesel generation would be at least $250,000 per annum based on approximately 2.5 kWh consumption at 10 cents per kWh by UKHM.

[4] Stewart-Keno Transmission Line Project Proposal, Chapter 6, page 6-3.

remoteness of the line as well as terrain and access challenges also magnify the costs and difficulties involved in managing maintenance and reliability of this asset.

No power quality studies were performed for the existing 69kV transmission line due to the fact that the numerous outages were the assumed to be the cause of power quality issues experienced.

The following is noted regarding past inspections/ assessments for L250:

- A Line inspection was performed on L250 in 2002.
- A detailed Line inspection was performed on L250 in 2008.
- Wood pole test and treat was performed on the line on L250 in 2011.
- Outage statistics on L250 are updated as they occur.

Yukon Energy performs overhead line inspections and wood pole test and treat inspections to determine the condition of the line and poles. Outage reports are also reviewed annually to identify reliability issues.

See Table 1 below for a summary of the outages from 2011 to 2020 mid-year. Total cost to respond to outages (planned and unplanned) are about $320,900 (2012 to date) with an average annual cost of roughly $35,655. Additionally, capital investment in this line over the same period totaled $963,700.

Table 1: Number and Duration of Outages: 2011 to 2020

Year	Unplanned Outages	Planned Outages	Total Outages	Outage Hours
2011	8	0	8	16.19
2012	4	0	4	5.91

(d)

YEC explored three alternatives: the STATCOM (Static synchronous compensator); SVC (static VAR compensator); and the synchronous condenser.

The synchronous condenser was proposed as the best solution as it provided reactive power support while also being able to recover the system frequency with excursions below 64Hz in a large load loss such as Eagle Gold Mine. However, due to the associated costs the STATCOM was chosen as a compromise as its more responsive than the SVC solution.

See Table 2 below for further details.

Table 2: Stewart Crossing Potential FACTS Solutions

	STATCOM	SVC	Synchronous Condenser	BESS plus STATCOM
Pros	Fastest response for reactive power support.	The most economical solution for reactive power support.	Provides frequency stability enhancement in addition to reactive power support. This may avoid predicted and future review/changes for frequency protection relays or RASs.	Potentially addresses frequency issues.
Cons	There are no cons associated with the STATCOM solution, for providing the required reactive power support	It is considered as a harmonic source, and doesn't have a quick response time compared to the STATCOM (e.g. flicker).	No-load running losses; may require additional maintenance when compared with the STATCOM or SVC solution.	Not commercially available. Would require custom design and assembly.
Relative Budgetary Cost *	1.0	0.90 - 0.95	1.4 – 2.0	Unknown. Costs would need to be determined via communication with the potential suppliers.
Other Notes	For low inertia systems, the addition of a STATCOM (as a solution for the deficient reactive power support) is a fix for only one issue. However, the wide swing of frequency may impact the evaluation of the required reactive power support.	This technology is fading in popularity. A STATCOM would be the preferred solution for reactive power support.	Synchronous condensers (synchs) are the solution for both reactive power deficiency and frequency instability. Synchs will provide long term operational easiness. They will also reduce or eliminate the need for future frequency RASs. YEC personnel have O&M synchronous condenser experience.	This solution would require significant research/study, consultation/coordination with suppliers, etc. which would result in additional time and cost for the project. Ongoing costs associated with battery life would need to also be considered.

NOTE: * The above relative budgetary costs are provided based on Teshmont's in-house information. Supplier input was not obtained.

(f), **(g)** and **(h)**

As noted in part (b) a new line from Mayo to the Keno City region is required to replace the end of life existing 69 kV line constructed in the 1950's. This fundamental requirement necessitated the project as a key element of the PPA as approved by the Board.

Please see Attachment 1 to this response which provides the Chimax Inc Transmission Line preliminary design report; and Attachment 2 which provides the Chimax Inc Transmission Line Scope Extension Report which reviews overall project cost comparisons between Mono Pole and H-Frame transmission structures.

As reported on and reviewed during the VGC Group PPA proceeding, an assessment was also carried out to determine the transmission upgrades required to supply the proposed Eagle Gold facility (EG) from the Yukon Energy Corporation (YEC) power system while providing acceptable service and reliability to EG and existing YEC customers. This study confirmed the system upgrades required (as provided for in the PPA), and the STACOM requirement as part of the overall system improvements.

The decision to complete the design of the project using a 138 kV standard was made in March 2017 as a result of completion of the detailed design of the powerlines and substations and comparative pricing using 138 and 69 kV design standards. Table 3 below provides a cost comparison. Cost reductions shown in Table 3 are in comparison with the 138 kV H-frame design. For L180 line the cost reduction to use a 69 kV design compared to 138 k was less than 10% (between 3.8% and 9.4%).

Table 3: Preliminary Cost Estimates SKTP

Estimated Cost	**$12,117,969.81**	**$11,392,153.10**	**$11,653,153.28**	**$10,980,670.20**	**$7,745,383.47**	**$7,253,352.25**	**$6,728,713.44**
cost per km	$390,902.25	$367,488.81	$375,908.17	$354,215.17			
Comparison							
Cost Differences		($725,816.71)	($464,816.53)	($1,137,299.61)		($492,031.22)	($1,016,670.03)
% Reduction		-5.99%	-3.84%	-9.39%		-6.35%	-13.13%
Assumptions:							
All mono pole embedments are based on 10% pole length plus 6ft (from grade). Actual embedment requirement will vary, require additional engineering in final design.							
For 138kV mono pole, average pole span is approximately 150m (cable galloping governed)							
For 69kV mono pole, average pole span is approximately 120m (cable galloping governed)							
Remarks:							
The increased structure count and combined with higher Braced Post Insulator cost, the mono pole option with braced post insulator would not provide significant saving compared with H-Frame structure. The reduced 69kV span allow utilization of post insulator which can significantly reduce the overall cost.							

The decision to utilize a 138 H-frame design was based on the following factors:

1. For an increase in initial capital cost of between 4 % and 10% (for L-180 this would amount to between $0.5M and $1.0M) from 69 to 138 kV.

2. The benefits of prebuilding to a 138 kV standard are an increase in the ultimate line capacity of up to 400%.

3. The existing powerline is at its end of life and must be replaced in order to continue to serve existing customers in this region and new industrial customers.

4. It is not possible to upgrade a 69 kV line to 138 kV design at a later date cost effectively if at all.

5. The long term plan for any expansion to the Yukon's hydro grid is at the 138 kV voltage level or higher due to the small incremental capital cost between 69 kV and 138 kV.

6. Increase in reliability.

The selection of 138 kV vs 69 kV for this project was also addressed at some length during the VGC PPA proceeding. It was noted that the VGC Group PPA default transmission option defines a minimum priority development consistent with the SKTP planning to provide 138 kV capability to facilitate potential future load and/or renewable resource supply development in this region. Key features noted included the following:

- SKTP planning assessed transmission options, including 69 versus 138 kV options, and concluded that the mono pole option with braced post insulators at 69 kV would not provide significant cost savings compared with the proposed H-Frame structure and 138 kV when assessing costs for this new transmission.

- Further, proceeding to install a 69 kV transmission option with adequate upgrade limited only for VGC Group and Alexco would maintain existing service, but ignore the opportunity to strengthen and enhance the existing grid system to better support future development opportunities in the region.

- The example of the existing relatively new 69 kV from Stewart Crossing to Mayo highlights the significant added costs to come back in future (as per the full SKTP proposal) to increase the capability of transmission to 138 kV after a new 69 kV line has been installed.

It is expected that reliability will improve through replacing a 66 year old transmission line (built in the 1950's) that is at end of life with a new transmission line that is installed using today's line design standards.

Once the line is in service, reliability will be tracked.

(i)

Attachment 1 summarizes concerns raised by members of the public as part of the public engagement process to support the development of the Project Proposal for the Stewart-Keno Transmission Line Project and how these concerns were addressed.

During construction – the following stakeholder engagement occurred:

- Virtual meetings with FNNND Council, Village of Mayo and Selkirk Development Corporation (designate for Selkirk First Nation) to discuss status of the project, COVID-19 safety plans and to determine any concerns with proceeding with the project during COVID-19 (no concerns were raised about proceeding with the project during COVID-19 so long as YEC followed strict project and community COVID-19 safety plans).

- Weekly Project Updates to contacts at the FNNND, Selkirk First Nation, Village of Mayo, Selkirk Development Corporation and NND Development Corporation. These started in June 2020 and have continued since.

- Monthly Project Updates prepared for Village of Mayo Council, FNNND Council and Selkirk First Nation Council. Emailed to each government's designates beginning in June 2020 and have continued since.

- One Newspaper ad that ran in the Yukon News in June 2020 to advise Yukoners that the project was moving forward.

- Project Newsletters mailed to residents in Mayo, Keno and Pelly with updates about the project. Newsletters were distributed in June 2020, August 2020 and February 2021.

- A virtual public meeting hosted on June 11, 2020 to discuss the project. Less than five people attended.

- Project information is provided on YEC's website and in occasional social media posts.

YEC received a complaint about ruts that were left in a resident's driveway by one of YEC's contractors during construction. The complaint was addressed and repairs were made to the driveway.

The Department of Environment, Government of Yukon also engaged YEC to discuss a public complaint of construction-related disturbances to the Minto Creek Bridge Interpretive Trail area. Yukon Energy prepared a restoration plan for consideration by YG in this regard and expects to implement the restoration activities in the spring and summer of 2021 as it conducts other post-construction clean-up activities along the transmission line typical of such projects.

(j)

Contractors were selected through a competitive RFP process. Each of the contacts were evaluated based on technical ability, price and the ability to provide FN opportunities. Once the evaluation process was completed and successful bidder selected based on total score, contract negotiations began, were finalized and signed.

(k)

The L180 Transmission line will be completed and fully energized in March 2021. Upon energization of the new line, the old 69kV line will be decommissioned / removed with an anticipated end date of April 2021.

1.0 Project Overview

Yukon Energy Corporation (YEC) is proposing to construct a 138kV transmission line from Stewart Crossing South (SCS) substation to Keno City (KC) substation. The overall transmission line and associated substation construction or modification is grouped as SKTL project.

1.1 Project Descriptions

The proposed 138kV transmission line route originates and travels north from SCS substation (S251) generally parallel existing L175 138kV transmission line to a point north of Stewart Crossing North (SCN). At this point the route turns east and parallels the existing L176 69kV transmission line to Mayo substation (S249). The transmission line will turn northeast to parallel the existing L250 69kV transmission line to KC substation (S257). A new substation at McQuesten (S258) will be constructed north of Halfway Lakes to convert voltage from 138kV to 69kV. The transmission line from S258 to S257 will be constructed for 138kV and energized at 69kV.

The existing L176 and L250 69kV transmission right of way is 60m wide which should accommodate 2 (two) parallel transmission line circuits.

The preliminary design will assess deviations from the YEC primary proposed route due to land use conflicts, environmental restriction, construction and maintenance access, geological restriction, etc.

DRAFT

2.0 Design Codes and Regulations

The design of the 138kV transmission line will be based on both deterministic approach as per CSA C22.3 No.1 (C22.3 No.1) "Overhead System" and reliability approach as per CSA C22.3 No.60826 (C22.3 No.60826) "Design Criteria of Overhead Transmission Lines".

The conditions outlined in CSA C22.3 No.1 are minimum design requirements for both transmission and distribution overhead lines.

CSA C22.3 No.60826 outlines additional extreme weather conditions and design requirements for transmission line voltage exceeding 70kV (phase – phase voltage) as recommended in CSA C22.3 No.1 Section 10.

YEC has specified the design of the SKTL transmission lines to comply with Alberta Electrical Utility Code (AEUC) in addition to CSA code requirements. Chimax will also review and incorporate the relevant information and guidelines outlined in the Alberta Electrical System Operator (AESO) ISO Rules Section 502.2 "Bulk Transmission Line Technical Requirements".

In addition to the Canadian overhead line design code, additional design codes and regulations will be followed for each transmission line component design. A full list of design codes and regulations is provided in Appendix B.

DRAFT

3.0 Meteorological (Climate) Data

3.1 Site Descriptions

The closest meteorological locations outlined in both C22.3 No.1 and C22.3 No.60826 is Dawson City.

3.2 Deterministic Approach Weather Case

CSA C22.3 No.1 Section 7 outlines the minimum deterministic weather loads shall be applied to each line components. C22.3 No.1 Annex C Figure C.1 indicates that the Yukon falls under CSA Medium A Loading condition which does not represent local observed ice loading situations. The CSA Heavy Loading is used for the previous CSTL and proposed transmission lines. Parameters are given in C22.3 No.1 Table 30 and are listed as follows:

Table 3.1

Conditions	Temperature (°C)	Horizontal Wind Loading (N/m^2)	Radial Ice	
			Thickness (mm)	Ice Density (kg/m^3)
CSA Heavy	-20	400	12.5	900

3.3 Reliability Approach Weather Cases

CSA C22.3 No.60826 is the Canadian adaptation of IEC 60826 "Design criteria of overhead transmission lines", with implementation of appropriate Canadian variations and weather parameters. C22.3 No.60826 Table CA.1 listed 50 years return period (1/50) weather conditions for Canadian Locations. The mean annual maximum snow accumulation depths are provided in CSA C22.3 No.1 Table D.1. The ice, wind and snow depth parameters for the closest meteorological locations to the transmission line are listed below:

Table 3.2

Locations	Reference Average Minimum Temperature (°C)	Reference (1/50) Wind Speed (km/h)	Reference (1/50) Radial Ice		Mean Annual Maximum Snow Depth (m)
			Thickness (mm)	Ice Density (kg/m^3)	
Whitehorse (reference)	-43	85	10	900	0.4
Dawson City	-51	80	10	900	0.6

The ambient temperature for radial ice formation due to freezing precipitation is assumed at -10°C.

The reference wind and ice loading values given above are based on 1 in 50 year (1/50 return period) event.

3.3.1. Reference Ice Loadings

The reference ice loading listed in CSA C22.3 No.60826 does not reflect the occasionally observed rime ice condition on existing transmission line in Yukon. Additional ice loading of 51mm (2") rime ice (density of 350kg/m^3) has been included in the design of the proposed transmission line.

The cable diameter factor and structure height factor according to C22.3 No.60826 Section 6.3.4.1 will be adjusted accordingly in PLS-Cadd model for site specific design.

3.3.2. Reference Wind Loading

The 1 in 50 return period reference wind loading is recommended for the design of the transmission line for capital cost minimization.

3.3.3. Combined Wind and Low Temperature

As per requirement under CSA C22.3 No.60826 Section 6.2.4 for span typically less than 200m, combination of minimum temperature with wind shall be included for reliability design load scenario. The combination shall be verified for reference average minimum temperature with 60% of design wind speed. The design wind speed for combination with minimum temperature is recommended to be 1 in 50 return period.

3.3.4. Combined Ice and Wind Loadings

The requirement of combination of the ice with wind is defined in CSA C22.3 No.60826 Section 6.4. The section outlines two ice and wind combinations as follows:

- Reduced Ice with High Wind - 85% Reference Ice with 60% Reference Wind (normal combined ice and wind)
- High Ice with Average Wind - 130% Reference Ice with 40% Reference Wind (extreme combined ice and wind with spatial factor)

The recommended level of reliability for ice loading combined with wind loading shall be 1 in 50 return periods.

DRAFT

4.0 Electrical Design Criteria

4.1 Code Clearances

4.1.1. Vertical and Horizontal External Clearances

4.1.1.1. Vertical Clearances

The minimum vertical ground clearance required for lowest cable is listed in C22.3 No.1 Table 2 (ground clearances), Table 3 (waterways), Table 9 (building, signs, fence, etc.) and Table 10 (bridges).

Segments of the proposed transmission lines are located at altitude between 1000 m to 1300 m above sea-level. According to C22.3 No.1 clause 5.3.1.1 (b), the required clearance shall be increased by 1% for each 100 m above of 1000 m. The designed high altitude clearance will be based on 3% increase of basic minimum clearance.

The minimum code specified clearance and recommended design values are summarized below:

Table 4.1 - 138kV (Maximum Voltage 155kV Ph-Ph) Vertical Ground Clearance

Clearance Descriptions	C22.3 No.1 Min. Clearance	Mean Annual Snow Depth	Survey Tolerance	Const. Tolerance	138kV Design Clearance	138kV High Altitude Clearance
	(m)	(m)	(m)	(m)	(m)	(m)

Buildings	4.2	0.6	0.3	0.3	5.4	5.6
Signs, Fences, etc.	4.2		0.3	0.3	4.8	5.0
Bridges	3.4	0.6	0.3	0.3	4.6	4.8
Ground Clearance (AEUC 2013 Table 5)						
Non-Vehicular Clearance (Pedestrian / ATV < 3.6m)	5.0	0.6	0.3	0.3	6.2	6.4
High Load Clearance (Vehicle Height <5.3m)	6.7		0.3	0.3	7.3	7.5

The C22.3 No.1 vertical clearances between cable crossings not supported by same structure are listed in C22.3 No.1 Table 13.

In addition to C22.3 No.1 wire crossing specification, Local Distribution Companies (YEC & AEY) should be consulted at each crossing for specific requirement during the final design.

Table 4.2 - Aerial Cable Crossing Vertical Clearance

Upper Cables **Lower Cables**	**69kV (m)**	**138kV (m)**
Communication	0.9	1.2
Secondary (<750V)	0.8	1.1
Distribution (>750V & ≤34.5kV)	0.9	1.2
Sub-Transmission (>44kV & ≤69kV)	1.1	1.4
138kV to 138kV		1.5
Limit of Approach		2.5

The wire crossing of the 138kV transmission lines will be designed based on the highest specified clearance requirement.

4.1.1.2. Horizontal Clearances

The horizontal cable clearance is defined for cable under conductor Blowout Wind condition as specified in C22.3 No.1 Section 5.2.7 & A5.2.7. The horizontal clearance requirements are specified in C22.3 No.1 Table 6 (Railroad), Table 9 (building, signs, fence, etc.), Table 10 (bridges) and Table 35 (flashover for tree pruning).

Table 4.3 – 138kV Horizontal Electrical Ground Clearance

Clearance Descriptions	**C22.3 No.1 Min. Clearance**	**Survey Tolerance**	**138kV Design Clearance**
	(m)	**(m)**	**(m)**
Railroads (CSA C22.3 No.1 Table 6)			
Main Tracks	3.5	0.3	3.8
Sidings	2.9	0.3	3.2
Features (C22.3 No.1 Table 9, Table 10 & Table 35)

Signs, Fences, etc.	2.6	0.3	2.9
Bridges	2.2	0.3	2.5
Tree Pruning	0.97	0.3	1.3

The specified horizontal conductor clearances are specified for locations where vertical clearances are not achieved.

In addition to conductor electrical clearance, minimum structure clearances in proximity to adjacent features are also governed by appropriate national, provincial and local bylaws.

Table 4.4 – Structural Clearance to Adjacent Facilities

Clearance Descriptions	Min. Clearance (m)
Railroads (C22.3 No.1 Table 7)	
Railroad Tracks	
Main Tracks	2.5
Sidings	1.9
Road Clear Zone Requirement	
Edge of Road	7.0
Edge of Highway	9.0

4.1.2. Electrical Clearances to Structures

Electrical clearance from energized conductors and hardware depends on maximum system voltage and switching surge ratio of the transmission system.

The minimum electrical clearances between phase conductors to supporting structure for voltage greater than 50kV phase-ground (<69kV phase-phase) are outside of the voltage range specified in C22.3 No.1. American National Electrical Safety Code (NESC – IEEE C2) shall be used to determine the electrical clearances between energized live parts and support structure components. As per NESC clause 235E1 for 138kV transmission lines, Table 235-6 shall provide the minimum clearance requirements. In addition, CSA C22.3 No. 1 Table A.1 provides flashover to ground distance based on typical switching surge factor.

Table 4.5.1 – 138kV Electrical Clearances to Structures

Clearance Descriptions	Minimum Clearance (m)
NESC Table 235-6 (290 Pa [6 psf] wind @ 15°C)	
Surface of Structure	0.81
Anchor Guys

Extreme Hourly Wind	0.33

DRAFT

Table 4.5.2 – 138kV Electrical Design Clearances for Insulator Swing

Cable Conditions	Design Minimum Clearance (m)
Every Day Temperature	1.27
Blowout Wind (290 Pa wind @ 15°C)	0.97
-51°C	0.81
1/50 IEC Gust Wind	0.33

4.1.3. Lightning Performance and Shielding

The average structure height (ground to OPGW and OHGW) of the proposed transmission lines shall be below 92ft, the shielding angle of 30 degree, as per RUS 1724E-200 Table 8-3, was used for the determination of shieldwire and phase conductor separation.

Shielding angle of lightning protection by OPGW and OHGW shall be verified based on latest edition of IEEE Standard 1243 "Guide for Improving the Lightning Performance of Transmission Lines". The ground flash design should either be based on historical data (when available) or IEEE Std. 1243 equation (2) or equation (3).

4.1.4. Grounding

Pole and shieldwire grounding shall be installed at every structure location. Unattached grounding system resistivity shall be 100 ohms or below. Grounding study shall be performed in final design phase to estimate number of ground rod(s) at each ground connection.

4.1.5. Galloping Conductors

Conductor and shield wire separations will be assessed for ice and wind galloping under the following conditions;

Table 4.6 – Galloping Conditions

Conditions	Temperature (°C)	Horizontal Wind Loading (Pa) [psf]	Radial Ice	
			Thickness (mm)	Ice Density (kg/m^3)
Galloping Swing	-5	95.7 [2]		
Galloping Ice	-5	95.7 [2]	12.7	900

An additional separation of 0.3m shall be provided between galloping ellipses for design buffer.

4.2 Clearance Buffers

The proposed design clearance buffers has been listed in each of the clearance categories

4.3 Structure Spotting Criteria

The preferred standard design span for proposed 138kV transmission lines to be 150m to 180m based on phase separation requirement under galloping conditions and maintaining reasonable structure height during extreme ice loading conditions. The actual design spotting will be based on above

consideration with right of way constraint and adjacent utilities provided in topographical survey utilizing PLS-Cadd 3D TIN terrain model.

4.4 Ampacity Rating Criteria

The phase conductor ampacity calculations are performed based on IEEE Std. 738-2013. C22.3 No.1 Section 3 "Rated ampacity" which outlines the basic ambient and cable conditions to be used for the ampacity calculation.

The ampacity calculations based on parameters outlined in Table 4.4.1 for selected phase conductor cable 266.8MCM ACSR (Partridge) and 397.5MCM ACSR (Ibis) are performed using PLS-Cadd embedded IEEE 738-2013 module. The PLS-Cadd program generated ampacity calculation outputs are given in Appendix F. The calculated continuous and limited thermal ratings for a single conductor are summarized below:

Table 4.7 – IEEE Std. 738 Ampacity Calculations

Parameters	**CSA C22.3 No.1**	**AESO 502.2**
Ambient Temperature	40°C	40°C
Case 1 – Maximum Thermal Rating (Maximum Conductor Temperature)	100°C	100°C
Case 2 – Operating Temperature 40 MW (44.5 MVA) x 1.25 OL @138 kV	240 A	240 A
Case 3 –Design Thermal Rating (Design Conductor Temperature)	75°C	75°C
Wind Speed	0.61 m/s (2 ft/s)	0.61 m/s (2 ft/s)
Wind Angle to Conductor	90°	90°
Conductor Latitude	63.6°	63.6°
Conductor Elevation (above sea level)	800m	800m
Conductor Direction (maximum solar heat)	E-W	E-W
Emissivity	0.5	0.6
Solar Absorption Coefficient	0.5	0.8

Table 4.8 – Conductor Continuous and Limited Thermal Ratings

Cable Conditions	**CSA C22.3 No.1**	**AESO 502.2**
Case 1 – Maximum Thermal Rating		
266.6 MCM 27/6 ACSR (Partridge)	484 A	475 A
397.5 MCM 27/6 ACSR (Ibis)	624 A	612 A
Case 2 – Operating Temperature		
266.6 MCM 27/6 ACSR (Partridge)	59.0°C	62.7°C
397.5 MCM 27/6 ACSR (Ibis)	54.9°C	58.9°C
Case 3 – Design Thermal Rating		

266.6 MCM 27/6 ACSR (Partridge)	361 A (62 MW @138 kV) (31 MW @69 kV)	341 A (58 MW @138 kV) (29 MW @69 kV)
397.5 MCM 27/6 ACSR (Ibis)	463 A (79 MW @138 kV) (39 MW @69 kV)	434 A (74 MW @138 kV) (37 MW @69 kV)

Based on above ampacity and conductor temperature data for the proposed 138kV transmission lines, the design conductor sag shall be based on conductor temperature of 75°C.

DRAFT

5.0 Structural Design Criteria

5.1 Conductor and Conductor Support Hardware

The conductor and conductor supporting hardware shall be design and selected to withstand the required loadings as per requirement outlined in this section.

5.1.1. Conductor Tension Limits

CSA C22.3 No.1-2006 and CSA C22.3 No.60826 design codes are based on maximum allowable design tensions under various loading conditions. However, the latest edition of CSA C22.3 No.1-2010 has been revised to recommended maximum initial catenary for phase conductor.

5.1.1.1. Tension Limit (% Ultimate Tensile Strength)

C22.3 No.1-2006 Table 34 and Table 35 outlined the tension limit of phase conductor and galvanized steel wire as lightning protection wires (Table 35 has not been modified in the 2010 edition).

Table 5.1 – CSA C22.3 No.1-2006 Allowable Cable Tension Limits

Loading Conditions	AAC, ACSR and Aluminum Alloys Phase Conductors	Galvanized Steel Wires
Maximum tension under appropriate loading conditions	60%	60%
Maximum recommended initial unloaded (initial) tension at mean temperature (EDT)	35%	20%
Maximum recommended final unloaded (creep) tension at mean temperature (EDT)	25%	15%

Strength factor for reliability design are listed in C22.3 No.60826 Section 7. The standard values for strength coefficient of variation is given in C22.3 No.60826 Table 18 and support design strength values for tangent / running and angle / dead end configurations are given in C22.3 No.60826 Canadian Section 7.3.3. The combined allowable material factors and equivalent tension limits are given below:

Table 5.2 – CSA C22.3 No.60826 Allowable Cable Material Factors

Conductor & Shieldwire	Cable Material Factor		Support Design Strength Factor	Combined Allowable Material Factor
	COV	Factor		
Intact Load	3%	0.962	0.80	0.77
Failure Load	3%	0.962	0.90	0.87

5.1.1.2. Maximum Initial Cable Catenary

CSA C22.3 No.1-2010 edition section 8.7.3 “Wire tension limits” has been revised to provide additional safety for fatigue damage of conductors due to aeolian vibration. C22.3 No.1 2010 Table 33 provides the recommended catenary parameter for different span lengths.

As per CSTL design requirement, the catenary parameter requirement is consistent with maximum 15% cable UTS under -50°C. These requirements did impact the structure height requirement but provide reliability where large ranges of temperature variation can occur.

5.1.1.3. Recommended Cable Design Criteria

In consideration of various governing factors for cable design criteria, the follow conditions and criteria are used for the design of conductor and OPGW / OHGW;

Table 5.4 – Recommended Cable Design Criteria

Design Conditions	Cable Condition	Conductor	OPGW / OHGW
C22.3 No.1 CSA Heavy	Loaded	50% UTS	50% UTS
C22.3 No. 60826 Extreme Ice	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Gust Wind	Loaded	50% UTS	50% UTS
C22.3 No. 60826 Wind & Low Temp.	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Ice & Wind (High Wind)	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Ice & Wind (Low Wind)	Loaded	70% UTS	60% UTS
EDT	Initial	35% UTS	20% UTS
EDT	Creep	25% UTS	15% UTS
Catenary @ Mean Annual Min. Temp.	Initial	1500 m	1500 m
Min. Temperature (-50°C)	Creep	15% UTS	15% UTS

5.1.2. Insulators, Support Hardware and Conductor Accessories

Reliability design utilizes actual environmental loadings based on desired project return period to compare with reduced allowable material resistances.

The allowable material strength is dependent on material consistency and structure reliability requirement. Material strength factor for reliability design are listed in C22.3 No.60826 Section 7. The standard values for strength coefficient of variation is given in C22.3 No.60826 Table 18 and support design strength values for tangent / running and angle / dead end configurations are given in C22.3 No.60826 Canadian Section 7.3.3. The combined allowable material factors are summarized below;

Table 5.5 - CSA C22.3 No.60826 Cable and Hardware Material Factors

Materials	Material Factor		Running		Deadend	
	COV	Factor	Intact (0.9)	Failure (1.0)	Intact (0.8)	Failure (0.9)
Insulators	5%	0.936	0.84	0.94	0.75	0.84
Hardware	5%	0.936	0.84	0.94	0.75	0.84

Despite C22.3 No.60826 outlines the allowable strength factors for insulator and hardware, manufacturers of insulator and hardware recommended the allowable strength for these items shall be 50% of the design tensile strength. The selection of insulators and conductor attachment hardware shall be based on manufacturer design limits, with exception of the high ice with average wind (130% Ice & 40% Wind) combination, the maximum insulator and hardware usage shall be 0.75.

5.2 Guys and Hardware

CSA C22.3 No60826 clause 7.3.1 outlines the damage limit of steel guys and Table 18 provide material strength factor for grouted guy anchor design. The design of guy anchors shall be according to IEEE Std. 691 "IEEE Guide for Transmission Structure Foundation Design and Testing".

5.2.1. Guy Strand & Hardware

The maximum allowable guy cable and hardware tension shall be 0.75 (75%) ultimate tensile strength as per CSA C22.3 No.60826 Table 14.

5.2.2. Guy Anchors

The maximum design loadings for commercial available guy anchor shall be according to manufacturer recommended holding capacity. The material factor for grouted rock anchor shall be as follows;

Table 5.6 - CSA C22.3 No.60826 Allowable Rock Anchor Material Factors

Materials	Material Factor		Running		Deadend	
	COV	Factor	Intact (0.9)	Failure (1.0)	Intact (0.8)	Failure (0.9)
Grouted Rock Anchor	10%	0.872	0.78	0.87	0.70	0.78

DRAFT

5.3 Structures

5.3.1. Load Factors

Deterministic approach is applied for designing transmission line components to withstand factored loads (vertical, transverse and longitudinal loads) under C22.3 No.1 conditions specific to the project area (see Table 3.1). The required overload factors are specified in C22.3 No.1 Section 7.4 to 7.9 and summarized in C22.3 No.1 Table 31.

Table 5.7 – CSA C22.3 No.1 Overload Factors for Limit State Design (Deterministic Approach)

Structure Type	Grade 2 Construction			Grade 1 Construction		
	Vertical	Trans.	Long.	Vertical	Trans.	Long.
Steel Components (crossarms, davit arms, braces, etc.)						
Tangent & Running Angle	1.15	1.10	1.00	1.30	1.20	1.10
Heavy Angle & Deadend	1.15	1.10	1.10	1.30	1.20	1.20
Wood Pole						
Tangent & Running Angle	1.50	1.30	1.00	2.00	1.90	1.20
Heavy Angle & Deadend	1.50	1.30	1.30	2.00	1.90	1.90

The allowable strengths for each transmission line structural component is calculated by PLS-Pole based on input material parameters, such as geometry, material yield strengths, mechanical properties of material type.

5.3.2. Strength Reduction Factors

The allowable material strength is dependent on material consistency and structure reliability requirement. Structural material strength coefficient of variation for steel component is given in C22.3 No.60826 Table 18 and support design strength values for tangent / running and angle / dead end configurations are given in C22.3 No.60826 Canadian Section 7.3.3. The combined allowable material factors are summarized below:

Table 5.8A - CSA C22.3 No.60826 Allowable Structural Material Factors

Materials	Material Factor		Running		Deadend	
	COV	Factor	Intact (0.9)	Failure (1.0)	Intact (0.8)	Failure (0.9)
Steel Component	5%	0.936	0.84	0.94	0.75	0.84
Wood Component	15%	0.808	0.73	0.80	0.65	0.73

5.4 Design Loads

The design load cases for the proposed 138kV transmission lines shall be based on the climatic data outlined in Section 3.

5.4.1.1. CSA Minimum Deterministic Load Case

The minimum design loads for the proposed transmission lines shall be CSA Heavy Condition as per Table 3.1.

5.4.1.2. Extreme Ice Load Cases

The maximum extreme ice loadings shall be designed for 1 in 50 years return period reference data.

5.4.1.3. Maximum Gust Wind Load Cases

The maximum gust wind loadings shall be designed for 1 in 50 years return period reference.

5.4.1.4. Combined Ice and Wind Load Cases

Both combination of ice with wind loading conditions will be evaluated according to Section 3..3.4.

5.4.1.5. Broken Wire and Unbalanced Ice Loads

For tangent and running angle structures, since the application of braced post insulator had limited longitudinal load capability, the unbalanced longitudinal loading conditions are not considered.

5.4.1.6. Containment Structures

All dead end angle structures and double dead end containment structures shall be designed to withstand complete one sided cable loadings in addition to standard configuration loadings under all climatic conditions.

5.4.1.7. Construction and Maintenance Loads

Construction and maintenance load requirements are specified in C22.3 No.60826 Section 6.5.

The lifting components (such as lifting vent if required) during structure erection shall have minimum safety factor of 1.5 for planned control operation.

The safety factor for cable tension shall be 2.0 during cable stringing operation with 50% of the applied tension added as longitudinal load on all running angle structures.

DRAFT

5.5 Structure Design

The wood pole design shall be preformed using PLS-Pole wood pole structural add-on application module. The PLS-Pole model shall include wood pole, steel crossarm, steel cross braces, insulators, guy cables, etc.

Attachment loadings will be generated by PLS-Cadd line design application using Method 4 "Structure Loads" calculations. Additional longitudinal loads for maintenance and construction scenario under every day temperature will be applied manually in PLS-Pole application.

5.6 Foundation Design

Transmission pole structures in this project are direct-embedded poles and shall be designed to resist the overturning moment, shear and axial loads generated from the design of pole structures using L-Pile caisson foundation application.

5.6.1. Moment Foundations

5.6.1.1. Design Philosophy

For direct-embedded method, the pole embedment length below the ground line shall be determined using an allowable lateral displacement approach. Horizontal subgrade reaction along the embedded length is determined based on borehole record information as per the geotechnical investigation report. Pole structure shall be designed to withstand the structural loading specified in other sections of this criteria document, and shall also be qualified to sustain the corresponding geotechnical loading to ensure structural integrity.

5.6.1.2. Deflection Limits

Pole recoverable deflection at ground line is limited to 25mm due to actual loading under normal weather condition, and 40mm due to actual loading under extreme weather condition. The soil input parameters for L-Pile application, such as friction angle for granular material and undrain strength for cohesive material, are deduced from site geotechnical report.

Evaluation Criteria

Re: ***YEC L170 Transmission Line – Clearance and Structural Evaluation Criteria***

1. General Description

The existing L170 138kV transmission line connects YEC Takhini switching station near Whitehorse and YEC Carmacks switching station at Carmacks. The L170 along with Carmacks to Stewart 138kV transmission lines (CSTL) (L173 Carmacks switching station to Minto Landing substation, L174 Minto Landing substation to Stewart Crossing South substation and L175 Stewart Crossing South substation to Stewart Crossing North switching station) provide the transmission grid tie between YEC southern operation area with northern operation area (Keno-Mayo-Dawson).

This document outlines the current governing design codes requirements for 138 kV transmission line clearance and structural criteria to be used in the evaluation of existing L170 structure compliance.

2. L170 Thermal Capacity & Conductor Temperature

The existing L170 has an operating capacity of 35MW with power factor of 0.93. The projected future capacity of L170 has been estimated to be 70MW. Based on power factor of 0.9, provide margin for flexibility, the calculated required ampacities are used in determination of the L170 conductor temperatures under different ambient temperatures and code reference conditions.

The CSTL 138kV transmission lines were designed with maximum conductor temperature of 75°C under both winter and summer conditions.

The phase conductor ampacity calculations are performed based on IEEE Std. 738-2013. The PLS-Cadd program generated ampacity calculation outputs are given in Appendix A.

Table 2.1 – IEEE Std. 738 Ampacity Calculations

Input Parameters	CSA C22.3 No.1	AESO 502.2	YEC Winter Operation	YEC Normal Operation	YEC Summer Operation
Ambient Temperature	40°C	40°C	10°C	15.6°C (60°F)	30°C
Wind Speed	0.61 m/s (2 ft/s)				
Wind Angle to Conductor	90°				
Conductor Latitude	61°				
Conductor Elevation (above sea level)	100m				
Conductor Direction (maximum solar heat)	E-W				
Emissivity	0.5	0.6	0.6	0.6	0.6
Solar Absorption Coefficient	0.5	0.8	0.8	0.8	0.8
Case 1 – Existing Thermal Loadings (35MW)	165 A				
Case 1 – Future Thermal Loadings (70MW)	330 A				
Case 3 – CSTL Design Conductor Temperature	75°C				

Table 2.2 – Conductor Continuous and Limited Thermal Ratings

Input Parameters	CSA C22.3 No.1	AESO 502.2	YEC Winter Operation	YEC Normal Operation	YEC Summer Operation
Ambient Temperature	40°C	40°C	10°C	15.6°C (60°F)	30°C
Case 1 – Conductor Temperature @ Existing Thermal Loadings (35MW)	54°C	57°C	28°C	33°C	48°C
Case 1 – Conductor Temperature @ Future Thermal Loadings (70MW)	71°C	75°C	44°C	50°C	65°C
Case 3 – Thermal Rating @ CSTL Design Conductor Temperature	358 A	337 A	500 A	474 A	399 A

3. Vertical Ground Clearance Criteria

In addition to compliance to CSA C22.3 No.1 "Overhead Systems", YEC is mandated to conform with Alberta Electrical Utility Code (AEUC) under Yukon regulation. The minimum code specified clearance and recommended design values are summarized below:

Table 3.1 - 138kV (Maximum Voltage 155kV Ph-Ph) Vertical Ground Clearance

Clearance Descriptions	Code Ref. Min. Clearance	Mean Annual Snow Depth	Survey Tolerance	Const. Tolerance	Summer Design Clearance	Winter Design Clearance
	(m)	(m)	(m)	(m)	(m)	(m)
Ground Clearance (CSA C22.3 No.1 Table 2)						
Vehicular Clearance (Vehicle Height <4.15m)	5.5	0.6	0.3	0.3	6.1	6.7
Non-Vehicular Clearance (Pedestrian / ATV)	4.0	0.6	0.3	0.3	4.6	5.2

Bridges	3.4	0.6	0.3	0.3	4.0	4.6
Ground Clearance (AEUC 2013 Table 5)						
Non-Vehicular Clearance (Pedestrian / ATV < 3.6m)	5.0	0.6	0.3	0.3	5.6	6.2
Vehicular Clearance (Vehicle Height <4.15m)	5.5	0.6	0.3	0.3	6.1	6.7
High Load Clearance (Vehicle Height <5.3m)	6.7	0.6	0.3	0.3	7.3	7.9

4. Structural Loadings

CSA C22.3 No.1 (Overhead Systems) Design Loadings

CSA C22.3 No.1 Section 7 outlines the minimum deterministic weather loads shall be applied to each line components. C22.3 No.1 Annex C Figure C.1 indicates that the Yukon falls under CSA Medium A Loading condition which does not represent local observed ice loading situations. The CSA Heavy Loading is used for the previous CSTL and proposed transmission lines.

Table 4.1 - C22.3 No.1 Table 30 Deterministic Weather Loads

Conditions	Temperature (°C)	Horizontal Wind Loading (N/m^2)	Radial Ice	
			Thickness (mm)	Ice Density (kg/m^3)
CSA Medium A	-20	400	6.5	900
CSA Heavy	-20	400	12.5	900

CSA C22.3 No.60826 (Overhead Transmission Lines) Design Loadings

CSA C22.3 No.60826 is the Canadian adaptation of IEC 60826 "Design criteria of overhead transmission lines", with implementation of appropriate Canadian variations and weather parameters. C22.3 No.60826 Table CA.1 listed 50 years return period (1/50) weather conditions for Canadian Locations. The mean annual maximum snow accumulation depths are provided in CSA C22.3 No.1 Table D.1. The ice, wind and snow depth parameters for the closest meteorological locations to the transmission line are listed below:

Table 4.2 - C22.3 No.60826 Table CA.1 Reliability Weather Reference Data

Locations	Reference Average Minimum Temperature (°C)	Reference (1/50) Wind Speed (km/h)	Reference (1/50) Radial Ice		Mean Annual Maximum Snow Depth (m)
			Thickness (mm)	Ice Density (kg/m^3)	
Whitehorse (reference)	-43	85	10	900	0.4
Dawson City	-51	80	10	900	0.6

The reference wind speed are based on 10 minutes average wind. Gust factor is applied in the PLS-Cadd program according the line configuration (typical factor of 1.6).

Ambient temperature for the corresponding wind and ice loadings are based on -10°C.

The reference ice loading listed in CSA C22.3 No.60826 does not reflect the occasionally observed rime ice condition on existing transmission line in Yukon. Additional ice loading of 51mm (2") rime ice (density of 350kg/m^3) has been proposed for the evaluation of transmission line structure.

Figure 4.1 – Extreme Rime Ice on L174 (2011)

Table 4.3 - Recommended Design Load Combinations

Conditions	Temperature (°C)	Horizontal Wind Loading (km/h) [Pa]	Radial Ice	
			Thickness (mm)	Ice Density (kg/m^3)
CSA Heavy	-20	25.5 [400]	12.7	900
IEC Ice	-10	--	12.7	900
IEC Wind	-10	85 [425]	--	--
IEC Wind & Low Temp.	-24	51 [161]	--	--
IEC Low Ice & High Wind	-10	51 [161]	10.8	900
Extreme Min. Temp.	-51	--	--	--
YEC Rime Ice	-30	--	-51	350

Gust and height factor applied in PLS-Cadd program according to code specification.

Based on available information, the existing L170 designs are based on the following load combinations.

Table 4.4 – Existing L170 (1968) Design Load Combinations

Conditions	**Temperature (°C) [°F]**	**Horizontal Wind Loading (Pa) [psf]**	**Radial Ice**	
			Thickness (mm) [in]	**Ice Density (kg/m^3)**
Extreme Ice	-18 [0°F]	--	25.4 [1]	900
CSA Ice & Wind	-18 [0°F]	383 [8]	12.7 [1/2]	900
Extreme Wind	-18 [0°F]	574 [12]	--	--
Extreme Min. Temp.	-37 [35°F]	--	--	--

5. Recommendations

For the evaluation of existing L170 structures and replacement structure design, the ground clearance should be based on projected future capacity of 70MW. The clearance criteria should be as follows:

Table 5.1 Recommended Clearance Criteria

Conditions	Conductor Condition			Clearance (m)	
	Temperature (°C)	Wind (Pa)	Ice (mm)	Along ROW	Cross / Along Highway
YEC Summer (30°C Ambient)	65	--	--	6.1	7.3
YEC Winter (10°C Ambient)	45	--	--	6.7	7.9
Rime Ice	-20	--	50 mm @350 kg/m^3	--	7.9

The structural evaluation of existing L170 structural components are recommended to comply with following loading criteria:

Table 5.2 Recommended Loading Criteria for Existing Structural Components

Conditions	Conductor Condition			Adjustment Factors	
	Temperature (°C)	Wind (Pa)	Ice (mm)	Wind Height Factor	Wind Gust Factor
CSA Heavy	-20	400	12.7 @900 kg/m^3	1	1
Extreme Ice	-20	--	25.4 @900 kg/m^3	1	1
IEC Wind	-10	425	--	IEC 60826	IEC 60826
Extreme Minimum Temp.	-51	--	--	1	1

The design of replacement structures shall conform to all loading listed in Table 5.2 and the following additional requirement:

Table 5.3 Additional Loading Criteria for Replacement Components

Conditions	Conductor Condition			Adjustment Factors	
	Temperature (°C)	Wind (Pa)	Ice (mm)	Wind Height Factor	Wind Gust Factor
IEC Wind & Low Temp.	-24	161	--	IEC 60826	IEC 60826
IEC Low Ice & High Wind	-10	161	10.8 @900 kg/m^3	IEC 60826	IEC 60826
Rime Ice	-20	--	50 mm @350 kg/m^3	1	1

Project Name: 'c:\project\cable ampacity.DON'

IEEE Std. 738-2012 method of calculation

Air temperature is 40.00 (deg C)
Wind speed is 0.61 (m/s)
Angle between wind and conductor is 90 (deg)
Conductor elevation above sea level is 1000 (m)
Conductor bearing is 248 (deg) (perpendicular to solar azimuth for maximum solar heating)
Sun time is 11 hours (solar altitude is 51 deg. and solar azimuth is 158 deg.)
Conductor latitude is 61.0 (deg)
Atmosphere is CLEAR
Day of year is 172 (corresponds to June 21 in year 2017) (day of the year with most solar heating)

Conductor description: 266.8 kcmil 26/7 Strands PARTRIDGE ACSR - Adapted from 1970's Publicly Available Data
Conductor diameter is 1.631 (cm)
CORE STRANDS:
       Diameter is 0.000 (mm)
Radial Thermal Conductivity is 2.00 (W/m-K)
Conductor AC resistance is     0.2136 (Ohm/km) at  25.0 (deg C)
                       and     0.2556 (Ohm/km) at  75.0 (deg C)
       Conductor resistance is computed using average of core and surface temperatures.
Emissivity is 0.5 and solar absorptivity is 0.5

Solar heat input is      8.734 (Watt/m) (corresponds to Global Solar Radiation of 1071.190 (Watt/m^2) - which was calculated)
Radiation cooling is     2.469 (Watt/m)
Convective cooling is   12.723 (Watt/m)

Given a constant ac current of 165.0 amperes,
The conductor surface temperature is 53.0 (deg C)
The conductor core temperature is 53.1 (deg C) (based on radial thermal conductivity of 2.00 (W/m-K))

Project Name: 'c:\project\cable ampacity.DON'

IEEE Std. 738-2012 method of calculation

Air temperature is 40.00 (deg C)
Wind speed is 0.61 (m/s)
Angle between wind and conductor is 90 (deg)
Conductor elevation above sea level is 1000 (m)
Conductor bearing is 248 (deg) (perpendicular to solar azimuth for maximum solar heating)
Sun time is 11 hours (solar altitude is 51 deg. and solar azimuth is 158 deg.)
Conductor latitude is 61.0 (deg)
Atmosphere is CLEAR
Day of year is 172 (corresponds to June 21 in year 2017) (day of the year with most solar heating)

Conductor description: 266.8 kcmil 26/7 Strands PARTRIDGE ACSR - Adapted from 1970's Publicly Available Data
Conductor diameter is 1.631 (cm)
CORE STRANDS:
       Diameter is 0.000 (mm)
Radial Thermal Conductivity is 2.00 (W/m-K)
Conductor AC resistance is     0.2136 (Ohm/km) at  25.0 (deg C)
                       and     0.2556 (Ohm/km) at  75.0 (deg C)
       Conductor resistance is computed using average of core and surface temperatures.
Emissivity is 0.5 and solar absorptivity is 0.5

Solar heat input is      8.734 (Watt/m) (corresponds to Global Solar Radiation of 1071.190 (Watt/m^2) - which was calculated)
Radiation cooling is     6.304 (Watt/m)
Convective cooling is   29.875 (Watt/m)

Given a constant ac current of 330.0 amperes,
The conductor surface temperature is 70.6 (deg C)
The conductor core temperature is 70.9 (deg C) (based on radial thermal conductivity of 2.00 (W/m-K))

IEEE Std. 738-2012 method of calculation

Air temperature is 30.00 (deg C)
Wind speed is 0.61 (m/s)
Angle between wind and conductor is 90 (deg)
Conductor elevation above sea level is 1000 (m)
Conductor bearing is 248 (deg) (perpendicular to solar azimuth for maximum solar heating)
Sun time is 11 hours (solar altitude is 51 deg. and solar azimuth is 158 deg.)
Conductor latitude is 61.0 (deg)
Atmosphere is CLEAR
Day of year is 172 (corresponds to June 21 in year 2017) (day of the year with most solar heating)

Conductor description: 266.8 kcmil 26/7 Strands PARTRIDGE ACSR - Adapted from 1970's Publicly Available Data
Conductor diameter is 1.631 (cm)
CORE STRANDS:
       Diameter is 0.000 (mm)
Radial Thermal Conductivity is 2.00 (W/m-K)
Conductor AC resistance is     0.2136 (Ohm/km) at  25.0 (deg C)
                       and     0.2556 (Ohm/km) at  75.0 (deg C)
       Conductor resistance is computed using average of core and surface temperatures.
Emissivity is 0.6 and solar absorptivity is 0.8

Solar heat input is     13.974 (Watt/m) (corresponds to Global Solar Radiation of 1071.190 (Watt/m^2) - which was calculated)
Radiation cooling is     3.600 (Watt/m)
Convective cooling is   16.690 (Watt/m)

Given a constant ac current of 165.0 amperes,
The conductor surface temperature is 47.1 (deg C)
The conductor core temperature is 47.1 (deg C) (based on radial thermal conductivity of 2.00 (W/m-K))

Appendix C – Transmission Line Cost Data

1.0 Project Overview

Yukon Energy Corporation (YEC) is proposing to construct a 138kV transmission line from Stewart Crossing South (SCS) substation to Keno City (KC) substation. The overall transmission line and associated substation construction or modification is grouped as SKTL project.

1.1 Project Descriptions

The proposed 138kV transmission line route originates and travels north from SCS substation (S251) generally parallel to the existing L175 138kV transmission line to a point north of Stewart Crossing North (SCN). At this point the route turns east and parallels the existing L176 69kV transmission line to Mayo substation (S249). The transmission line will turn northeast and parallel the existing L250 69kV transmission line to KC substation (S257). A new substation (S258) will be constructed north of Halfway Lakes to step down voltage from 138kV to 69kV. The transmission line from S258 to S257 will be constructed for 138kV and energized at 69kV.

The existing L176 and L250 69kV transmission right of way is 60m wide which should accommodate 2 (two) parallel transmission line circuits.

The preliminary design will assess deviations from the YEC primary proposed route due to land use conflicts, environmental restriction, construction and maintenance access, geological restriction, etc.

1.2 Design Codes and Regulations

The design of the 138kV transmission line will be based on both deterministic approach as per CSA C22.3 No.1 (C22.3 No.1) “Overhead System” and reliability approach as per CSA C22.3 No.60826 (C22.3 No.60826) “Design Criteria of Overhead Transmission Lines”.

The conditions outlined in CSA C22.3 No.1 are minimum design requirements for both transmission and distribution overhead lines.

CSA C22.3 No.60826 outlines additional extreme weather conditions and design requirements for transmission line voltage exceeding 70kV (phase – phase voltage) as recommended in CSA C22.3 No.1 Section 10.

YEC had specified the design of SKTL transmission lines to comply with Alberta Electrical Utility Code (AEUC) in addition to CSA code requirements. Chimax has also reviewed and incorporated the relevant information and guidelines outlined in the Alberta Electrical System Operator (AESO) ISO Rules Section 502.2 “Bulk Transmission Line Technical Requirements”.

The complete design criteria document (1513-DBM-0001) is provided in Appendix B.

2.0 SKTL Transmission Line Descriptions

2.1 L179 138kV TL – Stewart Crossing South Substation (S251) to Mayo Substation (S249)

The existing Stewart Crossing North substation is connected to Stewart Crossing South via L175 69kV H-frame configuration transmission line designed and built for 138kV operation and connected to Mayo substation (S249) via 69kV mono pole cross-arm transmission line. The proposed L179 138kV transmission line will run parallel to existing L175 and L176 transmission lines with nominal circuit separation of 20m.

The preliminary design of L179 is used to evaluate and finalize the proposed alignment for environmental permitting. The L179 design is also used as the baseline scenarios in comparing the fiber-optic cable configuration. The conductor size comparison between YEC current standard conductors are also performed during the preliminary design of L179.

2.2 L180 138kV TL – Mayo Substation (S249) to McQuesten Substation (S258)

The proposed L180 138kV transmission line will be replacing the existing L250 69kV transmission circuit line between Mayo substation and the proposed McQuesten substation. The existing L250 follows old highway alignments and crosses over the current highway in multiple locations while certain portions of the line are some distance from the highway right of way. The proposed L180 alignment will be parallel the existing L250 alignment with realignment to bring the new transmission line closer to the current highway alignment.

The proposed L180 is designed with H-Frame configuration with OPGW and shieldwire for fiber optic communication and lightning protection. As an alternative to supplying local service using 138kV potential transformer (P.T.) platform substation, mono framings with 25kV distribution underbuilt is also considered for cost comparison.

2.3 L250 69kV TL – McQuesten Substation (S258) to Keno Substation (S257)

The proposed L250 69kV transmission line rebuild will parallel the existing circuit to replace an existing aging mono pole line. The proposed transmission line will be designed and constructed for 138kV system and will be operating at 69kV.

Due to restricted right of way expansion around Keno City, the proposed transmission line will change from H-Frame configuration to mono pole configuration when the line exits Galena Hill and enters the Keno City boundary.

2.4 McQuesten Substation (S258 By-pass)

To improve reliability of the power supply to Keno City, an alternative emergency connection of L180 to Mayo 69kV system will be implemented. Existing L250 69kV transmission line structures at Mayo and structures adjacent to the new McQuesten substation will be modified to provide connections to by-pass McQuesten 138 / 69kV transformer and supply power to Keno City from Mayo substation.

3.0 Transmission Line - Design Parameter Comparisons

3.1 Fiber Optic Cable Configuration

On power lines, fiber communication is typically integrated into two types of applications: Optical Ground Wire conductor "OPGW" and All-Dielectric-Self-Supported conductor "ADSS".

OPGW offers the dual function of protection from lightning and short-circuit and of high capacity fiber communication. It has a high reliability because fibers are housed within the armor of the ground wire strands. OPGW installation and operation resembles those of conventional bare wires on power lines. Location of OPGW is at top of structure replacing the conventional ground wire.

ADSS is a fiber communication medium protected by a dielectric jacket typically installed below phase conductors. Challenges to ADSS are larger creep at heavy ice loading, limited strength for long span and vulnerability to UV and "tracking damages" due to surface gradient in very high voltage environment. Physical vertical clearance to ground and to conductors will still require an allowance of additional structure heights. When height is suitable, ADSS is best for retrofit situations and live line installations.

From a cost point of view, ADSS is cheaper than OPGW. This cost difference and its percentage shrinks when we include installation cost and as the fiber count increases. A final overall cost difference can be 10% or lower.

OPGW is recommended for new installation and its inherent added reliability while ADSS is recommended for short span, retrofit live line conditions.

3.2 Conductor Size Comparison

Standard YEC 138kV transmission line utilizes 266.8 MCM 26/7 ACSR (Partridge). Alternative conductor used in the YEC transmission network is 397.5 MCM 26/7 ACSR (Ibis). The Carmack to Stewart 138kV transmission line (CSTL) utilized 336.4 MCM 26/7 ACSR (Linnet) as long crossing spans conductors.

YEC has not reported any electro-magnetic field issues regarding operating 266.8 MCM ACSR on its 138kV transmission line. However, the minimum recommended conductor size for 138kV transmission line by US Rural Utilities Service (RUS) Design Manual is 336.4 MCM ACSR to minimize surface potential gradient.

For provision to future load growth and electro-magnetic field consideration, the larger YEC standard conductor 397.5 MCM ACSR has been used for structure loading calculations and cost estimations.

Based on Southwire standard published unit cost data, prior to volume discount and baseline currency exchange of 0.75, the unit conductor costs are estimated as follows:

Conductor	US$/km	CAD$/km
266.8 MCM ACSR (Partridge)	$4020.00	$5360.00
336.4 MCM ACSR (Linnet)	$4690.00	$6253.00
397.5 MCM ACSR (Ibis)	$5340.00	$7120.00

The conductor costs used in the transmission line cost estimates are based on volume discount of 0.8 to provide a conservative project estimate to allow for currency and metal index variations.

3.3 L180 Distribution Service Supplies

Existing distribution service supplies between Mayo and Halfway Lake utilize 69,000V/120V pole mount transformer at service locations. Future 138kV transmission voltage would require platform Potential Transformer PT substation(s) to provide distribution services. The standard estimated cost for a 138 kV PT substation is approximately $250,000.00 per location.

Alternatively, distribution underbuilt from Mayo to Halfway Lake has also been considered. This option would allow future supply of service along the transmission line route without high capital costs.

4.0 Basis of Cost Estimate

4.1 Final Design & Field Service Cost

The transmission line final design cost is estimated based on a unit cost of $6,000.00 per km to reflect the typical engineering hours required for lines of these lengths. If all 3 lines are to be designed under a single engineering contract, the unit rate should decrease by 20 to 25%.

In addition to the transmission line design cost, other field and permit costs should also be considered:

1. Environmental Assessment
2. Vegetation Clearing Permits
3. Crossing Permits (Roads and Water bodies)
4. Land Registrations

Since some of the transmission line alignments are different from the existing right of way, $200,000 has been included for land registration and other land matters.

Other field service costs have not been included in the transmission line estimates as these items will be considered as a YEC planning cost.

4.2 Transmission Corridor Preparations

4.2.1. Vegetation Clearings

The transmission line right of way (ROW) corridor widths are determined based on the preliminary line structure spotting and selected structure configurations. The 138kV H-frame structures with the standard span of 180m will require a minimum right of way of 25m. The 138kV mono pole structures with span of 100m will require a minimum right of way of 18m. These right of way widths are based on minimum electrical clearance.. Standard YEC 138kV right of way is typically cleared for 30m wide.

Vegetation clearing boundaries had been prepared based on the minimum requirements along with the required additional guy anchor clearings. Vegetation clearing areas are extracted as the base line requirements.

The proposed transmission lines are typically located 20m from the existing L176 and L250 transmission lines. Based on the existing transmission line ROW being cleared for 30m, the actual required clearing width could be reduced by 7.5m for H-frame and 4m for mono pole.

Due to geotechnical limitations, such as permafrost and wetland, the vegetation clearing operation is preferred to be performed during winter months. The unit cost associated with vegetation clearing for these transmission lines will be higher than typical due to this environment constraint.

The cost of vegetation clearing in CSTL was approximately $10,000 per hectare which included construction of access roads.

4.2.2. Access Road Entrance Preparation

Primarily, the proposed transmission line route follows the existing transmission line right of way with only a few locations where it has been realigned to parallel the existing highway.

Access road entrances will predominantly be the existing entrances with a limited number of new access points being proposed. Since the maintenance of the existing transmission line occurred regularly, there will be minimal entrance improvements required for construction.

4.2.3. Access Road Entrance Preparation

The cost of vegetation clearing in CSTL was an average of $10,000 per hectare which included access road entrance preparation. However, the final cost was reported by the contractor to be less than satisfactory. For SKTL, an estimate of $13,000 per hectare ($39,000/km) was used for the vegetation clearing and access entrance improvements. The estimated cost is conservative due to the geotechnical nature of the line route.

4.3 Material Procurements

Detailed conductor assembly and framing drawings of the proposed transmission line structures have been prepared for the preliminary design. The material costs are separated into 5 categories:

4.3.1. Insulator Assemblies

YEC prefers toughened glass insulator strings for the proposed transmission lines. Unit cost of the toughened glass insulator had been solicited from Sediver based on projected requirements.

Insulator Type	Attachment	Unit Cost
N70/146	Tangent & Running	$22.50 / disc
N12/146	Deadend	$25.00 / disc

The number of discs per insulator string varies from 7 to 10 dependent on the pollution level of the area. The preliminary design and cost estimates are based on 10 discs per string for conservative estimation.

Alternatively, polymer insulators were employed for mono pole structures. The costs of 138kV braced post insulators for tangent structures and strain insulators for running and deadend structures were based on actual project procurement costs of current transmission line construction projects.

Insulator Type	Attachment	Unit Cost
Braced Post	Tangent & Running	$415.00 / Assembly
Strain Insulator (UTS 30Kip)	Deadend	$78.00

Alternatively, other utilities have adopted using toughened glass suspension insulators for H-frame structures while employing polymer insulators for their deadend supports.

4.3.2. Cable Attachments

Conductor, shieldwire and OPGW attachment costs are calculated according to attachment drawings. Individual hardware cost is based on actual procurement costs of current transmission line construction projects.

4.3.3. Wood Poles

The preliminary design of the SKTL with H-frame and mono pole framing configurations resulted in poles ranging from 55ft CL3 to 115ft H2. The wood pole cost is based on data compiled from project procurements and quotations over the last two years. The wood pole costs range from $900.00 to $7,750.00 per pole.

4.3.4. Guying and Anchoring

Guying material costs are estimated based on standard helical anchor and log anchor with an average estimate of $1,500.00 per guy. Additional pole anchoring and guying material costs for swamp and bedrock are estimated based on a percentage of structures being located in these areas. The additional cost adder ranged from $1,500.00 to $3,500.00 per structure.

4.3.5. Miscellaneous Items

Additional miscellaneous items (such as aerial markers, structure markers, fiber optic splices etc.) are also included in the estimates.

4.4 Construction Cost

The construction cost of transmission line in Canada has been increasing during the last 5 years due to high demand in Alberta, Ontario and the Maritimes.

The average transmission line labor rate from several national transmission line contractors is approximately $105 per hour. Based on 10 hours work day, the adjusted labor rate used in the cost assessment is set at $125 per hour including expenses. Based on previous CSTL transmission line cost and labor hour information, the SKTL construction costs are calculated based on the hours required per structure type times the adjusted labor rate. The calculated unit installation cost for each structure type has also been compared with 2010 CSTL pricing with 5% annual inflation.

The conductor and OHGW/OPGW setup and stringing costs are based on CSTL unit costs with 5% annual escalation. The unit costs are as follows:

Cable Type	Unit Cost /km
Conductor	$17,000.00
3/8” EHS Steel OHGW	$13,000.00
OPGW	$20,000.00

The guy and anchor installation cost is based on assigned unit cost. The base cost is assigned using helical / log anchor materials and installation. Additional costs for rock anchor and swamp are based on estimated percentage of the lines.

4.5 Construction Project Management

The construction project management represents the owner engaged subcontractor for transmission line construction management and site inspection. The site service cost is based on the following factors:

- Anticipated duration (months) for vegetation clearing
- Anticipated duration (months) for line construction and demolition
- Construction schedule (hour/day and day/week)
- Number of site personnel required for each construction activities
- Unit cost per site personnel ($150.00/hour)
- Daily expense per site personnel ($600.00/day)
- Number of construction site offices

5.0 Recommendations & Conclusions

The transmission line cost estimates were calculated based on the preliminary line designs and cost parameters as outlined in the previous sections.

In additional to the estimated engineering services, environmental and permit supports, procurement and construction costs, a 15% contingency cost has been included to allow for changes in the final design, unforeseen issues and future escalation.

Per direction from YEC, there are no owner financing costs included in the transmission line cost estimates.

The individual transmission line cost breakdowns are listed in Appendix C. The transmission line estimated budgetary costs are summarized as follows:

Transmission Line	Item	Line Configuration	Base Estimate	15% Misc. Allowance
L179 S251 to S249 (54.2 km)	1A	138kV H-Frame with OPGW	$25,000K	$3,750K
	1B	138kV H-Frame with ADSS (no OHGW)	$23,885K	$3,583K
L180 S249 to S258 (31.1 km)	2A	138kV H-Frame with OPGW (Mono Poles at Restricted ROW Locations)	$13,423K	$2,014K
L250 S258 to S257 (20.2 km)	3A	138kV H-Frame with OPGW (Mono Poles at Restricted ROW Locations)	$9,660K	$1,449K

The cost differential between ADSS fibre optic and OPGW fibre optic configuration is mainly due to the additional shieldwire installation for the OPGW scenario. The OPGW configuration provides lightning protection for the transmission line in addition to fibre optic communication.

The overall project cost comparisons between Mono Pole and H-Frame transmission structures has been evaluated in the Extension Scope Report.

The estimated transmission line costs were calculated individually for each of the transmission line segments. For existing L250 replacement cost, please refer to Extension Scope Report for additional details.

1.0 Project Overview

Yukon Energy Corporation (YEC) is proposing to construct a 138kV transmission line from Stewart Crossing South (SCS) substation to Keno City (KC) substation. The overall transmission line and associated substation construction or modification is grouped as SKTL project.

1.1 Project Descriptions

The proposed 138kV transmission line route originates and travels north from SCS substation (S251) generally parallel existing L175 138kV transmission line to a point north of Stewart Crossing North (SCN). At this point the route turns east and parallels the existing L176 69kV transmission line to Mayo substation (S249). The transmission line will turn northeast to parallel the existing L250 69kV transmission line to KC substation (S257). A new substation at McQuesten (S258) will be constructed north of Halfway Lakes to convert voltage from 138kV to 69kV. The transmission line from S258 to S257 will be constructed for 138kV and energized at 69kV.

The existing L176 and L250 69kV transmission right of way is 60m wide which should accommodate 2 (two) parallel transmission line circuits.

The preliminary design will assess deviations from the YEC primary proposed route due to land use conflicts, environmental restriction, construction and maintenance access, geological restriction, etc.

1.2 Design Codes and Regulations

The design of the 138kV transmission line will be based on both deterministic approach as per CSA C22.3 No.1 (C22.3 No.1) “Overhead System” and reliability approach as per CSA C22.3 No.60826 (C22.3 No.60826) “Design Criteria of Overhead Transmission Lines”.

The conditions outlined in CSA C22.3 No.1 are minimum design requirements for both transmission and distribution overhead lines.

CSA C22.3 No.60826 outlines additional extreme weather conditions and design requirements for transmission line voltage exceeding 70kV (phase – phase voltage) as recommended in CSA C22.3 No.1 Section 10.

YEC has specified the design of the SKTL transmission lines to comply with Alberta Electrical Utility Code (AEUC) in addition to CSA code requirements. Chimax will also review and incorporate the relevant information and guidelines outlined in the Alberta Electrical System Operator (AESO) ISO Rules Section 502.2 “Bulk Transmission Line Technical Requirements”.

In addition to the Canadian overhead line design code, additional design codes and regulations will be followed for each transmission line component design. A full list of design codes and regulations is provided in Appendix B.

2.0 Equipment and Material Descriptions

2.1 Cable Descriptions

The 138kV phase conductors, optical fiber cable and overhead grounding wire (OHGW).

2.1.1. 138kV Phase Conductor

The YEC standard phase conductor for the proposed 138 kV transmission lines is 266.8MCM 26/7 ACSR (Partridge). Alternatively, 397MCM 26/7 ACSR (Ibis) had also been used on few YEC transmission lines. Based on future load growth and cost estimate consideration, 397.5 MCM 26/7 ACSR (Ibis) was used as benchmark phase conductor. Comparison of structural requirement between the two conductors are also performed.

The general mechanical and electrical properties of 266.8 MCM 26/7 ACSR (Partridge) and 397.5 MCM 26/7 ACSR (Ibis) are listed in Table 2.1.1.

Table 2.1.1

Mechanical Properties								
Conductor	**Conductor Size**		**Stranding No. x Dia. (in)**		**O.D. (in)**	**Nominal Mass (lb/1000 ft)**	**Rated Strength**	
	MCM	**mm^2**	**Al**	**Steel**			**(lbf)**	**(kN)**
266.8 MCM ACSR (Partridge)	266.8	135.2	26x0.1013	7x0.0788	0.642	366.0	11300	50.3
397.5 MCM ACSR (Ibis)	397.5	201.4	26x0.1236	7x0.0961	0.783	545.0	16100	71.6
Electrical Properties								
Conductor	**Cross Section Area (in^2)**		**Resistance (ohms/ 1000ft)**			**GMD (ft)**	**Inductive Reactance (ohms/1000ft)**	**Capacitive Reactance (Mohms/1000ft)**
	Total	**Al**	**DC @20°C**	**AC @25°C**	**AC @75°C**			
266.8 MCM ACSR (Partridge)	0.2437	0.2095	0.0651	0.0665	0.0796	0.0217	0.0880	0.5673
397.5 MCM ACSR (Ibis)	0.3630	0.3123	0.0437	0.0447	0.0535	0.0265	0.0835	0.5361

2.1.2. Optical Fiber Cable

YEC will install optical fiber communication cable along proposed transmission line to improve existing protection and control communication. Standard installation of optical fiber cable on new transmission line will utilize optical grounding wire (OPGW). The current YEC 138kV transmission line standard does not utilize any lightning protection wire. Chimax has evaluated both optical cable communication underbuilt, all dielectric self-support (ADSS) and compared it to the OPGW configuration.

Table 2.1.2 – OPGW Properties

Electrical and Mechanical Properties							
OPGW Size	**Fibers (max)**	**Fault Current $(kA)^2s$**	**Cross Section Area (in^2)**	**O.D. (in)**	**Nominal Mass (lb/ft)**	**Rated Strength**	
						(lbf)	**(kN)**
SFPOC/SFSJ-J-10783	48	63	0.1474	0.496	0.356	18454	82.0

The final selection of OPGW will depended on the long-term forecast fault current levels and ground resistivity along the transmission line route.

Due to relative long span and restricted cable sag of ADSS cable required for the proposed transmission line, technical information is not available as standard information. Manufacturer had only confirmed the following parameters at this time.

Table 2.1.3 – ADSS Properties

Electrical and Mechanical Properties							
ADSS Size	**Fibers (max)**		**Cross Section Area (in^2)**	**O.D. (in)**	**Nominal Mass (lb/ft)**	**Rated Strength**	
						(lbf)	**(kN)**
OFS ADSS	48		0.2186	0.527	T.B.C.	T.B.C.	T.B.C.

Overhead Shield Wire (OHGW)

For H-Frame with two shieldwire configuration and lightning protection within 1 km of any station for other configuration, the overhead ground wire (OHGW) for the proposed transmission line will be based on existing shieldwire used in existing YEC transmission lines.

Table 2.3 – OHGW Properties

Mechanical Properties							
Cable Size	**Stranding No. x Dia. (in)**	**O.D. (in)**	**Cross Section Area (in^2)**	**Resistance (ohms/ 1000ft) @20°C**	**Nominal Mass (lb/1000ft)**	**Rated Strength**	
						(lbf)	**(kN)**
3/8" EHS Galv. Steel	7x0.1819	0.546	0.182	0.2264	524.9	27030	120.1

2.2 Insulator and Configuration

The preferred suspension insulators for standard 138kV H-Frame tangent and running angle structures shall be toughened glass suspension insulators. The Mono wood pole alternative shall employ a braced post insulator configuration for tangent structures.

The default deadend insulators shall be toughened glass strain insulators. Alternatively, polymeric strain insulator will be considered in the cost evaluation. (SaskPower standard H-Frame utilize glass insulators for suspension / running angle structures and polymer strain insulators for deadend application)

The electrical and mechanical properties of individual toughened glass insulators are given in Table 2.2.1.

Table 2.2.1 – Toughen Glass Suspension & Strain Insulator Properties

Mechanical & Electrical Properties							
Insulator Description	**Diameter (in) [mm]**	**Leakage Distance (in) [mm]**	**Tensile Strength (lbf) [kN]**	**Low Frequency Flashover**		**Critical Impulse Flashover**	
				Dry (kV)	**Wet (kV)**	**Positive (kV)**	**Negative (kV)**
Sediver N70/146	10 [255]	12 5/8 [320]	15000 [70]	80	50	125	130
Sediver N12/146	10 [255]	12 5/8 [320]	25000 [120]	80	50	125	130

The minimum insulation level for 138kV transmission line depends upon the critical impulse flashover and the pollution levels along the transmission line area. For 138kV transmission line, the maximum phase to phase voltage shall be 145kV and phase to ground voltage of 84kV. Table 2.2.2 summarized the insulation criteria and minimum insulator requirement for 138kV transmission line.

Table 2.2.2 – Minimum Insulator Requirement

	Pollution Level			
	Very Light	Light	Medium	Heavy
Critical Impulse Flashover (kV)	715			
No. of Insulators	6			
IEC 60815 Leakage Distance (mm/kV)	22.0	27.8	34.7	43.3
Minimum Leakage Distance (mm)	1848	2336	2915	3638
No. of Insulators	6	7.3	10	12
Recommended No. of Insulators	7	8	10	12

Typical recommended minimum leakage distance in manufacturer catalogue is based on 25mm/kV which will be 7 strings insulator and is consistent with existing YEC specification.

For the preliminary design of the SKTL, 8 strings insulator will be used for the majority of the 138kV H-Frame structures. For structures located on Galena Hill and Keno where pollution levels are expected to

be higher, 10 string insulators will be utilize. The preliminary designs and cost estimates will be based on 10 strings insulators to allow flexibility in final transmission line design.

The proposed polymer insulators electrical and mechanical properties are outlined in Table 2.2.3 and Table 2.2.4.

Table 2.2.3 – Polymer Suspension & Strain Insulator Properties

Mechanical & Electrical Properties							
Insulator Description	**Section Length (in) [mm]**	**Leakage Distance (in) [mm]**	**Tensile Strength (lbf) [kN]**	**Low Frequency Flashover**		**Critical Impulse Flashover**	
				Dry (kV)	**Wet (kV)**	**Positive (kV)**	**Negative (kV)**
NGK-Locke 251-SC410-YJ	60 [1525]	114.6 [2911]	25000 [111]	525	465	815	865

2.3 Structure Material and Configuration

The proposed 138kV transmission lines shall be YEC standard H-Frame structures along with alternative mono wood pole structures.

Currently, the baseline design will be based on wood poles H-Frame configuration utilizing toughened glass suspension insulator for tangent and light angle structures. Where right of way is restrictive, mono wood pole configuration will be used. The mono wood pole tangent and light angle shall be braced post triangular configuration with top and bottom phases on one side and middle phase on opposite side. Mono wood pole angle and dead end structures shall be vertically framed with guying.

As per previous Carmack to Stewart transmission line (CSTL), the minimum pole class shall be Class 3 to provide reliability and facilitation of pole climbing during maintenance.

2.4 Foundation Configuration

For H-Frame configuration, all wood poles shall be direct embedded with standard 10% pole length plus 0.610m (2ft) embedment. Additional foundation augmentation will be determined based on site requirement, such as side slope, swamps and weak soils.

For mono pole configuration, standard 10% pole length plus 0.610m will be used as baseline embedment and evaluated against site soil condition and ground line bending moment to ensure sufficient resistance will be achieved.

2.5 Conductor Hardware

All conductor hardware shall meet or exceed the specification outlined in CSA C83 “Communication and Power Line Hardware”. In addition, all current carrying connectors shall also meet the requirements outlined in CSA C57 “Electric Power Connectors for Use in Overhead Line Conductors”.

Baseline suspension clamp for proposed 138kV transmission lines shall be standard aluminum suspension clamp along with armor rod protection.

2.6 Vibration Protection

In addition to critical loading scenarios for phase conductor, the conductor tension is further limited to 15% UTS under -50°C extreme winter temperature to minimize vibration fatigue.

Stockbridge vibration damper will be installed on all phase conductors as well as for OHGW as required. Spiral vibration damper will be specified on all OPGW for vibration control to protect the fiber optic cable.

The preliminary vibration damper calculation will be performed using Preformed Line Product (PLP) Vortex Damper Design Application with design span and tension information.

3.0 Meteorological (Climate) Data

3.1 Site Descriptions

The closest meteorological locations outlined in both C22.3 No.1 and C22.3 No.60826 is Dawson City.

3.2 Deterministic Approach Weather Case

CSA C22.3 No.1 Section 7 outlines the minimum deterministic weather loads shall be applied to each line components. C22.3 No.1 Annex C Figure C.1 indicates that the Yukon falls under CSA Medium A Loading condition which does not represent local observed ice loading situations. The CSA Heavy Loading is used for the previous CSTL and proposed transmission lines. Parameters are given in C22.3 No.1 Table 30 and are listed as follows:

Table 3.1

Conditions	Temperature (°C)	Horizontal Wind Loading (N/m^2)	Radial Ice	
			Thickness (mm)	Ice Density (kg/m^3)
CSA Heavy	-20	400	12.5	900

3.3 Reliability Approach Weather Cases

CSA C22.3 No.60826 is the Canadian adaptation of IEC 60826 "Design criteria of overhead transmission lines", with implementation of appropriate Canadian variations and weather parameters. C22.3 No.60826 Table CA.1 listed 50 years return period (1/50) weather conditions for Canadian Locations. The mean annual maximum snow accumulation depths are provided in CSA C22.3 No.1 Table D.1. The ice, wind and snow depth parameters for the closest meteorological locations to the transmission line are listed below:

Table 3.2

Locations	Reference Average Minimum Temperature (°C)	Reference (1/50) Wind Speed (km/h)	Reference (1/50) Radial Ice		Mean Annual Maximum Snow Depth (m)
			Thickness (mm)	Ice Density (kg/m^3)	
Whitehorse (reference)	-43	85	10	900	0.4
Dawson City	-51	80	10	900	0.6

The ambient temperature for radial ice formation due to freezing precipitation is assumed at -10°C.

The reference wind and ice loading values given above are based on 1 in 50 year (1/50 return period) event.

3.3.1. Reference Ice Loadings

The reference ice loading listed in CSA C22.3 No.60826 does not reflect the occasionally observed rime ice condition on existing transmission line in Yukon. Additional ice loading of 51mm (2") rime ice (density of 350kg/m^3) has been included in the design of the proposed transmission line.

The cable diameter factor and structure height factor according to C22.3 No.60826 Section 6.3.4.1 will be adjusted accordingly in PLS-Cadd model for site specific design.

3.3.2. Reference Wind Loading

The 1 in 50 return period reference wind loading is recommended for the design of the transmission line for capital cost minimization.

3.3.3. Combined Wind and Low Temperature

As per requirement under CSA C22.3 No.60826 Section 6.2.4 for span typically less than 200m, combination of minimum temperature with wind shall be included for reliability design load scenario. The combination shall be verified for reference average minimum temperature with 60% of design wind speed. The design wind speed for combination with minimum temperature is recommended to be 1 in 50 return period.

3.3.4. Combined Ice and Wind Loadings

The requirement of combination of the ice with wind is defined in CSA C22.3 No.60826 Section 6.4. The section outlines two ice and wind combinations as follows:

- Reduced Ice with High Wind - 85% Reference Ice with 60% Reference Wind (normal combined ice and wind)
- High Ice with Average Wind - 130% Reference Ice with 40% Reference Wind (extreme combined ice and wind with spatial factor)

The recommended level of reliability for ice loading combined with wind loading shall be 1 in 50 return periods.

4.0 Electrical Design Criteria

4.1 Code Clearances

4.1.1. Vertical and Horizontal External Clearances

4.1.1.1. Vertical Clearances

The minimum vertical ground clearance required for lowest cable is listed in C22.3 No.1 Table 2 (ground clearances), Table 3 (waterways), Table 9 (building, signs, fence, etc.) and Table 10 (bridges).

Segments of the proposed transmission lines are located at altitude between 1000 m to 1300 m above sea-level. According to C22.3 No.1 clause 5.3.1.1 (b), the required clearance shall be increased by 1% for each 100 m above of 1000 m. The designed high altitude clearance will be based on 3% increase of basic minimum clearance.

The minimum code specified clearance and recommended design values are summarized below:

Table 4.1.1 - 138kV (Maximum Voltage 145kV) Vertical Ground Clearance

Clearance Descriptions	C22.3 No.1 Min. Clearance	Mean Annual Snow Depth	Survey Tolerance	Const. Tolerance	138kV Design Clearance	138kV High Altitude Clearance
	(m)	(m)	(m)	(m)	(m)	(m)

Ground Clearance (CSA C22.3 No.1 Table 2)					
Vehicular Clearance (Vehicle Height <4.15m)	4.5	0.6	0.3	0.3	5.7
Non-Vehicular Clearance (Pedestrian / ATV)	2.5	0.6	0.3	0.3	3.7
Railroad Crossings	7.3		0.3	0.3	7.9
Waterway Crossings (CSA C22.3 No.1 Table 3)					
Class 1 (Vessel H ≤ 4.0 m)	5.0		0.6		5.6
Class 2 (Vessel H ≤ 6.0 m)	7.0		0.6		7.6
Class 3 (Vessel H ≤ 8.0 m)	9.0		0.6		9.6
Class 4 (Vessel H ≤ 10.0 m)	11.0		0.6		11.6
Class 5 (Vessel H ≤ 12.0 m)	13.0		0.6		13.6
Class 6 (Vessel H ≤ 14.0 m)	15.0		0.6		15.6
Features (CSA C22.3 No.1 Table 9 & Table 10)					
Buildings	0.1	0.6	0.3	0.3	1.3
Signs, Fences, etc.	0.1		0.3	0.3	0.7
Bridges	2.5	0.6	0.3	0.3	3.7
Ground Clearance (AEUC 2013 Table 5)					
High Load Clearance (Vehicle Height <5.3m)	5.6	0.6	0.3	0.3	6.8

The C22.3 No.1 vertical clearances between cable crossings not supported by same structure are listed in C22.3 No.1 Table 13.

In addition to C22.3 No.1 wire crossing specification, Local Distribution Companies (YEC & AEY) should be consulted at each crossing for specific requirement during the final design.

Table 4.2 - Aerial Cable Crossing Vertical Clearance

Upper Cables **Lower Cables**	**69kV (m)**	**138kV (m)**
Communication	0.9	1.2
Secondary (<750V)	0.8	1.1
Distribution (>750V & ≤34.5kV)	0.9	1.2
Sub-Transmission (>44kV & ≤69kV)	1.1	1.4
138kV to 138kV		1.5
Typical LDC Clearance (Communication to 44kV Cables)		2.5

The wire crossing of the 138kV transmission lines will be designed based on the highest specified clearance requirement.

4.1.1.2. Horizontal Clearances

The horizontal cable clearance is defined for cable under conductor Blowout Wind condition as specified in C22.3 No.1 Section 5.2.7 & A5.2.7. The horizontal clearance requirements are specified in C22.3 No.1 Table 6 (Railroad), Table 9 (building, signs, fence, etc.), Table 10 (bridges) and Table 35 (flashover for tree pruning).

Table 4.3 – 138kV Horizontal Electrical Ground Clearance

Clearance Descriptions	**C22.3 No.1 Min. Clearance**	**Survey Tolerance**	**138kV Design Clearance**
	(m)	**(m)**	**(m)**
Railroads (CSA C22.3 No.1 Table 6)			
Main Tracks	3.5	0.3	3.8
Sidings	2.9	0.3	3.2
Features (C22.3 No.1 Table 9, Table 10 & Table 35)

Signs, Fences, etc.	2.6	0.3	2.9
Bridges	2.2	0.3	2.5
Tree Pruning	0.97	0.3	1.3

The specified horizontal conductor clearances are specified for locations where vertical clearances are not achieved.

In addition to conductor electrical clearance, minimum structure clearances in proximity to adjacent features are also governed by appropriate national, provincial and local bylaws.

Table 4.4 – Structural Clearance to Adjacent Facilities

Clearance Descriptions	**Min. Clearance (m)**
Railroads (C22.3 No.1 Table 7)	
Railroad Tracks	
Main Tracks	2.5
Sidings	1.9
Road Clear Zone Requirement	
Edge of Road	5.0 or 6.0 depended on Road Classification

4.1.2. Electrical Clearances to Structures

Electrical clearance from energized conductors and hardware depends on maximum system voltage and switching surge ratio of the transmission system.

The minimum electrical clearances between phase conductors to supporting structure for voltage greater than 50kV phase-ground (<69kV phase-phase) are outside of the voltage range specified in C22.3 No.1. American National Electrical Safety Code (NESC – IEEE C2) shall be used to determine the electrical clearances between energized live parts and support structure components. As per NESC clause 235E1 for 138kV transmission lines, Table 235-6 shall provide the minimum clearance requirements. In addition, CSA C22.3 No. 1 Table A.1 provides flashover to ground distance based on typical switching surge factor.

Table 4.5 – 138kV Electrical Clearances to Structures

Clearance Descriptions	**Minimum Clearance (m)**
NESC Table 235-6 (290 Pa [6 psf] wind @ 15°C)	
Surface of Structure (joint-use)	0.76
Anchor Guys	
Inline Parallel Guys	1.59
Bisect & Offset Guys	0.96
CSA C22.3 No. Table A.1	
Switching Surge Flashover	0.97
Additional Clearance Consideration (RUS 1724E-200 Table 7-1)	
At Rest - No Wind	1.22
Extreme Hourly Wind	0.31

4.1.3. Lightning Performance and Shielding

The average structure height (ground to OPGW and OHGW) of the proposed transmission lines shall be below 92ft, the shielding angle of 30 degree, as per RUS 1724E-200 Table 8-3, was used for the determination of shieldwire and phase conductor separation.

Shielding angle of lightning protection by OPGW and OHGW shall be verified based on latest edition of IEEE Standard 1243 "Guide for Improving the Lightning Performance of Transmission Lines". The ground flash design should either be based on historical data (when available) or IEEE Std. 1243 equation (2) or equation (3).

4.1.4. Grounding

Pole and shieldwire grounding shall be installed at every structure location. Unattached grounding system resistivity shall be 25ohms or below. Grounding study shall be performed in final design phase to estimate number of ground rod(s) at each ground connection.

4.1.5. Galloping Conductors

Conductor and shield wire separations will be assessed for ice and wind galloping under the following conditions;

Table 4.6 – Galloping Conditions

Conditions	Temperature (°C)	Horizontal Wind Loading (Pa) [psf]	Radial Ice	
			Thickness (mm)	Ice Density (kg/m^3)
Galloping Swing	-5	95.7 [2]		
Galloping Ice	-5	95.7 [2]	12.7	900

An additional separation of 0.3m shall be provided between galloping ellipses for design buffer.

4.2 Clearance Buffers

The proposed design clearance buffers has been listed in each of the clearance categories

4.3 Structure Spotting Criteria

The preferred standard design span for proposed 138kV transmission lines to be 150m to 180m based on phase separation requirement under galloping conditions and maintaining reasonable structure height during extreme ice loading conditions. The actual design spotting will be based on above consideration with right of way constraint and adjacent utilities provided in topographical survey utilizing PLS-Cadd 3D TIN terrain model.

4.4 Ampacity Rating Criteria

The phase conductor ampacity calculations are performed based on IEEE Std. 738-2013. C22.3 No.1 Section 3 "Rated ampacity" which outlines the basic ambient and cable conditions to be used for the ampacity calculation.

The ampacity calculations based on parameters outlined in Table 4.4.1 for selected phase conductor cable 266.8MCM ACSR (Partridge) and 397.5MCM ACSR (Ibis) are performed using PLS-Cadd embedded IEEE 738-2013 module. The PLS-Cadd program generated ampacity calculation outputs are given in Appendix F. The calculated continuous and limited thermal ratings for a single conductor are summarized below:

Table 4.7 – IEEE Std. 738 Ampacity Calculations

Parameters	**CSA C22.3 No.1**	**AESO 502.2**
Ambient Temperature	40°C	40°C
Case 1 – Maximum Thermal Rating (Maximum Conductor Temperature)	100°C	100°C
Case 2 – Operating Temperature 40 MW (44.5 MVA) x 1.25 OL @138 kV	240 A	240 A
Case 3 –Design Thermal Rating (Design Conductor Temperature)	75°C	75°C
Wind Speed	0.61 m/s (2 ft/s)	0.61 m/s (2 ft/s)
Wind Angle to Conductor	90°	90°
Conductor Latitude	63.6°	63.6°
Conductor Elevation (above sea level)	800m	800m
Conductor Direction (maximum solar heat)	E-W	E-W
Emissivity	0.5	0.6
Solar Absorption Coefficient	0.5	0.8

Table 4.8 – Conductor Continuous and Limited Thermal Ratings

Cable Conditions	**CSA C22.3 No.1**	**AESO 502.2**
Case 1 – Maximum Thermal Rating		
266.6 MCM 27/6 ACSR (Partridge)	484 A	475 A
397.5 MCM 27/6 ACSR (Ibis)	624 A	612 A
Case 2 – Operating Temperature		
266.6 MCM 27/6 ACSR (Partridge)	59.0°C	62.7°C
397.5 MCM 27/6 ACSR (Ibis)	54.9°C	58.9°C
Case 3 – Design Thermal Rating		
266.6 MCM 27/6 ACSR (Partridge)	361 A (62 MW @138 kV) (31 MW @69 kV)	341 A (58 MW @138 kV) (29 MW @69 kV)
397.5 MCM 27/6 ACSR (Ibis)	463 A (79 MW @138 kV) (39 MW @69 kV)	434 A (74 MW @138 kV) (37 MW @69 kV)

Based on above ampacity and conductor temperature data for the proposed 138kV transmission lines, the design conductor sag shall be based on conductor temperature of 75°C.

5.0 Structural Design Criteria

5.1 Conductor and Conductor Support Hardware

The conductor and conductor supporting hardware shall be design and selected to withstand the required loadings as per requirement outlined in this section.

5.1.1. Conductor Tension Limits

CSA C22.3 No.1-2006 and CSA C22.3 No.60826 design codes are based on maximum allowable design tensions under various loading conditions. However, the latest edition of CSA C22.3 No.1-2010 has been revised to recommended maximum initial catenary for phase conductor.

5.1.1.1. Tension Limit (% Ultimate Tensile Strength)

C22.3 No.1-2006 Table 34 and Table 35 outlined the tension limit of phase conductor and galvanized steel wire as lightning protection wires (Table 35 has not been modified in the 2010 edition).

Table 5.1 – CSA C22.3 No.1-2006 Allowable Cable Tension Limits

Loading Conditions	AAC, ACSR and Aluminum Alloys Phase Conductors	Galvanized Steel Wires
Maximum tension under appropriate loading conditions	60%	60%
Maximum recommended initial unloaded (initial) tension at mean temperature (EDT)	35%	20%
Maximum recommended final unloaded (creep) tension at mean temperature (EDT)	25%	15%

Strength factor for reliability design are listed in C22.3 No.60826 Section 7. The standard values for strength coefficient of variation is given in C22.3 No.60826 Table 18 and support design strength values for tangent / running and angle / dead end configurations are given in C22.3 No.60826 Canadian Section 7.3.3. The combined allowable material factors and equivalent tension limits are given below:

Table 5.2 – CSA C22.3 No.60826 Allowable Cable Material Factors

Conductor & Shieldwire	Cable Material Factor		Support Design Strength Factor	Combined Allowable Material Factor
	COV	Factor		
Intact Load	3%	0.962	0.80	0.77
Failure Load	3%	0.962	0.90	0.87

5.1.1.2. Maximum Initial Cable Catenary

CSA C22.3 No.1-2010 edition section 8.7.3 “Wire tension limits” has been revised to provide additional safety for fatigue damage of conductors due to aeolian vibration. C22.3 No.1 2010 Table 33 provides the recommended catenary parameter for different span lengths.

As per CSTL design requirement, the catenary parameter requirement is consistent with maximum 15% cable UTS under -50°C. These requirements did impact the structure height requirement but provide reliability where large ranges of temperature variation can occur.

5.1.1.3. Recommended Cable Design Criteria

In consideration of various governing factors for cable design criteria, the follow conditions and criteria are used for the design of conductor and OPGW / OHGW;

Table 5.4 – Recommended Cable Design Criteria

Design Conditions	Cable Condition	Conductor	OPGW / OHGW
C22.3 No.1 CSA Heavy	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Extreme Ice	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Gust Wind	Loaded	50% UTS	50% UTS
C22.3 No. 60826 Wind & Low Temp.	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Ice & Wind (High Wind)	Loaded	60% UTS	60% UTS
C22.3 No. 60826 Ice & Wind (Low Wind)	Loaded	70% UTS	60% UTS
EDT	Initial	35% UTS	20% UTS
EDT	Creep	25% UTS	15% UTS
Catenary @ Mean Annual Min. Temp.	Initial	1500 m	1500 m
Min. Temperature (-50°C)	Creep	15% UTS	15% UTS

5.1.2. Insulators, Support Hardware and Conductor Accessories

Reliability design utilizes actual environmental loadings based on desired project return period to compare with reduced allowable material resistances.

The allowable material strength is dependent on material consistency and structure reliability requirement. Material strength factor for reliability design are listed in C22.3 No.60826 Section 7. The standard values for strength coefficient of variation is given in C22.3 No.60826 Table 18 and support design strength values for tangent / running and angle / dead end configurations are given in C22.3 No.60826 Canadian Section 7.3.3. The combined allowable material factors are summarized below;

Table 5.5 - CSA C22.3 No.60826 Cable and Hardware Material Factors

Materials	Material Factor		Running		Deadend	
	COV	Factor	Intact (0.9)	Failure (1.0)	Intact (0.8)	Failure (0.9)
Insulators	5%	0.936	0.84	0.94	0.75	0.84
Hardware	5%	0.936	0.84	0.94	0.75	0.84

Despite C22.3 No.60826 outlines the allowable strength factors for insulator and hardware, manufacturers of insulator and hardware recommended the allowable strength for these items shall be 50% of the design tensile strength. The selection of insulators and conductor attachment hardware shall be based on manufacturer design limits, with exception of the high ice with average wind (130% Ice & 40% Wind) combination, the maximum insulator and hardware usage shall be 0.75.

5.2 Guys and Hardware

CSA C22.3 No60826 clause 7.3.1 outlines the damage limit of steel guys and Table 18 provide material strength factor for grouted guy anchor design. The design of guy anchors shall be according to IEEE Std. 691 "IEEE Guide for Transmission Structure Foundation Design and Testing".

5.2.1. Guy Strand & Hardware

The maximum allowable guy cable and hardware tension shall be 0.75 (75%) ultimate tensile strength as per CSA C22.3 No.60826 Table 14.

5.2.2. Guy Anchors

The maximum design loadings for commercial available guy anchor shall be according to manufacturer recommended holding capacity. The material factor for grouted rock anchor shall be as follows;

Table 5.6 - CSA C22.3 No.60826 Allowable Rock Anchor Material Factors

Materials	Material Factor		Running		Deadend	
	COV	Factor	Intact (0.9)	Failure (1.0)	Intact (0.8)	Failure (0.9)
Grouted Rock Anchor	10%	0.872	0.78	0.87	0.70	0.78

5.3 Structures

5.3.1. Load Factors

Deterministic approach is applied for designing transmission line components to withstand factored loads (vertical, transverse and longitudinal loads) under C22.3 No.1 conditions specific to the project area (see Table 3.1). The required overload factors are specified in C22.3 No.1 Section 7.4 to 7.9 and summarized in C22.3 No.1 Table 31.

Table 5.7 – CSA C22.3 No.1 Overload Factors for Limit State Design (Deterministic Approach)

Structure Type	Grade 2 Construction			Grade 1 Construction		
	Vertical	Trans.	Long.	Vertical	Trans.	Long.
Steel Components (crossarms, davit arms, braces, etc.)						
Tangent & Running Angle	1.15	1.10	1.00	1.30	1.20	1.10
Heavy Angle & Deadend	1.15	1.10	1.10	1.30	1.20	1.20
Wood Pole						
Tangent & Running Angle	1.50	1.30	1.00	2.00	1.90	1.20
Heavy Angle & Deadend	1.50	1.30	1.30	2.00	1.90	1.90

The allowable strengths for each transmission line structural component is calculated by PLS-Pole based on input material parameters, such as geometry, material yield strengths, mechanical properties of material type.

5.3.2. Strength Reduction Factors

The allowable material strength is dependent on material consistency and structure reliability requirement. Structural material strength coefficient of variation for steel component is given in C22.3 No.60826 Table 18 and support design strength values for tangent / running and angle / dead end configurations are given in C22.3 No.60826 Canadian Section 7.3.3. The combined allowable material factors are summarized below:

Table 5.8A - CSA C22.3 No.60826 Allowable Structural Material Factors

Materials	Material Factor		Running		Deadend	
	COV	Factor	Intact (0.9)	Failure (1.0)	Intact (0.8)	Failure (0.9)
Steel Component	5%	0.936	0.84	0.94	0.75	0.84
Wood Component	15%	0.808	0.73	0.80	0.65	0.73

5.4 Design Loads

The design load cases for the proposed 138kV transmission lines shall be based on the climatic data outlined in Section 3.

5.4.1.1. CSA Minimum Deterministic Load Case

The minimum design loads for the proposed transmission lines shall be CSA Heavy Condition as per Table 3.1.

5.4.1.2. Extreme Ice Load Cases

The maximum extreme ice loadings shall be designed for 1 in 50 years return period reference data.

5.4.1.3. Maximum Gust Wind Load Cases

The maximum gust wind loadings shall be designed for 1 in 50 years return period reference.

5.4.1.4. Combined Ice and Wind Load Cases

Both combination of ice with wind loading conditions will be evaluated according to Section 3..3.4.

5.4.1.5. Broken Wire and Unbalanced Ice Loads

For tangent and running angle structures, since the application of braced post insulator had limited longitudinal load capability, the unbalanced longitudinal loading conditions are not considered.

5.4.1.6. Containment Structures

All dead end angle structures and double dead end containment structures shall be designed to withstand complete one sided cable loadings in addition to standard configuration loadings under all climatic conditions.

5.4.1.7. Construction and Maintenance Loads

Construction and maintenance load requirements are specified in C22.3 No.60826 Section 6.5.

The lifting components (such as lifting vent if required) during structure erection shall have minimum safety factor of 1.5 for planned control operation.

The safety factor for cable tension shall be 2.0 during cable stringing operation with 50% of the applied tension added as longitudinal load on all running angle structures.

5.5 Structure Design

The wood pole design shall be preformed using PLS-Pole wood pole structural add-on application module. The PLS-Pole model shall include wood pole, steel crossarm, steel cross braces, insulators, guy cables, etc.

Attachment loadings will be generated by PLS-Cadd line design application using Method 4 "Structure Loads" calculations. Additional longitudinal loads for maintenance and construction scenario under every day temperature will be applied manually in PLS-Pole application.

5.6 Foundation Design

Transmission pole structures in this project are direct-embedded poles and shall be designed to resist the overturning moment, shear and axial loads generated from the design of pole structures using L-Pile caisson foundation application.

5.6.1. Moment Foundations

5.6.1.1. Design Philosophy

For direct-embedded method, the pole embedment length below the ground line shall be determined using an allowable lateral displacement approach. Horizontal subgrade reaction along the embedded length is determined based on borehole record information as per the geotechnical investigation report. Pole structure shall be designed to withstand the structural loading specified in other sections of this criteria document, and shall also be qualified to sustain the corresponding geotechnical loading to ensure structural integrity.

5.6.1.2. Deflection Limits

Pole recoverable deflection at ground line is limited to 25mm due to actual loading under normal weather condition, and 40mm due to actual loading under extreme weather condition. The soil input parameters for L-Pile application, such as friction angle for granular material and undrain strength for cohesive material, are deduced from site geotechnical report.

Code & Regulations

Re: ***Transmission & Distribution Line Design – Code & Specifications***

This document listed the Design Code & Specifications for transmission and distribution overhead line design.

Design Specifications

- CAN/CSA C22.3 No. 1-10 "Overhead Systems"
- CAN/CSA C22.3 No. 1-06 "Overhead Systems"
- CAN/CSA C22.3 No. 60826-10 "Design Criteria for Overhead Transmission Lines"
- CAN/CSA C22.3 No. 61936-1:08 "Power Installations Exceeding 1 kV A.C."
- IEEE Std. 738-2012 "IEEE Standard for Calculating the Current-Temperature Relationship of Bare Overhead Conductors"
- National Electrical Safety Code (NESC C2-2012), 22st Edition 2012

Supplementary Specifications

- CAN/CSA C22.1-15 "Canadian Electrical Code, Part 1"
- Ontario Electrical Safety Code (OESC), 25th Edition 2012
- Alberta Electrical Utility Code (AEUC), 4th Edition 2013
- CAN/CSA M421-11 "Use of Electricity in Mines"
- CAN/CSA C22.3 No. 3-1998 "Electrical Coordination"
- CAN/CSA C22.3 No. 4-1974 "Control of Electrochemical Corrosion of Underground Metallic Structures"
- CAN/CSA C22.3 No. 5.1-93 "Recommended Practices for Electrical Protection – Electric Contact Between Overhead Supply and Communication Lines"
- CAN/CSA C22.3 No. 6-13 "Principles and Practices of Electrical Coordination Between Pipelines and Electric Supply Lines"
- CAN/CSA C22.3 No. 7-10 "Underground Systems"
- CAN/CSA C22.3 No. 9-08 "Interconnection of Distributed Resources and Electricity Supply Systems"
- ASCE/SEI 74-09 "Guidelines for Electrical Transmission Line Structural Loading"
- ASCE/SEI 48-11 "Design of Steel Transmission Pole Structures"
- ASCE/SEI 10-97 "Design of Latticed Steel Transmission Structures"
- IEEE Std. 524-2003 "IEEE Guide to the Installation of Overhead Transmission Line Conductors"
- IEEE Std. 691-2001 "IEEE Guide for Transmission Structure Foundation Design and Testing"
- IEEE Std. 951-1996 "IEEE Guide to the Assembly and Erection of Metal Transmission Structures"
- IEEE Std. 977-2010 "IEEE Guide to Installation of Foundations for Transmission Line Structures"
- IEEE Std. 1243-1997 "IEEE Guide for Improving the Lightning Performance of Transmission Lines"
- IEEE Std. 1441-2004 "IEEE Guide for Inspection of Overhead Transmission Line Construction"

Design Manual

- RUS Bulletin 1724E-200 “Design Manual for High Voltage Transmission Lines”
- RUS Bulletin 1724E-205 “Design Guide “Embedment Depths for Concrete and Steel Poles”
- RUS Bulletin 1724E-224 “Electric Transmission Guide Specifications and Drawings for Steel Pole Construction – 34.5 to 230 kV”
- RUS Bulletin 1724E-226 “Electric Transmission Guide Specifications and Drawings for Concrete Pole Construction – 34.5 to 230 kV”
- RUS Bulletin 1728F-810 “Electric Transmission Specifications and Drawings for 34.5 Through 69 kV”
- RUS Bulletin 1728F-811 “Electric Transmission Specifications and Drawings for 115 Through 230 kV”
- RUS Bulletin 1724E-104 “Reduced Size Neutral Conductors for Overhead Rural Distribution Lines”
- RUS Bulletin 1724E-150 “Unguyed Distribution Poles – Strength Requirements”
- RUS Bulletin 1724E-151 “Mechanical Loading on Distribution Crossarms”
- RUS Bulletin 1724E-152 “The Mechanics of Overhead Distribution Line Conductors”
- RUS Bulletin 1724E-153 “Electrical Distribution Line Guys and Anchors”
- RUS Bulletin 1724E-154 “Distribution Conductor Clearances and Span Limitations”
- RUS Bulletin 1728F-803 “Specifications and Drawings for 24.9/14.4 kV Line Construction”
- RUS Bulletin 1728F-804 “Specifications and Drawings for 12.47/7.2 kV Line Construction”
- Chance “Encyclopedia of Anchoring”
- Chance “Encyclopedia of Grounding”

Cable Specifications

- CAN/CSA G12-92 "Zinc-Coated Steel Wire Strand"
- ASTM A363-03 "Standard Specification for Zinc-Coated (Galvanized) Steel Overhead Wire Strand"
- ASTM A475-03 "Standard Specification for Zinc-Coated Steel Wire Strand"
- CAN/CSA C61089:03 "Round Wire Concentric Lay Overhead electrical Stranded Conductors"
- CAN/CSA C49.2-1975 "Compact Aluminum Conductors Steel Reinforced"
- CAN/CSA C68.3-97 "Shielded and Concentric Neutral Power Cables Rated 5 – 46 kV"

Insulator Specifications

- CAN/CSA C411.1-10 "AC Suspension Insulators"
- CAN/CSA C411.4-10 "Composite Suspension Insulators for Overhead Lines > 75 kV"
- CAN/CSA C411.5-10 "Dead-end/Suspension Composite Insulators for Overhead Lines ≤ 75 kV"
- CAN/CSA C411.6-11 "Line Post Composite Insulators for Overhead Distribution Lines ≤ 75 kV"
- CAN/CSA C411.7-11 "Composite Insulators for Guy Wires"
- IEC/TS 60815-2 "Selection and dimensioning of high-voltage insulators intended for use in polluted conditions – Part 2: Ceramic and glass insulators for a.c. systems"
- IEC/TS 60815-3 "Selection and dimensioning of high-voltage insulators intended for use in polluted conditions – Part 3: Polymer insulators for a.c. systems"
- ANSI C29.2-1992 "Wet-Process Porcelain and Toughened Glass – Suspension Type"
- ANSI C29.7-1996 "Wet-Process Porcelain Insulators – High Voltage Line-Post Type"
- ANSI C29.4-1989 "Wet-Process Porcelain Insulators – Strain Type"
- ANSI C29.9-1983 "Wet-Process Porcelain Insulators – Apparatus, Post-Type"
- ANSI C29.12-1997 "For Insulators – Composite – Suspension Type"
- ANSI C29.13-2000 "For Insulators – Composite – Distribution Deadend Type"
- ANSI C29.17-2002 "For Insulators – Composite – Line Post Type"
- ANSI C29.18-2003 "For Insulators – Composite – Distribution Line Post Type"
- RUS Bulletin 1724E-220 "Procurement and Application Guide for Non-Ceramic Composite Insulators, Voltage Class 34.5 kV and Above"

Material Specifications

- CAN/CSA O15-15 “Wood Utility Poles and Reinforcing Stubs”
- CAN/CSA O80 Series-08 “Wood Preservation”
- CAN/CSA A14-07 “Concrete Poles”
- CAN/CSA C57-98 “Electric Power Connectors for Use in Overhead Line Conductors”
- CAN/CSA C83-96 “Communication and Power Line Hardware”
- RUS Bulletin 1724E-204 “Guide Specification for Steel Single Pole and H-Frame Structures”
- RUS Bulletin 1724E-206 “Guide Specification for Spun, Prestressed Concrete Poles and Concrete Pole Structures”
- RUS Bulletin 1724E-214 “Guide Specification for Standard Class Steel Transmission Poles”
- RUS Bulletin 1724E-216 “Guide Specification for Standard Class Spun, Prestressed Concrete Transmission Poles”
- RUS Bulletin 1728F-700 “Specification for Wood Poles, Stubs and Anchor Logs”
- RUS Bulletin 1728H-701 “Specification for Wood Crossarms (Solid and Laminated), Transmission Timbers and Pole Keys”
- RUS Bulletin 1728H-702 “Specification for Quality Control and Inspection of Timber Products”
- ASTM A370-09a “Standard Test Methods and definitions for Mechanical Testing of Steel Products”
- ASTM A354-07a “ Standard Specification for Quenched and Tempered Alloy Steel Bolts, Studs, and Other Externally Threaded Fasteners”
- ASTM A490-09 “Standard Specification for Structural Bolts, Alloy Steel, Heat Treated, 150 ksi Minimum Tensile Strength”
- ASTM A320/A320M-08 “Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low Temperature Service”
- ASTM A572/A572M-07 “Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel”

(1) Code words shown denote ACSR with regular-strength Class A galvanized steel core (S1A). See the Options section to find the appropriate code word modifier designation for alternative design options.
(2) Due to rounding, total values may be slightly greater or slightly less than the sum of the component values.
(3) Weights shown are for conductor only and do not include the reel. Normal length and shipping tolerances apply.
Dimensions and weights not designated minimum or maximum are nominal values and subject to manufacturing tolerances. In this context, weight means mass.

(4) Code words shown denote ACSR with regular-strength Class A galvanized steel core (S1A). See the Options section to find the appropriate code word modifier designation for alternative design options.
(5) Based on a conductivity of 61.0% IACS at 20°C for aluminum and ignores the effects of the steel core. To convert to ohms/mile, multiply by 5.28. To convert to ohms/km, multiply by 3.281.
(6) Based on a conductor temperature of 75°C at 60 Hz and the following conditions: 32°C ambient temperature, 1.98 ft/sec (0.6 m/s) crosswind (90° to conductor), 0.5 coefficient of emissivity, 0.5 coefficient of absorbtivity, 42° northern latitude, sea level elevation, 90° azimuth of line (East-West), clear atmosphere, and a date and time of noon on July 1 (resulting in 95.0 W/ft² of solar and sky radiated heat). Actual ampacity will differ based on local conditions. For specific ampacities, please contact your General Cable sales representative.
(7) Values for inductive reactance and capacitive reactance are expressed in terms of a 1 ft radius (30.48 cm). To convert the Geometric Mean Radius (GMR) to cm, divide the value by 0.03821. To convert inductive reactance to ohm/km, multiply the value by 3.281. To convert capacitive reactance to ohm/km, divide the value by 3.281.

(1) Code words shown denote ACSR with regular-strength Class A galvanized steel core (S1A). See the Options section to find the appropriate code word modifier designation for alternative design options.
(2) Due to rounding, total values may be slightly greater or slightly less than the sum of the component values.
(3) Weights shown are for conductor only and do not include the reel. Normal length and shipping tolerances apply.
Dimensions and weights not designated minimum or maximum are nominal values and subject to manufacturing tolerances. In this context, weight means mass.

(4) Code words shown denote ACSR with regular-strength Class A galvanized steel core (S1A). See the Options section to find the appropriate code word modifier designation for alternative design options.
(5) Based on a conductivity of 61.0% IACS at 20°C for aluminum and ignores the effects of the steel core. To convert to ohms/mile, multiply by 5.28. To convert to ohms/km, multiply by 3.281.
(6) Based on a conductor temperature of 75°C at 60 Hz and the following conditions: 32°C ambient temperature, 1.98 ft/sec (0.6 m/s) crosswind (90° to conductor), 0.5 coefficient of emissivity, 0.5 coefficient of absorbtivity, 42° northern latitude, sea level elevation, 90° azimuth of line (East-West), clear atmosphere, and a date and time of noon on July 1 (resulting in 95.0 W/ft² of solar and sky radiated heat). Actual ampacity will differ based on local conditions. For specific ampacities, please contact your General Cable sales representative.
(7) Values for inductive reactance and capacitive reactance are expressed in terms of a 1 ft radius (30.48 cm). To convert the Geometric Mean Radius (GMR) to cm, divide the value by 0.03821. To convert inductive reactance to ohm/km, multiply the value by 3.281. To convert capacitive reactance to ohm/km, divide the value by 3.281.

DIMENSIONS

	According to CSA-C411.1 & ANSI C29-2	
Diameter of shell (D)	10 in	255 mm
Spacing (P)	5 3/4 in	146 mm
Creepage distance	12 5/8 in	320 mm
Coupling according to CSA-C411.1 & ANSI C29-2	Type:CS-3 & Class: 52.3 Type:B	
Approximate net weight	8.8 lbs	4 kg

ELECTRICAL PERFORMANCES

Tested as per CSA-C411.1 & ANSI C29.2

Low frequency	
Dry flashover voltage	80 kV
Wet flashover voltage	50 kV
Critical impulse flashover voltage	
Positive	125 kV
Negative	130 kV
Low frequency puncture voltage	130 kV
Radio interference test voltage rms	10 kV
Maxi radio interference - 1 MHz	50 µV

MECHANICAL PERFORMANCES

According to CSA-C411.1 & ANSI C29.2

Combined mechanical and electrical strength	15000 lbs	70 kN
Tension proof	7500 lbs	35 kN
Mechanical impact strength	400 in.lbs	45 N.m

COMPONENT PARTS

Dielectric shell : TOUGHENED GLASS
Cap : HOT DIP GALVANIZED CAST IRON
Pin : HOT DIP GALVANIZED FORGED STEEL
Cotter key : STAINLESS STEEL
Cement : ALUMINOUS, hot cured

Approx. Weight is for Y-clevis & Ball unless otherwise specified.

Test methods and criteria are in accordance with ANSI C29.11 and ANSI C29.12.

All tables show the typical products. Please contact NLPI for other dimensions and end fitting combinations.

Electrical values exceeding the capacity (AC FOV>1200kV, L.I. FOV>3000kV) are presumed by the extrapolation of values obtained from short string unit.

ANSI 30kip / SC, SS, SL Shed Series

1) Refer to individual product catalogs for details of the components.
2) The leakage distance is the lesser value of the strut and stay.
3) Design loads are for single loads in the specified direction.
4) Design load values do not consider the supporting structure strength.

The catalog numbers listed above use a bendable curved base. A flat base option is also available upon request.
Application of corona ring(s) depends on requirements.
For more detailed information please contact our local sales representative.

Appendix F – IEEE Std. 738 Ampacity Calculation Program Output

```
PLS-CADD Version 13.20x64    3:50:27 PM Thursday, July 23, 2015
Chimax Inc.
Project Name: 'c:\project\cable ampacity.DON'

IEEE Std. 738-2013 method of calculation

Air temperature is 40.00 (deg C)
Wind speed is 0.61 (m/s)
Angle between wind and conductor is 90 (deg)
Conductor elevation above sea level is 800 (m)
Conductor bearing is 270 (deg) (perpendicular to solar azimuth for maximum solar heating)
Sun time is 12 hours (solar altitude is 50 deg. and solar azimuth is 180 deg.)
Conductor latitude is 63.6 (deg)
Atmosphere is CLEAR
Day of year is 172 (corresponds to June 21 in year 2015) (day of the year with most solar heating)

Conductor description: 266.8 kcmil 26/7 Strands PARTRIDGE ACSR - Adapted from 1970's Publicly Available Data
Conductor diameter is 1.631 (cm)
CORE STRANDS:
       Diameter is 10.363 (mm)
Radial Thermal Conductivity is 2.00 (W/m-K)
Conductor resistance is     0.2136 (Ohm/km) at  25.0 (deg C)
                    and     0.2556 (Ohm/km) at  75.0 (deg C)
       Conductor resistance is computed using average of core and surface temperatures.
Emissivity is 0.5 and solar absorptivity is 0.5

Solar heat input is      8.539 (Watt/m) (corresponds to Global Solar Radiation of 1047.273 (Watt/m^2) - which was calculated)
Radiation cooling is    14.183 (Watt/m)
Convective cooling is   59.286 (Watt/m)

Given a maximum conductor temperature of 100.0 (deg C),
The steady-state thermal rating is 484.4 amperes

       Conductor resistance is computed using average of core and surface temperatures.
Emissivity is 0.6 and solar absorptivity is 0.8

Solar heat input is     13.662 (Watt/m) (corresponds to Global Solar Radiation of 1047.273 (Watt/m^2) - which was calculated)
Radiation cooling is     5.393 (Watt/m)
Convective cooling is   22.393 (Watt/m)

Given a constant ac current of 240.0 amperes,
The conductor surface temperature is 62.6 (deg C)
The conductor core temperature is 62.7 (deg C) (based on radial thermal conductivity of 2.00 (W/m-K))

1.0 Project Overview

Yukon Energy Corporation (YEC) is proposing to construct a 138kV transmission line from Stewart Crossing South (SCS) substation to Keno City (KC) substation. The overall transmission line and associated substation construction or modification is grouped as SKTL project.

Chimax Inc. had developed the transmission line cost estimations for the three segments of the SKTL transmission lines. The preliminary design report was produced in early January 2016.

The preliminary SKTL cost estimates for transmission lines and substations are approximately $86 million which substantially higher than conceptual cost estimation of the project.

The transmission line L250 between Mayo to Keno City had already past the end of life and required constant replacement maintenances.

An extension scope had been requested by YEC to provide cost estimations of rebuilding existing L250 to 138kV standard between Mayo to Keno City and operate at 69kV until further customer loads warrant 138kV operation.

1.1 Extension Scope Descriptions

The extension scope is to provide a cost breakdown of the rebuild of existing L250 based on transmission line alignments determined in the original scope with addition configuration scenarios:

I. Mono Pole with Braced Post Insulators (Like as Like Replacement)
   a. 138kV Mono Pole without shieldwire (OPGW or OHGW)
   b. 138kV Mono Pole with shieldwire provision (future OPGW or OHGW)
   c. 138kV Mono Pole with OHGW installed (lightning protection)
   d. 138kV Mono Pole with OPGW installed (lightning protection & fiber communication)

II. H-Frame with Suspension Insulators (Preferred Configuration)
   a. 138kV H-Frame without shieldwire (Identical to CSTL)
   b. 138kV H-Frame with shieldwire provision (future OPGW or OHGW)
   c. 138kV H-Frame with 2xOHGW (lightning protection)
   d. 138kV H-Frame with 1xOHGW & 1xOPGW (lightning protection & fiber communication)

Chimax Inc. will also review and assess YEC cost adjustments applied in their project cost workbook.

A high-level assessment of the incremental cost increase for provision to provide space for future distribution underbuilt below 138kV transmission line between Mayo to Minto Bridge.

2.0 Configuration Comparison & Benefits

2.1 Mono Pole Configuration

Mono Pole 138kV transmission line with braced post insulators has been utilized widely where transmission right of way is limited. The standard transmission post insulators are limited by the cantilever capacities and often restrict the transmission span to 120m or less depending on the loading criteria. Braced post insulators transfer majority of the vertical loading to the strut suspension insulator, where the design span can range from 150m to 250m.

The 72kV mono pole compared to 138kV mono pole will be slightly reduces the pole height requirement due to reduce phase to phase separation and lower ground clearance requirement. The braced poet insulator cost for 72kV will also be slightly lower compared to 138kV braced post insulator. The class of wood pole will predominantly identical. All other material and construction cost remain identical. The overall cost reduction is approximately 2 to 5% of the 138kV transmission line cost.

The critical consideration of Mono Pole transmission structures is the soil properties. Self-supported Mono Pole structures will exert substantial bending moment at the ground line, therefore available soil resistance will become the controlling factor in the design and cost process.

2.2 H-Frame Configuration

H-frame transmission line structures had been in used for many years. The advantage of H-frame structure is the reduced requirement for soil resistance. H-frame tangent structures with cross braces and guyed angle structures have majority of the ground line reactions as vertical down and uplift forces with minimal bending moments. This configuration is more suitable in poor soil conditions and transmission line can be designed with minimal geotechnical data during design stage.

The disadvantage of H-frame structures compared with Mono Pole structures is the additional right of way requirement in order to accommodate the required configuration. In general, H-frame structures will require additional 5m to 10m extra width compared to Mono Poles.

2.3 Shieldwire (OHGW or OPGW)

Despite YEC not implementing shieldwire requirement in past transmission lines, the requirement of shieldwire above 69kV had been implemented in many other Provincial regulations, including Alberta AESO ISO rules.

The performance of shieldwire for lightning protection depends on the local lightning frequency, shielding angle of the lightning protection and soil ground resistivity.

As per information provided by YEC, service outage resulted from lightning strike on existing L250 has been increasing. Implementation of shieldwire in the rebuild of L250 should be considered.

3.0 Cost Adjustment to Initial Preliminary SKTL Design Estimation

3.1 Structure Procurement and Construction Cost

Based on YEC final billing information on CSTL 2 construction cost, Chimax had performed a comparison analysis to verify the structure procurement construction based on 2015 values. The cost comparison is based on identical structures having shieldwire protection. The comparison is attached in Appendix A.

The unit cost of steel for the SKTL cost estimation has been reduced from initial $2.50 per lbs to $2.00 per lbs. The initial unit cost is based on the upper market cost, while the adjusted cost will be medium to low market cost range.

The comparison has shown the SKTL estimated structure costs are in general agreement with the inflation adjusted CSTL 2 project with difference of approximately 8%.

3.2 EPCM Cost Adjustment

Chimax had review the adjustment to the EPCM cost for each line segment.

The reduction in number of site office from 2 to 1 is acceptable. The previous CSTL and CSTL 2 project did not actually utilized proper site office.

The adjustment of construction period is generally acceptable while keeping 4 EPCM personnel during the construction. This should in general provide sufficient funding budget for the EPCM contract.

3.3 Final Design & Field Services

Several permitting and legal items have been removed in the YEC cost estimations.

- Environmental Assessment
- Vegetation Clearing Permits
- Crossing Permits
- Legal & Consultation Cost
- Land Easement Cost

Chimax initially included the above items in the cost estimates to ensure the associated cost is accounted. The relocation of the above item costs from the project budget to operating budget is acceptable.

The engineering cost is based on engineering company performing final design for the SKTL without previous knowledge of YEC standards and project managements.

3.4 Survey Cost for Engineering Design

Chimax have included a confirmation survey cost of $150,000 for each segment of transmission line. The confirmation survey can be performed ahead of final design or during final design prior to construction. The requirement of confirmation survey will be depended on the engineering company performing the final design of the transmission line. Chimax have no objection in remove the survey cost from the transmission line budget.

4.0 Existing L250 Replacement Costs

The L250 replacement cost comparisons outlined below are for procurement and construction (PC) cost, while all other indirect cost are excluded since they will remain same for different configurations.

The PC costs for the different configurations are summarized in Appendix B.

4.1 Like as Like Replacement

Chimax has further revised the new L180 and L250 designs with Mono Pole configurations to provide the budgetary cost for Like as Like replacement.

Line Configuration	PC Cost	Incremental Increase	Cost / km
Base Case - Mono Pole (no shieldwire provision)	$16,814,524.00		$327,729.00
Option 1 – Mono Pole (shieldwire provision)	$16,900,224.00	$85,700.00	$329,439.00
Option 2 – Mono Pole (OHGW Installed)	$17,765,524.00	$865,300.00	$346,307.00
Option 3 – Mono Pole (OPGW Installed)	$18,197,124.00	$431,600.00	$354,720.00

Based on lightning outage data from L250, the Like as Like scenario without shieldwire provision is highly not recommended. The incremental cost increase of $85,700.00 to allow L250 replacement to have future provision of shieldwire protection should be considered as the baseline scenario.

The implementation of OHGW during initial replacement construction will cost approximately $865,000, while installing the OHGW at the later date would likely cost additional $300,000 due to contractor mobilization, administration and construction management.

The incremental increase of installing OPGW instead of OHGW depends on YEC future system planning and protection & control protocol. The installation of OPGW will only be justified if fiber-optic communications between YEC assets are planned.

4.2 H-Frame Replacement

The H-Frame comparison costs are based on original preliminary design with re-alignment at Minto Bridge area due to land application. Incremental cost comparisons have also been performed for H-frame structures.

Line Configuration	PC Cost	Incremental Increase	Cost / km
H-Frame (CSTL 2) (no shieldwire provision)	$17,437,607.00		$339,914.00
Option 1 – H-Frame (shieldwire provision)	$17,609,425.00	$171,818.00	$343,264.00
Option 2 – H-Frame (2xOHGW Installed)	$19,251,035.00	$1,641,610.00	$375,264.00
Option 3 – H-Frame (OHGW & OPGW Installed)	$19,687,635.00	$436,600.00	$383,775.00

4.3 Cost Comparison Mono Pole Versus H-Frame

The following cost comparison is based on replacing existing L250 with structures having OHGW protection.

PC Costs	H-Frame (Option 2)	Mono Pole (Option 2)	Differential
L250 Replacement	$19,251,035.00	$17,765,524.00	$1,485,511.00
Cost / km	$375,264.00	$346,307.00	$28,957.00

Despite the overall costs for H-frame configuration are higher compared with Mono Pole configuration, the reliability of H-frame structures are much better due to less dependency on soil conditions, better distribution of loads along the structures and minimal structure deflection during extreme climate conditions.

4.4 High-Level Cost Estimation for 3 Phases Distribution Underbuilt

High level design review had been performed in order to provide the cost increment for provision to allow 3 phases distribution underbuilt below L180 between Mayo substation and Minto Bridge (Mease Farms).

The mono pole tangent structures have increased height by 5 ft to 10 ft in length and class of pole increased from Class 1 to H1. The resulting incremental cost increase is approximately $30,000.00 per km without distribution hardware. For approximately 8 km between Mayo to Minto Bridge, the estimated cost increase is approximately $240,000.00 for pole procurement.

In general, the incremental cost to have provision below transmission line will be less than building independent distribution line for same distance. Additional electrical studies should be performed regarding induction between transmission and distribution circuit to ensure the underbuilt will have acceptable power quality.

5.0 Recommendations & Conclusions

For transmission line in Yukon where soil conditions are generally loose gravel, wet swamp and permafrost in many areas, the H-frame configuration is recommended for long term reliability.

For transmission line designed for future 138kV operating voltage, lightning protection should be included in the structure designs.

Installation of shieldwire at later date would cost additional $300,000.00 compared to installing shieldwire at the time of replacement construction. It is recommended to include shieldwire installation in the project budget.

Interests and Concerns Raised by Members of the Public and Areas where Feedback from Public Engagement Activities was considered in the Environmental and Socio-economic Assessment Process

Issue	Interest/Concern Raised	Response
Project Description and Transmission Line Route	New line segment between Mayo and Keno City should limit frequency of crossing over the highway.	This was a consideration in the routing of the new transmission line between Mayo and Keno City. See Chapter 6, Section 6.3.3.
	New line should avoid crossing properties as it enters Keno City substation (Mayo to Keno City Line Segment).	See Chapter 6, Section 6.3.3.
	Concern regarding the potential for the new line to encroach on existing private property as distance between existing centre line and private property line is limited.	See mitigation discussed in Chapter 7, Section 7.3.3.2 (Private and Commercial Land Use).
	Special care and attention was requested for a buried water line near McGuinty Creek along the proposed route.	See mitigation discussed in Chapter 7, Section 7.3.3.2 (Private and Commercial Land Use).
	Concern regarding avoidance of historic signage and engine on Alexco parcel near Keno City.	See mitigation discussed in Chapter 7, Section 7.3.3.2 (Private and Commercial Land Use). See also Chapter 6, section 6.3.3.
	Interest in the types of poles being used to replace the line segment between Mayo and Keno City.	An H-Frame configuration is planned with use of mono-pole or double circuit design provided in specific areas to mitigate adverse impacts on private property or other interests.
Substations	Interest in the potential locations for the substations.	Project Description, Chapter 6, Section 6.3.3.1 describes alternatives locations for substation.

Issue	Interest/Concern Raised	Response
Safety and Reliability	New line should limit the frequency and duration of power outages for customers (Mayo to Keno City Line Segment).	See Chapter 6, Project Description. The Project will improve the transmission grid infrastructure in central Yukon between Stewart Crossing and Keno City, and reinforce and strengthen the grid between Stewart Crossing and Mayo ensuring continued safe and reliable service.
	Concern regarding power outages during line construction.	In the event that substantial power outages are anticipated, generators will be put in place to reduce impacts of outages to hours (not days).
	Concern regarding potential for stray electricity coming off the new line given it will be operated at a higher voltage.	Due to the size of the line this concern is not an issue.
Transformer Upgrades	Concern regarding replacement of existing transformers that were considered insufficient to meet existing power needs of two customers along the route northeast of Mayo.	The Project will also provide updated transformer infrastructure for service to specific properties near the Minto Bridge and Halfway Lakes.
	Interest in new opportunities to access grid power and associated costs.	The cost of a new transformer and distribution line is borne by the customer. However, the Yukon Government's Rural Electrification Program may provide some financing assistance. A 69kV step-down transformer may cost between $100,000 and $150,000 (a 138 kV step-down transformer would cost slightly more). Ten distribution poles (100 m apart) would cost on the order of $15,000.

Issue	Interest/Concern Raised	Response
Project Costs	Concern regarding how the Project will be funded; and impact of Project costs and potential cost over-runs on ratepayers.	Funding by the Yukon Government through Yukon Development Corporation (YDC), rather than by Yukon Energy, will allow the system improvement to be completed without any adverse cost impacts on electrical rates. Yukon Energy does not have any specific information regarding how the Yukon Government or YDC plans to finance the Project at this time, but understands a number of funding options are being considered.
	Concern regarding extreme cost of the Project when there are only a handful of customers in Keno; suggestion to decommission the line and turn on the diesels in the communities. Suggestion that money could be used more strategically.	See Chapter 6, Section 6.3.3. Moving existing customers from grid generation to thermal (diesel) generation is not consistent with the goals of Yukon government's Energy Strategy for Yukon or the Climate Change Action Plan. Removal of the line would also likely limit potential future industrial growth in this area of longstanding mining activity, which could have an adverse impact on potential economic growth in Yukon. It would also limit future renewable generation development in this area for connection to the Yukon grid.
	Concern over how the government is funding the Project.	Yukon Energy understands that the government is considering a number of funding options.

Issue	Interest/Concern Raised	Response
	Concern over building public infrastructure to potentially support uncertain and future private development. Suggest that mining companies should pay for their own infrastructure. Concern regarding the high cost of substations for industrial purposes.	See Chapter 6, Section 6.3. The Project will reinforce and strengthen the grid between Stewart Crossing and Mayo, and replace and remove deteriorated and 'end of life' transmission infrastructure between Mayo and Keno City, ensuring continued safe and reliable service and facilitating future economic development within the territory. See also discussion in Chapter 5, Section 5.4 which outlines the current industrial customer investment policy as approved by the YUB. This reduces the risk of adverse cost impacts to other utility ratepayers from new capital costs needed to connect a new major industrial customer and focuses on maximizing potential industrial customer investment to new transmission facilities developed to extend service to them as well as to retain direct assignment of annual capital-related transmission costs for existing facilities, where appropriate.
Employment Opportunities	Queries regarding who would be hired to do line work.	Line work will be put out to competitive and open tender.
	Interest in construction employment opportunities, including local contractors (brushing, clearing, substation crews).	Line work will be put out to competitive and open tender. Brushing contracts have been tendered separately in the past. Yukon Energy would like to understand the capacity of local residents have for this type of work in order to maximize Project benefits to local residents and Yukoners in general.
	Interest in environmental contracts.	There are not likely to be any other environmental contracts at this time; however, Yukon Energy is pursuing potential heritage work.
	Interest in local economic benefits. YEC should have a policy that supports using local companies and businesses for their infrastructure projects and should consider local businesses during tender process.	Yukon Energy will endeavour as part of the remaining project planning, procurement and construction stages to maximize benefits to local businesses.

Issue	Interest/Concern Raised	Response
	Interest in the location of construction camps and potential opportunities for local businesses.	Decisions have not yet been made regarding the number of camps or camp locations. Camp location would very likely be located on private property.
Consultation	Interest in consultation/engagement process and how individuals could participate in the planning and assessment process so that their views could be discussed.	See discussion included in Section 4.3 and Section 4.4 of this Chapter regarding methods of communication for the public engagement process.
Project Schedule	Interest in overall Project schedule (YESAB submissions, construction, operation).	See Chapter 6, Section 6.5 for overall Project schedule.
Biophysical Environment	Concern regarding important small mammal habitat area.	See Chapter 7, Section 7.2.3.3.
	Interest in impact collisions related to migratory birds.	See Chapter 7, Section 7.2.3.4.
	Request to avoid Community Ecological Monitoring Plots.	See Chapter 7, Section 7.3.3.2.
	Include a vegetative buffer between roadway and transmission line.	See mitigation discussion in Chapter 7. A vegetative buffer is being provided to the extent feasible.
	Concern over past construction practises regarding waste materials and garbage along the ROW.	There will be environmental monitoring and adequate oversight. Yukon Energy will ensure its EMS is applied.
	Concern regarding ground disturbance along the ROW including permafrost melting, soil erosion and drainage.	See mitigation measures described in Chapter 7. Ground disturbance will be minimized through avoidance of poor terrain, where possible, and other mitigation measures as described in Chapter 7.
Heritage	Concern over heritage or historic sites of value along the proposed route.	See Chapter 7, Section 7.3.3.5. A Heritage Resources Impact Assessment has been completed. Yukon Energy's Heritage and Culture EWP will be followed during construction.

Issue	Interest/Concern Raised	Response
Timber Salvage	NND and local community residents (Mayo and Keno City) noted importance of access to fuel wood.	The Timber Salvage Plan has been prepared as part of the submission.
	Queries regarding whether hand clearing or machinery would be used.	See Chapter 7 and Timber Salvage Plan provided as Appendix 6C. In areas of low salvageable timber and extensive permafrost the wood will likely be mulched and left as ground cover. In conventional terrain areas it will be slashed and burned.
	Interest in access to usable salvaged poles.	Yukon Energy will offer opportunities for salvage/use of decommissioned poles where appropriate.
Future Development	Concern over whether Mayo will still be serviced with new infrastructure if mining activities become productive in the future.	Mayo will still be serviced with new infrastructure if mining activities become productive in the future.
	Interest in renewable energy projects, specifically the potential power from future wind projects on Ferry Hill to be fed into the system.	Consideration, via data collection, is being given to the feasibility of the Ferry Hill power source. See also Chapter 6, Section 6.3. The proposed improvements to the integrated system will extend Yukon's existing 138 kV grid from Stewart Crossing to Mayo and the Keno City area, addressing continued reliability concerns, and also facilitating connection to the integrated grid of potential future customers and sources of renewable energy in this region that require a higher voltage power line with greater capacity.
	Interest in fibre optic cable providing faster internet speeds being included in this Project.	See Project Description provided in Chapter 6. Fibre optic cable will be for utility usage only.

REFERENCE: **Application, Tab 5.2.1.4, page 5-13**

ISSUE: **McQuesten Substation Project**

QUOTE: "Total cost estimated for the McQuesten Substation during the VGC PPA proceeding were $8.529 million (assuming no need for a Step Down transformer)…"

"YEC has received an asset contribution from VGC Group valued at $10.688 million, and has incurred a net cost of $0.931 million (related to added facilities to enable future 138 kV service operation if required)." (footnote removed)

QUESTION:

a) Please explain in what circumstances YEC would require a step-down transformer in this substation and the likelihood of such a transformer in the near future.

b) Please explain the assets included in the $10.688 million contribution amount and whether this amount will equate to future 138 kV service operation, if required.

ANSWER:

(a)

YEC would require a step down transformer if the line from Stewart Crossing substation to McQuesten substation was energized at 138kV. The likelihood of installing the step down transformer is unknown at this time.

(b)

The assets included in the $10.688 million asset contribution from VCG Group include substation assets and all related ancillary components that VGC Group was responsible for funding, i.e., all capital costs related to the McQuesten Substation development except for costs to enable operation at 138 kV voltage. Accordingly, this amount is not related to future 138 kV service operation, if required.

The VGC Group PPA provides for VGC Group to recover from YEC the incremental fees, costs and expenses associated with the McQuesten Substation, as initially developed, being able to operate at 138 kV voltage ("YEC McQuesten Substation Costs" as specified in Schedule B of the VGC Group PPA). YEC McQuesten Substation Costs as included in Schedule B of the VGC Group PPA are summarized in the Table below, and are YEC's net cost related to this facility.

Table B-2: YEC McQuesten Substation Costs

S258 McQuesten & S249 Mayo		YEC
Construction	**$**	**605,931**
Supervision	$	36,000

ISSUE: **Transmission Line Refurbishment Project**

QUOTE: "YEC's 138 kV Whitehorse-Aishihik-Faro (WAF) transmission system was constructed in the late 1960's and early 1970's, and plays a critical role linking key hydro generation sources to load centres in Whitehorse and on the northern grid. Recent studies as well as a detailed line assessment in 2017 indicated that key components of the WAF system were at end of life, in poor condition, and required replacement."

"Specifically, certain components of these lines had begun to exhibit higher failure rates. Based on these events, YEC commissioned external asset assessments of the key backbone lines on the integrated system as noted above. These assessments indicated that a large number of cross arms and insulators are at end of life with a high risk of failure." (footnote removed)

QUESTION:

a) Please provide and explain the studies (including the detailed line assessment conducted in 2017) that were conducted to show that key components of the WAF transmission system were at end of life, in poor condition and required replacement. For example, what reliability criteria were violated, and were contingency analyses performed?

b) Please explain how often YEC carried out studies and assessed the reliability of the WAF transmission system in the past.

c) Please explain which components of the system began exhibiting higher failure rates and whether this system experienced any outages. If so, please provide the number and duration of outages experienced in the last 10 years, on a per annum basis, and the costs incurred due to these outages.

ANSWER:

(a)

The requested studies are provided in the following attachments:

Attachment 1 provides the "Transmission Line Overhead Facilities Condition Assessment Technical Specification and Project Management Requirements." The document defines the requirements for inspection and condition assessment of Yukon Energy Corporation's (YEC) overhead transmission line assets and notes as follows in the Overview:

> The intent of transmission line inspection and condition assessment is to ensure that sufficient information is available to support ongoing operations and maintenance of these assets, plan for maintenance upgrades in the future, and address immediate maintenance issues that may affect reliability or availability. In general, the transmission line inspection will assess the present condition of each structure and piece of hardware associated with the line, as well as noting possible foundation, clearance, and vegetation issues related to the line. The line patrol will also involve identifying original structure location relative to its replacement structure. A photo record of each structure and associated foundation and of every defect recorded will be part of the inspection and assessment work. Inspection crews are required to install missing structure tags in the field as necessary, the structure tags will be supplied by YEC.
>
> Following collection of field data, the inspection results, record of defects and repair priorities is to be summarized in the supplied excel worksheet.

The excel worksheet is provided as **Attachment 2**.

Other studies undertaken that show that key components of the WAF transmission study were at end of life, in poor condition or required replacement are summarized below. Generally, cross-arms, insulation and the shell thickness of the poles were the main components of concern.

- **Attachment 3** provides the Powertech Labs Inc. assessment of "Failure Analysis and Condition Assessment Tests on Suspension Insulators from Yukon Energy 138 kV Transmission Line". As noted in the report, Yukon Energy sent seventy-

eight insulators that had been removed from a failed wood pole 138 kV transmission structure (it burned) to Powertech for determination of the root cause of the fire and to assess the condition of all insulators removed from the same structure. A series of test were carried out on the insulators. The Powertech report notes in summary that "if the condition of these insulators is typical of the insulators in this transmission line it is recommended that all insulators that are marked with "Made in England 1968" or "Buller's England 1968" be replaced. Any live line work done on these transmission lines should take into account there is a significant risk that there are punctured insulators and there may be insulators with low mechanical strength in the insulator strings being work on."

- **Attachment 4** provides PowerTech "Condition Assessment and Evaluation of Type ASX Cross Arms". A condition assessment and evaluation of in-service crossarms from a 138 kV transmission line operated by Yukon Energy was performed by Powertech Labs, to determine the remaining load carrying capacity of the crossarms, and whether they still meet both historical and upgraded modern design load requirements. The crossarms were from angled tangent structures, in which the angle of the crossarms is approximating that of the sloping terrain. The report noted that "Given the high probability of not meeting design vertical loads and the age of the crossarms (close to 50 years old), as well as evidence of failure in service, it is recommended that the replacement of these crossarms should be initiated to mitigate the risk of failure in service". The following priorities were suggested:
    - Long spans should be given priority for replacement over short spans;
    - Crossing structures should be given priority over non-crossing structures; and
    - For all spans, those structures in which knots and checks are noted around connection points should be given priority over structures in which these features are not seen.

- **Attachment 5** provides "Condition Assessment and Evaluation of 138 kV Wood Cross Arms". Wood crossarms utilized in single crossarm H-frame structures from an existing 138 kV transmission line were supplied by Yukon Energy Corporation for full scale mechanical testing and flexural testing. The crossarms of the transmission line are scheduled to be replaced by steel crossarms, the testing was undertaken to assess the existing structural integrity of the crossarms and their serviceability with respect to updated design criteria for the line, and gauge the

immediacy of the replacement program. The report notes, “Based on the test results, it can be stated that the existing single wood crossarms do not meet the updated design criteria for the line. The design criteria itself takes into account load factors in combination with worst case climate load scenarios. From the reliabilities obtained against the unfactored design load, it is seen that the probability of any immediate failures of existing crossarms is low.” It was recommended that the replacement program of steel crossarms begin as soon as operational practicability dictates, and be guided as follows:

- Long spans should be given priority for replacement over short spans;
- Crossing structures should be given priority over non-crossing structures;
- For all spans, those structures in which knots and checks are noted around connection points should be given priority over structures in which these features are not seen.

(b)

YEC established the first Test and Treat in 2009. Tests and treat is a process that determines the pole shell thickness above and below grade, treats cavities and eliminates insect infestations. Detailed line assessments occur on the various transmission lines at approximately 10-year intervals. The first was in 2003, and the latest was in 2018.

(c)

Cross-arms, insulation and the shell thickness of the poles were the main components of concern. For further details see Attachments 3, 4 and 5 to part (a) of this response.

Please see Table 1 below for number and duration of outages on L170 and L171 over the past 10 years. Outage data is not available for L172.

Total costs related to outages are as follows:

- L170 total cost to respond to outages (planned and unplanned) are $313,500, with an average annual cost (2012-2020) of $34,800; additionally, capital investment in this line over the same period totaled $7,064,600;

- L171 total cost to respond to outages (planned and unplanned) are $100,500, with an average annual cost (2012-2020) of $11,200; additionally, capital investment in this line over the same period totaled $3,718,600; and

- L172 total cost to respond to outages (planned and unplanned) are $25,400, with an average annual cost (2012-2020) of $2,800; additionally, capital investment in this line over the same period totaled $321,000.

Transmission Line Overhead Facilities Condition Assessment

Technical Specification and Project Management Requirements

REVISION LOG:

Revision #	Revision Date	Amendment
0	2016-Sep-09th	Release for Detailed Line Assessment – (RFP 2016-044)
1	2016-Oct-06th	Release for Detailed Line Assessment – L171 (Field Work)
2	2016-Dec-16th	Remove GPS requirements for Detailed Line Assessment 2017

1. OVERVIEW

This document defines the requirements for inspection and condition assessment of Yukon Energy Corporation's (YEC) overhead transmission line assets.

The intent of transmission line inspection and condition assessment is to ensure that sufficient information is available to support ongoing operations and maintenance of these assets, plan for maintenance upgrades in the future, and address immediate maintenance issues that may affect reliability or availability. In general, the transmission line inspection will assess the present condition of each structure and piece of hardware associated with the line, as well as noting possible foundation, clearance, and vegetation issues related to the line. The line patrol will also involve identifying original structure location relative to its replacement structure. A photo record of each structure and associated foundation and of every defect recorded will be part of the inspection and assessment work. Inspection crews are required to install missing structure tags in the field as necessary, the structure tags will be supplied by YEC.

Following collection of field data, the inspection results, record of defects and repair priorities is to be summarized in the supplied excel worksheet. All data including hard and soft copies of all field inspection check sheets, line assessment summary spreadsheets, notes, tailboards and photo record (soft-copy only) are to be returned to YEC following completion of the transmission line inspection.

1.1. LINE GENERAL INFORMATION

YEC's 138kV transmission line network consists primarily of wood pole H-Frame type transmission structures. Some of the newer lines and replacement structures make use of steel crossarms and steel cross-braces. Insulation is a mix of porcelain dating to 1968, toughened glass, and composite.

1.1.1. L171 (Aishishik Generation - Takhini Substation)

L171 is a 129km transmission line built in 1976 to connect Aishihik power generation to Whitehorse. L171 is comprised of ~611 structures.

L172 (Riverside Substation – Takhini Substation)

L172 was part of the L170 original line built from Whitehorse (Riverside) to Faro Mining community in 1970. Later, Takhini substation was built and the L170 structures #1 - #112 became their own line, L172. L172 is 25km long, with ~112 structures.

L169 (L172 tap – McIntyre Substation)

L169 was built to connect the 138kV L172 to McIntyre Substation in 1980. L169 is 6.5 km long with ~30 structures.

1.1.2. L170 (Takhini Substation – Carmacks Airport Sub)

L170 is 152 km transmission line built in 1970, and has maintained its Line designation from the original build to the Carmacks area. L170 is comprised of ~723 structures.

1.1.3. L178 (Carmacks Airport Sub – Faro Mine)

L178 was part of the L170 original line built from Whitehorse (Riverside) to Faro Mining community in 1970. L178 is 190km from Carmacks Airport Sub to the Faro Mine and is comprised of ~832 structures.

1.2. GROUND PATROL SCOPE OF WORK

The scope of work for this assessment project consists of the following aspects:

1. Complete ground patrol and structure condition assessment and accurate recording of field data. Assess urgency of associated maintenance actions.
2. Produce photographic record of each structure, structure foundation, and all visible defects.
3. Note and photo record vegetation along Right of Way (ROW).
4. Install missing structure tags where required.
5. Provide all equipment and supplies required to perform the assessment in a safe, professional manner including: quads; trailers; vehicles; fuel; hand tools; binoculars; GPS enabled camera; computers; safety and communications equipment; food; accommodations, and so on. (YEC will supply structure tag kit).
6. Project management, tracking, and reporting of progress.
7. Support YEC QA/QC process and checks.
8. Compile results into final report including line assessment summary spreadsheet and provide to YEC.

1.3. YUKON ENERGY RESPONSIBILITIES

1. Supply plan and profile drawings of the line to be inspected.
2. Supply number tags and plates for replacement of missing structure tags.
3. Co-ordination of pre-job safety review between the Contractor and YEC personnel.
4. Perform contractor orientation and QA/QC checks to ensure quality of returned data matches specification and expectations.
5. Responsive support from YEC SCC to track and support daily operations (daily check-in and check-out).

2. FACILITIES INSPECTION PATROL REQUIREMENTS

2.1. STRUCTURE CONDITION ASSESSMENT

A structure by structure ground patrol, on foot where difficult terrain prevents ATV access, examination of each structure on the line (including PT-Substation structural components and take off structures from main substations) is the primary goal of this project.

Each aspect of the structure is to be identified, inspected, and the condition recorded. Any associated visual defects and deficiencies are to be identified and recorded. Each deficiency is to be categorized on a YEC defined maintenance priority scale, reflecting the urgency of need for repair.

2.1.1. Structure (STR)

Each structure is to be visually inspected to establish the general condition of the structure framing. The structure type is to be identified and recorded. General structure straightness and condition is to be noted and recorded.

Each component shall be visually inspected for condition and defect, including poles, cross-arms, insulators, hardware, armor-rod, conductor, guys and anchors.

2.1.2. Poles (POL)

Pole height, class, species, date stamp, general external condition, evidence of ant infestation and any external visual damage including burns, woodpecker holes and mechanical damage are to be identified, noted and recorded as part of the patrol finding.

Internal testing of poles is not included as part of the scope of the patrol inspection. Separate inspection program will determine the pole structural adequacy.

2.1.3. Foundation (FDN)

The condition of structure foundations is to be examined, the type of foundation is to be recorded, and visual deficiencies such as leaning structures, inadequate backfill, sloughing, soft-rot and other problems are to be identified, noted and recorded.

2.1.4. Guys and Anchors (G&A)

The number, type, configuration, general condition of the guy and anchor shall be noted and recorded. Visual damage of the guy wire and hardware shall be noted and categorized for maintenance priority. Anchor surface condition shall be inspected to determine the state of the anchor performance. Any anchor deficiency shall be noted, recorded and categorized for maintenance priority.

2.1.5. Cross Arm (XRM)

Type of cross arm, steel or wood, general external condition, visual damage including cracks, burns, bow, bend, twist, sloping grain, rust are to be identified, noted and recorded as part of the patrol finding. Cross arms before road or trail crossings are to be noted with key words ‘ road crossing’ in the comment section.

2.1.6. Cross Brace (XBR)

Type of cross brace, steel or wood, general external condition, visual damage including cracks, bow, twist, grain, rust are to be identified, noted and recorded as part of the patrol finding.

2.1.7. Insulators (INS)

The colour (grey or brown) and type (ceramic or composite) of the insulators on each structure are to be noted during the inspection patrol, as this will date the age of the insulator. The condition of the insulator and any defects including staining, rust, cement bulging, burn marks, chips, cracks, misalignment, defective pins, etc, are to be identified, noted and recorded as part of the inspection.

2.1.8. Vibration Damper (VIB)

The type and number of vibration damper on each span shall be noted and recorded as part of the inspection.

2.1.9. Aerial Marker (AMK)

The type and number of aerial marker, general condition, visual damage including gun shot, broken marker, colour fading are to be identified, noted and recorded as part of the inspection.

2.1.10. Conductor and Shield Wire (C&S)

The condition of conductor between structures is to be visually assessed and any visible damage, such as loose or broken strands, bird caging, gunshot damage or other types of damage is to be recorded. Any damage to overhead shield wire, where it exists (typically only near substations) should be noted as well. The presence of in-line splices is to be noted as part of the inspection, and the key words ‘auto sleeve’ added to the comment field.

A span of conductor will be identified by the name of the structure behind it. For example the span between structures L170-455 and L170-456 is to be recorded as span L170-455.

2.1.11. Grounding and Bonding (G&B)

The condition of grounding wires and connections are to be visually assessed. Any missing connections, broken wires, missing guards, signs of tracking or burning are to be noted.

Bonding of hardware in presence of shield wire or metal cross arm is to be inspected for any visible damage, loose or missing connections.

2.1.12. Hardware (HDW)

All hardware and attachments are to be inspected in detail. Any deficiencies, including damaged, worn, missing, decayed, loose, miss-aligned or incorrectly installed items are to be identified, noted and recorded. Deficiencies are to be categorized on a YEC defined relative priority scale, reflecting the urgency of need for repair.

2.1.13. Vegetation on Right of Way (VEG)

Vegetation in the span following the structure (in the direction of the structure with the next highest number) is to be assessed, and the average height estimated. Any trees in danger of falling on the Line will be noted.

2.1.14. General Comments (GRL)

Any access issues to the structure should be recorded here.

2.2. EQUIPMENT CONDITION CODES AND MAINTENANCE PRIORITY CODES

All deficiencies noted are to be categorized as to equipment condition as well as the maintenance priority. Condition and Priority Codes are defined on a YEC defined priority scale reflecting the relative urgency for repair.

Equipment Data Collection Codes[1], Equipment Condition Codes, and Maintenance Priority Codes are supplied in the Appendix.

The Condition (general) and Maintenance Priority Codes to be assigned to deficiencies found in the field are summarized in the table below.

2.2.1. YEC Transmission Line Condition Codes (General Summary)

YEC has supplied specific equipment condition codes for each aspect of a transmission in the Appendix.

In general, condition codes are assigned as per the following pattern.

G	Good Condition – No Visible Defects (Will Last Next 10 Years) No maintenance necessary. Re-inspect at next cycle (Priority Code of 5).
F	Fair Condition – Visible Defects Not Critical. Requires Maintenance, Adjustment, Repair at next opportunity, or Ongoing Monitoring (Priority Code of 4 or 5 would be appropriate depending on the defect).
P	Poor Condition – Replace or Repair Required. Priority Code of 1, 2, or 3 would be appropriate depending on the defect.
M	Missing – Replace Missing Item (Priority Code of 1, 2 or 3 would be appropriate depending on the missing component).
O	Other Condition – Specify.
N/A	Not Applicable

[1] Abbreviations used to identify different types of each structure aspect found in Appendix A.

2.2.2. YEC Transmission Line Maintenance Priority Codes

1 Indicates a very serious system reliability or public safety problem. Repairs or modifications should be made immediately (probably within 1 to 2 days). Contact YEC T&D Leadhand as soon as possible (ASAP).

2 Indicates a reliability or safety problem which is serious enough it should be rectified in the not too distant future (possibly within 3 months). Condition is serious enough that it would probably be dealt with prior to the next scheduled routine maintenance.

3 Indicates a concern which should be corrected, but is minor enough that it could be rectified as part of a planned maintenance program (possibly within the next 1 to 5 years).

4 Indicates a concern which is minor enough it would only be corrected if convenient to do so. Corrections would only be made if other work were being done in the same area or on the same pole.

5 Indicates a comment which is recorded for information only – no corrective action is required.

2.3. NOTE AND RECORD VEGETATION GROWTH IN THE ROW DURING GROUND PATROL

The Contractor is to document and record in general terms the predominant type and height of vegetation in the cleared ROW for each span (e.g. mixed willow / poplar to 3m). The intent is for YEC to confirm brushing plans in the coming years, and to manage any danger tree or clearance issues which have arisen between clearing cycles. The Contractor is to make note of any danger trees (or potential danger trees) threatening the transmission line. Digital photos are to be taken to support the observations of general vegetation condition and danger trees.

2.4. REPLACE MISSING STRUCTURE TAGS DURING GROUND PATROL

The Contractor will be required to re-install missing structure tags with a YEC Supplied structure tag kit during the ground patrol.

2.5. PHOTO RECORD

For each structure, a baseline of four digital photos is required, showing the entire structure and foundation from each quadrant; Front, Left, Back and Right side. Example; L170-000963-FRNT, L170-000963-LEFT, L170-000963-BACK, L170-000963-RGHT.

For ground patrol, additional images will be taken to show specific details of the structure to illustrate any concerns or deficiency, if necessary.

The Contractor will be required to supply his own photographic equipment for this project. Photos taken must have an accurate time/date stamp and GPS location Data inserted in the picture by the camera. The digital images shall be in JPEG format. Images shall have a minimum resolution of 3 megapixels.

Two copies of the photo record shall be provided to YEC in a photo directory on separate USB keys. Photos are to be saved with proper orientation, such that no further rotation is needed. Photos shall be titled in accordance with the following system:

- L170-xxxxxx-aaa-xx
  - L170 indicates line number
  - xxxxxx indicates structure number (Six characters required: Leading zeros are needed for effective database sorting e.g. S91 is not acceptable; S000091 is acceptable).
  - aaa-xx 3 digit alpha code to indicate which aspect of the structure;

STR - Structure	INS - Insulator	G&B - Grounding and
POL - Pole	VIB - Vibration Damper	Bounding Defect
FDN - Foundation	AMK - Aerial Marker	HDW – Hardware
G&A - Guy & Anchor	C&S – Conductor &	VEG – Vegetation
XRM - Cross-Arm	Shield Wire	GRL - General Comments
XBR - Cross-Brace		

and 2 digit numeric code for different images of the same detail.

- Examples
  - L170-000963-STR-01.JPG Line 170, Structure 963, Structure defect image 01
  - L170-000963-FDN-01.JPG Line 170, Structure 963, Foundation defect img 01
  - L171-0062_7-XRM-01.JPG Line 171, Structure 62/7, Cross Arm defect img 01

3. FINAL REPORT

A draft of the final report detailing the condition of the transmission line is to be submitted within 10 working days of the completion of the transmission line assessment. Upon YEC's approval of the draft, the final hard copy of the report shall be submitted to YEC within 10 working days.

YEC retains rights to all field and summary data, photos and records collected during the course of inspection.

The final report will consist of the following;

- A summary describing the general condition of the line and significant findings or discussion of difficulties encountered.
- Hard copies of the field inspection check sheets, sorted by line and structure.
- Hard copies of daily tailboards by field crew, in chronological order.
- A base excel line assessment summary spreadsheet complete with all assessment information[2]. This spreadsheet will be, sorted by structure number, containing all the findings and notes of the field assessment, including:
  - Inspection data, condition codes and related comments.
  - Defects noted, related priority code, and photo reference.
  - Structure photo references (minimum 4).
  - Notes regarding minor maintenance work performed in the field (eg. structure tags).
  - Height of vegetation growth for each span.
  - Location of old structure relative to existing, where structure has been replaced.
  - Road crossings spans.
- Summary of structure issues which require attention, sorted by priority.
- Separate summary of issues, sorted by aspect category (first) and then by priority.

[2] Format supplied by YEC and is intended for conversion to a database by YEC.

- The complete photographic record of the line, by structure, including photos of all defects (soft-copy only).

The Contractor is responsible for all computer hardware and software required to record data and compile the line assessment summary spreadsheet, as well as the integrity of all data until the project is complete and all reports have been submitted to, and accepted by, YEC. During the project, data backups, security, and storage are the responsibility of the Contractor.

Two hard copies of the final report are to be submitted to YEC in separate binders, with sections logically separated by tabs. Two soft copies of the final report are to be submitted on separate USB keys in both PDF and native formats. These submissions are to include copies of field inspection check sheet forms and copies of daily tailboards and weekly progress updates. Two soft copies of the Photo Record on separate USB memory sticks will be submitted to YEC. Hard copy photo prints of structures and defects are not required.

The Contractor will submit a draft report to YEC for review prior to publishing the final report. YEC will review the draft report and advise the Contractor, within 7 working days, whether the report is acceptable or whether deficiencies exist. If changes are needed, the Contractor shall remedy any deficiencies and re-submit the final report within a further 10 working days.

4. PROJECT MANAGEMENT, SAFETY PLANNING, AND GENERAL INFORMATION

4.1.

The YEC project manager will implement the following Q/A Q/C checks with the contractor's cooperation, to ensure returned data accurately captures the condition of equipment in the field, and that expectations between YEC, the contractor, and the inspection team are aligned.

1. Prior to Field inspection, YEC will review the inspection specification and expectations with the inspection field team. This will occur immediately following safety and environmental orientation at the project kick-off with the contractor.
2. Field Audit on Day 1 Week 1: YEC will accompany the contractor on the entire first day of field inspection and oversee the quality of data collection as performed by the contractor meets YEC expectations.
3. Field Audit on Day 3 Week 1: The contractor will complete inspections on the second day without YEC oversight. YEC will randomly select at minimum one structure from the second day of inspection for field audit to confirm the quality of collected data.
4. The contractor is to return to YEC all inspection data collected over the course of a week by the end of day Sunday. This is to support field inspection, and is not to be considered as the final report or complete inspection data package deliverable to be supplied at the end of the project.
5. Field Audit Week 2: The contractor will submit weekly field data for YEC review at the end of the first week of inspection. YEC will randomly select a structure from Week 1 inspection for field audit to confirm the quality of collected data.
6. Field Audit Week 3: The contractor will submit weekly field data for YEC review at the end of the second week of inspection. YEC will randomly select a structure from the week prior inspection for field audit to confirm the quality of collected data. YEC will confirm tailboards with the crew in the field.
7. Field Audit on returned data: Once the contractor has processed the first batch of field data into the summary spreadsheet, YEC will select a structure from the data set and perform a field audit to confirm the summary spreadsheet condition data matches the structure in the field.
8. Ongoing Q/A Q/C checks: Every two weeks for the duration of the project, YEC will perform at least one structure inspection audit to compare contractor collected data with a field structure.

4.2. ACCESS

YEC will supply known, existing access points, which YEC uses for planned maintenance activities. However, for inspection purposes without heavy equipment (e.g ATV or foot

access), any publicly accessible access point may be used. The exception is private property or First Nations Settlement Land Parcels.

Crossing of private property land parcels without the landowners' permission is not permitted. It is incumbent on the Contractor to pre-arrange access over private land where it may be necessary.

First Nations Settlement Land is to be respected as private property. YEC will engage the first nation and work to arrange for access across settlement land parcels for the Contractor before field work begins, and may require the Contractor's input in this regard. YEC advises that the FN may impose access restrictions.

Access roads may not be modified or altered, nor may new accesses be created.

YEC will provide maps showing line plan view, which will identify the transmission line route and structure locations, road ROW, known access points for YEC maintenance purposes, private surveyed land parcels and First Nation settlement land.

Regardless of land title or ownership, YEC expects that the crew performing field work will act in a professional manner, not leave behind litter or waste, and treat land and residents living near or along the transmission line with respect.

Access to substations (some PT Substations are fenced) is not expected. If needed, access arrangements shall be made with YEC System Control Center (SCC).

4.3. DAILY CHECK-IN AND CHECK-OUT

The Contractor will be required to check-in with the YEC System Control Centre (SCC) at the beginning of each day, indicating the section of line that is planned to be patrolled during that day, and the hours of work planned.

The Contractor will be required to check-out with SCC at the end of each working day.

4.4. PROJECT TRACKING

The Contractor shall supply a weekly project update to the YEC project manager overseeing inspection. The weekly report is due by the end of day Sunday, and will include:

- Project report of structures inspected in the past week
- Field data from the previous weeks inspection work, to support and facilitate YEC QA/QC checks.
- Structures/sections scheduled for inspection in the week ahead.
- Notable difficulties encountered.
- Notable deficiencies and critical defects encountered requiring immediate attention.
- Any change to forecast completion date as a result of progress to date.

4.5. CRITICAL DEFECTS

The YEC Lead-hand T&D is to be called as quickly as possible and notified of critical field issues found during the ground patrol which require immediate attention to avoid failure of the line.

In all circumstances, the initial call to YEC Lead-hand T&D is to be followed up with an email within five working days. The email will indicate;

- Where: Line and structure number
- When: The problem was first noticed
- What: Nature of the problem
- Photograph

4.6. SAFETY PLANNING / COMMUNICATIONS

The Contractor is required to develop and present to YEC before beginning field work, a comprehensive safety plan for their work including: Tailboards and job plans, communications equipment, emergency contact information, MSDS sheets where applicable, PPE and safety equipment, and training appropriate to the work being done.

The inspection Contractor is required to comply with all YEC Health, Safety and Environmental requirements and policies, Yukon OH&S requirements, environmental regulation and reporting requirements, as well as any additional H&S requirements as deemed necessary by the Contractor as part of the Contractor's Health and Safety Plan.

All field personnel are required to complete YEC Health, Safety, and Environmental orientations prior to beginning field work. Environmental portion includes awareness of bird nesting habits and fish bearing streams.

A joint safety review / orientation meeting between YEC, the Contractor, and all workers involved in the project, will be conducted by the YEC project manager before any field work is carried out. Radio communication with YEC repeaters is not reliable along all sections of transmission line. It is suggested that the Contractor not plan to depend on the YEC radio repeater network for communications during this project.

The Contractor will make provision to supply their own satellite phone for each crew in the field for the duration of the field work. The YEC System Control Centre must be able to contact the field crew(s) while they are working in the field. When working on YEC property/ROW, SCC should be the first line of contact for the Contractor in an emergency.

Appendix A - Abbreviations For Transmission Line Master Inspection Form

Structure Information (STR)

Structure Number Sxxxxxx

L170, L172, L178 - Structure Type:

A / AX	Tangent Structure 0° to 3°
B	Angle Structure 3° to 12° 30’
BS	Angle Structure 3° to 12° 30’ for Side Slope Locations
C	Angle Structure (Str. 1244) Angle 12° 48’ Left
CS	Permanent Structure (Str. 1208) Angle 12° 48’ Left
D	Angle Structure 30° to 60°
DS	Angle Structure 30° to 60° for Side Slope Locations
E	Angle Structure 0° to 90°
ES	Angle Structure 0° to 90° for Side Slope Locations
F	Transposition Structures
G	Uplift Structure Tangent 0° to 3°
AG / AGX	Tangent Structure 0° to 3° with OHGW
EG	Angle Structure Deadend 0° to 90° with OHGW
AXS	Tangent Structure for Sloping Locations (Snowshed structures)

L171 – Structure Type:

Type H	Tangent Structure: 0° - 1°
Type HG	Tangent Structure: 1° - 3°
Type HW	Tangent Structure with OHG (Unguyed Structures)
Type HWG	Tangent Structure with OHG (with Side Guys 1° to 3° line angle)
Type HWX	Tangent Structure with OHG (with longitudinal guys – dead end of OHG)
Type T	Transposition Structure
Type 3A	Angle Structure: 3° - 15°
Type 3AS	Sidehill Tangent Structure
Type 3B	Angle Structure: 15° - 30°
Type 3C	Angle Structure: 30° - 45°
Type 3D0	Dead End Angle Structure: 0° to 1°
Type 3D10	Dead End Angle Structure: 1° to 10°
Type 3D90	Dead End Angle Structure: 10° to 90°
Type 3DW10S	Dead End Structures with OHGW: 0° - 10° Slack Span
Type 3DW90S	Dead End Structures with OHGW: 10° to 90° Slack Span
Type 3DW90	Dead End Structures with OHGW: 10° to 90°

Number Tag:

G	Number Tag in Good Condition
P	Number Tag in Poor Condition (replace during inspection)
M	Number Tag Missing (replace during inspection)

Structure Straightness

G	Structure Straightness in Good Condition
LT	Structure Leaning in Transverse Direction (Left or Right) e.g. structure leaning sideway perpendicular to line
LL	Structure Leaning in Longitudinal Direction (Forward or Back) e.g. structure leaning toward either ahead or back along the line

Wood Pole (POL)

Pole Class and Height

L	Left Pole (As seen when looking down the Line[3])
C	Center Pole
R	Right Pole

1/80 Denote Class 1 80ft pole

Species (Code according to CSA O15-2015 Clause 6.5.3)

Cedar		
	WC	Western Red Cedar
Fir		
	DF	Douglas Fir
Pine		
	LP	Lodgepole Pine
	RP	Red Pine
	SP	Southern Yellow Pine

Date Stamp 68 (for 1968)

Pole Condition

E	Pole in Excellent Condition (Like New)
G	Pole in Good Condition – No Visible Defects (Will Last Next 10 Years) e.g. light weathering, light cracking along wood grains
F	Pole in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. moderate to heavy weathering, minor groundline rotting, deep cracks along wood grains, minor insect / animal damage, small woodpecker hole, etc.
P	Pole in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. severe groundline rotting, cracks perpendicular to wood grains, large woodpecker hole with opening larger than 4 inches, etc.
O	Other Condition – Specify

POL Maintenance Comments

In addition to noting the pole condition;

- Note bird nests on pole tops.
- Record distance and direction to old Pole stubs from existing, where structure has been replaced.
- Record quantity and size of Wood Pecker Holes (WPH) openings
  Size: - Small <2”
  - Medium 2-4”
  - Large >4”

[3] As seen while facing the structure being inspected, with your back towards lower number structures. Looking toward the end of the line with the highest structure number.

Pole Foundation (FDN)

Foundation Type

D	Direct buried - no stub
S1D	Direct buried - one stub
S2D	Direct buried - two stubs
S3D	Direct buried - three stubs
TC	Timber crib filled with rocks - no stub
S1TC	Timber crib filled with rocks - one stub
C	Culvert filled with rocks - no stub
S1C	Culvert filled with rocks - one stub

Ground Type

SO	Soil
SW	Swamp
R	Rock

Foundation Condition

S	Foundation Stable
U	Foundation Unstable (Require Maintenance) e.g. pole base sinking (tilted structure), large void surrounding pole, pole base heaving, water pond surrounding pole base, etc.

Guys & Anchors (G&A)

Configuration g/a number of guys / number of anchors

Guy & Anchor Condition

NA	Not Available (Not Require As Per Framing)
G	Guy & Anchor in Good Condition – No Visible Defects
F	Guy & Anchor in Fair Condition – No Visible Defects (Adjustment Performed During Inspection) e.g. guy tension adjustment, preform snapped shut, etc.
P	Guy & Anchor in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. bended anchor rod, anchor out of alignment with guy wire, broken anchor or wire, anchor movement (shifted/pulled/exposed), significant corrosion, etc.
M	Guy & Anchor Missing (Require Replacement)
O	Other Condition – Specify

Cross arm (XRM)

Cross arm Type

ST	Steel Cross arm
WD	Wood Cross arm

Cross arm (Wood) Condition

E	Cross arm in Excellent Condition (Like New)
G	Cross arm in Good Condition – No Visible Defects (Will Last Next 10 Years) e.g. light weathering.
F	Cross arm in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. moderate to heavy weathering, lightly bowed or twisted, bird nesting, etc.
P	Cross arm in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. broken, split, surface rot, deep cracking along wood grains, cracks perpendicular to wood grains, wood grain of cross arm sloped (not parallel to arm), excessive knots, heavily bowed or twisted, burned, etc.
O	Other Condition – Specify

Cross arm (Steel) Condition

E	Cross arm in Excellent Condition (Like New)
G	Cross arm in Good Condition – No Visible Defects (Will Last Next 10 Years) e.g. light weathering (discoloration)
F	Cross arm in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. minor rusting on attachment holes, lightly bowed or twisted, burned, etc.
P	Cross arm in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. bended, damaged, rusting along entire cross arm, heavily bowed or twisted, etc.
O	Other Condition – Specify

XRM Maintenance Comments

In addition to noting the cross arm condition;

- Use key words ‘road crossing’ where next span crosses road or trail.
- Where the structure has multiple cross arms, record condition and maintenance priority code based on the worst cross arm condition in both the ‘Front’ and ‘Back’ sets. Use comment field to record condition of remaining cross arms.

Cross Brace (XBR)

Cross Brace Type

ST	Steel Cross Brace
WD	Wood Cross Brace

Cross Brace (Wood) Condition

E	Cross Brace in Excellent Condition (Like New)
G	Cross Brace in Good Condition – No Visible Defects (Will Last Next 10 Years) e.g. light weathering.
F	Cross Brace in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. moderate to heavy weathering, lightly bowed or twisted, bird nesting, etc.
P	Cross Brace in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. broken, split, surface rot, deep cracking along wood grains, cracks perpendicular to wood grains, sloping grain, heavily bowed or twisted, burned, etc.
O	Other Condition – Specify

Cross Brace (Steel) Condition

E	Cross Brace in Excellent Condition (Like New)
G	Cross Brace in Good Condition – No Visible Defects (Will Last Next 10 Years) e.g. light weathering (discoloration)
F	Cross Brace in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. minor rusting on attachment holes, lightly bowed or twisted, burned, etc.
P	Cross Brace in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. bended, damaged, rusting along entire brace, heavily bowed or twisted, etc.
O	Other Condition – Specify

Insulators (INS)

Insulator Type

BP	Brown Porcelain
GP	Grey Porcelain
TG	Toughen Glass
EP	Epoxy / Composite
MX	Mixed

Fitting Type

BS	Ball-Socket End Fittings
CT	Clevis-Tongue End Fittings

Count i Number of Insulator Units

Insulator Visible Condition (Porcelain / Glass)

- G — Insulators in Good Condition – No Visible Defects (Will Last Next 10 Years)
- F — Insulators in Fair Condition – Specify Visible Defects (Require Maintenance)
  e.g. light pollution contamination, minor rust stains on skirt, light rust on caps, foreign object lodged, etc.
- P — Insulators in Poor Condition – Specify Visible Defects (Recommend Replacement)
  e.g. heavy pollution, moderate to severe rust on caps, tracking or flash marks, gunshot damage, chipped or cracked bell skirt, shattered or missing bell skirt, rusty pin, crushed socket, insulator not hanging straight, burn marks, bulged porcelain, etc.
- O — Other Condition – Specify

Insulator Visible Condition (Polymer)

- G — Insulators in Good Condition – No Visible Defects (Will Last Next 10 Years)
- F — Insulators in Fair Condition – Specify Visible Defects (Require Maintenance)
  e.g. light pollution contamination, minor rust stains on skirt, etc.
- P — Insulators in Poor Condition – Specify Visible Defects (Recommend Replacement)
  e.g. heavy pollution, tracking or flash marks, gunshot damage, broken skirt (missing pieces of skirt), moderate to heavy rusting of end fittings, etc.
- O — Other Condition – Specify

Vibration Damper (VIB)

Vibration Damper v/Type Number Per Phase on Each Span / Damper Type

Vibration Type

SB	Stockbridge Dampers – two small weights suspended by short cable.
HX	Helix Spiral Dampers – pre-form grip section, followed by widening spirals.

Aerial Marker (AMK)

Marker Condition

NR	Not Required
G	Aerial Marker in Good Condition – No Visible Defects (Will Last Next 10 Years)
P	Aerial Marker in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. broken aerial marker, severe color fading, gunshot damage, etc.
M	Aerial Marker Missing (Require Replacement)

Conductor & Shield Wire (C&S)

Cable Condition

G	Cables in Good Condition – No Visible Defects (Will Last Next 10 Years)
F	Cables in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. bird cage, minor outer strands breakage, etc.
P	Cables in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. severe strand breakage, burned, severe corrosion, etc.
O	Other Condition – Specify

C&S Maintenance Comments

In addition to noting the conductor and shield wire condition;

- Use key words ‘auto sleeve’ where next span has splice in conductors.

Grounding & Bonding (G&B)

G&B Condition

G	Ground and Bond Wires in Good Condition – No Visible Defects (Will Last Next 10 Years)
F	Ground and Bond Wires in Fair Condition - Specify Visible Defects (Require Maintenance) e.g. light discoloration at contact point, loose connections, damaged guard, etc.
P	Hardware in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. moderate to heavy discoloration, severe wearing (reduce effective thickness), broken connections, signs of tracking, burn marks on pole, etc.
O	Other Condition – Specify

Hardware (HDW)

Hardware Condition

G	Hardware in Good Condition – No Visible Defects (Will Last Next 10 Years)
F	Hardware in Fair Condition – Specify Visible Defects (Require Maintenance) e.g. light rusting at contact point, loose hardware, etc.
P	Hardware in Poor Condition – Specify Visible Defects (Recommend Replacement) e.g. moderate to heavy rusting, severe wearing (reduce effective thickness), deformation, missing hardware, missing retaining cotter pin, etc.
O	Other Condition – Specify

Right of Way Vegetation (VEG)

Species

P/A	Poplar / Aspen
B	Birch
W	Willow
S/P	Spruce / Pine
O	Other – Specify

Vegetation Density

LD	Low Density – Maintenance Vehicle Can Travel Along
MD	Medium Density – ATV Can Travel Along Easily
HD	High Density – ATV Can Travel Along with Difficulty

Vegetation Height h ft Highest vegetation along ROW

Clearance Concern

N	No Vegetation Clearance Issue (Within Next 10 Years)
Y	Vegetation Clearance Violation (Within Next 10 Years)

Danger Tree

N	Not Present
Y	Danger Tree Present

Danger Tree Height d ft Danger Tree Height

Vegetation Comments List Vegetation Concern on Each Line

Priority

1	Indicates a very serious system reliability or public safety problem. Repairs or modifications should be made immediately (probably within 1 to 2 days). Contact YEC T&D Leadhand as soon as possible (ASAP).
2	Indicates a reliability or safety problem which is serious enough it should be rectified in the not too distant future (possibly within 3 months). Condition is serious enough that it would probably be dealt with prior to the next scheduled routine maintenance.
3	Indicates a concern which should be corrected, but is minor enough that it could be rectified as part of a planned maintenance program (possibly within the next 1 to 5 years).
4	Indicates a concern which is minor enough it would only be corrected if convenient to do so. Corrections would only be made if other work were being done in the same area or on the same pole.
5	Indicates a comment which is recorded for information only – no corrective action is required.

General (GRL)

GRL Additional Comments

- Record any issues with structure access.

Structure Maintenance Concern

Maintenance Comments List Individual Defect on Each Line

INS	Insulator Defect	GRL	General – Any Additional Notes

Priority

1	Indicates a very serious system reliability or public safety problem. Repairs or modifications should be made immediately (probably within 1 to 2 days). Contact YEC T&D Leadhand as soon as possible (ASAP).
2	Indicates a reliability or safety problem which is serious enough it should be rectified in the not too distant future (possibly within 3 months). Condition is serious enough that it would probably be dealt with prior to the next scheduled routine maintenance.
3	Indicates a concern which should be corrected, but is minor enough that it could be rectified as part of a planned maintenance program (possibly within the next 1 to 5 years).
4	Indicates a concern which is minor enough it would only be corrected if convenient to do so. Corrections would only be made if other work were being done in the same area or on the same pole.
5	Indicates a comment which is recorded for information only – no corrective action is required.

FAILURE ANALYSIS AND CONDITION ASSESSMENT TESTS ON SUSPENSION INSULATORS FROM YUKON ENERGY 138 KV TRANSMISSION LINE

PROJECT NO. PL-01281

ABSTRACT: Yukon Energy sent seventy-eight insulators that had been removed from a failed wood pole 138 kV transmission structure (it burned) to Powertech for determination of the root cause of the fire and to assess the condition of all insulators removed from the same structure. A series of test were carried out on the insulators. Twenty percent of the individual insulators had a failure load below the rated value on a combined mechanical and electrical test.

The root cause of fire was most likely due to excessive leakage current which triggered a pole top file. If the condition of these insulators is typical of the insulators in this transmission line it is recommended that all insulators that are marked with “Made in England 1968” or “Buller’s England 1968” be replaced. Any live line work done on these transmission lines should take into account there is a significant risk that there are punctured insulators and there may be insulators with low mechanical strength in the insulator strings being work on.

1 SUMMARY

Yukon Energy sent nine strings of insulators to Powertech (three suspension and three dead-end horizontal strings with three jumper strings - 78 insulators). They had been removed from a failed wood pole 138 kV transmission structure (it burned). Powertech was requested to determine the root cause the fire incident and to assess the condition of all insulators removed from the same structure. A series of test were carried out on the insulators.

The megger tests found one failed insulator. Visual inspection found that the insulator strings had some electrical and environmental damage. Pollution level tests (ESDD) found the pollution level on the insulators was very low. Five percent of the insulators failed an RIV (radio-influence voltage) test. Two of the insulators punctured on the AC flashover test and one of the insulators was cracked. Corrosion assessment of the insulators found them to be in good shape from a corrosion perspective. Twenty percent of the individual insulators had a combined mechanical and electrical failure load below the rated value.

The root cause of fire was most likely due to excessive leakage current which triggered a pole top file. No parts of the wood structure were available for examination therefore it is not possible to definitively conclude that the fire was due to high leakage current, however, based on the poor condition of the insulators and the absence of lightening or switching activity in the this is the most likely cause of the failure.

These insulators were all removed from on structure so it is not possible to determine if the insulator condition is typical of the insulators on this transmission line. However, if this is typical it is recommended that all insulators marked “Made in England 1968” or “Buller’s England 1968” be replaced. They are all at high risk of failing either electrically and mechanically. Given that there were three similar failures in 2015 there is a high probability of further failures. It is recommended that a replacement program be implemented as soon as possible. If live line work is to be done on these transmission lines the work procedures should take into consideration that there may be punctured (shorted) insulators and/or insulators with lower than rated mechanical strength on the structure being worked on.

2 REQUEST

Yukon Energy requested Powertech to determine the root cause of an pole fire incident on its 138 kV transmission line and to assess the condition of all insulators removed from the same structure.

The following information was provided on the incident:

- Failure occurred on Oct. 8 2015 around 19:00
- Failed structure was str.1248 on L-178
- The insulators are brown porcelain made in England in 1968
- It was raining when the string failed
- There is sign of flashover on the glass
- There had been a trip on L-178 two weeks earlier but it was caused by a tree on C phase
- We replaced all the glass on str. 1248 and one other string also should signs of tracking
- There have been three similar failures this year all of them have been on three pole double dead ends. I believe it may be cause by the lack of bonding and the close proximity of the dead end to the uninsulated guy.

The results relate only to the items tested
This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

- There is no known history of maintenance on this structure.

Appendix II shows pictures taken at the failure site.

Nine strings of insulators (three suspension and three dead-end horizontal strings with three jumper strings) were removed from the failed wood pole structure and sent to Powertech. The insulators received were only identified by the phase they came from. The individual insulators were not identified as to which insulator string they came from or by their position in the insulator string.

3 TEST STANDARD

The tests were performed in accordance with CAN/CSA-C411.1, "AC Suspension Insulators" and IEEE Std. 4, "IEEE Standard Techniques for High-Voltage Testing".

4 TESTS PERFORMED

The following tests were performed on the insulators:

- Megger all insulators at 1 kV
- Visual examination on all insulators
- An ESDD (pollution level) measurement on six insulators from three strings of insulators
- Radio influence voltage (RIV) test on all insulators
- Dry AC flashover test on all insulators
- Assessment of any corrosion on the insulators
- Combined mechanical and electrical test on all insulators

5 INSULATOR IDENTIFICATION

The insulator strings were identified as follows:

Identification on Glaze: Type 1: Made in England 1968
Type 2: Buller's England 1968

The insulator strings were removed from structure 1248, L-178 (based on the marking on the insulator crates):

Insulator type: ANSI Class 52-3 (based on the insulator dimensions and rating on the insulators)

The insulators from each string were identified as follows:

1. Structure 1248, L-178 (Road phase).

6 TEST DATE

The tests were performed during the period of 13 April 2016 to 31 May 2016.

7 TEST RESULTS

7.1 *Megger Test*

7.1.1 Acceptance Criterion

This test was done to determine if any of the insulators "as received" were punctured. The insulators pass the test, if the insulator is not shorted or it does not have a low resistance value at 1000 VDC.

7.1.2 Test Procedure

A voltage of 1000 VDC was applied between each insulators cap and pin and the insulator resistance value was recorded.

7.1.3 Test Results

7.2 *Visual Examination*

7.2.1 Examination Results

The visual examination looks for any abnormalities or damage in all parts of the insulators i.e. the cap, the porcelain shell the pin and the cement. This examination is used to make an overall visual assessment of the insulator condition.

Structure 1248, L-178 (Road phase)

Insulator No.	Visual Examination Results
1273-1A	15000 lb, No rust on cap, the mould was a little rougher than other insulators. There is a round mould bump on top. The code “HF 8326” was moulded onto the cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. The portion of the cap under the lip is not as recessed as other brands. There is a brass coloured sheen in this area; there is a light line of material run off from the cap on the porcelain surface under the lip. There is also a fine line running from the point on the cap to the edge. The porcelain retains its lustre. Some points where the glaze is missing, the surface of the glaze is covered with extremely tiny pits. Light dust covers the surface, common to all. The sheds underneath have a light dust layer. The 3rd skirt in has a portion missing, probably done in disassembly of the strings or shipping. There are some manufacturer defects, such as runny glaze that appears darker and raised. Some tiny points of missed glaze. There is no rust on the pin. The grout looks O.K.
1273-2A	15000 lb, No rust on cap, the mould was a little rougher than other insulators. There is a round mould bump on top. The code “HF 8326” was moulded onto the cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is brass colour sheen in this area. There is a deposit on the porcelain in this area about 3” long under the cap. The deposit fans out towards the edge. There are 2 flashover marks etched into the porcelain beside this deposit, they converge on a point at the edge. The rest of the porcelain looks good with very tiny pits on the surface. Underneath the point where the tracking occurs there is a similar etching going from shed to shed then along the surface to the pin. There is no damage on the pin. The rest of the porcelain retains its lustre. There are bits of grit glazed into the surface and a lot of pits without glaze. The grout has a single crack otherwise O.K.
1273-3A	15000 lb, No rust on cap, there is a slight brass colour on one side. There is a long triangular stain coming up from the cap bottom; it has a white powder along its perimeter. This area has a concrete deposit on the porcelain for about 5 cm. The top porcelain looks O.K. it still holds its lustre with the same roughened tiny pits on the surface. The porcelain underneath has a hardened dust deposited on its surface on one side about 20%. The three inner sheds have a layer of light brown dirt in the troughs. There are some manufacturer defects like flattened shed, raised surface, tiny points of missed glaze. The pin is O.K. but off centre. Grout looks good.
1273-4A	15000 lb, No rust on cap. The code “HF 8326” was moulded onto the cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base, the mould line is raised, the mould plug is raised and rough. There are tiny deposits beneath the cap on the porcelain around most of the circumference. There is a fine layer of dust on the surface, there is tiny pitting on the surface, and there are tiny points where there is no glaze. Underneath the surface has hardened dust that can be removed by wiping with force. The sheds on one side have about 20% of hardened dust in the troughs. The inner shed beside the grout it is baked on. The pin is O.K. with some slag on the surface from manufacture. The grout looks O.K.

The results relate only to the items tested
This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Insulator No.	Visual Examination Results
1273-5A	15000 lb, this insulator looks rougher than others, the cap looks rough and the galvanizing is not smooth. There is a rust ring on top outside of the socket possibly from wear as there is some shine on the surface on the other side of the socket. There is little bit of deposit under the cap. The top part of the porcelain still has its lustre but is roughened. The outside edge has had some abrasion as it looks scuffed and lustreless, this could have occurred during shipping. The porcelain underneath has a hardened dust deposited on its surface on one side about 20% There are some manufacturer defects like irregular surfaces on shed and missed glaze. The pin stem looks O.K. but the ball is blackened, there is tinge of rust possibly from arcing. The grout looks O.K.
1273-6A	15000 lb, the cap looks O.K. the socket is blackened, there are some wear patterns on the pin surface. There is one dot of rust on the surface of the cap. The top porcelain looks O.K. but with some tiny pits. Underneath the porcelain there is a light layer of dirt, except around the pin where there is some hardened dust and possibly concrete from the grout. The glaze has some grit in it, the pin looks O.K., and the grout surface is slightly eroded.
1273-7A	15000 lb, No rust on cap, the cap looks O.K. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a fine deposit under cap from dust, the cap itself and cement. There is some light dust on the top porcelain. Underneath the porcelain there is some dense dust. There are some manufacturer defects, some tiny points of missed glaze, same with the top porcelain. The pin is O.K. The grout looks O.K.
1273-8A	15000 lb, No rust on cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a 1cm deposit underneath the porcelain; quite thick and cement coloured, it extends and fades as it approaches the porcelain edge in a streaky pattern. There is some electrical etching on this portion. There are tiny points on whole porcelain surface. There is a light layer of dust underneath the porcelain. There are some manufacturer defects, such as runny glaze that appears darker and raised. Some tiny points of missed glaze The pin is O.K. The grout has a 3mm weathered hole against pin.
1273-9A	15000 lb, No rust on cap, the cap looks O.K. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a 2cm concrete colour deposit under this portion and it is fairly thick near the cap then fades towards the edge. There is highly dense dust on the top porcelain. Underneath the porcelain there is some light dust slightly heavier on one side, otherwise it looks good. There are some manufacturer defects, such as some tiny points of missed glaze. The pin is O.K. The grout has one crack and a tiny hole against the porcelain.
1273-10A	15000 lb, No rust on cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base, there is a slight brass discolour at this area, the other side of the porcelain has two points that might be slight arc damage, there is a faint line from the cap t the edge that coincides with the two points. There is a slight layer of dust on the top porcelain. The cap has a point of stain with deposit underneath that extends and fades to the edge. Slightly roughened surface, there is a light dust layer

The results relate only to the items tested
This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Insulator No.	Visual Examination Results
	underneath. There are some bits in glaze and pin point glaze flaws. There is a round deposit on porcelain near grout. The pin is O.K. The grout looks O.K.
1273-11A	15000 lb, No rust on cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base, at the bottom edge of this area it is darker and rougher, the stain comes to point in within this darker area but light at the point. There is a 4cm deposit on the porcelain underneath the cap that extends the full width but fades around the porcelain edge. There is a thin line etched into this deposit edge. There is light dust on the top porcelain covered with tiny points of glaze. Underneath there is some light dust layered, with some particles in glaze and pin point missed glaze. The pin is O.K. The grout looks O.K.
1273-12A	15000 lb, No rust on cap. There is some cement on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a large bloom in galvanizing near the socket opening. There is a stain on the cap under the pattern on the porcelain, it extends and fades towards the edge. There is some light dust on the surface underneath. There are some points of exposed glaze, with a couple of bits glazed into the surface. There is a bump beside the inner ring that has some electrical erosion. The pin is O.K. The grout has some cracks
1273-13A	15000 lb, there is a tiny area of rust neat the cotter pin. There is uneven moulding coming off of the cap base to the middle of the cap, at the top of this there is a wear mark, it is hard to tell if it is electrical or mechanical. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a point on the cap with fingers spreading out to the top and cotter pin hole. There is a bright tinge at this area. There is some deposit on the porcelain surface in this area. There is a very faint deposit extending towards the porcelain edge. The top porcelain has lustre and covered with tiny pits. There is some grit glazed into the porcelain. Some accumulation of dirt in one area of skirts underneath heaviest in inner skirt, the rest is fairly clean and retains lustre, some missing points of glaze and glazed over bumps. The pin is O.K. There are a couple of superficial cracks on the grout surface.
1273-14A	15000 lb, No rust on cap. The original moulding is not smooth. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a light deposit on the porcelain under the point about 3cm wide extending and fading towards the porcelain edge. The top porcelain has lustre with tiny pits on the surface, also there are some points with missed glaze, and Some accumulation of dirt in one area of skirts underneath heaviest in inner skirt, the rest is fairly clean and retains lustre. There is a number of glazed bumps on the surface of skirts and one point of missed glaze.
1273-15A	15000 lb, No rust on cap There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a deposit about 5cm under the cap that won't scrape off, it is dark at the cap and lightens as it reaches the cap edge. There are tiny pits on the porcelain surface with some missed glaze parts. Underneath there are a number of points of missing glaze. Irregularities on skirt edges from the moulding.

The results relate only to the items tested
This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Insulator No.	Visual Examination Results
	Lustre O.K. The pin is O.K. The grout looks O.K.
1273-16A	15000 lb, No rust on cap. There are some bits of concrete on it. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base, it has a slight brass colour. There are deposits on porcelain underneath. There is a streak pattern with electrical lines etched in it that extend almost all the way to the porcelain edge. The porcelain has lustre, a point of no glaze and tiny pits. There is high dust accumulation underneath the porcelain, some bits in glaze.
1273-17A	15000 lb, No rust on cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base, slight brass colour, There are deposits on porcelain underneath, it extends across porcelain surface to the edge fanning out and fading. The porcelain retains its lustre. Some points where the glaze is missing, the surface of the glaze is covered with extremely tiny pits, there is slight arc damage on the edge. There is a tiny bit of dust underneath. There is arc damage corresponding to the bit on the edge, it extends right to the pin.
1273-18A	15000 lb, No rust on cap There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base, and the base of the cap is much darker. There is a deposit on porcelain underneath about 4cm, the deposit extends and fades to the edge, to the left of this deposit there is a thin arc damage line that extends to the edge then underneath to the pin. The porcelain retains its lustre. Some points where the glaze is missing, the surface of the glaze is covered with extremely tiny pits.
1273-19A	15000 lb, No rust on cap, but rough mould on seams. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There are some circular marks below socket opening that look like arc damage. There is a light deposit on porcelain under extending and fading towards the porcelain edge. There is a faint layer of dust on the surface. The porcelain retains its lustre. Some points where the glaze is missing, the surface of the glaze is covered with extremely tiny pits. The porcelain underneath looks O.K. There are bits of grout in the glaze, some missing glaze points. The pin is O.K. with a tinge of rust on the bell. The grout looks O.K.
1273-20A	15000 lb, No rust on cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. Outside the cap opening there is a large circle of shiny galvanizing with possible electrical lines going through it, the pattern comes to a point on the cap bottom. There is a deposit underneath on the porcelain about 3cm that extends to the porcelain edge fading as it approaches. There appears to be electrical lines etched into this part of the surface. The porcelain retains its lustre. Some points where the glaze is missing, the surface of the glaze is covered with extremely tiny pits. There is light dust on the top and bottom of the shell. There are a number of points missing glaze underneath. There is some grit on the porcelain. The pin is O.K. The grout looks O.K.
1273-21A	15000 lb, No rust on cap. There is no noticeable pattern on the cap as the previous insulators did, but there is a large circle underneath the cap opening. There is no real deposit under the cap on the porcelain. There are very faint fingers that extend from the edge of the cap to the edge of the porcelain. There is not much lustre

Insulator No.	Visual Examination Results
	underneath; there is a light deposit underneath that is easily scrapped off. There is dirt about 15% on one area of the inner sheds. There are some particles in the glaze. The pin is O.K. The grout looks O.K.
1273-22A	15000 lb, there is a slight tinge of rust on the very top of the cap otherwise the cap is O.K. Porcelain has lustre overall. There are tiny pits on the surface. Underneath the lustre is somewhat lost. There is baked on deposit that can be scrapped off. There is some dirt on the inner rings, one portion about 20%. There is some grout in the glaze with a tiny bit of rust on the pin top.
1273-23A	15000 lb, No rust on cap, there is some discoloration on the bottom edge; the galvanizing has a bloom shape near the opening at the bottom. The top porcelain looks O.K. There is a circular mark on the surface that can't be scratched off. There are a lot of tiny pits on the surface. Underneath the surface has little lustre as there is a film attached to the surface that is wiped off with some force. The two inner skirts on one side have dirt in the recess. There is a mould imperfection, bumps on the skirts and the inner ring. There is some grout in the glaze. The pin is O.K. The grout looks O.K.
1273-24A	15000 lb, There is a tinge of rust at the top and bottom edge. There is a small rust spot just outside the cap opening. There are some rough spots from the galvanizing, also a small chunk of concrete stuck on the surface beside the cap opening. There is also a galvanized bloom beneath the opening, the top porcelain has its lustre but with a lot of tiny pits. There is a circular mark on the surface that can't be scratched off. Underneath there is a thin film on the surface that can be rubbed off with some force. The two inner skirts on one side have dirt in the recess. There are some manufacturer defects, such as moulding flaws, grit in glaze and some tiny points of missed glaze. The pin is O.K. The grout looks O.K.
1273-25A	15000 lb, the cap has very light rust on the opening at the top. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. The porcelain surface underneath this point has a deposit running about 4cm under the cap; the deposit extends to the porcelain edge; narrowing and fading. There are electrical streamers from the cap etched into the surface. The surface is pitted, but it retains its lustre. The underneath retains its lustre. There is dirt between sheds on one side. There are a number of pin points of missing glaze. The pin is O.K. There are some cracks on the grout.
1273-26A	15000 lb, the cap has slight rust on the top edge of the opening. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. Under this point there is a deposit about 3cm wide. It narrows and fades as it reaches the edge of the porcelain. There is some tracking in the deposit, beside this deposit there are 2 spots on the shell possibly from electrical erosions, it appears in one of the spots as if the glaze has lifted off. There are a lot of pits on the surface, and a few spots where the glaze was missed and one large spot without glaze. There are a number of depressions on the surface in this area. Underneath is fairly clean, the lustre is retained. There are some pin points of missing glaze. The pin is O.K. The grout has a couple of cracks.

Structure 1248, L-178 (Centre phase)

Insulator No.	Visual Examination Results
1273-1B	15000 lb, Cap rust free. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a deposit on the porcelain under the point about 3cm long, it extends halfway to the edge and then fades out. There is some electrical environmental activity on the deposit bot it is not etched in the surface. The surface is pitted but it retains its lustre. Underneath, the porcelain is covered in light dust. There is some grit in the glaze and exposed points of glaze. There are a few moulding flaws. There are some spots of rust at the bottom of the pin ball, otherwise O.K. There is a single crack in the grout.
1273-2B	15000 lb, Cap rust free. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a slight brass colour on this pattern. There is a deposit on the porcelain under the point about 1cm long, it extends halfway to the edge and then fades out. There is some electrical environmental activity on the deposit and around it. There are some fine lines etched into the surface to the edge. The surface is pitted but it retains its lustre. Underneath, the porcelain is covered in light dust. There are a number of fine bits in the glaze. The pin looks O.K. The grout looks O.K.
1273-3B	15000 lb, Cap rust free. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a deposit on the porcelain under the point about 1cm long, it extends halfway to the edge and then fades out. The surface is pitted but it retains its lustre. Underneath, the porcelain is covered in light dust, but it retains its lustre. There are some bits in glaze and some missed glaze points. The pin looks O.K. The grout looks O.K.
1273-4B	15000 lb, Cap rust free. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a bloom circle of galvanizing under the cap opening. There is a deposit on the porcelain under the point about 3cm long, it extends halfway to the edge and then fades out. There is some electrical environmental activity on the deposit bot it is not etched in the surface. The surface is pitted but it retains its lustre. Underneath the porcelain retains good lustre. There are bits of grit in the porcelain. The pin looks O.K. The grout looks O.K.
1273-5B	15000 lb, there is a tiny bit of rust on the top of the cap. Uneven area during original manufactured concrete on surface. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a bloom circle of galvanizing under the cap opening. There is a deposit on the porcelain under the point about 4cm long, it extends halfway to the edge and then fades out. There is some electrical environmental activity on the deposit bot it is not etched in the surface. Some missed glaze points, but still has its lustre. Underneath the porcelain retains its lustre. There are some missed glaze points and some grit in the glaze. The pin looks O.K. The grout looks O.K.
1273-6B	15000 lb, Cap rust free. There is a light stain caused by electrical activity coming

Insulator No.	Visual Examination Results
	from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. There is a brass hue to this portion. There is a deposit on the porcelain under the point about 1cm long, it extends halfway to the edge and then fades out, there are some electrical streamers in it, a few are etched in and extend to the edge of the porcelain. The deposit fades 1/3 away from the cap. There are some points of missing glaze. There are a couple of circular blemishes permanently on the surface. Underneath the lustre is O.K. There are bits in the glaze and points of missing glaze. The pin looks O.K. The grout has a couple of cracks.
1273-7B	10000 lb, there are light rust marks on some areas of the cap. There is a light stain caused by electrical activity coming from the socket to the cap base, it appears as lines at the top and converges to a point on the cap base. This brand of insulator has a smoother edge on the cap. There is a deposit on the porcelain under the point about 1cm long, it extends halfway to the edge and then fades out. There are some points of missed glaze. The porcelain underneath is in good shape, and it retains its lustre. The pin is O.K. The grout is O.K. but is deep down inside the insulator.
1273-8B	10000 lb, the cap is O.K. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain under the point about, it extends halfway to the edge and then fades out. There is some grit in the glaze, underneath there is good lustre, and a number of points of missed glaze. There is a halo around some areas on sheds where they are bunched points. The glaze around the pin hole has some manufacturer flaws, grit, concrete and thinner glaze. The pin is O.K. but there is erosion on the grout at the glaze interface.
1273-9B	10000 lb, the cap is O.K. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain under the point about 2cm long, it extends halfway to the edge and then fades out. There is electrical activity marks etched into the deposit, the porcelain retains its lustre, and there are some tiny points of missed glaze. The porcelain underneath retains its lustre, but there are a lot of missed glaze points especially in the area nearest to the pin. There are a couple of halos on the shed edges. There are some manufacturer defects in the porcelain around the pin.
1273-10B	10000 lb, the cap is O.K. There is white material in the socket. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain under the point about 1cm long, it extends 1/3 to the edge and then fades out. The porcelain lustre is good; there is a dense dirt layer above and below. There is a good lustre underneath; there is grit in the glaze as well as points of missed glaze or thin glaze. The pin and grout look O.K. There are a couple of halos on the shed edges; they can't be rubbed off, possible flashover marks.
1273-11B	10000 lb, the cap is O.K. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain under the point about 1cm long, it extends halfway to the edge and then fades out. There is electrical activity marks etched into the deposit. The porcelain underneath retains its lustre, but there are a lot of missed glaze points. Underneath the edge where the deposit sits on the top of the shell, there are a couple of metallic looking halos on the shed edges, possibly flashover marks. The pin and grout are O.K.
1273-12B	10000 lb, the cap is O.K. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain, it extends halfway to the edge and then fades out. There is electrical activity marks etched into

Insulator No.	Visual Examination Results
	the deposit. The porcelain underneath retains its lustre, but there are a lot of missed glaze points. Underneath lustre is good, there are some points of glaze missing, and some manufacturer defects. There is a chunk of porcelain missing from one of the sheds, possibly cracked off during disassembly. The outside shed has a halo spot over from activity on the top shell. The pin and grout are O.K.
1273-13B	15000 lb, the cap has some rust on one side near the opening at the base of the opening and a pin cotter pattern in the opening. There is no patter on the cap like the other insulators did. The top porcelain is O.K. There is pitting on the surface. Underneath there is some dirt on one side between 2 skirts. There is some deposit reducing the porcelain's lustre it can be wiped off with force. There are some bits in the glaze and some points of missed glaze. The pin and grout are O.K.
1273-14B	15000 lb, there is no rust on the cap. There is a circular galvanized bloom below the opening. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain, it extends halfway to the edge and then fades out. The porcelain still has its lustre, there are some concrete deposits under the cap on the porcelain, and there is a lot of pitting. Underneath there is some dirt in between 2 sheds. There is some deposit reducing the porcelain's lustre it can be wiped off with force. There are some bits in the glaze, and some points of missing glaze. The pin and grout are O.K.
1273-15B	15000 lb, there is a tinge of rust on the top. There is one spot of rust at the bottom on mould seam. There is a galvanized bloom under the opening and below at the cap base. The porcelain has some pitting but it retains its lustre. Underneath there is some dirt on one side on the inner 2 skirts. There is some deposit on the surface mostly on the inner area and it reduces the lustre. There are pin points of missed glaze, some bits in the glaze. The pin is O.K. The grout is O.K. Except one area at the pin base where there is a space between the grout and the pin, possibly during manufacture.
1273-16B	15000 lb, there is no rust on the cap. There is a galvanized bloom under the opening and below at the cap base. There is a light stain caused by electrical activity coming from the socket to the cap base. The top porcelain is O.K. There is some pitting and grit in the glaze. There are circular halos on the surface that can't be scrapped off. Underneath there is some dirt on the inner 2 skirts. There is deposit on most of the surface, as well as some mould flaws. The pin and grout look O.K.
1273-17B	15000 lb, there is slight rust on the cap. There is a galvanized bloom under the opening and below at the cap base. There is a light stain caused by electrical activity coming from the socket to the cap base. The top porcelain is O.K. There is some pitting and grit in the glaze. There are circular halos on the surface that can't be scrapped off. Underneath there is some dirt on the inner 2 skirts. There is deposit on most of the surface, as well as some mould flaws. The pin O.K. but not centred, grout looks O.K.
1273-18B	15000 lb, there is a tinge of rust on the cap. There is no pattern on the cap like the previous insulators. The porcelain retains its lustre. There are tiny pits on the porcelain and some bits of missed glaze. There are a few bumps on the surface. There is a deposit underneath on most of the surface. There is some dirt on the 2 inner sheds on one side. The surface on the inner ring is irregular. There are some electric lines at this spot. There is some dirt in the glaze and some missed points of glaze. The pin is O.K. and the grout has uneven surface.

The results relate only to the items tested
This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Insulator No.	Visual Examination Results
1273-19B	15000 lb, the cap is O.K. There is a light stain caused by electrical activity coming from the socket to the cap base which is different from the others; the lines are finer and numerous and converge on a round spot in the middle of the cap. There is a circular bloom on the other side of the cap. The porcelain lustre is O.K. at the top and bottom. There is very little dirt underneath. There are some manufacturer flaws. The pin is O.K. but not centred, the grout has no cracks but there is a hole.
1273-20B	15000 lb, the cap is O.K. There is a large stain caused by electrical activity coming from the socket to the cap base which is different from the others. Below the point there is a very light deposit about 3cm that extends and fades to the porcelain edge. There is electrical activity etched in the surface. There is some lustre on the top porcelain, with small points of missing glaze, there are some grits in the glaze and manufacturer flaws near the centre porcelain near the pin. The pin and grout look O.K.
1273-21B	15000 lb, the cap is rust free. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain under the point about 4cm wide, it extends halfway to the edge and then fades out, there is some electrical activity etched on the surface of the deposit, but it can be wiped off with the deposit. There are some pits in the porcelain. Underneath the porcelain retains its lustre, there are some bits in the glaze and a few points of missing glaze. The pin and the grout look O.K
1273-22B	15000 lb, there is a tinge of rust on the cap opening. There is a light stain caused by electrical activity coming from the socket to the cap base. Underneath the point there is a 3cm deposit, extending and fading towards the edge of the porcelain. There is some electrical activity that etched into the deposit. There are several pits on the porcelain surface. Underneath is fairly clean, there are some missing points of glaze and tiny debris in the glaze. The inner small shed near the pin and grout is deformed in shape and has a concentrated amount of small pits. The pin looks O.K. The grout looks O.K.
1273-23B	15000 lb, the cap is rust free. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a fine deposit on the porcelain under the cap that fades across the porcelain. Underneath there is good lustre, the porcelain has some pits, there are some points of missed glaze and grit in the glaze. The pin looks O.K. The grout has a single crack.
1273-24B	15000 lb, the cap is rust free. There is some concrete on the top of the cap. There is a light stain caused by electrical activity coming from the socket to the cap base, the imprint is quite defined. Underneath the cap there is a deposit about 2cm wide that extends and fades towards the porcelain edge, electrical activity etched into the surface. The top porcelain surface is pitted. Underneath lustre is good, but there is some light dirt. There is some missed glazed and there is grit in the glaze. The pin looks O.K. The grout looks O.K.
1273-25B	15000 lb, there is a tinge of rust on the cap socket. There is not a pattern on the cap like other insulators. There is a weld spot on the centre of the cap on the cotter pit side. In front of it, on the porcelain there is a shiny metallic deposit with flashover marks etched into it. There is a small point of missed glaze on top of the porcelain. Underneath lustre is lost due to deposits, they can be wiped off with force. There are some flaws during manufacturing and point of missed glaze. The pin is O.K. The grout is O.K.

The results relate only to the items tested
This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Insulator No.	Visual Examination Results
1273-26B	15000 lb, The cap is rust free. There is not a pattern on the cap like other insulators. The top porcelain has a darkened chip on the surface. Lustre is O.K. but with some pits on the surface and points of missed glaze. Underneath the inner sheds have baked dirt and a deposit on most of the bottom porcelain. The pattern of dirt around the porcelain suggests heavy electrical activity. There are some pitting and flaws on the surface. There is a bit of rust on the pin top and at pin base/grout interface, also on the pin stem. The grout has a rust colour and one crack.

Structure 1248, L-178 (Bush phase)

Insulator No.	Visual Examination Results
1273-1C	15000 lb, There is a slight tinge of rust at the top of the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is no deposit below this point but there is more pitting and a rougher surface on the side. Underneath there is a layer of dirt on one side, and a fine dust cover the rest. Underneath this layer there is a deposit that can be scraped off, it is most noticeable in the centre porcelain near the pin. The deposit has a heavy electrical pattern on its surface. There is some grit in the glaze and a few points of missing glaze. There is a tiny bit of rust on the pin head and the stem/grout interface. The grout is O.K but it has a rust tinge.
1273-2C	15000 lb, There is a slight tinge of rust at the top of the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a small deposit under the cap about 3cm wide that extends 1cm towards the edge of the porcelain. There is a small bloom on the porcelain to the side of the deposit that can't be rubbed off. Underneath the porcelain retains its lustre. There are a number of manufacturer flaws. There are also tiny points of missed glaze. The pin is O.K. The grout is O.K.
1273-3C	15000 lb, the cap is rust free. There is a slight discoloration at the top of the cap. There is some concrete from manufacturing on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit below the stain underneath the cap about 3cm that extends and narrow to the edge of the porcelain edge. There is a metallic sheen on the deposit next to the cap. There is some electrical activity on the surface of the deposit. The top porcelain has pitting and missed glaze points. Underneath lustre is good, there are some manufacturer flaws. Outside the shed there is a thin line about 1.5cm of missing glaze. The pin is O.K. The grout has a single crack.
1273-4C	15000 lb, there is some rust on the top of the cap and a dark rust pattern alongside near the opening. The galvanizing is rough near the cotter pin and opening. There is a light stain caused by electrical activity coming from the socket to the cap base. The metal is a brass colour. There is some concrete from manufacturing at the bottom of the cap. There is a deposit about 2cm on the porcelain underneath the cap, it extends and fades towards the porcelain edge. Lustre on top porcelain is O.K. There is some pitting. Underneath the lustre is good. There is a small chip on the second shed from the pin. There are some bits in the glaze. The pin is O.K. The grout is O.K.
1273-5C	10000 lb, There is a small amount of rust at the top of the cap. Lustre is good .

Insulator No.	Visual Examination Results
	There are some points of missing glaze. Underneath there is dirt in between two rings on one side. There is a light deposit on the rest of the bottom porcelain. There are a number of tiny points of missed glaze. There is a “W” stamp in the middle near the pin. There is some electrical activity etched into this area. The pin is set deep in the insulator, and the grout is about 1.5cm down.
1273-6C	10000 lb, there is a small amount of rust at the top of the cap. Lustre is good . There are some points of missing glaze. Underneath there is dirt in between two rings on one side. There is a light deposit on the rest of the bottom porcelain. There are a number of tiny points of missed glaze. There is a “W” stamp in the middle near the pin. There is some electrical activity etched into this area. The pin is O.K. The grout is O.K.
1273-7C	15000 lb, there is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is some discoloration where the stain pattern is. Underneath the cap there is a deposit on the porcelain about 3cm wide that extends and fades towards the edge. There is some electrical activity on the surface of the deposit; one line is faintly etched in the surface. The top porcelain has tiny pits, there are a couple of points of missed glaze. Underneath lustre is good, there are some manufacturer flaws on the inner ring closest to the pin, it also has a number of concentrated pits.
1273-8C	15000 lb, there is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit underneath the cap on the porcelain about 4cm wide that extends and fades towards the edge. There is some electrical activity on the deposit with a couple of lines slightly etched in the porcelain surface. There are tiny pits on the surface of the porcelain. Underneath there is good lustre, there are some pin points of missing glaze and a bit of grit in the glaze. The pin is O.K. The grout has a single crack.
1273-9C	15000 lb, there is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit underneath the cap below the stain patter about 4cm wide that narrows and fades towards the porcelain edge. There is some electrical activity etched in the deposit. The porcelain has some points of missed glaze. There are some manufacture flaws like bumps and flat spots on the sheds. The pin is O.K. The grout is O.K.
1273-10C	15000 lb, there is a slight tinge of rust on the top of the cap. There are bits of concrete on the surface. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit on the porcelain at this point below the cap about 3cm wide that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The top porcelain has some grit in the glaze. The surface is pitted. There are a couple of points of missed glaze. Underneath the porcelain still has good lustre. There are several pin points of missed glaze, uneven surfaces. The centre ring around the pin has little lustre. The pin is O.K. The grout is O.K.
1273-11C	10000 lb, There is some rust on the side at the seam. There is no stain on the cap as the other insulators did. The porcelain has good lustre with some points of missed glaze. Most of the porcelain has some dirt on it. There is some grit in the glaze. The pin is O.K. The grout is O.K.
1273-12C	10000lb, there is no rust on the cap. There is no stain on the cap as other insulators did. The top porcelain has good lustre. There are several pin points of missed glaze,

Insulator No.	Visual Examination Results
	and there is some grit in the glaze. Underneath there is some dirt on the two inner rings. There are deposits on most of the bottom porcelain reducing its lustre. There are a number of points missing glaze. The pin is O.K. The grout is roughened but O.K.
1273-13C	15000 lb, there is a tinge of rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. The cap is discoloured at the stain. There is a 3cm wide deposit on the porcelain underneath the cap that extends and fades towards the porcelain edge. There is electrical activity etched in the deposit, with a metallic sheen to it. There are some pits on the surface. Underneath the lustre is good, but there are tiny bits of concrete on the surface, tiny bits of missing glaze, and a few missed glaze points. The pin is O.K. The grout is O.K.
1273-14C	15000 lb, There are a couple of tiny rust spots on top of the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 3cm that extends and fades towards the porcelain edge. The top porcelain is pitted and there are tiny points of missed glaze. There is a single piece of grout in the glaze. Underneath the glaze is good, but there are bits of missed glaze. There are some manufacture flaws, flattened surface on the sheds, runny glaze. The pin is O.K. The grout has a single crack.
1273-15C	15000 lb, There is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 2cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The top porcelain is pitted and there are tiny points of missed glaze. Underneath the lustre is good. There are bits of missed glaze. The pin is O.K. The grout has a crack with a hole in it.
1273-16C	15000 lb, There is no rust on the cap. This sample is marked “punctured 0.2MΩ”. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 1cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The top porcelain is pitted and there are tiny points of missed glaze. There is a single bloom on the porcelain. Underneath the lustre is good, but there are some bits in the glaze. There are some manufacture flaws like flattened porcelain on the sheds. The pin is O.K. The grout is O.K.
1273-17C	15000 lb, There is a tiny bit of rust on the top. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 3cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. There is a circular bloom near the edge. There are bits of missed glaze. Underneath the lustre is good There are bits of missed glaze. The centre porcelain around pin has glaze erosion. The pin is O.K. The grout is O.K.
1273-18C	15000 lb, there is a tinge of rust on the cap. There is a galvanizing bloom near the opening. There is no stain pattern like other insulators did. The porcelain is pitted. Underneath the lustre is hidden by deposit on most of the surface it can be rubbed off with force. There is some dirt on one side of the inner rings. There is some grit in the glaze and a few pin points of missed glaze. The pin is O.K. The grout is O.K.
1273-19C	15000 lb, there is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 3cm that extends and fades towards the porcelain edge. The porcelain is pitted. There are

Insulator No.	Visual Examination Results
	bits of missed glaze. There is a bloom on the surface. Underneath the lustre is good. There are bits of missed glaze. The pin is O.K. The grout is O.K.
1273-20C	15000 lb, there is no rust on the cap, but does have 4 arc damage points. One below the cotter pin and three in line under the side of opening. There are a couple of light arc marks in line on the porcelain. The surface under the cap is rough and has a tiny bit of porcelain damage. There is a faint pattern on the cotter pin side that includes the one arc point on the cap. There is a small deposit that extends and fades towards the porcelain edge. The top porcelain is pitted and there are tiny points of missed glaze. There is no arc damage underneath. There are some manufacture flaws. The pin is O.K. The grout is O.K.
1273-21C	15000 lb, there is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 3cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The top porcelain is pitted and there are tiny points of missed glaze. The lustre is less than others. Underneath the lustre is good. There is some arc damage on the edge of the outer shed. There are some manufacture flaws. The pin is O.K. The grout is O.K.
1273-22C	15000 lb, there is a tinge of rust on the cap. There is some concrete on the surface. There is a light stain caused by electrical activity coming from the socket to the cap base. There is a deposit about 2cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The lustre is good but there are pits and points of missed glaze. Underneath there is arc damage in a small area on the 3 outer sheds. The 2nd shed is discoloured, showing high temperature damage. The rest of the area looks good with lustre. There are bits of missed glaze. The pin is O.K. The grout is uneven with a hole at the base of the pin.
1273-23C	15000 lb, there is no rust on the cap, but some discoloration on one side. There is a light stain caused by electrical activity coming from the socket to the cap base. There are a couple of arc marks around the cotter pin area and one near opening. There is a deposit about 3cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The top porcelain is pitted and there are tiny points of missed glaze. Underneath the lustre is good There are bits of missed glaze. The pin is O.K. The grout is O.K.
1273-24C	15000 lb, there is no rust on the cap. There is a light stain caused by electrical activity coming from the socket to the cap base. The cap is discoloured at the stain patter. There is a deposit about 3cm that extends and fades towards the porcelain edge. There is some electrical activity etched into the deposit. The top porcelain is pitted and there are tiny points of missed glaze. There are some manufacture flaws underneath, runny glaze, irregular bumps on sheds, bits in glaze. The pin is O.K. The grout is O.K.
1273-25C	10000 lb, there is a tinge of rust on the cap. There is no stain pattern like other insulators did. The top porcelain has good lustre. There are bits of missed glaze. There is a metallic stain on the surface, not sure if it is from a tool or arc damage, it can't be scrapped off. Underneath is quite dirty; there is an electrical pattern in the dirt. There is some missed glaze on the inner shed by the pin. There are pin points of missing glaze. The pin is O.K. but off centre. The grout is O.K.

Insulator No.	Visual Examination Results
1273-26C	10000 lb, there is no rust on the cap. There is no stain pattern like other insulators did. The lustre is good but there is some grit in the glaze and there are bits of missed glaze. Underneath is quite dirty. There is some missed glaze. The lustre is hidden by the dirt and surface deposits can be wiped with force. The pin and grout are O.K.

7.2.2 Main findings in the visual inspections:

Visual inspection shows these insulator strings had some electrical and environmental damage. The inspections found evidence on all of the insulator strings of some electrical activities such as: flashover and electrical discharge. This electrical activity indicates that all of these insulators have been subjected to higher than normal leakage current. Many of the insulators in all the strings have cracks in the grout; however, there was no significant loss of grout observed. The cracks are typical of old insulators and are not an immediate concern unless accompanied by loss of grout.

Figures 1 to 3 shows examples of electrical damage:

Figure 1 – Stain from the cap that extends and fades towards the porcelain edge.

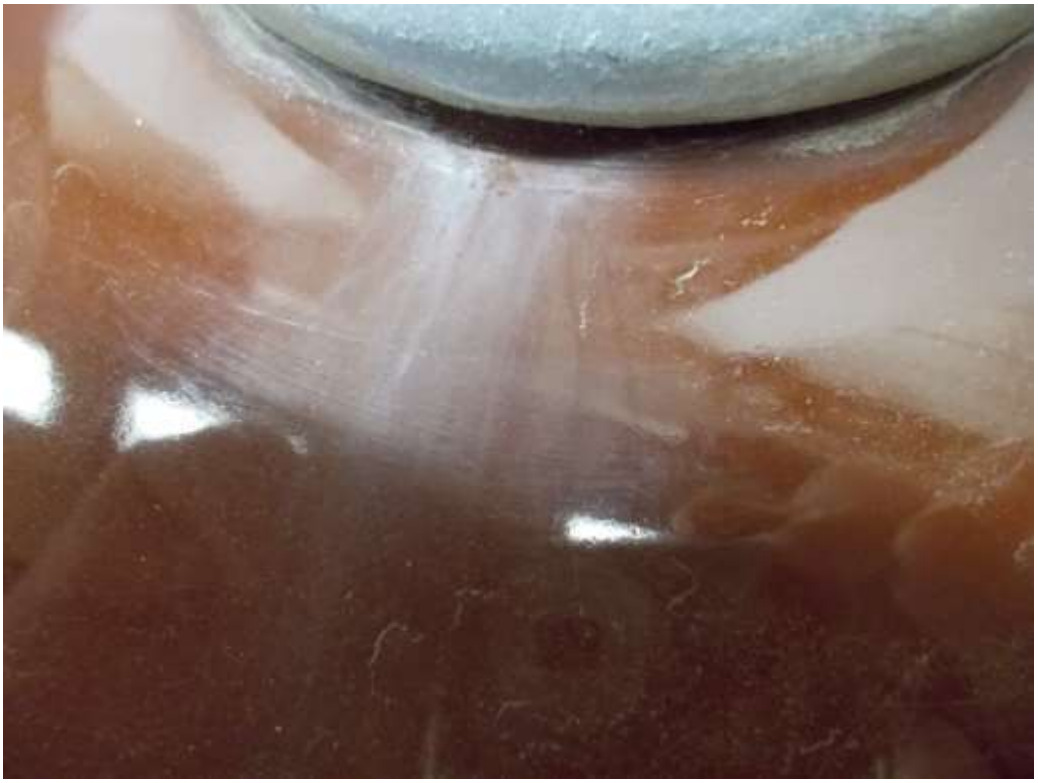

Figure 2 - Electrical activity etched in the stain,

Figure 3 – Arcing damage

7.3 *ESDD Measurement*

7.3.1 Test Description:

The ESDD test (Equivalent Salt Deposit Density-IEEE Std. 4) is a measure of the pollution level on the insulators. The pollutant on the upper and the lower surfaces of the insulators was washed off separately and the ESDD was determined for each surface.

Two insulators from each of the three different insulator sets were tested.

7.3.2 Test Results:

Insulator Sample No.	ESDD (mg/cm^2)
1273-20A Top	0.014925
1273-20A Bot	0.007788
1273-6A Top	0.014433
1273-6A Bot	0.017628
1273-11B Top	0.019195
1273-11B Bot	0.009725
1273-17B Top	0.014343
1273-17B Bot	0.013867
1273-25C Top	0.015205
1273-25C Bot	0.01653
1273-8C Top	0.014817
1273-8C Bot	0.007517

According to the information from IEC Standard 815, the ESDD level on an insulator below 0.03 mg/cm^2 is generally considered to be very light pollution level. The results from the ESDD measurement on these insulators show that the pollution level was lower than a "very light pollution level" on all the insulators tested.

7.4 *Radio Interference Test*

7.4.1 Acceptance Criterion

According to the CSA standard each of five tested insulators shall meet the requirements for maximum radio interference voltage (RIV). If one insulator fails an additional five insulators are to be tested. In this investigation all 78 insulators were tested in order to give an overall picture of the condition of the insulators on the 138 kV transmission line.

Rating: < 50 µV @ 1 MHz, using an applied test voltage of 10 kV rms.

A high RIV reading indicates that there is partial discharge activity on the insulators which means that there is some damage to the insulator. This test is normally done as type test but no insulator in service should exhibit high RIV (partial discharge) levels. The high RIV level

can be caused by external problems with the insulators (such as glaze damage) or to internal problems (such as cracks).

7.4.2 Atmospheric Test Conditions

Test date:	May 2, 2016	May 3, 2016
Barometric pressure:	752.2 mmHg	758.1 mmHg
Temperature, dry-bulb:	21.2 °C	22.2 °C
Relative humidity:	34.0 %	44.0 %

Background RIV = <1.0 µV @ 1 MHz at an applied test voltage of 10 kV rms

7.4.3 Test Results

Note: In the following tables all insulators that had an RIV above 50 µV electrical or mechanical failure below the rating of 15 kip are highlighted in red.

7.4.4 Summary of RIV test results:

The radio-interference voltage of all the insulators was measured.

The overall failure rate of the insulators was 6% (5 out of 78). These insulators failed the radio-interference voltage test.

7.5 *Dry Power-Frequency Voltage Flashover Test*

7.5.1 Acceptance Criterion

The insulators pass the test, if the average dry flashover voltage of three tested insulators is equal to or exceeds 95% of the rated dry flashover value of 80 kV (corrected to standard atmospheric conditions) and no insulators are punctured. For evaluation purpose all the insulators were tested and they were evaluated on the basis of the complete string.

7.5.2 Test Procedure

The applied voltage to the insulator was initially increased to approximately 75% of its flashover value. Then it was increased gradually with a rate of rise of about 2% of the estimated flashover voltage (80 kV) per second until the flashover voltage was reached. Five flashover values were obtained per insulator.

7.5.3 Atmospheric Test Conditions

Date of test:	2 May 2016	3 May 2016
Barometric pressure:	757.2 mmHg	758.1 mmHg
Temperature dry-bulb:	21.2 °C	22.2 °C
Relative humidity:	39.2 %	44.0 %

Note: Test results are corrected to standard atmospheric conditions, as specified by the test standards, so that the evaluation of the results is based on the same atmospheric conditions.

7.5.4 Test Results

Note: In the following tables all insulators that had an RIV above 50 µV electrical or mechanical failure below the rating of 15 kip are highlighted in red.

1273-26C	71.92	69.84	71.76	71.28	69.52	70.86	

Overall the insulators fail the requirements of CAN/CSA-C411.1-M89, Clause 5.3: "Dry power frequency voltage tests". The corrected average flashover voltage was <76 kV (95% x 80 kV). There were two insulator punctures and one cracked insulator (very low flashover voltage of 21 kV).

7.6 *Assessment of Corrosion*

7.6.1 Condition Assessment of Insulators

The condition of the galvanized fittings and grouted interfaces were assessed with respect to corrosion attack. The samples were subjected to the following examinations:

- Visual Examination of Galvanized Fittings and Grouted Interfaces
- Energy Dispersive X-ray Spectroscopy
- Coating Thickness Measurements

7.6.2 Visual Examination

All sample sets showed varying degrees of similar features, with the following observations noted:

- The galvanized cap and pin of the insulators are in excellent condition. The majority of samples do not exhibit any corrosion product on the surface. Several samples were noted having a white crystalline corrosion product present on the cap; typical of minor corrosion attack of a galvanized coating. However, the amount of corrosion product was minor and the presence of the zinc corrosion products is actually beneficial, as they are adherent and fairly insoluble; acting as a passive layer to slow the effective corrosion rate as time progresses and the corrosion product builds. The typical surface condition of the galvanized caps is seen in Figures 4 and 5.

- Several samples sets showed dust like debris primarily on the bottom side of the sheds, seen in Figure 6

- The grout condition on the underside of the insulators is also in good condition, with no cracking, shrinkage or porosity noted in the grout. Similarly no features of cement growth phenomena which can lead to cracking in the shells was noted. Examples of the grout condition is seen in Figure 4

Figure 4: Overall Condition of In-Service Insulators. No apparent corrosion attack of the galvanized coating is noted in the majority of samples.

Figure 5: Example of insulator containing a small amount white crystalline deposit on cap of

insulator.

Figure 6: Debris present on underside of insulator sheds. Also note good condition of grout

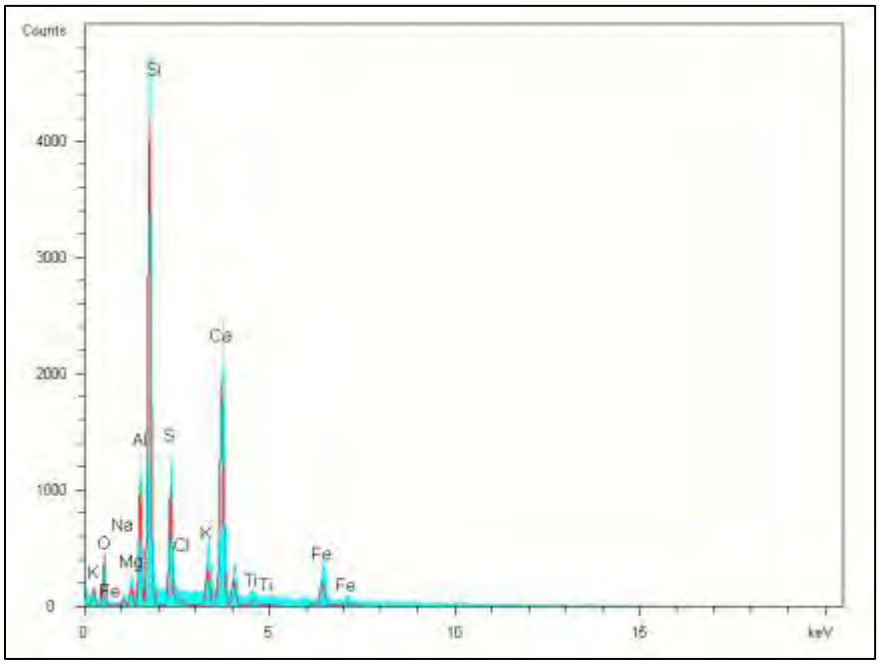
Figure 7: Typical condition of underside of insulator, with no dust like debris on underside

7.6.3 Energy Dispersive X-ray Spectroscopy

The general dust like debris on the underside of several sheds noted in the assessment was sampled from the insulators. The collected material was then placed in a Hitachi SU1510 Scanning Electron Microscope and analyzed by Energy Dispersive X-ray Spectroscopy (EDS) to determine the elemental composition.

A representative EDS spectrums obtained from the analyses is seen in Figure 5.

The dust debris on the underside of the sheds consisted primarily of silicon (Si), calcium (Ca), aluminum (Al), and sulphur (S), as expected for general dust contamination (Figure 7). Minor concentrations of potassium (K), iron (Fe), magnesium (Mg) and sodium (Na) were also noted in the spectrum, elements that are also commonly attributed to general dust contamination. While sulphur can act as a corrosion accelerant, this typically occurs in environments where there is continuous wet / dry cycling. The presence of sulphur in the debris on the sheds of the insulators is clearly not causing corrosion, as the galvanized components are in excellent condition.



7.6.4 Coating Thickness Measurements

The coating thickness of the cap and pin of selected insulators was measured using a PosiTector 6000 coating thickness gage. At each test location, the surface of the area tested was cleaned of any surface debris. Three reading were performed in each area, and the average value reported. The results of the coating thickness measurements are seen summarized in Table 1.
There was minor variation in the coating thickness between samples, however all samples tested show a significant remaining coating thickness, with the current values consistent with a newly hot dip galvanized product

Table 1: Coating Thickness Measurements

Sample ID	Coating Thickness Readings Cap (mils)			Avg. Coating Thickness Cap (mils)	Coating Thickness Readings Pin (mils)			Avg. Coating Thickness Pin (mils)

7.7 *Electro-mechanical Failing Load Test*

7.7.1 Test Procedure

Each insulator was tested individually. The insulator was subjected to a mechanical load with the load initially increased rapidly and smoothly from zero to approximately 11.3 kip (75 % of the specified electromechanical failing load). It was then increased at a rate between 35% to 100% of the rating per minute until the failing load was reached. Simultaneously, a 60 Hz voltage of 60 kV was applied to the tested insulator - an internal electrical discharge would indicate that a mechanical failure of the insulating part (porcelain shell) has occurred prior to the mechanical failure. An electrical failure causes the circuit breaker on the high voltage to trip. The load at which this occurs is recorded while the mechanical load increase is continued at the same rate till the mechanical failing load is reached. The electrical (E) and mechanical (M) failure loads were both recorded.

7.7.2 Acceptance Criteria

The insulators pass the test if the tested units (normally ten insulators. in this case the complete set of 26 insulators was evaluated) comply with the electro-mechanical failing load test requirements of CAN/CSA-C411.1-M89, Clause 6.6 as follows:

(a) $X \geq R + 3S$

where X = mean value of the lowest (electrical or mechanical) individual failing load test
R = specified failing load (rating) of 15 kN
S = standard deviation of sample test units provided by the formula

$$S = \sqrt{\frac{(X_1 - \overline{X})^2 + (X_2 - \overline{X})^2 + \cdots (X_N - \overline{X})^2}{N - 1}}$$

where

N = number of units tested

(b) each value measured should be equal to or greater than the rating of 15 kip ($X_i \geq R$)

where

X_i = each individual failing load value measured
i = 1, 2, 3, … N

7.7.3 Test Results

Note: In the following tables all insulators that had an electrical or mechanical failure below the rating of 15 kip are highlighted in red.

Bush phase individual insulators summary:

Insulators Tested	Electrical Failures (<15 kip)	Mechanical Failures (<15 kip)	Total Failures (<15 kip)
26	3 (12 %)	0 (0 %)	3 (12 %)

The tested insulators did not comply with the acceptance criterion, which requires that $X_i \geq R$ and X + 3S and that the average electrical or mechanical failure exceed the rating of 15 kip. A large percentage (21%) of the individual insulators had an electrical failure load below the rated value. The mechanical failure load in all cases were at or above the rated load, however, the centre and bush phases did not meet the requirement that $X \geq R + 3S$.

7.7.4 M&E Test Result Summary

The three sets of insulators failed to meet the requirements of CAN/CSA-C411.1Clause 6.6.1: "Electro-mechanical failing load test" based on the rating of 15 kip (.

The Electro-mechanical failing load test results show serious concern for the electrical and mechanical strength of these insulators.

8 DISCUSSION AND CONCLUSIONS

The megger test found one failed insulator on the Structure 1248, L-178 (Road phase). The visual inspection found that the insulator strings had some electrical and environmental damage. The inspections found evidence on all of the insulator sets of electrical activities such as flashovers and electrical discharge. The ESDD evaluation of the insulators found the pollution level on the insulators was very low. Five of the 78 (6%) insulators failed the RIV test. Two of the insulators were found to be punctured on the AC flashover test and one of the insulators was cracked. Each of the three sets of insulators had a punctured or cracked insulator. The corrosion assessment of the insulators found them to be in good shape from a corrosion perspective. All three sets of insulators failed the combined mechanical and electrical test. They did not comply with the acceptance criterion, which requires that Xi $\geq$R and X + 3S and that the average electrical or mechanical failure exceed the rating of 15 kip. A large percentage (21%) of the individual insulators had an electrical failure load that was below the rated value. The mechanical failure load in all cases was at or above the rated load, however, the center phase and bush phase insulators did not meet the requirement that X $\geq$ R + 3S. The failure rate was evenly distributed between the two insulator types.

These insulators were manufactured in 1968. The condition of the glaze has deteriorated over time due electrical activity and the porcelain on some of the insulators has punctured. The porcelain does slowly degrade over time due to the electric field. The rate of this degradation slow but the higher the electric field and the temperature the faster the degradation will be. Insulators can also puncture due to steep front transient voltages that the transmission line is expose to from lightning. Insulators manufactured today are required to pass a steep front impulse test. Insulators manufactured in 1968 did not have to pass this test and based on testing experience it very unlikely these insulators would have passed a steep front when they were manufactured.

Fires on wood structures can be caused be insulator string flashovers or by excessive leakage current into the structure. Flashovers can be due to transient conditions (such as lightning strikes or switching transients) or due to loss of insulation strength. Excessive leakage current flowing into the wood can also occur due to moist/fog weather conditions combined with polluted insulation combined, poor insulator quality or a combination of these conditions. In this case there is no evidence of polluted insulation. The insulators are, however, in poor electrical condition. The pole top fire occurred on bush phase. This phase of the line had one punctured insulator which would have resulted in an increase in leakage current due to the higher electrical stress on the remaining intact insulators. This structure did not have any bonding. There was no reported lightning or switching activity at the time of the failure. It was raining at the time of the failure.

None of the wood structure was available for examination. Based on the condition of the insulators, the lack of pollution on the insulators and information provided that there were no lighting and switching activity at the time of the failure the most probable cause of the pole top fire is excessive leakage current which initiated the fire. In dry weather the wood structure dries out and then under

the wet humid conditions the leakage current increases. The current flows through from the insulators into the wood. If the wood is dry enough and the current is high enough the wood will be ignited and a fire will start. It is not possible to definitively conclude that the fire was due to high leakage current, however, based on the available information about the event the poor electrical condition of the insulators as determined in the test program this is the most likely cause of the failure.

In general to reduce the risk of pole top fires on wood structures excessive current must be prevented from entering the wood structure or the current density where it enters the pole must be decreased. There are a number of methods that can be used to achieve these objectives.

1. Increase the number of insulators in the string to reduce the leakage current.
2. Increase the surface area of the metal at the area that the current enters the pole. This will reduce the current density. This has been found to be effective in some line designs were the washers used were too small.
3. Bond all metal parts on the pole together and connect them to a local ground so the current does not flow into the pole. This is the most reliable solution. However this method will reduce the lightning and switching transient insulation withstand level for the structure as it will no longer have the added insulation of the wood components.
4. In this particular transmission line replacing faulty insulators with new insulators that meet the specification will also reduce the risk of a pole top fire.

It is recommended that all 1968 vintage insulators from these manufacturers be replaced. They are all at high risk of failing either electrically and mechanically. Given that there were three similar failures reported in 2015 there is a high probability of further failures. It is recommended that a replacement program be implemented with the priority being given to structures that have more than one insulator string per phase. The greater the number of insulator strings on the same structure the higher the leakage current would be.

The information we have is that this transmission line has not had a long term history of having problems with pole top fires, this is a recent issue. This is consistent with the problem being due to deterioration of the insulators. Replacing the insulators will restore the structures to their original electrical condition. At present the horizontal suspension strings have nine insulators and the vertical suspension strings have eight insulators. Increasing all strings to nine insulators would provide an increase safety margin.

The insulators evaluated in this project were all removed from on structure. The recommendation to replace all 1968 vintage insulators is based on the assumption that the results are typical of all the insulators of this type on this transmission line. This could be confirmed by removing and evaluating additional insulators from this transmission line. For such a program we would recommend that insulators from 0.5 % (based on recommendation for quality conformance testing of ANSI C29.2B, “Wet Process Porcelain and Toughened Glass-Transmission Suspension Type”) of the structures be evaluated.

Any live line work done on these transmission lines should take into account there is a significant risk that there are punctured insulators and there may be insulators with low mechanical strength in the insulator strings being worked on.

Powertech

EXECUTIVE SUMMARY

A condition assessment and evaluation of in-service crossarms from a 138 kV transmission line operated by Yukon Energy was performed by Powertech Labs, to determine the remaining load carrying capacity of the crossarms, and whether they still meet both historical and upgraded modern design load requirements. The crossarms were from angled tangent structures, in which the angle of the crossarms is approximating that of the sloping terrain. Six pairs of crossarms were received, and subjected to a visual examination and condition assessment, with full scale structure testing and flexural testing performed.

Significant cracking was evident on two pairs of the as received crossarms, indicating that in-service failures have happened on the 138 kV line. However, the overall condition of the other crossarms can be considered fair. No rot or insect damage is present, and although the crossarms do contain sporadic large knots and sloping grain, these features are within the allowable provisions of structural lumber grades common for crossarm use.

In general the crossarm assembly performed well during the full-scale vertical and longitudinal load tests. The vertical loads achieved agree with the prediction based on the flexural test results. No anomalies were found at the connections and hardware. One of the three vertical loads obtained from full-scale testing was lower in comparison to others, as it failed prematurely in splitting alone an existing crack through the pole and crossarm connection. This failure mode is similar to the observed cracking on the two as-received pairs mentioned above.

The longitudinal load test demonstrated that the crossarm assembly has adequate remaining strength against the design load applied on a typical tangent structure.

Based on flexural test results the remaining vertical load carrying capacity at the high side phase was predicted followed by a statistical analysis. The statistical analysis shows that in the conservative approach, the existing crossarm system has a high probability of not meeting the vertical design loads of the modern standard. In particular, the remaining vertical load carrying capacity of the crossarm assembly is not adequate to withstand the 50 mm hoar frost scenario, even on a standard span.

Given the high probability of not meeting design vertical loads and the age of the crossarms (close to 50 years old), as well as evidence of failure in service, it is recommended that the replacement of these crossarms should be initiated to mitigate the risk of failure in service, with the following priorities suggested:

- Long spans should be given priority for replacement over short spans
- Crossing structures should be given priority over non-crossing structures
- For all spans, those structures in which knots and checks are noted around connection points should be given priority over structures in which these features are not seen

Powertech

INTRODUCTION

Yukon Energy operates and maintains a 138 kV transmission line from Whitehorse to Vangorda. The transmission line contains angled tangent structures, identified as type "ASX", for sloping locations. These structures consist of double wood crossarms on wood poles in a typical H-frame structure, with the crossarms mounted at an angle approximating that of the sloping terrain. A crossarm from such a structure failed in the spring of 2015, with no snow or ice load on the line, and no apparent anomalous events. Powertech Labs was contracted to test and evaluate the mechanical performance and material properties of the existing aged in-service wood crossarms; to determine the remaining load carrying capacity of the crossarms and whether they can still meet both the historical and the upgraded load requirements.

SCOPE

The scope of the work included the following examinations and tests:

- Visual examination and condition assessment of the existing in-service crossarm samples
- Full-scale structure testing of the crossarms for evaluating remaining load carrying capacity in the vertical and longitudinal directions as well as the corresponding stiffness and connection points
- Flexural testing as per ASTM D198-09 on specimens removed from the crossarm samples to determine bending strength (modulus of rupture (MOR) and modulus of elasticity (MOE))

From the results of the testing, a statistical and serviceability analysis was performed to determine whether a typical crossarm set is serviceable for given load requirement scenarios.

DESIGN DOCUMENTATION

Limited design documentation for the 138 kV type ASX H-frame structures was available due to the age of the original construction (late 1960s). The structure detail, with nominal dimensions and typical hardware, are contained in drawing NCP-29029, and is available as an appendix to the report. Regardless of the slope, the following conditions are common to the ASX type structure:

- Center to center pole spacing is 16'
- Crossarms were to be drilled in the field to provide 14' phase spacing

The original design conditions pertaining to conductor properties, load conditions and tension limitations were also provided. These included the stringing table and charts (tension and sag) for various ruling spans. The longest ruling span was identified as 1605' (490m).

Fax: (604)590-6656
www.powertechlabs.com

No information related to vertical or longitudinal design loads or reliability based design were available. Based on information received from Yukon Energy for a previous crossarm test project, the following vertical design loads were used for the serviceability analysis:

- Standard span, 50 mm hoar frost = 2920 Lbs
- Standard span, CSA ML = 1260 Lbs
- Long span, 50 mm hoar frost = 3860 Lbs
- Long span, CSA ML = 2000 Lbs

VISUAL INSPECTION

Upon receipt, the cross arms were visually inspected to assess the current condition, and the spacing of the connection points measured to determine structure angle. The structure number was labeled on each set of crossarms, with the exception of one set of crossarms. For identification purposes, this set of crossarms is herein referred to as UK (unknown).

Figure 1 is a portion of the design drawing of the tangent structure. For each set of crossarms, the following measurements were taken:

- Low side to high side pole connection points
- Low side connection to load line
- High side connection point to load line

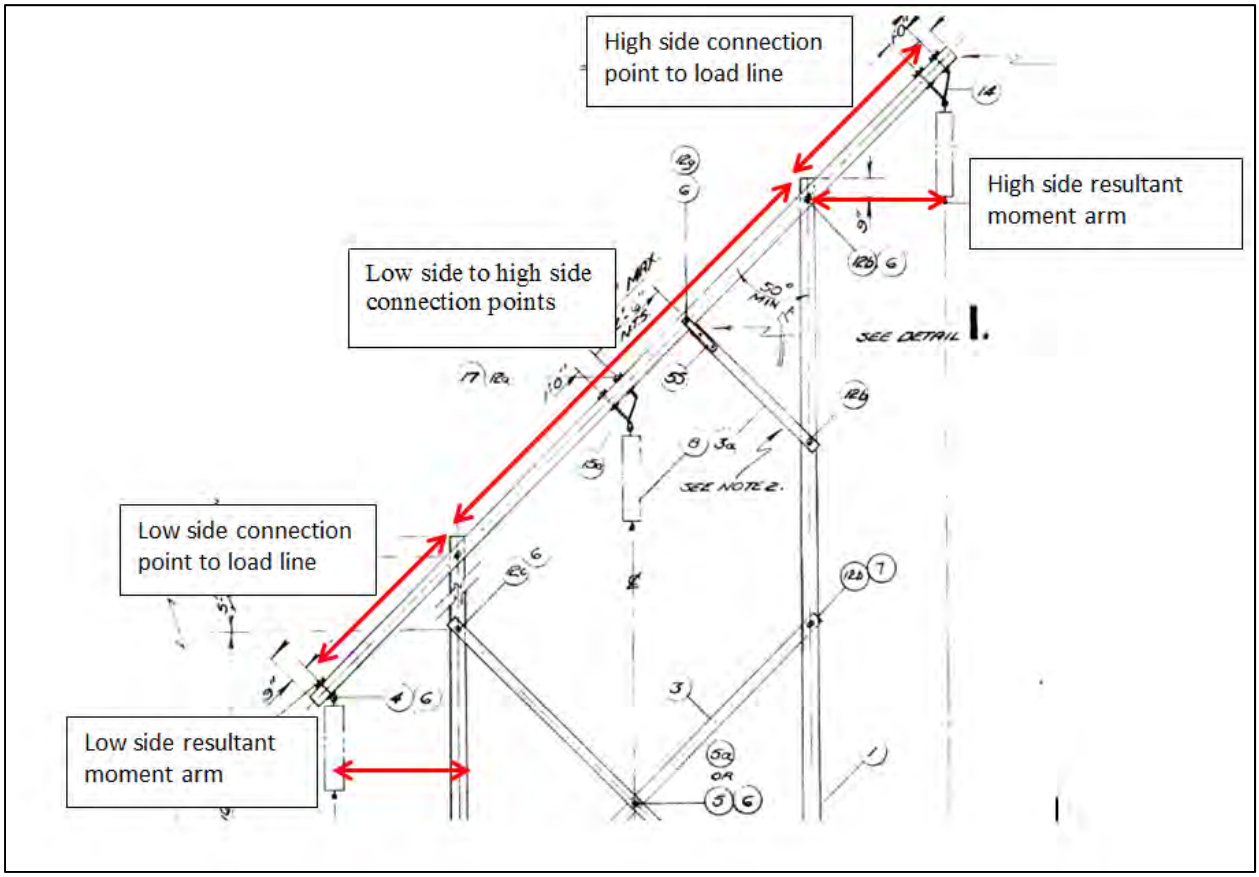

Figure 1: Portion of Design Drawing

Given the set center to center pole spacing of 16', the resultant crossarm angle and horizontal moment arms of the structures were calculated and are seen tabulated in Table 1.

Table 1: Crossarm Hole Spacing and Resultant Angles and Moment Arms

Str. #	Low to High Side Connection Points	Resultant Angle	Low Side Connection Point to Load Line	Resultant Horizontal Moment Arm		High Side Connection Point to Load Line	Resultant Horizontal Moment Arm	
	(inches)	(degrees)	(Inches)	(Inches)	(Feet)	(Inches)	(Inches)	(Feet)
UK	209	23.3	78	71.7	6.0	84	77.2	6.4
723	221	29.7	82.5	71.7	6.0	90	78.2	6.5
724	239.5	36.7	89.5	71.7	6.0	97.5	78.2	6.5
725	220	29.2	82.5	72.0	6.0	90	78.5	6.5
730	236.5	35.7	84	68.2	5.7	80	64.9	5.4
735	221	29.7	83	72.1	6.0	88.5	76.9	6.4

From the measurements, it can be seen that 3 of the sampled structures were nominally 30 degrees, 2 were 36 degrees, with one set of crossarms at the comparatively low angle of 23.3

Also of note is that the high side of the structures consistently has a higher resultant horizontal moment arm, typically 6" longer than that of the low side.

The condition of the crossarms was evaluated with respect to ANSI standard O5.3-2002 "Sold Sawn-Wood Crossarms and Braces – Specifications and Dimensions" and WCLB Standard #17, "Grading Rules for West Coast Lumber", with the following observations noted:

- The crossarms are predominantly straight, with little bow or warpage
- Incising marks are seen along the length of the wood, indicative of a pressure treatment, likely PENTA
- No significant rot or insect damage is seen in the crossarms
- Several of the crossarms contained large knots with the grain pattern at an angle respect to the longitudinal axis, however the size and spacing of the knots and the angle of the grain were within the allowable provisions of grading
    - Several knots exceeded the allowable 1-7/8" diameter, however these were sporadic and not indicative of the general condition
    - The slope of the grain in the middle 1/3 of the length is not to exceed 1 in 15, no crossarms exceeded this limit
- One crossarm from Structure 735 appeared to be completely failed through its high side connection point. The crossarm had 2 drill holes on the high side, with a knot present between the drill holes, and a significant check running through the connection point. Transverse cracking is also seen in this crossarm indicating the section was over-stressed in bending. The presence of the double holes did weaken the strength
- One crossarm from Structure 730 appeared to be completely failed, with several fractures present around the brace connection point location and the high side connection point
- Several of the crossarms had either elongated drilled connection holes points on the high side or two thru-holes for connection points very close to each other. As indicated on the drawing, the crossarms were drilled in the field to accommodate the angle, which likely presented challenges to the installation crew, leading to elongated or hogged-out connection point holes or re-drilling of a hole after the initial installation did not fit
- Checks (cracks along the woods grain pattern, but not passing through the entire thickness) are seen sporadically in the crossarms
- Significant checks are seen through the high side connection points of structures 725 and 727 These checks had not yet developed to splits; however it is likely the checks opened to their current level during service and shows the high side of the structure is susceptible to premature failure

Examples of the features noted in the inspection are seen in Figures 2 through 8.

EVALUATION METHODOLOGY

To determine the remaining vertical and longitudinal load carrying capacity of the crossarms, and to perform reliability based statistical analysis, both full scale load tests and flexural tests are required. In the design of the structure, the expected failure mode of the crossarms is in flexure (bending), typically in the section encompassing the connection to the pole in which the maximum bending stress is present. In this scenario, the wood fibers on the tension side of the bend fracture. This is the predominant mode of failure in H-frame crossarm structures; however crossarms can fail by cracking through existing checks and various other defects present in the wood. The full scale testing therefore provides important information on whether the crossarms will fail as theoretically expected, or if there is a likelihood of atypical failures, and at what loads these failures occur at.

The standardized flexural tests allows for a statistically significant population of specimens to be tested, as multiple samples can be taken from one crossarm. Assuming the data obtained from the specimens are representative, the test results are used to quantify statistically the remaining vertical load carrying capacity of the crossarm population through a Weibull analysis, with upper and lower bounds. When predicting the vertical load capacity based on flexural test results, the typical failure mode of bending is assumed. By performing both tests, the data obtained can be cross validated.

Selection of the crossarms for full-scale tests were based predominantly on the condition of the crossarms, with the crossarms deemed most structurally sound tested. The selection included 2 sets that were of the same structure angle (nominal 30 degrees) as that of the failed sample, with the final set at a lower angle of 23 degrees. For the vertical testing, the high side phase location was loaded as this was the side in which the failure and the majority of cracking and checking were seen

For the flexural test, 10 specimens were cut from the untested or unaffected crossarms such that the connection point to the wood poles was centered between the loading noses, the area of highest bending stress.

FULL SCALE TEST SETUP

A test frame was built in the mechanical lab at Powertech Labs in accordance with Yukon Energy's type ASX H-frame design specifications. Two 12" x 12" x 0.5" steel I-beams were used to support the crossarm samples with spacing of 16 ft between the two columns. One of the two steel columns (south side) was anchored using an existing anchor pad and another column (north side) was anchored using an anchor system specially built for anchoring the column. The anchoring system was comprised of two 12" x 12" x 0.5" I-beams connected to other anchor pads for longitudinal and transverse constraints. Three concrete blocks each weighing 4300 lbs (20 kN) were placed on the anchoring system to provide vertical restraint to the north column.

To represent the actual connection between crossarms and wood poles, a wood pole was selected from BC Hydro's pole yard and sectioned to a semi-elliptical cross section. The sectioned wood column was placed and fastened between the two flanges of the I-beam so that a wood to wood connection existed as per actual installation practices.

Yukon Energy provided the standard hardware (tie plates, clevis bolts and square washers) used for the pole and phase connections, which were used in assembling the structure in the mechanical lab as per the design drawing.

The crossarms from the structures 723, 724 and UK were selected for vertical testing, with the crossarm pair from structure 7 used for the longitudinal test.

For the vertical load test, the vertical load was applied to the south end using a 10-ton overhead crane through a pulley attached to an anchor pad. A load cell was placed in line with the overhead crane on the north end, and a displacement transducer attached to the cross arm. The load and displacement were subsequently data logged with a Soltec high speed data acquisition system.

Images of the test setup can be seen in Figures 9 through 11.

For the longitudinal test, the longitudinal load was applied to the south end using the same overhead crane through a pulley attached to a short I beam anchored to the ground. A load cell was placed in line with the overhead crane on the south end, and a displacement transducer attached to the cross arm. The load and displacement were subsequently data logged with a Soltec high speed data acquisition system. Images of the test setup can be seen in Figures 12.

FULL SCALE MECHANICAL TEST RESULTS

Three full-scale vertical load tests were performed with the ultimate loads achieved summarized in Table 2.

It was observed that:

- The near side crossarm of structure 723 failed at an ultimate load of 3,743 lbs when a crack developed at the connection point, likely from an existing shallow check, and propagated along the angle grain pattern

- Both crossarms of structure 725 failed simultaneously, at an ultimate load of 4,046 lbs. The near side crossarm failed when the wood fibers on the tension side of the bend fractured under load. The far side crossarm failed through its connection point, propagating between several large knots

- The crossarms of the unknown (UK) structure achieved the highest vertical load carrying capacity, with the near side crossarm fracturing on the tension side just above the connection point at a load of 6,735 lbs. No knots or checks were present in the immediate area of failure

This report shall not be reproduced, except in full, without the written approval of Powertech Labs Inc.

Canada V3W 7R7
Tel: (604)590-7500
Fax: (604)590-6656
www.powertechlabs.com

- Before the ultimate loads were reached the entire system performed well and no anomalies were found at the crossarm, pole connections as well as the tie plates and hardware, and no excessive displacement was noticed

- The failure mode of structure 725 and UK was as theoretically expected, fracture of the wood fibers on the tension side of the section subject to maximum bending stress. The differing failure mode of structure 723 however illustrates that the theoretical bending failure mode cannot be assumed for all structures, as existing defects and anomalies in the structure can lead to low failure loads

- The average of the three ultimate vertical loads achieved is 4,841 Lbs and the COV 34%

- The vertical loads achieved in general agree with the remaining vertical load carrying capacity calculated based on flexural test results shown in Table 5

Load versus displacement data for the final load to failure tests for each crossarm are seen in Figures 13 through 15. Images of the bending deflection, failure modes and features noted during the vertical testing are seen in Figures 17 through 23.

Table 2: Summary of Ultimate Vertical Load Carrying Capacity of Crossarms

Figure 21: Structure UK, Failure Above Connection Point on Tension Side

One longitudinal load test was performed on structure 140. The load versus displacement data for the longitudinal test is seen graphically in Figure 22, with the bending deflection achieved seen in Figures 23.

The longitudinal load test was stopped at 3,560 Lbs without breaking the crossarm completely. It was observed that

- Cracking began to occur on the tension side of the bend at approximately 3,000 lbs.
- Linear-elastic response of the crossarm assemblies were observed throughout the entire loading and unloading process as shown in Figure 22.

It should be noted that the proof load achieved is much higher than the longitudinal load that a tangent structure would subjected to, thus the remaining longitudinal load carrying capacity is adequate.

FLEXURAL TEST

The objective of the flexural test was to determine the material properties of the wood crossarms: modulus of rupture (bending strength), modulus of elasticity, and maximum shear stress. The results can be used to estimate the bending and shear strength of the crossarm assembly at any section and to predict the remaining vertical load carrying capacity.

Two-point loading tests were conducted as per ASTM D198-09 using Powertech's Tinius-Olsen test machine as shown in Figure 24. A displacement transducer was attached to the intersection of the beam center and natural axis.

Figure 24: Flexural Test Setup

It was observed that for all tests, that the failure initiated at either existing checks or knots located on the tension side, or the connection hole, and in between loading points, where the beam is subject to maximum bending stress. Based on deflection measured and maximum break load, the MOE, MOR and shear stress were calculated and summarized in Table 3. Load versus displacement data for each specimen is seen in Figures 25 through 34. Images of the typical failure mode of the beams are seen in Figures 35 through 39.

Of particular interest was the low failure of samples cut from the sister crossarm of 735, with the same transverse fracture pattern noted. In the case of sample 735C, the breaking load was substantially lower than the average.

STATISTICAL ANALYSIS

In order to determine whether the existing crossarm assemblies in the system can withstand the design vertical loads, a reliability analysis was carried out based on the flexural and full-scale vertical load test. It was assumed that

- The section subject to maximum bending stress is the connection of the high side pole to the crossarm
- The maximum bending arm (connection to the high side phase) is 6.5 feet
- The specimen samples are representative to the crossarm population of the line

Based on the flexural test results, the vertical load carrying capacity at the crossarm high side phase was calculated as below, and is summarized in Table 4:

- Vertical load (single arm) = bending strength (MOR) x Section Modulus / bending arm

Where:

- Section modulus = depth of beam ^{2} x width of beam /6 = 7.75^2 x 3.75 /6 = 37.54 in^3
- Length of bending arm = 6.5 ft = 78 inches

Table 4: Estimate of vertical load carrying capacity at high side connection

MOR (psi)	Single arm (Lbs)	Double arms (Lbs)
3,619	1742	3483
4,580	2204	4409
3,529	1699	3397
6,157	2963	5926
3,290	1583	3167
3,787	1823	3645
3,348	1611	3222
4,034	1941	3883
1,499	721	1443
3,596	1731	3461

It can be seen from Table 4 that the remaining capacity ranges from 1,443 lbs to 5,926 lbs, with a mean of 3,604 lbs and a standard deviation of 1,116 Lbs. To get the statistical significance of the loads estimated above, a Weibull analysis was performed using Weibull ++8, developed by ReliaSoft. The data shown in Table 4 combined with the full-scale load test results were fitted using two parameter Weibull distributions, and plotted as shown in Figure 39. The lack of data points was taken care of by the lower bound and upper bound also plotted with a 90% confidence level. The curves provide a probabilistic description of the remaining load carrying capacity of the crossarm assemblies. It can be used to estimate the probability of remaining capacity being exceeded by a given vertical load with lower and upper bounds and a confidence level.

Table 5 gives an example of the probabilities calculated for the given design vertical loads. It should be noted that the probabilities cannot be used to compare the actual probability of failure the line has experienced. To predict probability of crossarm failure, a structural reliability analysis need to be performed in which both uncertainties involved in material properties and weather loads are taken into account, as well as differing failure modes. The procedure and methodology are detailed in the two CEATI reports [1, 2] Powertech has prepared.

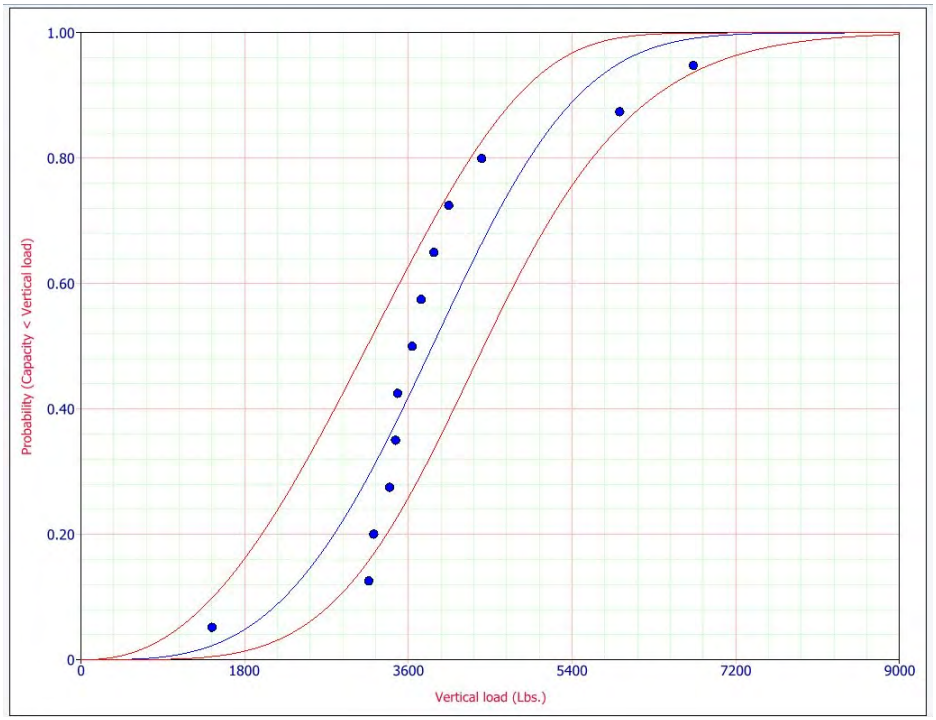

Figure 39: Probability description of load carrying capacity at high side connection including lower and upper bound with 90% confidence level

Table 5: Probability of not meeting design vertical loads (90% confidence level)

Design vertical load (Lbs)	Probability of not meeting a given design vertical load		
	Upper bound	Lower bound	Average
1,260 (Standard span, CSA ML)	7.2%	0.28%	1.43%
2,000 (Long span, CSA ML)	20.3%	2.2%	6.9%
2,920 (Standard span, 50 mm hoar frost)	43.7%	11.4%	23.2%
3,860 (Long span, 50 mm hoar frost)	69.7%	33.0%	49.9%

It can be seen from Table 5 that due to the lack of sample size, the gap between lower bound and upper bound is quite large. For example, the probability of vertical load carrying capacity not meeting 2,000 Lbs could range from 2.2% to 20.3% with average of 6.9%. For conservative purpose one could use the upper bound for the worst case scenario if needed. In this approach, it can be seen that the existing double wood crossarm system has a high probability of not meeting the design vertical loads formulated for the transmission line (7.2%, 20.3%, 43.7% and 69.7% for four load cases respectively, with 90% confidence level).

CONCLUSIONS AND RECOMMENDATIONS

From the evaluation and test results, the following conclusions and recommendations are made:

- The overall condition of the crossarms can be considered fair. No rot or insect damage is present, and although the crossarms do contain sporadic large knots and sloping grain, these features are within the allowable provisions of structural lumber grades common from crossarm use

- Significant cracking evident on two pairs of as received crossarms indicates that in-service failures did happen on the 138 kV line

- In general the crossarm assembly performs well during the full-scale vertical and longitudinal load tests. The vertical loads achieved agree with the prediction based on the flexural test results. No anomalies were found on the connections and hardware. One of the three vertical loads obtained from full-scale tests was 3,743 lbs, which does not meet the design load of 3,860 lbs.

- The low full scale test result was a result of the failure initiating through a shallow check at the connection point, rather than the theoretical assumed failure of fibers on the tension side of the maximum bending stress.

- Based on test results and analysis, the remaining vertical load carrying capacity of the crossarm assembly is not adequate to withstand the 50 mm hoar frost, even on a standard span

- Allowing for the worst case scenario (upper bound), the existing double wood crossarm system has a high probability of not meeting the vertical design loads of the modern standard

- The longitudinal load carrying capacity is adequate

- Given the high probability of not meeting design vertical loads and the age of the crossarms (close to 50 year old) as well as evidence of failure in service, it is recommended that the replacement of these crossarms should be initiated to mitigate the risk of failure in service, with replacement prioritized as follows:

  - Long spans should be given priority for replacement over short spans
  - Crossing structures should be given priority over non-crossing structures
  - For all spans, those structures in which knots and checks are noted around connection points should be given priority over structures in which these features are not seen

Attention: Mr. Ed Peake, Manager, Electrical Operations

Dear Mr. Peake

Re: Condition Assessment and Evaluation of 138 kV Wood Cross Arms

SUMMARY

Wood crossarms utilized in single crossarm H-frame structures from an existing 138 kV transmission line were supplied by Yukon Energy Corporation for full scale mechanical testing and flexural testing. The crossarms of the transmission line are scheduled to be replaced by steel crossarms, the testing was undertaken to assess the existing structural integrity of the crossarms and their serviceability with respect to updated design criteria for the line, and gauge the immediacy of the replacement program. Four (4) vertical load scenarios were identified in the design, based on span and hoar frost loading, increasing in load severity.

The full scale test portion entailed testing the existing crossarms to each level, and then to failure to determine the ultimate load carrying capacity of the crossarms. In the test, a dead load at each design criteria level was applied to one end phase, with the opposite end phase then loaded to that level. The middle phase connection point was left unloaded, as this represented the worst case scenario in service; all three phases loaded, with the center phase dropping out, leading to maximum bending stress in the beam. None of the 4 crossarms tested reached the final design load criteria, 1 failed below the second criteria, two below the third level and one just before the final design load criteria.

The flexural testing of the crossarms provided the material properties of the wood, from which the load carrying capacity at the crossarm end phase was calculated and a reliability analysis carried out to develop a probabilistic description (Weibull curve) of both the factored and unfactored loads.

Based on the test results, it can be stated that the existing single wood crossarms do not meet the updated design criteria for the line. The design criteria itself takes into account load factors in combination with worst case climate load scenarios. From the reliabilities obtained against the unfactored design load, it is seen that the probability of any immediate failures of existing crossarms is low. However, it is recommended that the replacement program of steel crossarms should begin as soon as operational practicability dictates. The replacement program can be guided as follows:

- Long spans should be given priority for replacement over short spans
- Crossing structures should be given priority over non-crossing structures
- For all spans, those structures in which knots and checks are noted around connection points should be given priority over structures in which these features are not seen

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

INTRODUCTION

The 138 kV L170 transmission line operated by Yukon Energy Corporation currently consists of single wood crossarms on wood poles in a typical H-frame construction. A replacement program is being considered for the transmission line, in which the existing wood crossarms will be replaced by steel crossarms. As part of the replacement program, the criteria and design load requirements for the transmission line have been updated to current CSA standards. Powertech Labs Inc was contracted to conduct mechanical and material property testing on representative samples of the existing crossarms, to determine their serviceability with regards to the new design criteria, and gauge the immediacy of need for replacement. The testing consisted of full scale testing of the crossarms on a mockup of the H-frame structure, as well as flexural testing to determine the modulus of rupture (bending strength), modulus of elasticity and maximum fiber shear strength of the wood members.

DESIGN DOCUMENTATION

The design documentation for the 138 kV H-frame structures was provided by Yukon Energy, and is available as an appendix to the report. The full scale test program was based on the 4 vertical design loadings indicated in the document, consisting of the following load scenarios ranked in load severity:

1. Standard span, CSA medium loading 250m = 1,260 lbs
2. Long span, CSA medium loading 395m = 2,000 lbs
3. Standard span, 50 mm hoar frost 340m = 2,920 lbs
4. Long span, 50 mm hoar frost 450m = 3,860 lbs

The longitudinal load carrying capacity of the crossarms was also included in the test program, consisting of the conductor tie down load and was considered to be 400 lbs in which a 2.0 load factor is included

VISUAL INSPECTION

Upon receipt, the cross arms were visually inspected to assess the current condition, with the following observations noted:

- The crossarms were structurally sound, with no major mechanical damage or rot noted, including around the connection point through holes
- The crossarms are predominantly straight, with little bow or warpage
- Incising marks are seen along the length of the wood, indicative of a pressure treatment, likely PENTA
- The crossarms contain very few knots, knots that do exist are relatively small and tight; as such the lumber is considered to be of a good grade, likely 1 common if applying current softwood dimensional lumber grades
- Checks (cracks along the woods grain pattern, but not passing through the entire thickness) are seen sporadically in the crossarms

Based on the observations noted, the current overall condition of the wood crossarms is considered to be good; the crossarms are structurally sound and of good grade. Examples of the features noted in the inspection are seen in Figures 1 and 2.

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Figure 1: Overall view of crossarm from structure 128. Crossarm is sound, with very few knots along length. Knots that are present are relatively small and tight

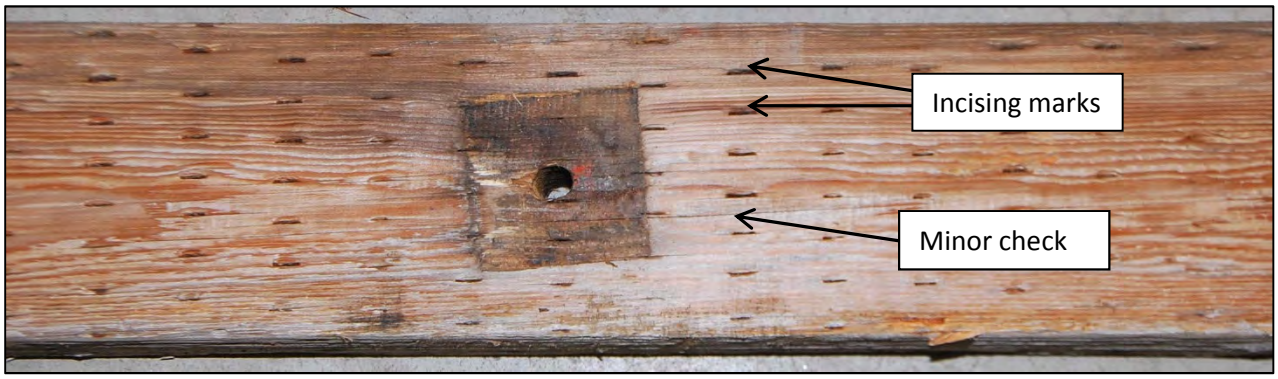

Figure 2: Macro view of crossarm from structure 141 around wood pole connection point. Note regular incising marks indicative of pressure treatment. No rot noted around through holes, some minor checks

FULL SCALE MECHANICAL TEST SETUP

A test frame was built in the mechanical lab at Powertech Labs in accordance with Yukon Energy's 138 kV H-frame design specifications. Two 12" x 12" x 0.5" steel I-beams were used to support the crossarm samples with spacing of 16 ft between the two columns. One of the two steel columns (south side) was anchored using an existing anchor pad and another column (north side) was anchored using an anchor system specially built for anchoring the column (Figure 3). The anchoring system was comprised of two 12" x 12" x 0.5" I-beams connected to other anchor pads for longitudinal and transverse constraints. Three concrete blocks each weighing 4300 lbs (20 kN) were placed on the anchoring system to provide vertical restraint to the north column.

To represent the actual connection between crossarms and wood poles, a wood pole was selected from BC Hydro's pole yard and sectioned to a semi-elliptical cross section. The sectioned wood column was placed and fastened between the two flanges of the I-beam so that a wood to wood connection existed as per actual installation practices. The connection interface for the testing is seen schematically in Figure 4.

Standard ¾" diameter Hubbell cold weather crossarm bolts and large flat plate washers were used to fasten the crossarms to the test columns. Standard ¾" eyebolts were used as the phase connection hardware, with a large flat washer plate placed on the topside of the crossarm. The connection hardware used is seen in Figures 5 and 6.

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

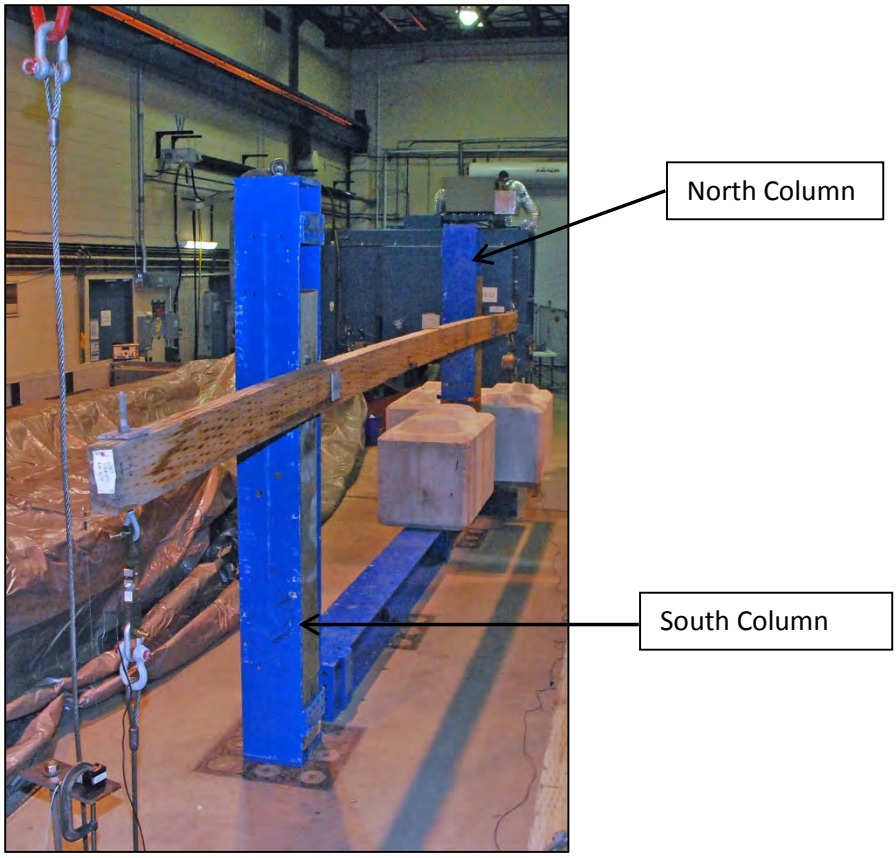

Figure 3: Test setup for full scale mechanical test of wood crossarms

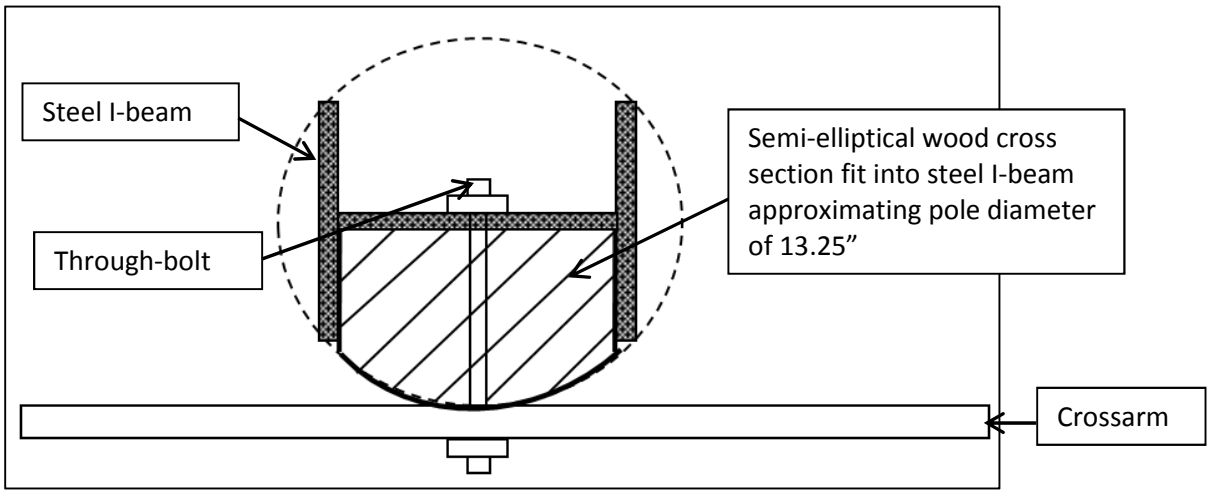

Figure 4: Schematic representation of connection interface for testing

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

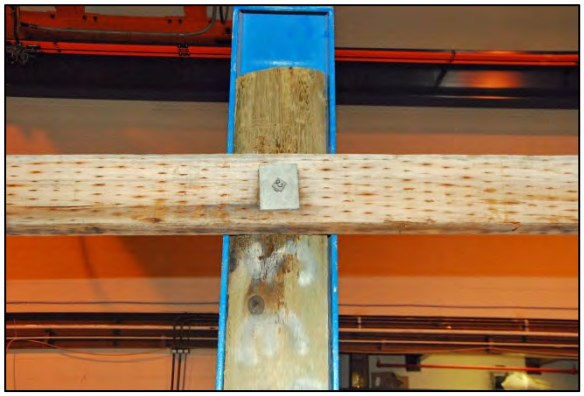

Figure 5: Single ¾" diameter crossarm bolt and flat washer used to connect crossarm

Figure 6: ¾" eyebolt and flat washer used as phase connection

The typical setup for the vertical load tests is shown schematically in Figure 7. The vertical load was applied to the south end using a 10-ton overhead crane through a pulley attached to an anchor pad. A dead load was applied to the north end to simulate the worst-case scenario for the line (i.e. all phases under equal load, center phase drops out leading to maximum bending stress at H-frame connection points). The dead load at the north end was applied via a chain hoist and load cell, seen in Figure 8. A load cell was placed in line with the overhead crane on the south end, and a displacement transducer attached to the cross arm. The load and displacement were subsequently data logged with a Soltec high speed data acquisition system. The setup at the south end is seen in Figure 9.

Each load scenario was treated independently, with the loads applied in the following manner:

- Apply dead load of 1,260 lbs to north end, apply load up to 1,260 lbs at south end, record observations, unload
- Apply load of 2,000 lbs to north end, apply load up to 2,000 lbs at south end, record observations, unload
- Apply load of 2,920 lbs to north end, apply load up to 2,920 lbs at south end, record observations, unload
- Apply load of 3,840 lbs to north end, apply load up to 3,840 lbs at south end, record observations
- Continue applying load to south end until failure

For the longitudinal test, the load was applied to the south end using the overhead crane and pulley attached to a short beam anchored to the ground opposite of the application point. No dead load was applied to the north end for the longitudinal test.

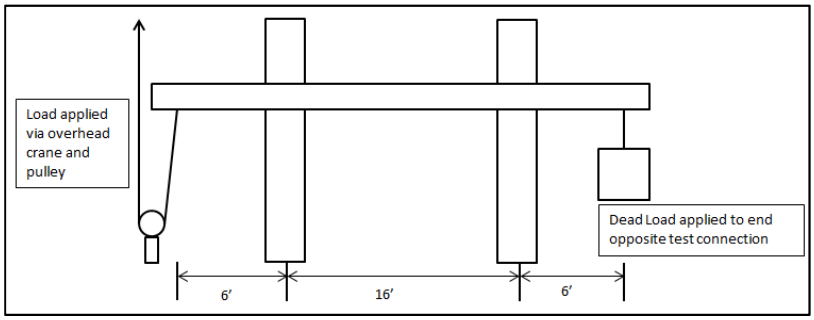

Figure 7: Schematic representation of full scale load test

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Figure 8: Chain hoist and load cell for application of dead load at north end

Figure 9: Load cell, displacement transducer and pulley for application of live load at south end

FULL SCALE MECHANICAL TEST RESULTS

The vertical load carrying capacity of the crossarms is seen summarized in Table 1. Detailed deflection data and observations for each test iteration for all crossarms samples are compiled in Table 2. None of the tested samples achieved the final load severity (3,840 Lbs) of the design criteria.

All samples reached the first design load criteria of 1,260 lbs. At this load no apparent damage or cracking of wood fiber was noted. At the second design load criteria of 2,000 lbs 3 of the 4 samples showed cracking of fiber and opening of existing checks along their length.

Crossarm 128 failed to meet the second load criteria of 2,000 lbs, fracturing at 1,429 lbs. Failure occurred as existing checks opened up and propagated between knots present within the crossarm. The failure of this crossarm at a relatively low load illustrates the effects of the knots to the structural integrity of the beam. Several knots were present on the tension side of the bend in the high stress area around the connection point; the orientation and presence of these knots is the reason for low failure.

Crossarms 142and 624 failed during the attempted application of the third design load criteria.

Crossarm 142 failed during the application of the dead load at the north end, with the south end completely unloaded. The failure occurred spanning several knots on the tension side, again illustrating the effect of knots within the wood grain structure.

Crossarm 624 achieved the highest vertical load carrying capacity, failing just short of the final design load criteria. No knots were present in the immediate area of failure; failure initiated from the through hole connection point.

Load versus displacement data for the final load to failure tests for each crossarm are seen in Figures 10 through 13. Images of the bending deflection, failure modes and features noted during the vertical testing are seen in Figures 15 through 23.

The longitudinal test of structure 140 was stopped at 1,200lbs, 3 times the design load criteria of the longitudinal load carrying capacity. The test was not carried through to ultimate failure as the load was already 3 times the design load, which itself has a safety factor of 2.0. The load versus displacement data for the longitudinal test is seen graphically in Figure 14, with the bending deflection achieved seen in Figure 24.

Table 1: Summary of Ultimate Load Carrying Capacity of Crossarms

Structure ID	Ultimate Vertical Load Achieved (lbs)	Constant Load at North End (lbs)	Deflection at Load (mm)
620	3,442	3,860	264
128	1,429	2,000	91
624	2,450	2,920	163
142	2400	2,400	118

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

Table 2: Deflection Data and Observations for All Vertical Load Scenarios

Test ID	Structure #	Load Scenario	Dead Load (North End)	Applied Load (South End)	Deflection at Applied load	Observations
1	620	1	1,260	1,260	104	Minor creaking of wood, no apparent damage
2		2	2,000	2,000	153	Existing checks opening up along crossarm length
3		3	2,920	2,920	210	Additional opening and lengthening of checks along crossarm length
4		4	3,860	3,442	264	Fracture of wood grain at connection point
5	128	1	1,260	1,260	60	Existing checks opening along length
6		2	2,000	1,429	91	Checks present under knot in high stress area adjacent to connection point fractures
7	624	1	1,260	1,260	68	Minor creaking of wood
8		2	2,000	2,000	110	Continuation of creaking, no checks in immediate area of connection point
9		3	2,920	2,450	163	Sudden failure initiating from connection point
10	142	1	1,260	1,260	53	Minor creaking of wood
11		2	2,000	2,000	118	Existing checks opening along crossarm length
12		3	2,400	---	N/A	Sudden failure initiating from knot in high stress area adjacent to connection point

FLEXURAL TEST

The objective of the flexural test was to determine the material properties of the wood crossarms: modulus of rupture (bending strength), modulus of elasticity, and maximum shear stress. Two-point loading tests were conducted using Powertech's Tinius-Olsen test machine as shown in 25. A displacement transducer was attached to the intersection of the beam center and natural axis. Eight specimens with full size cross sections and a span of 2.7m were cut from the crossarms. The specimens were cut such that the connection point to the wood poles was centered between the loading noses, the area of highest bending stress.

Figure 25: Two-point flexural loading test setup for flexural testing

This report shall not be reproduced except in full, without the written approval of Powertech Labs Inc.

It was observed that for all tests, that the failure initiated at either existing checks or knots located on the tension side, or the connection hole, and in between loading points, where the beam is subject to maximum bending stress. Based on deflection measured and maximum break load, the MOE, MOR and shear stress were calculated and summarized in Table 3. Images of the typical failure mode of the beams are seen in Figures 26 and 27, with the load versus displacement data for each specimen seen in Figures 28 through 35.

Table 3: Flexural Test Results

Specimen ID	Defl. at 10,000 lbs	Modulus of Elasticity (MOE)		Breaking Load		Modulus of Rupture (MOR)		Max Shear Stress

STATISTICAL ANALYSIS

Based on the flexural test results, the load carrying capacity at the crossarm end phase was calculated. A reliability analysis was then carried out to develop a probabilistic description (Weibull curve, Figure 36) of the load carrying capacity. Based on the curve, the probability of the load carrying capacity exceeding the specified design loads were quantified and provided in Table 4.

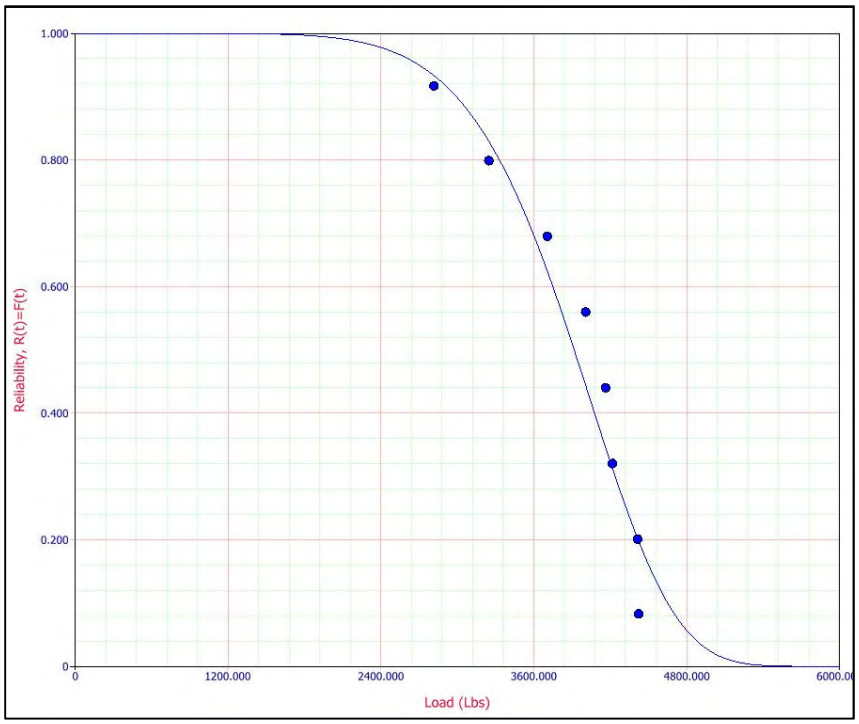

Figure 36: Reliability curve of the load carrying capacity at end phase

Table 4: Reliability for each of the design load cases (95% confidence level)

Factored Design load (Lbs)	Reliability of the load carrying capacity exceeding factored design loads	Unfactored Design load (Lbs).*	Reliability of the load carrying capacity exceeding unfactored design load
1,260	96%	630	99%
2,000	86%	1000	98%
2,920	63%	1460	94%
3,860	25%	1930	87%

*vertical load factor of 2.0 is used

CONCLUSIONS AND RECOMMENDATIONS

The wood crossarms are considered to be in good condition; however checks and knots within the beams, and their random proximity to the high stress areas could significantly reduce the load carrying capacity, as demonstrated by the test results.

Based on the test results and the reliability analysis, it can be seen that the existing single wood crossarms of the H-frame structures have a high probability of not meeting the updated design load criteria formulated for the transmission line (4%, 14%, 37% and 75% for four load cases respectively, with 95% confidence level).

The design loads themselves incorporate load factors, and are worst case scenarios; from the reliabilities obtained against the unfactored design load, it is seen that the probability of any immediate failures of existing crossarms is low. However, it is recommended that the replacement of these crossarms should be initiated, in order for the line to meet the new design criteria. The replacement program can proceed along operational convenience, with the following considerations:

- Long spans should be given priority for replacement over short spans
- Crossing structures should be given priority over non-crossing structures
- For all spans, those structures in which knots and checks are noted around connection points should be given priority over structures in which these features are not seen

ISSUE: **Transmission Line Refurbishment – L178 Project**

QUOTE: "Outages on the L178 currently trip at S164 (Takhini Substation) and can result in an outage on the Takhini-Carmacks L170 transmission line. Failure to complete this element of the refurbishment project would increase the risk of component failure on L178 resulting in a split in the North-South grid and significant thermal generation costs in the northern gird to maintain supply to all customers."

"The $1.3 million budget will cover the work done in 2021, which is only a portion of the full L178 transmission line refurbishment forecast to cost $8.3 million (costs to be brought into rate base each year as each year's work is completed)."

QUESTION:

a) Please provide the number and duration of outages on transmission line L178 experienced in the last 10 years, on a per annum basis, and the costs incurred due to these outages.

b) Please explain when YEC expects this project to be completed.

c) What is the expected annual frequency and duration of outages due to component failure on L178 if this project is not completed? What costs would YEC continue to incur if the project is not completed? Given the expected frequency and duration, please estimate the additional annual costs resulting from the need for additional thermal generation due to those outages.

ANSWER:

(a)

The number and duration of outages on transmission line L178 experienced in the last 10 years are summarized in Table 1 below.

Table 1: Number and Duration of Outages – 2011 to 2020

Year	Unplanned Outages	Planned Outages	Total Outages	Outage Hours
2011	2	0	2	18.31
2012	2	0	2	1.49
2013	1	0	1	0.19
2014	3	8	11	17.25
2015	4	3	7	5.66
2016	5	5	10	8.5
2017	6	14	20	32.05
2018	6	2	8	69.42
2019	6	0	6	70.15
2020	10	4	14	78.14

The total costs incurred from 2014-2020 due to outages on L178 is $1,213,581 ($782,723 O&M and $430,858 capital). The average annual cost over the period is $173,368. Cost estimate amounts are available for the period from Jan 2014-Dec 2020.[1]

(b)

Not known at this time; remaining works will be allocated to future fiscal periods as resources and priorities warrant.

(c)

There is an expected annual outage frequency due to component failure of 2 – 5 failures per year increasing with the age of the line. Outage duration can be anywhere from 1 day to a week or more depending heavily on access. Access is much more of an issue in an unplanned event.

Unplanned repairs cost substantially more. A helicopter charge of $3500 – $7000 is typical on L178 just to locate the failure that caused the outage. In a planned scenario crews are on site with materials and civil work complete.

Diesel costs during summer conditions to run the town of Faro are approximately $300/hour. It usually takes at least 24 hours to respond and complete a repair on a simple

[1] New financial software implemented in late 2013.

failure with reasonably good access. A difficult repair with challenging access could take up to a week or more. Consequently, diesel cost per event would likely be in the range of $7,200-$36,000.

On planned maintenance projects Civil & Mob costs would normally be divided over many structures. In an unplanned failure, Civil & Mob costs for a challenging repair can easily be $25,000 - $40,000 or more for a single structure. The type of failure could be a broken cross arm or structure. A failure in easily accessed locations would have a civil cost usually of $10,000 or less.

Labour and Equipment and Travel cost for the onsite structure repair are about $16,500 for a 12 hour work day during the regular work week. 1 – 2 days of full crew for onsite and preparation/monitoring

In summary, an unplanned repair estimated cost per event can be from $35,000 to $110,000. With historical 2-5 failures on this line, the costs may range between $70,000 to $550,000 annually. It is noted that the line is aging and the repair costs continue to increase, and YEC expects higher failure rates if the identified issues are not addressed. L178 is geographically located in difficult terrain that provides challenging access to the structures. Depending on the location of the problem, costs and repair durations can escalate quickly.

It is also noted that L178 line protection is not as secure or advanced as the other lines mostly due to the lack of a breaker at Carmacks where the line splits. This protection scheme under certain conditions results in faults on L178 impacting the whole system by splitting the grid at Takhini and Minto substations. This results in significantly more customer outages and longer restoration durations.

A challenging repair in winter would leave a substantial amount of generation unavailable to support grid requirements.

REFERENCE: **Application, Tab 5.2.1.7, page 5-16**

ISSUE: **Breaker Replacement Program Project**

QUOTE: "The project involves replacement of twelve aging circuit breakers in various substations throughout the Yukon, including the replacement of five 34.5 kV Medium Voltage (MV) and five 138 kW High Voltage (HV) breakers. Many of the breakers are 40 years old, replacement parts are not available and any damage to aging components could result in lengthy outages to implement repairs or eventual replacement of a breaker, impacting system reliability. Restricted operation of some breakers and non-routine maintenance are becoming increasingly frequent."

"Replacement of 7 high voltage (138kV) breakers in YEC substations at Aishihik Faro, Riverside and Takhini: this was initiated in 2018 and was to be completed in 2019. The high voltage breaker replacement program was completed in 2019 with a total cost of $2.26 million." (footnote removed)

QUESTION:

a) Please explain how often YEC tested the breakers involved in this project to assess their reliability in the past 40 years and how often maintenance work was required. If possible, please provide the number of times maintenance was conducted on these breakers in the last 10 years, on a per annum basis, and the cost of this maintenance work.

b) YEC stated that five HV breakers were being replaced in one instance of its application and that seven HV breakers were being replaced in another instance. Please confirm the correct number of HV breakers being replaced in this project.

ANSWER:

(a)

Testing frequency of breakers is every 5 years. Costs for the testing are largely labour with a small material component. YEC tests on average 5 breaker per year at a cost of $5000 per breaker, total cost $25,000.

It should be noted that these breakers were 40 years old, spare parts were not available, and any failure of aging components may have led to lengthy outages to repair.

(b)

Seven breakers were replaced in this project.

REFERENCE: **Application, Tab 5.2.1.8, pages 5-17 to 5-18**

ISSUE: **Replacement of the P125 Head Gate Project**

QUOTE: "The P125 Hydro Plant originally commissioned in 1958 … The headgates at the P125 plant are located above the plant at the water intake structure … To date, the headgates have never been overhauled."

"An external engineering firm (SNC Lavalin) performed tests and structural assessments of the P125 headgates in 2019 that indicate that the headgates can no longer be relied upon for emergency closure or for single device isolation. The gates were tested, in a controlled situation, to determine if they would close during emergency conditions and two out of the three gates did not close. This failure could result in a unit runaway / over-speed that could potentially cause severe damage to the unit as well as the plant."

"The scope of the project includes the removal of existing headgates, design and installation of new headgates and control systems, and refurbishment of the headgate hoist mechanism. YEC tendered and proceeded with work on the WH2 headgate in 2020 … It is expected that the WH2 headgate will be completed in 2020 at a forecast cost of $2.3 million."

"… is assessing team capacity to complete replacement and refurbishment of the gates and related infrastructure for units WH1 and WH3 in 2021 … and that the WH1 and WH3 headgates will be completed in 2021 at a forecast cost of $3.5 million."

QUESTION:

a) Please explain how often YEC tested out the headgates at the P125 Hydro Plant in the past to assess their reliability and how often maintenance work was required. If possible, please provide the number of times maintenance was conducted on the headgates in the last 10 years, on a per annum basis, and the cost of this maintenance work.

b) Please provide the tests, structural assessments and any other studies conducted to show that the headgates could no longer be relied upon.

c) Please provide and explain the studies conducted to mitigate the concerns brought on by the existing headgates. For example, how was the design of new headgates and control systems carried out, and how was the preferred solution reached? Please describe the results of the assessment in which it was determined that work on the WH2 headgate needed to be carried out before work on the WH1 and WH3 headgates.

d) Please indicate whether work for the WH2 headgate was completed in 2020. Did YEC staff complete this portion of the project, or was an external consultant required? If an external consultant was required, please provide details on the selection process of the contractor and how costs were awarded.

e) Please provide an update on the work currently completed for the WH1 and WH3 headgates. For example, what objectives have been met so far, and is YEC expecting this portion of the project to be completed by 2021? Additionally, will YEC complete this portion of the project, or will an external consultant be required?

ANSWER:

(a)

The head gates are used annually during the hydro planned maintenance. There is annual maintenance on the hoist motors (grease/oil) and regular pulley inspections. Cost for this maintenance is less than $5,000.

(b)

Please see Attachment 1 and Attachment 2 to this response which provides reports from SNC regarding the inspection and assessment of the P125 Headgates.

(c)

Studies determined that the P125 Headgates are not certifiable for Single Device Isolation. Tests determined the headgates could not close fully in an emergency. Additional

concerns were the reliability of the hoist and controls. The new gates, hoist controls and refurbished hoist addressed each of these concerns. WH2 was selected to be done first because of the upcoming WH2 Uprate and the need for reliable means of isolation.

The P125 Headgate Assessment report is provided Attachment 1 to YUB-YEC-1-56(b). The inspection report from SNC regarding the inspection and assessment of the P125 Headgates is provided as Attachment 2 of YUB-YEC-1-56(b).

(d)

The WH2 Headgate Project was completed in 2020. The work was carried out by a prime contractor selected through an RFP process.

The RFP was issued and posted publicly through MERX. Two bids were received and were evaluated. A best value approach was taken with points awarded based on the following criteria: technical, cost and FN content. The Proponent with the highest total score was recommended.

(e)

YEC will complete the preliminary design and tendering of the WH1 and WH3 headgate in 2021 for project completion in 2022. YEC will engage an engineering firm for assistance with this process.

1.0 INTRODUCTION

1.1 General

Yukon Energy Corporation's (YEC) P125 hydroelectric generating station was constructed in 1958 on the Yukon River in Whitehorse, Yukon Territory. The original plant included two double-regulated Kaplan turbine-generators (WH1 and WH2) each with a capacity of 5.8 MW. The powerhouse was extended in 1969 to add a third 8.4 MW propeller type unit (WH3). The power intakes for the three units are located at the end of a 600 m long approach channel located on the left side of the dam and spillway. Three penstocks connect the power intakes to the powerhouse.

The intake structure includes stoplogs and emergency closing headgates for each unit. One set of stoplogs is available to isolate any one of the three units. Each unit has an emergency closing headgate and dedicated wire-rope hoist. Headgates for units WH1 and WH2 were installed in 1958 with the original construction, while the third intake was left otherwise blocked. The third headgate (for unit WH3) was added in 1969 along with the addition of the third turbine-generator unit. Since their original installation it is understood that the headgates have not undergone any major maintenance or repair works. The headgates are intended to provide isolation for safe work downstream, and to close against flow in case of emergency.

Photograph 1 - WH1 Headgate Inspection Position

The WH2 turbine-generator unit is to be refurbished and "uprated" in year 2021. As part of its mandate as Owner's Engineer for the WH2 Uprate Project, SNC-Lavalin Inc. (SLI) was asked to review the condition of balance-of-plant equipment related to the WH2 unit and define the scope for required upgrades. This work identified that a detailed assessment of the headgates was required. The three intakes are identical apart from age and minor design differences of the WH3 headgate. As such, the scope for headgate assessment was extended to include the WH1 and WH3 intake headgates.

Inspections of the three headgates were completed by SLI and YEC in May and June 2019. Following the inspections, SLI analysed stresses in the headgates with consideration of the as-found conditions of each gate. This technical report documents the results of the inspections and analysis and makes recommendations based on the findings.

1.2 Purpose

The objective of the assessment is to verify if the P125 headgates and hoists are fit for purpose in their current condition, and to define the scope of work required to either refurbish and/or replace equipment as necessary. Where appropriate, the assessment considers the estimated costs for both refurbishment and replacement options.

1.3 Key Parameters

WH1 / WH2 Headgates:	
Design/Manufacture	Dominion Bridge
Gate type	Fixed-Wheel Vertical Lift
Year of manufacture	1958
Fabrication method	Riveted
Height – Clear opening	4.11 m
Height – To lintel seal	4.15 m
Width – Clear opening	3.81 m
Width – Seal to seal	3.94 m
Width – Wheel to wheel	4.18 m
Elevation of sill	641.91 m
Original design maximum head	10.67 m
Normal operating maximum head*	11.19 m
Material	ASTM A36
Gate mass (including concrete ballast)	8050 kg

WH1 / WH2 Headgate Hoists:	
Design/Manufacture	Dominion Bridge
Hoist type	Wire-rope
Capacity	12700 kg
Hoisting speed	2.1 m/min
Lowering speed	3.4 m/min
Power supply	550 V / 3 ph. / 60 Hz
Rated motor capacity	5.6 kW
Control panel voltage	125 VDC

* Units are routinely operated at heads that exceed the original design values.

WH3 Headgate:	
Design/Manufacture	Dominion Bridge
Gate type	Fixed-Wheel Vertical Lift
Year of manufacture	1969
Fabrication method	Welded
Height – Clear opening	4.11 m
Height – To lintel seal	4.15 m
Width – Clear opening	3.81 m
Width – Seal to seal	3.96 m
Width – Wheel to wheel	4.18 m
Elevation of sill	641.91 m
Original design maximum head	10.67 m
Normal operating maximum head*	11.19 m
Material	ASTM A36
Gate mass (including concrete ballast)	8050 kg
WH3 Headgate Hoist:	
Design/Manufacture	Dominion Bridge
Hoist type	Wire-rope
Capacity	13600 kg
Hoisting speed	1.2 m/min
Lowering speed	3.0 m/min

Power supply	550 V / 3 ph. / 60 Hz
Rated motor capacity	3.7 kW
Control panel voltage	115 VAC

* Unit is routinely operated at heads that exceed the original design values.

2.0 METHODOLOGY

The following sections describe the methods used in the various aspects of the headgate assessment.

2.1 Condition Assessment

Inspections of all three headgates were completed in May and June of 2019. The headgates were raised to their highest position possible using their wire rope hoists. Gate inspections included:

- Cleaning of headgates
- Visual inspection of gate structural steel and connections
- Dimensional measurements
- Corrosion pitting measurements
- Visual inspection and measurement of rivet condition

- Visual inspection of one-wheel bushing condition (WH2 gate only)
- Ultrasonic thickness measurements
- Magnetic particle inspections

Gate guides were inspected by YEC using a remote operated vehicle, with video recording.

The headgate hoists were visually inspected and observed during operation.

Notes, photographs, and measurement results from the inspections were recorded and documented in memoranda.

2.2 Gate Stress Analysis

Calculations were prepared to estimate the normal stress in the structural elements of the headgates in their current condition. The calculations consider the measured thickness of structural elements and ultrasonic checks were completed during the inspections. A reservoir level of 653.1 m is assumed in the analysis based on the maximum normal operating range observed at P125. At this stage, the analysis does not consider seismic or flood conditions, as it is only preliminary. A more detailed analysis should be done at the next stage.

The analysis was performed using the allowable stress method, with the allowable tensile stress defined as 60% of yield strength and the allowable shear stress defined as 2/3 of the allowable tensile stress. These limits are within the normal range of allowable stresses used in the industry, as summarized in the following table.

Standard	Allowable Tensile Stress
P.F. Erbisti, Design of Hydraulic Gates (2014)	68% S_y
ASME Boiler and Pressure Vessel Code	67% S_y
CAN/CSA S16	60% S_y
DIN 19704-1976	60% S_y
BC Hydro Design Standard H2124/H2676	54% S_y
US Army Corps of Engineers EM 1110-2-2105	50% S_y

S_y = Yield strength

Where possible, the allowable stress was defined based on material test results. For WH1 and WH2 this was done based on a coupon sample tested in 2010. Material test data was not available for the WH3 headgate so a minimum yield strength based on the ASTM standard (A36) was assumed.

Calculations included:

- Bending stress, shear stress and deflection in horizontal girders according to methods of Erbisti (2014)
- Skinplate stress according to DIN 19704 – 1976

- Vertical end-girder bending and shear stress approximated as a simply supported beam
- Wheel contact stresses according to Erbisti (2014)
- Wheel axle shear stress assuming simple support
- Wheel bushing stress according to Erbisti (2014)

Stress in the skinplate was calculated with plate thickness determined by the UT measurements and also with consideration of reduced thickness due to area-averaged pitting corrosion depth.

2.3 Hoist Analysis

Calculations were prepared to check the adequacy of the hoist capacity and to verify the wire rope loads are acceptable. The estimate of hoist loads included the calculation of buoyancy, wheel friction, seal friction, and hydraulic downpull. Wheel friction and seal friction calculations were based on the methods presented in Erbisti (2014).

The hydraulic downpull was approximated based on a simplified method presented in Erbisti (2014) wherein a downpull factor (k) is multiplied by the product of the gate cross-sectional area and the hydrostatic pressure on the gate. The k-factor was assumed at 0.2 based on a review of gate lip designs and model test data presented by Erbisti.

The capacity of the wire rope was checked against the required hoisting loads. The wire rope strength was taken from the Machinery's Handbook according to the rope type specified on the hoist assembly drawings.

3.0 RESULTS

3.1 Condition Assessment Results

The results of the headgate inspections were presented in memoranda (see Section 1.4 herein). In summary, the WH1 and WH2 headgates were found to have significant corrosion on the skinplate (primarily the upstream side), the webs of horizontal girders, and somewhat less corrosion on vertical end-girders. Although the thickness of the skinplate was found to be greater than as shown in the drawings, corrosion pitting on the skinplate was measured to depths exceeding 4 mm. The heads of rivets were found to have varying levels of corrosion, with some rivet heads in good condition and others heavily corroded. The shaft of rivets inspected were found to have no corrosion. Wheels and wheel bushings were found to be in good condition. The dimensions of the gate were found to match the design drawings, with the exception of the skinplate thickness. Magnetic particle inspections did not identify any cracks in the areas inspected, including rivet hole locations, drainage holes in horizontal girder webs, wheel axle holes in vertical end-girders, and in the inspected wheel bushing pin.

In comparison, the WH3 headgate was found to be in much better condition. The extent of inspection was limited to the top section of the gate, as a result of the limit switches on the hoist limiting travel. However, from inspection of the top section it was found that there was much less corrosion than the WH1 and WH2 headgates. Again, the skinplate thickness was found to exceed what is shown on the design drawings. Welds, to the

extent that they could be visually inspected, appeared to be in good condition. Wheels appeared in good condition although were found to not turn as easily as those on the other headgates. Measured dimensions were found to match the design drawings, with the exception of the skinplate thickness. Magnetic particle inspections did not find any cracks in the areas inspected.

The gate guides of WH2 appeared from the ROV videos to be in good condition. Some roughness due to corrosion appears to be present, although it is difficult to quantify from the video. The condition of guides on WH1 and WH3 could not be clearly ascertained from the videos, but they are expected to be in similar condition.

The wire ropes of all three gate hoists were observed to have some corrosion and wear. It is not clear from the available maintenance history whether the ropes have been replaced since the original installation. The gearbox of the WH2 hoist was inspected and the gears found to be in good condition. Greasing points on all three hoists showed signs of recent greasing and maintenance staff report that regular greasing is part of normal maintenance schedules. Operation of the wire rope hoists was observed to be smooth and trouble-free. The local control panels for all three gate hoists are using outdated technology and are expected to be at or beyond their design life.

3.2 Gate Stress Analysis Results

The main results of the stress analysis for the headgates are summarized in the following table. Where multiple elements (girders, skinplate sections, etc.) were evaluated the maximum calculated stresses are shown. Although the WH3 headgate was found to have little corrosion, a nominal reduction in thickness of 0.5 mm was assumed to be conservative.

Description	**Percent of Allowable Stress**			
	WH1 / WH2 Headgates		**WH3 Headgate**	
	Original Plate Thickness	Thickness After Corrosion	Original Plate Thickness	Thickness After Corrosion
Horizontal girder – Bending	74%	n/a	92%	n/a
Horizontal girder – Shear	38%	65%	48%	54%
Skinplate stress	139%	172%	148%	162%
Vertical end-girder – Bending	55%	n/a	58%	n/a
Vertical end-girder – Shear	25%	n/a	29%	n/a
Wheel contact stress	56%	n/a	56%	n/a

Description	Percent of Allowable Stress			
	WH1 / WH2 Headgates		WH3 Headgate	
	Original Plate Thickness	Thickness After Corrosion	Original Plate Thickness	Thickness After Corrosion
Wheel axle shear	16%	n/a	16%	n/a
Wheel bushing	35%	n/a	35%	n/a
Rivet tension	66%	n/a	n/a	n/a
Rivet shear	89%	n/a	n/a	n/a

The summary table shows that most elements of the gates are within allowable stress limits, except the skinplates which have stresses far exceeding the allowable stress. After consideration of thickness reduction due to corrosion, the stress in the WH1/WH2 skinplates slightly exceeds the tested yield strength of the material.

3.3 Hoist Analysis Results

The hoist load calculations found a maximum hoist load of approximately 15,600 kg, which exceeds the rated capacity of the hoists. This hoist load is estimated for the condition of lifting the gates to their filling position when the downstream water passage is dewatered. As noted in Section 2.3, the hydraulic downpull on the gates is approximated according to a simplified method, therefore there is some uncertainty in the estimated maximum hoist load.

The capacity of the wire ropes was found to have a factor of safety of 4.6 over the calculated maximum hoist load. Industry standard requires a minimum factor of safety of 5.0.

4.0 DISCUSSION

4.1 Refurbishment / Replacement Options

Due to the extensive corrosion pitting damage observed on the WH1 and WH2 headgates refurbishment is not seen as a practical option. Extensive welding work would be required to repair the corrosion pitting damage. Additional stiffeners would need to be added to reduce the skinplate stress. Due to the condition of rivets all the rivets would need to be removed and replaced by welded fabrication. With such extensive work a careful program of dimensional control would need to be put in place. As such, there is no advantage seen in refurbishing these gates as compared to replacing them.

The WH3 headgate was found to be in good condition and therefore refurbishment is possible. The high stresses found in the skinplate can be addressed by the addition of vertical stiffeners midway between the existing vertical stiffeners. This would lower the skinplate stresses into the allowable range. Refurbishment would include sandblasting and recoating the gate.

Based on the video inspections it is expected that the embedded guides for all three gates can be refurbished. Work should include detailed inspection and measurement, followed by machining if/as necessary to achieve typical flatness and verticality.

Refurbishment of all three headgate hoists is possible. Wire ropes should be replaced with new wire ropes, which would provide an increased safety factor due to improvements in wire rope strength since the original equipment was supplied. Other hoist components can be dismantled, cleaned and greased. Gearbox oil should be drained, gears cleaned, and refilled with oil.

The local controls for all three wire rope hoists should be replaced with modern control systems. Instrumentation (limit switches) on the hoists should be replaced due to age.

4.2 Cost Estimates

The costs for the refurbishment (where appropriate) and replacement of the equipment were estimated by scaling from recent projects and similar market quotations recently obtained. In some cases the costs were estimated by SNC and YEC based on calculated quantities and estimated unit rates and labour. Budgetary quotations were requested from vendors but none were able to provide the estimates at time of reporting due to seasonal resource limitations. The cost estimates are summarized in the following table.

Equipment	Refurbish Cost	Replace Cost
WH1 and WH2 Headgates	n/a	$465,900
WH3 Headgate	$150,000	$233,000
Embedded Parts Repair x3	$656,300	n/a
Wire rope hoists c/w controls x3	$645,600	$855,000

The accuracy of the estimates is at the level of an AACE Class 4 estimate.

4.3 Outage Costs

It will be necessary to shut down the units while work is being done on the headgates and hoists. As such, consideration was given to the evaluation of outage costs (lost generation) for the refurbishment and replacement options. Gate refurbishment options would require removal of the gate(s) to a shop for a period of time during which the respective unit must be out of service. In comparison, gate replacement options would require shorter duration outages since the new gate would be ready to install earlier.

Refurbishment of the WH1 and WH2 headgates is not practical as mentioned in Section 4.1, therefore associated outage costs will not be evaluated.

It is understood that there are times of the year when the WH3 generating unit is not typically used and therefore outage costs are insignificant (no lost generation). If the work is planned for a period of time when the unit is not scheduled for operation, then the outage costs do not need to be considered in the evaluation of options.

It is anticipated that refurbishment of the headgate hoists would be completed during the same outage as the gate refurbishment/replacement work. As such, the costs of outage do not factor into the decision to refurbish or replace the hoists.

4.4 Engineering Costs

An estimate of engineering hours was used to establish a budget for engineering related to the headgate works. This would include detailed tender design and analysis, drafting, preparation of procurement specifications, tender support, review of vendor shop drawings and submittals. For replacement of all three headgates plus refurbishment of the hoists and upgrades of the controls, the engineering costs are estimated as follows:

Mechanical Engineering Hours	400
Electrical Engineering Hours	210
PM / Administrative Hours	120
Total Cost	$85,000

If the WH3 headgate is refurbished rather than replaced then an additional 250 mechanical engineering hours would be required. The total cost in that case would be $114,000.

4.5 Shop Inspection and Field Inspection Costs

In case YEC wishes to engage an engineering consultant or a third party to carry out shop inspections and field inspections, for installation and commissioning, the associated costs are estimated as under:

Hours for Mechanical Inspections	160
Hours for Electrical Inspections (including commissioning supervision)	60
PM / Administrative Hours	40
Expenses (travel and stay)	$14,000
Total Cost	$45,000

The hours and expenses for inspections are tentative and based on initial planning for replacement/refurbishment works. These costs can be confirmed after YEC's planning for inspections is determined and schedule for replacement/refurbishment works is firmed up.

5.0 CONCLUSION AND RECOMMENDATIONS

The assessment has shown that the stresses in all three headgate skinplates are far beyond the acceptable limits. As such, the headgates should not be relied upon to isolate the water passages for the purpose of worker access. If personnel access in the water passage is required then the stoplogs must be used, or the headgates could be safely used at a reduced water level (approximate elevation 649 m).

Refurbishment of the WH1 and WH2 headgates is not practical due to the extent of corrosion. These gates should be replaced.

The wire rope hoists can be effectively refurbished (and local controls replaced) for a lower cost than replacement with new hoists. As such, this option is preferred over providing completely new wire rope hoists.

The WH3 gate could either be refurbished or replaced. This then yields two options for the project scope: ***Option A*** would include refurbishment of the WH3 headgate and ***Option B*** would consider replacement of the WH3 headgate. Both options would include replacement of the WH1 and WH2 headgates, refurbishment of all three wire rope hoists, and replacement of the local control panels. The costs are summarized as follows:

Scope Item	Option A	Option B
WH1 and WH2 Headgates – Replacement	$465,900	$465,900
WH3 Headgate	$150,000	$233,000
Embedded Parts Repair x3	$656,300	$656,300
Wire rope hoists c/w new controls x3 - Refurbishment	$645,600	$645,600
Engineering	$114,000	$85,000
Shop Inspection and Field Inspection Costs	$45,000	$45,000
Total Cost	**$2,076,800**	**$2,130,800**

The cost estimates above are Class 4 estimates and exclude all owner's costs, taxes, bonds, risk, contingency and other indirect costs.

The costs for the two options are within 5% of each other. It is worth noting that although Option A is less expensive, there is more risk involved. Risks would include the potential of finding the gate to be in worse condition than expected when it is fully removed from the slot, and the risk that extended duration of in-shop gate refurbishment would result in delays to the outage period.

Additionally, replacement of the WH3 headgate will result in a longer service life for the equipment when compared with refurbishment. Option B appears favourable, considering that the cost estimates for both options are close in value, and it involves less risk of cost and schedule variation and may result in a longer service life.

Further evaluation should be done to obtain more certainty on costs for the two options by obtaining budget quotations from several vendors. That work can be done in parallel with the engineering required to support the final procurement activities.

Date: **August 9, 2019**

From: **Cyril Kasongo, P.Eng.**

Subject: **P125 / WH1 & WH3 Headgates Inspection**

1 INTRODUCTION

On June 26-28, 2019 YEC and SNC-Lavalin carried out inspections of WH1 and WH3 headgates at YEC's P125 hydroelectric facility. An inspector from TEAM Industrial Services (TISI Inc.) was on site to provide non-destructive testing (NDT) services for the inspection. In addition, YEC self-performed an underwater inspection of the WH3 headgate guides using a remote-operated vehicle (ROV).

This memo documents the observations gathered during the inspections. It also serves as an addendum to previously released WH2 headgate condition assessment memorandum (ref. "P125 / WH2 Headgate Inspection").

2 WH1 HEADGATE INSPECTION

2.1 Inspection Setup

The WH1 headgate was lifted above the concrete intake deck using its dedicated hoist system. The hoist drum was dogged and locked-out in position to secure the headgate's position during the inspection. Due to intake configuration, the bottom section of the gate body remained enclosed within the intake "dog-house"; thus, not entirely accessible for inspection.

Rolling scaffold was set up on the upstream side of the gate to provide safe access. Fall-arrest anchors were set up on the concrete hoist tower structures above the work area and harnesses were worn by participants whenever working at height.

The inspection position of WH1 headgate is shown on Photo 1.

Measurements on the gate skin-plate were referenced according to the diagram shown on Figure 1.

Photo 1 *– WH1 Headgate Inspection Position (looking downstream)*

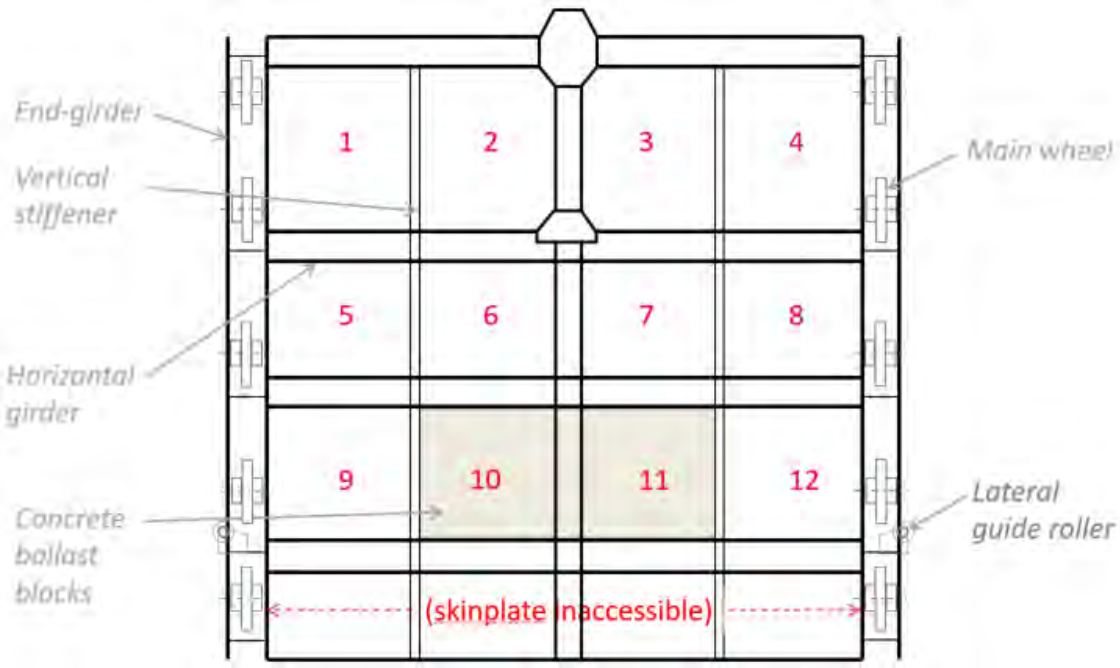

Figure 1 *– WH1 Headgate – Skin-plate Reference Diagram (looking downstream)*

2.2 Dimensional Checks

WH1 headgate dimensions were verified by YEC against historical design drawing E51563 shown in APPENDIX A. Measurements were taken with a typical construction-grade measuring tape. No significant deviations from the design drawing were identified. However, NDT inspection later revealed some discrepancies on the skin-plate wall thickness (see Section 2.4 NDT Inspection).

2.3 Corrosion Pitting Measurement

Corrosion products and tubercles were densely observed on all areas of the WH1 headgate body. More particularly on: the upstream side of the skin-plate, the webs of the horizontal girders, the end girders, and the rivet heads. Overall, the WH1 headgate condition was very similar to WH2 headgate (if not slightly more damaged by corrosion).

Given strong similarities between WH1 and WH2 headgates condition, YEC/SNC-Lavalin decided to perform pitting measurement only on the two most corroded skin-plate panels; i.e. areas #4 and #6 per Figure 1 reference diagram.

In order expose pit cavities and proceed with measurements, YEC personnel performed:

i. Pressure washing of the headgate to remove sediment and mud deposits; followed by

ii. Localized grinding of the headgate surface to remove rust built-ups and tubercles.

Trough-type corrosion pits of various shapes were revealed including: narrow pits, deep pits; shallow pits, wide pits, and elliptical pits. A calibrated bridge-cam gauge was used to measure pitting corrosion depth. Measurements and photographs (skin-plate panels #4 and 6#) are shown in APPENDIX B.

The following table summarizes the corrosion pitting measurements for the WH1 headgate:

Skin-Plate Area Ref.	Approximate Percent Pitted area	Largest Single Pitted Area	Maximum Pitting depth	Typical Average Pitting Depth within Pitted Areas (estimate)
#4	20%	≈ 8” x 6”	6 mm	2.875 mm
#6	20%	≈ 6” x 9”	3 mm	2.416 mm

Table 1 – *Summary of skin-plate corrosion pitting measurements for WH1 headgate*

Average pitting depths in areas #4 and #6 of WH1 headgate (respectively 2.8mm and 2.4mm) are superior to measurements on WH2 headgate’s worst corroded panel (approximately 2.0mm).

2.4 NDT Inspection

Ultrasonic testing (UT) measurements were performed on the following structural members of the WH1 headgate: skin-plate, horizontal girder web, and end-girder web. Skin-plate wall thickness records ranged from 0.375 inches to 0.449 inches. The average measured thickness is 0.420 inches; i.e. 0.045” thicker than what is shown on historical design drawing E51563 showing 0.375”.

Magnetic particle (MP) inspection was also carried out to check for cracks in randomly selected structural joints, rivet heads and adjacent base material. No cracking was observed.

Detailed examination reports for UT and MP inspections have been prepared by TISI Inc. technician and included in Appendix C.

2.5 Wheel Inspection

The accessible main wheels of WH1 headgate (8 out of 10) were checked for rotation. They were found to be stiff and hard to turn by hand. The rolling surface of the wheels showed signs of roughening as well as corrosion (small tubercles) extending to the wheel axles.

The lateral guide rollers of WH1 headgate (2 out of 2) were also checked for rotation. They were found to be seized/stuck on their axle and unable to operate. The surface of the rollers showed heavy signs of deterioration including densely distributed rust and corrosion tubercles.

See pictures below compiled for reference.

***Photo 2** – WH1 Main Wheels Condition*

WH1 left bank guide roller

WH1 right bank guide roller

***Photo 3** – WH1 Lateral Guide Rollers Condition*

3 WH3 HEADGATE INSPECTION

3.1 Inspection Setup

Due to inability to bypass the gate hoist limit switch, the WH3 headgate could not be fully lifted above the concrete intake deck. The body of the gate remained partially submerged in water and enclosed within the intake “dog-house”. Hence, inspection was limited to the upper section of WH3 headgate (approximately 1/4 of vertical height).

The hoist drum was dogged and locked-out in position to secure the headgate’s position during the inspection.

The inspection position of WH3 headgate is shown on Photo 4.

Measurements on the gate skin-plate were referenced according to the diagram shown on Figure 2.

Photo 4 *– WH3 Headgate Inspection Position (looking downstream)*

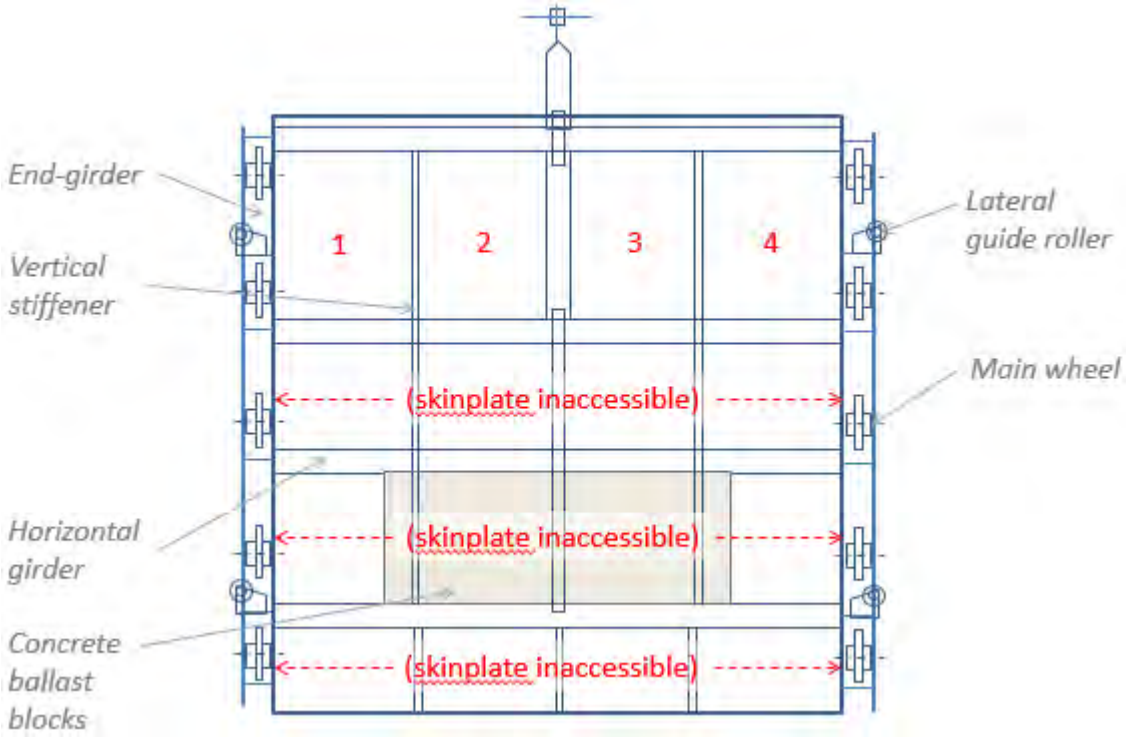

Figure 2 *– WH3 Headgate – Skin-plate Reference Diagram (looking downstream)*

3.2 Dimensional Checks

WH3 headgate dimensions were verified by YEC against historical design drawing M0186-1 shown in APPENDIX D. Measurements were taken with a typical construction-grade measuring tape. No significant deviations from the design drawing were identified. However, NDT inspection later revealed some discrepancies on the skin-plate wall thickness (see Section 3.4 NDT Inspection).

3.3 Corrosion Pitting Measurement

WH3 headgate was found to be in relatively good condition in comparison with WH1 and WH2 headgates, both severely corroded. Rust and wear spots were observed in low to moderate quantity; no signs of pitting corrosion (i.e. tubercles) were revealed on structural members of WH3 headgate.

Top View (Left Bank)

Front View (Right Bank)

Photo 5 *– WH3 Headgate Overall Surface Condition*

3.4 NDT Inspection

Ultrasonic testing (UT) measurements were performed on the following structural members of the WH3 headgate: skin-plate, horizontal girder web, and end-girder web. Skin-plate wall thickness records ranged from 0.431" to 0.461". The average measured thickness is 0.447" (against 0.375" on historical design drawings).

Magnetic particle (MP) inspection was also carried out to check for fatigue/stress cracks. As there are no rivets on WH3 headgate (welded construction), testing was made on a dozen of weld samples. No cracking was observed.

Detailed examination reports for UT and MP inspections have been prepared by TISI Inc. technician and included in APPENDIX E.

3.5 Wheel Inspection

The accessible main wheels of WH3 headgate (2 out of 10) were checked for rotation. They were found to be easily rotating when being turned by hand. The rolling surface of the wheels showed normal signs of roughening. The wheel axles showed more advanced signs of wear including coating flaking and surface rust.

The lateral guide rollers of WH3 headgate (2 out of 4) were also checked for rotation. They were found to be seized/stuck on their axle and unable to operate. The surface of the rollers showed heavy signs of deterioration including densely distributed rust and corrosion tubercles.

See pictures below compiled for reference.

WH3 Main Wheel @ (Row 1, Right Bank)

Photo 6 *– WH3 Main Wheels Condition*

WH3 left bank guide roller

WH3 right bank guide roller

Photo 7 *– WH3 Lateral Guide Rollers Condition*

3.6 ROV Inspection

Underwater inspection was carried out by YEC using their own Remotely Operated Vehicle (ROV). Video record of the inspection provided to SNC-Lavalin and reviewed.

The video generally shows that the WH3 headgate body is in decent condition relative to WH1/WH2 headgates. Localised corrosion spots were observed on structural members but no apparent pits/tubercles.

Unfortunately, the gate guides (wheel and seal paths) could not observed properly due to lack of light and poor visibility. The second stage concrete surrounding the guides appeared to be in good condition with no cracking, spalling or break-out observed in the video.

Snap-shots taken from parts of the ROV video are included shown below for reference. The video files remain on the YEC Sharepoint website.

***Photo 8** – WH3 Headgate ROV Inspection Video Snapshots*

4 CONCLUSION

Dimensionally the WH1 and WH3 headgates were found to largely match their respective historical design drawings. Presence of concrete ballasts was also confirmed.

WH1 headgate displayed significant level of deterioration and corrosion comparable to WH2 headgate. Severe pitting corrosion was observed on critical structural members gate (skin-plate, girders, stiffeners, rivet heads) as well as gate wheels and rollers (seized or hardly rotating for the majority). Altougth the WH1 headgate skin-plate is thicker than shown on historical drawings, the wall thickness reduction induced by the observed pitting corrosion will result in higher stresses. Preliminary calculations (and past checks by KCB) have already shown the skin-plate to have higher than typically

allowable stresses. Corrosion observed on the rivet heads puts into question the capacity of the rivets to resist the tensile forces placed on them.

WH3 headgate showed a better overall condition than WH1/WH2 headgates with more reasonable levels of rust build-ups. No signs of pitting corrosion were observed. This may be attributable to the fact that WH3 was built 12 years after WH1/WH2 (1956 vs. 1968); hence with improved materials, coatings and fabrication methods. Another noticeable advantage of WH3 headgate is its welded construction, versus riveted for WH1/WH2. The welds appeared to be in good condition with no cracks revealed during magnetic particle examination.

The measurements taken and recorded in this memo will be used by SNC-Lavalin in their gate stress analysis and considerations for refurbishment/replacement options.

Sincerely,

Cyril Kasongo, P. Eng., PMP
Mechanical Engineer

MAGNETIC PARTICLE EXAMINATION REPORT

MT – 1084 – 02-BB

CLIENT: **Yukon Energy Corporation** DATE: **June 27, 2019** PAGE: 1 OF 1

INVOICE ADDRESS: Box 5920, #2 Mikes Canyon Rd Whitehorse, Yukon Y1A 6S7 WORK LOCATION: YEC Whitehorse hydro plant

EXAMINATION STANDARD: ASTM E 709 - 2017 ACCEPTANCE STANDARD: Customer Information

TEAM PROCEDURE: MT.CSA.1 R0 EXAMINATION OF: WH3 Headgate

TEAM JOB NO.:	50191084
BRANCH NO.:	5301
JOB NO.:	
AFE NO.:	

SURFACE CONDITION: ☐ AS GROUND ☐ MACHINED ☐ PAINTED ☐ SAND BLAST ☑ BASE METAL ☐ AS WELDED

MATERIAL: Carbon steel THICKNESS: 0.75" TEMPERATURE: 20 °C

TEST EQUIPMENT AND MATERIALS:

EQUIPMENT	MODEL AND SERIAL NO.	MAGNETIZING CURRENT	TEST MEDIUM/CONSUMABLES	MANUFACTURER /BATCH NO./CONCENTRATION
☑ AC YOKE	Contour Probe B300 S/N:9874	☑ AC	☑ WET VISIBLE	Magnaflux 7HF batch # 16F03K
☑ DAILY LIFT TEST	10 lbs. SN: 1126 Status: Pass	☐ DC	☐ DRY POWDER	
☑ WHITE LIGHT	Incandescent Flashlight 3 C cell	☐ N/A (Permanent Magnet)	☑ CONTRAST PAINT	Magnaflux WCP-2 batch # 17L12K
☑ LIGHT INTENSITY	176fc	☑ CONTINUOUS	☐ WET FLUORESCENT	
☑ LIGHT METER	Accumax XRP-3000 S/N: 1942038 cal due 11/30/2019	☐ RESIDUAL	☐ SETTELMENT TEST	

BLACK LIGHT INTENSITY BEFORE EXAMINATION: N/A µw/CM² BLACK LIGHT INTENSITY AFTER EXAMINATION: N/A µw/CM² WHITE LIGHT/BACKGROUND: N/A

PURPOSE: A Colour Contrast Magnetic Particle Examination was performed on the following:

WH3 Headgate

-Approximately 10 samples of weld was examined for fatigue/stress cracking after cleaning and removal of paint.

RESULTS: No cracking or other relevant indications were found at time of examination.

TECHNICIANS:

TEAM JOB NO.:	50190850
BRANCH NO.:	5301
PO No.:	
WO No.:	

SURFACE CONDITION: ☑ AS GROUND ☐ MACHINED ☑ PAINTED ☐ SAND BLAST ☑ BASE METAL ☐ AS WELDED

SCANNING SURFACE: MATERIAL: Carbon steel ☑ MANUAL UT ☐ AUTO UT

TEST EQUIPMENT AND MATERIALS:

INSTRUMENT: Olympus MODEL: Epoch 600 SERIAL No.: 140607001 CAL. DATE: Jan. 14, 2019 CABLE TYPE/LENGTH: Dual 6'

COUPLANT: UT-X CAL. BLOCKS: Metric Step Wedge SN 281713 SCANNING LIMITATION: Intake gate access

TRANSDUCER + SERIAL No.	ANGLE	FREQUENCY	CRYSTAL SIZE / TYPE	PRIMARY REFERENCE REFLECTOR/AMPLITUDE/DISTANCE/dB / TRANSFER	SCAN SENSITIVITY	RANGE CALIBRATION
GE FDU Gamma S/N 13D01GA5	0°	5 MHz	6.25 mm Dual	BWE @ 80% FSH	As required	50 mm

PURPOSE: Ultrasonic thickness readings were performed on the skin plates, horizontal webs, vertical channels and end channels on WH1 intake gate to measure remaining wall thickness.

RESULTS: Thickness readings are recorded on Pages 2-3.

General Notes:
1) All thickness measurents are in inches.
2) Thickness measurements were taken on non-corroded/pitted base material to measure nominal wall thickness. Areas of corrosion were measured by hand with bridge cam gauge by YEC.
3) Thickness measurements recorded as "no access" were due to cement squares blocking access to surrounding steel.

Phone (780) 417-7777 Fax: (780) 417-1185

MT – 1084 – 04-BB

CLIENT: **Yukon Energy Corporation** DATE: **June 28, 2019** PAGE: 1 OF 2

INVOICE ADDRESS: Box 5920, #2 Mikes Canyon Rd Whitehorse, Yukon Y1A 6S7 WORK LOCATION: YEC Whitehorse hydro plant

EXAMINATION STANDARD: ASTM E 709 - 2017 ACCEPTANCE STANDARD: Customer Information

TEAM PROCEDURE: MT.CSA.1 R0 EXAMINATION OF: WH1 Headgate

TEAM JOB NO.:	50191084
BRANCH NO.:	5301
JOB NO.:	
AFE NO.:	

SURFACE CONDITION: ☐ AS GROUND ☐ MACHINED ☐ PAINTED ☐ SAND BLAST ☑ BASE METAL ☐ AS WELDED

MATERIAL: Carbon steel THICKNESS: 0.75" TEMPERATURE: 20 °C

TEST EQUIPMENT AND MATERIALS:

EQUIPMENT	MODEL AND SERIAL NO.	MAGNETIZING CURRENT	TEST MEDIUM/CONSUMABLES	MANUFACTURER /BATCH NO./CONCENTRATION
☑ AC YOKE	Contour Probe B300 S/N:9874	☑ AC	☑ WET VISIBLE	Magnaflux 7HF batch # 16F03K
☑ DAILY LIFT TEST	10 lbs. SN: 1126 Status: Pass	☐ DC	☐ DRY POWDER	
☑ WHITE LIGHT	Incandescent Flashlight 3 C cell	☐ N/A (Permanent Magnet)	☑ CONTRAST PAINT	Magnaflux WCP-2 batch # 17L12K
☑ LIGHT INTENSITY	176fc	☑ CONTINUOUS	☐ WET FLUORESCENT	
☑ LIGHT METER	Accumax XRP-3000 S/N: 1942038 cal due 11/30/2019	☐ RESIDUAL	☐ SETTELMENT TEST	

BLACK LIGHT INTENSITY BEFORE EXAMINATION: N/A µw/CM² BLACK LIGHT INTENSITY AFTER EXAMINATION: N/A µw/CM² WHITE LIGHT/BACKGROUND: N/A

PURPOSE: A Colour Contrast Magnetic Particle Examination was performed on the following:

WH1 Headgate

-Adjacent base material was examined around a quantity of 10 rivet heads after cleaning and removal of paint on rivet head and adjacent base material.

RESULTS: No cracking or other relevant indications were found at time of examination.

TECHNICIANS:

INTERPRETATION IS IN ACCORDANCE WITH THE ABOVE MENTIONED STANDARDS, TO THE BEST OF MY PROFESSIONAL ABILITY

REFERENCE: **Application, Tab 5.2.1.9, pages 5-18 to 5-19**

ISSUE: **WH2 Uprate Project**

QUOTE: "Whitehorse Hydro #2 (WH2) was commissioned in 1958 and is one of the three units installed at P125. It is a Kaplan Turbine unit with nominal rating of a 5.8 MW and is currently operating with the original runner, rotor, stator and windings from 1958. WH2 asset health has been declining due to its age, and there is an increased risk of failure and related unplanned outages and costs. Specifically, the generator has exceeded a typical winding life of 40 years; and issues have been identified with oil leaks at the runner blade to hub seals and with possible voids in the concrete behind the draft tube liner. In the circumstances, it was considered prudent to rewind the generator in order to mitigate these risks and their potential reliability and cost implications. External studies also determined that unit efficiency would be improved with a new runner of modern design." (emphasis added)

"In 2017, Hatch completed an economic assessment of various uprate options at the Whitehorse Rapids Generating Station (WRGS). The report concluded that the uprating of the WH1 or WH2 units would be the most cost-effective option and provide the best payback of the WRGS hydro units. Management selected the uprating of WH2 over WH1 since there are existing known issues with the WH2 governor, and the uprating project would resolve these issues."

"The project is planned to be implemented over a three year period (2019 21), and is expected to add 6.4 GWh/yr additional hydraulic generation to the grid [starting in the third quarter of 2021]. The project is also expected to increase dependable capacity of WH2 by 0.94 MW… YEC contracted Litostroj Power to undertake the runner fabrication with the following concurrent activities planned for 2020: governor fabrication, balance of plant civil construction; balance of plant P&C design completion, relace of balance of plant request for proposal, and delivery of materials to Whitehorse."

QUESTION:

a) Please explain how often YEC carried out tests on WH2 in the past to assess its reliability and how often maintenance work was required. If possible, please provide the number of times maintenance was conducted on WH2 in the last 10 years, on a per annum basis, and the cost of this maintenance work. For example, how many times did YEC rewind the generator?

b) Please indicate if any unplanned outages have occurred with WH2. If confirmed, please provide the number and duration of these outages in the last 10 years, on a per annum basis, and the costs incurred due to these outages.

c) Please provide the external studies showing that unit efficiency would be improved with a new runner of modern design, and explain the improvements found with this design. Additionally, please indicate which consultant carried out these studies, and provide details on the selection process of the contractor and how costs were awarded.

d) Please provide Hatch's economic assessment of the various uprate options at the Whitehorse Rapids Generating Station, and provide the costs of all the uprate options explored in this assessment.

e) Please provide further detail on YEC's choice of uprating WH2 over WH1. For example, what process was carried out to determine that WH2 required uprating over WH1? Did YEC conduct technical meetings with its staff or carry out an assessment comparing issues between both assets?

f) Please provide an update on the work currently completed for this project. Is YEC currently on schedule with this project?

ANSWER:

(a)

YEC carries out annual scheduled maintenance and testing on WH2.

A major overhaul was completed in 2016 at a cost of $686,764. The generator has never been rewound since it was put into service in 1958. All major components of WH2 are original.

There is also annual maintenance work scheduled for 2-3 weeks per year. Average costs for this work is $80,000-$100,000 depending on discoveries (cavitation). YEC historically performs 10 year major overhauls on the major hydro assets.

(b)

Please see Attachment 1 to this response which provides WH2 KPIs from YTD back to 2015. The forced outage rate is very low. Costs would be difficult to provide due to the very low failure rate. Costs are captured in the general O&M accounts.

(c)

Please see also YUB-YEC-1-57(d) Attachment 1 which provides the Hatch study. Section 3 of this report outlines the benefits of replacing the runner as well as some of the other improvements that are being made to the WH2 Unit. Assessments for WH1 are applicable to WH2 as noted in the report.

Issues with existing unit performance are noted in Section 3.1. More specifically, the section notes issues with oil leakage at the runner blade to hub seals and with possible voids in the concrete behind the draft tube liner. Section 3.1 notes efficiency tests were conducted on WH1 in 2009 by Hydro Power Performance Engineering, Inc. (HPPE) for the KGS Group. Turbine flow was measured using flow meters installed at the intake. The tests indicated performance as follows:

- Peak turbine efficiency = 88.1%;
- Peak efficiency flow = 23 m3/s;
- Efficiency at full load = 82.3%;
- Full load flow = 39.5 m3/s; and
- Full load turbine output = 5.74 MW at 18 m net head.

Figure 3-2 of the report shows the efficiency of the existing turbine based on the testing done by HPPE, the efficiency of a modern state of the art turbine derived from model test information, and the estimated efficiency of the WH1 turbine with a new runner and possible stay vane modifications. The efficiency curve for the existing turbine is for the optimum wicket gate – runner blade relationship. The estimated increase in efficiency with a new runner is approximately 4%. Figure 3-2 also shows the estimated turbine performance for a new runner with a 10% increase in flow. The increase in energy and capacity for the various uprate options are discussed in Section 7.

Hatch was awarded the work to undertake the study noted through a competitive RFP process. Proposals were evaluated based on technical and organization competence and price; and demonstrate the best value for price submitted.

(d)

Please see the Hatch study provided as Attachment 1 to this response. The costs for each option assessed in the Hatch study are provided in Table 10-1 of the attached (excerpted below). Assessments for WH1 are applicable to WH2.

(e)

WH2 was selected over WH1 because the energy output of WH2 is higher based on the plant configuration. That is, WH2 produces more energy because it exhausts mid-stream; WH1 exhausts against the bank of the river which creates a loss of efficiency. Otherwise, the units are essentially identical units. Additionally, WH2 was having a problem with its governor, i.e., the WH2 governor was having issues with MW control and resolution was required.

(f)

Design and manufacturing are complete and the site work is currently underway. YEC is currently on schedule with the WH2 Uprate.

Executive Summary

A study considering uprating the turbines at Yukon Energy Corporation's (YEC's) Whitehorse Generating Station (WGS) has been undertaken by Hatch Ltd. (Hatch). The study includes a technical and economic review and analysis of the potential options for the uprating of units WH1, WH3, and WH4 at the Whitehorse Generating Station.

The generating units at WGS have three different types of turbines – WH1 and WH2, installed in 1958, have Kaplan turbines with a nominal rating of 5.8 MW; WH3, installed in 1969, has an 8.4 MW fixed-blade propeller turbine; and the newest unit (WH4) has a 20 MW fixed-blade propeller turbine installed in 1984.

Based on information and data provided by YEC, the generating units are maintained and overhauled on a regular basis. A detailed condition assessment by Knight Piesold, in 2016, did not identify major issues with the equipment. WH3 has experienced major blade cracking problems with the turbine runner in 2003, and there are some runner blade to hub seal issues on WH1 and WH2. Nevertheless, the turbines and generators do not appear to be near their end of useful life. However, although no specific issues have been identified with the generator windings, given their age rewind of the WH1 and WH2 generators may be prudent to mitigate risks associated with a winding failure and resulting unplanned outage.

The principal benefit of uprating the turbines at WGS is the ability for YEC to offset more costly thermal (diesel and LNG) generation. Replacement of the existing turbine runners with a new runner of modern design will increase generating unit efficiency and power output. A further increase in power will be possible by increasing the flow capacity of the new runner. Other than possible modifications to the existing stay vanes to improve approach flow into the runners, other major modifications are not envisioned.

Generator work associated with the uprate will be limited; however, depending on the capacity increase, it may include stator and rotor rewind. If stator and rotor rewind is not required to accommodate capacity increases, YEC may still consider taking advantage of the outage associated with the uprate to complete a rewind of the stator and rotor given the age of the existing generator windings.

To ascertain the benefits of potential turbine uprate options, operation and unit disptach of YEC's complete system including Whitehorse, Aishihik and Mayo hydro facilites as well as the thermal units were simulated using 14 years of flow records in conjunction with projected load forecasts provided by YEC.

There were 6 main uprate options studied for the Units WH1 to WH4. They are numbered as 1-1 through 6-1 in Table ES-1 below. There were also a number of sub-options considered as follows:

- Options suffixed by 1-'A' etc., considered the impacts to the financial case of a base option if costs associated with life extension activities such as turbine/generator disassembly and reassembly were either included or excluded from the costs assigned to the turbine uprate estimate.
- Options suffixed by 1-'4' etc., considered applying a different load scenario (ie. load scenario 3 or 4) to one of the base case options to compare the results of the different load scenario on the financial case for each base uprate option.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The cost of the various turbine uprate options were estimated using budgetary runner costs provided by turbine manufacturers along with reference cost information from other comparable projects.

The economic benefit of the various turbine uprate options will depend on the load scenario applied as well as how the various uprate costs are accounted for. The uprate program can be undertaken on its own or it can be completed as part of a 10-year equipment overhaul or part of generator rewind for life extension. A summary of costs, benefits, and benefit/cost ratios for the various turbine uprate options considered is presented in Table ES-1. The details of each of the options are identified in the table columns. The unit that is being uprated is shown in column 2; column 3 indicates whether the uprated unit is designed to have the same turbine flow or an increased turbine flow. Column 4 gives the assumed load scenario. Columns 8 and 9 indicate whether or not generator dismantling, re-installation and rewind are factored into the economic evaluation for that particular option or considered as part of a separate 10-year overhaul or unit life extension project that would be carried out at the same time as the work associated with the uprate.

Table ES-1: Uprate Cost/Benefit Summary

Option	Uprated Unit	Increased Turbine Flow (Y/N)	Load Scenario	Avoided Thermal Generation (MWh/yr)	Avoided Thermal Capacity (MW)	Capital Cost ($M)	Cost Incl. Disassemby & Install (Y/N)	Cost Incl. 5-1	WH4 - K	N	1	1583	0.70	10.38	Y	Y	-6.18	0.39	42 yrs	No Payback
5-4	WH4 - K	N	4	47	1.00	10.4	Y	Y	1.20	1.12	14 yrs	23 yrs
6-1	WH1 & 2	N	1	795	0.09	3.97	Y	N	-0.95	0.75	27 yrs	No Payback

The evaluation summarized in the table above demonstrates that uprating WH1 is economically attractive. The work associated with the uprate project can also be combined with a generator life extension program that includes stator rewind and rotor refurbishment to take advantage of the outage associated with the uprate project. A small increase in turbine flow can also provide added benefit.

Uprating of WH3 and WH4 can also be attractive, but only if there is a significant increase in forecast load from what has been provided by YEC. With power and energy demands similar to present conditions, uprating these units do not appear to be economically attractive at this time.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The study has also included an assessment of the cost of converting WH3 for operation as a synchronous condenser for providing reactive power. The estimated cost for this conversion is $288,000. However, at present, there is no requirement for reactive power and thus no benefit in carrying out this work.

.

1. Introduction

This report presents the results of a study investigating the potential options for the uprate of the WH1, WH3 and WH4 turbines at the Whitehorse Generating Station (WGS). The report has been prepared by Hatch Ltd. (Hatch) for Yukon Energy Corporation (YEC).

The study addresses the technical issues, costs and benefits of improving the performance of the generating units at YEC's Whitehorse plant. The assessment includes:

- A review of the potential, efficiency, capacity and energy increases for the generating units.
- An assessment of the potential hydraulic, mechanical and electrical impacts of the upgrade.
- An estimate of associated costs for the upgrades.
- A cost/benefit analysis.
- A review of the issues associated with converting WH3 to have the capability of operating in synchronous condenser mode.
- Other related issues, such as rehabilitation, refurbishment and modernization.

The work associated with the report included a site visit by Hatch electrical and mechanical engineers in early November 2016 to briefly inspect the facilities, collect drawings and other information, and to discuss the operation of WGS with YEC personnel.

The study primarily addresses three of the four generating units at the facility (WH1, WH3 and WH4). However, as WH1 and WH2 are essentially identical, the issues, costs and benefits relating to WH1 will also generally apply to WH2.

A description of the Whitehorse plant is provided in Section 2 of this report. Sections 3, 4 and 5 present the issues and costs associated with uprating Units WH1, WH3 and WH4 respectively. The conversion of WH3 for use as a synchronous condenser is discussed in Section 6. Potential energy increases for the uprated turbines are reviewed in Section 7 and a cost benefit analysis is presented in Section 8. A discussion of results is given in Section 9 and the conclusions of the study are summarized in Section 10. Drawings and other supporting information and data are included as appendices to this report.

2. Plant Description

2.1 General

The 40 MW Whitehorse Generating Station (WGS) is an important component of YEC's 132.5 MW generation portfolio. Other facilities include an additional 52 MW of hydro generation (Aishihik and Mayo), 31 MW of diesel, 8.8 MW of LNG units and 0.7 MW of wind generation. The generating facilities are connected to YEC's power grid which covers central and southern Yukon and operates isolated from the main North American electricity grid. One other station, the 1.3 MW Fish Lake hydro plant owned by ATCO Electric, also supplies power to the YEC grid.

WGS is located on the Yukon River on the outskirts of Whitehorse. The plant was constructed in 1956 when the first two units (WH1 and WH2) each with a capacity of 5.8 MW went into operation. A third unit (WH3), 8.4 MW in capacity, was added to the Whitehorse powerhouse in 1969. The power intakes are located at the end of a channel approximately 500 m long located on the left side of the dam and spillway. Three penstocks connect the power intakes to the powerhouse (WH0 or P125).

A second powerhouse was completed in 1984 with a single 20 MW generating unit (WH4). The intake for powerhouse WH4 (or P127) is located at the dam on the left side of the spillway, with a short penstock leading down to the powerhouse. A tailrace channel approximately 500 m long, directs flow from the powerhouse back into the river on the right side of the WH0 powerhouse. The downstream end of the tailrace has a fish screen structure whereby screens are installed in the summer to prevent fish from entering the WH4 tailrace.

Units WH1 and WH2 are equipped with adjustable blade Kaplan turbines and WH3 and WH4 have fixed blade propeller turbines. WGS has a gross head of approximately 19 m and a maximum discharge of 275 m^3/s.

The plant operates generally as a run-of-river facility although there is some water control available at the Marsh Lake Control Structure upstream of the plant. Figure 2-1 shows the WGS facility.

• Exciter type	rotating	rotating	static
In service date	1958	1969	1984

All four generating units have vertical shaft turbines directly connected to vertical synchronous generators. The turbines have embedded steel spiral cases and elbow draft tubes that are integral with the powerhouse concrete substructure.

WH1 and WH2 have mechanical gate shaft type governors. WH3 also has a gate shaft governor; however the original mechanical governor head has been converted to a digital head. WH4 is equipped with a cabinet actuator governor, which was originally a mechanical governor and has been converted to a digital governor.

WH1, WH2, and WH3 have rotating exciters with static automatic voltage regulators. WH4 has a full static excitation system.

Original Equipment Manufacturer (OEM) drawings of the turbines and generators as well as general arrangement drawings of the powerhouse structure and the plant single line diagrams are included in Appendix A.

3. WH1 Uprate

3.1 General / Existing Performance

WH1 (and WH2) are the oldest units at the plant, and have been in operation for nearly 60 years.

The turbines for both units generally operate in a reliable manner. They are dewatered for inspection and maintenance every year and are fully dismantled every 10 years. The last 10-year overhaul of WH1 was in 2015.

There are apparently some issues with oil leakage at the runner blade to hub seals and with possible voids in the concrete behind the draft tube liner.

The turbine has stainless steel runner blades and discharge ring. Cavitation damage is minimal and occurs on the suction side of the blades as well as on the draft tube liner just below the discharge ring. The damage is repaired each year during the annual outage.

Efficiency tests were conducted on WH1 in 2009 by Hydro Power Performance Engineering, Inc. (HPPE) for the KGS Group. Turbine flow was measured using flow meters installed at the intake. The tests indicated performance as follows:

- Peak turbine efficiency = 88.1%
- Peak efficiency flow = 23 m^3/s
- Efficiency at full load = 82.3%
- Full load flow = 39.5 m^3/s
- Full load turbine output = 5.74 MW at 18 m net head

Being an adjustable blade turbine, the unit has a wide operating range, from full load down to approximately 2 MW.

There are no major issues currently identified with the WH1 generator. Operating data indicates that the generator stator temperatures are fairly low. This is further discussed in Section 3.5.

3.2 Uprate Options

It will be possible to improve the performance of WH1 by installing a new turbine runner of modern design. The uprate options include:

- New more efficient Kaplan runner with the same flow capacity as the existing turbine. The increase in maximum power output will be directly proportional to the increase in turbine efficiency.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

- New more efficient Kaplan runner with increased flow capacity. This will further increase the maximum power output, with the power limit generally governed by the cavitation characteristics of the runner.

The performance characteristics of the uprated turbines are discussed in Section 3.3 below.

It would also be possible to install a new fixed blade propeller runner in place of the Kaplan design. This would provide increased efficiency and power, with a much lower runner cost. However output variation would be quite restrictive, with the units operating more or less at a single output. Therefore this option has not been studied in detail.

3.3 Performance Characteristics

The peak efficiency of the existing WH1 turbine is 88.1% as mentioned above. A modern Kaplan turbine operating under similar head and flow conditions would have a peak efficiency of approximately 94%. However, it is unlikely that this full efficiency increase can be achieved with only a new runner. The reason is that turbine efficiency must also encompass the spiral case, stay vanes, wicket gates and draft tube. A typical breakdown of losses for an axial flow (Kaplan or propeller) turbine is as follows:

- Runner hydraulic losses = 35% of total losses
- Runner periphery leakage losses = 5% of total losses
- Spiral case losses = 10% of total losses
- Stay vane losses = 10% of total losses
- Wicket gate losses = 10% of total losses
- Draft tube losses = 25 % of total losses
- Mechanical losses = 5% of total losses

While some modification of stay vanes is possible if necessary, the other components would be difficult to modify and as such would not be changed. Therefore a full efficiency increase to present day levels would be difficult to achieve. In particular, the turbine draft tube can have a significant effect on turbine performance.

The dimensions of the WH1 turbine components and water passages have been compared with a modern design. Also the diffusion characteristics of the draft tube have been reviewed, particularly in the critical elbow area where flow separation can negatively affect efficiency. The existing design appears to be fairly consistent with a modern turbine, as indicated in Table 3-1. The spiral case inlet diameter, as a ratio or runner diameter, appears fairly large, and this should help reduce losses. The draft tube is relatively shallow, which can be a concern. Nevertheless the diffusion characteristics of the draft tube appear to be good, with appropriate acceleration in the elbow area as illustrated on Figure 3-1.Some reduction in efficiency when compared to a modern design should also be assumed.

* Distance from runner centerline to bottom of elbow

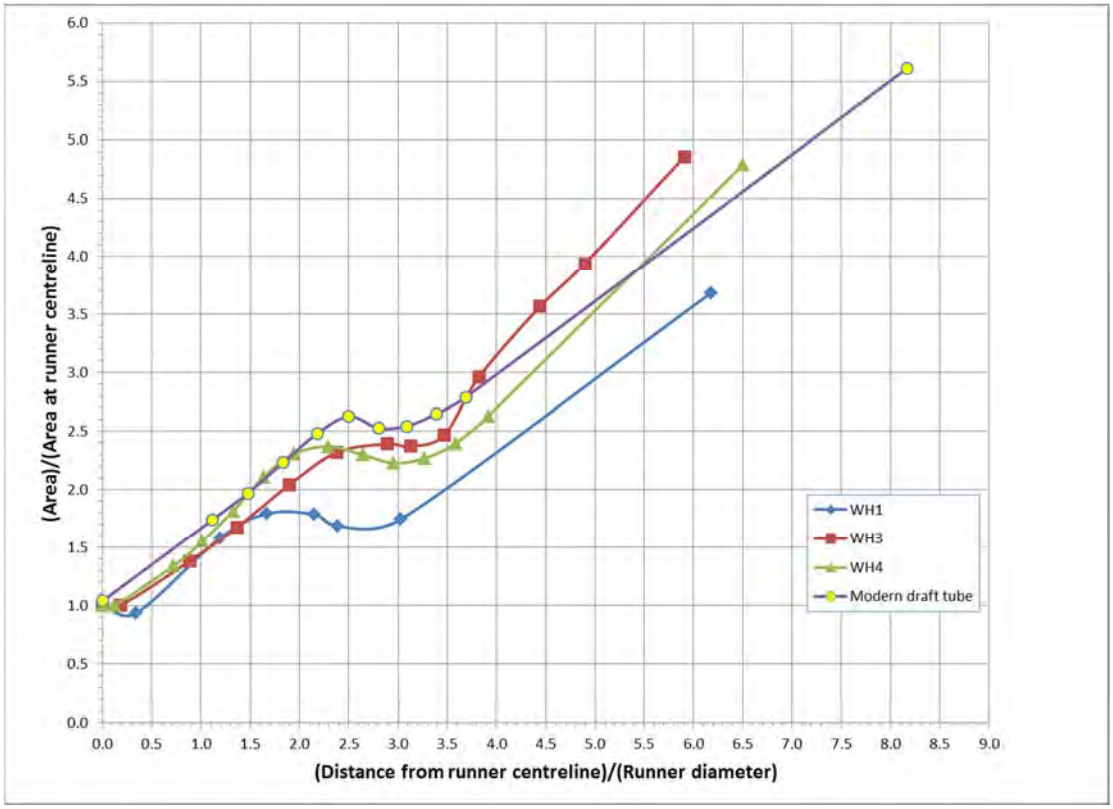

Figure 3-1: Draft Tube Characteristics

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

Figure 3-2 shows the efficiency of the existing turbine based on the testing done by HPPE, the efficiency of a modern state of the art turbine derived from model test information, and the estimated efficiency of the WH1 turbine with a new runner and possible stay vane modifications. WH3 and WH4 turbine curves are also shown for reference. The efficiency curve for the existing turbine is for the optimum wicket gate – runner blade relationship. The estimated increase in efficiency with a new runner is approximately 4%.

It is possible to replace only the runner blades, keeping the same runner hub including the internal blade operating mechanism. Equipment cost would be reduced for this option. However, it is expected that the level of efficiency increase would not match that of a complete new runner, and would perhaps be 50% of the increase as compared to a completely new runner, there would also be increased uncertainty in the performance of the new runner. Furthermore, fitting the new runner blades to the existing runner hub would require an increased outage for the uprate project as this could not be done until the existing generating unit was dismantled.

The new runner could also potentially be designed for some nominal increase in flow capacity. The limit for a potential flow increase is dictated by the cavitation characteristics of the runner as runner diameter, speed, and setting relative to tailwater level are fixed. From a review of model test information for similar turbine designs it appears that a 5 to 10% increase in flow will be possible. The higher flow runner will result in some reduction in efficiency, as losses in the spiral case, stay ring and draft tube increase with the square of the flow. Figure 3-2 also shows the estimated turbine performance for a new runner with a 10% increase in flow. The increase in energy and capacity for the various uprate options are discussed in Section 7.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

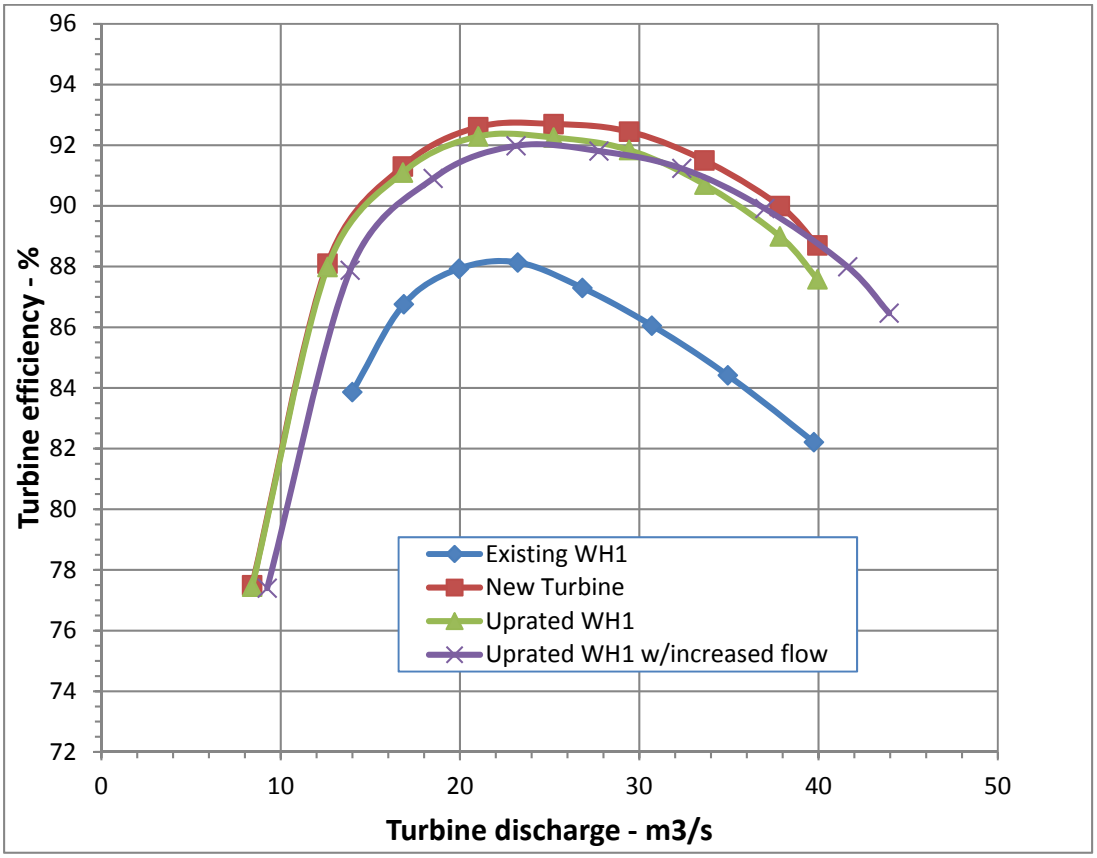

Figure 3-2: WH1 Turbine Performance

3.4 Mechanical Impacts

3.4.1 Turbine Shaft

The turbine is forged steel with an estimated outside diameter of 375 mm and inside diameter of 140 mm (both scaled from the drawing). The shaft material characteristics are not known, but a common shaft material is equivalent to ASTM A668 Class D, which has a yield strength of 260 MPa. At the present maximum turbine power of 5800 kW the torsional shear stress is 18.8 MPa, which is only 7.2% of tensile yield.

A common criterion for allowable shaft stress is for torsional shear to be 1/6 (16.7%) of yield as this provides a safety factor of 3, assuming shear yield strength is 50% of tensile yield strength. The calculated stress is significantly below this allowable stress level. Therefore the shaft should be adequate even with a substantial increase in power.

3.4.2 Turbine Guide Bearing

The load on the turbine guide bearing should not materially change with a new turbine runner. Load may actually be reduced as the new runner should have improved mechanical and hydraulic balance over the existing unit.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

3.4.3 Turbine Wicket Gate Operating Mechanism

There are two conditions that govern the wicket gate torque:

- Maximum torque to move the gates to full closed position.
- Maximum torque when opening the gates, which typically occurs in the 60 to 80% gate range.

The torque to fully close the wicket gates will remain unchanged, but the hydraulic torque to open the gates increases with the square of the flow.

It is not certain as to which torque governs the wicket gate servomotor size. Governor systems have traditionally been conservatively sized; therefore a problem is not expected. However, this would require site test verification if a new runner with increased flow capacity is selected.

On many uprated turbines, it is also necessary to increase the servomotor stroke to allow increase wicket gate opening. This is often accommodated by machining the servomotor piston or providing a new piston with adjusted length.

3.4.4 Generator Shaft

The generator shaft is forged steel with an outside diameter of 381 mm and an estimated inside diameter of 140 mm (scaled from the drawing). The shaft material is not known, but a common Westinghouse shaft material has a shear yield of 248 MPa. Allowable torsional shear will be 41 MPa. The calculated shear stress is 17.5 MPa, well below the allowable value. Therefore the shaft should be adequate even with a substantial increase in power.

3.4.5 Generator Bearings

The generator guide bearing load is dependent on the mechanical unbalance of the rotor as well as the air gap, which impacts the magnetic unbalance. Assuming that the mechanical balance and air gap meet recognized standards after the upgrade, there will be no issue with guide bearing load.

The load on the thrust bearing is equal to the weight of turbine and generator rotating parts plus the maximum hydraulic thrust. The weight of the rotating parts will be essentially unchanged. A new turbine runner could possibly be slightly heavier or lighter; however the runner weight is only a small fraction of the total weight of rotating parts. Hydraulic thrust is generally a function of the turbine runner area in plan, and this will also be unchanged. As total thrust loads will be nearly the same there should be no issues with the thrust bearing.

3.4.6 Generator Brackets

The generator brackets will not be affected by the by a turbine or generator uprate. The upper brackets support the generator floor plates. The lower bracket supports the thrust bearing and has a much higher load. However, as thrust bearing load is essentially unchanged, the lower bracket will not be affected.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

3.4.7 Generator Rotor

The normal stress levels in the rotor spider are due to the weight of the rim, the compressive stress from the interference fit of the rim, and the stress due to torque transfer between the shaft and the rotor rim. The stress due to torque transfer will be higher if turbine power increases. However, evaluation of the rotor on other Westinghouse generators of similar or earlier vintage has indicated no significant issues with increased stresses due to torque transfer.

Turbine runaway speed should not significantly change with a new runner design; therefore stresses in the rotor spider at runaway speed will be nearly the same. These stress levels are generally quite low.

With regard to the rotor rim and poles, the highest stresses occur at runaway speed, which should not materially change.

3.4.8 Generator Stator and Stator Foundation

The highest stress in the generator stator and stator foundation occur as a result of short circuit conditions or a faulty synchronization. These loads are a function of the stator dimensions and the winding configuration, and therefore should not change materially even if the generator is rewound to accommodate a higher power output.

3.5 Electrical Impacts

An overall assessment of the electrical impacts of uprating the WH1 turbine is summarized below, assuming a nominal 10% increase in power. Recommendations are described where applicable, and their associated implementation costs are included in Section 3.7. This information applies to both WH1 and WH2 generators.

3.5.1 Generator

WH1 is a 6.7 MVA umbrella type synchronous generator rated at 6.9 kV and 0.85 power factor, with a full load current of 561 A. It was manufactured in Hamilton, Ontario in 1958 by Westinghouse. The generator incorporates a type of Class B (130 °C) insulation derived using mica in combination with a synthetic resin for all windings, connections, parallel rings, and bus work. By comparison, the designed temperature rises are 60 °C, 50 °C, and 65 °C for the windings, core, and collector rings respectively given an ambient temperature of 40 °C.

For cooling, fan blades attached to the rotor rim are used to force air through the brushgear, spider, and windings of the generator. The lubrication system for the generator bearings is cooled by circulating water through copper cooling coils.

During the site inspection, WH1 and WH2 were noted to be generating at approximately 5 MVA, 6.8 kV, and unity power factor. Although this operating point is only 75% of full load, the existing thermocouples indicated an average stator temperature of only 34 °C. Given that these observations were made during the winter season when outdoor air temperatures are lower, supplied trend data from October 2015 was also reviewed. However, it was noted that

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

the generators also run relatively cool. For example, at an operating point of 6.7 MVA, 6.8 kV, and unity power factor, the stator temperature was recorded as 42.7 °C.

Per the guaranteed data in the original specifications not including excitation losses, the overall efficiency of the generator is 95.85% at full load and 0.85 power factor, and it is 96.6% at full load and unity power factor.

YEC regularly performs cleaning and testing of the generator on an annual basis. According to the latest preventative maintenance report, the stator, rotor, and neutral grounding resistor were all megger-tested with no significant issues identified. Additional instrumentation, as well as protection and control tests were also conducted and the equipment was generally found to be functioning as designed. Partial discharge test information was not available for WH1 (and WH2).

Based on the information above, WH1 should be able to generate at an uprated output that is 10% higher than its nameplate capacity without exceeding the maximum rated operating temperature of its insulation system. However, given that the generator is approximately 60 years old without yet having undergone a major overhaul YEC could take advantage of the outage required to complete the mechanical upgrade work to replace the existing stator winding and also refurbish the rotor field poles and windings. Although the longevity of the existing generator is supported by the low operating temperature and lack of heavy thermal cycling, the generator has exceeded a typical winding life of 40 years, implying increased risk of failure, which may lead to an extended unplanned outage while repairs are undertaken.

Hatch notes that the existing generator CTs (current transformers) have 600:5 A ratios and the split phase CTs have 300:5 A ratios. These instrumentation transformers will not be able to accommodate the uprated generator current and will need to be replaced.

The generator excitation system is discussed in Section 3.5.3. No work is expected for the existing neutral leads, neutral grounding resistor, and potential transformers (PTs) which will be compatible with the uprated generator.

In summary, the following work is recommended:

- Replacement of the stator windings with modern Class F insulation, improved wedging, and marginally higher efficiency.
- Refurbishment the rotor poles using modern Class F insulation, upgrade of the pole windings, and replacement of the rotor brushgear and collectors.
- Replacement of thermocouples with higher accuracy RTD (resistance temperature detectors).
- Replacement of CTs with higher current ratings.
- Replacement of aging surge arresters and capacitors (presently located within the excitation cabinet) to prevent equipment damage from fast transients and lightning surges.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

3.5.2 *Generator Main Leads*

The generator main leads connect the generator terminals to the powerhouse 6.9 kV switchgear and consist of one armoured 500 kcmil cable per phase. These cables are routed through cable trays on the Generator Floor and then enter the WH0 Control Room on the Main Floor via individual ducts for each cable in the ceiling.

Throughout their route, the cables were found to be arranged with at least one cable diameter spacing between them. If they are assumed to be rated at a conservative 75 °C operating temperature, the cables have an ampacity of at least 620 A. Thus they will be able to pass the generator's uprated current of 561 A x 1.1 = 617 A.

In summary, no work is required.

3.5.3 *Excitation System*

The excitation system consists of an original main rotary exciter as well as an upgraded pilot static exciter. The main rotary exciter is a DC generator rated 50 kW, 125 V, and, according to its nameplate, it can produce up to 400 A. The pilot exciter including the automatic voltage regulator is Basler model SR125H.

WH1 currently requires a field current of 365 A when operating at rated capacity, voltage, and power factor. If the generator capacity is uprated by 10%, the existing excitation system will not have adequate capacity to drive the required field current and voltage on a continuous basis (including a margin of at least 5% for voltage variations from the generator's rated voltage). The actual field current ratings and excitation requirements will be confirmed once the new generator winding is designed and capacity confirmed.

A replacement of the rotary excitation system with a fully static excitation system will improve the stability of the generator by enabling it to more quickly and aggressively respond to transients and abnormal system conditions. As well, a more modern system will improve reliability and operational efficiencies by providing additional diagnostics, telemetry, and redundant components. Since a complete static excitation system primarily utilizes solid state devices, there is substantially reduced maintenance. Legacy electronic components which are subject to wear and sudden failures such as rheostats and potentiometers are also eliminated.

The size of the generator field leads is currently not known. They should be verified for adequate capacity to conduct the higher generator rated field current.

In summary, the following work is recommended:

- Replacement of the excitation system with a static exciter (transformer and rectifier).

3.5.4 *Medium Voltage (6.9 kV) Switchgear*

The generator output from WH1 is connected to a vacuum generator circuit breaker in the 6.9 kV switchgear, manufactured by Rosen's Electrical Equipment, located in the Control Room. The uprated generator current of 617 A is well below the 2000 A continuous rating of the generator circuit breaker. The 6.9 kV switchgear also houses circuit breakers for a feed from the WH2 generator as well as connections to the Spillway and Substation.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

If all of the generators (WH1, WH2, WH3, and WH4) are each uprated, the fault level at this 6.9 kV switchgear is expected to marginally increase. This increased short circuit level should remain under the maximum 500 MVA (42 kA) rating of the circuit breakers.

Since annual contact resistance and megger testing of the switchgear have also indicated that there are no problems with the equipment, the 6.9 kV switchgear does not have to be upgraded at this time.

The cables between the switchgear and the Substation were not accessible for inspection. The size of these cables should be verified for adequate capacity to accommodate the higher generator current once confirmed.

Note that an arc-flash study will have to be completed to re-evaluate the resulting incident energy values and PPE (personal protective equipment) requirements.

In summary, the following work is recommended:

- Arc-flash study and re-evaluation for the switchgear.

3.5.5 Station Service

Auxiliary loads in the WH0 Powerhouse are supplied from a motor control center (MCC) which in turn is fed by a 500 kVA, 6.9 kV – 600 V station service transformer located in the Substation. The auxiliary loads include generator lift pumps, governor oil HPUs (hydraulic pressure units), glycol cooling water pumps, and HVAC (heating, ventilation, and air conditioning).

It is expected that the demands of these loads will not change significantly as a result of uprating the turbine and generator. Thus no material upgrades to the station service system are expected. In the unlikely event that new or larger starters are needed, there are spare compartments available in the existing MCC.

In summary, no work is required.

3.5.6 Step-up Transformer

There are no step-up transformers dedicated to WH1. Presently, the generator output is directed to the Whitehorse Rapids Substation, which combines generation from the hydroelectric facilities and the adjacent diesel and gas plants. At the Substation, power is transformed from 6.9 kV to 138 kV and 34.5 kV for transmission and distribution. There is no equipment at the Substation which is specific to WH1 and would require replacement with the uprating of WH1.

In summary, no work is required.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

3.6 Balance of Plant Impacts

The impact of turbine uprate on the balance of plant equipment and services would be minimal. The heat load in the powerhouse would increase approximately in direct proportion to the increase in generator power. The ventilation system summer performance in Powerhouse WH0 will require study as to its effectiveness and ventilation capacity increased as required.

Other systems should not change.

3.7 Estimated Cost and Schedule

The estimated cost in present day (2017) dollars for the two turbine uprate options are summarized in Table 3-2 below. The basis of the estimates are:

- Budget prices for new runners provided by turbine suppliers.
- Actual pricing as well as reference pricing from other comparable projects with similar equipment.
- Nominal cost allowances for small items such as servomotor pistons.

Requests for budgetary runner pricing were sent to several turbine manufacturers, and responses were received from Norcan, Andritz Hydro, Voith and GE (formerly Alstom). There was a wide range of runner prices from suppliers, and an intermediate value was selected for the cost estimate. A summary of pricing is included in Appendix C.

For the alternative where there is no turbine flow increase, the generator power level has been limited to the existing capacity. This essentially eliminates costs associated with the generator and associated electrical equipment, except for generator dismantling and re-installation costs. Given the age of the generator windings, it may be prudent to rewind the generator stator when uprating the turbine. However, as this would be a life extension activity, the generator rewind cost was not included as part of the turbine uprate cost benefit analysis.

If it is concluded that generator rewind is warranted for equipment life extension, it can be argued that the associated generator dismantling and reinstallation costs for both of the options in Table 3-2 should not be part of the turbine uprate cost. For the option with increased turbine flow capacity, the cost of generator rewind and rotor pole refurbishment would also be excluded from the turbine uprate cost. The estimated total cost attributed to turbine uprate for the two options would then be as follows:

- Same turbine flow $1,784,000
- Increased turbine flow $2,739,000

Some reduction in cost would be expected if it is decided to uprate both WH1 and WH2. The savings would likely be in the new runner supply costs, as well as stator winding supply costs.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

These costs may be about 20% less for the second unit. For schedule reasons the site work would likely occur one year apart. Therefore no significant saving on site costs are foreseen.

The total time required for an uprate program for WH1, including upfront engineering, equipment tendering, equipment procurement, is estimated to be approximately 23 months. A preliminary schedule is included in Appendix B. The unit outage time is estimated to be 4.5 months. This allows some time for turbine and generator rehabilitation work that would typically be done when the equipment is dismantled. The rehabilitation work is not attributed to the uprate; therefore it is not included in the capital cost discussed above. The schedule includes generator rewind; however it would not be significantly shortened if a rewind is not required. The outage would be scheduled appropriately to minimize cost implications to YEC from the outage. This is discussed in Section 7 and included in the cost benefit analysis in Section 8.

Table 3-2: Capital Cost Estimate for WH1 Turbine Uprate

		Same Turbine Flow	***Increased Turbine flow***
1	**Dismantling and Re-installation**		
1.1	Turbine & generator dismantling	$380,000	$380,000
1.2	Turbine & generator reinstallation and testing	$580,000	$580,000
2	**Turbine**		
2.1	New turbine runner	$530,000	$530,000

3.8 Equipment Life Considerations

The expected life of the turbine and generator equipment and the possibility of major failure can influence an uprate program. The existing equipment is approaching 60 years of age.

The WH1 turbine does not appear to be approaching the end of its useful life. As mentioned in Section 3.1, the turbines are dismantled every 10 years for overhaul. YEC personnel have not noted major problems with the turbine, and the 2016 Knight Piesold condition report does not identify significant turbine issues. Kaplan runner hub seal leakage has been noted as well as some spiral case leakage (on WH2). However, these issues should not materially affect equipment life. Cavitation damage to the turbine is reported to be manageable.

There are operating plants with Kaplan turbines dating from the 1930's, which are the earliest designs, still in use. A further 30-year operating life for the existing WH1 turbine can be foreseen.

Likewise, extended operation of the WH1 generator should be possible. There are numerous hydro generators dating from the 1920's and earlier that are still in use. The primary issue with the generator is the stator windings and, to some extent, the stator core. The existing windings are approaching 60 years in life as compared to an average generator winding life of about 40 years. This does not mean that the windings are in immediate danger of failing. Various factors influence winding life. For example, a "rule of thumb" is that a 10°C reduction in winding temperature can double winding life. WH1 temperatures are low. There are hydro generators in operation with 80-year old windings. As mentioned in Section 3.5.1, generator inspection reports indicate satisfactory generator condition. Unfortunately, there is no historical partial discharge (PDA) data to allow trending of stator winding condition.

Nevertheless, it is difficult to project the life of the generator stator, and it would be appropriate to plan for a rewind in the next 10 years. Further, as mentioned in Section 3.5.1, if a 10% increase in power output is planned, the generator stator and rotor should be rewound regardless.

4. WH3 Uprate

4.1 General / Existing Performance

WH3 went into operation in 1969. The turbine is a fixed blade propeller type; therefore unlike WH1 and WH2, it has a limited power range for efficient operation. It is the least efficient unit at the facility and therefore is the last unit operated.

The turbine is dewatered for inspection every year and there is a planned overhaul on a 10-year cycle.

In February 2003, the unit was shut down when severe turbine vibration was noted. Upon inspection, a long crack completely through one of the blades was identified extending from the trailing edge to near the leading edge of the blade. NDT inspection indicated some cracking in a similar location on the three of the other blades. A root cause assessment of the problem was made by BC Hydro, and it was concluded that the cracking was related to the age of the turbine and the number of starts and stops, possibly aggravated by material embrittlement due to welding. The cracks were repaired using a procedure prepared by BC Hydro.

The turbine has not had a major overhaul since the 2003/2004 outage for the blade cracking issue and associated repair. The runner material is carbon steel, and cavitation damage is relatively light and predominately on the pressure side of the blades. There is also some damage on the draft tube liner just below the discharge ring. Repairs are made by welding each year, generally over a 3-day period.

Efficiency tests were conducted on WH3 in 2009 by HPPE for the KGS Group. Turbine flow was measured by current meters at the intake. The tests indicated performance as follows:

- Peak turbine efficiency = 86.2%
- Peak efficiency flow = 53.8 m^3/s
- Efficiency at full load = 77.3%
- Full load flow = 62.0 m^3/s
- Full load turbine power = 8.22 MW at 17.5 m net head

The turbine has a rough operating zone between approximately 5.5 MW to 6 MW, and has increased vibration below 6 MW.

There are no major issues identified with the WH3 generator. Operating data indicates that the generator stator temperatures are fairly low.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.2 Uprate Options

It will be possible to improve the performance of WH3 by installing a new turbine runner of modern design. The uprate options include:

- New more efficient propeller runner with the same flow capacity as the existing turbine. The increase in maximum power output will be directly proportional to the increase in turbine efficiency.
- New more efficient propeller runner with increased flow capacity. This will further increase the maximum power output, with the power limit generally dictated by the cavitation characteristics of the runner.
- Retrofit the turbine with a Kaplan runner to allow operation over a wide range of flow. This has significant implications for the generator because of higher runaway speed as well as impacts to the turbine and generator shaft and the turbine discharge ring. These issues are further discussed in Section 4.4.9.

The performance characteristics of the uprated WH3 turbine are discussed in Section 4.3.

The limited operating range of the propeller runner is a disadvantage of WH3.The possibility of installing a mixed flow runner rather than a conventional fixed blade propeller runner has also been considered. The mixed flow runner has a different blade shape, generally a higher number of blades, and provides a somewhat less “peaky” efficiency curve when compared to a propeller runner. However the turbine speed, runner diameter, and head combination are not well suited to a mixed flow runner. A comparison of the WH3 and WH4 turbines with mixed flow turbines is shown in Table 4-1. A lower operating speed (N11) and lower specific speed (Nq) would be required for a mixed flow turbine design with a flatter efficiency curve. Therefore, a mixed flow runner does not appear to be a suitable option. In addition it is expected that the supply cost for a mixed flow runner would be about 10% higher than a conventional fixed blade propeller runner because of the increased length and number of blades

Table 4-1: Runner Comparison

	WH3	WH4	Cabinet Gorge U3	EB Campbell U7 and 8
Runner type	Propeller	Propeller	Mixed flow	Mixed flow
Head (m)	18.0	18.2	29.0	31.9
Runner diameter (m)	2.79	4.159	5.380	4.311
Speed (rpm)	200	150	120	120
Discharge (m^3/s)	62.0	135.2	292	293.3
Unit speed (N11)	***131.5***	***146.2***	***119.9***	***91.6***
Unit Discharge (Q11)	1.877	1.832	1.870	1.461
Specific Speed (Nq)	***180.2***	***197.9***	***164.0***	***110.7***

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.3 Performance Characteristics

The peak efficiency of the existing WH3 turbine is 86.2% as mentioned in Section 4.1. A modern propeller turbine operating under similar head and flow conditions would have a peak efficiency of about 94%. However, the same issues as discussed in Section 3.3 will limit the efficiency that can be achieved with a new runner.

The dimensions of the WH3 turbine components and water passages have been reviewed and compared with a modern design. Also the diffusion characteristics of the draft tube have been reviewed, particularly in the critical elbow area where flow separation can negatively affect efficiency. The turbine appears to be fairly consistent with a modern turbine as shown on Table 3-1 and Figure 3-1 Nevertheless, efficiency levels somewhat lower than a modern design should be assumed.

Figure 4-1 shows the efficiency of the existing turbine based on the testing done by HPPE, the efficiency of a modern state of the art turbine derived from model test information and the estimated efficiency of the WH3 turbine with a new runner and possible stay vane modifications. The estimated increase in peak efficiency with a new runner is still quite sizeable and is approximately 6%. The increase in energy and capacity for the uprate options are discussed in Section 7.

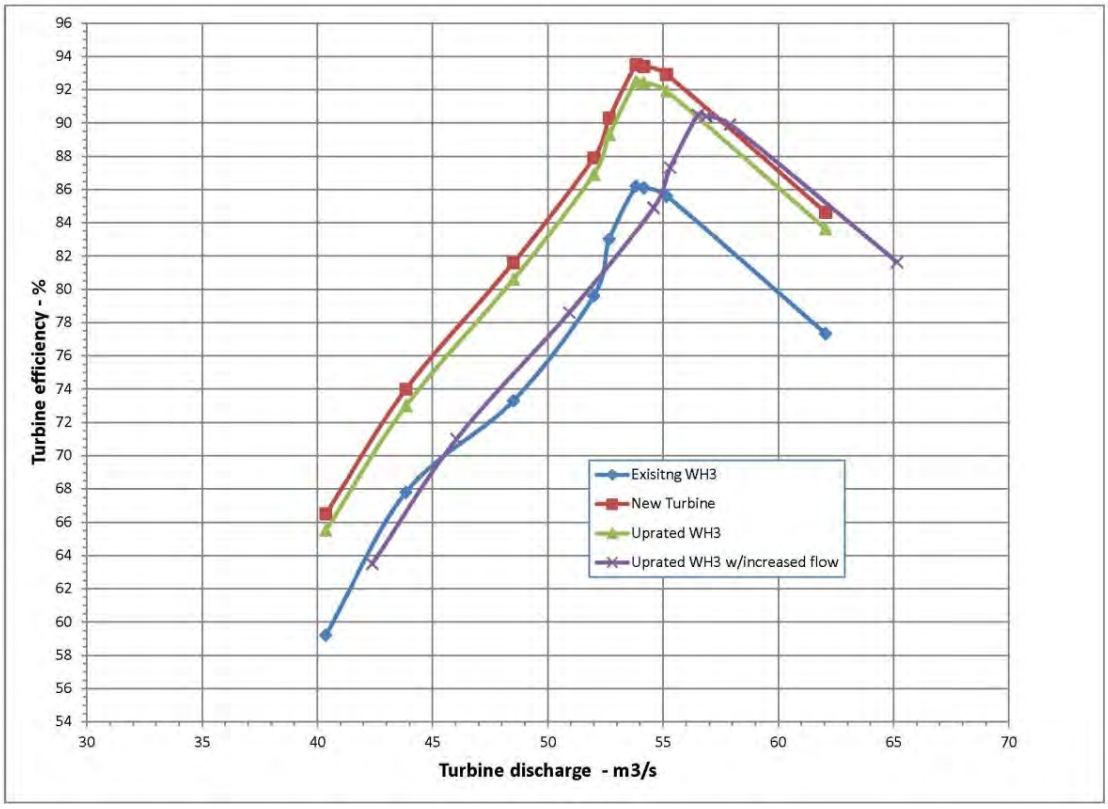

Figure 4-1: WH3 Performance

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The new runner could also be designed for some increase in flow capacity. The limit is dictated by cavitation characteristics, as the runner diameter, speed, and setting relative to tailwater level are fixed. From a review of model test information for similar turbine designs, it appears that a 5% increase in flow will be possible. The higher flow runner will result in some reduction in efficiency, as losses in the spiral case, stay ring and draft tube increase with the square of the flow. Figure 4-1 also shows the estimated turbine performance for a new runner with a 5% increase in flow.

Installation of a Kaplan runner in place of the fixed blade propeller runner is possible, but there are significant mechanical impacts as discussed in Section 4.4. A performance curve for a Kaplan runner is shown on Figure 4-2. The increase in energy and capacity for the uprate options are discussed in Section 7.

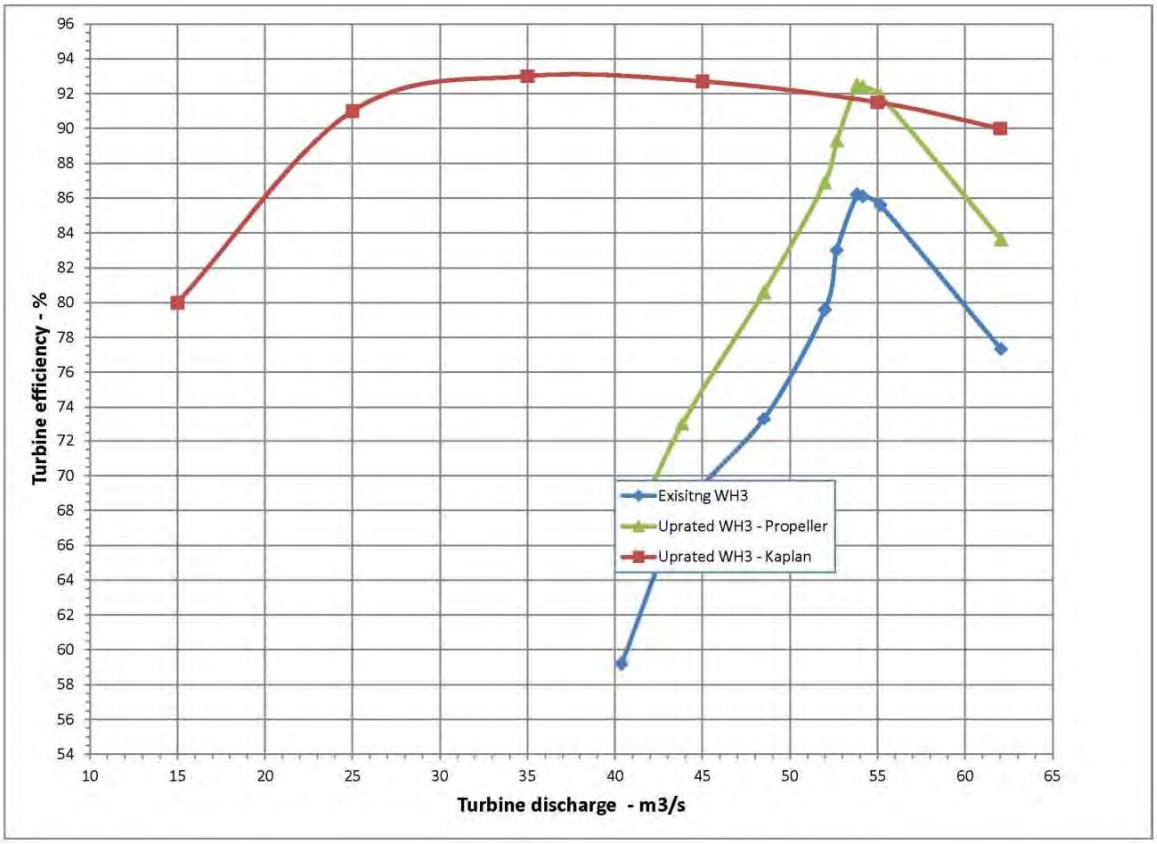

Figure 4-2: WH3 Kaplan and Propeller Runners

4.4 Mechanical Impacts

The mechanical issues relating to uprating the WH3 turbine are reviewed in the sections below. The issues associated with a new propeller runner are addressed in Section 4.4.1 to Section 4.4.8. The additional implications for installation of a Kaplan runner are discussed in Section 4.4.9.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.4.1 *Turbine Shaft*

The turbine is forged steel with an outside diameter of 356 mm. From the drawings, the shaft appears to have no inner bore. The shaft material characteristics are not known, but a common shaft material is equivalent to ASTM A668 Class D, which has a yield strength of 260 MPa. At the present maximum turbine power of 8220 kW, the torsional stress is 44.5 MPa which is which is 17.1 % of tensile yield.

A common criterion for allowable shaft stress is for torsional stress to be 1/6 (16.7%) of yield as this provides a safety factor of 3, assuming shear yield strength is 50% of tensile yield strength. The calculated stress is above this value. If turbine power is increased by 10%, the stress levels would be 18.8% of yield or 13% over the criteria. This may still be suitable but is becoming marginal. A review of the files to determine actual shaft strength is recommended depending on the level of uprate. A new shaft with higher strength steel could also be procured; however this is unusual on turbine uprate projects. A new shaft would have the same diameter as the existing shaft to avoid impacting the guide bearing and shaft seal design.

4.4.2 *Turbine Guide Bearing*

The load on the turbine guide bearing should not materially change with a new turbine runner. Load may actually be reduced if the new runner should have more accurate mechanical and hydraulic balance.

4.4.3 *Turbine Wicket Gate Operating Mechanism*

There are two conditions that govern the wicket gate torque:

- Maximum torque to move the gates to full closed position.
- Maximum torque when opening the gates, which typically occurs in the 60 to 80% gate range.

The torque to fully close the wicket gates will remain unchanged, but the hydraulic torque to open the gates increases with the square of the flow.

It is not certain as to which torque governs the wicket gate servomotor size. Governor systems have traditionally been conservatively sized; therefore a problem is not expected. However this would require site test verification if a new runner with increased flow capacity is selected.

On some uprated turbines it is necessary to increase the servomotor stroke to allow increase wicket gate opening. This is often accommodated by machining the servomotor piston or providing a new piston with adjusted length.

4.4.4 *Generator Shaft*

The generator shaft is forged steel with a diameter of 356 mm, the same as the turbine shaft. Therefore the issues discussed above for the turbine shaft will apply.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.4.5 *Generator Bearings*

The generator guide bearing load is dependent on the mechanical unbalance of the rotor as well as the air gap, which impacts the magnetic unbalance. Assuming that the mechanical balance and air gap meet recognized standards after the upgrade, there will be no issue on guide bearing load.

The load on the thrust bearing is equal to the weight of turbine and generator rotating parts plus the maximum hydraulic thrust. The weight of the rotating parts will be essentially unchanged. A new turbine runner could possibly be slightly heavier or lighter; however the runner is only a small fraction of the total weight of rotating parts. Hydraulic thrust is generally a function of the turbine runner area in plan, and this will also be unchanged. As total thrust loads will be neatly the same, there should be no issues with the thrust bearing.

4.4.6 *Generator Brackets*

The generator brackets will not be affected by the by a turbine or generator uprate. The upper brackets support the generator floor plates. The lower bracket supports the thrust bearing and has a much higher load. However, as thrust bearing load is unchanged, the lower bracket will not be affected.

4.4.7 *Generator Rotor*

The normal stress levels in the rotor spider are due to the weight of the rim, the compressive stress from the interference fit of the rim, and the stress due to torque transfer between the shaft and the rotor rim. The stress due to torque transfer will be higher if turbine power increases. However, evaluation of the rotor on other GE generators of similar or earlier vintage has indicated no significant issues with increased stresses due to torque transfer.

Turbine runaway speed should not significantly change with a new runner design; therefore stresses in the rotor spider at runaway speed will be nearly the same. These stress levels are generally quite low.

With regard to the rotor rim and poles, the highest stresses occur at runaway speed, which should not materially change.

4.4.8 *Generator Stator and Stator Foundation*

The highest stress in the generator stator and stator foundation occur during short circuit conditions or on faulty synchronization. These loads are a function of the stator dimensions and the winding configuration, and therefore should not change materially even if the generator is rewound for higher power output.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.4.9 Impacts of a Kaplan Runner

Replacement of the propeller runner with a Kaplan design will significantly increase the operating range of WH3. However, the Kaplan runner will have a number of additional impacts on the equipment, as summarized below:

- Modification to the bottom half of the discharge ring should be made to create a spherical surface that matches the runner blades as they rotate.
- New turbine shaft with internal bore for the oil piping to the runner blade servomotor.
- Possible head cover modifications to suit the Kaplan runner hub.
- New generator shaft with internal bore for the oil piping to the runner blade servomotor.
- Oil head to be mounted on top of the generator.
- Modifications to the generator collector.
- Possible thrust bearing upgrade as hydraulic thrust may increase by approximately 20%.
- Address higher runaway speed, as discussed below.
- Provide a blade positioner to operate the runner blades or provide a completely new governor that has both wicket gate and runner blade control features.

The effect of higher runaway speed on the generator would require careful study. The runaway speed of the propeller design is about 200% of synchronous speed, while a Kaplan turbine is typically 250% to 275% of synchronous speed. Stresses in the pole to rim connection vary with the square of the speed; therefore stress levels will be increased 55% to 90% when a Kaplan runner is installed. As stresses at runaway speed usually govern the design, it is reasonable to assume that the existing generator was not designed for the increased runaway speed.

It is likely that the existing rotor spider would be adequate to withstand the increased runaway speed; however it is expected that a new rotor rim and poles would need to be procured and as a result this option carries substantial cost implications. On some units, centrifugal mechanical over-speed protection has been provided. The device directs oil to the runner blade servomotors to move the blades to a steep position where runaway speed is lower. This is not the ideal approach as there are implications of reduced reliability/safety; however, maximum “off cam” runaway speed where the blades and gates are unsynchronized should not occur. The overspeed protection device is designed to be as failsafe as possible.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.5 Electrical Impacts

An overall assessment of the electrical impacts of uprating the WH3 turbine is summarized below, assuming a nominal 10% increase in power. Recommendations are described where applicable, and their associated implementation costs are included in Section 4.7.

4.5.1 Generator

WH3 is a 9.4 MVA umbrella type synchronous generator rated at 6.9 kV and 0.85 power factor, with a full load current of 787 A. It was manufactured in Peterborough, Ontario in 1968 by General Electric. The generator incorporates a type of Class B (130 °C) insulation made of asphalt mica for all windings, connections, parallel rings, and bus work. By comparison, the designed temperature rise is 60 °C for the windings given an ambient temperature of 40 °C.

For cooling, fan blades attached to the rotor are used to force air through the brushgear, spider, and windings of the generator. The lubrication system for the generator bearings is cooled by circulating water through copper cooling coils.

During the site inspection, WH3 was noted to be generating at approximately 8 MVA, 6.8 kV, and unity power factor. Although this operating point is only 85% of full load, thermocouples indicated an average stator temperature of only 40 °C. Given that these observations were made during the winter season when outdoor air temperatures are lower, supplied trend data from October 2015 was also inspected. However, it was noted that the generators also run fairly cool. For example, at an operating point of 8.8 MVA, 6.9 kV, and 0.99 power factor, the stator temperature is 47.0 °C.

Per the guaranteed data in the original specifications not including excitation losses, the overall efficiency of the generator is 96.5% at full load and 0.85 power factor.

YEC regularly performs cleaning and testing of the generator annually. According to the latest preventative maintenance report, the stator, rotor, and neutral grounding resistor were all megger-tested to be without problems. Additional instrumentation, as well as protection and control tests were also conducted and the equipment was found to be functioning as designed. Partial discharge test information was not available for WH3.

Based on the information above, WH3 should be able to generate at an uprated value of 10% higher than its nameplate capacity without exceeding the maximum operating temperature of its insulation. However, given that the generator is approximately 50 years old without yet having undergone a major overhaul, it would make sense to take advantage of the outage required to complete the mechanical upgrade work to also replace the existing stator winding and also refurbish the rotor field poles and windings. Although the longevity of the existing generator is supported by the low operating temperature and reduced run time compared to the other units, the generator has exceeded a typical winding life of 40 years, implying increased risk of failure, which may lead to an extended unplanned outage while repairs are undertaken.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The generator excitation system is discussed in Section 4.5.3. No work is expected for the existing neutral leads, neutral grounding resistor, CTs, and PTs which will be compatible with the uprated generator.

In summary, the following work is recommended:

- Replacement of the stator windings with modern Class F insulation, improved wedging, and marginally higher efficiency.
- Refurbishment the rotor poles using modern Class F insulation, upgrade of the pole windings, and replacement of the rotor brushgear and collectors.
- Replacement of thermocouples with higher accuracy RTD (resistance temperature detectors).
- Replacement of aging surge arresters and capacitors (presently located within the excitation cabinet) to prevent equipment damage from fast transients and lightning surges.

4.5.2 Generator Leads

The generator leads connect the generator terminals to the powerhouse 6.9 kV switchgear and consist of two armoured 500 kcmil cables per phase. These cables are routed through cable trays on the Generator Floor and then enter the WH0 Control Room on the Main Floor via individual ducts for each cable in the ceiling.

Throughout their route, the cables were found to be arranged with at least one cable diameter spacing between them. If they are assumed to be rated at a conservative 75 °C operating temperature, the cables have an ampacity of at least 1240 A. Thus they will be able to pass the generator's uprated current of 787 A x 1.1 = 866 A.

In summary, no work is required.

4.5.3 Excitation System

The excitation system consists of an original main rotary exciter as well as an upgraded pilot static exciter. The main rotary exciter is a DC generator rated 70 kW, 125 V, and, according to its nameplate, it can produce up to 580 A. The pilot exciter including the automatic voltage regulator is Basler model SR125E.

WH3 currently requires a field current of 550 A when operating at rated capacity, voltage, and power factor. If the generator capacity is uprated by 10%, the existing excitation system will not have adequate capacity to drive the required field current and voltage on a continuous basis (including a margin of at least 5% for voltage variations from the generator's rated voltage). The exact field current ratings and excitation requirements will be confirmed once the new generator is designed.

Hatch notes that a replacement of the rotary excitation system with a fully static excitation system will improve the stability of the generator by enabling it to more quickly and aggressively respond to transients and abnormal system conditions. As well, a more modern

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

system will improve reliability and operational efficiencies by providing additional diagnostics, telemetry, and redundant components. Since a complete static excitation system primarily utilizes solid state devices, there is substantially reduced maintenance. Legacy electronic components which are subject to wear and sudden failures such as rheostats and potentiometers are also eliminated.

The size of the field leads is currently not known. They should be verified for adequate capacity to conduct the higher generator rated field current.

In summary, the following work is recommended:

- Replacement of the excitation system with a static exciter (transformer and rectifier).

4.5.4 Medium Voltage (6.9 kV) Switchgear

The generator output from WH3 is connected to a vacuum generator circuit breaker in a dedicated 6.9 kV switchgear cubicle, manufactured by Rosen's Electrical Equipment, located in the Control Room. The uprated generator current of 866 A is well below the 2000 A continuous rating of the generator circuit breaker. The load side of this circuit breaker is connected to the Substation.

If all of the generators (WH1, WH2, WH3, and WH4) are each uprated, the fault level at this 6.9 kV switchgear is expected to marginally increase. This increased short circuit level should remain under the maximum 500 MVA (42 kA) rating of the circuit breaker.

Since annual contact resistance and megger testing of the switchgear have also indicated that there are no problems with the equipment, the 6.9 kV switchgear does not have to be upgraded.

The cables between the switchgear and the Substation were not accessible for inspection. The size of the cables should be verified for adequate capacity to conduct the higher generator current.

Note that an arc-flash study will have to be completed to re-evaluate the resulting incident energy values and PPE (personal protective equipment) requirements.

In summary, the following work is recommended:

- Arc-flash study and re-evaluation for the switchgear.

4.5.5 Station Service

The WH3 station service loads are connected to the same MCC and source as the WH1 configuration. Refer to Section 3.5.5 for more information.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

4.5.6 Step-up Transformer

There are no step-up transformers dedicated to WH3. Presently, power outputted by the generator is directed to the Whitehorse Rapids Substation, which combines generation from the hydroelectric facilities and the adjacent diesel and gas plant. At the substation, power is transformed from 6.9 kV to 138 kV and 34.5 kV for transmission and distribution. There is no equipment at the substation which is specific to WH3 and needs to be replaced in coordination with uprating WH3.

In summary, no work is required.

4.6 Balance of Plant Impacts

The impact of turbine uprate on the balance of plant equipment and services would be minimal. The heat load in the powerhouse would increase approximately in direct proportion to the increase in generator power. The ventilation system summer performance in Powerhouse WH0 will require study as to its effectiveness and ventilation capacity increased as required.

Other systems should not change.

4.7 Estimated Cost

The estimated cost in present day (2017) dollars for the three turbine uprate options are summarized in Table 4-2. The basis of the estimates are as given in Section 3.7 for WH1. As discussed for WH1 for the uprate option with no increase in turbine power, no allowance is made for generator rewind. For energy estimates, power has been limited to the existing generator capacity.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

Table 4-2: Capital Cost Estimate for WH3 Turbine Uprate

		Same Turbine Flow	*Increased Turbine flow*	*Kaplan Runner*
1	**Dismantling and Re-installation**			
1.1	Turbine & generator dismantling	$425,000	$425,000	$425,000
1.2	Turbine & generator reinstallation and testing	$725,000	$725,000	$725,000
2	**Turbine**			
2.1	New turbine runner	$760,000	$760,000	$1,250,000
2.2	Stay vane modications	$130,000	$130,000	$130,000
2.3	New servomotor pistons		$20,000	
2.4	Discharge ring modifications			$450,000
2.5	New turbine shaft			$120,000
2.6	Head cover modifications			$40,000
2.7	Blade postioner and oil head			$250,000
2.8	Overspeed protection device			$80,000
3	**Generator**			
3.1	Replace stator windings		$1,500,000	$1,500,000
3.2	Refurbish rotor poles		$400,000	$400,000
3.3	Replace thermocouples with RTD's		$25,000	$25,000
3.4	Replace surge arrestors & capacitors		$100,000	$100,000
3.5	New generator shaft			$120,000
3.6	Thrust beating upgrade			$100,000
3.7	Collector ring modifications			$20,000
4	**Exciter**			
4.1	Replace exciter		$500,000	$500,000
5	**6.9 kV Switchgear**			
5.1	Arc flash evaluation		$10,000	$10,000
6	**Balance of plant**			
6.1	Ventilation system upgrade		$40,000	$40,000
	Subtotal	$2,040,000	$4,635,000	$6,285,000
	Contingency (15%)	$306,000	$695,250	$942,750
	Construction cost	$2,346,000	$5,330,250	$7,227,750
	Engineering and administration (10%)	$234,600	$533,025	$722,775
	Estimated total cost	**$2,580,600**	**$5,863,275**	**$7,950,525**

WH3 was last overhauled in 2003/2004. If it is assumed that the turbine uprate work would be done during the next overhaul and the costs for turbine and generator dismantling and reinstallation are included as part of the overhaul, the turbine uprate costs will be reduced. Similarly, if generator rewind costs are assigned to life extension, the cost for stator and rotor work can also be excluded from the turbine uprate cost. The estimated total cost attributed to turbine uprate for the three options would then be as follows:

- No change in turbine flow $1,177,000
- Increased turbine flow $2,024,000
- Kaplan runner $4,112,000

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The total time required for the turbine uprate is estimated to be 24 months, only marginally longer than for WH1. A preliminary schedule is included in Appendix B. A schedule for a Kaplan runner installation has not been developed; however, it is anticipated that the schedule would be increased by two months for the Kaplan option.

4.8 Equipment Life Considerations

The expected life of the turbine and generator equipment and the possibility of major failure can influence an uprate program. The same considerations discussed in Section 3.8 for WH1 apply to WH3. The WH3 turbine is newer than WH1 and WH2, and no near term end of useful life is foreseen. It appears that the severe blade cracking issues on the turbine runner have been addressed 13 years ago with no recurring problems.

The WH3 generator is also newer than WH1 and WH2. Therefore extended operation should be possible. The primary issue with the generator is the stator windings and, to some extent, the stator core. The existing windings are approaching 50 years in life as compared to an average generator winding life of about 40 years. This does not mean that the windings are in immediate danger of failing. Nevertheless, it is difficult to project the life of the generator stator. As mentioned in Section 4.5.1, if a 10% increase in power output is planned, the generator stator and rotor should be rewound.

5. WH4 Uprate

5.1 General / Existing Performance

Unit WH4 went into operation in 1984 and is the newest unit at the Whitehorse station. The turbine is a fixed blade propeller type; therefore unlike WH1 and WH2, it has a limited power range for efficient operation. The turbine is dewatered for inspection every year and there is a planned overhaul on a 10-year cycle.

The last major overhaul of the turbine was in 2007, and another overhaul is planned for 2017.

Performance of the WH4 turbine is based on index tests conducted in 1984, shortly after the unit went into operation. The estimated performance was as follows:

- Peak turbine efficiency = 93.0%
- Peak efficiency flow = 128.4 m^3/s
- Efficiency at full load = 91.2%
- Full load flow = 135.2 m^3/s
- Full load turbine power = 22 MW at 18.2 m net head

Unlike WH1 and WH3, the WH4 site testing did not include actual turbine flow measurements. Therefore the efficiency numbers are based on the assumption that actual efficiency equals that predicted by the turbine model.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

Because of rough operation and vibration, the unit is restricted to power levels above approximately 16 MW in summer when tailrace levels are high, and 18 MW in winter when tailwater levels are lower.

There are no major issues that have been identified with the WH4 generator. Operating data indicates that the generator stator temperatures are fairly low.

Refer to Hatch report H354082-00000-260-066-0001 - Yukon Energy - Whitehorse Generating Station Unit WH4 Capacity Increase Desktop Study - June 2017 for additonal information pertaining to the potential uprate of WH4.

5.2 Uprate Options

It will be possible to improve the performance of WH4 by installing a new turbine runner of modern design. The uprate options include:

- New more efficient propeller runner with the same flow capacity as the existing turbine. The increase in maximum power output will be directly proportional to the increase in turbine efficiency.
- New more efficient propeller runner with increased flow capacity. This will further increase the maximum power output, with the power limit generally dictated by the cavitation characteristics of the runner.
- Retrofit the turbine with a Kaplan runner to allow operation over a wide range of flow. This has significant implications with the generator because of higher runaway speed as well as impacts to the turbine and generator shaft and the turbine discharge ring, similar to a possible Kaplan installation in WH3.

The performance characteristics of the uprated WH4 turbine are discussed in Section 5.3.

A mixed flow runner has also been considered for WH4. However, for the reasons discussed in Section 4.2 the mixed flow design is unsuitable for this installation.

5.3 Performance Characteristics

The peak efficiency of the existing WH4 turbine is 93 % as mentioned in Section 5.1. A modern propeller turbine operating under similar head and flow conditions would have a peak efficiency of about 94%. However, because of limitations with the turbine fixed parts, as discussed in Section 3.3, the efficiency that can be achieved with a new runner may not reach this level.

The dimensions of the WH4 turbine components and water passages are close to a modern design. The draft tube is also similar to a modern design. This is illustrated in Table 3-1 and on Figure 3-1.

Figure 5-1 shows the efficiency of the existing turbine based on the index testing done in 1984, the efficiency of a modern state of the art turbine derived from model test information,

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

and the estimated efficiency of the WH4 turbine with a new runner and possible stay vane modifications. The increment is quite small. However, it is possible that the actual efficiency of the present WH4 turbine is slightly lower than estimated.

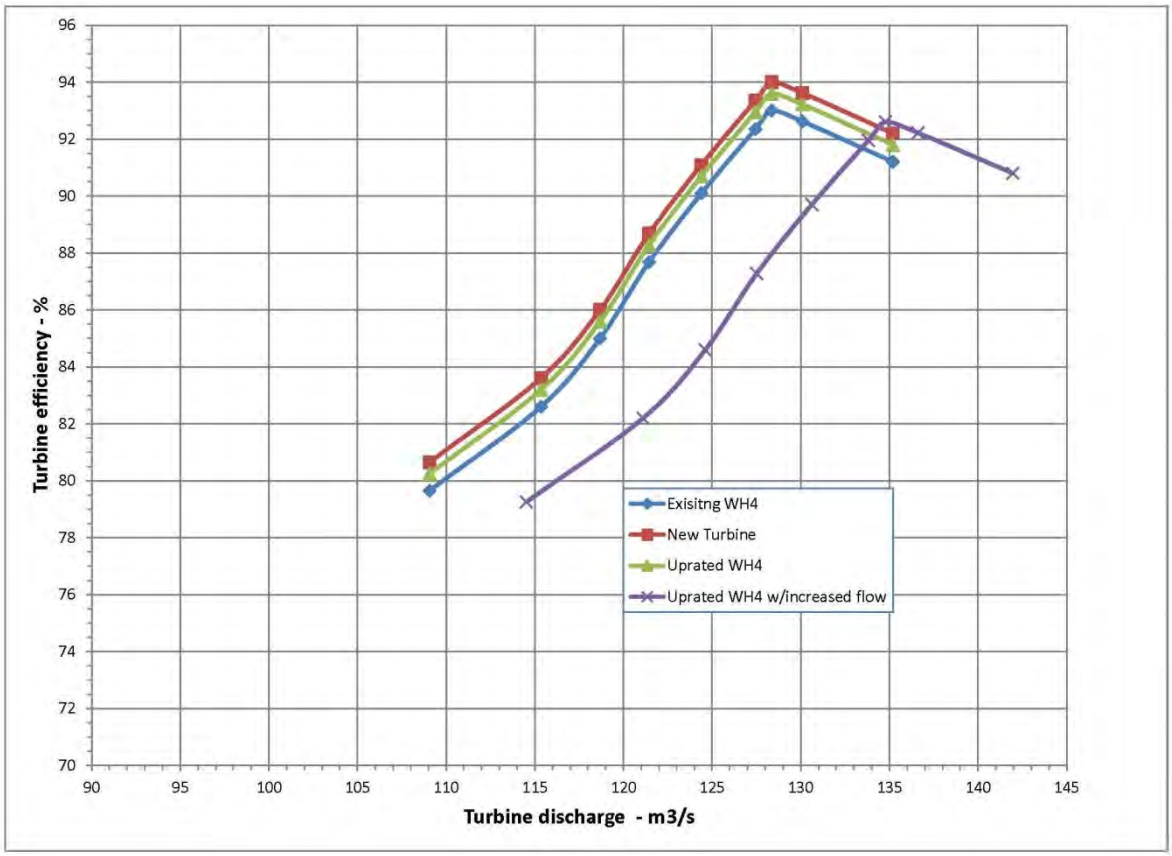

Figure 5-1: WH4 Performance

The new runner could also be designed for some increase in flow capacity. The limit for the turbine is dictated by cavitation characteristics, as the runner diameter, speed, and setting relative to tailwater level are fixed. From a review of model test information for similar turbine designs, it appears that a 5% increase in flow will be possible. The higher flow runner will result in some reduction in efficiency, as losses in the spiral case, stay ring and draft tube increase with the square of the flow. Figure 5-1 also shows the estimated turbine performance for a new runner with a 5% increase in flow.

A higher flow runner needs to be considered with caution, given that intake flow conditions are less than ideal and surface vortices are already evident. The vortices are related to the cross flow caused by spillway discharges as well as the intake submergence. An assessment of submergence using a common empirical formula indicates the submergence should be deeper. For increased turbine flow the requirement for an intake vortex suppressor should be evaluated.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

Installation of a Kaplan runner in place of the fixed blade propeller runner is possible, but there are significant mechanical impacts as discussed in Section 4.4. A performance curve for a Kaplan runner is shown on Figure 5-2.

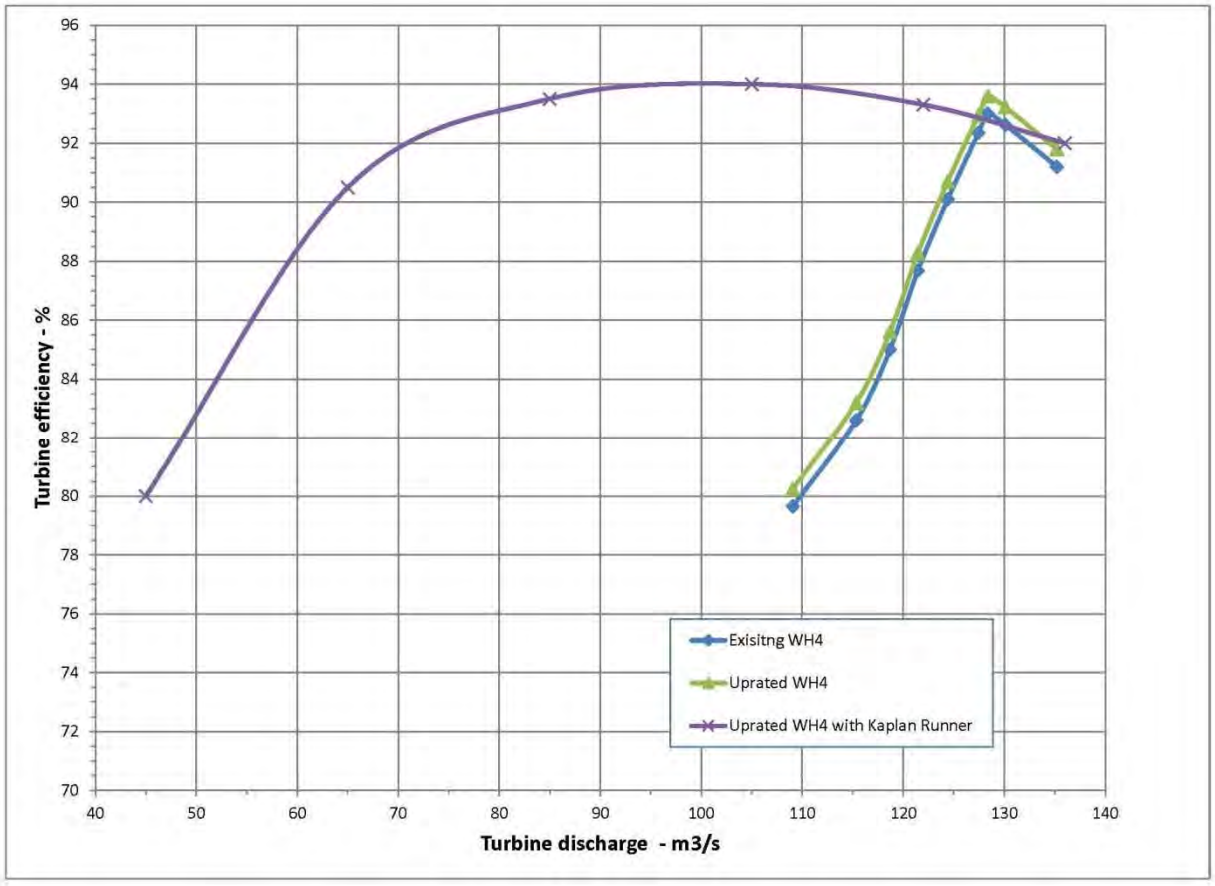

Figure 5-2: WH4 Kaplan and Propeller Runners

5.4 Mechanical Impacts

A review of the mechanical issues uprating to turbine uprate is summarized in the subsections below. Sections 5.4.1 to 5.4.8 address the issues with a new propeller runner. The additional implications for installation of a Kaplan runner are discussed in Section 5.4.9.

5.4.1 Turbine Shaft

The turbine is forged steel with an outside diameter of 546 mm and an inside diameter of 152 mm. The drawings indicate that shaft material is ASTM A668 Class D, which has a yield strength of 260 MPa. At the present maximum turbine power of 22,000 kW the torsional stress is 44.1 MPa which is which is 17 % of tensile yield.

A common criterion for allowable shaft stress is for torsional stress to be 1/6 (16.7%) of yield as this provides a safety factor of 3, assuming shear yield strength is 50% of tensile yield

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

strength. The calculated stress is marginally above this value. If turbine power is increased by 5%, the stress levels would be 17.9% of yield or 7% over the criteria. This would be considered satisfactory.

5.4.2 Turbine Guide Bearing

The load on the turbine guide bearing should not materially change with a new turbine runner. Load may actually be reduced because the new runner has more accurate mechanical and hydraulic balance.

5.4.3 Turbine Wicket Gate Operating Mechanism

There are generally two conditions that govern the wicket gate torque:

- Maximum torque to move the gates to full closed position.
- Maximum torque when opening the gates, which typically occurs in the 60 to 80% gate range.

The original commissioning data indicated a problem with wicket gate stall when moving in the closing direction at very high gate openings. For this reason the 100% gate opening was adjusted to a lower position. The turbine power guarantee was still achieved at the reduced gate opening. For an option with increased turbine flow, a means of increasing the servomotor closing force is required. This could be new servomotors of slightly larger capacity or perhaps springs that provide added closing force from maximum gate opening.

5.4.4 Generator Shaft

The generator shaft is forged steel with a diameter of 356 mm, the same as the turbine shaft. Stress levels will be the same as in the turbine shaft.

5.4.5 Generator Bearings

The generator guide bearing load is dependent on the mechanical unbalance of the rotor as well as the air gap, which impacts the magnetic unbalance. Assuming that the mechanical balance and air gap meet recognized standards after the upgrade, there will be no issue on guide bearing load.

The load on the thrust bearing is equal to the weight of turbine and generator rotating parts plus the maximum hydraulic thrust. The weight of the rotating parts will be essentially unchanged. A new turbine runner could be possibly slightly heavier or lighter; however, the runner weight is only a small fraction of the total weight of rotating parts. Hydraulic thrust is generally a function of the turbine runner area in plan, and this will also be unchanged. As total thrust loads will be nearly the same there should be no issues with the thrust bearing.

5.4.6 Generator Brackets

The generator brackets will not be affected by the by a turbine or generator uprate. The upper brackets support the generator floor plates. The lower bracket supports the thrust bearing and has a much higher load. However, as thrust bearing load is unchanged, the lower bracket will not be affected.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

5.4.7 *Generator Rotor*

The normal stress levels in the rotor spider are due to the weight of the rim, the compressive stress from the interference fit of the rim, and the stress due to torque transfer between the shaft and the rotor rim. The stress due to torque transfer will increase if turbine power increases. However, evaluation of the rotor on other GE generators of similar vintage has indicated no significant issues with increased stresses due to torque transfer.

Turbine runaway speed should not significantly change with a new runner design; therefore stresses in the rotor spider at runaway speed will remain unchanged. These stress levels are generally quite low.

With regard to the rotor rim and poles, the highest stresses occur at runaway speed, which should not materially change.

5.4.8 *Generator Stator and Stator Foundation*

The highest stress in the generator stator and stator foundation occur on short circuit conditions or of faulty synchronization. These loads are a function of the stator dimensions and the winding configuration, and therefore should not change even if the generator is rewound for higher power output.

5.4.9 *Impacts of a Kaplan Runner*

Replacement of the propeller runner with a Kaplan design will significantly increase the operating range of WH4. However, the Kaplan runner will have a number of additional impacts on the equipment, as summarized below:

- Modification to the bottom half of the discharge ring should be made to create a spherical surface that matches the runner blades as they rotate.
- New turbine shaft with internal bore for the oil piping to the runner blade servomotor.
- Possible head cover modifications to suit the Kaplan runner hub.
- New generator shaft with internal bore for the oil piping to the runner blade servomotor.
- Oil head to be mounted on top of the generator.
- Modifications to the generator collector.
- Possible thrust bearing upgrade as hydraulic thrust may increase by about 20%.
- Address higher runaway speed, as discussed below.
- Provide a blade positioner to operate the runner blades or provide a completely new governor that has both wicket gate and runner blade control features.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The effect of higher runaway speed on the generator would require careful study. The runaway speed of the propeller design is about 200% of synchronous speed, while a Kaplan turbine is typically 250% to 275% of synchronous speed. Stresses in the pole to rim connection vary with the square of the speed; therefore stress levels will be increased 55% to 90% when a Kaplan runner is installed. As stresses at runaway speed usually govern the design, it is reasonable to assume that the existing generator was not designed for the increased runaway speed.

It is likely that the existing rotor spider would be adequate to withstand the increased runaway speed; however it is expected that a new rotor rim and poles would need to be procured and as a result this option carries substantial cost implications. On some units, centrifugal mechanical over-speed protection has been provided. The device directs oil to the runner blade servomotors to move the blades to a steep position where runaway speed is lower. This is not the ideal approach as there are implications of reduced reliability/safety; however maximum “off cam” runaway speed where the blades and gates are unsynchronized should not occur. The overspeed protection device is designed to be as failsafe as possible.

5.5 Electrical Impacts

An overall assessment of the electrical impacts of uprating the WH4 turbine is summarized below. Recommendations are described where applicable, and their associated implementation costs are included in Section 5.7.

5.5.1 Generator

WH4 is a 23.6 MVA umbrella type synchronous generator rated at 6.9 kV and 0.85 power factor, with a full load current of 1975 A. It was manufactured in Peterborough, Ontario in 1983 by General Electric. The generator incorporates Class F (155 °C) insulation for all windings, connections, parallel rings, and bus work. By comparison, the designed temperature rise is 60 °C for the windings, given an ambient temperature of 40 °C.

For cooling, fans attached to the rotor are used to force air through the brushgear, spider, and windings of the generator. The lubrication system for the generator bearings is cooled by circulating water through copper cooling coils. The generator is also equipped with air-to-water heat exchangers.

During the site inspection, WH4 was noted to be generating at approximately 19 MVA, 6.9 kV, and 0.96 power factor. Although this operating point is only 80% of full load, thermocouples indicated an average stator temperature of only 65 °C. Given that these observations were made during the winter season when outdoor and cooling water temperatures are lower, supplied trend data from October 2015 was also inspected. However, it was noted that the generators also run cool. For example, at an operating point of 19.5 MVA, 6.8 kV, and 0.99 power factor, the stator temperature was 68.4 °C.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

Per guaranteed data in the specifications not including excitation losses, the overall efficiency of the generator is 97.26% at full load and 0.85 power factor, and 97.89% at full load and unity power factor.

YEC regularly performs cleaning and testing of the generator annually. According to the latest preventative maintenance report, the stator, rotor, and neutral grounding resistor were all megger-tested and no issues were identified. Additional instrumentation, as well as protection and control tests were also conducted and the equipment was found to be functioning as designed. Partial discharge (PD) tests were last conducted in April 2016 and found that WH4 was exhibiting minor levels of PD which are typically not a concern but should be monitored.

Based on the information above, WH4 is able to generate at an uprated value of 5% higher than its nameplate capacity without exceeding the maximum operating temperature of its insulation. Given that the generator is only thirty years old and it is also equipped with a higher rated temperature class of insulation, no major upgrades to the stator windings and rotor windings or poles are necessary.

The generator excitation system is discussed in Section 5.5.3. No work is expected for the existing neutral leads, neutral grounding resistor, CTs, and PTs which will be compatible with the uprated generator.

In summary, no work is required.

5.5.2 Generator Leads

The generator leads connect the generator terminals to the powerhouse 6.9 kV switchgear and consist of three armoured 500 kcmil cables per phase. These cables are routed through cable trays on the Generator Floor and then enter the switchgear on the Main Floor via individual ducts for each cable in the ceiling.

Throughout their route, the cables were found to be arranged with one cable diameter spacing between them. Since the WH4 installation is more modern, the cables are assumed to be rated with a 90°C operating temperature which yields an ampacity of 2100 A. Thus they will be able to pass the generator's uprated current of 1975 A x 1.05 = 2074 A.

In summary, no work is required.

5.5.3 Excitation System

The excitation system consists of an excitation transformer and static exciter rectifier. While the transformer is built by Polygon and rated at 720 kVA, 6.9 kV – 465 V, the rectifier is manufactured by General Electric (type Silcomatic IV) with a 153 VDC, 1090 A continuous, and 1576 A 30-second output. The exciter is also capable of outputting a ceiling voltage of 600 VDC at 985 A.

Given that the WH4 generator presently has a rated field current of 1050 A at rated capacity, voltage, and power factor, an uprating of the generator by 5% will overload the continuous capabilities of the existing excitation system. An additional margin of at least 5% for voltage variations from the generator's rated voltage should also be designed in. Thus, the exciter

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

rectifier will need to be replaced, but it is possible to retain the exciter transformer because its capacity appears to be sufficient.

The size of the field leads is currently not known. They should be verified for adequate capacity to conduct the higher rated generator field current.

In summary, the following work is recommended:

- Replacement of the exciter rectifier with a model capable of higher current output.

5.5.4 Medium Voltage (6.9 kV) Switchgear

The generator output from WH4 is connected to a vacuum generator circuit breaker in a dedicated 6.9 kV switchgear cubicle, manufactured by Schneider Electric, located on the Main Floor. The uprated generator current of 2074 A is well below the 3000 A continuous rating of the generator circuit breaker. The load side of this circuit breaker is connected to a step-up transformer directly outside of the Powerhouse.

If all of the generators (WH1, WH2, WH3, and WH4) are each uprated, the fault level at this 6.9 kV switchgear is expected to marginally increase. This increased short circuit level remains under the maximum 500 MVA (42 kA) rating of the circuit breaker.

Since annual contact resistance and megger testing of the switchgear have also indicated that there are no problems with the equipment, the 6.9 kV switchgear does not need to be upgraded.

The cables between the switchgear and the Substation were not accessible for inspection. The size of these cables should be verified for adequate capacity to conduct the higher generator current.

Note that an arc-flash study will have to be completed to re-evaluate the resulting incident energy values and PPE (personal protective equipment) requirements.

In summary, the following work is recommended:

- Arc-flash study and re-evaluation for the switchgear.

5.5.5 Station Service

Auxiliary loads in the Powerhouse are supplied from an MCC which in turn is fed by a 500 kVA, 6.9 kV – 600 V station service transformer located on the Main Floor. The auxiliary loads include generator lift pumps, governor oil HPUs (hydraulic pressure units), glycol cooling water pumps, and HVAC (heating, ventilation, and air conditioning).

It is expected that the demands of these loads will not change significantly as a result of uprating the turbine and generator. Thus no material upgrades to the station service system are expected. In the unlikely event that new or larger starters are required, there are spare compartments available in the existing MCC.

In summary, no work is required.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

5.5.6 Step-up Transformer

A dedicated oil-filled step-up transformer (T9) adjacent to the Powerhouse steps up the voltage of the WH4 generator from 6.9 kV to 138 kV. It has a capacity rating of 18 MVA (ONAN) and 24 MVA (ONAF).

The transformer was manufactured in 1983 and has undergone insulation and oil analysis by Orbis in May 2016. The test report states that “T9 has already served 34 years in continuous service [and] this transformer is a critical asset as it allows WH4 to connect on to the entire system with WH4 being considered a ‘backbone’ generator for the entire YEC system.” It further recommends that the transformer be replaced in the next five years in order to avoid the risk of a forced outage. Given that this transformer will also be slightly overloaded to 25 MVA if WH4 is uprated by 5%, the replacement of this transformer would also be justified.

There is a short transmission line span between the step-up transformer and the Substation. By visual inspection from the ground, the size of this line is estimated to be at least 300 kcmil, which has an ampacity of 400 A. Due to the relatively small amount of current which is conducted by this line (i.e., 100 A), Hatch believes that this existing line will not need to be upgraded even if WH4 is uprated. However, the actual capacity and condition of this line should be confirmed.

In summary, the following work is recommended:

- Replace step-up transformer.

5.6 Balance of Plant Impacts

The impact of turbine uprate on the balance of plant equipment and services would be relatively small. The cooling water flow may need to be upgraded to accommodate added heat load on the generator heat exchangers. As the generator is totally enclosed, the increase in powerhouse ventilation load should be very small.

Other systems should not change.

5.7 Estimated Cost

The estimated cost in present day (2017) dollars for the two turbine uprate options are summarized in Table 5-1. The basis of the estimate is the same as described in Section 3.7 for WH1.

The next WH4 overhaul is scheduled for this year. This work will include the installation of a new generator rotor spider. It is unlikely that this work would be delayed to allow procurement a new runner for turbine uprate. Therefore turbine and generator dismantling and re-installation costs cannot be omitted from the turbine uprate costs.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

Because the WH4 unit is larger than WH1 and WH3, the overall schedule is slightly longer than the schedule for the other units. Two schedules are included in Appendix B, one for a new propeller runner and one for a conversion to a Kaplan unit. The preliminary schedule for the propeller runner is approximately 27 months and it is 29 months for the Kaplan. The Kaplan schedule is understandably longer because of added time for runner manufacture and increased site work for items such as the discharge ring modifications.

Table 5-1: Capital Cost Estimate for WH4 Turbine Uprate

		Same Turbine Flow	*Increased Turbine flow*	*Kaplan Runner*
1	**Dismantling and Re-installation**			
1.1	Turbine & generator dismantling	$710,000	$710,000	$710,000
1.2	Turbine & generator reinstallation and testing	$1,080,000	$1,080,000	$1,080,000
2	**Turbine**			
2.1	New turbine runner	$1,400,000	$1,400,000	$2,250,000
2.2	Stay vane modications	$180,000	$180,000	$180,000
2.3	New servomotor pistons		$40,000	
2.4	Discharge ring modifications			$900,000
2.5	New turbine shaft			$180,000
2.6	Head cover modifications			$50,000
2.7	Blade positioner and oil head			$360,000
2.8	Overspeed protection device			$100,000
3	**Generator**			
3.1	Replace stator windings			
3.2	Refurbish rotor poles			
3.3	Replace thermocouples with RTD's			
3.4	Replace surge arrestors & capacitors			
3.5	New generator shaft			$180,000
3.6	Thrust bearing upgrade			$120,000
3.7	Collector ring modifications			$25,000
3	**Generator Leads**			
4.1	Replace generator leads			
5	**Exciter**			
5.1	Replace exciter		$500,000	$500,000
6	**6.9 kV Switchgear**			
6.1	Arc flash evaluation		$10,000	$10,000
7	**Step-up Transformer**			
7.1	Replace step-up transformer		$1,500,000	$1,500,000
8	**Balance of plant**			
8.1	Upgrade cooling water system		$60,000	$60,000
	Subtotal	$3,370,000	$5,480,000	$8,205,000
	Contingency (15%)	$505,500	$822,000	$1,230,750
	Construction cost	$3,875,500	$6,302,000	$9,435,750
	Engineering and administration (10%)	$387,550	$630,200	$943,575
	Estimated total cost	**$4,263,050**	**$6,932,200**	**$10,379,325**

5.8 Equipment Life Considerations

WH4 is the newest of the units at the WGS, and as such has a longer projected life. There have been issues with the generator rotor spider in recent years and these are being addressed with the installation of a new spider design later this year.

There are no turbine issues that threaten to shorten the equipment life and, as discussed in Section 5.5.1 rewind of the generators in the near term does not appear necessary, even with a nominal increase in turbine power.

6. Conversion of WH3 to Operate as a Synchronous Condenser

6.1 Conceptual Design

An evaluation has been made of the requirements and associated costs for converting WH3 to allow operation as a synchronous condenser for reactive power support. Hydro units are often ideally suited for synchronous condenser operation, and this is achieved by motoring the unit synchronized to the grid with the turbine runner spinning in air to reduce the motoring power.

Conversion of WH3 would include addition of a compressed air system with air receiver and associated piping valves and controls to allow depressing the tailwater level to approximately 1.5 m below the bottom of the runner. A conceptual design has been developed for the system, which includes:

- An 11 m^3/min 700 kPa rotary screw compressor.
- A 12 m^3 air receiver.
- Piping from the air receiver to the turbine pit with multiple connections in the turbine head cover for air admission. If possible, the piping will partly use the existing turbine vent piping. However, if not possible, additional air openings will be added to the head cover.
- Control valves and air release valves for initiating the tailwater depression and for refilling the runner area with water.
- Water level sensing piping and controls at the draft tube access door for sensing the water level in the draft tube and controlling admission of “make-up” air.
- Modification of the generating unit controls to initiate and control tailwater depression and to disable reverse power protection when the unit is operating as a synchronous condenser.

The piping from the air receiver to the turbine would be sized to allow the water level to be depressed below the bottom of the runner in approximately 10 seconds. This would minimize power transients or spikes when initiating tailwater depression and synchronous condenser operation.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

When operating as a synchronous condenser, the power requirement motoring the unit is estimated to be approximately 800 kW.

Possible locations for the new equipment have been reviewed, as space within the powerhouse is limited. The air receiver in particular is quite large in size. The best location may be on the main generator floor, although two half size tanks could possibly be located on the turbine floor between WH3 and WH2. A higher pressure system (2000 kPa) to reduce air receiver size has also been evaluated; however the equipment cost is higher.

It would also be possible to combine the tailwater depression system with the existing service air system for the powerhouse. However, considering that a reliable service and brake air system will still be required, the savings with this approach appear to be minimal. Such an option could be revisited if the concept proceeds beyond the preliminary study phase.

6.2 Mechanical Impacts

Mechanical impacts, in addition to the new compressed air system described above, include:

- Connecting the air supply to the existing turbine head cover vent piping.
- Addition of water level instrumentation at the draft tube door.

It is important to manage water leakage at the wicket gates during synchronous condenser operation in order to minimize the make-up compressed air supply and to keep the power requirements for motoring the generator at a minimum. At the time of the site visit, it was mentioned by YEC that wicket gate nose-to-tail clearances are good and end (top and bottom) clearances are minimum. Therefore it is assumed that gate leakage would not be an issue.

6.3 Electrical Impacts

Electrical impacts are primarily control related, and include:

- Modifications to the existing generator control PLC program to process synchronous condenser air and water level instrumentation and valve control, air admission valve control, air exhaust valve control, generator operational interlocks, governor control logic changes, and new alarms.
- Disabling reverse power protection.
- Addition of control switches at the local generator control panels and interfaces at the remote control center to switch the generator into and out of sync condense mode.

The control system modifications would not be a minor item as considerable reverse-engineering of the existing software may be necessary, in addition to implementation and testing of the new code and overall design.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

6.4 Balance of Plant Impacts

Except for the items mentioned in Section 6.3 above no balance of plant impacts are foreseen.

6.5 Estimated Cost

The estimated cost for conversion of WH3 for synchronous condenser operation is presented in Table 6-1. Equipment supply prices were obtained from suppliers. Installation, control system modification and miscellaneous costs are internal estimates.

Table 6-1: Capital Cost Estimate for WH3 as Synchronous Condenser

		Estimated Cost
1	**Equipment Supply**	
1.1	Air compressor	$35,000
1.2	Air receiver	$16,000
1.3	Piping and valves	$8,000
1.4	Instrumentation	$4,000
2	**Installation**	
2.1	Install compressor and receiver	$25,000
2.2	Piping, valve & instrument installation	$24,000
2.3	Connection to existing piping and draft tube	$3,000
2.4	Instrumentation wiring	$3,000
3	**Turbine-Generator Control Modifications**	
3.1	Control modifications	$100,000
	Subtotal	$218,000
	Contingency (15%)	$32,700
	Construction cost	$250,700
	Engineering and administration (15%)	$37,300
	Estimated total cost	**$288,000**

7. Potential Energy Increase

7.1 Hydrology and Water Levels

7.1.1 Background Information

Flow data for the Yukon River at Whitehorse is available from the Water Survey of Canada flow gauge 09AB001 in Whitehorse, with daily flow records since 1944. There is a significant seasonal variation in river flow, as illustrated in Figure 7-1.

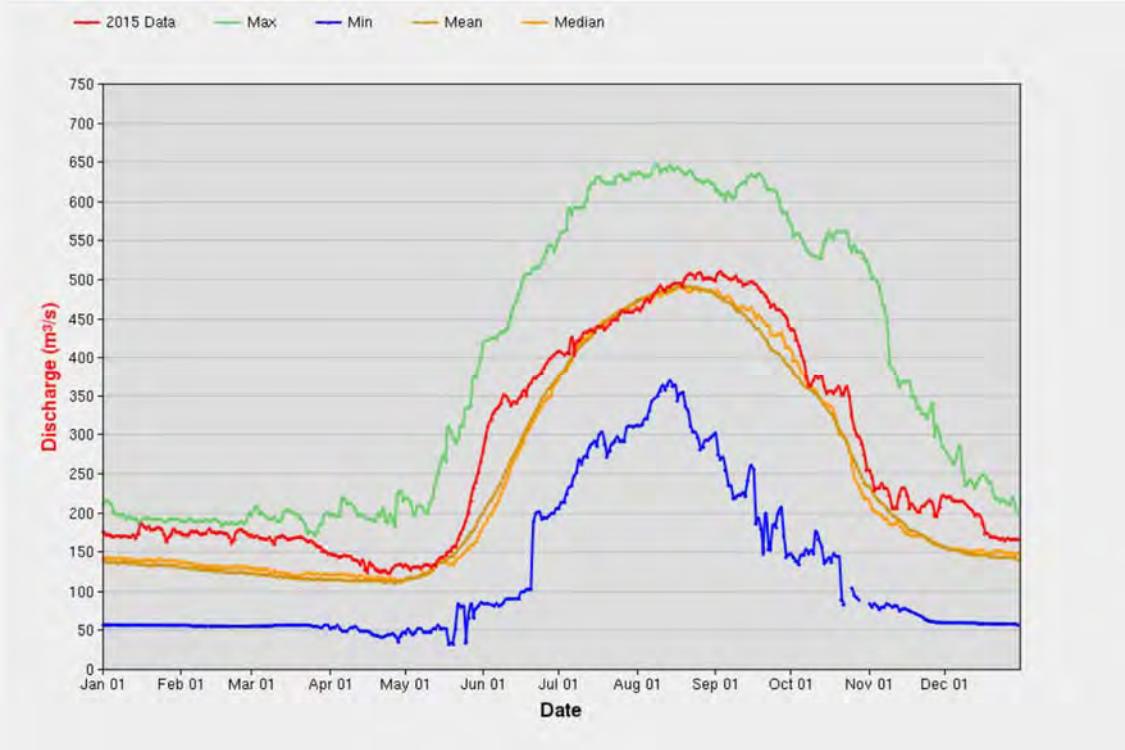

Figure 7-1: Yukon River Flows at Whitehorse

Monthly flow duration curves based on daily data are shown on Figure 7-2 and Figure 7-3.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

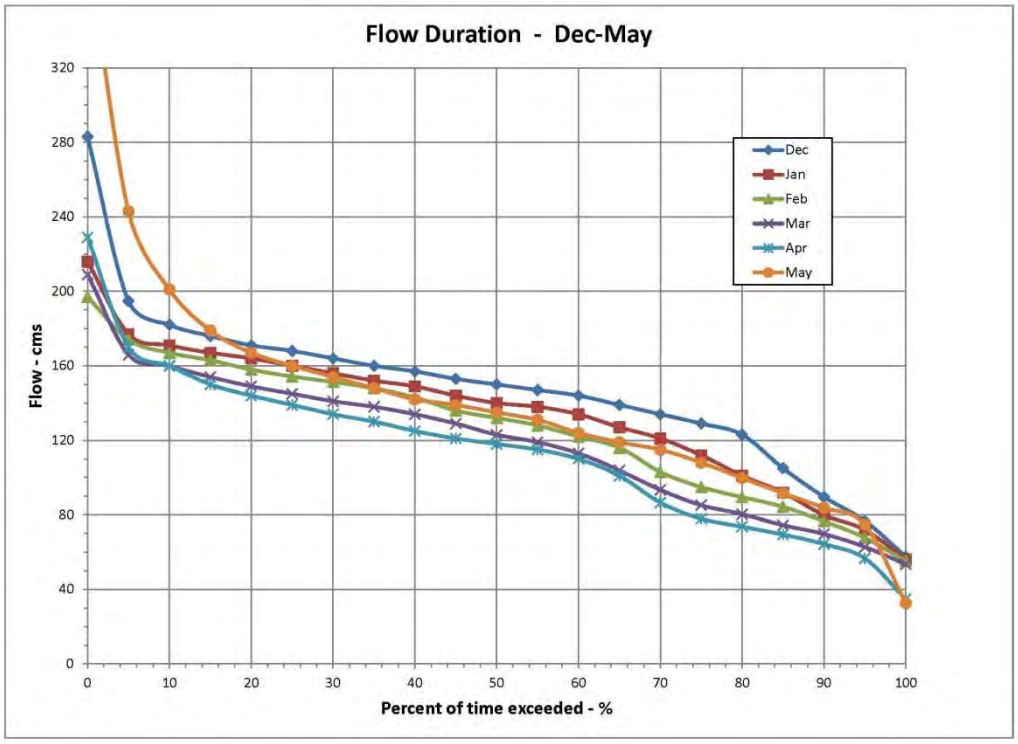

Figure 7-2: Monthly Flow Duration – Dec-May

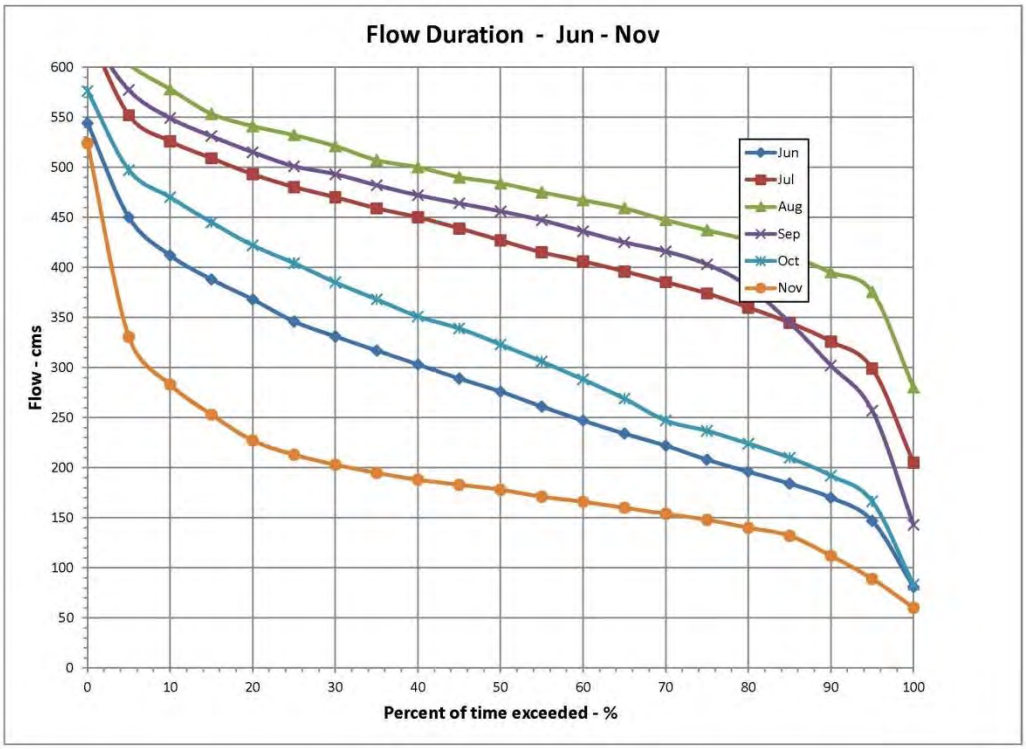

Figure 7-3: Monthly Flow Duration – Jun-Nov

Ver: 04.03

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The headwater level at the WGS is held constant at El 653.1 m.

Tailwater level at Powerhouse W0 varies with plant discharge as well as the downstream lake level. A plot of tailwater level versus plant discharge is shown on Figure 7-4. The tailwater level at WH4 is higher because of the head loss in the tailrace channel as well as the river bed profile at the channel exit. In addition, the fish screens that are installed at the end of the channel in the summer months increase the tailwater levels by about 0.4 m. The difference between the WH4 tailwater and the WH0 tailwater levels versus WH4 discharge is shown on Figure 7-5.

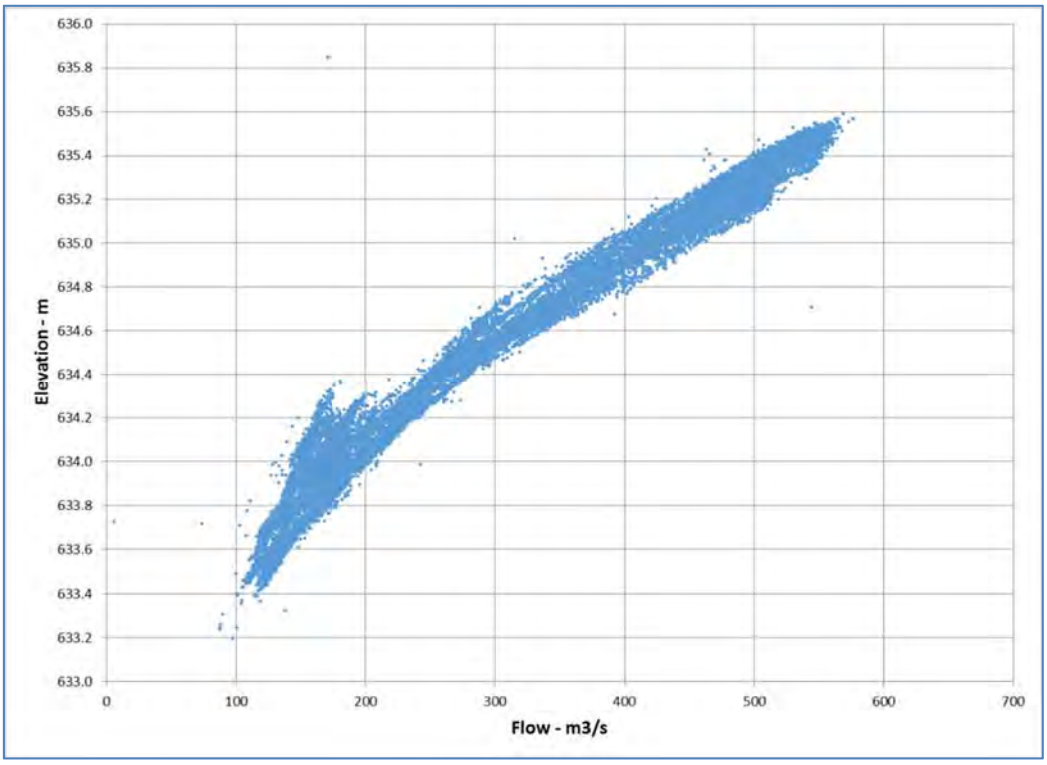

Figure 7-4: Tailwater level at WH0 powerhouse

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

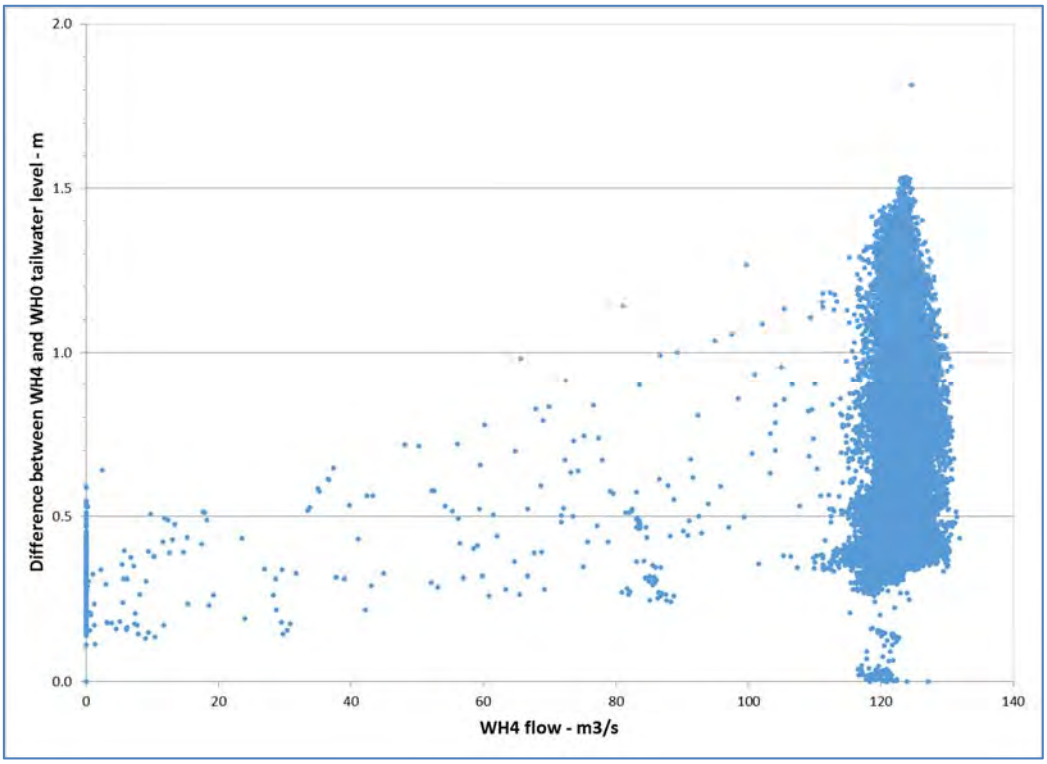

Figure 7-5: Difference between WH4 and WH0 tailwater levels

7.1.2 Representative Hydrologic Sequences

The uprate study for WGS requires YEC's complete generation system to be analyzed. Therefore the Marsh Lake flows in the Aishihik and Mayo rivers must be considered, in addition to the Yukon River flow. The available hydrology for the three rivers covers different periods, with the fourteen years between 1981 to 1994 being the overlapping period for all three rivers. To determine if the 14 overlapping years is adequate for the system study, each year in the 1951 to 1994 available hydrology was ranked from the wettest to driest, and the distribution of the 1981 to 1994 years was examined.

As seen in the table below, the 1981 to 1994 flows (shown in bold) cover the range of the entire record well. However, there are more occurrences of wet years. Therefore, the duration curve of the daily flows for the 1981 to 1994 series was compared with that of the entire 1951 to 1994 record. As indicated on Figure 7-6, the two curves match well at both the upper and lower end, with the 1981 to 1994 series being only slightly higher in the mid-range. Therefore, the 14 years are a good representation of the hydrology of the three rivers.

7.2 System Load

YEC's power system operates as an isolated grid where generation equals power demand and the generating units must regulate system frequency and provide voltage support to the system. YEC has provided three load scenarios for monthly power demands that included projected load forecasts until 2035. The three Load Scenarios, designated 1, 3 and 4 are illustrated on Figure 7-7 to Figure 7-9.

Load Scenario 1 represents today's power demand with relatively small projected load increases over the next 20 years. Load Scenarios 3 and 4 reflect increased mining development in the region, whereby power requirements increase much more rapidly but peak in the 2025 to 2030 timeframe, with loads in 2035 similar to Scenario 1.

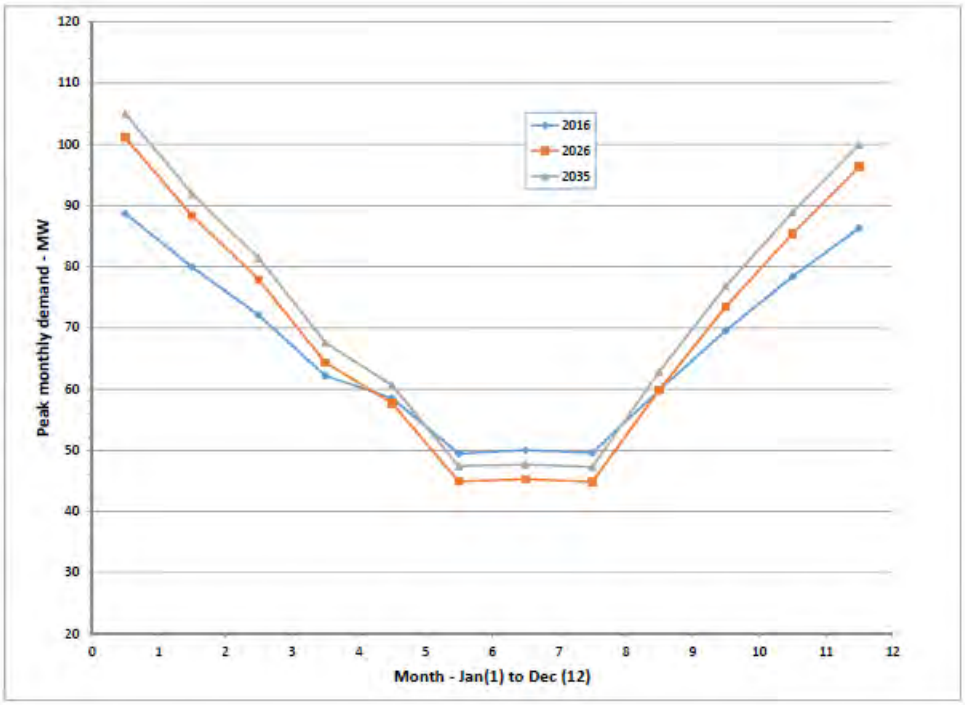

Figure 7-7: Load Scenario 1 Power Demand

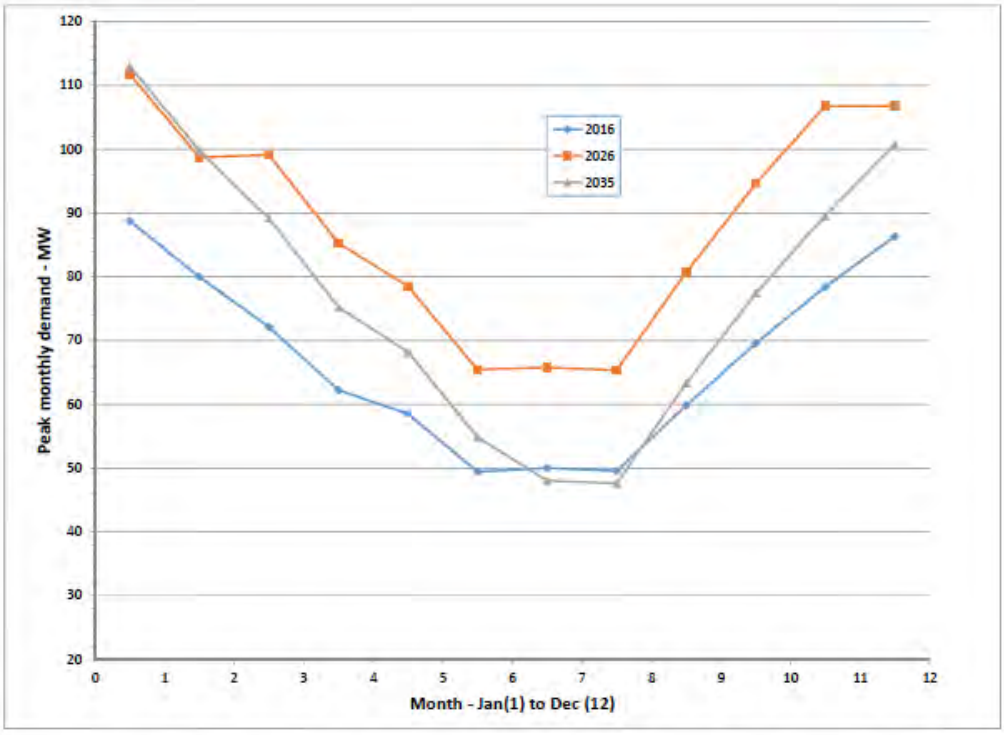

Figure 7-8: Load Scenario 3 Power Demand

Ver: 04.03

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

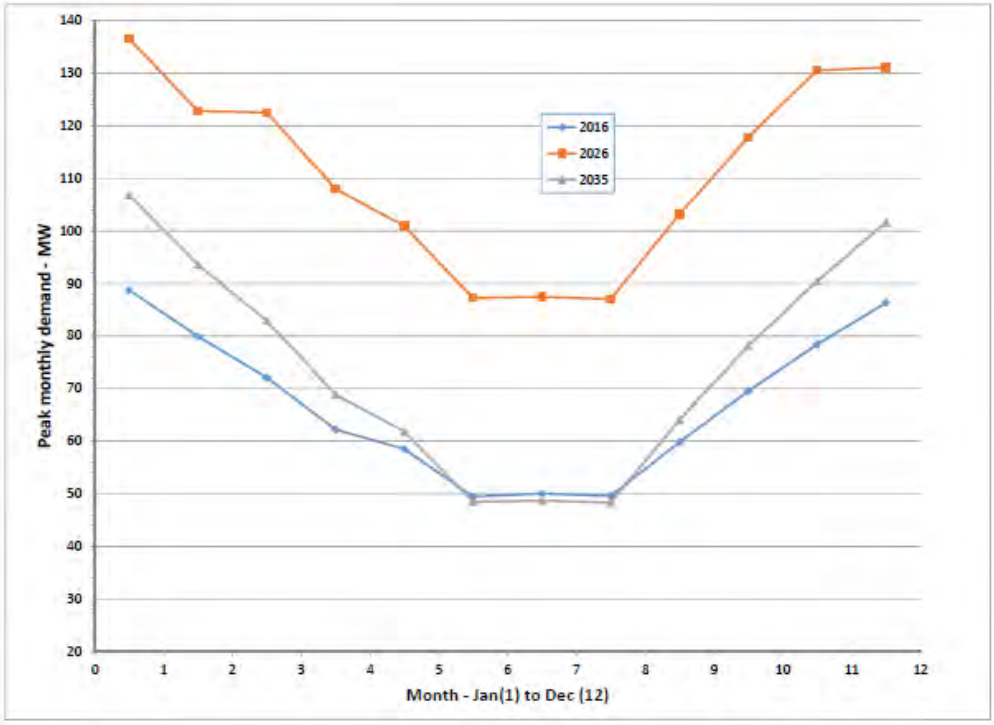

Figure 7-9: Load Scenario 4 Power Demand

The forecasts for these three Load Scenarios, which included both average monthly energy requirements and peak power demands are included in Appendix D.

At present virtually all power and energy demand is met with YEC's hydro units, with thermal (diesel and LNG) units utilized during peak periods, particularly in winter when energy demands are high due to heating load, and available flow for hydro generation is low. There is also increased thermal generation when hydro units are out of service. The benefit of uprating the hydro units is a reduction in thermal generation and the cost savings associated with this.

7.3 Method of Analysis

To assess the energy gains that would occur with unit upgrade options, a YEC system simulation was undertaken. To define detailed system operation for the status quo facilities, and for unit upgrade options, a simulation was undertaken for the load year 2020.

The simulation included the complete generation system, namely:

- Whitehorse (WH1, WH2, WH3 and WH4)
- Aishihik

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

- Mayo
- Diesel/LNG plants.

While the small wind generator and ATCO Electric's Fish Lake hydro also provide energy to the YEC grid, these generating facilities are small; therefore they were not included in the energy model.

The Vista Decision Support System (Vista DSS™) was employed, specifically the LT Vista module, which evaluates operation for numerous hydrologic sequences (14 representative sequences as discussed in Section 7.1.2). A daily time-step was utilized, with each day further subdivided into three sub-periods (peak, off-peak, premium peak). The sub-periods were developed from hourly load forecasts for 2017 provided by YEC. Figure 7-10 shows examples of hourly load forecast (from YEC) and the sub-period simulation used in the VISTA model.

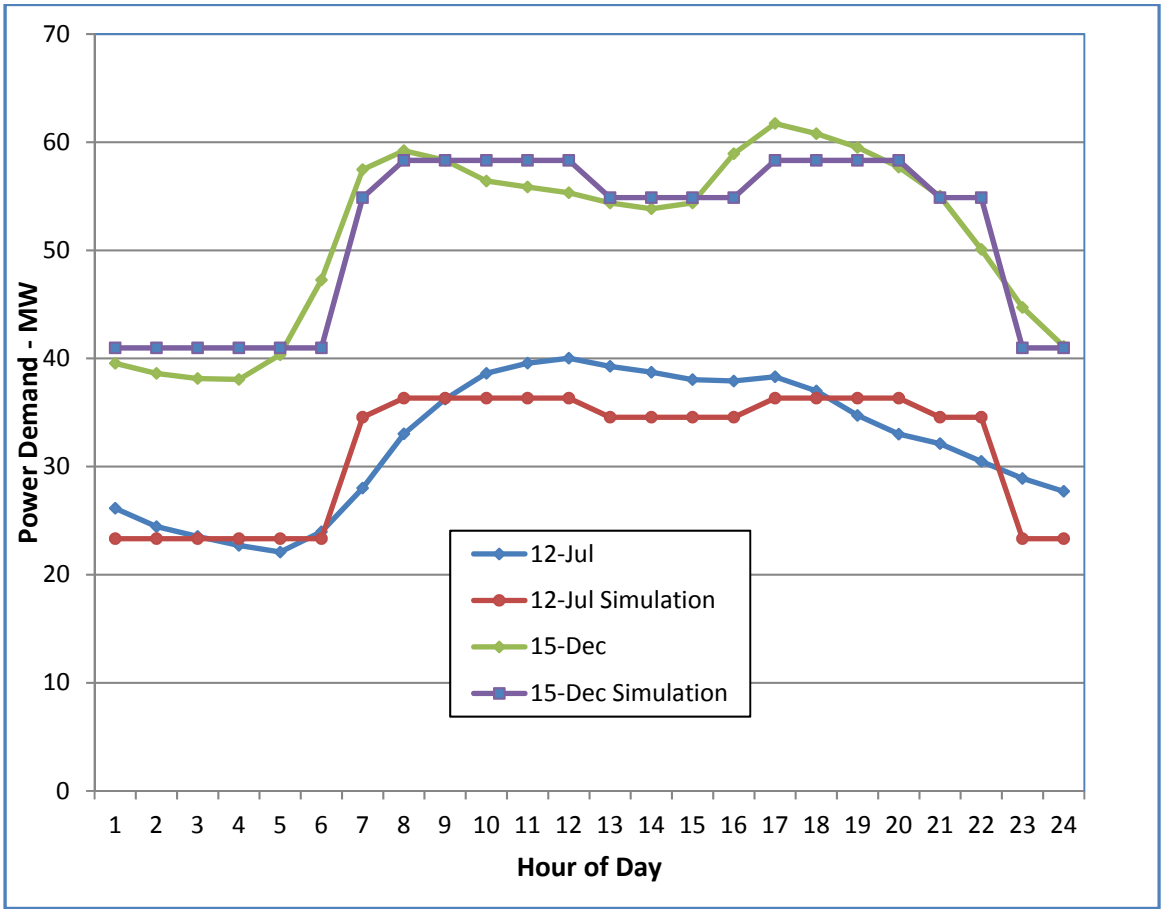

Figure 7-10: Hourly Load Variation

For all energy analysis an allowance was made for 5 MW of hydro spinning reserve.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

A Base case run was undertaken for the status quo conditions. Operation for upgrade options was evaluated in two different ways, as follows.

1) Flows for each Whitehorse unit, for each day and sub-period of the simulation, and for each of the 14 hydrologic sequences, were listed in a spreadsheet. The revised unit characteristics were used to derive the modified power output for each line. Energy gains were also calculated for each line item. These values were aggregated and average annual energy gains were computed.

2) The detailed system simulation was repeated in Vista DSS™ for each option.

Given the various turbine uprate options discussed in Sections 3, 4 and 5 as well as the different load scenarios and variation in load over time discussed above, a very large number of permutations are possible for the system energy analysis. Nine different options were selected for the detailed energy simulation, as summarized in Table 7-2. These options were selected in stages, with the later options determined based on the results of the earlier analysis.

The results of these analyses were used to assess the cost benefit of the nine options and also for assessing the attractiveness of other uprate options.

Table 7-2: Summary of Options for Energy Simulations

Option #	Description	Load Scenario	Load Year
1-1	Uprate WH1 with no increase in flow	1	2020
2-1	Uprate WH3 with no increase in flow	1	2020
3-1	Uprate WH4 with no increase in flow	1	2020
4-1	Uprate WH1 with 10% increase in flow	1	2020
5-1	Uprate WH4 with a Kaplan runner	1	2020
6-1	Uprate WH1 & WH2 with no increase in flow	1	2020
1-4	Uprate WH1 with no increase in flow	4	2025
2-4	Uprate WH3 with no increase in flow	4	2025
5-4	Uprate WH4 with a Kaplan runner	4	2025

While this study does not specifically address uprating of WH2; this was considered in Option 6-1 to assess the extent that uprating of more than one unit would influence the economics of turbine uprating.

Load Scenario 1 is a power and energy demand that is similar to existing conditions and will give a conservatively low estimate of incremental benefits for turbine uprate. Load Scenario 4 is a high or aggressive power and energy demand and represents the upper limit to incremental benefits of turbine uprate. The two scenarios are illustrated in Figure 7-11.

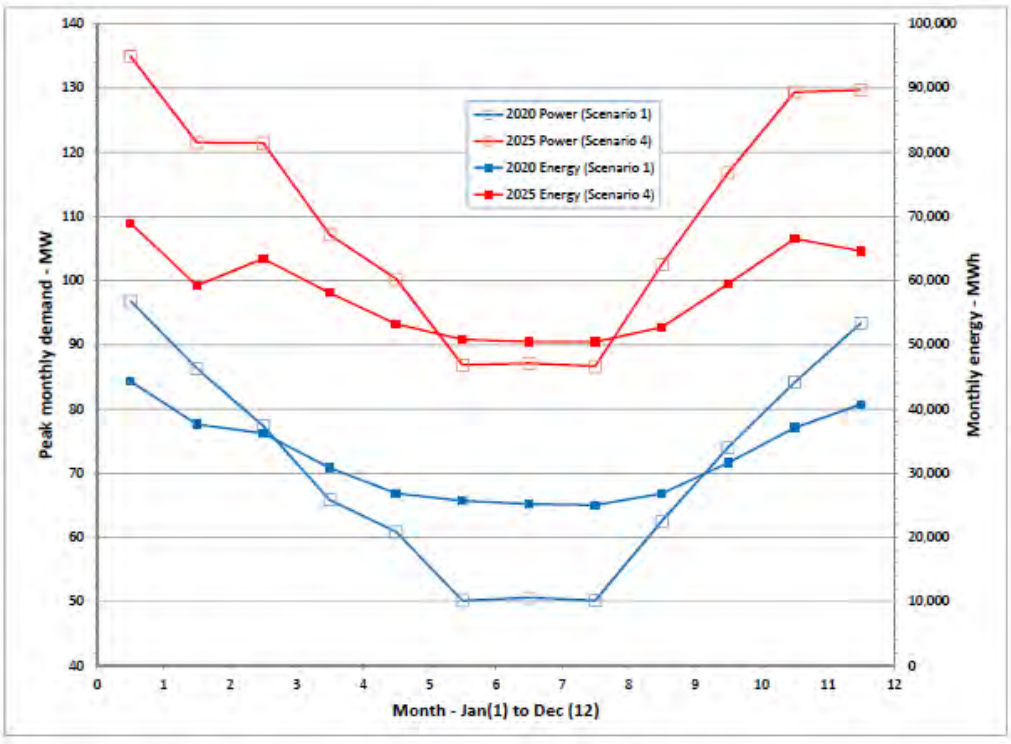

Figure 7-11: Scenarios 1 and 4

7.4 Energy Estimates

The table below summarizes the incremental energy (reduction in thermal energy) for the options summarized in Section 7.3. The average monthly generation for each of the Whitehorse units in the nine options is included in Appendix E.

Table 7-3: Incremental Thermal Generation Estimate

Option	Annual Thermal Generation (MWh)	Base Case Thermal Generation (MWh)	Incremental Thermal Generation (MWh)
1-1	14,888	15,448	-559
2-1	15,400	15,448	-47
3-1	15,053	15,448	-395
4-1	14,960	15,448	-488
5-1	13,864	15,448	-1583
6-1	14,653	15,448	-795
1-4	226,067	227,558	-1491
2-4	227,127	227,558	-430
5-4	223,573	227,558	-4020

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

7.5 Avoided Capacity Additions

Uprating of the turbines will reduce the capacity of future thermal generating additions. The avoided capacity additions for each of the options was estimated by determining for each option the maximum thermal power over the 14 years of simulation and comparing this with the maximum thermal power for the base case. The results are presented below.

Table 7-4: Avoided Thermal Capacity Addition

Option	Peak Thermal Power (MW)	Base Case Peak Thermal Power (MW)	Avoided Thermal Capacity (MW)
1-1	24.37	24.46	0.09
2-1	24.45	24.46	0.01
3-1	24.41	24.46	0.05
4-1	24.31	24.46	0.15
5-1	23.76	24.46	0.70
6-1	24.37	24.46	0.09
1-4	94.24	94.47	0.23
2-4	94.41	94.47	0.07
5-4	94.42	94.47	1.00

7.6 Energy Loss During Associated Outage for Turbine Uprate

In addition to the estimates of incremental generation for each of the options, a base case simulation was made with WH4 out of operation. From this simulation it was determined that, on the average, there would be added thermal generation of 12.2 MWh per day in the summer months when WH4 is not operational. This estimated daily energy was used to estimate the cost of lost energy when the unit is removed from service for the uprate work. For uprate of WH1 and WH3, the daily average added thermal generation was reduced in proportion to the capacity of the unit.

7.7 Other Options

There are a number of different turbine uprate options as discussed in Sections 3, 4 and 5 as well as different power and energy demand scenarios. Incremental thermal generation and avoided thermal capacity additions have been estimated for other options using the detailed results of the energy simulations summarized in Sections 7.4 and 7.5 above. The overall summary of options is presented in Table 7-5. The results shown in bold are the nine options from the Vista energy analysis presented in Tables 7-3 and 7-4, the other power and energy values are interpolated results based on the Vista analysis.

8. Cost Benefit Analysis

An economic analysis has been undertaken to assess the overall net benefit and benefit-cost ratio of the various turbine uprate options. The two key benefits are:

- Avoided thermal generation.
- Future capacity offset.

Specifically, the avoided thermal generation relates to the additional production of energy by the turbines that will replace a fraction of the thermal energy generation. The future capacity offset relates to the thermal capacity that will not be built in future years due to the additional turbine capacity (i.e. efficiency improvements and/or flow increase).

The magnitude of the key benefits was derived from the energy analysis as discussed in Section 7.

Principal assumptions used in the economic analysis are as follows:

- Real discount rate: 3.38%.
- Value of diesel/LNG energy offset: $200 per MWh.
- Value of added LNG capacity offset: $2,500,000 per MW.
- Distribution of capital costs: based on the construction schedule and generally over two years with 45% the first year and 55% the second.
- The results of the analysis are presented in Table 8-1. Detailed sheets for each option are included in Appendix F.

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

There were 6 main uprate options studied for the Units WH1 to WH4. They are numbered as 1-1 through 6-1 in Table 8-1 below. There are also a number of sub-options that were considered as follows:

- Options suffixed by 1-'A' etc., considered the impacts to the financial case of a base option if costs associated with life extension activities such as turbine/generator disassembly and reassembly were either included or excluded from the costs assigned to the turbine uprate estimate.
- Options suffixed with 1-'4' etc., considered applying a different load scenario (ie. load scenario 3 or 4) to one of the base case options to compare the results of the different load scenario on the financial case for each base uprate case.

The details of each of the options are identified in the table columns. The unit that is being uprated is shown in column 2; column 3 indicates whether the uprated unit is designed to have the same turbine flow or increased turbine flow. Column 4 gives the assumed load scenario. Columns 8 and 9 indicate whether or not generator dismantling, re-installation and rewind are factored into the economic evaluation for that particular option or considered as part of a separate 10-year unit overhaul or unit life extension project that would be carried out at the same time as the work associated with the uprate.

Table 8-1: Economic Analysis of Turbine Uprate Options

Option	Uprated Unit	Increased Turbine Flow (Y/N)	Load Scenario	Avoided Thermal Generation (MWh/yr)	Avoided Thermal Capacity (MW)	Capital Cost ($M)	Cost Incl. Disassemby & Install (Y/N)	Cost Incl. © Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

The analysis shows that uprating of the WH1 turbine is economically positive for Load Scenario 1 load (Option 1-1), although the payback period is 19 years. The benefits are improved slightly if the uprate is considered to be an “add-on” to a life extension program for generator work (Option 1-1A). For the increased load demand of Load Scenarios 3 and 4 (Option 1-3 and 1-4) the benefits are further improved, but the payback period still remains at 9 to 12 years. A new runner with increased flow (Option 4-4) does not improve the economics for the uprate of WH1 due to the corresponding reduction in turbine efficiency as a result of the increased flow. Uprating of both WH1 and WH2 reduces the benefit cost ratio to less than 1.0.

Uprate of WH3 is not economically attractive even if the turbine work associated with the uprate is carried out as part of a separate 10-year equipment overhaul or a generator rewind (life extension) project.

Uprate of WH4 provides more benefit than uprate of WH3; however, the results indicate that this option also does not appear to be economically attractive.

The retrofit of a Kaplan runner into WH4 results in the greatest energy benefit of all the options considered. However, there is significant added capital cost for a Kaplan conversion which makes the economic evaluation even less attractive than a simple propeller runner retrofit on WH4.

With the exception of WH1, all other unit uprate options even assuming Load Scenario 4 all had a benefit/cost ration of less than or slightly over 1.0.

9. Discussion

The efficiency improvements associated with a replacement runner for WH1 results in a positive economic benefit, with a NPV situated between $0.2M and $2.26M over a 30-year lifetime and a payback period of 9 to 19 years depending on the Option chosen and the assumed Load Scenario selected. It is therefore suggesting that WH1 efficiency improvements should be implemented. However the payback period is fairly long even under the assumption of the higher demand Load Scenarios 3 and 4.

Uprating of both WH1 and WH2 does not appear economically attractive. When only WH1 is uprated, it has preferential loading, which will increase the operating hours of this unit when compared to WH2. If the goal is to have equal operating hours on WH1 and WH2, then benefit of WH1 upgrade will be reduced.

An uprated turbine with increased flow capacity provides slightly higher economic benefit if it is assumed that the cost of uprating the generator is part of a separate life extension project rather than included with the turbine uprate. This is a reasonable assumption as the generators are now almost 60 years old and the stator windings have never been replaced. While there is no indication of a near term problem with the windings, they are now well beyond the typical winding life.

The economic benefit of uprating WH1 is based on an efficiency increase of approximately 4%. There is obviously some uncertainty in both the measured performance of the existing unit and the predicted performance of an uprated turbine. This represents an added risk to WH1 uprate.

Uprate of WH3 is not economic even with an increase in energy demand. This perhaps seems counterintuitive, as WH3 has a lowest measured efficiency and a significant performance improvement is predicted with a new runner. The reason for this is that WH3 has a limited useful operating range in the context of total powerhouse flow. Presently WH4 is base loaded while WH1 and WH2 cover variable load. This will not change even if the WH3 turbine efficiency is significantly increased. Installation of a Kaplan runner in WH3 would increase its operational range. However, the Kaplan option has much higher cost; therefore this option would not be economic.

WH4 is also shown to be uneconomic. Once reason for this in the high efficiency of the existing turbine, resulting is a low efficiency gain (approximately 0.6%) with an uprated runner. It is possible that the existing efficiency is slightly overstated, which would make WH4 slightly more attractive. However, it is difficult to foresee an increase sufficiently high to make uprate of this unit attractive.

The high load growth scenario associated with Options 1-4 and 1-4A (WH1) presents by large the highest NPV and benefit/cost ratio of all options. Even though this option is based on a hypothetical load growth, it provides further evidence that the efficiency improvement for WH1 should be performed – as further economic benefits might materialize for this option if the

© Hatch 2017 All rights reserved, including all rights relating to the use of this document or its contents.

power demand increases in future years. It also indicates that WH2 should be upgraded in high load growth cases.

Other turbine uprate options presented in this analysis are shown to be not economically attractive at present (i.e. efficiency improvements for WH3 and WH4) and should be reassessed in future years if significant changes in the energy demand and supply patterns are to occur.

The above general conclusions are considered realistic; nevertheless, there are other items to consider:

- Even if YEC elects to not uprate any of the turbines at WGS, the replacement of the cams that define the WH1 and WH2 wicket gate runner blade relationship is recommended. This is consistent with the recommendation made by HPPE in its report on the 2009 performance tests. Per the HPPE report the increment efficiency with an updated cam is expected to be in the range of 2%. The energy analysis completed as part of this study shows that a 4% increase in turbine efficiency results in an average annual reduction of 559 MWh in thermal generation. From this it can be assumed that a new cam will provide half this energy or 280 MWh (in addition to the upgrade energy gain). This is a sizeable amount of energy considering the relatively low cost of a new governor cam. If YEC is uncertain about the true incremental efficiency with a new gate-blade relationship an additional index test can be performed to confirm the 2009 test results. A full efficiency test whereby flow is measured is not required, only a relatively index test.
- The analysis for Option 5-1 (Kaplan runner in WH4) does not consider the benefit of added operating flexibility for YEC system operations. This may be difficult to quantify. It also should be cautioned that the retrofit of a propeller turbine to a Kaplan design is a significant undertaking, and more detailed evaluation would be warranted prior to a final decision on such an option.

10. Conclusions

The performance of the turbines WH1, WH3 and WH4 at the Whitehorse Generating Station can be improved with new runners of modern design. Options with uprated turbines that have the same flow capacity, but higher efficiency, as well as turbines with increased flow capacity have been investigated. The benefit of uprating the turbines is primarily a reduction in more costly thermal (diesel or LNG) generation.

Uprating of WH1 with a more efficient runner has a projected positive net benefit. A higher flow runner should be possible but as efficiency would be reduced slightly the higher flow runner does not provide improved economics.

Uprating of either WH3 or WH4 does not appear attractive. The turbines for these units are fixed blade propeller type, which have very limited load variation capabilities and as such limited operational flexibility. As an alternative to new fixed blade propeller runners, these units could be converted to a Kaplan design. Energy benefits would increase and the units would have much better operating flexibility. However, estimated costs for a Kaplan conversion are significantly higher and as a result, this option does not appear to be financially attractive.

A summary of costs, benefits, and benefit/cost ratios for the various turbine uprate options considered is presented in Table 10-1.

Table 10-1: Uprate Cost/Benefit Summary

Option	Uprated Unit	Increased Turbine Flow (Y/N)	Load Scenario	Avoided Thermal Generation (MWh/yr)	Avoided Thermal Capacity (MW)	Capital Cost ($M)	Cost Incl. Disassemby & Install (Y/N)	Cost Incl. The schedule for an uprate, allowing for procurement is approximately two years. Advanced planning will be necessary for such a program. The outage for the uprate work would ideally be in the summer, when load demand is low. The unit outage itself would be in the range of four to five months.

Modification of WH3 for synchronous condenser operation is also possible. The major changes would be the installation of a large compressed air system to depress the tailwater below the runner and allow the unit to be motored in air, in addition to control system modifications. However, at present there is no demand for added reactive power. The reactive power requirements for the YEC system are currently met by operating the existing hydro units at slightly below unity power factor.

Budget Prices for New Runners

Supplier 1

- Design and supply new runners
  - WH1: $ 345,106
  - WH (new blades only): $ 285,571
  - WH3: $ 392,593
- Excludes delivery (from eastern Canada)

Supplier 2

- Design and supply new runners
  - WH1: $1,700,000
  - WH3: $1,760,000
  - WH4: $1,910,000
- Includes delivery
- Excludes import duties

Supplier 3

- Design and supply new runners
  - WH1: $ 491,220
  - WH3: $ 281,714
  - WH4: $ 577,066
- Excludes delivery (from India)

Supplier 4

- Design and supply new runners
  - WH1: $ 530,000
  - WH3: $ 760,000
  - WH4: $1,400,000
- Assumes WH1 and WH2 runners purchased as a single contract

REFERENCE: **Application, Tab 5.2.1.10, pages 5-19**

ISSUE: **WH4 Uprate – Servomotor Replacement Project**

QUOTE: "The project involves detailed design, procurement and installation of two new Servomotors for Whitehorse Hydro Unit 4 (WH4) wicket gate operation. Implementation will increase the output of the WH4 unit by allowing full range of operation of the wicket gates; this enhancement adds additional hydraulic generation of 0.9 GWh/year."

"Contracts with [ANDRITZ Hydro] (OEM), L&S Electric (to review documentation and develop a governor commissioning plan) and Hatch (owners engineer) have been finalized. Procurement has not yet been undertaken for testing services and installation of a lifting device."

"Final design is nearing completion and manufacturing is expected to commence in Q3 2020 … Delivery of the Servos is expected by January 2021. Contractor mobilization and installation, testing and commissioning is expected to occur in June 2021. The project is expected to be in service in June 2021."

QUESTION:

a) Please indicate the year in which the existing servomotors were installed and the expected service life at the time of installation.

b) Please explain why YEC decided to pursue this project. For example, were there reliability issues with the existing servomotors? Did the existing servomotors cause reliability issues with WH4? If outages were experienced at WH4 due to the servomotors, please provide the number and duration of outages in the last 10 years, on a per annum basis, and the costs incurred due to these outages.

c) If there were reliability issues with the servomotors, please explain how often YEC carried out tests in the past to assess reliability of the servomotors. If possible, please provide the number of times maintenance was conducted on the servomotors in the last 10 years, on a per annum basis, and the cost of this maintenance work.

d) Please explain how the enhancement proposed in this project adds additional hydraulic generation.

e) Please provide details on the selection process of contractors (specifically ANDRITIZ Hydro, L&S Electric and Hatch) for this project, including how contracts were awarded for this project.

f) Please provide an update on the work currently completed for this project. Is YEC currently on schedule with this project? For example, has final design and manufacturing been completed and is the project still expected to be in service in June 2021?

ANSWER:

(a)

Servo motors are original (1984). The expected service life at time of installation is not known.

(b)

Yukon Energy's (YEC) 10 Year Renewable Electricity Plan has confirmed that the Corporation faces an existing and forecast shortfall in renewable energy until such time that significant new sources of supply are sourced from the Atlin Hydro Expansion and the Moon Lake Pump Storage projects.

A number of smaller scale supply projects, including the replacement of servo-motors on YEC's Whitehorse Hydro #4 (WH4) hydro unit (also referred to as the 'WH4 Uprating Project') are included in the 10 Year Renewable Electricity Plan, in order to provide incremental sources of renewable energy in the short to medium term. The primary benefit of the project is a 0.8 MW increase in maximum output of WH4, resulting in an estimated gain in energy production of 0.9 GWh/yr. at average hydro conditions. The estimated Levelized Cost of Energy (LCOE) of this energy gain is $0.065/kWh under the base case load forecast, and $0.051/kWh under the high load case. This project LCOE compares favourably to the economics of both existing and new thermal and renewable generation options. Secondary benefits include reduced stress levels in the servo-motors, governor and wickets gates/operating ring which will increase reliability and safety during operation.

(c)

The current servo motors were not meeting IEEE code in terms of operation and reliability.

The servo motor is a hydraulic ram that requires little maintenance other than oil and filter changes. The issue with the servo motor on WH4 is not related to frequent failures. The servo is not capable (underpowered) enough to allow the hydro unit to operate at 100% gate opening. The unit if brought to 100% gate opening would be unable to close the wicket gates.

(d)

YEC's WH4 unit is currently limited to 92% gate opening as a result of undersized servo-motors. This limitation results in a reduction of the unit output as compared to the nameplate rating. The proposed project involves replacement of the servo-motors with spring assisted servo-motors that will augment the force provided by the high pressure hydraulic unit (HPU) and overcome the gate stalling issue experienced beyond 92% stroke. The governor gate position limiter will be removed and the WH4 unit will be re-commissioned with the capability to operate at 100% gate opening. The ability to operate at %100 gate opening will increase Energy and Capacity of the unit.

(e)

ANDRITZ Hydro and L&S were selected because they are the Original Equipment Manufacturers (OEM) for the equipment. The OEMs have all proprietary drawings, manuals and expert / familiar staff to perform the modifications that other manufacturers simply would not have. Hatch was selected through an RFP process.

(f)

Final design and manufacturing are complete and the project is expected to be completed by June 2021.

REFERENCE: **Application, Tab 5.3.1, pages 5-21 to 5-25 and 5-35 to 5-42**

ISSUE: **Costs for Deferred Projects Greater Than $1 Million**

PREAMBLE: In this section of its application, YEC outlined the costs for the Aishihik Generating Station Three-Year Licence Renewal and Demand Side Management projects, which were deferred projects incurring costs greater than $1 million. For the Aishihik Generating Station Three Year Licence Renewal Project, YEC indicated that it spent $0.805 million in 2019 and $0.200 million in 2020. For the Demand Side Management Project, YEC indicated that it spent $0.833 million in 2019, forecasted spending $0.375 million in 2020 and forecasted spending $0.894 million in 2021. YEC stated that it reflected these costs in Tables 5.3 to 5.6 in its application, found from pages 5-35 to 5-42. It is not clear how YEC allocated these costs over the previous years and how it plans to allocate these costs in its forecasted years.

QUESTION:

a) Regarding the Aishihik Generating Station Three-Year Licence Renewal Project, please provide a cost breakdown of the $0.805 million and $0.200 million spent in 2019 and 2020 respectively. More specifically, provide the activities conducted and then the cost amount allocated to each activity.

b) Regarding the Demand Side Management Project, please provide:

   i. a cost breakdown of the $0.833 million spent in 2019, a description the activities conducted and the cost amount allocated to each activity; and

   ii. a cost breakdown of forecasted spending on $0.375 million and $0.894 million in 2020 and 2021 respectively, a description of the activities YEC forecasts to conduct and the cost amount allocated to each activity.

ANSWER:

(a)

Please see Table 1 below.

Table 1: Aishihik Generating Station Three-Year Licence Renewal Project Costs

Year	Description	Cost
2019	Compensation-related activities including negotiating compensation with claimants pursuant to the Waters Act and legal support for negotiations	$127,325
2019	Project Management	$125,631
2019	Conducting impact assessment for YESAA Project Proposal	$21,607
2019	Conducting baseline studies and early monitoring in support of development of YESAA Project Proposal and MAMP	$62,144
2019	Assessment and review process activities, including: Development of YESAA Project Proposal, submission of Project Proposal to Designated Office and all activities supporting path through assessment process (e.g. interrogatories), Preparation of Yukon Water Board Application and DFO Fisheries Act Authorizations.	$368,061
2019	Stakeholder Engagement activities, including capacity funding of CAFN for technical review and participation in project activities	$99,704
2019	Accrual of AFUDC	$122
	Total 2019:	**$804,593**
2020	Project Management	$11,445
2020	Assessment and review process activities, including: Yukon Water Board hearing and DFO Fisheries Act Authorizations, activities to complete these processes.	$89,819
2020	Compensation payments under the Yukon Waters Act for the 3-year License Period	$8,700
2020	Accrual of AFUDC	$2,314
	Total 2020:	**$ 112,278**

(b)

(i)

Breakdown of $832,906 costs spent in 2019:

- $385,009 DSM Program Design.

- $433,612 Residential Demand Response Pilot (gross cost; contributions of $365,315 received and separately noted in Table 5.4).

- $14, 285 inCharge maintenance.

(ii)

In 2020, YEC planned to complete the design of a new portfolio of DSM programs as well as incur costs to administer the Residential Demand Response Pilot. The DSM 2020 program was delayed and actual 2020 costs were therefore lower than forecast in the Application. The actual 2020 DSM costs are broken out as follows:

- $571,901 Residential Demand Response Pilot (gross cost; contributions of $488,932 received and recorded as offset to project costs).

- $8,576 HPS light disposal and inCharge admin.

- Total Net Project Cost $91,545.

In 2021, YEC planned to implement the new portfolio of DSM programs as well as continuing the administration of the Residential Demand Pilot. The forecast costs for 2021 have been updated as required, given delays in the program starting in 2020.

The table below provides breakdown for the updated cost for 2021.

Demand Side Management		
DSM Administration	$	25,000
New Program Design Completion	$	300,000
New Program Implementation	$	240,000
Energy Management Tracking	$	-
Peak Smart Pilot (Gross Costs)	$	250,000
Total Gross Project Cost	**$**	**815,000**
Contributions (PeakSmart funding)	$	*(215,000)*
Total Net Project Cost	**$**	**600,000**

Net of contributions, the updated costs for 2020/2021 are $691.545 as compared with $904,000 in the Application.

REFERENCE: **Application, Tab 5.3.1.2, page 5-23, line 14; Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy, page 45**

ISSUE: **Demand Side Management (DSM)**

QUOTE: From page 5-23 of the Application:

"Since that determination the Yukon Government has put in place a Climate Change policy initiative called "Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy" which emphasizes the importance of DSM as a valuable resource to reduce the Yukon's energy and capacity requirements. As part of that policy the government fully expects YEC to pursue a cost-effective DSM program." (footnote removed)

From page 45 of Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy:

"ACTIONS
H26. Provide direction to the Yukon Utilities Board in 2020 to allow Yukon's public utilities to partner with the Government of Yukon to pursue cost-effective demand-side management measures (YDC)

H27. Establish a partnership between the Government of Yukon, YEC Corporation and ATCO Electric Yukon by 2021 that will collaborate on the delivery of energy and capacity demand-side management programs (EMR & YEC)"

QUESTION:

a) Please provide copies of any written communication from the Yukon Government directing YEC to deliver DSM programs.

b) Please provide references to any act, regulation or order in council since the Board issued Order 2018-10 directing YEC to deliver DSM programs or directing the Board to allow YEC to recover the costs of such programs through its rates.

ANSWER:

(a) and **(b)**

Please see OIC 2021-16 which added section 10 to OIC 1995/90, and response to YUB-YEC-1-46 (a to f).

REFERENCE: **Application, Tab 5.3.1.2, page 5-24, line 18**

ISSUE: **Pilot DSM Program**

QUOTE: "YEC faces a capacity shortage under the single contingency (N-1) planning criterion. With this capacity planning context, and mindful of the policy context outlined in the Yukon Government's Climate change strategy, YEC has pursued a pilot program testing internet connected, wifi enabled demand response technology designed to control residential baseboard and hot water heating during winter peak periods to help reduce system peak and reduce reliance on thermal generation such as diesel or natural gas.

The objective of the program is to: evaluate the technical feasibility of the demand response technology; model and test the peak shifting effect of the pilot; test the reliability of the peak shifting effects of the pilot; and evaluate customer acceptance of the demand response events.

The project is managed by YEC with funding support from Atco Electric Yukon (AEY), Yukon Development Corporation (YDC) and Natural Resources Canada (NRCan). Project expenditures of $0.809 million ($0.434 million in 2019 and $0.375 million in 2020) are to be included in rate base, offset by contributions of $0.365 million in 2019, are amortized over 10 years."

QUESTION:

a) Please provide a detailed description of the components of this pilot project. For example, in which areas of Yukon is the project being conducted, and how many customers are included in the pilot? Please provide the forecasted and actual costs to date allocated to each component.

b) Please provide details of the funding amounts provided by AEY, YDC and NRCan, including a description of how YEC and AEY determined the relative amounts to be contributed by each party.

c) Please provide the information and assumptions on which this pilot project is based, including but not limited to:

i. quantity of and electrical demand of the installed water heaters;

ii. percentage of water heaters that could be taking part in the final project;

iii. estimated demand of the water heaters during peak demand periods;

iv. average lifespan of water heaters being used in the pilot program compared to the typical household water heater;

v. the cost of the equipment, including installation cost, included in the pilot;

vi. description of any incentives offered to the participating ratepayers;

vii. potential security concerns for participants' wireless internet systems and measures being implemented to address those concerns; and

viii. estimated frequency and duration of disconnections or service calls resulting from the new equipment and YEC's proposed measures to manage such events.

d) Please provide any analysis carried out by YEC or its program partners comparing the proposed program to direct incentives paid to customers who take their own steps to reduce demand or shift peak demand. If no such analysis has been done, please explain why.

e) Please provide the results of analysis performed by YEC or its program partners examining the costs and benefits of the project relative to any alternatives considered.

ANSWER:

(a)

The Residential Demand Response Pilot will install internet-connected, wifi-enabled electric baseboard thermostats and hot water tank controllers in the homes of residential

electrical customers anywhere on the Yukon Integrated System. The thermostats and hot water tank controllers will be used to temporarily lower the temperature set-point of the homes heat and hot water during a period of peak demand to lower the demand on the grid.

1000 thermostats and 400 hot water tank controllers will be installed as part of the pilot across 400 Yukon residences.
The actual costs to the end of 2020 are $269K in equipment, $149K in labour, $512 in professional services and $8K in expenses. The forecast remaining costs to complete the pilot are $68K labour and $414 professional services, including ongoing licensing and support.

(b)

AEY is providing $300,000, YDC is providing $250,000 and NRCan is providing $650,000. The funding amounts with AEY and YDC were reached through discussion with these organizations. NRCan offers up to 50% of eligible costs in for the demonstration stream of their Smart Grid funding stream.

(c)

(i)

Controllers are being installed on 400 hot water tanks as part of this pilot. The electrical demand of a standard residential hot water tank is estimated to be an average of 4.5kW/unit.

(ii)

No projection has been made as to how many total hot water tanks could take part if this pilot is transitioned into a full program.

(iii)

As the heating elements of the 400 hot water tanks participating in the pilot are at various stages of heating, it is assumed that these tanks would contribute 400kW to the peak demand (1kW/unit).

(iv)

Controllers are being installed on customers' existing typical hot water tanks. Accordingly, the average lifespan of the hot water tanks in the program are the same as a typical hot water tank. YEC does not have detailed data on this expected lifespan at this time.

(v)

The total cost of equipment for this pilot is $269,000 and installation costs are $134,000.

(vi)

There are no financial incentives being paid to participants of the pilot.

(vii)

There was a potential security concern that records of a participant's hot water use and heating could be accessed and constitute a personal privacy breach. For this reason, the supplier of the controllers used in the pilot program were evaluated on the cyber security of their systems and care has been taken to protect any personal information of participants in the program design.

(viii)

It is expected that service calls or disconnections of a customer's heating or hot water are extremely infrequent. In the case that a participant experiences a heating or hot water emergency, a local electrical contractor is kept on retainer to respond. Participants are provided with the contractor's contact information as part of the program.

(d)

This particular pilot was pursued by YEC due to the funding opportunities from NRCan, AEY and YDC largely offsetting the program costs, enabling learnings from the pilot to be applied to future DSM programs at far less than the full project cost. The analysis and design of other DSM programs, such as direct incentives to customers, will now be advanced given OIC 2021/16 directions enabling YEC to recover through rates the costs reasonably incurred to provide or participate in a demand side management program.

(e)

YEC has not performed any analysis of this project relative to alternatives. As discussed in (d) this pilot was pursued as funding was available to do so.

REFERENCE: **Application, Tab 5.3.1.2, page 5-25, line 9**

ISSUE: **LED Streetlight Retrofit Program**

QUOTE: "In addition to the program's specifically developed in response to the Yukon Governments Climate Change initiative, the Board also noted in Order 2018-10 (Para 481) that it "considers that retrofitting streetlights at end of life with LED lights were prudent expenditures. Any LED installations that are not end-of-life conversions must not be included in YEC's rate base." The 2017/18 GRA outlined the basis for the LED Streetlight Replacement program noting that YEC decided to move forward with the retrofit of streetlight assets with LEDs. Streetlights in downtown Dawson and Mayo were retrofit in 2016 with plans to retrofit the remaining streetlights in Faro, Mendenhall and Champagne in 2018. As illustrated in Table 5.3, $0.273 million was added to rate base in 2018." (footnote removed)

QUESTION:

a) Please confirm that all costs added to rate base in 2018 for LED streetlight retrofits were for retrofitting streetlights that were at end of life. If not confirmed, please explain.

b) If part (a) is not confirmed, please separate the $0.273 million into amounts for end-of-life retrofitting and retrofitting of streetlights that were not at end of life.

c) Please confirm that YEC has not added any amounts to rate base for streetlight retrofitting in 2019 and 2020 and does not propose to do so in 2021. If not confirmed, please explain.

d) Are there any remaining streetlights that have not been retrofitted to LEDs? If so, please estimate the percentage of streetlights that have not been retrofitted, the cost of retrofitting the remaining streetlights, and outline YEC's planned timeline for doing so.

ANSWER:

(a) and **(b)**

For clarity, the transfer to rate base in 2018 for $0.273 million was not all related to the streetlight replacement program. The costs breakdown further as follows:

inCharge Program Delivery	$0.180
Streetlight Change Outs	$0.093
	$0.273

inCharge program delivery is the cost to deliver the programs approved by the YUB in Order 2014-06. As a historical DSM cost, this amount will be written off the accounts of YEC and ratepayers will bear no burden.

Not all of the streetlights retrofit were end-end-of-life. As described in response to YUB-YEC-1-81 in the 2017/18 GRA, YEC believes these assets are at or near end of life. This is assumed as the majority of the asset value is historical cost transferred by community i.e. YEC has no visibility on the value of the lamp head separate from the rest of the structure – pole, wiring, civil improvements, etc. Based on past experience with installation costs, YEC estimates $0.006 million in undepreciated capital costs from streetlights replaced. YEC proposes to write off this amount from the streetlight PP&E accounts.

(c)

Costs were added in 2020 for the environmental disposal of the old HPS streetlight heads ($0.008 million).

(d)

There are some high-powered highway lights that have not been retrofit. These lights were not retrofit as the business case of the energy savings did not justify the LEDs required for this application.

REFERENCE: **Application, Tab 5.3.2, page 5-26, line 15; Appendix A to Board Order 2018-10: Reasons for Decision, paragraphs 515 and 516**

ISSUE: **Deferred Costs for Projects Between $100,000 and $1 Million**

QUOTE: From Application page 5-26:

"Mayo and Aishihik Hydro Climate Change Study ($0.638 million in 2020 for expenditures from 2017 to 2020)…"

"Transmission Access Road Program Study ($0.133 million in 2020 and $0.200 million in 2021)…"

From Appendix A to Board Order 2018-10:

"515. For the Mayo and Aishihik climate change study, YEC spent $121,530 prior to 2017 and forecast $160,000 for each of 2017 and 2018. This project will deliver research and modelling to better understand how climate change will impact the Aishihik and Mayo drainages to help inform inputs to YEC's generation model…

516. In response to a UCG IR, YEC indicated that the 35 years of data inflows into YECSIM reflect what was recorded over the 35 years, including any climate change impacts relevant to those years. Given YEC's statement that its YECSIM model includes climate change impacts, the Board finds that YEC has not adequately demonstrated that it is necessary to engage in a separate study specifically on climate change impacts. Accordingly, the Board finds there is no justification for this project and directs YEC to remove these costs from its revenue requirement for each of 2017 and 2018 and not recover the 2016 costs. The Board directs YEC further to reflect this finding in its compliance filing." (emphasis added; footnotes removed)

QUESTION:

a) Please justify the costs for the Mayo and Aishihik Hydro Climate Change Study in this application, given that the Board directed YEC to remove costs associated

with studies on climate change impact in the previous application. Why should the $0.638 million incurred for this study be approved and put into rate base?

b) Please provide a breakdown of the $0.333 million incurred for the Transmission Access Road Program Study. More specifically, please provide the activities conducted by YEC and the cost allocated to each activity.

ANSWER:

(a)

The Mayo and Aishihik Climate Change Study as concluded in 2020 was required to develop an understanding of future climate change impacts on YEC's hydrological system and its hydroelectric generation.

Costs incurred on this project were not included in 2017-18 forecast revenue requirement or rates (i.e., YEC forecast in that application that these costs would remain in WIP).

Now that these costs are included in the forecast revenue requirement under the present application it is important to emphasize why this study is crucial to YEC's understanding of how its hydro facilities may be impacted by climate change. The information before the Board in Order 2018-10 did not adequately reflect why YEC pursued this study.

At a strategic level, Canadian utilities have focused significant attention on understanding the potential long-term impacts of climate change on energy supply, and also on developing strategies to adapt to the expected impacts of climate change in order to mitigate potential impacts to utility operations and ratepayers. As an example, a key requirement of the Canadian Electricity Association's *Sustainable Electricity Company* designation, which YEC achieved in 2016, is the development of a utility-specific climate change adaptation plan. As a hydro-based utility, YEC's focus is first to understand the expected long term impact of Climate Change on its hydro resources, which it critical to long term resource planning, risk mitigation and the development of any required adaptation plans.

In Board Order 2018-10, the Board stated:

> "YEC indicated that the 35 years of data inflows into YECSIM reflect what was recorded over the 35 years, including any climate change impacts relevant to those years. Given YEC's statement that its YECSIM model includes climate change impacts, the Board finds that YEC has not adequately demonstrated that it is necessary to engage in a separate study specifically on climate change impacts."

The YECSIM model data only reflects any impacts due to climate change observed to date by incorporating 35 years of actual historical data. However, the model does not predict or account for the expected future impact of climate change on the inflows. Further, as the timing of impacts of climate change can vary, a 35-year historical dataset does not necessarily adequately reflect the near-term impacts to be expected from climate change.

The future impact of climate change includes changes in the expected amount of precipitation (rain and snow), as well as the impact of glacier melt on the hydrological systems. These impacts directly affect the expected long-term water availability for hydroelectric generation. This is a key assumption for long-term resource planning. The future effects of climate change on hydro availability is a critical variable to evaluate when conducting long-term resource planning for the Yukon Interconnected System. Further, understanding the potential range of event severity due to climate variability is critical for understanding future impacts to system reliability and generation availability.

The project scope included development of a supplemental model, Hydrotel, which produces inflow forecasts that incorporate not only historical actual data, but also future climate change predictions. These predictions can be used in conjunction with YECSIM to understand the long-term generation limitations or behaviour due to future climate change impacts. The project scope was also updated to include an assessment of climate change and glacial melt impact on the Upper Yukon River, enabling the Hydrotel model to be used to forecast expected climate change impacts on all three of YEC's hydroelectric generation facilities.

The project was also partially funded by NSERC, which lessened the costs incurred by YEC to achieve the project objectives.

(b)

The Transmission Access Road Program Study includes the following key phases of activities:

1. Phase 1 activities were focused on completion of a desktop GIS study;

2. Phase 2 activities will focus on field work to confirm the findings of the desktop study undertaken in Phase 1; and

3. Phase 3 includes final reporting to tie the results of desktop GIS study and subsequent field work together.

Phase 1 activities were completed by Tetra Tech in 2020 at a total cost of $87,526. Phase 2 and Phase 3 activities planned for 2021 have been deferred to 2022.

REFERENCE: **Application, Tab 5.4.1.1, page 5-28, line 11 and page 5-30, line 10**

ISSUE: **Enterprise Asset Management (EAM) System Purchase and Implementation Project**

QUOTE: "YEC is undertaking a multi-year process to develop and implement a formal Physical Asset Management Managed System (PAMMS) that will align its practices with the ISO 55000 standard for physical asset management (see Appendix 5.1 for further details on the Asset Management Framework). A key part of the PAMMS initiative is the selection and implementation of an Enterprise Asset Management (EAM) solution suited to the needs of the company. (footnote removed)

The existing Computerized Maintenance Management System (CMMS) does not meet YEC's current or future asset management needs. An EAM system is an enterprise level software application that enables an organization – particularly an asset intensive organization – to manage and optimize its assets throughout the entire asset lifecycle including asset needs identification, asset investment planning and prioritization, advanced asset maintenance management and asset performance tracking." (page 5-28)

"Total costs to complete the project are currently estimated at $4.938 million. The project is expected to be fully implemented in early 2021." (page 5-30)

QUESTION:

a) Please provide a business case for the enterprise asset management system project, including the cost benefit analysis that could be used for a performance measure.

b) Please explain why the existing Computerized Maintenance Management System does not meet YEC's current or future asset management needs.

c) Please provide a cost breakdown of the $4.938 million estimated, specifically the activity that will be completed and the cost amount allocated to that activity.

d) Please explain if any other alternatives were explored by YEC in meeting its asset management needs and, if so, provide the costs of those alternatives.

e) Please provide an update on the work currently completed for this project. Is YEC currently on schedule with this project?

ANSWER:

(a)

The average estimated NPV for the EAM project is $2.87 million over a period of 10 years.[1] A detailed NPV analysis is provided as Attachment 1 to this response.[2] Savings from anticipated tangible benefits are as summarized in the table below. A description of tangible and intangible benefits of the Project are summarized in the discussion that follows.

[1] Assuming weighted average cost of capital of 4.82%; inflation rate of 2.0%; implementation cost allocation of $3.56 million in 2020 and $275,000 in 2021; estimated O&M costs and realized benefits for 10 years from 2021 to 2031, increasing form 2021 onwards from 0% in 2020; 40% in 2021; 80% in 2022 and 100% 2023 onwards.

[2] The total project cost is $ 4.6 million. The NPV evaluation used a project cost of $3.7 million which was at that time the cost looking forward, excluding costs incurred/ committed to date. The increase of $0.9 million is covered by the NPV result.

Table 1: Anticipated Tangible Benefits Summary

Benefits Description	Annual Expenditure	Low % Improvement	High % Improvement	Low Estimated Annual Benefit	High Estimated Annual Benefit
Productivity Gains	$3,055,143[2]	12%	25%	$366,617	$763,786
Inventory Management - Reduced Cost of Procured Parts	$1,153,181	0.5%	3%	$5,766	$34,595
Improved Reliability – Extended Asset Life	$11,770,068[3]	2%	3%	$235,401	$353,102
Improved Reliability - Reduced Diesel Consumption	$156,724	20%	30%	$31,345	$47,017
Improved Reliability - Revenue Recovery	$8,000	20%	30%	$1,600	$2,400
Warranty Claims Improvements	$10,000	100%	200%	$10,000	$20,000
TOTAL ESTIMATED BENEFITS:				**$650,729**	**$1,220,900**

Tangible Benefits:

- **Productivity Gains:** Implementation of an EAM solution is expected to improve YEC's overall maintenance performance and increase efficiency of execution of maintenance works. A study conducted for the power industry[3] has shown that wrench time can increase between 10 – 40% as a result of improvement in maintenance capabilities that are enabled by an EAM. YEC supervisors in respective groups estimate a 10 – 15% productivity improvement for electrical technicians and a 15 – 20% improvement for mechanical technicians. YEC estimates a productivity improvement range of 12 – 25% once all asset classes are fully deployed in the EAM by the end of 2021.

- **Improved Inventory Management and Procurement:** Because of integration of work with material requirements, better inventory visibility will result in forward planning of work and materials will enable YEC to source materials with longer lead times taking advantage of existing contractual agreements that are in place. Other electric utilities have estimated savings of 0.5 - 3% as a result of better contract management for purchases.

[3] Source: Booz & Company.

- **Improved Reliability – Extended Asset Life:** The use of an EAM system for planned maintenance requirements and scheduling can extend asset life and maintain a record of asset health. Organizations that have implemented EAM have reported reductions in long term asset costs of up to 5% by extending asset life. YEC is estimating an expected improvement of 2 – 3% on useful asset life as a result of asset life optimization.

- **Improved Reliability – Reduced Diesel Consumption:** Improved asset maintenance practices are expected to result in reduced outages and therefore a reduction in thermal consumption for backup power during restorations. A reduction of 20 – 30% in controllable outages and related thermal costs could be realized.

- **Improved Reliability – Revenue Recovery:** Utilizing the EAM to enable improved preventative maintenance before the point of asset failure is expected to reduce controllable outage events that cause customers to lose power, by 20 – 30%. This will result in additional revenue from the sale of energy otherwise not delivered.

- **Warranty Claims**: The EAM will record and track warranty periods for assets and parts that are placed into service. Should installed assets or parts require corrective work orders, the EAM will flag when those parts are still under warranty, and eligible for a warranty claim reimbursement. This is expected to increase successful warranty claims by 100 – 200%.

Intangible Benefits:

- **Process Improvement – Standardized Processes:** The EAM standardizes workflows, processes, and procedures related to the entire asset lifecycle; transitioning this knowledge from individuals into institutional knowledge retention. Particularly valuable is knowledge related to proactive maintenance strategies.

- **Availability and Retention of Information:** The EAM will improve access and availability of information (ad hoc and personal documents, corporate documents, etc.), gathered from currently disparate locations into an organized ‘single source of truth’.

- **Contributions to Safety:** Safety procedures can be attached to work orders; ensuring recorded completion of Job Safety Analysis (JSA) procedures and forms, all contributing to a reduced risk of injury.

- **Improved Decision Making:** Improved access to detailed, complete data sets on the assets of the Corporation, which can inform better decision making.

- **Increased Compliance with Regulatory Requirements:** The EAM will serve as the system of record for compliance work fulfilling regulatory requirements. These centralized data sets can be queried for trends or data points that support YEC's rate applications. The EAM will unlock a holistic view of capital projects that will better inform and justify deferral and renewals.

- **Improved Accountability:** Transparent workflows enable simple work order delegation, and managers can easily track the status of work orders. This improves accountability and supports quality control audits.

- **Increased Accuracy in Performance Measurement**: Enabling management to track and report on various performance measures, and trends over time. High value reports can be consolidated into dashboards tailored by audience.

(b)

While YEC's current CMMS allows YEC to track cost and raise reactive work orders, it has significant shortcomings and is not capable of planning and executing planned preventative maintenance work requiring coordinated scheduling of materials and labour requirements, tracking asset condition and criticality, nor does it support the end worker by making equipment records and history easily available.

In 2017, a preliminary market study and RFI were carried out by YEC and Hatch. To assess suitability of Key2Act's (YECs existing CMMS) to support YEC's long term strategic needs, Key2Act was invited to complete the RFI that was distributed to the other viable vendors. As noted, the self-assessment requests that the vendors confirm and demonstrate compliance to a series of functional requirements by answering yes/no and providing details on how their solution addresses each requirement. While Key2Act did not explicitly answer No to any questions, they did leave 14/44 responses blank, citing reasons such as "possibly with configuration" and "likely through customization" with no

additional detail. Specifically, Key2Act was unable to confirm compliance to the following functional requirements detailed in Attachment 1 to this response: F1, F2, F5, F15, F17, F18, F19, F20, F22, F25, F36, F39, F43, and F44.

When contrasted with the other vendor responses which provided substantial detail as to how they would address each requirement, Key2Act's responses illustrate a lack of understanding of this domain.

Additionally, interviews were held with YECs operational, engineering, and IT staff in which they were asked about their experiences with Key2Act. The interviews identified that the solution falls short of meeting YEC's current requirements which has resulted in the development of several stop-gap in-house solutions, and significant duplication of effort. It was also identified that the YEC staff have no confidence in Key2Act's ability to enhance their system to meet YEC's needs.

Based on the results of the self-assessment and the interviews with YEC staff, it was apparent that the Key2Act solution was not only incapable of supporting YEC's long term strategic objectives but that it is also not meeting their current operational needs. For this reason, Key2Act was not invited to submit costing to enhance their system to meet YEC's needs nor were they asked to participate in the solution demonstrations.

(c)

Please see Table 1 below for a breakdown of EAM costs.

Table 1: EAM Implementation Cost Breakdown

Cost Item	Forecast at Completion ($million)
Vendor Selection & Project Initiation	0.809
Application Software Licences	0.578
System Implementation	1.575
Hardware and Facilities	0.390
Internal Resources	0.462
Additional Data Loading (2021)	0.250
Change Management	0.114
Project Management	0.340
Subtotal	***4.518***
Contingency	0.118
Total Project costs	**$4.636**

Note there is a $0.302 million variance from the GRA forecast of $4.93 million. This is due to an error in the GRA forecast for this project.

(d)

Yes. Other software alternatives were explored. A preliminary market survey of EAM solutions was conducted in 2017. An RFI was distributed to 27 vendors in order to better understand the costs associated with implementation and integration.

YEC moved to a formal public tender in 2018. The process was divided into a two-part process including an RFSQ and an invitational request for proposal (iRFP) to be referred to as (RFP) in this report. A total of 9 vendors participated in the RFSQ, and 4 moved on to the detailed RFP. Submissions were scored and ranked based on their submissions, results of demos as well as their respective costs. At the RFP evaluation, vendor submissions for implementation cost ranged from $967k to $1,400k.

(e)

YEC is expecting to go live with the EAM project on March 15, 2021. YEC is currently on schedule with this project.

APPENDIX D – DETAILED NET PRESENT VALUE ANALYSIS

NPV Analysis of EAM Deployment

Assumptions	
Year 1 Implementation %	80%
Year 2 Implementation %	20%
Year 1 Benefits Captured	40%
Year 2 Benefits Captured	80%
Year 3 Benefits Captured	100%
Year 4 and beyond	100%
IRR	4.82%
Inflation %	2%

Figure 1: 10 Year Cost Benefits Projection for EAM Project

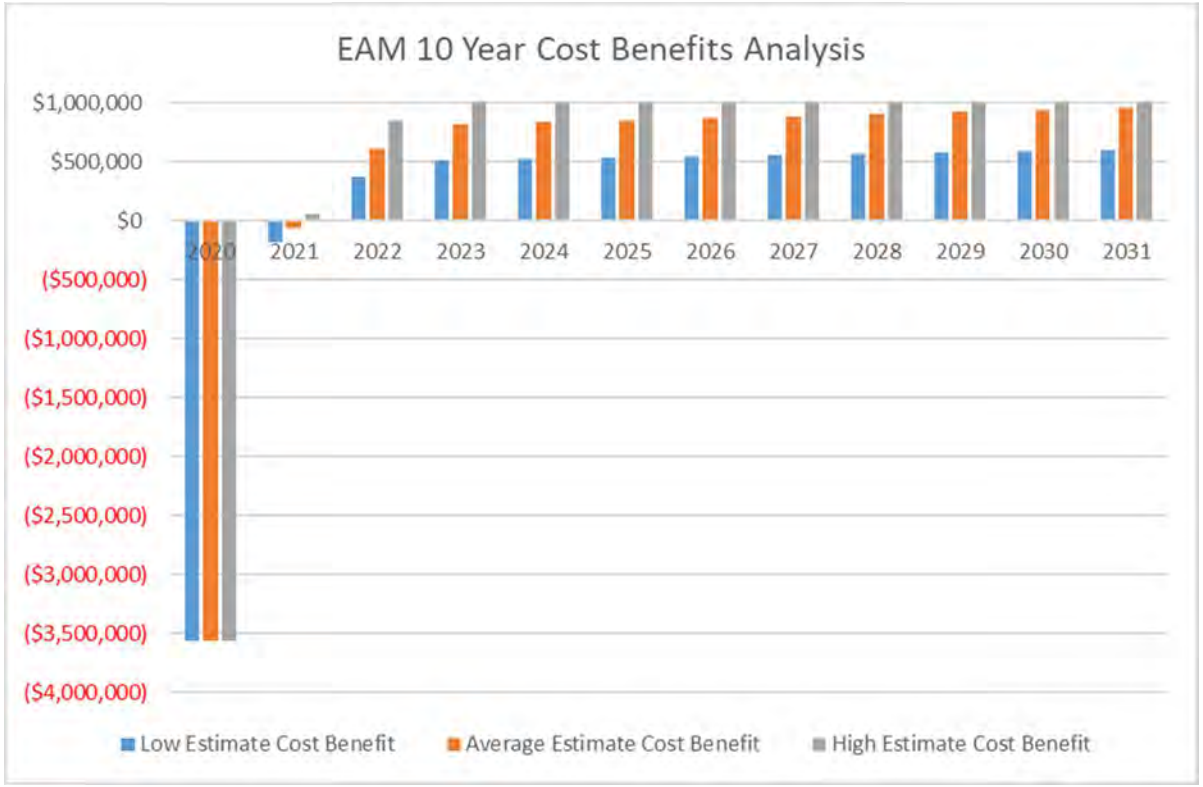

Table 4-1: Functional Requirements

#	Requirement	Description
F1	Alignment with ISO55000, 55001, and 55002	The system should be capable of managing the assets from concept to disposal.
F2	Base CMMS Functionality	The system should be capable of performing the basic maintenance functions for work order planning, execution, closing, and history.
F3	Asset Register	The system should provide a robust asset register.
F4	Critical Asset Identification	The system should enable the assignment of criticality to equipment to be used for prioritization.
F5	Management of Change (MoC) capabilities	The system should be capable of tracking and recording all changes made to equipment, procedures, and work orders by user and time stamp.
F6	Pending work back log	The system should be capable of monitoring the backlog of work to allow for prioritization of scheduling, and to make sure no high priority work is missed.
F7	ContractorProject Work Management	The system should be capable of supporting projects: tracking for schedule, costs and completion as well as history.
F8	KPIs and Reports	The system should support any required reports or KPIs.
F9	Material and Procurement Management	The system should be capable of performing Material management and procurement or integrating with existing systems.
F10	InventorySpares management	The system should be capable of tracking and managing inventory (and spares) as well as attaching parts to work orders and setting levels and allowing automatic reordering.
F11	Mobile Device Support	The system should have a robust mobile device capability to allow execution of work and recording of all required details by the technicians using it.
F12	Standard jobs & task lists	The system should enable common, repeated tasks (either PM or common repairs) to be created and saved including parts and special requirements then can be used when work is required without the need to keep recreating it.
F13	Reliability and related analysis	The system should be capable of tracking and storing the information required to perform reliability analysis.
F14	Asset Equipment History	The system should track all equipment history, work completed, schedule, and costs (for use with reliability and budgeting).
F15	Compatibility with condition monitoring system	The system should be capable of performing condition monitoring through Scada and others systems, with the ability use this information for reliability, and schedule generation.
F16	Manage PM and PdM work procedures	The system should support PM and PdM work procedures (and association to work orders).
F17	PM optimization including Reliability Analysis	The system should be capable of tracking the history of the PMs so it can be analyzed to see if the right work is being done at the right time.

#	Requirement	Description
F18	Support for failure modes and effects analysis (FMEA) and reliability centered maintenance (RCM)	The system should support FMEA and RCM or provide a mechanism to import these analyses from external sources for inclusion in reliability work.
F19	Track and differentiate non-recurring work failures and break downs	The system should monitor break in or break down work for use in reliability analysis.
F20	Track corrective maintenance results against PM and CBM	The system should be capable of tracking corrective maintenance results vs PM and CBM. This is used for PM optimization to ensure the right work is being created by the PM and PdM work orders. If the PM and PdM is being done but no corrective work is being generated these PMs and PdM may need to be adjusted.
F21	Track recurring work types - PM and PdM	The system should be capable of tracking recurring work types. This is used for the reliability functions of the PMs and PdMs. May signal a need for deeper investigation like RCM.
F22	Support for Asset Health Index Calculations	The system should be capable of using the RCA, FMEA and history to provide assets health index calculations.
F23	Work Order Management	Break out of CMMS function
F24	Work Close Out and Feed Back	Break out of CMMS function
F25	Work Order Routing	Break out of CMMS function
F26	Work Planning	Break out of CMMS function
F27	Work Scheduling and Resource Balancing	Break out of CMMS function
F28	Document Management	The system should provide a mechanism for attaching and managing documents. This can be through integration with external document management systems or native functionality within the system.
F29	Decision Analytics	This is part of the reliability functions and IDS functions. The reliability side can predict the life of the equipment and repairs will need to be made. This is information that will also be used by and IDS function to calculate costing.
F30	Asset and project views for business cases for both asset-based and needs-based projects	Part of the decision analytics
F31	Configurable for workflows, policies and processes	This requirement is to ensure the IDS system can facilitate the workflows for approvals and execution to align with the policies and processes of the organization.
F32	Ease of integration	This requirement is to ensure the IDS system can be integrated with the organizations other systems e.g. Finance.
F33	Method of "What if" analysis for investment analysis	The system should provide a mechanism for performing What-If analysis and scenario generation for investment and maintenance decisions.
F34	Asset management planning tools/approach	The system should provide all of the required tools for asset planning through its entire life cycle.
F35	System Architecture options	This requirement aims to establish the vendor solution systems architecture to ensure compatibility with other systems in the organization.
F36	Risk calculation evaluation	The system should support reliability and risk calculations, and analysis
F37	Ease of Customization	The system should be easily configured (and re-configured) to meet the organization's needs.
F38	Ease of use: implementation effort	This requirement aims to understand the effort involved in implementing the system.

#	Requirement	Description
F39	Hardware Support (if applicable)	This requirement aims to establish whether hardware support is part of the offering.
F40	Reporting and Ad-hoc Queries	The system should be support ad-hoc reporting and analytics.
F41	User Customizable Dashboards	The system should support user configurable dashboards.
F42	Financial Software Integration	The system should be capable of integrating with the existing financial information system.
F43	GIS Software Integration	The system should provide a mechanism to overlay EAM data on a GIS layer (through integration or native functionality).
F44	Scada Software Integration	The system should be capable of integrating with the existing Scada system.

REFERENCE: **Application, Appendices 5.1 to 5.6**

ISSUE: **Forecasted Dates Provided for Projects and Studies in These Appendices**

PREAMBLE: In the descriptions for the projects and studies, YEC provided the forecasted completion date. For example, YEC indicated that the forecasted completion date for the Dawson Voltage Conversion was 2022.

QUESTION:

a) For each project or study mentioned in Appendices 5.1 to 5.6, please indicate whether it is still viable for completion on the forecasted date. If not, please explain the reasons for delays on projects.

ANSWER:

(a)

Please see the summary provided below.

Table 1: Summary of projects/ Studies in Appendix 5.1 to Appendix 5.6

Project (Appendices 5.1 to 5.6)	Forecast completion date (Referenced in Appendices 5.1-5.6 of Application)	Still viable for completion on forecast date?	If no, Explain delay
Appendix 5.1: Capital Projects >$1 M Not Impacting Rate Base			
Dawson Voltage Conversion	2023/24	Yes	2020 and 2021 and 2022 are planning years due to significant amount of outages required and project complexity. We expect the project to be in service in 2023
MHO (Mayo A) Generating Station Slope Stability	2022	No	This project will be completed in 2023 as part of a suite of projects to take advantage of mobilization and demobilization costs as well as other synergies that exist.
Replacement of Mayo A Surge Chamber	2023	Yes	

Project (Appendices 5.1 to 5.6)	Forecast completion date (Referenced in Appendices 5.1-5.6 of Application)	Still viable for completion on forecast date?	If no, Explain delay
Stop Log Crane WH Main Spillway	2022	Yes	
Asset Management framework	2022	Yes	
Battery Energy Storage System	2022	Yes	
Pumped Storage	2028	No	Monitoring activities did not commence in 2020 as originally forecast. Initiation of these activities is contingent on securing Federal funding and alignment with First Nations whose Traditional Territories the project is located on.
Southern lake transmission line	2028	Yes	
Whitehorse Interconnection	2022	Yes	
Appendix 5.2: Capital Projects>$100,000 and <$1 M Added to Rate Base			
Dam Safety Program	2021	Yes	
Dam Safety Recommendations	2019, 2020	2019 Yes, 2020 No	As a result of the high water levels, work identified could not be completed. The work will be reprioritized and included in the 2021 DSR action plan.
P126 Boil off gas heat exchanger	2019	Yes	Completed
Wareham Gate Heater	2020	Yes	
Wareham Gate Refurbishment	2020	No	Higher than normal water levels in 2020 resulted in this project to be deferred until 2022. Investments to date will be held in WIP through 2021.
Whitehorse Diesel System Grounding for Generators	2020	Yes	
WH1 and WH2 Design and Installation of Dewatering system	2019	Yes	
WH4 Ventilation	2021	No	Engineering will be finalized in 2021 for installation in 2022.
Alexco Mobile Substation	2020	No	Alexco has had delays in selecting substation location and will not receive the substation

Project (Appendices 5.1 to 5.6)	Forecast completion date (Referenced in Appendices 5.1-5.6 of Application)	Still viable for completion on forecast date?	If no, Explain delay
			until March 2021. This has delayed the in service date.
Line 177 Re Route	2021	Yes	
Minto Mine Substation - NGR	2019	Yes	
Protection and Control Program	2021	Yes	Scope has been reduced in 2021 to allow for additional planning and estimating of activities in 2022 and beyond.
Transmission Line Access	2019, 2020	2019 yes, 2020 No	Activities planned for 2020 were deferred as a result of additional planning required to develop and prioritize the plan moving forward. Activities will resume in 2022. The spending for the project to date will be held in WIP until it is completed.
Van Gorda Substation	2019	Yes	
WAF Transmission Upgrades	2019	Yes	
Customer Extensions	2019, 2020, 2021	Yes	
L355 Voltage Regulator	2020	Yes	
System Improvements for Eagle Gold Mine	2019	Yes	
Communication Upgrades	2019	Yes	
Building Upgrades	2019, 2020	Yes	
Compact Digger Truck	2021	Yes	
Crane Replacement/ Refurbishment	2020, 2021	Yes	
Mayo Earthworks	2020	Please see the note	Preliminary engineering work was done in 2020. Further studies and engineering are required. Also being planned as part of a larger suite of projects to take advantage of synergies and reduce Mob and Demob costs. Any cost spent in 2020 will be held in WIP until the project is completed [potentially in 2022/23].
Mobile Office Unit – IT	2021	Yes	
Vehicle Purchases	2019,2020,2021	Yes	

Project (Appendices 5.1 to 5.6)	Forecast completion date (Referenced in Appendices 5.1-5.6 of Application)	Still viable for completion on forecast date?	If no, Explain delay
FD7 Overhaul	2021	No	Pricing for overhaul has been significantly higher than expected. Business case being performed in 2021 to determine if replacement is more cost effective than refurbishment. Any spending for 2021 business case will be held in WIP and reflected in GRA compliance filing.
Decommissioning on WD3	2019	Yes	
Site Restoration Transmission Lines	2019	Yes	
Appendix 5.3: Deferred Project >$1 M Not Added to Rate Base			
Aishihik Generating Station Long Term Year Water Use License Renewal	2022	Yes	
Whitehorse Rapids Generating Station Water Use Licence Renewal	2025	Yes	
Diesel Retirement Replacement	2023/24	Yes	
Southern Lakes Enhanced Storage Project	2023	Yes	
Mayo Lake Storage Enhancement Project – Including Mayo Lake Outlet Dredging	2023	Yes	
Appendix 5.4: Deferred Projects >$100,000 and <$1 M Added to Rate Base			
IPP Standing Offer Program Implementation	2019	Yes	
Mt Sumanik Wind Feasibility Studies	2020	Yes	
WH2 uprate Engineering	2021	Yes	
Building Condition Reports 2020-2024	2021	Yes	
Business Continuity Plan	2021	Yes	
Mayo and Aishihik Hydro Climate Change	2020	Yes	

Project (Appendices 5.1 to 5.6)	Forecast completion date (Referenced in Appendices 5.1-5.6 of Application)	Still viable for completion on forecast date?	If no, Explain delay
PMF Flood Study	2021	Yes	
Transmission Access Road Program Study	2020, 2021	2020 Yes, 2021 No	2020 will be closed separately. The planned additional phases for 2021 have been deferred to 2022/23 and will be in WIP at end of 2021. YEC is looking at a GIS project in the future and want to ensure that the data collected is compatible with the system of choice.
Whitehorse Diesel Rental Substation improvements	2021	Yes	
10-Year Renewable Electricity Plan	2020	Yes	
Atlin Hydro EPA Preparation	2020	No	2021
Dam Safety Review	2020	No	Project will be completed in 2021, impacts from COVID-19 and high water levels prevented completion in 2020. All assessments are completed and drafts reports submitted.
Appendix 5.5: Deferred Studies >$100,000 <$1 M Not Impacting Rate Base			
EV Infrastructure Project	>2021	Not specified	Given the delays in the rollout of the electric vehicles contemplated in Yukon Government's strategy from the original draft in November 2019, the project is not required to be completed in 2021 and has been delayed.
P125 Trash rack Study	2021	No	To be completed in 2023 in conjunction with the remaining Headgate replacement projects. Synergies with equipment rentals, and a reduction in mob and demob costs is the rationale
Appendix 5.6: Intangible Assets >$100,00 <$1 M Added To Rate Base			
ERP System Upgrades	2020	Yes	

24

REFERENCE: **Application, Appendix 5.1-1, page 5.1-2**

ISSUE: **Dawson Voltage Conversion Project**

QUOTE: "Dawson City's two 4.16 kV distribution feeders have reached their practical operating limits, resulting in frequent power outages, constant voltage flicker, and longer fault clearing times. Teshmont Consultants LP conducted a site visit to assess the entire 4.16 kV distribution system to identify protection issues, potential voltage levels, transformer utilization and power flow. The primary issues facing the Dawson distribution system were noted as follows …"

"Teshmont recommended converting the operating voltage of the Dawson City distribution system from 4.16 kV to 12.47 kV in a single stage. Increasing the voltage immediately improves the capacity on the existing conductors, reduces fault current at the primary, reduces voltage drops and decreases energy losses."

QUESTION:

a) Please indicate the year in which these two feeders were installed and the expected service life of the feeders at the time installation.

b) Please explain how often YEC carried out tests on these feeders in the past to assess their reliability and how often maintenance work was required. If possible, please provide the number of times maintenance was conducted on these feeders in the last 10 years, on a per annum basis, and the cost of this maintenance work.

c) Please provide the number and duration of outages resulting from the two Dawson City distribution feeders for each of the last 10 years, on a per annum basis, and the costs incurred due to these outages.

d) Please provide the assessments conducted by Teshmont Consultants LP. Were any other alternatives explored for mitigating the issues on the Dawson distribution system?

ANSWER

(a)

The F1 Breaker was installed in 1978; and the F2 breaker was installed in 1976. The expected service life is 40 years for the wire, pole and insulators.

(b)

These breakers receive 10 year inspections. The estimated cost is $3,500 for this testing. The other feeder assets (i.e., transformers, poles) are typically run to failure. It is noted that studies and engineering are continuing in 2021 and 2022 that will include further data collection and analysis to support the project justification. The project will not be in service until 2023.

(c)

Attachment 1 to this response provides the outage list for F1 and F2. Table 1 below summarizes the total number of outages and duration.

Table 1: Number and Duration of Outages

Year	Total Outages	Outage Hours
2011	8	4.36
2012	11	2.87
2013	12	26.95
2014	7	2.46
2015	20	10.43
2016	12	5.31
2017	21	11.59
2018	9	6.96
2019	25	26.46
2020	19	11.34
	144	**108.73**

Cost associated with the individual outages would be onerous. Studies and engineering are continuing in 2021 and 2022 that will include further data collection and analysis to support the project justification. The project is not planned to be in service until 2023.

(d)

Please see Attachment 1 to this response for the assessment provided by Teshmont LP.

The Dawson Voltage conversion project is set to be in-service in 2023. Temporary measures have been implemented such as increasing the breaker trip settings and fuse sizes, which leads the system to experience different types of issues such as brownouts. An interim solution has been implemented which includes a partial voltage conversion to 12.47 kV which has relieved the load on Dome area. A voltage conversion to 24.94 kV was not considered due to the excessive costs.

2017	Qtr 1	2017-0006	Jan 17, 2017	Segs: 2	Dawson	(706) Other Adverse Environment	Aishihik Plant slowly began to shed load until all three Aishihik units were taken off line. This event was caused by a complete ice build up on the intake - warm weather caused ice to weaken along power canal and eventually break off and plug up intake. Divers and steamer truck needed to remove ice/debris from trashracks. Minto Mine placed on their back up diesel generators until Aishihik plant brought back to service.		0.38	906	342.8	YUB

2017	Qtr 3	2017-0099	Aug 09, 2017	Segs: 1	Dawson	(506) Other Equipment Failure	At 04:16:38 AH2 tripped offline. The Upper guide bearing temp trip (80c) alarm came in and the unit locked out. All Main breakers were closed at 05:42:25 and load pickups were completed shortly after 07:00. Restoration was done with Whitehorse Diesels and AH2, after it was inspected. The cause of the August 9th outage was a high temperature bearing trip on Aishihik unit 2 (AH2). AH2 was placed on line on Aug 8th to eliminate the thermal being used to replace WH4 generation. The unit had been inspected after being on line for an hour with no issues found. The bearing over heated due to a clogged cooling water supply to the bearing.		0.23	468	109.7	YUB

2018	Qtr 1	2018-0009	Feb 07, 2018	Segs: 2	Dawson	(501) Electrical Failure	Protection and Systems Engineer: Based on what tripped I am about 90% sure that it was the T1 protection that operated. When it operates, it also trips the R1 lockout relay (along with the 52-5 lockout relay, the SC1 lockout relay, and the high-speed grounding switch). The reactor protection only trips the reactor lockout relay, not the rest. Furthermore, the last event logs that I did see from the relay (from November 2017) showed the overcurrent protection on T1 picking up and dropping out multiple times under non-fault conditions. There are some setting changes waiting to be applied that would increase the pickup slightly.		0.21	934	192.0	YUB

2018	Qtr 2	2018-0023	Apr 10, 2018	Segs: 2	Dawson	(501) Electrical Failure	TIV closed resulting in AH1 shutdown. After investigation it was determined that the TIV had a stuck Electrical Actuated valve. When looking at the PLC program it showed that a bit called the TIV open_command_latch was not getting turned on. The request for an open should cause this latch to happen. This command is blocked only by a TIV Alarm or a TIV Close command. When operating the TIV it was noted that it immediately went into alarm and then cleared after the TIV fully traveled. This happened in both directions (open or Close). Further investigation showed that at least one of the Atco electrically operated valves was stuck causing a Fail to open Alarm thus allowing water flow when it should not and without the Open Latch signal the TIV was able to drift off of its fully open state. I will try to get the signal from the Open latch bit indicating to our SCADA System for a short term solution. I believe we need to look into some stronger type of operating valves to insure that after sitting for a few months the control power will be strong enough to move the valve. Minto Mine left on their own dieswel generation until Aishihik problem resolved.		0.24	934	219.5	YUB

2018	Qtr 2	2018-0075	Jun 20, 2018	Segs: 2	Dawson	(304) Off-ROW Tree	Lost everything on the Northern Grid except Mayo Townsite. MH1 was the only hydro generator online and very overloaded to the point of cycle degradation. L250 fault tripped S249 52-4 and S249 52-5 which effectively disconnected MBH0 from the rest of the grid. Dawson islanded for restoration. The system was delivering very poor power quality to Minto Mine and Faro couldn't synch to the grid due to low Hz. Only MH1 was online. SCC dumped Minto Mine to regain Hz and opened S249 89-17 to bridge back and regain MBH1 for generation. Minto Mine remains on their own diesel power. A leaning structure was found and believed to be the cause. After investigation a tree had fallen onto the structure and caused it to lean. Rick Brooker and Daniel Lafleur dismantled the structure and SCC energized using MBH1. S253 52-1 and 52-2 deadbus closes didn't work. Matt O'Brien closed breakers locally.		0.47	934	416.2	YUB

		2018-0085	Jul 27, 2018	Segs: 1	Dawson	(301) Falling Tree	Earlier today S255-52-1 tripped. Outages in Faro and along L178 were experienced. SCC was just informed that Whitehorse PLT flew the line and the all clear was given to SCC to reenergize the power line. After closing S255-52-1 it tripped immediately. Whitehorse PLT flew the line again and discovered a tree was discovered on the power line just north of Drury Creek. As it was getting too late to remove the tree, L178 was isolated from North of Drury Creek to Faro for the night. The next day (July 28) the tree was removed and L178 was reenergized.		0.19	468	87.1	YUB

Executive Summary

Dawson City's 4.16 kV distribution system has currently reached its practical operating limits resulting in frequent power outages and longer fault clearing times. This report is intended to study the system, identify deficiencies, and recommend remedial action.

Following the field visit by the Senior Distribution Engineer, the entire distribution system was analyzed to identify the issues with protection, voltage levels, transformer utilization, and power flow including losses.

The complete distribution system study has concluded the causes of the issues faced by the Dawson City Distribution System to be:

- Inadequate protective settings (due to load growth) have increased outage frequency and fault clearing times resulting in poor quality of power to the customers.
- Inadequate available fault currents at the end of the feeders resulting in potential safety concerns due to protective devices failing to operate.
- Poor feeder end voltages limiting secondary conductor lengths and forcing underutilization of transformation capacity, resulting in increased life cycle costs.

This report recommends converting the operating voltage of the Dawson City distribution system from 4.16 kV to 12.47 kV in a single stage, including the implementation of revised protection coordination at a total cost of $833,000.00 (with a 30 year Net Present Value of +$26,000, 28 year payback and a quantifiable benefit /cost ratio of 1.03). The implementation of these recommendations would successfully mitigate all the issues identified above.

Since the cost savings realized through project implementation outweigh the interest cost savings through deferral, an early in service date of October 31st, 2019, is strongly recommended.

1. Introduction

The Yukon Energy Corporation's (YEC) Dawson City distribution system currently operates at 4.16 kV primary voltage.

Due to the increased electrical load in Dawson City over the years, there have been multiple instances of feeder breaker trips and blown fuses resulting in an elevated outage frequency.

Over the past few years, several system studies have been initiated which were never completed nor implemented. The YEC staff in Dawson City has been forced to implement certain short-term solutions to handle the system issues that have created their own adverse side effects such as safety concerns, prolonged outage durations, and poor power quality.

The electrical distribution system in Dawson City is very much in need of a comprehensive review to evaluate the long-term solutions and to make necessary recommendations ensuring safety, quality, and reliability for YEC customers.

The rural distribution system (industrial and residential), which is fed from the 12.47 kV Hunker Feeder from Callison Station, is not experiencing significant operational issues other than inadequate generation capacity to supply the industrial load. This is outside the scope of this report, however, YEC is currently handling this issue through customer owned generation and proposed new generation at Callison Station.

2. Dawson City Electrical Distribution System

2.1. Current State of the Dawson City Distribution System

The Dawson City distribution system currently consists of two (2) three-phase 4.16 kV feeders, Feeder #1 and Feeder #2, exiting out of the Dawson Diesel Generating Station's (DDGS) 4.16 kV bus. Under lightly loaded operating conditions, the DDGS 4.16 kV bus is energized by a 12.47 kV express feeder from Callison Station via a 12.47 kV – 4.16 kV, 4/5/6 MVA step down transformer located within the station fence. To handle an event of the loss or inadequate supply capacity, there is sufficient back up diesel generators connected to the 4.16 kV bus through normally open breakers. One (1) or more diesel generators can be synchronized for parallel operation as needed.

Callison Station has a single 5.6 MVA, 66 kV – 12.47 kV transformer and switchgear for two (2) energized feeders, one (1) spare cell, and a bus tie cell (for future). The two (2) energized 12.47 kV feeders are on an overhead double-circuit line picking up the Dawson City and Rural load. The top (express) circuit feeds the DDGS 4.16 kV bus through the step-down transformer. The bottom circuit (Hunker Feeder) services the Dome area and the rural industrial/residential loads. There is an existing 1500 kVA, 12.47 kV to 4.16 kV platform mounted step-down transformer (disconnected from both HV and LV sides) located at the south end of the Dawson City. The originally intended purpose of this transformer was to pick up Dawson City essential loads via the Hunker Feeder in an emergency situation.

All transformers mentioned above have spares stored in Callison Station yard.

As a temporary measure to handle the increasing town load, the YEC staff has increased breaker trip settings and fuse sizes, which leads the system to experience different type of issues such as longer fault clearing times (resulting in "brownouts"), protective device and inconvenience of seasonal settings. These are typical symptoms of a 4.16 kV system approaching the practical limitations.

As an interim solution to handle the increasing rural load, a partial voltage conversion to 12.47 kV has relieved the 4.16 kV load on Feeder #2 (Dome area). The YEC Operating Staff is very pleased with the performance of this smaller scale voltage conversion.

2.2. Major Issues Currently Faced by the Dawson City Distribution System

The recent and ongoing new commercial developments (including multi-family residential) within the Dawson City have increased at an alarming rate for a 4.16 kV system that is primarily meant for urban residential distribution. Please see Appendix A. This has forced the Dawson City distribution system to approach the practical operational limits of a 4.16 kV system on short notice.

Based on comments made by some major customers, the fluorescent lights start flickering and the LED lights turn off just prior to an outage. These brownouts appear to be a very common occurrence in Dawson City, especially the past few years.

The entire Dawson City distribution system relies solely on the integrity of the DDGS 4.16 kV bus and the integrity of cables feeding Feeder #1, Feeder #2, and the spare feeder regardless of the source of supply (either the diesel generators or the 12.47 kV express feeder through the step-down transformer or combination of both). The 5 kV Rubber Insulated Neoprene Jacketed (RINJ) feeder cables were very popular in the 1960's (with an original life expectancy of 20-30 years from the installation date) and are very near the end of their serviceable life now. Some Canadian Utilities have started replacement programs for this type of cable in the 1990's.

In addition, it is very evident that the distribution transformers in the system are considerably underutilized, which further increases the losses. The main reason for this underutilization is the rapid voltage drop of a loaded 4.16 kV feeder with distance resulting in very poor input voltage to distribution transformers that limits the maximum allowable secondary lengths significantly.

2.3. General Observations:

- Most of the overhead plant (except the distribution transformers and lightening arresters) is relatively new and built suitable for 12.47 kV operation. Conversion to 24.9 kV would require some minor modifications to the distribution plant, however, major modifications would be required to Callison station.
- While the vast majority of the transformers in the system are only suitable for single 4.16 kV operation, all recent transformer additions have been dual voltage, rated for future 12.47 kV conversion, which is YEC's current direction.
- All the 3-phase pad mounted transformers on the "Essential Services Underground Distribution Loop" are dual voltage, 4.16/12.47 kV rated. All the underground cables within this loop are rated to 25 kV. The essential loads include the two (2) transformers (one (1) in service and the other as an energized spare) feeding the hospital, the transformer feeding the museum, and the transformer feeding the wastewater treatment plant (WWTP).
- The local operating staff is diligent in building all new additions to the plant to be compatible with future 12.47 kV conversion.
- The utilization factors of the distribution transformers are very low (20%-30% of rated capacity), which is not their most efficient range of operation. There is no evidence of using load diversity in determining transformation capacity.
- The YEC staff has observed that customers are requesting much larger service sizes than required by the type of load. They even doubt whether the customers are using proper methodology as per Canadian Electrical Code (CEC) for demand calculations. See Appendix D.
- Due to the tight timelines, some service connections are being built prior to design approvals. The preferred process flow is: Service Request -> Planning & Protection study -> Design -> Construction -> "As built" plan updates.

2.4. Potential Causes of the Dawson 4.16kV Distribution System Issues

Downtown Dawson distribution Feeder # 1 and Feeder #2's voltages at the DDGS 4.16 kV bus are 4.22 kV, which represents 122 V, based on a 120 V reference. However, towards the very end of the feeder, the primary voltage drops down to 4.00 kV, which represents 115 V, based on a 120 V reference. Please see Appendix B. The secondary conductor lengths are typically selected based on a 4.0 V (3.5%) voltage drop, so any customer in Downtown Dawson could have a voltage range of 111 V – 122 V at the service entrance with maximum system and secondary load.

- Under normal operating conditions, YEC is obligated to maintain the CSA voltage ranges, which are 110/220 V-125/250 V for 120/240 V single-phase, 112/194 V-125/216 V for 120/208 V three-phase and 318/550 V-360/625 V for 347/600 V three-phase service entrances [2]. Under emergency operating conditions, these limits may be 106/212 V-127/254 V, 110/190 V-127/220 V and 306/530 V-367/635 V for 347/600 V, respectively. Please note the percentage voltage tolerances are the same regardless of the 3-phase secondary voltage.

- Based on current load. Downtown Dawson's 4.16 kV system may not meet the voltage criteria at certain customers' service entrances at maximum rating.
- Further additions of load, especially far away from the station, would force shorter maximum allowable secondary conductor lengths and eventually become practically impossible to meet the CSA voltage criteria above.
- Due to the reduced maximum allowable secondary lengths, more than required transformation will have to be added to the already underutilized transformation capacity.

Downtown Dawson's distribution Feeder #1 and Feeder #2 available fault currents at the DDGS 4.16 kV bus are 7264 A three-phase and 9510 A single-line to ground (SLG). Please see Appendix B. However, toward the very end of the feeder, the available fault currents drop down to 1406 A three-phase and 985 A SLG. The very high fault currents at the source and rapid drop of fault current with distance is an inherent issue with 4.16 kV systems.

- As the load increases, the protective settings have to be increased to avoid nuisance trips due to high load currents and cold load pickup.
  - For example, Feeder #1 and Feeder #2's loads are peaking at 200 A and 138 A, respectively, in January and February. To allow a minimum cold load pickup factor of 2.0, the feeder protective settings need to be set at 400 A and 300 A, respectively, making the protective reach unacceptably low for a 4.16 kV system.
- Further increase in load (which was very evident during the field trip) will force these settings to go higher, reducing the protective reach criteria to unsafe levels. Higher protective settings, reduced protective reach, and significantly increased operating times, which will cause the collapsed voltage (caused by the faults) last for a longer period, very noticeable to the customers prior to operation (brownouts).
  - This is the reason the customers are experiencing fluorescent lights flickering/LED lights turning off prior to an outage and eventual reduction of life expectancy of non-incandescent lighting and constant kVA loads such as motors.
  - If this situation were to continue, customer complaints/damage claims on premature failure of equipment/devices will potentially rise to an alarming level.
  - These very low reaches run the risk of the feeders staying energized without clearing especially under fault conditions involving ground. This is a major safety concern with excessively loaded 4.16 kV systems seeking immediate corrective action.
- The protective settings at DDGS have no room left for safe increases in the future, so the 4.16 kV system has reached the maximum practical limit. The fundamental reason for this situation is that the fault currents are approaching the load current levels that make the protective devices feed the fault as opposed to clearing it. The effect of the fault impedance is very significant on 4.16 kV, as compared to a 12.47 kV system (theoretically nine (9) times).
- The 4.16 kV system is suitable for urban residential distribution with limited electric heat and shorter feeder lengths. There are no viable solutions left to prolong the 4.16kV operation in the Dawson City Distribution System.
  - Increased load currents contribute to significant increase in line losses (I^2R) and low voltage issues, especially when there are large loads at the end of the feeder. Since the available hydro generation is limited, the incremental load due to the losses may cost as high as three (3) times the revenue rate.

- If the source and the line capacity were strengthened to extend the useable life of 4.16 kV, the available fault currents at the beginning of the feeder would increase to undesirable levels, causing other operational issues. The steep drop in voltage and available short-circuit currents would still continue to be an issue at 4.16 kV voltage level.

2.5. Solutions to the Issues with the Dawson City Distribution System

Downtown Dawson Distribution system's major issues are the inadequate system strength, protection coordination, voltage, and capacity to match the type/size of loading. The existing 4.16 kV system has already outlasted its serviceable life and some key system components are reaching the end of their life expectancy. Corrective action providing a long-term solution is required immediately.

The status quo is not a viable solution. Due to excessive cost, a voltage conversion to 24.94 kV can be eliminated as a viable option.

The 4.16 kV to 12.47 kV voltage conversion, accompanied by appropriate protection coordination and new feeder ties, will resolve the immediate safety/operational issues and provide a reasonably long-term solution to the City of Dawson distribution system as follows.

- Since the total load kVA remains the same, increasing the voltage by a factor of three (3) will reduce the load current by a factor of three (3). This will increase the capacity of the lines by the same factor, deferring potential conductor upgrades required for the near future.
- The reduction of the load currents will decrease the line losses significantly, reducing the kVA demand at the source, and resulting in a reduction in the requirement for supplementary diesel generation only when the Synchronous Condenser is not in operation, eventually lowering operational costs.

The voltage conversion will reduce the line voltage drop significantly, resulting in much more desirable primary voltages at the end of the feeder. The post conversion primary voltages throughout the system would be 12,380 V or better, which represents 119.1 V on 120 V reference. Please see Appendix B.

- This would allow a 7.1 V (or 5.9%) voltage drop across the secondary conductors to meet minimum CSA service entrance voltage requirements.
  - The recommended secondary lengths can be increased by approximately by 70% without violating the CSA voltage limit criteria.
  - This would mean less transformation (increasing the utilization factor) and more secondary, reducing the proposed voltage conversion cost and future expansion costs.
  - Although it may appear the increased secondary conductor lengths contribute to more losses, it actually is offset by the improved efficiency of the replacement transformers and therefore disregarded in the calculations.
  - The voltage profiles have been generated using off load taps of the Callison 66 kV – 12.47 kV transformer at nominal position, which are adequate for this analysis. However, the 12.47kV voltage profiles can be further improved by optimal use of those tap positions.

The voltage conversion will also reduce the fault currents at the beginning of the feeder down to 2597 A three-phase and 3304 A SLG, however, the fault currents will now decrease at a much lower rate than at 4.16 kV. The lowest available short-circuit current anywhere in the 12.47 kV system is 2306 A three-phase and 2077 A SLG.

- Due to the reduction in load currents and through proper sectionalizing, the 12.47 kV protective device settings can be reduced significantly. This will improve the protection coordination and

increase the protective reach significantly (as high as 5 – 7 times based on the protection coordination study) due to the better-sustained short-circuit levels with distance at 12.47 kV.

- This will eliminate the safety concern of the line remaining energized during high impedance faults.
- Better coordination between protective devices and ease of troubleshooting would reduce outage durations.
- Faster fault clearing times would resolve the "brownout" issues.

The proposed feeder configuration eliminates funnelling the total City of Dawson electricity consumption through ageing DDGS bus/breakers and the RINJ cables approaching the end of serviceable life. This will also immediately address the potential reliability issues associated with load increases due to rapid development. The implementation of appropriate protection coordination and the addition of feeder ties will significantly improve the steady state and transient reliability.

3. Evaluation of Voltage Conversion Options

3.1. Single Stage Dawson City Distribution System Full Voltage Conversion

In Service Date (ISD) of October 31st, 2019 (Option #1) - Cost = $833,000, Net Present Value (NPV) = $26,000 (Please see Appendix E, Appendix E and Appendix E.

- Convert 4.16 kV Feeder #1 to 12.47 kV and connect to the express feeder from Callison Station – ISD October 31st, 2019.
  - Construct one (1) span of 12.47 kV primary just outside the DDGS to energize Feeder #1 at 12.47 kV at the existing riser pole location.
  - The electrical load within the DDGS will remain at 4.16 kV, fed through the step-down transformer.
  - Replace all the single 2.4 kV rated transformers with 2.4/7.2 kV dual voltage rated units.
  - Replace all the lightening arresters with 9 kV Metal Oxide Varistor (MOV) units. This task needs to be completed just prior to the voltage conversion due to reduced margin of protection provided at 4.16 kV operation. The 9 kV arresters are meant for 12.47 kV systems designed for 95 kV Basic Impulse Insulation Level (BIL), whereas the 4.16 kV system has been designed only for 60 kV BIL.
  - Change the few remaining underrated dropouts and insulators as needed for 12.47 kV operation.
- Convert 4.16 kV Feeder #2 to 12.47 kV and connect to the express feeder from Callison Station - ISD October 31st, 2019.
  - Connect the 12.47 kV express feeder and Feeder #2 at the corner of 8th Avenue and Craig Street.
  - In addition to the transformer and arrester replacements, this would require removal of a short section of 4.16 kV underbuilt circuit just outside the station and splicing out a dead span at the time of voltage conversion. This would be an opportunity to resolve clearance issues and to remove obsolete poles within this section.
- Decommission 4.16 kV Feeder #1, Feeder #2, and spare, including cables, terminations, and transition assemblies, since they are no longer required.

- Salvage the platform mounted step-down transformer at the south end of the town and the spare stored at Callison Station. The line segment feeding this transformer shall be used to create the feeder tie point.
- Add a normally closed in-line disconnect switch on the 12.47 kV express circuit from Callison at the south corner of Dawson City, just north of the Klondike Hwy - ISD October 31st, 2019.
- Add a normally open feeder tie switch between the 12.47 kV circuits from Callison Station immediately on the load side of the line switch above - ISD October 31st, 2019.
- Connect the risers of Hunker feeder at the first pole south side of Klondike Highway near south end of the city.
- Switch #7908 at the corner of King Street and Fifth Avenue shall remain open.
- Implement protection coordination recommendations on both feeders - ISD October 31st, 2019.
    - The normal supply for the entire City of Dawson shall be the present 12.47 kV Express Feeder from Callison Station.
    - In addition to being the existing supply for the industrial and rural residential load, the bottom 12.47 kV circuit (Hunker Feeder) will have sufficient capacity and voltage to back up the new Downtown Feeder (old Express Feeder) via the new feeder tie.
    - The existing feeder protection relay for the 12.47 kV Hunker Feeder can be retained with appropriate overcurrent setting changes.
    - The existing differential and distance protection for the Express Feeder will require to be replaced with feeder overcurrent protection, similar to the Hunker Feeder, with appropriate settings.
    - In-line fuses or sectionalizers will be required at the three tie-in points between the main 12.47 kV feeder and the existing downtown distribution. These locations are along the back lane of Craig Street at 5th Avenue, 6th Avenue and 8th Avenue.
- The existing diesel generators will remain as an additional contingency and a peak shaving resource in event of the loss or inadequacy of the 12.47 kV supply.
    - In this mode, the transformer outside the station will step the 4.16 kV up to 12.47 kV.

At the client's request, a sample work plan has been added for option #1 (Appendix E) for illustration purposes only.

3.2. Two Stage Dawson City Distribution System Full Voltage Conversion

Stage 1 ISD of October 31st, 2019, and Stage 2 ISD of October 31st, 2021 (Option #2) - Cost = $843,000, Net Present Value (NPV) = -$700 (Please see Appendix Eand Appendix E)

- Convert entire 4.16 kV Feeder #1 and approximately 1/3 of Feeder #2 to 12.47 kV and connect to the express feeder from Callison Station - ISD October 31st, 2019.
    - Construct one (1) span of 12.47 kV primary just outside the DDGS to energize Feeder #1 at 12.47 kV at the existing riser pole location.
    - The electrical load within the DDGS will remain at 4.16 kV, fed through the step-down transformer.
    - Replace all the single-phase 2.4 kV rated transformers with 2.4/7.2 kV dual voltage rated units.
    - Replace all the lightning arresters 9 kV Metal Oxide Varistor (MOV) units.

- Convert a portion of 4.16kV Feeder #2 to 12.47kV and connect to Feeder #1 at the corner of 6th Avenue and the back lane of Craig Street. - ISD October 31st, 2019.
  - The 4.16 kV Feeder #2 and #3(spare) risers, and the 4.16 kV underbuilt along the back lane of Craig Street will remain to pick up the remaining Feeder #2 load.
  - Remove solid blades of the switch #7981 and construct a dead span between 4.16 kV and 12.47 kV.
- Remove the risers of switch #7908 and place a permanent hold card. Construct a dead span between 12.47 kV and 4.16 kV.
- Salvage the platform mounted step-down transformer at the south of the city and the spare. The line segment feeding this transformer shall be used to create the feeder tie point.
- Add a normally closed in-line disconnect switch on the 12.47 kV express circuit from Callison at the south corner of Dawson City, just north of the Klondike Hwy - October 31st, 2019.
- Add a normally open feeder tie switch between the 12.47 kV circuits from Callison station immediately on the load side of the line switch above - ISD October 31st, 2019.
- Connect the risers of Hunker feeder at the first pole south side of Klondike Highway near south end of the city.
- Implement protection coordination recommendations on both feeders similar to Option #1's description - ISD October 31st, 2019.
- The existing diesel generators will remain as described in Option #1.
- Convert the remainder of 4.16 kV Feeder #2 to 12.47 kV and connect to the Feeder #1 at the corner of 8th Avenue and Craig Street. - ISD October 31st, 2021.
- Remove all dead spans and reinstate the switches #7908 and #7981 back to their original mode of operation at 12.47 kV. - ISD October 31st, 2021.

3.3. Two Stage Dawson City Distribution System Full Voltage Conversion Using the Platform Mounted Step-Down Transformer

Stage 1 ISD October 31st, 2019, and Stage 2 ISD October 31st, 2021, (Option #3) - Cost = $849,000, Net Present Value (NPV) = -$5,500 (Please see Appendix Eand Appendix E)

- Convert the entire 4.16 kV Feeder #1 and approximately 1/3 of Feeder #2 to 12.47 kV and connect to the express feeder from Callison Station. – ISD October 31st, 2019.
  - Construct one (1) span of 12.47 kV primary just outside the DDGS to energize Feeder #1 at 12.47 kV at the existing riser pole location.
  - The electrical load within the DDGS will remain at 4.16 kV, fed through the step-down transformer.
  - Replace all the single 2.4 kV rated transformers with 2.4/7.2 kV dual voltage rated units.
  - Replace all the lightening arresters with 9 kV Metal Oxide Varistor (MOV) units.
- Convert a portion of 4.16 kV Feeder #2 to 12.47 kV and connect to Feeder #1 at the corner of 6th Avenue and the back lane of Craig Street. – ISD October 31st, 2019.
  - In addition to the transformer and arrester replacements, this would require removal of a short section of 4.16 kV underbuilt circuit just outside the station.
  - This would be an opportunity to resolve clearance issues and to remove obsolete poles within this section.

- Remove the risers of switch #7908 and place a permanent hold card. Construct a dead span between the 12.47 kV and 4.16 kV.
- Remove the solid blades of switch #7981 and construct a dead span between the 4.16 kV and 12.47 kV.
- Decommission 4.16 kV Feeder #1, Feeder #2, and spare, including cables, terminations, and transition assemblies, since they are no longer required.
- Test and connect the platform mounted step-down transformer, located at the south end of the town, to feed the unconverted 4.16 kV portion of Feeder #2. The transformer shall be protected by standard NEMA fuses as per protection coordination study.
- Add a normally closed in-line disconnect switch on the 12.47 kV express circuit from Callison at the south corner of Dawson City, just north of the Klondike Hwy - ISD October 31st, 2019.
- Add a normally closed feeder tie switch between the 12.47 kV circuits from Callison station immediately on the load side of the line switch above - ISD October 31st, 2019.
- The open risers of Hunker feeder at the first pole south side of Klondike Highway near south end of the city shall remain open.
- Implement protection coordination recommendations on both feeders similar to the Option #1 description - ISD October 31st, 2019.
- The existing diesel generators will remain as described in Option #1.
- Convert the remainder of 4.16 kV Feeder #2 to 12.47 kV and connect to Feeder #1 at the corner of 8th Avenue and Craig Street. The platform mounted step-down transformer and the spare located in Callison Station shall be salvaged. - ISD October 31st, 2021.
- Remove all dead spans and reinstate switches #7908 and #7981 back to their original mode of operation at 12.47kV. - ISD October 31st, 2021.

Between the two (2) stages of either Option #2 or #3, the Downtown Dawson City distribution system will have two (2) different operating voltages. The two (2) systems are constructed to the same standard, making them visually near identical. (Some utilities build 4.1 6kV systems with reduced clearances and they are visually recognizable.)

- The safety concern due to the two (2) different operating voltages has been addressed by the addition of a dead span.
- New staff may get confused initially due to the two (2) operating voltages, however, proper orientation addresses this issue.
- Once Stage 2 is implemented, Option #2 and option #3 will provide a system similar to Option #1.

It is highly recommended that Stage 2 not be deferred in either Option 2 or 3. Actually, the cost savings realized through project implementation outweighs the interest cost savings through deferral.

Table 3–1: Benefits and Constraints

	Option #1: Single Stage Full Voltage Conversion (ISD October 31st, 2019)	Options #2 & #3: Two Stage Full Voltage Conversion (Stage 1 ISD October 31st, 2019, & Stage 2 ISD October 31st, 2021)
Benefits	• Provides a good system backup through tie points and diesel generation from the ISD. • The downtown system losses are reduced by 20.8kW from the ISD. • Overall NPV is positive which means the cost savings from quantifiable benefits will pay for the project in less than 30 years (28 years precisely).	• This option allows a more convenient spread of capital expenditure and resource allocation.
Constraints	• This option allows lesser flexibility in spreading of capital expenditure and resource allocation.	• Between the two (2) stages, certain customers on the 4.16 kV system lack an alternate supply increasing outage times during maintenance. • The inconvenience of having two (2) different voltage systems in the city. This could lead to confusion for new staff. • Continued higher system losses in unconverted area. • This option runs the risk of Stage 2 deferral due to unforeseen financial constraints and prioritization of projects.

4. Conclusions and Recommendations

The status quo (do nothing) is not considered as an option.

Option #2 leaves the unconverted part of Feeder #2 in a worse situation than its current state for two (2) years due to lack of operational feeder ties. Maintenance work performed on de-energized 4.16 kV plant would result in prolonged outages.

Option #3 is functionally similar to Option #2, however, due to the smaller size of the platform mounted transformer, the available feeder end fault currents would be lowered, worsening the issues on the remaining 4.16 kV system. In addition, the cost is higher Option #2. The only favorable feature of Option #3 as compared to Option #2 is the independence of the DCGS main bus and the feeder cables.

Option #1 has the lowest implementation cost and provides the best Net Present Value (NPV) and is the only option with a positive NPV, among numerous unquantified other benefits. It also will provide a long-term solution right away.

Based on the analysis above, Option #1 is recommended.

Following the implementation of Option #1, it is strongly recommended to follow the methodology of determining transformation capacity as explained in Appendix D.

Although not included in the alternatives in this report, a complete long-term solution with further improved reliability may include the following, subject to the availability of capital funds and resources:

- A new 12.47 kV feeder out of Callison Station to exclusively pick up the Hunker industrial load.
  - The available spare feeder position in the switchgear cabinet may be used for this purpose.

- Estimated cost would be approximately $50,000, providing a great benefit/cost ratio.

- Addition of a second bank at Callison Station.
  - This will provide firm capacity (with full contingency) to the station.
  - The spare transformer stored at the station is converted to an “Energized Spare”.

[4] CSA C22.1 – 18, Canadian Electrical Code – Section 8 – Circuit Loading and Demand Factors.

[5] CSA C22.3 No. 01 – 15, Overhead Systems – Section 5 – Clearances, Separations and Spacings.

Appendix A

Recent and Current Load Growth in Downtown Dawson Area

Appendix A
Recent and Current Load Growth in Downtown Dawson Area

The following loads have been added recently and are being added to the City of Dawson distribution system:

- A 20-unit apartment building on 2nd Avenue.
  This load is being served at 120/208 V via a 3x100 kVA overhead transformer bank.

- Water Treatment Plant on 5th Avenue between Turner & Dugas Streets.
  This load is being served at 120/20 8V via a 3x100 kVA overhead transformer bank.

- An 8-unit apartment building on 6th Avenue between Queen and King Streets.
  This load is being served at 120/208 V via a 3x50 kVA overhead transformer bank.

- Parks Canada 600 A Service at 302 Front Street.
  This load is being served at 120/208 V via a 3x50 kVA overhead transformer bank.

- Four Plex on 2nd Avenue between York and Duke Streets.
  This load is being served at 120/240 V single-phase overhead transformer.

- Duplex with 4 meters on 4th Avenue between York and Duke Streets.
  This load is being served at 120/240 V single-phase overhead transformer.

The following loads have been added recently and are being added to the Hunker Feeder on the rural distribution system:

- Hunker mine 800 A Service at 347/600 V via a 3x100 kVA overhead transformer bank.

- YTG Airport Shop 800 A Service at 120/208 V via a 225 kVA pad mount transformer.

At the time of the field visit there was a lot of construction happening within the city all of which adds to the electric heat load. This is a very stressful to a 4.16 kV system approaching its practical limits.

Sample Load Estimate and Transformer Efficiency Calculations

Appendix D
Sample Load Estimate and Transformer Efficiency Calculations

Currently, YEC is oversizing the transformation capacity for loads. This report recommends better approach to select transformation capacity to reduce life cycle cost of owning distribution plant.

The overhead transformers can handle 30% overload in summer and 90% overload in winter without sacrificing normal life expectancy. This extra cushion can be used to allow for load growth and to be confident in sizing the transformers more aggressively. It's recommended YEC to keep in track of similar existing loads and develop reasonable diversity factors to get a better handle of transformer capacity utilization factors.

Sample CEC load calculations for an apartment or similar building:

For a new 20-unit apartment building, the section 8 – 202 of Canadian Electrical Code (CEC) applies. This would be a very conservative approach for a commercial residential dwelling.

Assumptions:

- Exterior dimensions of the building is 40' x 150', two storey
- Common area 20% of total square footage
- Coin operated laundry in common area
- Electric baseboard heat
- Dedicated 40 gallon HWT (3000 W) in each unit
- The load is predominantly resistive so, unity power factor = 1.0

Confirmation of unit and common area sizes:

- Total square footage = 40x150x2 =12000 ft^2
- Common area = 0.2*12000 = 2400 ft^2
- Square footage of each unit = (12000-2400)/20 = 480 ft^2 (44.6m^2) on average

Each Dwelling Unit (excluding electric heat):

As per CEC, section 8 – 202:

i) Basic load for the first 45 m^2 = 3.5 kW

ii) N/A

iii) N/A

iv) N/A

v) Electric Range = 6.0 kW

vi) Water heater = 3.0 kW (HWT @ 100%)

vii) N/A

Total Power consumed except electric heat = 3.5+6.0+3.0 =12.5 kW

Additional load not located in the dwellings (Connected to the common area panel):

- Washer and dryer = 5.0 kW
- Outside plugs/alarm system = 3.2 kW (8 plugs, block heater only)
- Common area/exterior LED lighting = 0.5 kW
- Subtotal = 8.7 kW
- Total space heating load (@10 W/ft^2) = 120 kW

As per CEC section 8-202(3), load at the customer service entrance

= 1.0*12.5 + 0.65 * 12.5*2 + 0.40*12.5*2 + 0.25*12.5*15 + 1.0* 10 + 0.75 *(120-10) + 0.75*8.7

= 184.65 kW

Calculated current at 120/208 Service = 184.65/(3*0.120) = 512 A (Customer may request a 600 A)

The above number was calculated as per CEC representing the worst-case scenario. In reality, 60% - 70% adjustment factor is used by the utility is very common to size the transformation.

As a general rule, for an apartment building;

- Size the secondary to match the panel rating.
- Size the transformation to 60%-70% of the customer's estimated demand.
- Keep in track of similar actual loads to get a better handle on the above diversity factor.

Based on the above calculations, the transformation capacity required = 0.7*184.65 kVA= 130 kVA

3x50 kVA overhead transformer bank is required.

Similar building being constructed on 2nd Avenue is served by a 3x100 kVA overhead transformer bank. Clearly, this single load addition is not 10% of current city demand. Therefore, 3x50 kVA bank should have been a better choice.

Demand calculation for other commercial services such as schools, hotels and hospitals are also performed as per CEC.

The following calculations analyze transformer life cycle costs under different utilization factors.

YEC Distribution Transformer Efficiency Evaluation

Transformer Rating (kVA)	15	25	50	75	100	167

LEGEND	
Data	
Calculated	

The above calculations assume the following:

- The transformer efficiency maximizes around 40% - 45% of capacity, which is very typical for overhead distribution transformers.
- Cost of losses is calculated at $0.20/kWh, which is a reasonable weighted average between revenue rate and the cost of diesel generation.
- The yearly load cycle consist of 4 months of winter, 2months each of spring/fall (with 75% of winter loading) and 4 months of summer (50% of winter loading).

Although downsizing 2.4/7.2 kVA existing transformers is not justified by the cost savings however, improved utilization of them through reduction of excess transformation is well justified.

The replacement transformers shall have better utilization factors as included in the cost calculations.

Although the overhead transformers can handle significant overload without sacrificing normal life expectancy, it increases the life cycle cost beyond economical limits. The most economical life cycle cost is achieved when the transformers are loaded between 50% and 100% of capacity during the yearly load cycle.

Appendix E

Cost Estimates

Appendix E
Cost Estimates

The unit costs below are used in cost estimates. Salvage labor and material credit nearly cancel each other and disregarded in the calculation.

Replacement of 15 kVA single-phase transformer c/w 9 kV arrester:

- Cost of the transformer $1,800.00
- Cost of arrester & risers and misc. $ 200.00
  - Total material $2,000.00
  - Material overhead (25%) $ 500.00
- Cost of labor 10 hours @ $120/hour $1,200.00
  - Total labor and material cost $3,700.00

Replacement of 25kVA, 50kVA, 75kVA and 100kVA single-phase transformers may be priced at 4000, $4500, S5200, $6000 respectively.

Option #1 Cost Estimate:

Rebuild/Make ready cost:

Add 36 – 15 kVA transformers @ $3,700/ea.	= $133,200.00
Add 30 – 25 kVA transformers @ $4,000/ea.	= $120,000.00
Add 47 – 50 kVA transformers @ $4,500/ea.	= $211,500.00
Add 04 – 75 kVA transformers @ $5,200/ea.	= $ 20,800.00
Add 03 – 25 kV Single pole disconnects (in line for express feeder)	= $ 3,000.00
Add 01 – 25 kV Gang operated switch (for the feeder tie)	= $ 10,000.00
Add 02 spans of overhead 1/0 ACSR primary	= $ 2,000.00
Add 20 spans of overhead 1/0 triplex secondary	= $ 16,000.00
Add 10 spans of overhead 4/0 quadraplex secondary	= $ 15,000.00
Replace 25 arresters on dual voltage transformers with 9kV units	= $ 12,500.00
Remove obsolete primary	= $ 8,000.00
Remove 3 sets of 4 kV RINJ cable and terminations	= $ 3,000.00
Add 03 – 40’ to 50’ Class 3 poles	= $ 9,000.00
Make ready cost (Labor & material)	**= $ 564,000.00**

Voltage Conversion labor including overheads **= $ 60,000.00**

Protection coordination labor and material (Both 12 kV circuits)	**= $ 70,000.00**
Total of all costs above	**= $ 694,000.00**
Add 20% contingency	**= $ 138,800.00**
Total Conversion Cost	**= $ 832,800.00 (In 2019 $'s)**

Note: There was no salvage credit allowed for the 4160 V rated distribution transformers. The salvage value of the transformer approximately balances out the salvage labor cost, which adds up to zero.

There are 187 overhead distribution transformers with ratings ranging from 10 kVA to 100 kVA would be replaced only with 117 units ranging from 15 kVA to 75 kVA, significantly improving the utilization factor. The voltage conversion reduced the load currents, which reduces the line losses significantly.

30-year life cycle operating cost savings by better utilization of transformers (assuming doubled utilization factor) as per Appendix D

= (6x3420+57x5036+96x8678+14x11021+14x13428) – (36x4606+30x6782+47x11687+4x14843)

= $1,482,946 - $977,937

=$505,009 over 30 years

=$16,834/year transformer life cycle cost savings

As per pre conversion and post conversion load flow studies, the overall system losses are reduced by 20.8kW (= 133.9kW – 113.1kW). This is due to reduction of load currents at the higher distribution voltage.

Average cost savings due to reduced losses = 20.8x24x365x0.20 = $36,442/year

Option #2 Cost Estimate:

Deferred conversion cost:

Add 06 – 15 kVA transformers @ $3,700/ea.	= $22,200.00
Add 10 – 25 kVA transformers @ $4,000/ea.	= $40,000.00
Add 10 – 50 kVA transformers @ $4,500/ea.	= $45,000.00
Removal of some RINJ cable and some primary	= $ 5,000.00
Voltage conversion labor	= $20,000.00
Protection Coordination Labor and Material	= $10,000.00
Total of above	**= $142,200.00**

Add 20% contingency	**= $ 28,440.00**
Total deferred Conversion Cost	**= $ 170,640.00 (to 2021)**

Cost incurred in 2019 = $832,800.00 - $ 170,640.00 = $662,160.00

Cost incurred in 2021 = $170,640 + $10,000 for extra crew mobilization/demobilization cost
= $180,640

Approximately only 2/3 of the cost savings are realized in the first two years due to partial conversion. Cost savings on transformer life cycle and reduced system losses are approximately $11,223 and $24,295 respectively.

Option #3 Cost Estimate:

Cost incurred in 2019 = Option 2 cost in 2019 + $5000.00 to test and energize the platform mount transformer
= $662,160 + $5000
= $667,160

The deferred conversion cost is the same as Option #2.
Cost incurred in 2021 = $180,640

Approximately only 2/3 of the cost savings are realized in the first two years due to partial conversion. Cost savings on transformer life cycle and reduced system losses are approximately $11,223 and $24,295 respectively.

Key financial levers for options:

Based on above calculations, assuming a 5% corporate discount rate for YEC, and applying the quantifiable benefits of the voltage conversion against the cost, the following financial levers were determined:

Option #1

Total Cost	**= $832,800**
Net Present Value (NPV)	**= $ 25,840**
Breakeven period	**= 28 years**
Benefit/Cost ratio	**= 1.03**

Internal Rate of Return (IRR) **= 5.31%**

Option #2

Total Cost **= $842,800**

Net Present Value (NPV) **= - $ 709**

Breakeven period **= N/A**

Benefit/Cost ratio **= 1.00**

Internal Rate of Return (IRR) **= 4.99%**

Option #3

Total Cost **= $847,800**

Net Present Value (NPV) **= -$ 5471**

Breakeven period **= N/A**

Benefit/Cost ratio **= 0.99**

Internal Rate of Return (IRR) **= 4.93**

Appendix F

Sample Work Plan

Appendix F
Sample Work Plan

As per request from YEC, a sample work plan for Option #1 has been developed (for illustration purposes only) as follows. The timelines of activities are highly dependent on YEC's internal processes, budgetary requirements and the resource allocation to the project and therefore are not included. The In Service date (ISD) may be deferred by a few months and/or timelines may be spread out as required. The following activities shall be completed in the order of priority. Live line work may be substituted as fit.

1. **Technical and Financial Approval of Project:**

Obtain approval for this project and commit required funds. The high-level planning cost estimates and key financial levers in this report may deviate based on the degree of optimization of design.

2. **Complete Detailed Distribution Design and Protection Package:**

Based on the concepts provided by this report and the distribution standards used, complete a detailed design including protection, which shall include the following steps:

- Complete inspection of entire distribution plant to Identify requirements for 12kV operation below.
  - Insulator, dropout, cable voltage rating upgrades.
  - Single voltage rated transformers requiring replacement and dual Voltage transformers that can remain.
  - Overhead plant compliance of CAN CSA C-22.3 No. 01, latest revision.
  - Underground/ above-ground plant compliance of CAN CSA C-22.3 No. 07, latest revision.
- Obtain loading information of each distribution transformer. Customer billing information may be used for this purpose.
- Determine the optimum location/size of replacement distribution transformers and associated secondary conductor reconfiguration/upgrades/additions.
- Incorporate Distribution Protection Coordination hardware requirements in the design.

The inspection, voltage rating upgrades and CSA Standard compliance above are mandatory. Please note the design optimization has been taken in to account in the cost estimates and key financial lever calculations therefore, may result in cost overruns if not followed.

The Distribution protection study including settings shall be ready at this stage.

3. **Complete "Make Ready Work" for Voltage Conversion:**

While the distribution system still operating at 4.16kV, the following tasks shall be completed. At the client's discretion, the work may be performed on energized plant following approved work procedures minimizing outages to the customers.

- Upgrade all insulators, dropouts and primary cables to suit 12.47/7.2kV operation.
- Ensure the entire distribution plant comply with the latest applicable CSA standards above. Voltage conversion is considered as a 'Significant Modification" of the system and at the time of implementation, the affected plant shall meet applicable CSA standards wherever "reasonably practicable". No "Grand parenting Clauses" shall apply.

- Replace all overhead 2.4kV single rated distribution transformers with 2.4kV/7.2kV dual voltage rated units. Ensure all three-phase transformers are 4.16kV/12.47kV dual voltage rated. Ensure the voltage selector switch is set for 4.16kV system operation.
- The existing lightning arresters may remain on the overhead system until voltage conversion.
- Ensure all parking stand and elbow arresters (if any) in the underground system are rated at 9kV. Ensure normally open points in the underground system are adequately protected for "surge doubling effect" from both normal and alternate feed sides.
- Install distribution protection hardware recommended by the protection coordination study. All reclosers/sectionalizers shall be bypassed until the voltage conversion stage unless they are field resettable for both 4.16kV and 12.47kV operations.
- The existing 4.16kV riser cables and the 4.16kV underbuilt circuit along the back lane of Craig Street may remain until the voltage conversion is complete.

4. Complete the Voltage Conversion:

This step would require multiple partial system outages. The outage durations depend on construction crew capacity and methodology employed. There are three major branches of the Dawson City Distribution System tapped off the three-phase 'back bone" line along the back lane of Craig Street at 4th Avenue, 6th Avenue and 8th Avenue respectively. At each tap, sectionalizing equipment is to be installed. To minimize customer outage durations, the client may schedule the voltage conversion on one tap at a time. Each of these taps is called a "section" hereafter.

- Convert the first section to 12.47kV operation.
  - To minimize the outage time, de-energize a portion of a section (starting from the tap sectionalizing device) at a time.
  - Keep the unconverted area energized at 4.16kV during this period following proper safety procedures such as dead spans, non-reclosing etc.
  - Change out all lightning arresters on the de-energized portion of the section to 9kV units (this task may have been completed during the "make ready" stage as long as the voltage conversion is completed prior to the next forecasted thunderstorm).
  - Set the voltage selector switches of all transformers within this portion of the section to 7.2kV (single phase) or 12.47kV (three phase) as appropriate.
  - Connect the recloser/sectionalizer risers. Ensure 12.47kV protection settings are applied.
  - Energize the portion of the section at 12.47kV.
- Convert the rest of the section to 12.47kV operation repeating similar procedure.
- Remove the 4kV under-built circuit along the back lane of Craig Street and convert the 4.16kV load on this circuit to 12.47kV.

ISSUE: **MH0 (Mayo A) Generation Station Slope Stability Project**

QUESTION:

a) Please provide a cost breakdown of the $1,500,000 cost for this project. More specifically, identify the activities YEC forecasts to conduct and the cost amount allocated to those activities.

ANSWER:

(a)

This project has been deferred to 2023 to allow for further engineering and planning.

REFERENCE: **Application, Appendix 5.1, page 5.1-3**

ISSUE: **Replacement of Mayo A Surge Chamber Project**

QUOTE: "The Mayo A surge chamber is at end life and must be replaced before there is a catastrophic failure. An engineering study is being undertaken in 2021 to determine solutions and further work is forecast in 2022."

QUESTION:

a) Please indicate the year in which the Mayo A surge chamber was installed and the expected service life at the time of installation.

b) Please explain how often YEC carried out tests on this chamber in the past to assess its reliability and how often maintenance work was required. If possible, please provide the number of times maintenance was conducted on this chamber in the last 10 years, on a per annum basis, and the cost of this maintenance work.

c) Please describe the nature of the catastrophic failure that could occur in the Mayo A surge chamber.

d) Please provide details on the engineering study that will be conducted on the chamber.

ANSWER:

(a)

The surge chamber was Installed in 1952. Expected service life unknown.

(b)

A reliability test was performed in 2018; annual maintenance consists of visual inspection and confirmation of heating functionality prior to winter.

Maintenance was performed twice (2019/2020)

- The 2019 cost was $142; and
- The 2020 cost was $21,212.

(c)

The nature of the catastrophic failure that could occur is unknown.

(d)

An engineering study will be completed to determine options and a recommendation for the replacement of the surge chamber.

REFERENCE: **Application, Appendix 5.1, page 5.1-4**

ISSUE: **Stop Log Crane WH Main Spill Way Project**

QUOTE: "The stop log crane at the Whitehorse hydro main spill way is critical infrastructure that is required for installing stop logs, including in emergency situations. Furthermore, cranes are subject to annual inspection by regulation. The stop log crane is aging and is experiencing a number of issues. Several structural fasteners are showing signs of rusting and possible fatigue … Due to the age and design of this unit, any parts required to facilitate this repair will have to be independently sourced and/or manufactured."

QUESTION:

a) Please indicate the year in which the stop log crane was installed and the expected service life at the time of installation.

b) Please clearly describe what work will be done, as part of this project in 2021, that is covered by the $200,000 cost. Are further costs, beyond the $200,000 in 2021, anticipated in the near future for the stop log crane?

ANSWER:

(a)

The estimated installation date is 1958 as part of the original infrastructure. The expected service life of an exterior crane is 20 years.

(b)

Assessment and engineering work will be completed in 2021 and has yet to begin. This information will be used for project planning and estimating. The crane replacement project will commence in 2022.

REFERENCE: **Application, Appendix 5.1, page 5.1-4**

ISSUE: **Asset Management Framework Project**

QUOTE: "YEC is proceeding in a staged manner. Asset Management Framework costs to the end of 2019 were $2.064 million, with $1.560 million of forecast expenditures in 2020 and $1.196 million of forecast expenditures in 2021. Project costs will remain in WIP at the end of 2021 as activities for the 5-year program remain ongoing in 2022. Costs for EAM system purchase and implementation are addressed separately (see Section 5.4.1)."

QUESTION:

a) Please confirm that this is a separate project from and in addition to the Enterprise Asset Management (EAM) in Section 5.4.1.1 in the Application. (IR 66) Why are they separated into two projects?

b) Please explain why it costs $4.82 million to develop a framework for managing capital assets.

c) Please provide a cost breakdown for this project. More specifically, provide the activities YEC has included in its forecasts and the cost amount allocated to those activities.

d) Please provide the results of analysis performed by YEC examining the costs and benefits of this project, including a comparison to any alternatives considered by YEC for this project.

ANSWER:

(a)

EAM implementation is a separate project from Asset Management Framework (AMF) and PAMMS.

The AMF project involves development of a governance model as it applies to lifecycle management of YEC assets cradle to grave. It is aligned with ISO 55000, the international standard on Asset Management, and involves the development of a managed system. This system includes policy, processes, procedures pertaining to the management of assets. Attachment 1 to this response provides the ISO 55000 standard.

The EAM tool is a component of the AMF. The EAM projects is a software tool project primarily used for planning maintenance work at YEC.

(b)

The objective of this 5-year project is to develop and implement a formal Asset Management Framework at YEC. Project deliverables include the following activities:

- Implementation of an AMF and governance model consisting of policies, procedure, and process;
- Completion of the asset hierarchy and naming convention;
- Asset data collection;
- Maintenance philosophy, and methodology;
- Refinement, Development and documentation of Maintenance Manuals (Maintenance plans and instructions);
- Development of Asset Management Plans (AMPs) which include YEC's hydro, protection and control, diesel, substation, dam, transmission, and distribution assets;
- Maintenance Repair and Operations (MRO) parts warehousing process and procedure development and implementation;
- Organizational change management procedures and processes; and
- Project management methodologies, processes and procedures.

(c)

Please see the cost breakdown provided in the table below.

Asset Management Project Budget March 2018		
Subject Area	**Total**	
Strategy and Planning	$	58
Whole Life Cost Justification	$	81
Lifecycle Delivery	$	3,015
Asset Information	$	645
Organizaion and People	$	228
Risk and Review	$	422
Project Management and Overhead	$	426
Subtotal	**$**	**4,875**
Contingency	$	608
Total	**$**	**5,482**

(d)

There was no formal cost/ benefit analysis or NPV business case study performed on the Asset Management Framework (AMF) project as the benefits are qualitative.

Successful execution of the proposed the AMF project is expected to deliver the following benefits to YEC:

- Organizational sustainability;
- Knowledge transfer;
- Operational Efficiencies;
- Long Term Capital Planning certainty;
- Regulatory Approval certainty;
- Managing the risk of project deferral; and
- Continuous improvement.

These benefits are discussed in further detail below.

Organizational Sustainability

Without a managed system, strategic items that are implemented are typically on someone's desktop or filed away where other employees have little to no access. A managed system prevents this, and information is stored and managed in a structure, such that any one employee can leave the company and the information is available and managed.

Knowledge capture / lasting change

The outcome of the development of the AMF (collaboratively developing and documenting roles and responsibilities, processes, and procedures) establishes documented business practices for YEC and ensures that the AMF becomes a persistent part of the culture and is resilient to potential risks such as turnover of key staff.

Operational Efficiencies

Utilities that have implemented Asset Management programs based on the ISO 55000 standard have achieved operational savings in the range of 15-25%[1]. While Management has not quantified the expected cost savings that will result from implementation of the proposed Asset Management framework, savings are expected to arise from of the following:

- Efficiency improvements in the planning and execution of maintenance work;
- Capital efficiency improvements through the prioritization of investments according to asset criticality, condition and risk;
- Optimization of relative expenditures on operating costs (e.g., maintenance) vs capital expenditures (asset refurbishment or replacement); and
- Efficiency improvements from improved availability and management of documentation and data related to assets.

[1] From presentation "Strategic Asset Management Delivering Value across the Organization", presented by The Institute of Asset Management CEATI Strategic Asset Management Planning conference, Vancouver 2017.

Long Term Capital Planning certainty

The proposed Asset Management program will deliver comprehensive data and supporting analysis on the condition of YEC's key assets, which will be used to support and justify YEC's long term Sustaining Capital plans and associated long term financing requirements. This data is critical for the evaluation of YEC's future capital needs by the YEC Board, Shareholder and Yukon Government.

Regulatory Approval certainty

Information on the condition of key assets can be used to demonstrate the prudency of YEC's Sustaining Capital investments to the Yukon Utilities Board (YUB). This results in YECs ability to deliver on its Capital Program consistently.

Managing the risk of project deferral

Upon project completion YEC will have information at hand to make well informed decision about an asset. Also, the maintenance program will be improved such that the overall lifecycle of an asset is longer than expected. This results in a flatter Capital program over a longer period of time, extending asset life as well as a reduction in equipment failures.

Continuous improvement

A managed system, by definition, deploys a Plan, Do, Check and Act process. The process, when followed, reviews existing systems, identifies improvement opportunities and where cost effective, defines actions to ensure that the "Status Quo" is challenged. This process is significant and allows an organization to become more efficient in its operations.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is Project Committee ISO/PC 251, *Asset management*.

This corrected version of ISO 55000:2014 incorporates the correction of the numbering of definitions 3.2.4 to 3.2.7 and corresponding cross-references.

Introduction

0.1 Purpose

This International Standard provides an overview of asset management and asset management systems (i.e. management systems for the management of assets). It also provides the context for ISO 55001 and ISO 55002.

International cooperation in the preparation of these standards has identified common practices that can be applied to the broadest range of assets, in the broadest range of organizations, across the broadest range of cultures.

0.2 Relationship with other standards

ISO 55001, ISO 55002 and this International Standard relate to a management system for asset management, which is referred to as an "asset management system" throughout the three standards.

ISO 55001, ISO 55002 and this International Standard can be used in combination with any relevant sector or asset type-specific asset management standards and technical specifications. ISO 55001 specifies requirements for an asset management system, while the other standards detail sector-specific, asset-specific or activity-specific technical requirements or give guidance on how ISO 55001 should be interpreted and applied within a specific sector or to particular asset types.

0.3 Target audience

This International Standard is primarily intended for use by:

— those considering how to improve the realization of value for their organization from their asset base

— those involved in the establishment, implementation, maintenance and improvement of an asset management system

— those involved in the planning, design, implementation and review of asset management activities; along with service providers.

0.4 Benefits of the standards

The adoption of ISO 55001, ISO 55002 and this International Standard enables an organization to achieve its objectives through the effective and efficient management of its assets. The application of an asset management system provides assurance that those objectives can be achieved consistently and sustainably over time.

Annex A provides additional information on areas related to asset management activities.

Annex B shows the relationship between key elements of an asset management system.

Asset management — Overview, principles and terminology

1 Scope

This International Standard provides an overview of asset management, its principles and terminology, and the expected benefits from adopting asset management.

This International Standard can be applied to all types of assets and by all types and sizes of organizations.

NOTE 1 This International Standard is intended to be used for managing physical assets in particular, but it can also be applied to other asset types.

NOTE 2 This International Standard does not provide financial, accounting or technical guidance for managing specific asset types.

NOTE 3 For the purposes of ISO 55001, ISO 55002 and this International Standard, the term "asset management system" is used to refer to a management system for asset management.

2 Asset management

2.1 General

The factors which influence the type of assets that an organization requires to achieve its objectives, and how the assets are managed, include the following:

— the nature and purpose of the organization;

— its operating context;

— its financial constraints and regulatory requirements;

— the needs and expectations of the organization and its stakeholders.

These influencing factors need to be considered when establishing, implementing, maintaining and continually improving asset management.

Effective control and governance of assets by organizations is essential to realize value through managing risk and opportunity, in order to achieve the desired balance of cost, risk and performance. The regulatory and legislative environment in which organizations operate is increasingly challenging and the inherent risks that many assets present are constantly evolving.

The fundamentals of asset management and the supporting asset management system introduced in this International Standard, when integrated into the broader governance and risk framework of an organization, can contribute tangible benefits and leverage opportunities.

Asset management translates the organization's objectives into asset-related decisions, plans and activities, using a risk based approach.

2.2 Benefits of asset management

Asset management enables an organization to realize value from assets in the achievement of its organizational objectives (see 2.5.3.4). What constitutes value will depend on these objectives, the nature and purpose of the organization and the needs and expectations of its stakeholders. Asset management

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

supports the realization of value while balancing financial, environmental and social costs, risk, quality of service and performance related to assets.

The benefits of asset management can include, but are not limited to the following:

a) **improved financial performance**: improving the return on investments and reducing costs can be achieved, while preserving asset value and without sacrificing the short or long-term realization of organizational objectives;

b) **informed asset investment decisions**: enabling the organization to improve its decision making and effectively balance costs, risks, opportunities and performance;

c) **managed risk**: reducing financial losses, improving health and safety, good will and reputation, minimizing environmental and social impact, can result in reduced liabilities such as insurance premiums, fines and penalties;

d) **improved services and outputs**: assuring the performance of assets can lead to improved services or products that consistently meet or exceed the expectations of customers and stakeholders;

e) **demonstrated social responsibility**: improving the organization's ability to, for example, reduce emissions, conserve resources and adapt to climate change, enables it to demonstrate socially responsible and ethical business practices and stewardship;

f) **demonstrated compliance**: transparently conforming with legal, statutory and regulatory requirements, as well as adhering to asset management standards, policies and processes, can enable demonstration of compliance;

g) **enhanced reputation**: through improved customer satisfaction, stakeholder awareness and confidence;

h) **improved organizational sustainability**: effectively managing short and long-term effects, expenditures and performance, can improve the sustainability of operations and the organization;

i) **improved efficiency and effectiveness**: reviewing and improving processes, procedures and asset performance can improve efficiency and effectiveness, and the achievement of organizational objectives.

2.3 Assets

An asset is an item, thing or entity that has potential or actual value to an organization. The value will vary between different organizations and their stakeholders, and can be tangible or intangible, financial or non-financial.

The period from the creation of an asset to the end of its life is the asset life (see 3.2.2). An asset's life does not necessarily coincide with the period over which any one organization holds responsibility for it; instead, an asset can provide potential or actual value to one or more organizations over its asset life, and the value of the asset to an organization can change over its asset life.

An organization may choose to manage its assets as a group, rather than individually, according to its needs, and to achieve additional benefits. Such groupings of assets may be by asset types, asset systems, or asset portfolios.

2.4 Overview of asset management

2.4.1 General

An organization's top management, employees and stakeholders should implement planning, control activities (e.g. policies, processes or monitoring actions) and monitoring activities, to exploit opportunities and to reduce risks to an acceptable level.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

Asset management involves the balancing of costs, opportunities and risks against the desired performance of assets, to achieve the organizational objectives. The balancing might need to be considered over different timeframes.

Asset management enables an organization to examine the need for, and performance of, assets and asset systems at different levels. Additionally, it enables the application of analytical approaches towards managing an asset over the different stages of its life cycle (which can start with the conception of the need for the asset, through to its disposal, and includes the managing of any potential post disposal liabilities).

2.4.2 Fundamentals

Asset management is based on a set of fundamentals.

a) **Value**: Assets exist to provide value to the organization and its stakeholders.

   Asset management does not focus on the asset itself, but on the value that the asset can provide to the organization. The value (which can be tangible or intangible, financial or non-financial) will be determined by the organization and its stakeholders, in accordance with the organizational objectives.

   This includes:

   1) a clear statement of how the asset management objectives align with the organizational objectives;

   2) the use of a life cycle management approach to realize value from assets;

   3) the establishment of decision-making processes that reflect stakeholder need and define value.

b) **Alignment**: Asset management translates the organizational objectives into technical and financial decisions, plans and activities.

   Asset management decisions (technical, financial and operational) collectively enable the achievement of the organizational objectives.

   This includes:

   1) the implementation of risk-based, information-driven, planning and decision-making processes and activities that transform organizational objectives into asset management plans (see 2.5.3.4);

   2) the integration of the asset management processes with the functional management processes of the organization, such as finance, human resources, information systems, logistics and operations;

   3) the specification, design and implementation of a supporting asset management system.

c) **Leadership**: Leadership and workplace culture are determinants of realization of value.

   Leadership and commitment from all managerial levels is essential for successfully establishing, operating and improving asset management within the organization.

   This includes:

   1) clearly defined roles, responsibilities and authorities;

   2) ensuring that employees are aware, competent, and empowered;

   3) consultation with employees and stakeholders regarding asset management.

d) **Assurance**: Asset management gives assurance that assets will fulfil their required purpose.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

The need for assurance arises from the need to effectively govern an organization. Assurance applies to assets, asset management and the asset management system.

This includes:

1) developing and implementing processes that connect the required purposes and performance of the assets to the organizational objectives;

2) implementing processes for assurance of capability across all life cycle stages;

3) implementing processes for monitoring and continual improvement;

4) providing the necessary resources and competent personnel for demonstration of assurance, by undertaking asset management activities and operating the asset management system.

2.4.3 The relationship of the asset management system to asset management

An asset management system is used by the organization to direct, coordinate and control asset management activities. It can provide improved risk control and gives assurance that the asset management objectives will be achieved on a consistent basis. However, not all asset management activities can be formalized through an asset management system. For example, aspects such as leadership, culture, motivation, behaviour, which can have a significant influence on the achievement of asset management objectives, may be managed by the organization using arrangements outside the asset management system. The relationship between key asset management terms is shown in Figure 1.

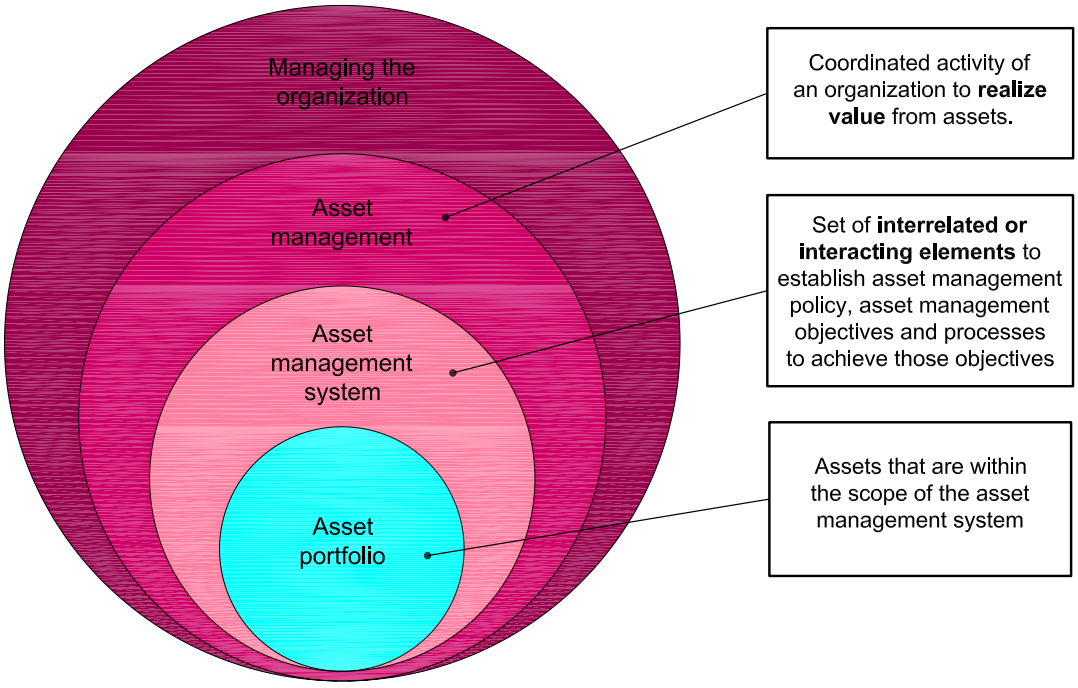

Figure 1 — Relationships between key terms

2.5 Overview of the asset management system

2.5.1 General

An asset management system is a set of interrelated and interacting elements of an organization, whose function is to establish the asset management policy and asset management objectives, and the processes, needed to achieve those objectives (see 3.4.3). In this context, the elements of the asset management

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

system should be viewed as a set of tools, including policies, plans, business processes and information systems, which are integrated to give assurance that the asset management activities will be delivered.

Asset management requires accurate asset information, but an asset management system is more than a management information system. Asset management interacts with many functions of an organization. The assets themselves can also support more than one function and more than one functional unit within the organization. The asset management system provides a means for coordinating contributions from and interaction between these functional units within an organization.

The asset management plan can enable an organization to create a link, if needed, between its asset management system (such as described by ISO 55001, ISO 55002 and this International Standard) and a variety of specific, technical asset management requirements. These specific, technical requirements are given in standards both inside and outside the ISO environment, and at the international, regional or national standardization levels; such standards provide information on strategies and tactics, as well as specific design, construction, material or process requirements. The definitions given in 3.4 refer specifically to the asset management system described in this International Standard; some of these terms may be defined differently for a specific, technical standard.

The establishment of an asset management system is an important strategic decision for an organization. ISO 55001 specifies the requirements of an asset management system, but does not specify the design of the system. ISO 55002 provides guidance on the design and operation of an asset management system.

2.5.2 Benefits of an asset management system

An asset management system provides a structured approach for the development, coordination and control of activities undertaken on assets by the organization over different life cycle stages, and for aligning these activities with its organizational objectives.

a) Creating an asset management system provides benefits in itself.

   The process of implementing an asset management system can require significant time effort and expense; however, the organization does not need to wait until the entire system is fully operational to begin accruing benefits. The benefits, or quick wins, in areas such as risk reduction, opportunity identification or process improvement can be identified early in the implementation, and can be exploited to demonstrate returns and gain stronger stakeholder support.

   — Asset management is data intensive and new tools and processes are often necessary to collect, assemble, manage, analyse and use asset data. The creation and use of these tools can stimulate and improve organizational knowledge and decision making.

   — The process of creating an asset management system brings new perspectives to the organization and new ideas on value creation from the use of assets. These new perspectives can also stimulate improvements in other organizational functions, such as purchasing, finance, human resources and information technology.

   — The creation of an asset management system is usually cross-functional and based on life cycle considerations; this can provide a focal point for addressing the issues of functional integration of the organization and life cycle planning.

b) Top management benefits from new insights and cross functional integration.

   An asset management system can help in gaining an understanding of assets, their performance, the risks associated with managing assets, investment needs, and asset value as an input to decision making and organizational strategic planning.

   — Top management should recognize the need to improve communication and interaction across functions. An asset management system inherently supports this interaction. It ensures that assets are managed in an integrated manner, and asset value is improved.

   — An asset management system supports a long-term and sustainable approach to decision making.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

— An asset management system provides an ideal framework for the identification, understanding and integration of the many technical standards, codes, guidelines and best practices that affect the organization's assets, and support the implementation of asset management.

— An asset management system supports energy management, environmental management and other activities related to sustainability.

c) Financial functions benefit from improved data and linkages.

Integration of an organization's strategic asset management plan (SAMP) (see 2.5.3.4 and 3.3.2), with its long-term financial plans can enable the balancing of short-term financial needs with the needs of medium-term activity plans, and with the much longer-term plans that some assets require.

— Robust financial information, based on integrated processes between the asset management and finance functions, is an important benefit of the asset management system. The linkage of asset management information to financial information is an important contribution of the asset management system to the financial function. This interaction supports improved assessment of the financial position and funding requirements of the organization in relation to its assets.

— The organization's risk-based decision making processes can become more effective by addressing asset and financial risks together, and by balancing performance, costs and risks.

— An effective taxonomy, which may be a feature of the asset management system, can enable an integrated financial and technical view of assets and asset systems.

d) Many parts of the organization benefit from an asset management system.

An asset management system touches many parts of the organization:

— the organization's human resources function may work with its asset management system on the development of competency models, training programs and processes for coaching and mentoring; these developments benefit both functions;

— some asset data comes from control systems, which are often isolated from other information systems. Integration of this data through the asset management system can provide new asset information, leading to improved organizational decision making;

— communicating with employees, suppliers and contracted service providers about the asset management system can result in improvements in the quality of asset information; it will also increase awareness amongst individuals, inside and outside of the organization, of their role in asset management decision making and the value of the activities they are undertaking;

— the asset management system can stimulate creativity and innovation by supporting people who understand the importance of asset management and are motivated to work towards achieving the asset management objectives.

2.5.3 Elements of an asset management system

2.5.3.1 General

An asset management system impacts the whole organization, including its stakeholders and external service providers, and can use, link or integrate many of the organization's activities and functions that would otherwise be managed or operated in isolation. The process of establishing an asset management system requires a thorough understanding of each of its elements and the policies, plans and procedures that integrate them.

The asset management system requirements described in ISO 55001 are grouped in a way that is consistent with the fundamentals of asset management:

— context of the organization (ISO 55001:2014, Clause 4);

 © ISO 2014 – All rights reserved

— leadership (ISO 55001:2014, Clause 5);

— planning (ISO 55001:2014, Clause 6);

— support (ISO 55001:2014, Clause 7);

— operation (ISO 55001:2014, Clause 8);

— performance evaluation (ISO 55001:2014, Clause 9);

— improvement (ISO 55001:2014, Clause 10).

2.5.3.2 Context of the organization

When establishing or reviewing its asset management system, an organization should take into account its internal and external contexts. The external context includes the social, cultural, economic and physical environments, as well as regulatory, financial and other constraints. The internal context includes organizational culture and environment, as well as the mission, vision and values of the organization. Stakeholder inputs, concerns and expectations are also part of the context of the organization. The influences of stakeholders are key to setting rules for consistent decision making and also contribute to the setting of organizational objectives, which in turn, influence the design and scope of its asset management system.

2.5.3.3 Leadership

Top management is responsible for developing the asset management policy and asset management objectives and for aligning them with the organizational objectives. Leaders at all levels are involved in the planning, implementation and operation of the asset management system. Top management should create the vision and values that guide policy, practice and actively promote these values inside and outside the organization. Top management also defines the responsibilities, accountabilities and asset management objectives and strategies, which create the environment for the asset management system. Leaders should lend their authority to supporting the asset management system, and should ensure its alignment to other management systems within the organization through appropriate organizational design.

Top management and leaders at all levels are responsible for ensuring that appropriate resources are in place to support the asset management system. These resources include appropriate funding, adequate and competent human resources, and information technology support.

Leaders should recognize and resolve conflicts between the internal culture of the organization and the performance of its asset management system.

Top management and leaders at all levels are responsible for communicating the organization's asset management objectives and the importance of its asset management system to all employees, customers, suppliers, contractors and other stakeholders. Communication should be two-way, with leaders being open to receiving information aimed at improving the asset management system from all levels.

2.5.3.4 Planning

The organizational objectives provide the overarching context and direction to the organization's activities, including its asset management activities. The organizational objectives are generally produced from the organization's strategic level planning activities and are documented in an organizational plan (see 3.1.15).

NOTE 1 The organizational plan can be referred to by other names, e.g. the corporate plan.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

The principles by which the organization intends applying asset management to achieve its organizational objectives should be set out in an asset management policy (see 3.1.18). The approach to implementing these principles should be documented in a strategic asset management plan (SAMP) (see 3.3.2).

NOTE 2 A strategic asset management plan can be referred to by other names, e.g. an asset management strategy.

An organization's SAMP should be used to guide the setting of its asset management objectives, and to describe the role of the asset management system in meeting these objectives. This includes the structures, roles and responsibilities necessary to establish the asset management system and to operate it effectively. Stakeholder support, risk management and continuous improvement are important issues to be addressed in the establishment and operation of the asset management system. The SAMP can have a timeframe that extends beyond the organization's own business planning timeframe, requiring the asset management system to address the complete lifetimes of the assets.

The organization should also use its SAMP to guide its asset management system in the development of its asset management plans (i.e. in establishing what to do). The asset management plans themselves should define the activities to be undertaken on assets, and should have specific and measurable objectives (e.g. timeframes and the resources to be used). These objectives can provide the opportunity for alignment of operating plans with the organizational plan and any unit level business plans.

Aligning the asset management objectives with the organizational objectives, as well as linking asset reports to financial reports, can improve the organization's effectiveness and efficiency, The linking of asset reports to financial reports can also improve and clarify the assessment of the financial status and long-term funding requirements of the organization.

2.5.3.5 Support

The asset management system will require collaboration among many parts of the organization. This collaboration often involves the sharing of resources. Coordinating these resources and applying, verifying and improving their use should be objectives of the asset management system. It should also promote awareness of the asset management objectives across the whole organization.

The asset management system provides information to support the development of asset management plans and the evaluation of their effectiveness. Asset information systems can be extremely large and complex in some organizations, and there are many issues involved in collecting, verifying and consolidating asset data in order to transform it into asset information. Creating, controlling, and documenting this information is a critical function of the asset management system.

The asset management system should specify the competency requirements for personnel involved in asset management. The implementation, maintenance, evaluation and improvement of these competencies normally requires close cooperation with the organization's human resource management system. These two systems should be mutually supportive.

2.5.3.6 Operation

The organization's asset management system can enable the directing, implementation and control of its asset management activities, including those that have been outsourced. Functional policies, technical standards, plans and processes for the implementation of the asset management plans should be fed back into the design and operation of the asset management system.

Operation of the asset management system can sometimes require planned changes to asset management processes or procedures, which can introduce new risks. Risk assessment and control in the context of managing change is an important consideration in operating an asset management system.

When an organization outsources some of its asset management activities, this should not remove those outsourced activities from the control of the organization's asset management system. In situations where interacting activities are outsourced to different service providers, the responsibilities and complexity of control will be increased.

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

2.5.3.7 Performance evaluation

The organization should evaluate the performance of its assets, its asset management and its asset management system. Performance measures can be direct or indirect, financial or non-financial.

Asset performance evaluation is often indirect and complex. Effective asset data management and the transformation of data to information (see 2.5.3.5) is a key to measuring asset performance. Monitoring, analysis and evaluation of this information should be a continuous process. Asset performance evaluations should be conducted on assets managed directly by the organization and on assets which are outsourced.

Asset management performance should be evaluated against whether the asset management objectives have been achieved, and if not, why not. Where applicable, any opportunities that arose from having exceeded the asset management objectives should also be examined, as well as any failure to realize them. The adequacy of the decision-making processes should be examined carefully.

The performance of the asset management system should be evaluated against any objectives set specifically for the system itself (either when it was established, or following previous evaluations). The primary purpose of evaluating the system should be to determine whether it is effective and efficient in supporting the organization's asset management. Periodic audits should be used to evaluate the performance of the asset management system; these may be complemented by self-assessments.

The results of performance evaluations should be used as inputs into management reviews.

2.5.3.8 Improvement

An organization's asset management system is likely to be complex and continually evolving to match its context, organizational objectives and its changing asset portfolio. Continual improvement is a concept that is applicable to the assets, the asset management activities and the asset management system, including those activities or processes which are outsourced.

Opportunities for improvement can be determined directly through monitoring the performance of the asset management system, and through monitoring asset performance.

Nonconformities or potential nonconformities of the asset management system can also be identified through management reviews and internal or external audits. The nonconformities require corrective action and the potential nonconformities require preventive action.

Of particular importance are asset-related incidents or emergency situations, for which emergency response planning and business continuity planning for identified risks should be addressed by the asset management system. All such incidents, including unanticipated events, should be investigated and reviewed to see if any improvements are needed to the asset management system, to prevent their recurrence and to mitigate their effects.

Improvements should be risk assessed prior to being implemented.

2.6 Integrated management systems approach

Using an integrated management systems approach allows an organization's asset management system to be built on elements of its other management systems, such as for quality, environment, health and safety, and risk management. Building on existing systems can reduce the effort and expense involved in creating and maintaining an asset management system. It can also improve integration across different disciplines and improve cross-functional coordination.

Organizations that have implemented an integrated systems approach have demonstrated the benefits of the integrated approach and shortened the time to implementation of each new system. The integrated approach, in addition to reducing cost, reduces risks and improves acceptance of each new system.

Asset management, because it touches so many parts of the organization, is a natural candidate for an integrated systems approach.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1 General terms

3.1.1
audit
systematic, independent and documented *process* (3.1.19) for obtaining audit evidence and evaluating it objectively to determine the extent to which the audit criteria are fulfilled

Note 1 to entry: An audit can be an internal audit (first party) or an external audit (second party or third party), and it can be a combined or integrated audit (combining two or more disciplines).

Note 2 to entry: "Audit evidence" and "audit criteria" are defined in ISO 19011.

3.1.2
capability
<asset management> measure of capacity and the ability of an entity (system, person or *organization* (3.1.13)) to achieve its *objectives* (3.1.12)

Note 1 to entry: *Asset management* (3.3.1) capabilities include *processes* (3.1.19), resources, *competences* (3.1.3) and technologies to enable the effective and efficient development and delivery of *asset management plans* (3.3.2) and *asset life* (3.2.2) activities, and their *continual improvement* (3.1.5).

3.1.3
competence
ability to apply knowledge and skills to achieve intended results

3.1.4
conformity
fulfilment of a *requirement* (3.1.20)

3.1.5
continual improvement
recurring activity to enhance *performance* (3.1.17)

3.1.6
documented information
information required to be controlled and maintained by an *organization* (3.1.13) and the medium on which it is contained

Note 1 to entry: Documented information can be in any format and media and from any source.

Note 2 to entry: Documented information can refer to:

— the *management system* (3.4.2), including related *processes* (3.1.19);

— information created in order for the organization to operate (documentation);

— evidence of results achieved (e.g. records, key performance indicators).

3.1.7
effectiveness
extent to which planned activities are realized and planned results achieved

3.1.8
incident
unplanned event or occurrence resulting in damage or other loss

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

3.1.9
monitoring
determining the status of a system, a *process* (3.1.19) or an activity

Note 1 to entry: To determine the status, there may be a need to check, supervise or critically observe.

Note 2 to entry: For the purposes of asset management, monitoring may also refer to determining the status of an asset. This is typically referred to as "condition monitoring" or "performance monitoring".

3.1.10
measurement
process (3.1.19) to determine a value

3.1.11
nonconformity
non-fulfilment of a *requirement* (3.1.20)

Note 1 to entry: Nonconformity can be any deviation from asset *management system* (3.4.2) requirements, or from relevant work standards, practices, procedures, legal requirements, etc.

3.1.12
objective
result to be achieved

Note 1 to entry: An objective can be strategic, tactical or operational.

Note 2 to entry: Objectives can relate to different disciplines (such as financial, health and safety, and environmental goals) and can apply at different levels (such as strategic, organization-wide, project, product and *process* (3.1.19)).

Note 3 to entry: An objective can be expressed in other ways, e.g. as an intended outcome, a purpose, an operational criterion, an *asset management* (3.3.1) objective or by the use of other words with similar meaning (e.g. aim, goal, or target).

Note 4 to entry: In the context of *asset management systems* (3.4.3), asset management objectives are set by the *organization* (3.1.13), consistent with the *organizational objectives* (3.1.14) and asset management *policy* (3.1.18), to achieve specific measurable results.

3.1.13
organization
person or group of people that has its own functions with responsibilities, authorities and relationships to achieve its *objectives* (3.1.12)

Note 1 to entry: The concept of organization includes, but is not limited to, sole-trader, company, corporation, firm, enterprise, authority, partnership, charity or institution, or part or combination thereof, whether incorporated or not, public or private.

3.1.14
organizational objective
overarching *objective* (3.1.12) that sets the context and direction for an *organization's* (3.1.13) activities

Note 1 to entry: Organizational objectives are established through the strategic level planning activities of the organization.

3.1.15
organizational plan
documented information (3.1.6) that specifies the programmes to achieve the *organizational objectives* (3.1.14)

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

3.1.16
outsource (verb)
make an arrangement where an external *organization* (3.1.13) performs part of an organization's function or *process* (3.1.19)

Note 1 to entry: An external organization is outside the scope of the *management system* (3.4.2), although the outsourced function or process is within the scope if its activities influence the effectiveness of the *asset management system* (3.4.3).

3.1.17
performance
measureable result

Note 1 to entry: Performance can relate either to quantitative or qualitative findings.

Note 2 to entry: Performance can relate to the management of activities, *processes* (3.1.19), products (including services), systems or *organizations* (3.1.13).

Note 3 to entry: For the purposes of *asset management* (3.3.1), performance can relate to *assets* (3.2.1) in their ability to fulfil *requirements* (3.1.20) or *objectives* (3.1.12).

3.1.18
policy
intentions and direction of an *organization* (3.1.13) as formally expressed by its *top management* (3.1.23)

3.1.19
process
set of interrelated or interacting activities which transforms inputs into outputs

3.1.20
requirement
need or expectation that is stated, generally implied or obligatory

Note 1 to entry: "Generally implied" means that it is custom or common practice for the *organization* (3.1.13) and *stakeholders* (3.1.22) that the need or expectation under consideration is implied.

Note 2 to entry: A specified requirement is one that is stated, for example in *documented information* (3.1.6).

3.1.21
risk
effect of uncertainty on *objectives* (3.1.12)

Note 1 to entry: An effect is a deviation from the expected — positive and/or negative.

Note 2 to entry: Objectives can relate to different disciplines (such as financial, health and safety, and environmental goals) and can apply at different levels (such as strategic, organization-wide, project, product and *process* (3.1.19)).

Note 3 to entry: Risk is often characterized by reference to potential "events" (as defined in ISO Guide 73:2009, 3.5.1.3) and "consequences" (as defined in ISO Guide 73:2009, 3.6.1.3), or a combination of these.

Note 4 to entry: Risk is often expressed in terms of a combination of the consequences of an event (including changes in circumstances) and the associated "likelihood" (ISO Guide 73:2009, 3.6.1.1) of occurrence.

Note 5 to entry: Uncertainty is the state, even partial, of deficiency of information related to, understanding or knowledge of, an event, its consequence, or likelihood.

[SOURCE: ISO Guide 73:2009, 1.1]

3.1.22
stakeholder
person or *organization* (3.1.13) that can affect, be affected by, or perceive themselves to be affected by a decision or activity

Note 1 to entry: A "stakeholder" can also be referred to as an "interested party".

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

3.1.23
top management
person or group of people who directs and controls an *organization* (3.1.13) at the highest level

Note 1 to entry: Top management has the power to delegate authority and provide resources within the organization.

Note 2 to entry: If the scope of the *management system* (3.4.2) covers only part of an organization, then top management refers to those who direct and control that part of the organization. If multiple *asset management systems* (3.4.3) are employed, the systems should be designed to coordinate efforts.

3.2 Terms relating to assets

3.2.1
asset
item, thing or entity that has potential or actual value to an *organization* (3.1.13)

Note 1 to entry: Value can be tangible or intangible, financial or non-financial, and includes consideration of *risks* (3.1.21) and liabilities. It can be positive or negative at different stages of the *asset life* (3.2.2).

Note 2 to entry: Physical assets usually refer to equipment, inventory and properties owned by the organization. Physical assets are the opposite of intangible assets, which are non-physical assets such as leases, brands, digital assets, use rights, licences, intellectual property rights, reputation or agreements.

Note 3 to entry: A grouping of assets referred to as an *asset system* (3.2.5) could also be considered as an asset.

3.2.2
asset life
period from *asset* (3.2.1) creation to asset end-of-life

3.2.3
life cycle
stages involved in the management of an *asset* (3.2.1)

Note 1 to entry: The naming and number of the stages and the activities under each stage usually vary in different industry sectors and are determined by the *organization* (3.1.13).

3.2.4
asset portfolio
assets (3.2.1) that are within the scope of the *asset management system* (3.4.3)

Note 1 to entry: A portfolio is typically established and assigned for managerial control purposes. Portfolios for physical hardware might be defined by category (e.g. plant, equipment, tools, land). Software portfolios might be defined by software publisher, or by platform (e.g. PC, server, mainframe).

Note 2 to entry: An asset management system can encompass multiple asset portfolios. Where multiple asset portfolios and asset management systems are employed, *asset management* (3.3.1) activities should be coordinated between the portfolios and systems.

3.2.5
asset system
set of *assets* (3.2.1) that interact or are interrelated

3.2.6
asset type
grouping of *assets* (3.2.1) having common characteristics that distinguish those assets as a group or class

EXAMPLE Physical assets, information assets, intangible assets, *critical assets* (3.2.7), enabling assets, linear assets, information and communications technology (ICT) assets, infrastructure assets, moveable assets.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

3.2.7
critical asset
asset (3.2.1) having potential to significantly impact on the achievement of the *organization's* (3.1.13) *objectives* (3.1.12)

Note 1 to entry: Assets can be safety-critical, environment-critical or *performance-critical* (3.1.17) and can relate to legal, regulatory or statutory *requirements* (3.1.20).

Note 2 to entry: Critical assets can refer to those assets necessary to provide services to critical customers.

Note 3 to entry: *Asset systems* (3.2.5) can be distinguished as being critical in a similar manner to individual assets.

3.3 Terms relating to asset management

3.3.1
asset management
coordinated activity of an *organization* (3.1.13) to realize value from *assets* (3.2.1)

Note 1 to entry: Realization of value will normally involve a balancing of costs, *risks* (3.1.21), opportunities and *performance* (3.1.17) benefits.

Note 2 to entry: Activity can also refer to the application of the elements of the *asset management system* (3.4.3).

Note 3 to entry: The term "activity" has a broad meaning and can include, for example, the approach, the planning, the plans and their implementation.

3.3.2
strategic asset management plan
SAMP
documented information (3.1.6) that specifies how *organizational objectives* (3.1.14) are to be converted into *asset management* (3.3.1)*objectives* (3.1.12), the approach for developing *asset management plans* (3.3.3), and the role of the *asset management system* (3.4.3) in supporting achievement of the asset management objectives

Note 1 to entry: A strategic asset management plan is derived from the *organizational plan* (3.1.15).

Note 2 to entry: A strategic asset management plan may be contained in, or may be a subsidiary plan of, the organizational plan.

3.3.3
asset management plan
documented information (3.1.6) that specifies the activities, resources and timescales required for an individual *asset* (3.2.1), or a grouping of assets, to achieve the *organization's* (3.1.13)*asset management* (3.3.1)*objectives* (3.1.12)

Note 1 to entry: The grouping of assets may be by *asset type* (3.2.6), asset class, *asset system* (3.2.5) or *asset portfolio* (3.2.4).

Note 2 to entry: An asset management plan is derived from the *strategic asset management plan* (3.3.2).

Note 3 to entry: An asset management plan may be contained in, or may be a subsidiary plan of, the strategic asset management plan.

3.3.4
preventive action
action to eliminate the cause of a potential *nonconformity* (3.1.11) or other undesirable potential situation

Note 1 to entry: This definition is specific to *asset management* (3.3.1) activities only.

Note 2 to entry: There can be more than one cause for a potential nonconformity.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

Note 3 to entry: Preventive action is taken to prevent occurrence and to preserve an *asset's* (3.2.1) function, whereas *corrective action* (3.4.1) is taken to prevent recurrence.

Note 4 to entry: Preventive action is normally carried out while the asset is functionally available and operable or prior to the initiation of functional failure.

Note 5 to entry: Preventive action includes the replenishment of consumables where the consumption is a functional *requirement* (3.1.19).

[SOURCE: ISO 9000:2005, 3.6.4, modified – Note 3 to entry has been modified; Notes 1, 4 and 5 have been added]

3.3.5
predictive action
action to monitor the condition of an *asset* (3.2.1) and predict the need for *preventive action* (3.3.4) or *corrective action* (3.4.1)

Note 1 to entry: Predictive action is also commonly referred to as either "condition monitoring" or "performance monitoring".

3.3.6
level of service
parameters, or combination of parameters, which reflect social, political, environmental and economic outcomes that the *organization* (3.1.13) delivers

Note 1 to entry: The parameters can include safety, customer satisfaction, quality, quantity, capacity, reliability, responsiveness, environmental acceptability, cost and availability.

3.4 Terms relating to asset management system

3.4.1
corrective action
action to eliminate the cause of a *nonconformity* (3.1.11) and to prevent recurrence

Note 1 to entry: In the case of other undesirable outcomes, action is necessary to minimize or eliminate the causes and to reduce the impact or prevent recurrence. Such actions fall outside the concept of corrective action, in the sense of this definition.

3.4.2
management system
set of interrelated or interacting elements of an *organization* (3.1.13) to establish *policies* (3.1.18) and *objectives* (3.1.12) and *processes* (3.1.19) to achieve those objectives

Note 1 to entry: A management system can address a single discipline or several disciplines.

Note 2 to entry: The system elements include the organization's structure, roles and responsibilities, planning, operation, etc.

Note 3 to entry: The scope of a management system may include the whole of the organization, specific and identified functions of the organization, specific and identified sections of the organization, or one or more functions across a group of organizations.

3.4.3
asset management system
management system (3.4.2) for *asset management* (3.3.1) whose function is to establish the asset management *policy* (3.1.18) and asset management *objectives* (3.1.12)

Note 1 to entry: The asset management system is a subset of asset management.

Annex A
(informative)

Information on asset management activities

Relevant asset management subject areas addressed by other published international, regional, or national standards include, but are not limited to, the following:

— data management;

— condition monitoring;

— risk management;

— quality management;

— environmental management;

— systems and software engineering;

— life cycle costing;

— dependability (availability, reliability, maintainability, maintenance support);

— configuration management;

— tero-technology;

— sustainable development;

— inspection;

— non-destructive testing;

— pressure equipment;

— financial management;

— value management;

— shock and vibration;

— acoustics;

— qualification and assessment of personnel;

— project management;

— property and property management;

— facilities management;

— equipment management;

— commissioning process;

— energy management.

Users of ISO 55001, ISO 55002 and this International Standard should also refer to such standards wherever possible, to ensure consistent delivery of asset management throughout their organization.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is Project Committee ISO/PC 251, *Asset management*.

Introduction

This International Standard specifies the requirements for the establishment, implementation, maintenance and improvement of a management system for asset management, referred to as an "asset management system".

This International Standard can be used by any organization. The organization determines to which of its assets this International Standard applies.

This International Standard is primarily intended for use by:

— those involved in the establishment, implementation, maintenance and improvement of an asset management system;

— those involved in delivering asset management activities and service providers;

— internal and external parties to assess the organization's ability to meet legal, regulatory and contractual requirements and the organization's own requirements.

The order in which requirements are presented in this International Standard does not reflect their importance or imply the order in which they are to be implemented.

Further guidance regarding the application of the requirements within this International Standard is provided in ISO 55002.

General information on asset management, and information on the terminology applicable to this International Standard, is provided in ISO 55000. Organizations can find that consideration of the principles will assist the development of asset management in their organization.

This International Standard applies the definition of "risk" given in ISO 31000:2009 and ISO Guide 73:2009. In addition, it uses the term "stakeholder" rather than "interested party".

This International Standard is designed to enable an organization to align and integrate its asset management system with related management system requirements.

Annex A provides additional information on areas related to asset management activities.

Asset management — Management systems — Requirements

1 Scope

This International Standard specifies requirements for an asset management system within the context of the organization.

This International Standard can be applied to all types of assets and by all types and sizes of organizations.

NOTE 1 This International Standard is intended to be used for managing physical assets in particular, but it can also be applied to other asset types.

NOTE 2 This International Standard does not specify financial, accounting or technical requirements for managing specific asset types.

NOTE 3 For the purposes of ISO 55000, ISO 55002 and this International Standard, the term "asset management system" is used to refer to a management system for asset management.

2 Normative reference

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 55000:2014, *Asset management — Overview, principles and terminology*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 55000 apply.

4 Context of the organization

4.1 Understanding the organization and its context

The organization shall determine external and internal issues that are relevant to its purpose and that affect its ability to achieve the intended outcome(s) of its asset management system.

Asset management objectives, included in the strategic asset management plan (SAMP), shall be aligned to, and consistent with, the organizational objectives.

4.2 Understanding the needs and expectations of stakeholders

The organization shall determine:

— the stakeholders that are relevant to the asset management system;

— the requirements and expectations of these stakeholders with respect to asset management;

— the criteria for asset management decision making;

— the stakeholder requirements for recording financial and non-financial information relevant to asset management, and for reporting on it both internally and externally.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

4.3 Determining the scope of the asset management system

The organization shall determine the boundaries and applicability of the asset management system to establish its scope. The scope shall be aligned with the SAMP and the asset management policy. When determining this scope, the organization shall consider:

— the external and internal issues referred to in 4.1;

— the requirements referred to in 4.2;

— the interaction with other management systems, if used.

The organization shall define the asset portfolio covered by the scope of the asset management system.

The scope shall be available as documented information.

4.4 Asset management system

The organization shall establish, implement, maintain and continually improve an asset management system, including the processes needed and their interactions, in accordance with the requirements of this International Standard.

The organization shall develop a SAMP which includes documentation of the role of the asset management system in supporting achievement of the asset management objectives.

5 Leadership

5.1 Leadership and commitment

Top management shall demonstrate leadership and commitment with respect to the asset management system by:

— ensuring that the asset management policy, the SAMP and asset management objectives are established and are compatible with the organizational objectives;

— ensuring the integration of the asset management system requirements into the organization's business processes;

— ensuring that the resources for the asset management system are available;

— communicating the importance of effective asset management and of conforming to the asset management system requirements;

— ensuring that the asset management system achieves its intended outcome(s);

— directing and supporting persons to contribute to the effectiveness of the asset management system;

— promoting cross-functional collaboration within the organization;

— promoting continual improvement;

— supporting other relevant management roles to demonstrate their leadership as it applies to their areas of responsibility;

— ensuring that the approach used for managing risk in asset management is aligned with the organization's approach for managing risk.

NOTE Reference to "business" in this International Standard can be interpreted broadly to mean those activities that are core to the purposes of the organization's existence.

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

5.2 Policy

Top management shall establish an asset management policy that:

a) is appropriate to the purpose of the organization;

b) provides a framework for setting asset management objectives;

c) includes a commitment to satisfy applicable requirements;

d) includes a commitment to continual improvement of the asset management system.

The asset management policy shall:

— be consistent with the organizational plan;

— be consistent with other relevant organizational policies;

— be appropriate to the nature and scale of the organization's assets and operations;

— be available as documented information;

— be communicated within the organization;

— be available to stakeholders, as appropriate;

— be implemented and be periodically reviewed and, if required, updated.

5.3 Organizational roles, responsibilities and authorities

Top management shall ensure that the responsibilities and authorities for relevant roles are assigned and communicated within the organization.

Top management shall assign the responsibility and authority for:

a) establishing and updating the SAMP, including asset management objectives;

b) ensuring that the asset management system supports delivery of the SAMP;

c) ensuring that the asset management system conforms to the requirements of this International Standard;

d) ensuring the suitability, adequacy and effectiveness of the asset management system;

e) establishing and updating the asset management plan(s) (see 6.2.2);

f) reporting on the performance of the asset management system to top management.

6 Planning

6.1 Actions to address risks and opportunities for the asset management system

When planning for the asset management system, the organization shall consider the issues referred to in 4.1 and the requirements referred to in 4.2 and determine the risks and opportunities that need to be addressed to:

— give assurance that the asset management system can achieve its intended outcome(s);

— prevent, or reduce undesired effects;

— achieve continual improvement.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

The organization shall plan:

a) actions to address these risks and opportunities, taking into account how these risks and opportunities can change with time;

b) how to:

— integrate and implement the actions into its asset management system processes;

— evaluate the effectiveness of these actions.

6.2 Asset management objectives and planning to achieve them

6.2.1 Asset management objectives

The organization shall establish asset management objectives at relevant functions and levels.

When establishing its asset management objectives, the organization shall consider the requirements of relevant stakeholders and of other financial, technical, legal, regulatory and organizational requirements in the asset management planning process.

The asset management objectives shall:

— be consistent and aligned with the organizational objectives;

— be consistent with the asset management policy;

— be established and updated using asset management decision-making criteria (see 4.2);

— be established and updated as part of the SAMP;

— be measurable (if practicable);

— take into account applicable requirements;

— be monitored;

— be communicated to relevant stakeholders;

— be reviewed and updated as appropriate.

The organization shall retain documented information on the asset management objectives.

6.2.2 Planning to achieve asset management objectives

The organization shall integrate the planning to achieve asset management objectives with other organizational planning activities, including financial, human resources and other support functions.

The organization shall establish, document and maintain asset management plan(s) to achieve the asset management objectives. These asset management plan(s) shall be aligned with the asset management policy and the SAMP.

The organization shall ensure that the asset management plan(s) take(s) into account relevant requirements coming from outside the asset management system.

When planning how to achieve its asset management objectives, the organization shall determine and document:

a) the method and criteria for decision making and prioritizing of the activities and resources to achieve its asset management plan(s) and asset management objectives;

b) the processes and methods to be employed in managing its assets over their life cycles;

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

c) what will be done;

d) what resources will be required;

e) who will be responsible;

f) when it will be completed;

g) how the results will be evaluated;

h) the appropriate time horizon(s) for the asset management plan(s);

i) the financial and non-financial implications of the asset management plan(s);

j) the review period for the asset management plan(s) (see 9.1);

k) actions to address risks and opportunities associated with managing the assets, taking into account how these risks and opportunities can change with time, by establishing processes for:

— identification of risks and opportunities;

— assessment of risks and opportunities;

— determining the significance of assets in achieving asset management objectives;

— implementation of the appropriate treatment, and monitoring, of risks and opportunities.

The organization shall ensure that its asset management related risks are considered in the organization's risk management approach including contingency planning.

NOTE See ISO 31000 for further guidance on risk management

7 Support

7.1 Resources

The organization shall determine and provide the resources needed for the establishment, implementation, maintenance and continual improvement of the asset management system.

The organization shall provide the resources required for meeting the asset management objectives and for implementing the activities specified in the asset management plan(s).

7.2 Competence

The organization shall:

— determine the necessary competence of person(s) doing work under its control that affects its asset performance, asset management performance and asset management system performance;

— ensure that these persons are competent on the basis of appropriate education, training, or experience;

— where applicable, take actions to acquire the necessary competence, and evaluate the effectiveness of the actions taken;

— retain appropriate documented information as evidence of competence;

— periodically review current and future competency needs and requirements.

NOTE Applicable actions can include, for example: the provision of training to, the mentoring of, or the re-assignment of currently employed persons; or the hiring or contracting of competent persons.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

7.3 Awareness

Persons doing work under the organization's control, who can have an impact on the achievement of the asset management objectives, shall be aware of:

— the asset management policy;

— their contribution to the effectiveness of the asset management system, including the benefits of improved asset management performance;

— their work activities, the associated risks and opportunities and how they relate to each other;

— the implications of not conforming to the asset management system requirements.

7.4 Communication

The organization shall determine the need for internal and external communications relevant to assets, asset management and the asset management system including:

— on what it will communicate;

— when to communicate;

— with whom to communicate;

— how to communicate.

7.5 Information requirements

The organization shall determine its information requirements to support its assets, asset management, asset management system and the achievement of its organizational objectives. In doing this:

a) the organization shall include consideration of:

   — the significance of the identified risks;

   — the roles and responsibilities for asset management;

   — the asset management processes, procedures and activities;

   — the exchange of information with its stakeholders, including service providers;

   — the impact of quality, availability and management of information on organizational decision making;

b) the organization shall determine:

   — the attribute requirements of identified information;

   — the quality requirements of identified information;

   — how and when information is to be collected, analysed and evaluated;

c) the organization shall specify, implement and maintain processes for managing its information;

d) the organization shall determine the requirements for alignment of financial and non-financial terminology relevant to asset management throughout the organization;

e) the organization shall ensure that there is consistency and traceability between the financial and technical data and other relevant non-financial data, to the extent required to meet its legal and regulatory requirements while considering its stakeholders' requirements and organizational objectives.

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

7.6 Documented information

7.6.1 General

The organization's asset management system shall include:

— documented information as required by this International Standard;

— documented information for applicable legal and regulatory requirements;

— documented information determined by the organization as being necessary for the effectiveness of the asset management system, as specified in 7.5.

NOTE The extent of the documented information for an asset management system can differ from one organization to another due to:

— the size of organization and its type of activities, processes, products and services;

— the complexity of processes and their interactions;

— the competence of persons;

— the complexity of the asset(s).

7.6.2 Creating and updating

When creating and updating documented information the organization shall ensure appropriate:

— identification and description (e.g. a title, date, author, or reference number);

— format (e.g. language, software version, graphics) and media (e.g. paper, electronic);

— review and approval for suitability and adequacy.

7.6.3 Control of documented information

Documented information required by the asset management system and by this International Standard shall be controlled to ensure:

a) it is available and suitable for use, where and when it is needed;

b) it is adequately protected (e.g. from loss of confidentiality, improper use, or loss of integrity).

For the control of documented information, the organization shall address the following activities, as applicable:

— distribution, access, retrieval and use;

— storage and preservation, including preservation of legibility;

— control of changes (e.g. version control);

— retention and disposition.

Documented information of external origin determined by the organization to be necessary for the planning and operation of the asset management system shall be identified, as appropriate, and controlled.

NOTE Access implies a decision regarding the permission to view the documented information only, or the permission and authority to view and change the documented information, etc.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

8 Operation

8.1 Operational planning and control

The organization shall plan, implement and control the processes needed to meet requirements, and to implement the actions determined in 6.1, the asset management plan(s) determined in 6.2, and the corrective and preventive actions determined in 10.1 and 10.2 by:

— establishing criteria for the required processes;

— implementing the control of the processes in accordance with the criteria;

— keeping documented information to the extent necessary to have confidence and evidence that the processes have been carried out as planned;

— treating and monitoring risks using the approach described in 6.2.2.

8.2 Management of change

Risks associated with any planned change, permanent or temporary that can have an impact on achieving the asset management objectives, shall be assessed before the change is implemented.

The organization shall ensure that such risks are managed in accordance with 6.1 and 6.2.2.

The organization shall control planned changes and review the unintended consequences of changes, taking action to mitigate any adverse effects, as necessary.

8.3 Outsourcing

When the organization outsources any activities that can have an impact on the achievement of its asset management objectives, it shall assess the associated risks. The organization shall ensure that outsourced processes and activities are controlled.

The organization shall determine and document how these activities will be controlled and integrated into the organization's asset management system. The organization shall determine:

a) the processes and activities that are to be outsourced (including the scope and boundaries of the outsourced processes and activities and their interfaces with the organization's own processes and activities);

b) the responsibilities and authorities within the organization for managing the outsourced processes and activities;

c) the processes and scope for the sharing of knowledge and information between the organization and its contracted service provider(s);

When outsourcing any activities, the organization shall ensure that:

— the outsourced resources meet the requirements of 7.2, 7.3 and 7.6;

— the performance of the outsourced activities is monitored in accordance with 9.1.

9 Performance evaluation

9.1 Monitoring, measurement, analysis and evaluation

The organization shall determine:

a) what needs to be monitored and measured;

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

b) the methods for monitoring, measurement, analysis and evaluation, as applicable, to ensure valid results;

c) when the monitoring and measuring shall be performed;

d) when the results from monitoring and measurement shall be analysed and evaluated.

The organization shall evaluate and report on

— the asset performance;

— the asset management performance, including financial and non-financial performance;

— the effectiveness of the asset management system.

The organization shall evaluate and report on the effectiveness of the processes for managing risks and opportunities.

The organization shall retain appropriate documented information as evidence of the results of monitoring, measurement, analysis and evaluation.

The organization shall ensure that its monitoring and measurement enables it to meet the requirements of 4.2.

9.2 Internal audit

9.2.1 The organization shall conduct internal audits at planned intervals to provide information to assist in the determination on whether the asset management system:

a) conforms to:

— the organization's own requirements for its asset management system;

— the requirements of this International Standard;

b) is effectively implemented and maintained.

9.2.2 The organization shall:

a) plan, establish, implement and maintain an audit programme(s), including the frequency, methods, responsibilities, planning requirements and reporting. The audit programme(s) shall take into consideration the importance of the processes concerned and the results of previous audits;

b) define the audit criteria and scope for each audit;

c) select auditors and conduct audits to ensure objectivity and the impartiality of the audit process;

d) ensure that the results of the audits are reported to relevant management; and

e) retain documented information as evidence of the results of the implementation of the audit programme and the audit results.

9.3 Management review

Top management shall review the organization's asset management system, at planned intervals, to ensure its continuing suitability, adequacy and effectiveness.

The management review shall include consideration of:

a) the status of actions from previous management reviews;

b) changes in external and internal issues that are relevant to the asset management system;

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

c) information on the asset management performance, including trends in:

— nonconformities and corrective actions;

— monitoring and measurement results;

— audit results;

d) asset management activity;

e) opportunities for continual improvement;

f) changes in the profile of risks and opportunities.

The outputs of the management review shall include decisions related to continual improvement opportunities and any need for changes (see 8.2) to the asset management system.

The organization shall retain documented information as evidence of the results of management reviews.

10 Improvement

10.1 Nonconformity and corrective action

When a nonconformity or incident occurs in its assets, asset management or asset management system the organization shall:

a) react to the nonconformity or incident, and, as applicable:

— take action to control and correct it;

— deal with the consequences;

b) evaluate the need for action to eliminate the causes of the nonconformity or incident, in order that it does not occur or recur elsewhere, by:

— reviewing the nonconformity or incident;

— determining the causes of nonconformity or incident;

— determining if similar nonconformities exist, or could potentially occur;

c) implement any action needed;

d) review the effectiveness of any corrective action taken; and

e) make changes (see 8.2) to the asset management system, if necessary.

Corrective actions shall be appropriate to the effects of the nonconformities or incident encountered.

The organization shall retain documented information as evidence of:

— the nature of the nonconformities or incident and any subsequent actions taken;

— the results of any corrective action.

10.2 Preventive action

The organization shall establish processes to proactively identify potential failures in asset performance and evaluate the need for preventive action.

When a potential failure is identified the organization shall apply the requirements of 10.1.

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

10.3 Continual improvement

The organization shall continually improve the suitability, adequacy and effectiveness of its asset management and the asset management system.

© ISO 2014 – All rights reserved

Annex A
(informative)

Information on asset management activities

Relevant asset management subject areas addressed by other published international, regional, or national standards include, but are not limited to, the following:

— data management;

— condition monitoring;

— risk management;

— quality management;

— environmental management;

— systems and software engineering;

— life cycle costing;

— dependability (availability, reliability, maintainability, maintenance support);

— configuration management;

— tero-technology;

— sustainable development;

— inspection;

— non-destructive testing;

— pressure equipment;

— financial management;

— value management;

— shock and vibration;

— acoustics;

— qualification and assessment of personnel;

— project management;

— property and property management;

— facilities management;

— equipment management;

— commissioning process;

— energy management.

Users of ISO 55000, ISO 55002 and this International Standard should also refer to such standards wherever possible, to ensure consistent delivery of asset management throughout their organization.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is Project Committee ISO/PC 251, *Asset management*.

This corrected version of ISO 55000:2014 incorporates the correction of the numbering of subclause 7.3.2.

Introduction

This International Standard provides guidance for the application of a management system for asset management, referred to as an "asset management system", in accordance with the requirements of ISO 55001.

This International Standard contains explanatory text necessary to clarify the requirements specified in ISO 55001 and provides examples to support implementation. It does not provide guidance for managing specific asset types.

This International Standard provides guidance for use by:

— those involved in the establishment, implementation, maintenance and improvement of an asset management system;

— those involved in delivering asset management activities and service providers.

General information on asset management, and information on the terminology applicable to this International Standard, is provided in ISO 55000.

Annex A provides additional information on areas related to asset management activities.

Annex B shows the relationship between key elements of an asset management system.

Asset management — Management systems — Guidelines for the application of ISO 55001

1 Scope

This International Standard provides guidance for the application of an asset management system, in accordance with the requirements of ISO 55001.

This International Standard can be applied to all types of assets and by all types and sizes of organizations.

NOTE 1 This International Standard is intended to be used for managing physical assets in particular, but it can also be applied to other asset types.

NOTE 2 This International Standard does not provide financial, accounting or technical guidance for managing specific asset types.

NOTE 3 For the purposes of ISO 55000, ISO 55001 and this International Standard, the term "asset management system" is used to refer to a management system for asset management.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 55000:2014, *Asset management — Overview, principles and terminology*

ISO 55001:2014, *Asset management — Management systems — Requirements*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 55000 apply.

4 Context of the organization

4.1 Understanding the organization and its context

4.1.1 Overview

4.1.1.1 The asset management system forms an integrated part of the organization's management system and has a prescribed structure. It should fit in and result from:

— the organizational objectives;

— the organizational plan.

The asset management system includes:

a) the asset management policy (see 5.2);

b) the asset management objectives (see 6.2);

c) the strategic asset management plan (SAMP);

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

d) the asset management plan(s) (see 6.2.2), which are implemented in:

— operational planning and control;

— supporting activities;

— control activities;

— other relevant processes.

Figure B.1 shows the relationship between the key elements of an asset management system, together with the related clauses in ISO 55001.

The scope of an organization's asset management system and the outputs from its asset management activities should be used to set out the approach to enable the delivery of its organizational objectives. The requirements for the scope and context of an organization's asset management system are given in ISO 55001:2014, Clause 4.

The organizational objectives provide the overarching context and direction to the organization's activities, including its asset management activities. The organizational objectives are generally produced from the organization's strategic level planning activities and are documented in an organizational plan.

NOTE 1 The organizational plan can be referred to by other names, e.g. the corporate plan.

The principles by which the organization intends applying asset management to achieve its organizational objectives should be set out in an asset management policy. The approach to implementing these principles should be documented in a strategic asset management plan (SAMP).

NOTE 2 A strategic asset management plan can be referred to by other names, e.g. an asset management strategy.

The SAMP should document the relationship between the organizational objectives and the asset management objectives, and should define the framework required to achieve the asset management objectives.

The links between the organizational plan and the SAMP should be two-way, and should be developed through an iterative process. For example, the organizational objectives should not be developed in isolation from the organization's asset management activities. Asset capability and performance, as well as the outputs from asset management activities (e.g. the asset management plan(s)), are key inputs into establishing realistic and achievable organizational objectives.

4.1.1.2 In developing its SAMP, the organization should:

a) consider the expectations and requirements of stakeholders;

b) consider activities that could extend beyond the organization's routine planning timeframe, and which should be subject to regular review;

c) clearly document the processes to establish its asset-related decision-making criteria.

The SAMP should be a high level plan that contains the asset management objectives. It should be used to develop the asset management plan(s), which should set out the asset level activities. The asset management plan(s) can be cascaded in large organizations or in organizations with complex asset portfolios.

4.1.1.3 All parts of the asset management system should be scalable, e.g. for small organizations, the organizational plan could be a single document that includes separate sections for:

a) the organizational objectives;

b) the SAMP;

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

c) the asset management plan(s).

Alternatively, the organizational plan could be kept separate from the SAMP, which could include the asset management plan(s) as a sub-section, or all three plans could be kept separately. While it is necessary to distinguish between the SAMP and the asset management plan(s), it is not a requirement of ISO 55001 to create separate documents for each.

The concept of ensuring alignment and consistency between the organizational objectives, the asset management policy, the SAMP, the asset management objectives and the asset management plan(s), should reinforce within the organization that asset level activities support the delivery of the organizational objectives. It is important that this alignment is communicated to ensure that stakeholders at all levels understand why asset activities and asset management activities are implemented.

4.1.2 Understanding the organization and its context

4.1.2.1 When establishing or reviewing an asset management system, it is important to ensure that the approach is consistent and aligned with the external and internal contexts of the organization, since these can significantly influence the design and scope of the asset management system.

4.1.2.2 Evaluating the organization's external context can include, but is not limited to, the following issues:

a) the social and cultural, political, legal, regulatory, financial, technological, economic, competitive and natural environment, whether international, national, regional or local;

b) key drivers and trends having impacts on the objectives of the organization;

c) relationships with, and perceptions and values of, external stakeholders.

4.1.2.3 Evaluating the organization's internal context can include, but is not limited to, the following issues:

a) governance requirements;

b) organizational structure, roles, accountabilities and authorities;

c) policies, objectives, and the strategies that are in place to achieve them;

d) capabilities, understood in terms of resources and knowledge (e.g. capital, time, people, systems and technologies);

e) information systems, information flows and decision-making processes (both formal and informal);

f) relationships with, and perceptions and values of, internal stakeholders;

g) the organization's culture;

h) standards, guidelines and models adopted by the organization;

i) the form and extent of contractual relationships;

j) risk management plans;

k) asset management practices and other management systems, plans, process(es) and procedure(s);

l) integrity and performance of the assets and asset systems;

m) feedback from the investigation of previous asset and asset system failures, incidents, accidents and emergencies;

n) assessing the ability of the asset management system to achieve the intended outcomes of the organizational objectives;

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

o) feedback from previous self-assessments, internal audits, third party reviews and certification reviews.

4.2 Understanding the needs and expectations of stakeholders

4.2.1 The organization should identify and review the stakeholders that are relevant to asset management and the needs and expectations of these stakeholders.

4.2.2 Internal stakeholders can include the following:

a) employees within the organization;

b) groups within the organization, i.e. functional groups (e.g. engineering, accounting, maintenance, operations, purchasing, receiving, logistics) or other groups (e.g. safety delegates);

c) shareholders, management consortiums, owners.

4.2.3 External stakeholders can include the following:

a) customers, users, suppliers, service providers and contractors;

b) non-governmental organizations, including civil society organizations, consumer organizations and the media with an interest in issues related to asset management;

c) government organizations, government agencies, regulatory authorities, and politicians at all levels of government;

d) investors or taxpayers;

e) local communities;

f) those in society interested in social, financial, environmental or other forms of sustainability;

g) financial institutions, rating agencies, and insurers;

h) employee representatives.

4.2.4 Stakeholders' needs and expectations should be documented and communicated. This may be captured in a statement of stakeholders needs within the SAMP and should reference any mandatory requirements, as well as the expectations of different stakeholder groups. The organization should consider a means of tracking how current the information is, and the methods involved for its collection. When engaging with stakeholders to determine their needs and expectations, the organization can use the list of contexts given in 4.1.2 to frame the discussions.

One objective of asset management is to enable the organization to meet the service needs of the customers and users of its asset(s). The organization should measure the levels of service (see 6.2.1) that its assets deliver, and analyse these against the requirements and expectations of its customers and users. A level of service review process can be a useful approach to understand the expectations of customers and users.

Stakeholders are likely to make judgments about the organization's asset management and its asset management outputs and outcomes, based on their perceptions. These can vary due to differences in values, needs, assumptions, concepts and concerns, as they relate to the issues under discussion. Since the views of stakeholders can have a significant impact on the organization's asset-related decisions, it is important that their perceptions are determined, recorded, and taken into account in the organization's decision-making process.

Understanding how asset-related decisions are made is an important part of asset management. The criteria for decision making are influenced by the needs of external and internal stakeholders, by the asset management policy and by the risk attitude of the organization. The external and internal stakeholders' input to establishing decision-making criteria is important for setting priorities and resolving conflicting

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

requirements. Decision-making criteria should be appropriate to the importance and complexity of the decisions being made. Decision-making criteria should be used to evaluate competing options to meet asset management objectives and develop asset management plans. The criteria can be expressed in a number of ways, to support quantitative, semi-quantitative or qualitative decisions. The processes to establish the decision-making criteria that guide asset management should be clear and documented.

The level of detail needed when reporting to stakeholders will vary from one stakeholder to another, depending on the scope of the organization's activities and on the complexity of the assets being managed. The detail should only disclose proprietary information as appropriate for the stakeholders receiving the information.

Stakeholders generally need to be informed about the decisions that can affect them and might need to provide input into decisions that can have an impact on them. Failure to both communicate and consult in an appropriate way about asset management activities can in itself constitute a risk, because it could later prevent an organization from fulfilling its objectives.

It is important that the terminology used in communicating with stakeholders is consistent and aligned with other functions in the organization, and in accordance with legal requirements, where applicable. This is particularly necessary when communicating financial information.

4.3 Determining the scope of the asset management system

Based on the outcomes of reviews of its context and stakeholders (see 4.1 and 4.2), the organization should define (or review) the boundaries of the asset management system, and establish its scope.

The boundaries and applicability of the asset management system should be captured in a statement of scope (which may be included in the SAMP). It should be communicated to all relevant stakeholders, both internal and external to the organization. The detail will be influenced by the size of the organization and the scale and complexity of the asset portfolio covered by the asset management system. It should clearly show what is considered inside and outside scope.

The scope should consider:

a) the assets, asset portfolio(s), their boundaries and interdependencies;

b) which other organizations are involved in meeting the organization's asset management system requirements (including the requirements of ISO 55001), e.g. through the outsourcing of asset management activities or activities related to life cycle stages;

c) the organizational aspects, e.g. which parts or functions of the organization are involved;

d) the organization's period of responsibility (e.g. where the management of assets is contracted out for a set period of time), including its residual liabilities beyond the operation or use of the asset (e.g. where an organization remains accountable for risks beyond its use of an asset, such as a chemical plant asset owner that retains liability for ground contamination);

e) the interactions with other parts of the organization's management system (e.g. for quality or environmental management), which can require defining the boundaries, functions, and responsibilities of each part of the management system.

4.4 Asset management system

In the initial development of the asset management system, the organization should outline how it will establish, implement, maintain and improve the system. An initial review of the organization's current processes against the requirements of ISO 55001 will determine the areas that need to be developed to support the functioning of a compliant asset management system.

The asset management system should not stand alone. A factor of successful asset management is the ability to integrate asset management processes, activities and data with those of other organizational functions, e.g. quality, accounting, safety, risk and human resources. Where possible, existing business

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

processes should be leveraged to avoid unnecessary new work and duplication of existing work and data. These interactions with the existing processes need to be clearly communicated to all involved.

Consideration should be given to how to prioritize what to develop first, as there is usually a limit on resources available. The review can guide the organization in formulating plan(s) for implementing and prioritizing improvements to its asset management system.

An appropriate starting point is the establishment of an asset management policy, which often helps to provide focus for the organization and to identify its intentions. Following this, the organization should develop its SAMP.

It is important to be aware of, and to clarify, any variations in terminology between ISO 55000 and the terminology used in the organization's common practice.

Compliance with all the requirements of ISO 55001 should be considered as achieving only the minimum starting point for an effective asset management system and should not be seen as the final goal.

5 Leadership

5.1 Leadership and commitment

Asset management leadership can be demonstrated by top management through positively influencing the organization (and in its execution of all the requirements of ISO 55001, and specifically the requirements of ISO 55001:2014, 5.1). Top management may appoint an individual to oversee the development, implementation, operation and continual improvement of an asset management system, however, it is important that ownership and accountability for asset management remains at the top management level.

Top management commitment to asset management can be demonstrated by:

a) making reference to asset management principles in communications;

b) engagement in setting the objectives and measures of success for the people responsible for the asset management system:

   — by setting priorities for these objectives;

   — by allocating appropriate resources for the achievement of these objectives;

c) establishing a strong collaborative work culture that is focused on delivering the asset management objectives;

d) using asset management related decision-making criteria for capital expenditures and other decisions;

e) supporting asset management related improvement activities;

f) supporting a management-development track that encourages and rewards time spent in roles associated with asset management and operation of the asset management system;

g) monitoring the asset management system performance and ensuring corrective or preventive actions, including opportunities for continual improvement;

h) assuring that asset management is considered at the same level of importance as safety, quality, environment, etc.;

i) addressing asset related risks and incorporating them into the organization's risk management processes;

j) aligning asset management and the asset management system to other organizational functions through collaboration on achieving the organizational objectives;

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

k) aligning asset management and the asset management system to other organizational practices and management systems, e.g. including the organization's approach to risk management.

5.2 Policy

The asset management policy is a short statement that sets out the principles by which the organization intends to apply asset management to achieve its organizational objectives. The asset management policy should be authorized by top management and thereby demonstrate commitment to asset management.

The policy should set out the organization's commitments and expectations for decisions, activities and behaviour concerning asset management. It should be aligned to and demonstrate support for the organizational objectives. For example, an organizational objective to reduce capital investment could result in an asset management policy statement for adopting risk-based approaches to capital investment.

Examples of asset management policy principles may include commitments for:

a) guiding principles for asset management activities, e.g. service delivery objectives are to guide asset management practices and decisions;

b) adherence to applicable laws, legislation and regulations;

c) the provision of resources to deliver on asset management objectives and the structure or working of the organization to achieve the organizational objectives, e.g. asset planning and management is to be integrated with corporate and business planning, budgetary and reporting processes;

d) the decision-making criteria to be used, e.g. asset management decisions are to be based on evaluations of alternatives that take into account life cycle costs, benefits and risks of the asset;

e) reporting on asset and asset management performance;

f) long-term objectives, sustainable outcomes and stakeholder requirements;

g) continual improvement of the asset management system.

It is not necessary for the policy to be captured in a discrete document; it can be contained in other high level organizational policies or documents, e.g. it may be included in the SAMP. The important point is that it is communicable to the organization. If this can be demonstrated, a separate asset management policy document may not be required.

There should be processes in place to review and update the asset management policy, and to ensure that if the organization's external or internal context changes, the actions necessary to update the policy are also triggered.

5.3 Organizational roles, responsibilities and authorities

The responsibilities and authorities of key functions should be defined (see ISO 55001:2014, 5.3). This should include both internal and outsourced roles and responsibilities. The interfaces between organizational functions should be clearly established. This becomes more important in an outsourced environment.

It should be clear which role is responsible for which activity. This can be achieved through the development of job descriptions, or through including asset management responsibilities in existing job descriptions, or through the production of a documented organizational chart.

When assigning internal roles, consideration should be given to the following:

a) an individual's experience and competence (see 7.2);

b) support for the role through training and mentoring;

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

c) other workload requirements and their variability, which could impact the individual's ability to deliver on asset management related objectives;

d) the individual being able to demonstrate an understanding of what the responsibilities mean in the context of their role (e.g. this can be achieved through the signed acceptance of a job description).

In small or medium-sized organizations, multiple asset management functions may be assigned to one individual. This does not change the need to communicate this to other stakeholders, or to clarify the responsibility of the individual.

For contractors and external service providers, their responsibilities and the competence required should be documented in the scope or elsewhere in contracts.

6 Planning

6.1 Actions to address risks and opportunities for the asset management system

The organization should determine the actions that are necessary for addressing risks when planning for its asset management system (see also ISO 55001:2014, 6.1). In this International Standard, it is assumed that the term "risk" also includes opportunities (see ISO 55000:2014, 3.1.21). The overall purpose is to understand the cause, effect and likelihood of adverse events occurring, to manage such risks to an acceptable level, and to provide an audit trail for the management of risks. The intent is for the organization to ensure that the asset management system achieves its objectives, prevents or reduces undesired effects, identifies opportunities, and achieves continual improvement.

When addressing risks in the asset management system, the organization should determine the risk assessment criteria (e.g. likelihood and consequence, and risk attitude) within asset management decision making for its asset management system (see 4.2). A risk matrix may be used as part of this process.

The approach of managing risks associated with the asset management system should be aligned with the organization's risk management approach and, where appropriate, this may include business continuity planning and contingency planning. The organization should consider how managing risks in its asset management system relate to other risk management processes in the organization (see 4.3).

The organization should determine and plan actions, and provide adequate resources, to address its asset management system risks. For example, asset management risks could be incorporated into an organization's divisional and project risk registers, with appropriate escalation mechanisms if they cannot be addressed at the level at which they are raised.

The organization should integrate the actions identified to address these risks into the implementation plan for the asset management system.

The organization should be able to demonstrate how it has evaluated the effectiveness of the actions that it has taken to manage the risks identified in relation to the organizational objectives and decision-making criteria.

6.2 Asset management objectives and planning to achieve them

6.2.1 Asset management objectives

6.2.1.1 The asset management objectives, derived as part of the SAMP, provide the essential link between the organizational objectives and the asset management plan(s) that describe how those objectives are going to be achieved. The asset management objectives transform the required outcomes (product or service) to be provided by the assets, into activities typically described in the asset management plan(s).

The asset management objectives should be tailored to suit each organization's needs, which may include addressing subsets of objectives (e.g. for the asset management system, asset portfolios, the

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

asset system and at asset level), and can vary for different functions carried out to meet stakeholder requirements. The organization should consider information or data from sources internal and external to the organization, including contractors, key suppliers, regulators or other stakeholders.

Asset management objectives should be specific, measurable, achievable, realistic and time-bound (i.e. "SMART" objectives). They can be both quantitative measurements (e.g. mean time between failure) and qualitative measurements (e.g. customer satisfaction).

The organization should consider the monitoring, measuring, analysing and evaluating needed to drive and support its decision making on improvement actions. When deciding what to measure, how to measure, what to analyse, etc., it is important for the organization to understand what type of behaviour and actions it wants to achieve from the asset management objectives before implementing them. The asset management objectives should be aligned to the organizational objectives and should promote collaboration with stakeholders.

6.2.1.2 During the development of its asset management objectives, the organization should:

a) review risks, including the potential impacts from the failure of

   — assets, or

   — the asset management activities on achieving asset management objectives, individually or in combination;

b) review the importance of assets related to their intended outcomes, objectives and product or service requirements;

c) check the applicability of the asset management objectives during the asset management planning process.

6.2.1.3 Typical issues, amongst others, that are addressed by objectives include the following:

a) for asset management:

   — total cost of ownership;

   — net present value;

   — return on capital employed;

   — performance against plan;

   — certification of the asset management system, or the assessment of asset management maturity (by benchmarking);

   — customer satisfaction scores;

   — society or reputation survey results;

   — environmental impact, e.g. carbon costs;

   — level of service;

b) for asset portfolios:

   — return on investment (or return on capital employed, or return on asset);

c) for asset systems:

   — asset system availability;

   — asset system performance (e.g. uptime, efficiency);

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

— unit cost of product or service;

d) for assets:

— reliability (mean time/distance between failures);

— asset condition, performance, or health score;

— life cycle costs;

— life expectancy;

— asset energy performance.

For large or complex asset management systems, the organization might also need to establish objectives for the asset management system itself.

6.2.1.4 Monitoring the performance of the organization's asset management, in terms of how well the asset management objectives and hence the organizational objectives are being met, is an important part of the asset management system (see 9.1). Deviations in performance should be used as inputs to revise the asset management objectives.

Asset management objectives should be subject to regular management review (see 9.3) and such reviews should inform the continuous improvement process (see 10.3).

6.2.2 Planning to achieve asset management objectives

6.2.2.1 The organization should develop an asset management plan(s) to define the activities that will be implemented and the resources that will be applied to meet the asset management objectives and consequently the organizational objectives. An asset management plan(s) provides the direction to, and expectations for, an individual asset or for a portfolio, group or class of assets.

An asset management plan(s) should be documented at a level that is appropriate to the organization and the degree of sophistication in its asset management approach. There is no set formula for what should be included or how it should be structured, however, it is common practice for such an asset management plan(s) to contain a rationale for asset management activities, operational and maintenance plans, capital investment (overhaul, renewal, replacement and enhancement) plans, and financial and resource plans, often based on a review of earlier achievements.

For some organizations, this may be captured in a single document, while for other organizations, multiple asset management plans may be appropriate. For example, a small municipality may produce one asset management plan for all of its assets, whereas a large rail organization may provide multiple plans for each asset class (e.g. stations, track, infrastructure), or a utility may provide multiple plans for different locations.

Asset management plan(s) should be developed to appropriate time horizons for the organization. The time horizons should meet the organization's needs and take account of the organization's period of responsibility and the life of its assets.

There can be benefits in developing the first asset management plan(s) as an interim plan as quickly as possible, using existing information. It helps the organization to understand the strengths and weaknesses of current asset management practices and to identify priorities for the development of future plan(s). It can also help avoid embarking on ambitious data collection exercises before needs are fully understood.

It is important for the organization to commit the resources that are identified in the asset management plan(s) as being necessary, in order to achieve its planned objectives. Implementation of the asset management plan(s) is an iterative process that involves resolving conflicts between what is planned and what can be afforded in terms of financial constraints. Once the financial implications arising from the asset management plan(s) have been quantified, linkages need to be established between the asset

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

management plan(s) and the financial plans of the organization, and decisions should be made jointly about financial allocations.

Asset management plan(s) should be reviewed periodically to ensure continual alignment with the asset management objectives. Planning should also consider solutions that do not require additional assets to achieve the organizational objectives (e.g. it can be preferable to change demand for products or services by changing pricing rather than building new assets or providing more services).

There should be a regular assessment of the ability of the SAMP to support the achievement of the asset management objectives. The intent is to determine what the mismatch or gaps are and where they exist. This analysis should be used as input to management review and to an improvement process for the asset management system.

A risk ranking process can determine which assets have a significant potential to impact on the achievement of the asset management objectives, i.e. which are the critical assets.

6.2.2.2 When developing or reviewing asset management plan(s), the organization should consider:

a) who should be responsible for developing and implementing the asset management plan(s) and their continual improvement: writing the asset management plan(s) internally is useful for ensuring better commitment to the asset management planning process, however, resources and capabilities can be such that external support is required; it is important that staff are familiar with the objectives and approach, and have the opportunity to learn from the project when external resources are used;

b) who will read the asset management plan(s), what they will want to know and need to know: a tiered approach to asset management plan development can assist in targeting several user groups, e.g. the executive summary aimed at top management and the general public, the main body of the plan at top management and key stakeholders, and appendices for more technical information for service providers;

c) the environments in which the assets are operating or are intended to operate and the activities that are being performed either on individual assets, on various components, where inter-dependencies exist or combinations of activities occur on the same asset, or on multiple assets (i.e. whether this activity on this asset is worthwhile and, if so, when);

d) activity program requirements, which will typically also involve operational planning activities and implementation (see Clause 8);

e) the performance of the assets and the intended outcomes expected from implementation of asset management plan(s) in enabling the organization to achieve its asset management objectives;

f) whether appropriate resources and funding is available;

g) applicable standards.

6.2.2.3 The organization should ensure that its assets are capable of delivering the required products or services and achieving its organizational objectives.

The organization should be able to create and demonstrate a link between the actions that address the risks and the organization's approach to risk management and business continuity planning.

When planning processes to manage risk in the asset management system, the organization should consider adopting a structured method for identifying, analysing and evaluating risk (see 6.1). An example method is provided below.

a) Classify assets and define the scope: prepare a list of asset systems and their constituent assets, and gather information about them, including the management and control activities which affect the assets' performance; define the scope and limits of the individual asset risk assessments (see 4.3).

b) Identify risks: create a table of potential events and their causes, ensuring that the identification process includes risks to the delivery of the organizational objectives.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

c) Identify risk controls that exist (or are proposed for planned assets and planned activities).

d) Analyse risks using appropriate process.

e) Evaluate the level of risk: estimate the likelihood and consequences for each potential event, based on the asset management decision-making criteria (see 4.2) and the risk management criteria (see 6.1). The effectiveness of any existing risk controls, and the likelihood and consequences of their failure, should also be considered.

f) Evaluate the level of risk over time: where appropriate, establish whether the identified risks will change over time, and how this will affect their consequences.

g) Evaluate the tolerability of the risks: decide whether planned or existing controls (if any) are sufficient to keep the risks under control and to meet any legal, statutory and other asset management requirements.

h) Determine the treatment of the risks: establish whether the risks will be treated by addressing them directly, avoiding, reducing, tolerating or transferring them.

6.2.2.4 The organization's method to identify, analyse and evaluate risk in the asset management system should be documented appropriately (see 7.6). The documentation of the risk management process in the asset management system may include the completion of a risk register, or another recording mechanism appropriate to the organization's risk management approach.

The organization should document the risks associated with asset management and incorporate risks critical to the achievement of the asset management objectives in its risk register. Larger organizations may need to use divisional or project risk registers, with appropriate escalation mechanisms if the risks cannot be addressed at the level at which they are raised.

The organization should establish governance arrangements for risk management in the asset management system (see 6.1). This includes audit of the risk management approach (see 9.2), and the review of risks by top management (see 9.3).

Where asset life cycle activities or asset management activities are outsourced as part of the organization's asset management approach, the organization should ensure that the asset management system includes control and management of risk (see 8.3).

Asset management plan(s) should consider the risks during the organization's period of responsibility, including any residual liabilities beyond the period of operation or use of the asset.

In the process of continual improvement, the organization should consider the risks that can change with time and how these could impact the asset management system in the future and plan to manage them. For example, asset deterioration related risks can change the asset management risks over time (e.g. corrosion of a pipeline), or currency exchange related risks can impact capital investments.

Standard risk management practices tend to overlook events that are very low probability/high consequence as not worth considering in detail. For example, extreme weather events do not occur often, but when they happen, asset managers tend to be inadequately prepared.

It is important that there be an additional dimension in the risk analysis to include the capability of the asset system to monitor and continually assess the probability of these rare, but potentially catastrophic, events. While the probability of such events can be very low, the organization should establish systems of monitoring indicators to identify when circumstances change abruptly, so that it can implement processes early to mitigate against them.

The organization should apply a common methodology for determining the financial implications of the asset management plan(s). Asset management planning should take into account the difference between the economic and technical aspects of assets.

Life cycle cost, which may include capital expenditure, financing and operational costs, should be considered in the decision-making process (see 4.2). The development of an asset management plan can

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

involve making decisions that have short- and long-term effects. It can also involve consideration of all the asset's life cycle stages, and the potential impacts of a decision at one stage on a later stage.

When making asset management decisions, the organization should use a methodology that evaluates options of investing in new or existing assets, or operational alternatives (which could include, for example, financial solutions that do not require assets). Consideration should be given to the different effects of capital expenditure, operational expenses and any resulting pricing impacts upon the organization's products and services.

NOTE See ISO 31000 for further information on risk management and IEC 31010 for guidance on risk assessment techniques.

7 Support

7.1 Resources

During the development and implementation of the asset management system, including the asset management objectives and asset management plan(s), the organization should determine the required resources. The organization should map its available resources to its planned activities to determine any gaps. This gap analysis can be used as an input to determining options for resourcing the activities. This analysis applies across all asset management activities, could be extensive and can require prioritization and programme planning of many projects to close these gaps.

It is possible that a resourcing analysis, for the reconciliation of available budgets with funding, could determine that not all proposed asset management activities can be resourced as proposed. An iterative process to reconcile proposed activities with available resources should be used, and the criteria and processes for prioritizing asset management activities should be decided and the asset management plan(s) be revised to reflect the available resourcing and the timing that the resource is assigned.

In determining options for resourcing the activities, the organization should consider both internal and external resources. For human resources, options available can be affected by organizational policy and strategic plans on human resources, contracting-out or outsourcing. For non-human resources, availability of resources should include consideration of procurement options (e.g. lease, hire, purchase or otherwise acquire). Both human and other resourcing needs can be influenced by the nature and duration of the activities (e.g. one-off versus on-going).

In some organizations, these activities can require that other parts of the organization provide additional resources in order to support the primary asset management activity (e.g. additional staff). Those responsible for implementing the asset management activity should ensure that they have coordinated effectively, so that all parts of the organization are resourced appropriately.

Any tools, facilities or equipment that are required for the delivery and control of asset management activities should be defined and managed as assets, at a level of detail appropriate to their function and purpose.

7.2 Competence

7.2.1 Competency in asset management should be addressed at all levels of the organization in a way that ensures alignment between roles and levels and not just for those considered to be asset managers. For example, a competent trades person should be able to demonstrate clear competency in specific asset management related tasks (e.g. condition rating) and also have an understanding of the relationship of what they do to the asset management activities others undertake (e.g. the input of the condition rating activity into the determination of remaining useful asset life).

7.2.2 The organization should determine the competences required for all asset management roles and responsibilities, and the awareness, knowledge, understanding, skills and experience needed to fulfil them. The organization should map its current competences to its required competences to determine any gaps. This gap analysis can be used to develop asset management competency improvement and

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

training plans, and enable the organization to incorporate specific asset management competences into its organizational competency framework, as considered appropriate.

For example, the gap analysis and the resulting competency improvement and training plans may include the following:

a) the assessment of competences for the role(s), responsibility(ies) and accountability(ies) to be undertaken for all stakeholders;

b) alignment to the organizational objectives as well as its asset management policy, asset management objectives, SAMP and asset management plan(s);

c) the creation of personal development programmes that identify the training, education, development and other support needed to attain the required competence;

d) the provision of training and mentoring, including the selection of suitable methods and materials;

e) knowledge and job sharing;

f) succession and knowledge management plans;

g) the hiring or contracting of competent persons;

h) the training of target groups;

i) documentation and monitoring of the training received;

j) the evaluation of the training received against defined training needs and requirements, in order to verify conformity with asset management system requirements.

All persons assigned roles and accountabilities within the organization that can have an impact on the asset management system should have those roles and accountabilities communicated to them, be provided with the training, education, development and other support needed to perform their role, and be able to demonstrate the competences required.

7.2.3 The organization should recognize that there is interdependency between its asset management competences, its organizational design and business processes. When undertaking a competency gap analysis, it should also consider undertaking a gap analysis of its organizational design and business processes and develop appropriate improvement plans, as necessary. For example, the organization could find it has competent asset managers that are disconnected from its business planning and budgeting function, which could impede its long range planning and investment decision making. Alternatively, the organization could discover that the majority of its asset management competences exist within one individual, with no effective succession and knowledge management plans (a situation requiring urgent remedial action).

The organization should:

a) establish appropriate and effective processes for managing the competence of persons undertaking asset management work that affects its asset and asset management performance;

b) consider linking these processes to its existing human resource management and competency improvement processes;

c) establish processes to periodically review and update the asset management competency improvement and training plans.

In the event that the organization decides to outsource any aspect of the asset management system, the organization should ensure that the external resource providers can demonstrate competency against the required activities. The organization should, depending on the criticality of the activity, validate claims of competency, and have a process to ensure that any third party resource provider continues to provide competent resources.

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

7.3 Awareness

7.3.1 Persons working under the organization's control should have appropriate awareness of the organization's asset management system and activities. Such persons can include staff, contractors, internal or external service providers, and suppliers. They should be aware of the asset management policy and the following:

a) why asset management is important to the organization;

b) the implications of changes in the operation of the organization (e.g. if the organization makes changes to its operational processes or performance objectives, those persons with accountability for the asset management system should be aware of any resulting impacts);

c) their contribution to the effectiveness of the asset management system, including the benefits of improved asset management system performance;

d) asset management related risk consequences (actual or potential) of their work activities, their behaviour, and the asset management benefits of improved personal performance and how they relate to each other;

e) their roles, responsibilities and authorities as well as the importance of their contribution in meeting the requirements of the asset management policy and the asset management system;

f) how well the organization is performing in meeting its objectives.

The specific awareness needs of any stakeholder should be determined by their role and its relationship to the organization meeting its asset management objectives. The need for awareness of some areas can apply to only a limited group of individuals, e.g. those directly involved in a particular function, such as plant maintenance.

7.3.2 The level of organizational awareness can be improved, for example, by the following:

a) a consultation process with staff throughout the organization concerning the establishment, operation, improvement and changes to the asset management system;

b) discussion of asset management in the organization's newsletters, briefings, introduction programme or journals (including new employee orientation);

c) inclusion of asset management articles on relevant web pages;

d) inclusion of asset management as a topic in staff and management team meetings;

e) briefings for top management;

f) briefing key suppliers and distributors on the organization's asset management arrangements.

7.4 Communication

7.4.1 General

Asset management activities carried out by the organization should be communicated to relevant stakeholders periodically, in a coordinated way, as an integral part of the organization's asset management activity and asset management system.

7.4.2 Communication plan

The organization should develop communication plan(s) with consideration of:

a) building awareness of the asset management requirements and expectations;

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

b) developing an understanding of how the implementation of the asset management system can impact stakeholders;

c) promoting engagement with stakeholders to embrace transparency and create accountability for the asset management system;

d) managing, informing and influencing stakeholders who can directly impact the asset management plans and the achievement of the asset management objectives.

7.4.3 Communication plan content

The content of the communication plan(s) may include the following:

a) the benefits of implementing an activity, project, programme, or asset modification or augmentation, and how these improvements are expected to collectively or individually impact stakeholders and the organization;

b) any improvement schedules, including key milestones, who will be involved, and for how long;

c) any resource specific communications, including statements of the asset management system expectations;

d) the who, why, when and what of communicating, including how well the organization is performing against its organizational objectives and the contribution asset management is making to this performance;

e) if appropriate, what external and internal knowledge is needed for the stakeholders to make informed contributions or decisions, or provide informed feedback;

f) the representative who is best suited to deliver specific communications;

g) the format to be used for the communications;

h) the feedback and reporting processes.

7.5 Information requirements

7.5.1 The organization should determine the information needs related to its assets, asset management and its asset management system.

The organization should use a systematic approach to identify the necessary asset information and establish the appropriate information repositories. For example, the organization should undertake a needs analysis, establish priorities, review system development options and data collection strategies, plan the creation of information repositories and data collection, then implement as appropriate.

NOTE ISO 55001 addresses information-related requirements in the following three subclauses:

— ISO 55001:2014, 7.5, which addresses the determination of required information;

— ISO 55001:2014, 7.6, which addresses the requirements for control over information;

— ISO 55001:2014, 9.1, which addresses the determination of requirements for information needed for performance reporting and evaluation.

7.5.2 In general, the organization should consider its asset information requirements related to the following areas:

a) strategy and planning (e.g. corporate service levels and objectives, asset strategy(ies), demand management strategy and plans);

b) process (e.g. process performance objectives and indicators, asset related processes and procedures);

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

c) technical and asset physical properties (e.g. asset attributes, ownership, design parameters, vendor information, physical location, condition, in service dates);

d) service delivery and operations (e.g. service levels, performance objectives, asset performance characteristics, future operational requirements, demand management objectives);

e) maintenance management (e.g. historical asset failures, betterment or replacement dates, future maintenance requirements);

f) performance management and reporting (e.g. asset performance data, continuous improvement objectives, regulatory reporting);

g) financial and resource management (e.g. historical cost, depreciation, asset replacement value, date of acquisition, materiality, capitalization rules, asset classification/hierarchies, life cycle costing analysis, useful lives of assets, residual value and any residual liabilities);

h) risk management;

i) contingency and continuity planning;

j) contract management (e.g. asset related contractual information, vendor information, service objectives, third party agreements).

7.5.3 When determining its information requirements the organization should consider:

a) the value of the information to enable decision making and its quality relative to the cost and complexity of collecting, processing, managing and sustaining the information;

b) the need to align its information requirements to suit the level of risk that an asset, or managing it, poses;

c) the participation of relevant stakeholders to determine the types of information required to support decision making as well as to ensure the completeness, accuracy and integrity of the necessary information;

d) the establishment and continual improvement of controls, specifications and level of accuracy for data;

e) the determination, assignment and periodic review of accountabilities for the stewardship of specific information;

f) the establishment of competences required to collect, interpret, utilize and report information;

g) the alignment of information requirements for different levels and functions within the organization: this includes the ability to have vertical alignment of the information from top management down into the operational areas, as well as horizontal alignment between asset management, financial management and risk management functions, by using a common terminology for financial and non-financial information;

h) the alignment of financial and non-financial terminology (it should be recognized that for some types of organizations, e.g. government type agencies, there are provisions that make their functional areas independently accountable for their own domain terminology: in such cases, a common terminology is unlikely to be achievable, however, conflicting terminology should be resolved where possible and documented);

i) the need for financial information regarding assets to be appropriate, consistent and traceable, and to reflect the technical and operational reality of the assets (e.g. completeness, accuracy, proper valuation and presentation, including ownership, is achieved through employing identifiable and auditable accounting records that are linked to the technical asset records);

j) the establishment of data collection processes from internal and external stakeholders (including contracted service providers);

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

k) the data flow and integration of information sources to planning, operational and reporting technology systems, appropriate for the size, complexity and capability of the organization (e.g. in more sophisticated asset management technology systems, specific data may be kept in separate asset registers);

l) its ability to maintain the appropriate quality and timeliness of the information (as the collection of data can be costly, the organization should prioritize data that is identified as strategically or operationally important).

7.6 Documented information

In establishing its documented information needs, the organization should consider the identification and definition of documented information that will be managed and maintained over the life cycle, taking into account its period of responsibility for the assets. The organization should also consider the requirement to maintain this documented information for any defined period beyond the disposal of the assets, in accordance with its business, legal and regulatory requirements. The controls put in place should be adequate for the type of information in supporting the asset management activity.

The organization should determine the documented information required to ensure effectiveness of its asset management system and asset management activity. Different types of documented information can address elements of the asset management system, asset management or a specific asset. The information required can differ from one organization to another and should be proportional to the complexity of the assets and the asset management activity.

When creating and updating documented information, an organization should determine if appropriate controls are in place to ensure that the information is appropriate; these controls are necessary to ensure that the personnel supporting the asset management activity are using the approved, accurate, most up to date information.

8 Operation

8.1 Operational planning and control

8.1.1 The organization should establish operational planning and control processes in order to support the effective delivery of the activities contained within the asset management plan(s). The processes should identify who is responsible for the planning and how the defined activities will be executed, including how risks arising during the planning and execution will be managed and controlled. (ISO 55001:2014, Clause 8, defines the requirements for the operational planning and control of both asset management and the asset management system).

8.1.2 In implementing the processes and actions, the following criteria, amongst others, should be considered:

a) roles and responsibilities;

b) procedures;

c) resource allocation;

d) competency development.

8.1.3 Control mechanisms for the processes and actions can include elements such as the following:

a) process performance measures;

b) internal audit criteria and schedules.

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

The implementation of the processes and actions should produce documentation to enable verification that the process steps were followed as designed and the expected output of the process is achieved, e.g. this could include signed completed work orders.

8.1.4 The organization should implement those processes and actions needed to address its risks (see 6.2). This should be done by establishing the criteria for risk management processes, controlling implementation of these processes based on the defined criteria, and keeping documentation that demonstrates the risk management processes have been executed as planned.

The organization should have the capability to determine emerging risks and to consider their impacts on its asset management objectives. The asset management system should enable the organization to consider and plan changes that affect its assets or asset management with sufficient time to act if required.

Implementation should involve an iterative process to achieve a balance between cost, risk and performance, to resolve conflicts between what is planned and what can be achieved, while taking into account the constraints faced by the organization.

8.2 Management of change

8.2.1 Internal or external changes affecting assets, asset management or the asset management system can impact on the organization's ability to achieve its asset management objectives. These changes should be evaluated and mitigating actions should be taken prior to implementation. The organization should review the consequences associated with both planned and unplanned changes and take the necessary action to mitigate any foreseen adverse effects.

8.2.2 The organization's considerations should address changes that include, but are not limited to, the following:

a) organizational structures, roles or responsibilities;

b) asset management policy, objectives or plans;

c) process(es) or procedure(s) for asset management activities;

d) new assets, asset systems or technology (including obsolescence);

e) factors external to the organization (including new legal and regulatory requirements);

f) supply chain constraints;

g) demands for products and services, contractors or suppliers;

h) demands on resources, including competing demands.

8.2.3 The organization should have the capability to make evidence-based decisions on proposed changes and the ability to consider scenarios systematically across the entire organization.

Risks associated with a change should be considered in relation to their impact on asset management and the asset management system. This should include unintentional consequences that occur to other parts of the organization, as a result of a change, e.g. the impact of resource constraints due to changes in service delivery requirements.

8.3 Outsourcing

8.3.1 Outsourcing is a common method for an organization that prefers to perform certain asset management activities not by itself, but by an external or internal service provider. When these activities influence the achievement of the asset management objectives, these should be part of the asset management system, and should be documented.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

8.3.2 The organization should formalize the relationship (e.g. through a contract, service level agreement or other appropriate commercial mechanism) for:

a) the governance of the outsourced activities, including responsibilities and authorities within the organization for managing the outsourced asset management processes and activities;

b) the processes and activities that are outsourced, with a description of the scope and boundaries, their interfaces with the organization and its control, quality, timelines, consultation requirements, financing, feedback and improvement opportunities;

c) the processes for the (bidirectional) exchange of information, knowledge, people, processes and technology at the start of the agreed period;

d) the processes for monitoring the activities of the assigned service provider(s);

e) the processes for sharing of knowledge, information and data, between the organization and its service provider(s);

f) the process of handing back the asset management activity from the service provider(s), including the required state of the asset and associated information.

8.3.3 Any asset management objectives, processes and activities that are outsourced should be controlled by the organization to provide assurance that performance is as planned. The performance of outsourced activities should be subject to a regular management reviews to ensure that they are adequately controlled.

The more extensively an organization chooses to outsource the delivery of its asset management, the greater will be the degree of control and integration into the asset management system that it will need to exert over the service provider(s), in order to give assurance that delivery of the SAMP will be achieved. The extent of outsourcing could require a service provider to establish its own asset management system that is aligned with the organization's asset management objectives.

8.3.4 The organization should consider the ownership and protection of intellectual property and corporate knowledge (including that generated during the outsourcing) when outsourcing asset management activities.

When outsourcing any life cycle activities and asset management activities, the organization should consider the risks and impacts on its assets, asset management and asset management system.

The organization should consider what potential risks cannot be transferred, even if the related asset management activities are transferred (e.g. damage to its reputation). A corresponding control over those risks should be maintained within the organization.

9 Performance evaluation

9.1 Monitoring, measurement, analysis and evaluation

9.1.1 General

9.1.1.1 The organization should develop processes to provide for the systematic measurement, monitoring, analysis and evaluation of the organization's assets, asset management system and asset management activity on a regular basis. In the development of these processes (and any associated procedures) the following should be taken into account:

a) setting of performance metrics and associated indicators, e.g. condition or capacity indicators;

b) confirmation of compliance with the requirements;

c) examination of historical evidence;

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

d) the use of documented information to facilitate subsequent corrective actions and decision making.

9.1.1.2 The processes should also reference the asset management policy and objectives.

More specifically the processes for monitoring performance should address:

a) the setting of performance metrics, including qualitative and quantitative measurements (financial and non-financial) that are appropriate to the needs of the organization;

b) the extent to which the organization's asset management policy and objectives are met;

c) the evaluation of compliance with legal and regulatory requirements, and any other requirements to which the organization subscribes;

d) identifying when the monitoring and measuring should take place;

e) the ability to aggregate and report information to those accountable for the asset management system and asset activities (see 7.5, bullet g));

f) the quality, reliability and completeness of the financial and non-financial asset information;

g) enabling top management to make statements on the organization's ability to manage its assets (see 4.2);

h) the performance of activities outsourced to external providers;

i) assessing the performance of the asset management processes, procedures and functions;

j) proactive indicators that are related to performance of the assets, asset management system, and activities (e.g. capacity or condition indicators);

k) reactive measures of performance to monitor failures, incidents, non-conformities (including near misses and false alarms) and other historical evidence of deficient asset management system and activity performance;

l) recording the data and results of monitoring and measurement, sufficient to facilitate subsequent corrective action analysis.

9.1.1.3 A set of performance indicators should be developed to measure the asset management activity and its outcomes. Measurements can be either quantitative or qualitative, financial and non-financial. Indicators should provide useful information to determine both successes and areas requiring corrective action or improvement. The organization should consider the relationship and alignment between performance indicators.

9.1.1.4 The asset management system should employ data from monitoring and measurement to identify patterns and obtain information regarding its performance. These data should be used to evaluate whether the organization's policy and objectives are being achieved, as well as identifying corrective actions and areas for improvement.

Documented information on all periodic evaluations and their results should be maintained.

The organization should analyse and, at planned intervals, evaluate the outcomes from the monitoring and measurement.

The performance of activities outsourced to external service providers should be monitored and be based on the evaluation of reported results, audits performed by the organization, or independent auditor's reports.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

9.1.2 Evaluation of the performance of the asset portfolio and asset management processes

9.1.2.1 The organization should conduct evaluations of its assets and asset management activity in order to ensure their continuing suitability, adequacy and effectiveness.

The evaluations should address the possible need for changes to policy, objectives, strategies, and other elements of the asset management system, e.g. in the light of reviews, changing circumstances, the commitment to continual improvement.

Evaluations can take the form of internal or external audits, or self-assessments. The frequency and timing of evaluations should be determined by the organization or can be determined by laws and regulations, depending on the size, nature and legal status of the organization. When setting the frequency of condition or performance monitoring and the parameters for measurement, the organization should consider, at a minimum, the costs of monitoring, the risks of failure or nonconformity, and potential deterioration mechanisms and deterioration rates. They might also be influenced by the requirements of stakeholders.

9.1.2.2 An evaluation of the organization's assets and asset management activity should verify whether:

a) the organization's asset management policy, strategies, objectives and asset management processes accurately reflect its priorities and requirements (i.e. the organizational objectives);

b) the persons doing work under the control of the organization are competent;

c) its procedures are effective and up-to-date;

d) processes have been clearly defined, documented and effectively implemented and complied with;

e) there are processes for on-going training and awareness;

f) the organization's assets and asset management fulfil their required function;

g) the organization's asset management is appropriate to the level of risk faced by the organization;

h) the asset management plan(s) and processes have been effectively communicated to relevant stakeholders;

i) persons doing work under the organization's control understand their roles and responsibilities;

j) change control processes are in place and operate effectively;

k) any changes (internal or external) that impact the organization are reviewed in relation to the asset management activities.

9.1.2.3 Outcomes from the evaluation should include evidence of whether:

a) there is proactive management and governance of the organization's asset management;

b) people are trained and competent;

c) there is operational planning and control of asset management;

d) the organization's asset management activities are in compliance with its processes;

e) significant changes in the organization have been reflected in the organization's asset management processes in a timely manner.

Documented information relating to all periodic evaluations and their results should be maintained as evidence.

9.1.2.4 In the context of continual improvement, the organization can acquire knowledge on new asset management technology and practices, including new tools and techniques (e.g. development of

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

reliability and predictive technologies during the procurement of new assets or the design of modified assets). This should be evaluated to establish its potential benefit to the organization.

9.1.2.5 To ensure that reported information used for monitoring has the same meaning with respect to different functions in the organization, common financial and non-financial terminology should be used in reports. Because cost plays such an important role in reflecting asset related performance, it may be useful to have a shared set of classification systems, hierarchical structures, and a common understanding of how asset portfolios, asset systems and individual assets are broken down for life cycle management purposes.

The change in future value of the assets and the risk profile should be evaluated in both a financial context and a non-financial context. The evaluation team should include stakeholders from relevant disciplines.

9.1.2.6 Monitoring should ensure that there is consistency and traceability between technical asset information and accounting records. In addition, monitoring should address the following key aspects of the data registration process.

a) a uniform technical, operational and financial glossary;

b) a technical, operational and financial linkage, which is consistent and traceable to the assets and their components at a predefined level of detail;

c) adequate and accurate financial and non-financial data and information of technical and operational events that have a potential impact on financial reporting.

This monitoring in the financial reporting system should be done at a level suitable to the risk, complexity and value of the assets. An asset breakdown structure can be used to identify the individual components of an asset, to enable the organization to take into account the significance of the value of the components in relation to the asset, and to determine the differences between the technical and economic lives of the components.

9.2 Internal audit

9.2.1 The organization should conduct internal audits at planned intervals to ensure the asset management system conforms to its requirements (and to the requirements of ISO 55001).

It is essential to conduct internal audits of the asset management system, particularly in relation to critical assets and asset systems, to ensure that the asset management system is achieving its objectives and plans and is identifying opportunities for improvement. Internal audits of the asset management system should be conducted at planned intervals to determine and provide information to top management on the appropriateness and effectiveness of the asset management system, as well as to provide the basis for setting objectives for continual improvement.

9.2.2 The organization should establish an audit process to direct the planning and conduct of audits, and to determine the audits needed to meet its objectives. The process should be based on the organization's activities, its risk assessments, the results of past audits, and other relevant factors.

Internal audits should be based on the full scope of the asset management system, however, it is not necessary for each audit to cover the entire system. Audits may be divided into smaller parts provided the audit programme ensures that all organizational units, functions, activities and system elements and the full scope of the asset management system are audited within the auditing period designated by the organization. In deciding the scope of an audit, it is good practice to consider the risk associated with both the asset management system and the assets. This can aid the relevance of an audit and help to objectively reassess the risk areas.

The results of an internal audit of an asset management system can be used to correct or prevent specific nonconformities, as an input for continual improvement, and to provide input for management review.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

Internal audits of the asset management system may be performed by personnel from within the organization or by external persons selected by the organization, working on its behalf. In either case, the persons conducting the audit should be competent and in a position to do so impartially and objectively. In smaller organizations, auditor independence can be demonstrated by an auditor being free from responsibility for the activity being audited.

Audits should support learning and improvement of the asset management system. To achieve this, the audits should focus on the performance of the asset management processes, as opposed to the performance of persons within the processes. Attention should be paid to examples of good practice and improvement opportunities. At the same time, audits should also determine system deficiencies, by checking conformity of practice and the asset management system with each other and to the requirements of ISO 55001.

9.2.3 Self-assessment can be helpful in driving continual improvement. Self-assessments should evaluate the viability and suitability of the asset management policy, objectives and plans to ensure they are consistent with each other, suitable, adequate, and achievable. This requires assessment of the following:

a) assumptions related to the organization's asset management;

b) the organization's process(es) and procedure(s), methods, tools and techniques;

c) the availability and allocation of funds and resources.

The self-assessment process should encourage participants to identify opportunities for continual improvement. Active participation, understanding and support of the organization's employees are important in conducting a self-assessment review.

9.3 Management review

9.3.1 Top management should review the organization's assets, asset management system and asset management activity, as well as the operation of its policy, objectives and plans, at planned intervals, to ensure their suitability, adequacy and effectiveness.

The review should also consider whether the asset management policy continues to be appropriate for the organization's purpose. It should establish new or updated asset management objectives for continual improvement, appropriate to the coming period, and consider whether changes are needed to any elements of the assets, asset management processes and the asset management system.

9.3.2 Inputs to management reviews should include:

a) the status of actions from previous management reviews;

b) changes in external and internal issues that are relevant to the asset management system, including changing circumstances (including developments in legal, regulatory and other requirements related to asset management), changes in technology, and changes in market requirements;

c) information on the asset management performance, including trends in:

   1) nonconformities and corrective actions, including evaluations of performance in addressing incident investigations, corrective actions and preventive actions;

   2) monitoring and measurement results including:

      i) the results of communication, participation and consultation with employees and other stakeholders (including complaints);

      ii) the performance of the assets, asset management processes and the asset management system, including trends apparent from nonconformities and corrective actions, the results of monitoring and measurement, and audit findings;

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

iii) the results of other evaluations of the assets or asset management system, e.g. condition or capacity;

iv) evaluations of compliance with applicable legal and regulatory requirements and with other requirements to which the organization subscribes;

v) audit results;

d) asset management activities;

e) opportunities for continual improvement;

f) changes in the profile of risks and opportunities;

g) asset performance and condition.

9.3.3 Management reviews provide top management with an opportunity to evaluate the continuing suitability, adequacy and effectiveness of the assets, asset management, and asset management system. The management review should cover the scope of the asset management system and the asset management activity, although it is not necessary to review all elements at once and the review process may take place over a period of time.

Reviews of the implementation and outcomes by top management should be regularly scheduled and evaluated. While ongoing system reviews are advisable, formal reviews should be structured and appropriately documented and scheduled on a suitable basis. Persons who are involved in implementing the asset management system and allocating its resources should be involved in the management reviews.

9.3.4 The outputs from management reviews should include decisions and actions relating to improvements in asset management system and activity including:

a) variations to the scope, policy and objectives;

b) criteria for asset management decision making;

c) updates to performance requirements;

d) resources including financial, human and physical resources;

e) changes to controls and how their effectiveness is measured, including roles, responsibilities and authorities.

9.3.5 The organization should retain documented information as evidence of the results of management reviews and should communicate the results of management reviews to relevant stakeholders. It should also take appropriate action based on the results, while managing any changes (see 8.2).

Management reviews should also cover aspects of the asset management system and activities, if any, that are outsourced to external service providers. Relevant information from management reviews should be communicated to specific employees, external service providers or other stakeholders.

Relevant outputs from management reviews should be used by top management during reviews of the organizational plan.

10 Improvement

10.1 Nonconformity and corrective action

10.1.1 General

The organization should be aware that nonconformities (including failures) can occur in its assets, asset management activity and asset management system. The organization should establish plans and processes to control nonconformities and their associated consequences, to minimize any adverse effects on the organization and on stakeholder needs and expectations. This can be accomplished by documenting and reviewing past nonconformities, evaluating how the consequences were dealt with, and by determining methodologies to prevent future nonconformity.

Corrective actions are actions taken to address the root cause(s) of identified non-conformances, or incidents, in order to manage their consequences, and to prevent or reduce the likelihood of recurrence. Aspects to be considered in establishing and maintaining corrective action processes should include:

a) the identification and execution of corrective measures, both for the short term and the long term;

b) the evaluation of any impact on risk identification and assessment results, including any need to update risk identification, assessment and control report(s);

c) the recording of any required changes in processes or procedures resulting from the corrective action or risk identification, assessment and control, and execution of these changes.

10.1.2 Processes for the investigation of asset-related nonconformities and incidents

The organization should establish, implement and maintain process(es) (and their associated procedure(s)) for the handling and investigation of nonconformities, functional failures, and incidents associated with assets, asset systems and the asset management system. These process(es) should define the significant criteria for the investigation of non-conformities or incidents and the necessary responsibilities and authorities (for all the actions listed in ISO 55001:2014, 10.1).

10.1.3 Processes for implementing corrective actions

The organization should establish, implement and maintain process(es) for instigating corrective action(s) for eliminating the causes of nonconformities or incidents identified from investigations, evaluations of compliance and audits, to avoid their recurrence.

Any corrective actions taken and their timings should be commensurate with the risk(s) encountered. Where a corrective action identifies new or changed risks, or the need for new or changed process(es), procedure(s) or other arrangements to control life cycle activities, the proposed actions should be risk assessed prior to implementation (see 8.2).

The organization should monitor the timely close-out or completion and the effectiveness of the corrective action(s). Documented information should be kept on the corrective actions taken.

The organization should ensure that any necessary changes arising from corrective actions are made to the asset management system (see 8.2).

10.2 Preventive action

Preventive actions, which may include predictive actions, are those taken to address the root cause(s) of potential failures or incidents, as a proactive measure, before such incidents occur. The organization should establish, implement and maintain process(es) for initiating preventive or predictive action(s). Elements to be considered in establishing and maintaining preventive action processes include:

a) the use of appropriate sources of information;

 © ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

b) the identification of any potential failures;

c) the use of an appropriate methodology;

d) the initiation and implementation of preventive action;

e) the recording of any changes in processes and procedures resulting from the preventive action;

f) assessment of the preventive action;

g) the input to the asset management plan(s) from preventive actions;

h) the need to keep documented information on the preventive or predictive actions.

10.3 Continual improvement

10.3.1 Opportunities for improvement should be identified, assessed and implemented across the organization as appropriate, through a combination of monitoring and corrective actions for the assets, asset management, or asset management system. Continual improvement should be regarded as an ongoing iterative activity, with the ultimate aim of delivering the organizational objectives. It should not be interpreted as cyclic (e.g. annual) improvement in asset performance parameters just because they can be achieved.

10.3.2 Continual improvement can be organized as a top-down or bottom-up process, or as a combination. The organization should establish, implement and maintain process(es) for determining opportunities and assessing, prioritizing and implementing actions to achieve continual improvement and reviewing their subsequent effectiveness. These processes may include:

a) non-conformity and corrective action (see 10.1), in particular failure and incident investigation (see 10.1.2);

b) preventive action (see 10.2);

c) trends in performance (see 9.1);

d) evaluation of compliance (see 9.1.1);

e) internal and external audits (see 9.2);

f) management review (see 9.3);

g) stimulating employees to come forward with suggestions;

h) management of change (see 8.2).

10.3.3 The organization should actively seek and acquire knowledge about new asset management-related technology and practices, including new tools and techniques; these should be evaluated to establish their potential benefit to the organization and be incorporated into the asset management system as appropriate. Examples include:

a) active participation in professional bodies and industry associations;

b) conferences, seminars, publications, (online) forums, journals;

c) benchmarking and technology transfer initiatives, and competitor check-ups;

d) engaging specialist organizations;

e) research and development;

f) consultation of suppliers and clients.

© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

10.3.4 Although the opportunities for improvement can be widely different in size and effect, the approach for processing them may consist of the following steps:

a) identification of improvement needs and potential;

b) evaluation of options;

c) estimation and determination of financial and non-financial consequences;

d) risk assessment and management of change (see 8.2) aspects;

e) links with decision-making criteria (see 4.2);

f) selection and execution;

g) tracking of outcomes and review.

Annex A
(informative)

Information on asset management activities

Relevant asset management subject areas addressed by other published international, regional, or national standards include, but are not limited to, the following:

— data management;

— condition monitoring;

— risk management;

— quality management;

— environmental management;

— systems and software engineering;

— life cycle costing;

— dependability (availability, reliability, maintainability, maintenance support);

— configuration management;

— tero-technology;

— sustainable development;

— inspection;

— non-destructive testing;

— pressure equipment;

— financial management;

— value management;

— shock and vibration;

— acoustics;

— qualification and assessment of personnel;

— project management;

— property and property management;

— facilities management;

— equipment management;

— commissioning process;

— energy management.

Users of ISO 55000, ISO 55001 and this International Standard should also refer to such standards wherever possible, to ensure consistent delivery of asset management throughout their organization.

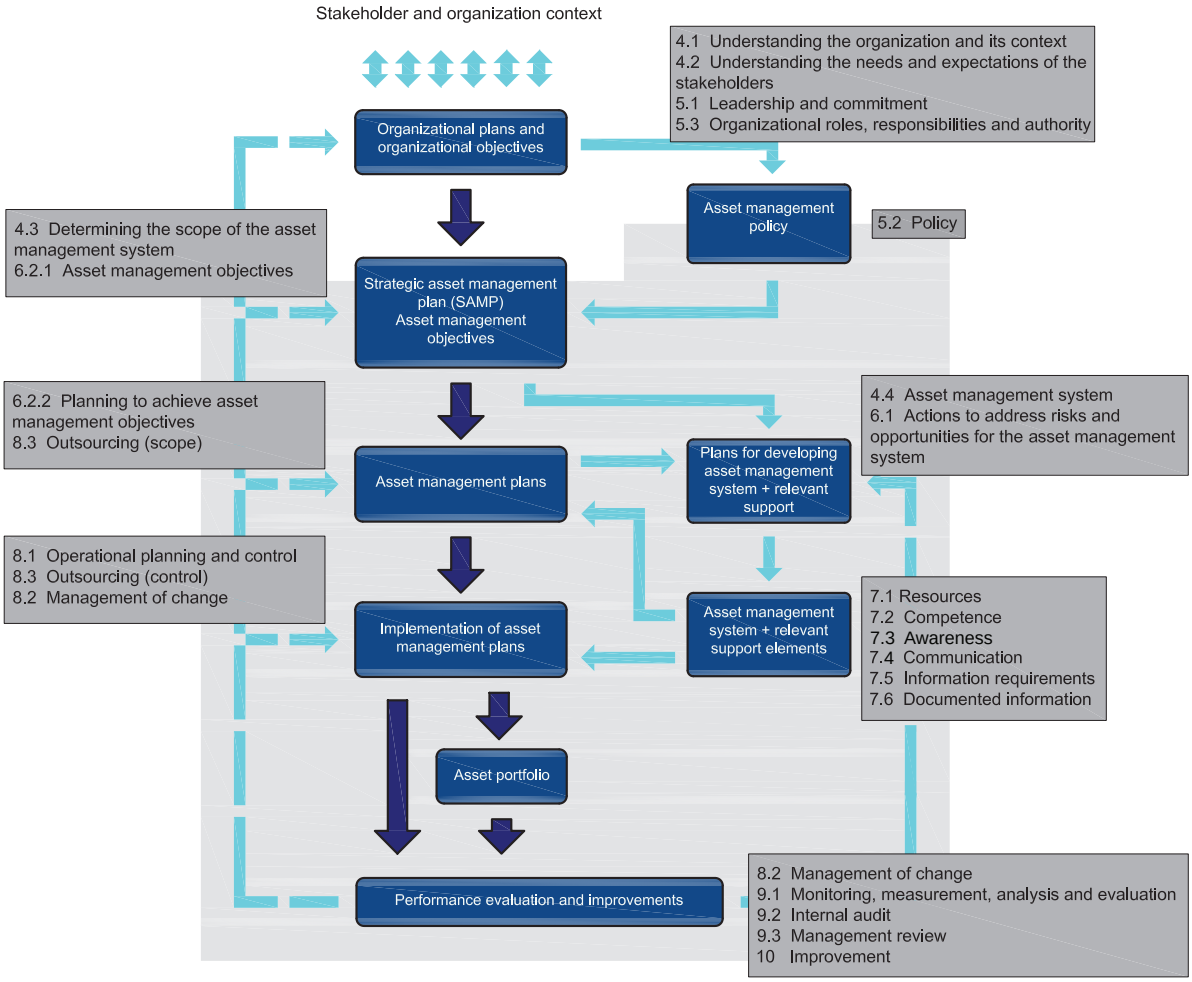
© ISO 2014 – All rights reserved

Licensed to Myrna Engren. ANSI order X_459822. Downloaded 12/12/2016 1:06 PM. Single user license only. Copying and networking prohibited.

Annex B
(informative)

Relationship between key elements of an asset management system

Figure B.1 shows the relationship between the key elements of an asset management system, together with the related clauses in ISO 55001.



NOTE 1 Only the primary connections are shown to avoid over complexity.

NOTE 2 This does not aim to repeat the distinction between asset management and an asset management system: it is a connections view showing directions of influence.

NOTE 3 The grey highlighted box designates the boundary of the asset management system.

Figure B.1 — Relationship between key elements of an asset management system

REFERENCE: **Application, Appendix 5.1-2, page 5.1-5; Appendix A to Board Order 2018 10: Reasons for Decision, paragraph 463**

ISSUE: **Battery Energy Storage System Project**

QUOTE: From Appendix 5.1-2, page 5.1-5:

"In Order 2018-10 regarding the 2017/18 GRA the Board noted its view that the estimated costs for 4 MW of battery storage did not compare favourably on a dollar per MW basis with the LNG third engine or the 20 MW thermal plant. Further, concern was noted that the technology was not tested, and shown demonstrated benefits, in northern climates. Given the costs and unproven nature of the technology in a northern environment, the Board determined the project was not viable and absent NRCan funding it was risky to undertake the project." (footnote removed)

From Appendix A to Board Order 2018-10:

"Further, the Board is of the view that, at this time, the technology used for battery storage has not been tested in northern climates such as Yukon and has not been shown to provide the benefits outlined by YEC in such jurisdictions. The Board finds that, given the costs and unproven nature of the technology in a northern environment, the project is not viable. If YEC did not have funding from NRCan, it was risky to undertake the project, considering that even the initial costs in the test years are forecast at over $9 million dollars. For these reasons, the Board finds that expenditures on such a project are not warranted. As a result, the Board denies the inclusion of costs associated with the battery energy storage project in the revenue requirement for the test years and directs YEC to reflect this finding in its compliance filing."

QUESTION:

a) Please provide the results of analysis performed by YEC examining the costs and benefits of the project relative to any alternatives considered by YEC.

b) Please identify how YEC has addressed the Board's concerns in Board Order 2018-10 with respect to the project's viability, benefits and expenditures.

c) If this project is approved by the Government of Yukon in 2021, please provide the current estimate of when YEC intends to add costs related to this project to its proposed rate base, e.g., in a future GRA.

ANSWER:

(a), **(b)** and **(c)**

The Battery Energy Storage System (BESS) project is planned to come into service in the latter part of 2022. It will remain in WIP during 2021 and not affect 2021 GRA revenue requirement.

The BESS project has been designated in OIC 2020/180 as a "regulated project" under Part 3 of the Public Utilities Act, and the Minister has referred to the YUB for review the YEC Application for an energy project certificate and an energy operation certificate for this project. The Board's review and report to the Minister will be completed before YEC undertakes any final commitments to proceed with this project.

Yukon Energy addressed the Board's concerns regarding this project through feasibility assessment by Hatch Engineering of the technology application in the Yukon climate and securing $16.5 million of federal grant funding towards development of this project as described in the GRA section referenced in this question.

The BESS will provide 7.2 MW dependable capacity [reduction of four diesel rentals] to reduce Yukon Energy's need to rely on rental of diesel generators during the winter months to address N-1 capacity shortfalls. The BESS will also provide other benefits, including: an operating reserve that reduces thermal generation requirements; enhanced blackstart capability; opportunities for diesel-peak shifting; and other system benefits. These benefits are forecast in the Part 3 Application to result in net ratepayer savings when compared to the use of diesel rentals which would be necessary should the Project not proceed, i.e., over the life of the Project the net present value (2022$) of the net YEC costs is $27.751 million compared to the net present value of benefits of $40.426 million for reduced diesel rental costs and reduced thermal generation fuel costs (see a copy below of Table 4-3 from the Part 3 Application). This indicates the BESS project will benefit

Yukon ratepayers (present value savings of $12.676 million). The BESS is expected to assist in YIS grid stability and reduce thermal generation and GHGs – benefiting both the environment and Yukon ratepayers.

Table 1: Annual Ratepayer Impacts from BESS (20 MW/ 40 MWh)
[Copy of Table 4-3 from YEC's Part 3 Application for the BESS Project]

	BESS Annual Costs ($000)				BESS Annual Savings ($000)				
$000	Annual Capital Cost	Annual Operating Cost [excl. recharging]	Annual Net Recharging Cost [15% return loss plus 3% idling loss]	Total Annual Costs	Avoided Diesel Rental Costs	Annual Savings from Operating Reserve Use	Annual Savings from Peak Shifting	Total Annual Savings	Net Annual Ratepayer Savings (Costs) ($000)
	A	B	C	D=A+B+C	E	F	G	H=E+F+G	I=H-D
Year 1	$1,530	$652	$82	$2,264	$1,216	$1,125	$11	$2,351	$87
Year 2	$1,492	$665	$84	$2,240	$1,265	$1,147	$11	$2,423	$182
Year 3	$1,454	$678	$85	$2,217	$1,315	$1,170	$11	$2,496	$280
Year 4	$1,416	$691	$87	$2,194	$1,368	$1,193	$11	$2,573	$379
Year 5	$1,378	$704	$89	$2,171	$1,423	$1,217	$12	$2,651	$481
Year 6	$1,340	$717	$91	$2,148	$1,480	$1,242	$12	$2,733	$585
Year 7	$1,302	$731	$92	$2,126	$1,539	$1,267	$12	$2,817	$691
Year 8	$1,264	$745	$94	$2,104	$1,600	$1,292	$12	$2,904	$801
Year 9	$1,226	$759	$96	$2,082	$1,664	$1,318	$12	$2,994	$912
Year 10	$1,189	$774	$98	$2,061	$1,731	$1,344	$13	$3,088	$1,027
Year 11	$1,151	$789	$100	$2,040	$1,800	$1,371	$13	$3,184	$1,144
Year 12	$1,113	$804	$102	$2,019	$1,872	$1,398	$13	$3,284	$1,265
Year 13	$1,075	$820	$104	$1,999	$1,947	$1,426	$13	$3,387	$1,388
Year 14	$1,037	$835	$106	$1,978	$2,025	$1,455	$14	$3,493	$1,515
Year 15	$999	$851	$108	$1,959	$2,106	$1,484	$14	$3,604	$1,645
Year 16	$961	$868	$111	$1,939	$2,190	$1,514	$14	$3,718	$1,779
Year 17	$923	$885	$113	$1,920	$2,278	$1,544	$15	$3,836	$1,916
Year 18	$885	$902	$115	$1,902	$2,369	$1,575	$15	$3,958	$2,057
Year 19	$847	$919	$117	$1,884	$2,463	$1,606	$15	$4,085	$2,201
Year 20	$810	$937	$120	$1,866	$2,562	$1,638	$15	$4,216	$2,350
NPV	**$16,318**	**$10,147**	**$1,286**	**$27,751**	**$22,647**	**$17,612**	**$167**	**$40,426**	**$12,676**

Notes:

1 2021 assumed as Year 1. Capital costs (Table 3-4) and operating costs (Table 3-5) each escalated 2% for one year inflation.

2 YEC WACC at 4.794% per 2021 GRA (real WACC with 2% inflation at 2.739%) is used for all net present values (NPVs).

3 Annual Capital Cost includes depreciation (20 year life) and return on mid-year rate base at YEC WACC of 4.794%.

4 Annual Net Recharging Cost assumes diesel generation for N-1 dependable capacity and operating reserve recharge losses, 75% LNG and 25% hydro for other recharge losses (peak shifting saving already addresses these losses), and hydro for idling losses.

5 Avoided Diesel Rental Costs assumes $168,896 per MW (2022$) and 7.2 MW (4 rental units) of dependable capacity.

REFERENCE: **Application, Appendix 5.1, page 5.1-6**

ISSUE: **Pumped Storage**

QUOTE: "Federal funding was identified as a critical requirement for this project to keep the project affordable for customers and to minimize risks."

QUESTION:

a) Does YEC have an estimate of the total cost for this project, if completed? If so, please provide a cost breakdown of the costs for this project. More specifically, provide the activities YEC forecasts to conduct and the cost amount allocated to those activities. If not, please explain why not.

b) Has YEC identified potential federal funding for this project? If so, please provide an overview of the funding YEC hopes to obtain and the status of efforts to do so.

c) Please provide the results of analysis performed by YEC examining the costs and benefits of the project relative to any alternatives considered by YEC.

d) Please comment on how an isolated electrical system running out of generation capacity can benefit over the short, medium and long term from energy storage within the isolated system.

e) Given the inefficiencies of storage systems and the current operating frequencies and duration for thermal generation in the Yukon, please comment on whether it is reasonable to use thermal generation to charge a storage facility.

ANSWER:

(a)

As outlined in the 10-Year Renewable Electricity Plan, the total cost for the Moon Lake Pumped Storage is estimated to be $280,000,000. A breakdown of the cost estimate can be found in Appendix F, Table 4.1 of the 10-Year Renewable Electricity Plan. [This Plan is provided in Attachment 1 to CW-YEC-1-36(a).]

(b)

YEC is working with Yukon government and the First Nations whose Traditional Territory the project is located on to secure Federal funding for the work required in the planning phase of the Moon Lake project. An application has been submitted for initial funding for project planning, but no confirmation has been received to date on its approval status from the Federal government. Material work on the project will not be undertaken until Federal funding is secured for these activities.

(c)

The 10-Year Renewable Electricity Plan analyzed a number of alternative resources to meet the Yukon's energy and capacity demands. The Moon Lake pumped storage project with federal funding has the most competitive Levelized Cost of Capacity (LCOC) compared to alternatives, as reviewed in Table 3 in the 10-Year Renewable Electricity Plan (see response to "a" above). Dependable capacity was the key element needed in resources to address the capacity shortfall and expected load growth, while providing additional benefits of seasonal energy storage.

(d)

The proposed pumped storage would enable the YIS to secure renewable dependable capacity sufficient to remove the sizeable N-1 dependable capacity shortfall forecast for the medium and long-term that would otherwise require reliance on rental and/or new permanent thermal generation capacity. The project would also utilize summer surplus renewable energy on the YIS, and (through the related transmission development) enhance prospects for sale of surplus renewable summer energy to the Skagway cruise ship tourist activity. Key factors related to pumped storage and YIS summer surplus renewable energy include the following:

- Today YEC has excess water in summer at WGS and have to spill;

- It is forecast that YEC will have 40 GWh of SOP IPP energy added to the grid, and all of the summer energy related to these IPPs is expected to increase spill at Whitehorse dam; and

- Pumped storage will utiltize this summer surplus and enable it to be redeployed to the winter, directly reducing thermal generation requirements.

(e)

YEC does not anticipate recharging the pumped storage system with thermal energy but would instead use surplus wind, solar and summer Whitehorse generation (which is currently spilled). Moon Lake is also expected to provide inflows and energy generation. Having a seasonal pumped storage facility would allow Whitehorse Generating Station to run at 100% capacity in the summer and shift this energy to the winter, reducing the thermal requirements in the Yukon.

REFERENCE: **Application, Appendix 5.1, page 5.1-7**

ISSUE: **Southern Lakes Transmission Line and Whitehorse Interconnection Projects**

QUESTION:

a) Does YEC have an estimate of the total costs for these two projects, if completed? If so, please provide cost breakdowns for the projects. More specifically, provide the activities YEC forecasts to conduct and the cost amount allocated to those activities. If not, please explain why not.

ANSWER:

(a)

As stated in the 10-Year Renewable Electricity Plan, the full cost of the Southern Lakes Transmission Line project is estimated at $166,000,000. The methodology for creating this cost estimate for the transmission project is presented in Section 3 of the Transmissions Options Evaluation Study, completed for the 2016 Resource Plan.[1] Specifically, Options 4 and 10, presented in Table 4 of this study. The full cost of the Whitehorse Interconnection Project is estimated to be $7.7 million, for the components as shown in the table below.

Element	Cost Estimate
Whitehorse S150 & P126 Upgrades	$3 million
L151 Reroute	$0.5 million
Riverside Substation S171 Upgrades	$3.5 million
Subtotal:	$7 million
Contingency (10%)	$0.7 million
Total Interconnection Upgrades Cost:	$7.7 million

[1] For further details see the following: https://yukonenergy.ca/media/site_documents/Appendix_5.21_Transmission_Options_Evaluation_(Midgard_2016).pdf.

REFERENCE: **Application, Appendix 5.2, page 5.2-1**

ISSUE: **Dam Safety Program Project**

QUOTE: "A full dam safety review (DSR) is performed every 5 years by an external consultant as recommended by the Canadian Dam Association (CDA) … Spending in 2021 is required to address 2020 DSR outcomes and priorities identified for 2021. Some of the high priority items that will be addressed include:

- Wareham dam spillway design
- Warning and danger signage around the six dams
- Public safety around Marsh Lake"

QUESTION:

a) Please confirm that the $300,000 cost for 2021 is for the work included in the bullet list. If confirmed, please break down the $300,000 cost into the three projects.

b) Please explain what "public safety around Marsh Lake" entails.

c) Is the cost of performing the dam safety review included in YEC's revenue requirement? If so, please provide a reference to where that is described in YEC's Application.

d) Was a competitive process used to retain an external consultant to perform the review? If not, why not? If so, please describe the process, including the number of quotes or proposals received and details of the successful vendor.

ANSWER:

(a)

The $300,000 cost is broken out as follows:

- Warning/danger signage - $50,000;
- Public safety around Marsh Lake - $150,000;
- Emergency Preparedness Plan and Operational MS - $25,000; and
- Canyon Lake control structure repairs - $75,000.

(b)

The work includes the development of a public safety plan, signage and safety boom installation.

(c)

Yes, Dam Safety Program cost is included in the 2021 test year revenue requirements as part of rate base. No amortization expense is included for 2021 test year as the project is forecast to be closed by end of 2021.

The project is listed in Appendix 5.2: Capital Projects >$10,000 and < $1 million added to Rate Base and also included in Table 5.2-1 “Projects Included in 2021 Rate Base”.

(d)

A competitive RFP process was initiated. Eight proposals were received evaluated and awarded based on total score based on best overall proposal which included evaluating technical ability and price. Ecora Engineering was selected as the successful proponent.

REFERENCE: **Application, Appendix 5.2, page 5.2-2**

ISSUE: **Dam Safety Recommendations 2017-18**

QUOTE: "2019 spending included required maintenance around the Marsh Lake control structure, and replacement of Whitehorse piezometers; while planned 2020 activities include replacement of the Mayo Lake Dam wood planking, Wareham Dam seismic upgrades, and the implementation of a public safety plan at the Marsh Lake control structure."

QUESTION:

a) Please provide a cost breakdown for 2019 and 2020 spending by the work items listed in the quote above.

b) Please explain why each of the work items listed in the quote above were required to be done in 2019 and 2020.

c) Was the work scheduled to be done in 2020 completed? If not, please explain why and provide an update on the status of the work.

ANSWER:

(a)

A breakdown of 2019 and 2020 spending is outlined in the table below.

	2019 (+)	2019 (+)	2020 (+)
	Total Cost (+)	Cust Connect Contract (+)	Total Cost (+)
P16-026) Dam Safety Recommendations - (-)	272,274.92		124,011.21
(C18053) Dam Safety Recommendations -Closed	172,735.64		
(C19601) DSR-WH Spillway Drainage -Closed	560.66		.00
(C19602) DSR-Marsh Lake Sheet Pile Isla -Closed	3,521.28		
(C19603) DSR-Marsh Lake Boat Lock -Closed	3,214.03		
(C19604) DSR-Mayo Replace Wall Planking -Open	24,377.73		3,405.32
(C19605) DSR-Wareham Dam 2007 Seismic -Open	23,164.62		38,988.33
(C19606) DSR-P125 Stability of stoplogs -Closed	76.82		
(C19607) DSR-Aishihik GS Contingency Pl -Closed	2,999.61		
(C19608) DSR-Aishihik CLCS Non-Conforma -Closed	3,735.98		
(C19609) DSR-WH Embankmt Piexometer Rep -Closed	3,804.16		
(C19610) DSR-EPP/OMS and Other Support -Closed	25,323.16		42,803.25
(C19611) DSR-Owner Cost -Closed	6,978.60		
(C19612) Dam Safety Management Program -Closed	977.86		3,475.35
(C19613) Dam Safety Inspection -Closed			35,338.96
(C19614) WRGS Seismic Study -Closed	804.77		

The total actual spend for 2020 was $124,011 (compared to the forecast of $0.300 million in the GRA). The remainder was to be applied to the Mayo Wall Planking construction, the Wareham Dam Seismic Upgrades construction, and the Public Safety Plan. The Mayo Wall Planking and the Wareham Dam Seismic Upgrades were deferred due to the high water levels in both Mayo Lake and Wareham Lake. The Public Safety Plan was deferred until the completion of the 2020 Dam Safety Review.

These 3 projects are identified as part of Dam Safety Review and will be completed.

(b)

Items listed for 2019/2020 were generated from Dam Safety Inspection (performed yearly) and the Dam Safety Review of 2015.

(c)

Mayo Lake Planking not completed due to high water levels. Currently YEC is waiting for lower water levels to drop such that the planking can be replaced safely.

Wareham Dam Seismic Upgrades were also not completed due to high water levels. This work will now be completed as part of other Wareham Dam projects currently being planned.

Public Safety Plan was not completed due to the fact that YEC is waiting for results from the 2020 Dam Safety Review for inclusion into the Public Safety Plan.

REFERENCE: **Application, Appendix 5.2, page 5.2-2**

ISSUE: **P126 LNG Boil-Off Gas Heat Exchanger Project**

QUOTE: "Prior to decommissioning of the Mirrlees diesel generators, LNG boil off gas was piped to P126 and burned in the P126 plant boiler and/or dissipated through the WD1 jacket water heat exchanger. With retirement and removal of the three Mirrlees gensets at the Whitehorse Diesel Plant (P126) there was a requirement to replace this heat dissipation function and to design, supply and install a new heat exchanger at the plant to dissipate extra heat from the combustion of LNG boil off gas. Work related to the installation of the heat exchanger included hiring an owners engineer to prepare design, drawings and specifications for the new heat exchanger, piping, a new pump with VFD, and a temperature sensing device, and provide mechanical and electrical drawings and technical specifications for equipment and piping installation for tendering the construction work."

PREAMBLE: The Board requires additional information regarding how removal of the Mirrlees generators necessitates a new heat dissipation function and heat exchanger.

QUESTION:

a) Were the P126 plant boiler and WD1 jacket water heat exchanger removed or decommissioned when the diesel generators were decommissioned?

b) Please explain why removal of the diesel generators necessitates installation of a new heat exchanger.

ANSWER:

(a)

P126 boiler was not removed. WD1 Jacket and water heat exchanger were removed when the diesel generators were decommissioned.

(b)

New heat exchanger was installed to dissipate heat from the boil off gas from the LNG site. The diesel cooling system previously dissipated heat prior to removal.

REFERENCE: **Application, Appendix 5.2, page 5.2-2**

ISSUE: **Wareham Gate Heating Project**

QUOTE: "The Wareham Gate Heating project replaced an old and ineffective heating system on both Wareham Spillway Gates. The new system is designed to keep both spillway gates operational through the winter. Passing flows during outages and times of high inflows is a critical function of the spillway."

QUESTION:

a) Please indicate the year in which the original heating system was installed and the expected service life at the time of installation.

b) Please describe the frequency and duration of periods during which the Wareham spillway gates were out of operation during the winter over the last ten years, on a per annum basis.

c) Please describe the effect of those periods on available capacity.

ANSWER:

(a)

The original heating system was installed in circa 1990. The expected service life is unknown.

(b)

Due to the extreme cold weather at Mayo keeping the gates operational is problematic. Prior to the repair of the gate heat and installation of the bubbler system in 2015 the spill gates required steaming at least 1-2 times per year to keep them operational.

(c)

There is no effect on available capacity.

The installation of the Mayo B facility (2011) required an increase to the Wareham forebay level, i.e., the layout of the penstock to Mayo B instituted a higher Wareham forebay level to run one or both units[1]. The higher operating forebay reduces the time to start spilling if the hydro is shutdown; and the higher forebay requirements have required increased availability and operability of the Wareham spill gates. Additional gate heat and sealing of the gates was required to accomplish this.

[1] The high point in the penstock (PI2) limits the variations in the forebay.

REFERENCE: **Application, Appendix 5.2, page 5.2-4**

ISSUE: **WH4 Ventilation**

QUOTE: "The WH4 plant is overheating during the summer. Given that YEC is adding additional capacity to the WH4 hydro unit with new servo motors in 2021, removing the restriction placed on output by the overheating issue will enable the extra capacity to be used reliably throughout the year."

QUESTION:

a) Please describe the work to be done as part of this project and break down the $750,000 cost to the work items comprising this project. In your response, provide any assumptions on how the $750,000 cost was derived.

b) Please describe the frequency and duration of outages at WH4 resulting from overheating over the last ten years, on a per annum basis.

ANSWER:

(a)

The project was forecast to be completed in 2021. It will now be completed in 2022 and therefore will not be part of the test year revenue requirement. A breakdown of project costs is not available at this time.

(b)

Outages were avoided by limiting the output. Summer output was limited to ~80% due to the overheating.

REFERENCE: **Application, Appendix 5.2, page 5.2-7**

ISSUE: **L355 Voltage Regulator Project**

QUOTE: "Atco Electric Yukon (AEY) has reported low voltage levels (below CSA standards) at the AEY Haines Junction substation, which is supplied from Aishihik via distribution line L355. The project identified the voltage profile of L355, determined the appropriate location and settings of voltage regulators, and completed all installation and commissioning work.

QUESTION:

a) Please explain the frequency at which AEY is experiencing low voltage levels.

b) Please provide the voltage levels prescribed in CSA standards and the voltage levels experienced at the Haines Junction substation.

ANSWER:

(a)

The low voltages at the AEY Haines Junction substation occur during periods of high load. Most frequently during the winter months.

(b)

The nominal voltage at the point of sale and purchase should not vary by more than +/- 6% as per CAN3-C235-83 (reaffirmed in 2015). On two previous occasions, the incoming voltage to the Haines Junction substation has dipped as low as 6.4% and 10% below nominal.

REFERENCE: **Application, Appendix 5.2, page 5.2-9, footnotes**

ISSUE: **Building Upgrades**

QUOTE: "[7]There are many exterior works, including roofing, heat trace, metal or wood cladding, structural or building envelope work or windows and doors. A variety of work is required to be done on staff housing, offices and plants.

[8] Numerous Heating Ventilation and Air Conditioning (HVAC) issues have been identified. The intent is to group the HVAC work requirements into annual tenders seeking contractor to do works within the communities required.

[9] Flooring issues identified relate to removal of warn carpeting or sealing of foundation flooring to alleviate any potential radon into the workplace.

[10] A majority of electrical panels are at end of life or currently overloaded and need to be replaced.

[11] A stepdown transformer is required for the Aishihik office plant as the existing one has exceeded its life expectancy."

QUESTION:

a) Please provide the costs for the work items listed in footnote 7 and explain why each is necessary.

b) Please describe the issues and problems with the existing HVAC systems and equipment and the proposed remedies and forecast cost of those remedies.

c) Please provide and comment on the results of any testing done for radon in YEC's buildings and the forecast cost of replacing flooring in those buildings.

d) Are the electrical panels currently experiencing problems or issues leading to safety concerns or excessive maintenance costs? Please explain.

e) Please provide the estimated cost of replacing the panels.

f) Is the existing stepdown transformer currently experiencing problems or issues leading to safety concerns or excessive maintenance costs? Please explain.

g) Please provide the estimated cost of replacing the stepdown transformer.

ANSWER:

(a)

Exterior Works planned for 2019 included replacement of metal cladding and joint sealers at two offices and a hydro plant, roofing replacement at a staff house and office trailer, and the installation of an ice melt system in the concrete ramp at the WH4 hydro plant. The roofing replacement of the Faro staff house was completed during Q3; other planned work was deferred to 2020 due to the need for further investigation, contractor availability, or further inspection determined the work not to be required and it was removed from the scope.

Total costs incurred in 2019 for exterior work was $11,989.

(b)

The consultant identified number of HVAC units that were at end of lifecycle. YEC deemed it prudent to proactively replace these now, rather than waiting for them to breakdown. Run-to-failure is not a principled approach to managing this class of asset. This equipment is critical during heating season so any failures in winter would likely entail higher costs for call-outs, overtime, etc.

Planned HVAC Retrofits for 2019 involved the replacement of furnaces, boilers, ventilation, or fan coils at a number of locations including offices, generation plants, and staff houses. HVAC work was completed in Q4 at the Aishihik plant, Dawson and Faro offices, Mayo staff house, Kulan warehouse, and Whitehorse IT & drafting trailers. Total costs allocated to HVAC work in 2019 were $68,709.

(c)

Radon testing results did not indicate any areas high zone for radon. The flooring works being undertaken consequently do not relate to radon but relate to the end of life of the existing product in place.

Flooring Replacement was completed as planned at the main office and a staff house in Dawson. The quotes for replacement of the carpet in the Whitehorse main office came in higher than expected, however, this was offset by removing the flooring replacement in the electrician's trailer from the scope of work. Work planned for 2020 includes flooring replacement at staff houses in Faro and Mayo.

Total costs allocated to flooring work in 2019 was $86,014.

(d)

Some panels are reaching end of life and some are fully loaded requiring a larger panel installation. Works identified within BCR were to be addressed internally if possible. The panels that were replaced were deemed priority for load and life cycling purposes.

(e)

The estimated cost for replacing the panels was $18,250.

(f)

An internal inspection was undertaken and it was determined that this stepdown transformer is not currently overloaded, will not be taking on any more load and could have significant useful life remaining if not operated at a high load. Although it is exceeding its life expectancy the transformer will be monitored and replaced when it starts showing signs of failure or requires additional load.

(g)

The cost estimate to replace the stepdown transformer in 2013 was $9,800.

REFERENCE: **Application, Appendix 5.2, page 5.2-9**

ISSUE: **Compact Digger Truck**

QUOTE: "The purchase of a 4 to 5 ton chassis compact digger truck for use in Dawson will substantially decrease risks for workers and ensure greater efficiency in day to day work; including providing improvements in outage response times. Servicemen currently use an attachable bucket that goes on the side of the digger boom for many types of work from street light maintenance, service work, trouble call response, and new construction. The bucket is heavy and difficult to attach/detach. In a trouble call scenario this can also be time consuming and increase trouble call response time leading to frustration and potential unsafe working conditions."

QUESTION:

a) On average, how many times per year is the bucket attached to and removed from the digger boom, how many service personnel does it typically take to attach the bucket, and how long does it typically take to do so?

b) Please use the answers to part (a) to estimate the annual incremental cost of not purchasing a new digger truck.

c) In the past five years, have any injuries or safety concerns been reported by service personnel as a result of having to attach the bucket? If so, please explain.

d) Please provide the models and website links (with purchase prices) for the models of compact digger trucks being considered. Please also include YEC's comments on which model(s) are preferable and why.

ANSWER:

(a)

It is practice to remove the bucket if the boom is to be used for lifting. This can include being used for poles, transformers, and wire. Frequency of removing and re-attaching the bucket to the digger boom can range from multiple times per day to just a few times per week depending on the tasks being completed. It is estimated that there can be between 250 and 400 change overs per year.

Dawson PLT's are often in a working alone situation due the district requirements. This can lead to the bucket being attached/re-attached by one PLT. This can be difficult to do as the bucket alone weighs over 100 lbs and can be difficult to handle. Slippery conditions can also add a degree of difficulty to this work.

For one person working alone this can take 15-20 minutes, and with two people it can take about 10 minutes. The digger takes about twice as long to set up as does a compact bucket truck.

(b)

Two separate options to purchasing a new digger truck are noted: (1) renting a bucket truck; and (2) continuing to operate in the same manner:

1. **Rental Option:** YEC could rent bucket truck for the busy season at a cost of $5000-6000 a month for 6 months. This would total about $30,000 - $36,000 per year. However, rentals are difficult to procure locally and would likely need to be mobbed/ de-mobbed from a southern province. Mob cost are about $6000 each way.

2. **Status Quo:** This option would result in more pressure on, and maintenance for, the Whitehorse large bucket truck. YEC would continue to incur unnecessary travel costs, over time and contractor use. The bucket truck travels to Dawson an estimated 10 times per year, a round trip of 1,064 km. Having the compact bucket truck in Dawson would not eliminate all of these trips but would increase the capacity of Dawson PLT's and greatly reduce trips to Dawson. The closest bucket truck is in Whitehorse which leaves us more exposed to outages in Dawson.

(c)

No Injuries have been recorded in the past five years.

(d)

YEC has received information from four vendors regarding the purchase of a compact bucket truck. Table 1 that follows provides a comparison of the information received. Attachment 1 provides the information and specs received from each vendor.

- In comparing the four units YEC has concluded that the Altec AT41M (rank #1) would be the best selection for YEC. Altec is a reputable name when it comes to bucket trucks. It is the same make of the bucket YEC currently owns (smaller model). The AT41M has the best work height of all the comparable units. The rear two step access makes the bucket very accessible. The truck is a “single Cab” which keeps the overall length short and is ideal for the alley ways in Dawson. This truck comes ready to work with all necessary boom testing, strobe lights and compartment lights. The price of this unit is $187,975. This unit will be ready in June which is months sooner than the Versalift below.

- The next most comparable unit is the Versalift VST 40-I (rank #2). This truck comes on the same chassis and the base price is $167,500. Although this unit is $20k lower cost it does not have all of the features of the Altec AT41M and will require upgrades to be ready for work (e.g., inadequate strobes, no compartment lighting, no go light).

YEC will release a public RFP in 2021 to ensure optimal pricing and fit for service.

Unit / Body Specifications

- Altec model AT41M telescopic articulating aerial device with continuous rotation and ISO-Grip insulating system at boom tip
  working height: 45.8 ft
  side reach: 30.1 ft
- Single one man platform, 180 degree rotation
- Material handling jib/winch, hydraulically articulating, top mounted, round
- Two (2) platform steps
- Platform cover
- Platform liner
- One set of hydraulic tool outlets at the boom tip
- Engine start/stop with secondary stowage system
- Jib stick, 36 in L, non-extension dependent, non-certified
- Modified A-frame primary outriggers with fixed shoes and safety interlock system
- Temperature Sight Gauge
- Small aerial service body with side access, 29 inch long tailshelf
- T-60 style pintle hitch
- Wood outrigger pads
- Complete LED FMVSS lighting package
- 4-Corner strobes, amber LED
- Strobes, amber LED, with brush guard, installed on post at front of body, one (1) each side
- 6-Way trailer receptacle, pin type
- Secondary stowage system
- Standard Altec warranty: one (1) year parts, one (1) year labor, ninety (90) days travel and limited lifetime structural.

Chassis Specifications

- Ford F550
  4x4 drivetrain
  84 inch CA
  6.7L Power Stroke diesel
  330 HP engine rating
  Automatic transmission
  GVWR 19,500 lb

Item	Description	Qty
	Unit	
1.	Altec Model AT41M Articulating Telescopic Aerial Device with a fiberglass upper boom and fiberglass insulator in the articulating arm and proportional joystick upper controls. Built in accordance to ALTEC's standard specifications and to include the following features:	1

A. Ground to Bottom of Platform Height: 40.8 feet at 7.3 feet from centerline of rotation (12.45 m at 2.21 m)
B. Working Height: 45.8 feet (13.96 m)
C. Maximum reach to edge of platform with Upper Boom Non- overcenter: 30.1 feet (at 17.3 feet platform height)
D. Upper boom extension: 110 inches
E. Continuous rotation
F. Articulating Arm: Articulation is from -3 to 82 degrees. Insulator provides 19 inches of isolation.
G. Compensation System: By raising the articulating arm only, the telescopic boom maintains its relative angle in relation to the ground. The work position is achieved through a single function operation.
H. Upper Boom: Articulation is from -25 to 85 degrees. The fiberglass section provides a minimum of 10.9 inches of isolation in the upper boom (when retracted and 42.3 inches when extended).
I. Platform leveling is achieved by a hydraulic master-slave leveling system. This lifetime system is very low maintenance.
J. The dielectrically tested, insulating upper control system includes the following boom tip components that can provide an additional layer of secondary electrical contact protection.
Control Handle: A single handle controller incorporating high electrical resistance components that is dielectrically tested to 40 kV AC with no more than 400 microampers of leakage. The control handle is green in color to differentiate it from other non-tested controllers. The handle also includes an interlock guard that reduces the potential for inadvertent boom operation.
Auxiliary Control Covers: Non-tested blue silicon covers for auxiliary controls.
Control Console: Non-tested non-metallic control console plate.
Boom Tip Covers: Non-tested non-metallic boom tip covers. The covers are not

Item	Description	Qty
	dielectrically tested, but they may provide some protection against electrical hazards.	
	K. Hydraulic system: Open center (full pressure), maximum flow 6 GPM, maximum operating pressure 3,000.	
	L. Dielectric rating: Category C, 46 kV and below	
	M. Unit is painted with a powder coat paint process which provides a finish-painted surface that is highly resistant to chipping, scratching, abrasion and corrosion. Paint is electrostatically applied to the inside as well as outside of fabricated parts then high temperature cured prior to assembly ensuring maximum coverage and protection.	
	N. Manuals: Two (2) Operator's and two (2) Maintenance/ Parts manuals containing instructional markings indicating hazards inherent in the operation of an aerial device.	
	O. Unit meets or exceeds ANSI 92.2 standards.	
2.	Pedestal	1
3.	Single 1-Man Platform, Fiberglass, 24" x 30" x 42", End Mount, 180 Degree Rotation	1
4.	No Platform Elevator	1
5.	Platform Mounted Single Handle Controls	1
6.	Material Handling Jib/Winch, Hydraulically Articulating, Top Mounted, Round (ARM Jib)	1
7.	One (1) Platform Step - located on the side of the platform nearest the elbow in the stowed position	1
8.	Platform Cover - soft vinyl, 24 x 30 inches (610 x 762 mm)	1
9.	Platform Liner, 24 x 30 x 42 inches (610 x 762 x 1067 mm), 50 kV Rating	1
10.	Hydraulic Tool Circuit at Platform: One set of quick disconnect couplings at the boom tip for open center tools.	1
11.	Engine Start/Stop & Secondary Stowage System: 12 VDC powered motor and pump assembly for temporary operation of the unit in a situation wherein the primary hydraulic source fails. Electric motor is powered by the chassis battery. This feature allows the operator to completely stow the booms, platform, and outriggers. Secondary Stowage & Start/Stop is activated with an air plunger at the platform or momentary switch at the lower control station and outriggers.	1
12.	Jib Stick, 36" L, non-extension, non certified, grey in color	1
13.	Slip Ring: Required for engine start/stop, secondary stowage system, and throttle control options	1
14.	Outriggers, Primary, Modified A-Frame With Integrated Subbase, 30"-34" Chassis Height, Electric Interlock, No Valves On Legs, 114" Spread, Fixed Shoe (AT37/41 M/ME/P/PE/S/SE)	1
15.	Winch load line swivel hook	1
16.	Altec Unit Powder Painted White	1

QUANTITY	DESCRIPTION	Quote Number: Sample
	AERIAL DEVICE	
1	One (1) New Terex Hi-Ranger LTM40 Articulating / Telescoping Aerial Device providing a working height of 44.5 ft (13.6 m) and a side reach of 30.7 ft (9.4 m) with a platform. Unit will be mounted behind the cab. Design Criteria: * Design criteria is in accordance with current industry and engineering standards applicable and accepted for structural and hydraulic design. Platform Leveling: * Leveling is provided by a master/slave cylinder system. * A control a both the upper and lower control is provided. Upper Controls: * "Control-Plus" single stick controller (4-function) * Non-metallic control handle * Dielectrically tested for limited secondary protection between the valve and handle. * May provide limited secondary protection for operator depending on condition and cleanliness. * Not rated for electrical protection, although it may provide limited secondary protection. * Not intended to replace safe work practices or primary protection such as cover-up and personal protection equipment. * Enable lever must be actuated before operation. * Controls lower boom lift, upper boom lift, boom extension and rotation. Insulated Engine Stop / Start: * Controlled from platform and lower control station. Lower Control: * Individual control levers are located in an accessible location on the turntable. * The lower controls activate boom lift, boom extension, platform leveling, and rotation. * An upper/lower control selector provides override of platform controls, along with an emergency stop. Lower Boom: * Constructed of high strength, rectangular steel tube with a rectangular bi-axial epoxy resin filament wound, high strength fiberglass insert providing an insulation gap of 12 inches. * The lower boom articulation is from -5 to 90 degrees. Upper Boom: * Aerial device upper boom is constructed of high strength steel. * The upper boom has an articulation of -20 to 80 degrees * A boom rest with a cam style tie down strap is provided. Second Section Boom: * The second section boom is constructed of high strength filament wound fiberglass.	

QUANTITY	DESCRIPTION	Quote Number: Sample

* Extension of the second section is accomplished by a hydraulic cylinder.
* The upper boom has a total insulation gap of 14 inches retracted and 61 inches extended for end mount platform.
* (Note: Side mount platform will be reduced by 12 inches.)
* Tapered non-metallic rollers mounted at the end of the second section boom support the fiberglass boom under load minimizing scratches and abrasions. The sides of the fiberglass boom are supported and guided by non-metallic rollers to reduce tracking.

Lower Boom Cylinder:
* Single, threaded end gland design, double acting hydraulic lift cylinder equipped with integral holding valves.

Upper Boom Cylinder:
* A double acting hydraulic lift cylinder equipped with integral holding valve is provided.

Extension Cylinder:
* The boom cylinder is of threaded end gland design.
* The cylinder is equipped with integral holding valves to prevent creep and hold the boom is position in the event of hose failure.

Boom Interlock:
* To operate the boom the outriggers must be extended.

Pedestal:
* The pedestal is of welded high-strength steel construction.
* The pedestal top plate is machined from a single piece of plate.
* The top plate bearing surface is pre-machined and inspected after weld to provide a flat mounting surface for the rotation bearing.

Turntable:
* The turntable is constructed of side plates with an offset configuration to provide maximum strength.
* The steel bottom plate has provisions for attaching the outer race of the rotation bearing.

Continuous Unrestricted Rotation:
* A hydraulic rotary manifold provides a rotating oil distribution system for continuous and unrestricted rotation.
* One 3/8 inch hydraulic port is available for options.
* Self-locking worm gear rotation drive is provided and equipped with bi-directional motor.
* A 7/8 inch external hex shaft allows for manual rotation.
* A minimum 4-channel electric collector ring is provided.

Rotation Bearing:
* The rotation bearing is a heavy-duty "shear ball" bearing with external gear teeth utilizing polished alloy steel balls.
* Both the inner and outer races are made from high-strength alloy steel and are heat treated to provide maximum life.
* High strength grade 8 bolts attach the inner and outer races to the pedestal and turntable.

ANSI & CSA Rating:
* Aerial device is designed as a Category C machine and is dielectrically tested and rated for operation up to 46,000 volts AC per ANSI/SIA A92.2-2009 and CSA C225-10.

Hydraulic System:
* Full pressure, open center hydraulic system.
* A 20 gallon external hydraulic oil reservoir is provided with a 60 mesh filler screen, baffles, 100 mesh suction screen with bypass, clean out access hole, dip stick and shut off valve.
* A spin on type 10 micron return line filter is provided.
* A relief is also provided.
* Hydraulic hoses are equipped with permanent type fittings.

Miscellaneous:
* All metallic components of the complete aerial device are prime painted.
* The fiberglass upper boom, boom inserts, platforms, and covers are white.
* Two complete manuals providing operation and maintenance procedures, and a replacement parts listing.

QUANTITY	DESCRIPTION	Quote Number: Sample
	* Warning decals provided with unit.	
1	Pedestal * Sized for F550 Super cab Chassis	
1	Platform 24 x 30 x 42: * One (1) person, end mounted, fiberglass platform with a rated capacity up to 400 lbs. * Includes one outside access step with slip-resistant surface. * A safety harness with lanyard.	
1	Hydraulic Platform Rotator: * For end mount platform. * Allows 180-degrees hydraulic rotation and is controlled at the upper controls.	
1	Insulated Platform Liner with Step for 24" x 30" x 42" Platform: * Tested at 50 KV AC.	
1	Vinyl Platform And Control Cover For 24" x 30" Platform: * Waterproof with internal elastic cord around edge and external elastic cord around control cover.	
1	Dual Hydraulic Tool Outlets At Platform With Flow Control: * Installed at the platform to accommodate two open center hydraulic tools. * Provides 5 GPM at 2250 psi at engine idle.	
1	Auxiliary Power: * Allow the operation of any function for a time period limited by the battery life. *Includes 12 volt electric motor for use on a 12 volt chassis. Note: This includes a switch for activation at pedestal for electric or air function.	
1	Platform Rest Saddle with a padded rest. * Provides platform support during road travel	
1	Top mount, Removable 800 lb. Jib/Winch * Levels with platform. * Hydraulic articulation from -20 to 70 degrees. * 51" load radius from the platform shaft. * Manual extension 17". * Maximum jib capacity of 800 lb. * Includes up to 65' of 3/8" winch rope and hook. * Low profile stowed position of 16" and the boom can still utilize its full range of motion down to -40 degrees. * Poppet valve protection of fiberglass boom. Stops boom operation if jib contacts fiberglass boom. * Jib/winch is removable and comes with ship loose socket to store the jib/winch when removed (placed during installation) *King post attached to jib. Low profile socket when jib removed to minimize interference and overall height.	
1	Model 438506 Standard Duty Low Profile A-Frame Outriggers: * Hydraulic double acting outriggers including integral holding valves. * 135.8 " Spread pin to pin and 147.8 " to outside of pads at 3.1 " penetration and 32 " frame height. * 7 " x 12 " Stabilizer pads.	
1	Control For 1-Set Of Outriggers (Open center systems): * Recessed at rear of truck each side for ease of view for outrigger placement. * Includes switches and alarm for outrigger in motion alarm.	
1	Mounting Kit: * Behind cab mount for use with (1) set of outriggers and tie plates.	
1	SAG Light opening in outrigger leg for 1 set of Outriggers: * Includes wiring and switch. * Opening only, no light.	
1	Sight Gauge With Thermometer:	

QUANTITY	DESCRIPTION	Quote Number: Sample
	* Mounted within an aluminum body to protect sight tube. * Installed on end of hydraulic oil reservoir. * Thermometer has a range of 0-300 degrees Fahrenheit.	
1	Pump for systems requiring 8 gallons per minute: *Fixed displacement vane pump providing 5 gallons per minute at 950 engine rpm and 8 gallons per minute at 1370 engine rpm with a 98% PTO. * Typically used for transmissions required an elevated speed for PTO operation. Note: LTM product 6 gallons per minute at 900 engine RPM.	
1	Metric and Imperial Load Chart	
	UTILITY BODY	
1	Brand FX BFXB 84T Line Body with C2 Walk-Up – 53130-0007 * Overall Pack Length 132" * Overall Width 94" * Floor Width 58" * Overall Height 48 1/2" * Mounting Height: 30" * Pack Depth 18" * Stainless Steel Hinges and Slam Locks * Vinyl Covered S/S cable door stops * Non Skid Compartment Tops * Full length Aluminum Drip Rail * Clear Vinyl Rock Guards * Automotive grade Bubble gasket * One piece Molded Doors with Automotive finish both sides * Recessed Door Jambs * Flow through Ventilation System * Hot-stick Door Street Side Street Front Compartment * (5) Locking Swivel Hooks 2-1-2 mounted high * (5) Locking Swivel Hooks 2-1-2 mounted Low * Outrigger Cutout Street Front Compartment #2 * 3 Adjustable Shelves with Dividers * Dri-Dek Compartment Liner Street Horizontal Compartment * 1 Adjustable Shelf * Dri-Dek Compartment Liner Street Rear Compartment * 3 Adjustable Shelves * Dri-Dek Compartment Liner Curb Side Front * 3 Adjustable Shelves with Dividers * Dri-Dek Compartment Liner * Outrigger Cutout Curb Front #2 * Walk-Up Stairs – Grip-strut * Access to Deck Curb Horizontal * Fixed Shelf on either side of three pull-out drawers * Fixed Shelf on bottom with Dividers	

QUANTITY	DESCRIPTION	Quote Number: Sample
	* Dri-Dek Compartment Liner Curb Rear Compartment * (5) Locking Swivel Hooks 2-1-2 mounted high * (5) Locking Swivel Hooks 2-1-2 mounted Low * Dri-Dek Compartment Liner LED Flexglo Compartment Lighting * Top & Sides of Doors Wheel Well Liners – Aluminum. Fully covering Fiberglass in front, behind and on top of Wheel Wells * Extends under Verticals by 3 inches Wheel Chock Holders * Mounted Curbside at Fenders Aluminum ladder rack mounted on the street side compartment top	
	INSTALLATION & ACCESSORIES	
1	Install Aerial Device Behind Cab And Install All Associated Components: * Final test and inspect completed unit including stability and dielectric testing per manufacturers requirements, ANSI/SIA A92.2-2001 and CSA C225-10.	
1	Hose and fittings to connect the hydraulic system from the oil reservoir to the pump and unit.	
1	Miscellaneous Shop Supplies.	
1	Commercial Custom Aerial Boom Rest * Heavy Gauge Steel Construction	
2	Stainless Steel Grounding Point * 3/4" Stainless Steel round bar * Welded to bottom of outrigger leg	
1	Outrigger controls protection cover * Controls to be enclosed with Aluminum box to protect them from tire and road debris	
30	Hydraulic Oil * ESSO Univis HVI 13	
1	Power take off, 6-bolt, with indicator light for automatic transmission.	
1	Relocate factory DEF Tanks * Required procedure on Ford F550 chassis	
1	Rear towing Recovery Eyes 50,000 pound capacity - used in pairs only * Closed eye 1 1/2" diameter hole * Material - 1" 50,000 PSI steel * One (1) Left & One (1) Right - vertical orientation * Mounted directly to frame rail * 5" W X 16" L * Engineered rating - see 2285-1	
1	Heavy Duty Aluminum Checker Plate Deck	
4	Deck "D" Rings * Welded to cross members * Flush mount	
1	Aluminum Tail Shelf * Checker plate top surface	

QUANTITY	DESCRIPTION	Quote Number: Sample
	* Aluminum grab handle mounted on top surface	
1	Vise bracket that fits vertical in a pocket. * 2 inch receiver * Mounted at curb side of Tailshelf	
1	Set chassis parameters * Programming of the Multi-Plex circuits * Writing the programming for the ECU * Program Throttle and PTO * Program Stop/Start * Program all safety controls.	
1	License Plate Lamp * LED * Meets SAE J587 * Complete with bracket	
1	VMAC Throttle Commander * Maintains rpm over engine torque loads * 12-Volt activated * 3 preset programmable rpm settings	
1	Wired-Rite system for chassis.	
1	Truck-Lite LED 7-lamp DOT Lighting Package: * Complies with CMVSS 108 * Includes required lights, junction box and wiring harness	
1	Golight Stryker Search Light * Wireless Remote Controlled Operation * 370° Rotation x 135° Tilt * 500,000 Candle Power, 5.5 Amps * UV Ray and Saltwater Resistant * Integrated 12V DC High-Torque Motors * Weatherproof for Land and Sea Applications * Waterproof Remote Transmitters * R.F. Programmable Super Heterodyne Receiver * 5-Year Limited Warranty * Mounted on hood of vehicle	
2	Amber strobe light with 6" lens and mounting bracket. * Mounted on Boom rest behind Cab * 360 degree visibility	
2	Truck-Lite 60122Y LED amber oval strobe light offering dual or quad flashing patterns. * Flush mounted at rear of body * Switched in Cab	
2	Strip LED lighting mounted in loadbed both sides Extruded aluminum drip rails mounted above lighting	
1	Back-up alarm to sound when the vehicle is shifted into reverse.	
1	Prowatt 3000 Inverter is designed for high power and industrial applications. Its high surge output is ideal for heavy-duty loads or multiple smaller AC loads. It can often be used in place of a generator for large intermittent loads. Product Features * 3000 watts maximum, 5000 watt surge capability * Built-in LED display for DC volts and amps * Supports addition of external AC outlets	

QUANTITY	DESCRIPTION	Quote Number: Sample
	* Single GFCI receptacle for safe operation and hardwire AC connections * Heavy duty terminals for trouble-free battery connection * Includes ON/OFF remote switch * Two year warranty	
1	400 Amp fuse Product Features * DC rated, UL listed high current Class-T fuse * Protective clear removable cover protects against inadvertent contact * Dual post design to reduce arcing * Easy to change, user replaceable fuses	
1	Battery Interconnect * 12V * 100 Amp * Uni-Directional /w aux start	
2	Duplex GFI Outlet * Mounted in NEMA 4 Junction Box	
1	Inverter/Battery Cable Package * Required to connect the Vehicle Batteries with the Inverter * Includes all necessary Hardware	
1	Bin Heater mounted in SS2 – with switch in cab Engine coolant type – provide air access via 3” holes to SS1 & Hot stick shelf.	
1	Paint completed Unit one solid colour (white) * Aerial unit powder coated Terex White * Fiberglass service body to be white Gelcoat * Cargo area to be coated with spray-on non-slip coating * Side pack tops to non-slip coated * Front surface of outriggers to be coated with spray on coating * Body under carriage, rear hitch assembly and bottom side of front outrigger sub frame to be undercoated with petroleum based coating	
2	Level indicator, inclinometer, +/- 5 Degrees.	
2	Mud Flap * Plain Black - 24" x 30" * Includes mounting hardware	
1	One pair of anti-sail brackets for mud flaps.	
1	Cone Holder * Deck Mounted.	
2	Outrigger Pads - wood * 24" x 24" x 2"	
2	Outrigger Pad Holder * For Single Outrigger Pads - 24" X 24" * Mounted under body in close proximity to the Outriggers	
2	Wheel Chock * Standard Rubber Type	
1	DOT Triangle Reflector Kit.	
1	First Aid Kit – BC Level 1 * Ship loose.	

QUANTITY	DESCRIPTION	Quote Number: Sample
2	5lb ABC Fire Extinguisher * Includes mounting bracket. *Ship loose – customer to install	
1	CMVSS Inspection. * Scale Ticket * Road Test * Fuel Truck.	
1	Dielectric Testing to CSA Standards * Fibreglass Boom Sections only * Auxiliary Jibs not included	
1	Stability Testing to CSA standards * Weight studies will be provided for customer approval prior to start of assembly.	
1	Orientation of Completed Unit with Customer * This is for the customers personnel * Certified Trainer reviews the operation of the new unit with crew * Safety items are discussed * Maintenance schedules are discussed * Classroom discussion followed up with a hands on Orientation Session * Orientation is performed on Customers Site * Up to one day in length.	
1	Chassis (Customer Supplied) * Quote is based on clear frame back of cab, customer supplied chassis. * Quote does not include any modification to chassis including but not limited to suspension modifications, axle relocation, relocation of batteries, air brake components, fuel tanks or other items not covered by this quotation. * Prior to order we required a detailed chassis specification provided by original manufacturer to confirm suitability of vehicle.	
	CHASSIS	
1	Ford F550 Super Cab 4x4 Chassis * 84" CA * 6.7 Liter Diesel Engine * 6 speed Automatic Transmission * 4.88:1 ratio differential * 19,500 GVWR * Customer supplied Specifications	

Budgetary price per unit: $261,000.00

Requirements

2 - 1" x 24" x 24" plywood with 8 holes, centered as in Detail 'A'.
Drill 8 holes 9/16" x depth of plywood.

1 - 1" x 24" x 24" plywood drilled and channeled as in detail 'B'
Then drill 8 holes 9/16" x depth of plywood as in detail 'A'.

8 - Hex Bolts 1/2" by 2 3/4".

1 - Piece of rope, 3/8" with knots at each end. Long enough to press knot into each hole run up channel and leave approximately 11" outside for a handle

- Allpieces of wood to be glued together.
- All weathered sides of wood to have Thompsons Weather Seal applied.

CHASSIS SPECS & BODY SPECS

Cab And Chassis:
Ford F-550 4X4 Cab And Chassis With A CA Of 84”
GVWR: 19,500 Lbs.
6.7L 4V OHV Power Stroke V8 Turbo Diesel Engine
Torqshift 6-Speed Automatic Transmission
4.88 Limited Slip Axle.
Air Conditioning.
Engine Block Heater
225/70RX19.5G BSW Traction Tires.
Radio: AM/FM Stereo Includes 4 Speakers.
HD Vinyl 40/20/40 Slit Bench Seat
Trailer Brake Controller
Operator Commanded Regeneration
Painted Oxford White.

Dakota Bodies 132” Long X 40” High X 94” Wide Service Body:
30 Inch Aluminum Tread Plate Platform Extension
LED Lighting Package Installed In Tail Shelf.
Cable Access Step At Rear And Side Access.
Two (2) Chrome Grab Handles At Side Access And
Two (2) Pool Type Grab Rails At Rear Tail Shelf.
Wheel Chock Storage And Outrigger Pad Holders.
Push/Pull Rod Lock System
40” High Street Side Compartments As Follows
1st Vertical: Two (2) Adjustable Shelves With Dividers And Cutout For Outrigger
2nd Vertical: Two (2) Adjustable Shelves With Dividers
Horizontal: One (1) Removable Shelf With Dividers
Rear Vertical: Two (2) Adjustable Shelves With Dividers
Hot Stick Shelf With Rear Access Door.
40” High Curbside Compartments As Follows
1st Vertical: Two (2) Adjustable Shelves With Dividers And Cutout For Outrigger
2nd Vertical: Grip Strut Access Steps To Bed Area With Removable Composite Side Gate.
Horizontal: One (1) Adjustable Shelf With dividers
Rear Vertical: Five (5) fixed material hooks 1-3-1

EQUIPMENT SPECS

Versalift VST-40-I, Insulated 40Ft. 4 In Telescopic Aerial Platform Lift, 45Ft. 4 In Working Height With A Horizontal Reach Of 30 Ft.2 In. To Include The Following Items:

Standard Platform Capacity Of 400 Lbs
Right Hand Single Stick Control.
Hydraulic Platform Rotator.
Hydraulic Dual Arm Articulating Jib Pole And Winch Package For Up To 1,000 Lbs. Capacity, Including Insulated Jib Pole
360 Degree Continuous Rotation Including Slip Rings
Six GPM Open Center Hydraulic System With A 3000 PSI Operating Pressure
Side Mounted Telescopic Upper Boom Allows Low Stowing Of Platform.
ANSI A92.2 Requirements For Category C 46KV And Below.
Chassis Insulating System (Fiberglass Lower Boom Insert) Providing 12 In. Insulation Gap And Including Accommodations To Bridge Insulation Gap For Testing Per ANSI 92.2
Electrogard And Inner Boom Finished With White Urethane Paint Over A White Gel Coat.
Non-Lube Bearings Used Throughout.
One Set Of Hydraulic Tool Outlets With Pressure Limit Valve. Valve Can Be Adjusted From 1000 To 2500 PSI.
Sub Frame Mounted Main A-Frame Outriggers With Pivot Feet, Two Control Valves, And A Selector Valve.
Outrigger Boom Interlock System For Main Outriggers
Integral Reservoir With A 17-Gallon Capacity And Dual Sight Gauges.
Side Mounted Closed Heavy-Duty One-Step 24 In. X 30 In. X 42 In.
Fiberglass Platform Including Platform Liner And Vinyl Cover.
Individual Full Pressure Controls At The Turret Actuate All Boom Functions And Is Equipped With A Selector Valve To Override Upper Controls
12 Volt DC Backup Pump Providing Power To All Boom Functions.
2 speed Throttle Control.
Start/Stop at upper controls
Safety Harness And Lanyard
Two Operator Manuals And Service Manuals

REV. 03/20

VERSALIFT is a leading manufacturer of bucket trucks, digger derricks and cable placers. Customers in the electric utility, telecommunications, forestry and sign, light & traffic industries experience a lower true cost of ownership by choosing Versalift. Our equipment is engineered to be lighter, while keeping the designs simple, which provides advantages like less unscheduled maintenance, greater payloads and ease of maintenance. Versalift has the lowest recall rate in the industry making it the smarter and most reliable choice. Versalift aerial lifts are the only units to feature the patented TruGuard® safety system, which provides additional protection to linemen in the bucket. Versalift is a Time Manufacturing Company, and together with Aspen Aerials has more than 1,400 employees worldwide.

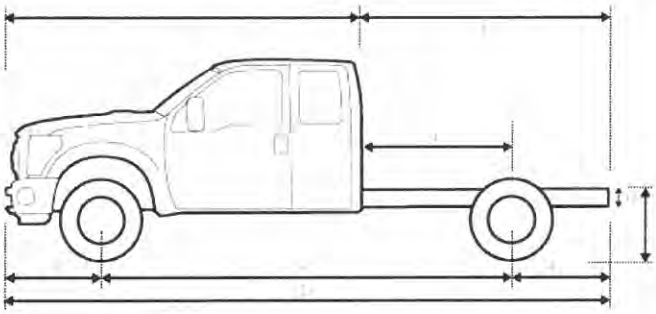
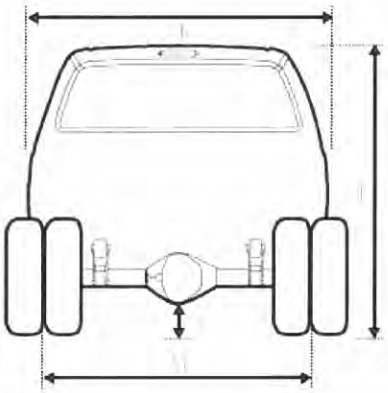
Vehicle Dimension and Performance Summary

Performance predictions in this report represent an estimate of vehicle performance based on standard operating conditions. Variations in customer equipment, load configuration, ambient conditions, and/or operator driving techniques can cause significant variations in vehicle performance. These values are not representative of results that may be shown in actual dynamometer tests. This report should therefore be used as a guide for comparative vehicle performance.





Dimensions

A	Front of Bumper to Front Axle	38.30 in.
B	Front Bumper to Back of Cab (BBC)	146.30 in.
C	Wheelbase (WB)	192.00 in.
D	Overall Length (OAL)	277.40 in.
E	Back of Cab to Rear Axle (CA)	84.00 in.
F	Back of Cab to End of Frame	131.20 in.
G	Rear Axle to End of Frame (AF)	47.20 in.
H	Frame Section Height	N/A
I	Rear Frame Height Unloaded	34.30 in.
I	Rear Frame Height Loaded	28.60 in.
J	Cab Height	81.80 in.
K	Body Width	80.00 in.
L	Maximum Ground Clearance	N/A
L	Minimum Ground Clearance	8.20 in.
M	Front Tread	74.80 in.
M	Rear Tread	74.00 in.

Prices and content availability as shown are subject to change and should be treated as estimates only. Actual base vehicle, package and option pricing may vary from this estimate because of special local pricing, availability or pricing adjustments not reflected in the dealer's computer system. Vehicle Dimension and Performance Summary (cont'd)

Start, Grade and Speed

Start	Ratio	Desired	Calculated
Start grade capability in 1st gear	3.97	15.00 %	42.71 %
Start grade capability in reverse	3.13	15.00 %	33.62 %
Grade	**Ratio**	**Desired**	**Calculated**
Maximum grade in 4th gear	1.15	3.00 %	13.00 %
Maximum grade in 5th gear	0.86	3.00 %	9.71 %
Maximum grade in 6th gear	0.67	3.00 %	7.63 %
Speed		**Desired**	**Calculated**
Top Speed (level grade)		75 mph	88 mph
To meet your requirement you need a maximum axle ratio of 5.74			
Top Speed on 3.0% grade		55 mph	
To meet your requirement you need a maximum of 122 hp			
Cruise Speed		60 mph	65 mph
Engine RPM at desired cruise speed			2,121 rpm

Variables in Use

Rear axle ratio:	4.88/4.88	Governed RPM:	3,120 rpm
Tire size:	225/70R19.5 (645 rev/mile)	Frontal Area:	40.44 Sq.Ft.
Gross Vehicle Weight (GVW):	19,500 lbs	Cruising RPM	2,300 rpm
Clutch engagement torque:	375 ft.lbs.	Worst road surface	Typical Highway
Torque conversion ratio:	1.90	Final Drive Ratio:	0.67
Peak engine torque:	750 ft.lbs.	Drag Coefficient	0.80
Engine Power:	330 hp @ 2,600 rpm		

Prices and content availability as shown are subject to change and should be treated as estimates only. REFERENCE: **Application, Appendix 5.2, page 5.2-9**

ISSUE: **Crane Replacement/Refurbishment**

QUOTE: "During an annual crane inspection, three YEC cranes (Aishihik service building, P127 powerhouse, & P127 stop log hoist) were identified as needing significant structural, electrical, and mechanical repairs in order remain in acceptable working condition. 2020 spending will provide for a detailed assessment of each crane to determine an engineered plan for replacement or refurbishment as required. Actual construction activities are planned for 2021."

QUESTION:

a) Are the cranes being repaired or replaced with mobile or fixed cranes? If they are mobile cranes, how many mobile cranes does YEC have available at the specified locations? Please comment on the possibility of other cranes being used in place of the cranes to be repaired or replaced.

b) Please explain what is entailed in the assessments of the cranes, who will carry out the assessments and why the assessment of three cranes will cost $165,000.

c) Please confirm that the $400,000 forecast cost for 2021 is the estimated cost to repair or replace all three cranes. If not confirmed, please explain.

d) What is the estimated full replacement cost of the three cranes?

e) When did the three cranes enter service, and what is their expected service life?

ANSWER:

(a) and **(e)**

To clarify, the three cranes in the quote provided refer to the following equipment:

These two cranes entered service on the following dates:

- Whitehorse Spillway: 1958 (capacity: 20t);
- P127 (WH4) Whitehorse Powerhouse crane: 1984 (capacity: 80T); and
- Aishihik Powerhouse: 1975 (capacity: 38t/5t).

The typical life span on all crane hoists is 20-25 years. With major overhauls, the typical lifespan can potentially extend by an additional 20-25 years (and the process can be repeated). The steel and the concrete structure itself has a typical lifespan of 50 years and a major overhaul can be undertaken to extend its life.

Fixed cranes are proposed. YEC currently has 25 mobile cranes, however, the lifting capacity of mobile cranes is far less than the fixed cranes.[1]

(b)

The value reported in the GRA for 2020 was a forecast; actual work completed resulted in an actual value of $155,296. 2020 Crane works included asset assessment and capital corrective works. The assessment work was conducted on three cranes:

- WH4 Powerhouse Crane;
- WHS Whitehorse Spillway Crane, and
- Aishihik Service Building Crane.

Total value of assessment work was $51,750. The scope of the assessment work is as follows:

[1] The lift capacity of service truck cranes is about 2,000 lbs at 3 ft. radius. Large PLT trucks have greater capacity and can lift up to 20,000 lbs. YEC Digger Derricks in Mayo, Dawson and Whitehorse have this capacity.

WHS Spillway Crane Whitehorse:

- **Structural Assessment:** Measurement of structural members; Engineer assessment of structural members, welds, joints, bolts and rivets; Determination of current crane capacity and life cycle stage.

- **Mechanical Assessment:** Examination of gearing, couplings, drive trains, and power transfer systems (involving disassembly).

- **Electrical/Controls Assessment:** Engineer assessment of controls, motors, switching, wiring etc.; Testing of electric motors and panels; Determination of current condition and life cycle stage.

WH4 Powerhouse Crane – Whitehorse

- **Structural Assessment:** Measurement of structural members; Engineer assessment of structural members, welds, joints, bolts and rivets; Determination of current crane capacity and life cycle stage.

- **Mechanical Assessment:** Servicing of internal couplings (disassembly required).

- **Electrical Assessment** Disassembly and internal inspection of resistor cubicles and panels.

Aishihik Service Building Crane

- **Mechanical Assessment:** Disassembly and inspection of internal couplings, gearcase.

As the contractor was on site already, YEC had them address a number of deficiencies on the cranes. The value of this work was $103,500 and included repair/replacement of various components:

- Braking systems;

- Cables;

- Electrical components; and

- Control systems.

Additionally, the repair scope included addressing recommendations on the inspection of numerous mobile cranes at YEC ($30,000). Both the inspections and repair works were completed by Kone Crane.

(c)

No. The $400k is for Major capital repairs including:

- An engineered assessment on replacement of the Whitehorse Stop Log crane;

- Retrofit to the Aishihik Service Building Crane Auxiliary Hoist Drum Replacement; and

- A 5 Ton Electric Chain Hoist Replacement for the Aishihik surge chamber unit that is damaged and non-serviceable.

These major works are approximately 80% of the total budget. The remaining $80k of budget relates to addressing safety considerations for other cranes.

(d)

Unknown at this time; cost will be based on an engineered solution, followed by an RFP cost estimate and review.

REFERENCE: **Application, Appendix 5.2, page 5.2-9**

ISSUE: **Mayo Earthworks Project**

QUOTE: "A number of issues at and around the Mayo Hydro facilities have been identified. These include slope instability and erosion issues near access roads (Mayo A, Mayo B, and Wareham dam), both powerhouse buildings, surge tank, and both substations. During 2019 a complete site inventory of civil issues was undertaken to identify and prioritize issues. The inspection highlighted several required projects to improve roads, make culvert installations and secure embankments. 2020 spending developed a detailed work plan for identified issues including a geotechnical assessment, topographic survey, detailed engineering design (including drawings and specifications), construction methodology, and project scope, schedule & budget development."

QUESTION:

a) Please confirm that 2020 spending was only on development of the work plan for the Mayo earthworks project. If not confirmed, please explain.

b) When does YEC propose to undertake the works required to remediate the identified issues and what is the estimated cost of those works?

c) Please describe the safety issues and or threats to infrastructure caused by the issues identified.

ANSWER:

(a)

Spending was only on the work plan for the Mayo Earthworks project. Please see response to YUB-YEC-1-65.

(b)

The project will begin in 2022 and stretch in 2023. Costs not identified as of yet.

(c)

Current issues are: erosion at edges of roads that will increase hazards for drivers; and erosion of slopes that cause landslides that could increase and potentially impact access safety or equipment.

REFERENCE: **Application, Appendix 5.2, page 5.2-10**

ISSUE: **New Mobile Office Unit – IT**

QUOTE: "The existing IT trailer houses five offices and a closed storage space. It is aging and requires additional O&M support each year. The project involves replacement of the aging, undersized IT trailer with a larger unit able to accommodate eight office spaces and storage. Additional office spacing would allow for staff expansion as a less costly solution than building onto the main building."

QUESTION:

a) What was the original cost of the existing IT trailer, when did it enter service and what was its expected service life?

b) How many YEC personnel currently use the IT trailer, and what is the typical number of personnel occupying the trailer at any time?

c) What is the estimated annual O&M cost associated with the IT trailer, and what is the estimated annual O&M if a new trailer is purchased?

ANSWER:

(a)

YEC is unable to locate the original cost of the existing IT trailer or the original expected service life. According to the Atco tag on the building, the unit was factory constructed in 1991.

(b)

Excluding Covid-19 pandemic limitations, five employees normally occupy this space on a full-time basis, with an additional one employee using it on a part-time basis.

(c)

The estimated annual O&M cost associated with the IT trailer is $8,500. The estimated annual O&M on a new trailer would be expected to be less than $8,500.

REFERENCE: **Application, Appendix 5.2, page 5.2-10**

ISSUE: **Vehicle Purchases**

QUOTE: "Fleet vehicles were historically replaced at regular intervals based simply on age and mileage. YEC has recently adopted a replacement policy that considers more comprehensive criteria when assessing specific vehicles to be replaced each year. The forecast amounts for 2019 include the purchase of pickup trucks with service bodies, including a 2 tonne mechanical operator's vehicle (the current 1 tonne vehicles did not have sufficient chassis to do the work safely), and forecast 2020 acquisitions focused on vehicles based in Dawson and Mayo due to the higher cost of local repair services. 2021 costs are to replace aging/ high mileage vehicles that are incurring greater O&M costs to maintain."

QUESTION:

a) For each of the last five years (actual) and 2021 (forecast), please provide the number of vehicles replaced and the average age and average mileage of those vehicles.

b) Please provide YEC's estimate of the average annual maintenance cost of vehicles in its fleet based on the number of years the vehicle has been in service, beginning at one year and ending with the age of the oldest vehicle replaced in the last five years.

ANSWER:

(a)

Please see the table below for the requested information:

YEC Vehicle Replacement 2017-2021				
Year	# of Vehicles replaced (additional vehicle(s) added to fleet)	Average Mileage of vehicles replaced	Average Age of vehicle being replaced (Years)	Notes
2017	2 (2)	216683	10	Added 2 additional vehicles to inventory - Digger Truck & Pool vehicle. Blown Transmission in PLT truck reduced Average age of vehicle being replaced
2018	1 (1)	197465	11	Added 1 additional vehicle to inventory - PLT's vehicle
2019	3	182003	13.6667	Ambulance (unit # 54) was replaced driving up average age
2020	4 (1)	211172	9.25	Added 1 additional vehicle to inventory - Electrician's vehicle
2021	6	196126	11.2	Unit # 113 being replaced due to rollover/writeoff accident, not factored in averages. Please note Average mileage will increase before replacemnent vehicles are obtained

(b)

The question is unclear; the table below shows annual maintenance cost by vehicle category: >= 1 ton and < 1 ton as well as the number of units in the fleet during that year. The cost per unit for >1T shows more variability, in part due to the nature of the equipment. This category includes large utility equipment such as bucket trucks, crane trucks and diggers. By their nature, the maintenance requirements of the attached equipment, i.e., cranes can be variable with respect to timing and amount. Cranes are required by law to be inspected by certified inspectors and the recommendations of the inspector must be complied with or the unit will be tagged out from service.

	2016		2017		2018		2019		2020	
	Maintenance Cost	# units	Maintenance Cost	# units	Maintenance Cost	# units	Maintenance Cost	# units	Maintenance Cost	# units
Service Vehicles > 1T	$83,855	25	$146,892	26	$146,428	26	$222,068	27	$146,340	27
Service Vehicles < 1T	$58,860	26	$65,535	27	$57,722	27	$59,125	27	$75,603	28

1

REFERENCE: **Application, Appendix 5.2, page 5.2-10**

ISSUE: **Water Improvement Upgrades**

QUOTE: "The cooling water and potable water systems in the YEC main corporate office have experienced pre-mature piping failure and select cooling coil leaks for at least the past 10 years. An external engineering firm was engaged to assess the current systems and provide recommendations to address the issues. The project will implement those recommendations including the installation of a particulate filter, a VFD drive for the existing pump, a heat exchanger, new cooling water piping and valves, and fan coil drip pans with leak detection."

QUESTION:

a) What was the cause of the problems experienced with the office water systems? Please describe how the proposed work will prevent similar problems in the future.

ANSWER:

(a)

An assessment was undertaken by Stantec in 2019 to assess the identified failures related to the cooling water and potable water systems in the YEC main corporate office. This identified two potential reasons for the failures: (1) the first was that the well water is possibly slightly corrosive towards the piping (not likely to form scale in the piping); and (2) the second is that excessive flow velocities are present in sections of the piping.

Work completed to address these concerns included the following:

- New pex piping;
- New filtration system from well water to building;
- Installation of lead/standby pumps with integral variable speed drives and sensors self-modulating to meet pressure set points;

- Installation of chemical pot feeder;

- Revising control valves to 3rd floor fan coils; and

- Supplying of VFD and Pressure sensor for domestic water.

REFERENCE: **Application, Table 5.2-1, page 5-33**

ISSUE: **Other Projects Under $100K**

QUESTION:

a) Please provide more details on the "Other projects under $100K" line item in Table 5.2.1. What were these projects associated with? Why were they required?

ANSWER:

(a)

Projects under $100k include various small projects under the generation, transmission, distribution and general plant and equipment functions. Detailed business cases are typically not provided for these projects in the GRA application given small cost magnitude within the forecast capital costs for the test year, i.e., collectively all such small projects in Table 5.2-1 account for $915k in 2021 forecast capital works (with 71% under "General Plant & Equipment").

The following is noted regarding the nature of the projects:

- **Generation –** Includes small projects that relate to maintenance of generation facilities such as insulation, water level sensor upgrades, stairways, etc.

- **Transmission –** Includes small projects that relate to maintenance of transmission facilities such as substation protection and control minor upgrades.

- **Distribution –** Includes small projects that relate to maintenance of distribution facilities including distribution upgrades and land management and easement project.

- **General Plant and Equipment –** The majority of projects under general plant have annual blanket costs such as operations tools and equipment, fencing upgrades, IT equipment and replacements, etc.

REFERENCE: **Application, Appendix 5.2, page 5.2-11**

ISSUE: **FD7 Overhaul Project**

QUOTE: "Faro Diesel #7 (FD7) is located at the Faro Diesel Plant and uses as 12 cylinder Caterpillar Model 3612 diesel engine as its prime mover (vintage 1992). The unit was used when purchased by YEC from a mining operation; however, the complete service history for the unit is not known (YEC has registered 28,624 operating hours). A conditional assessment for the engine was undertaken in 2016 by MPR Associates and a follow-up inspection was undertaken by Finning in May 2016. The inspection focused on items identified in the MPR report and included a more fulsome mechanical inspection that included: removal, measurement and inspection of piston/ rings; inspection of camshaft segments and filter assemblies; measurement of heads and valves and connect rod bearings. One cylinder lining was found cracked and replaced during the inspection. Due to the significant wear found on the inspected parts, it was recommended that a complete overhaul of the unit be undertaken."

QUESTION:

a) Please indicate the number of hours FD7 was in operation for the last 10 years.

b) If the overhaul is completed as proposed, does YEC expect the annual operating hours for the unit to increase, decrease or stay the same? Please explain.

c) What is the estimated purchase and installation price to completely replace FD7?

d) Were any alternatives to this project considered? If not, please explain why not. If so, please provide details of the results of this consideration.

e) Please provide a breakdown of the work proposed to be done on FD7 and the estimated cost of each component.

ANSWER:

(a)

Please see Table 1 below which provides FD7 running hours for the past 10 years. This also provides for 2014 to 2020 the hours available for operation.

Table 1: FD7 Running Hours and Hours Available for Operation

Year	Running Hours	Available for Operation
2011	573.40	
2012	263.60	
2013	599.20	
2014	204.60	8,705.94
2015	208.90	8,589.79
2016	114.50	8,433.76
2017	202.40	8,390.61
2018	173.40	8,176.99
2019	496.50	8,671.70
2020	427.30	8,721.54
2021 to date	66.73	
Total	**3,330.53**	**59,690.33**

(b)

With the overhaul complete the annual operating hours for the unit are expected to stay the same.

YEC's dispatch utilizes renewable energy first on the generation dispatch. YEC Faro generation is lower than LNG, rentals, Whitehorse and Dawson thermal assets in the stacking order. FD7 provides community backup during unplanned events as well as planned maintenance work.

(c)

Replacement cost for FD7 is estimated at $4-5 million.

(d)

The option for a replacement unit has been considered and will be reviewed through a business case assessment. Discoveries during OH's are a project risk and do increase the cost to repair. The condition of the block may necessitate a replacement of the component (block) resulting in a substantial increase in cost. These costs can equal or exceed the replacement cost.

(e)

As indicated in response to YUB-YEC-1-65, pricing for this overhaul was significantly higher than expected when the GRA forecast was prepared. Therefore, a business case is being performed in 2021 to determine if replacement is more cost effective than refurbishment. Any spending for 2021 business case will now be held in WIP and reflected in GRA compliance filing.

The original work proposed to be done on FD7 in the GRA included disassembly of engine; cleaning and inspection of all parts and components and reassembly of engine, including:

- Installation of all must-do parts[1] (includes main, rod, & cam bearings);
- Exchange components including:
    - Cylinder Heads;
    - Turbocharger Complete;
    - Cylinder Liners;
    - Pistons (Including Rings, Retainers, Pins, Bearing shafts);
    - Fuel Injectors;
    - water, oil and fuel lines;
    - valve train;
    - air lines;
    - instrument panel and wiring (where applicable);
    - front & rear gear train; and
    - aftercooler and exhaust.

The OH quote is high level and does not provide individual component costs.

[1] "Must-Do Parts" are seals, gaskets, bearings, plugs, pins, springs and other minor parts necessary in a standard complete in-frame overhaul.

REFERENCE: **Application, Appendix 5.1, page 5.1-1 and Appendix 5.3, page 5.3-1**

ISSUE: **Projects Not Impacting Rate Base and Deferred Projects**

QUOTE: "Appendix 5.1 provides project summaries for capital projects with spending over the period from 2019 to 2021 exceeding $1 million that remain in WIP at the end of 2021 (and therefore do not affect the 2021 GRA revenue requirement)."

"Deferred expenditure test year spending on major projects (i.e., expenditures over $1 million) retained in WIP is focused on projects required to address sustaining capital requirements (i.e., required to replace, repair or enhance/ improve components of the existing system to ensure continued reliability, safety and environmental or regulatory compliance), investments to ensure sufficient dependable capacity for the integrated grid, and continued planning expenditures to meet other potential future generation and transmission requirements."

QUESTION:

a) Please explain why there are two different appendixes (5.1 and 5.3) for projects held in WIP and what the purpose of each of those appendixes is.

b) Please confirm that no costs for projects listed in Appendix 5.1 and Appendix 5.3 have been added to YEC's rate base or revenue requirement for 2021. If not confirmed, please explain and provide a breakdown of all costs for these projects that YEC is proposing to add to rate base.

c) Please explain the rational for YEC's "Not Impacting Rate Base" and "Deferred Projects" categories. At some point, will YEC put the costs of projects currently listed as "Not Impacting Rate Base" into the rate base?

d) Please provide YEC's capitalization policy.

ANSWER:

(a) through **(c)**

Appendices 5.1 and 5.3 review Major Projects (i.e., projects with forecast costs exceeding $1 million) for PPE (Appendix 5.1) and deferred costs (Appendix 5.3) that are forecast to remain in WIP during the 2021 test year. The purpose of these appendices is to clearly identify major projects with costs that will not affect forecast test year rate base and therefore do not require detailed review at this time for the purpose of the 2021 GRA Application. Accordingly, it is confirmed that no costs for projects listed in these appendices have been added to rate base or revenue requirement for 2021.

The rationale generally for the “Not Impacting Rate Base” category is to identify clearly project costs that are not added to rate base or revenue requirement for 2021. It is expected that the costs for projects in WIP will at some point after 2021 (e.g., when brought into service or closed) be brought into rate base.

To clarify further, information on individual projects with costs that remain in WIP is provided in separate appendices for each category (Appendix 5.1 for Major Projects that are capital works, Appendix 5.3 for Major Projects that are deferred studies, and Appendix 5.5 for deferred studies with costs between $100,000 and $1 million).

(d)

Please see Attachment 1 to this response. The policy is unchanged from the version reviewed during the 2017/18 proceeding.

YUKON ENERGY	Finance Accounting Practice FX-Appendix	DEPARTMENT:	INQUIRIES TO:	TOPIC:
		All	Finance	Property, Plant and Equipment Definitions
		ISSUED:	REVIEW DATE:	APPROVED BY:
		January 1, 2021	January 1, 2024	Chief Financial Officer

1.0 Purpose

To provide detailed definitions for various Property, Plant and Equipment (PP&E) terminologies.

2.0 Definitions

1. ***Property, plant and equipment*** are identifiable tangible assets that meet all of the following criteria:

a) are held for use in the production or supply of electrical services, for administrative purposes, or for the development, construction, maintenance or repair of other property, plant and equipment;
b) have been acquired, constructed or developed with the intention of being used on a continuing basis for longer than one year;
c) are not intended for sale in the ordinary course of business (i.e. goods purchased for resale),
d) have a cost greater than $1,000.

2. ***Acquisition Costs***

a) The cost of an item of property, plant and equipment includes the purchase price and other acquisition costs such as options costs when an option is exercised, brokers' commissions, installation costs, site preparation costs, freight, brokerage and duty charges, transportation insurance costs, , acceptance and commissioning costs.

b) The cost of an item of property, plant and equipment that is acquired, constructed, or developed over time includes carrying costs directly attributable to the acquisition, construction, or development activity such as interest costs. For a rate-regulated asset, the cost includes the directly attributable AFUDC allowed by the Yukon Utilities Board (YUB) (see 10.)

3. ***Units of Property*** represent the main units of equipment or property contained within each PP&E category. A unit of property is defined as that which is independently operational, readily separable and useful in its own right. Examples include dam, turbine, wood pole structures, conductors, transformers, regulators, circuit breakers, diesel engines and hydro generators.
(refer to GP Users Manual for Property, Plant and Equipment for additional information)

4. ***Components of Units*** represent the associated parts or items making up units of property. Components must be in service to be considered for capitalization. Examples include transformer bushings, voltage regulator bushings, fuel pumps, cross arms, guys or insulators.

5. ***Betterment*** is an upgrade and/or enhancement that extends the life of a capital asset or increases its functionality or service potential without replacement of a complete unit. Betterment relates to such additions to the asset that increase its useful life, results in reliability and/or quality improvements, increase in previously assessed physical output or service capacity, reduces operating costs by a substantial and quantifiable amount over a period of at least three years or reduces financial liability, environmental or safety risks. Overhaul and maintenance of machinery and equipment are not betterment expenditures.

6. ***Maintenance costs*** incurred to maintain the service potential of an item of property, plant or equipment are repairs and must be expensed.

   Note: If a cost has the attributes of both a repair and betterment, the portion considered a betterment should be capitalized.

7. ***Overhauls*** are routinely conducted on diesel, wind and hydro production units. Major overhauls extend the useful life of the unit and minor overhauls maintain the efficient and effective operations of the unit. Costs associated with major overhauls are capitalized and depreciated, while costs associated with minor overhauls are expensed in the period in which they are incurred. (refer to FX-002 Overhauls for additional information)

8. ***Allowance for Funds Used During Construction (AFUDC)*** is imputed interest that is applied to capital projects during construction. It is intended to cover the cost of financing a capital project during the period of construction. AFUDC ceases when an item of property, plant and equipment is substantially complete and ready for productive use. Determining when an asset, or a portion thereof, is substantially complete and ready for productive use requires consideration of the circumstances and operating functions.
   (refer to FX-004 AFUDC for additional information)

9. ***Asset retirements*** – when assets reach the end of their useful life they are retired from service.

10. ***Salvage*** - is any recovery associated with the retirement of an asset from service including any proceeds received from the sale of the retired asset.

11. ***Net Salvage*** – is proceeds received from salvage less any costs incurred to remove or dismantle assets retired from service.

12. ***Disposals*** – assets are said to be disposed of when they are sold, destroyed, lost, abandoned, or expropriated. Disposals require the approval of the Chief Financial Officer.

REFERENCE: **Application, Appendix 5.3, page 5.3-2**

ISSUE: **Aishihik Generating Station (AGS) Long-Term Water Use Licence Renewal Project**

QUOTE: "The planned long term AGS Water Use Licence renewal project and related costs were initially reviewed as part of the 2017/18 GRA. At that time, it was noted that the total forecast budget for the project was $3.569 million spread over five years (2015-2019) … The deferred costs forecast in the Application include spending in WIP increasing from $4.957 million at the end of 2018 to $7.918 million by the end of 2021. The project is forecast to be complete by the end of 2022."

QUESTION:

a) Please break down the $7.918 million cost for this project into the various components of the project and provide a description of why each component is necessary for the project to proceed.

b) Please explain why the total cost of this project has increased from $3.569 million in the 2017-18 GRA to $7.918 million in the current application.

c) Please provide a description of each new cost item and each cost item that has increased since the previous GRA, along with a description of why the new cost item or the increased cost is necessary.

d) Please include an explanation of why YEC's initial cost estimate was less than half of the current estimate and the measures YEC has implemented or plans to implement to improve its ability to forecast the costs of projects like this.

e) Please describe the actions YEC has taken throughout the duration of this project and the actions YEC plans to implement moving forward to control and minimize the costs of this project.

ANSWER:

(a)

The $7.918 million cost noted in Appendix 5.3 of the Application provided forecast project costs to the end of 2021, including 2020 forecasts. These costs now need to be updated to reflect revised forecast costs for 2020, 2021 and 2022.

As set out in Table 1 below – costs forecast to the end of 2021 are now expected to be $0.871 million higher than forecast in the Application. See Table 2 (response to (b) and (c) below) for updated forecast costs to the end of 2022.

Table 1: Project Costs - 2018 WIP to 2021 WIP

	2018 WIP Actual Cost	2019 Actual Cost	2020 Actual Cost	Forecast 2021	Total
Project Management	$276,268	$1,247	$152,946	$200,000	$630,461
CAFN Compensation & Stakeholder Engagement	$705,319	$2,373	$1,012,811	$350,000	$2,070,503
Impact Assessment Studies	$3,748,543	$94,741	$406,438	$ -	$4,249,722
Early Monitoring	$ -	$226,900	$258,049	$65,000	$549,949
Permitting processes	$40,218	$182,847	$303,625	$325,000	$851,690
Aishihik Advisory Committee	$186,851	$4,648	$4,935	$ -	$196,434
Future AFUDC*	$ -	$ -	$ -	$240,000	$240,000
Project Total:	**$4,957,199**	**$512,755**	**$2,138,804**	**$1,180,000**	**$8,788,758**

*Note: Previous AFUDC accruals for actuals 2018WIP, 2019 and 2020 are embedded within each category total

Set out below are descriptions of the various cost components (and why they are necessary for the project is as follows):

- Project management costs are primarily YEC internal costs related to work on planning and executing the project. These costs are required to move the project forward and coordinate the various working groups and deliverables.

- CAFN Compensation and stakeholder engagement costs are related to the following:

    1. Engagement with the CAFN, including funding the Champagne and Aishihik Community Advisory Committee (CACAC);
    2. Compensation to the CAFN to be approved by the Yukon Water Board;
    3. Negotiation costs to reach a reconciliation agreement with the CAFN;
    4. Capacity funding to CAFN to support participation in the project technical review and development of the Monitoring and Adaptive Management Plan and
    5. Public engagement activities.

  YEC deemed it prudent to engage the CAFN at the beginning of the current water use license renewal process, given that the facility is located within the CAFN's traditional territory. The objective of engagement was to increase participation by the CAFN in the water use relicensing regulatory process, increasing collaboration between YEC and CAFN and reducing the risk of conflict and/or adversarial legal action during the formal regulatory proceedings.

- Impact assessment studies costs are related to the planning and execution of the environmental and social impact assessment studies in preparation for the YESAB and Yukon Water Board applications. These costs are required to be able to prepare the Project Proposal for the YESAB Designated Office and develop a Monitoring & Adaptive Management Plan for the Yukon Water Board application.

- Early monitoring costs are related to early monitoring carried out to address issues relevant to CAFN, YESAB and regulators (including requirements from 3-year license to support 25-year renewal).

- Permitting process costs are required to complete the regulatory activities which are mandatory to achieve the primary objective of the project (obtaining a 25-year water use license for the facility). They include: 1) the project proposal to the Yukon Environmental and Socio-economic Assessment Board (YESAB); 2) regulatory application to the Department of Fisheries and Oceans (DFO); and 3) regulatory application to the Yukon Water Board (YWB).

- Aishihik Advisory Committee (AAC) costs related to funding the activities of the AAC from 2015 to 2018. The AAC's role was to provide ongoing advice and feedback as Yukon Energy and CAFN developed the necessary regulatory applications. In addition, the AAC worked to reconcile potential opposing interests and values of the YEC, CAFN, external stakeholders, and public related to the use of Aishihik Lake.

(b), **(c)**, **(d)** and **(e)**

As noted, the $7.918 million cost provided in Appendix 5.3 of the Application relates to forecast costs only to the end of 2021. Appendix 5.3 noted that the project is now forecast to be complete by end of 2022.

Table 2 below compares:

(a) the forecast cost breakdown provided during the 2017/18 GRA[1] to complete the 25-year licence renewal; and
(b) the updated forecast costs to complete this project by the end of 2022.

The updated forecast costs of $9,388,758 to complete the project include 2020 and 2021 costs that are $0.871 million higher than the forecast reviewed in Appendix 5.3 of the 2021 GRA (see Table 1 above) plus $600,000 forecast costs for 2022 (the 2021 GRA did not provide any forecast for this project's costs after 2021).

[1] The response to YUB-YEC-1-77(a) in the 2017-18 GRA proceeding provided a cost breakdown for $3.149 million, excluding compensation costs to CAFN. Table 2 includes the added $0.42 million (as required for the $3.569 million 2017-18 GRA forecast) under CAFN Compensation and Stakeholder Engagement.

Table 2: 2017/18 GRA Forecast compared to Updated Forecast to end of 2022 – Aishihik Relicensing Project Costs

	Forecast cost to end of 2022	2017/18 GRA Forecast Cost Sept, 2015 budget	Variance	Cost Drivers
Project Management	$730,460	$553,000	$177,460	Additional project management required to provide project management services over extended project timeline and coordinate/attend increased number of technical subgroups.
CAFN Compensation & Stakeholder Engagement	$2,145,503	$804,000	$1,761,083	$500,000 Chemi Narrows compensation payment (requirement from 2002 relicensing process, adjusted to this compensation in the Three Year Licence) was not included in initial budget. Significant additional engagement and collaboration requirements beyond those anticipated in the initial budget, including increased capacity funding for CAFN.
Impact Assessment Studies	$4,249,722	$1,759,000	$2,490,722	Additional studies and technical work beyond that anticipated in the initial budget. drove higher costs, particularly during shared study planning process with CAFN plus added costs due to extended time for studies.
Early Monitoring	$564,949	$-	$564,949	Engagement with CAFN and YG revealed requirement for early monitoring programs (as well as requirements from 3-year license to support 25-year renewal) not anticipated in the initial budget. Some items raised for consideration or requested by external parties to be part of the MAMP were required to be piloted to ensure commitments over long term are effective and achievable. In order to address assessment and permitting risk, elements initiated to evaluate impact for

				the long-term license requirements.
Permitting processes	$1,001,690	$300,000	$701,690	Collaborative approach with external parties as directed in Three Year Licence drove an increase in the MAMP scope. Specific information on the MAMP is required for the Water Board; accordingly, scope increases drove additional supporting technical work to complete the processes.
Aishihik Advisory Committee	$196,434	$153,000	$43,434	Increased scope of committee activities per input from committee members; Additional accrual of AFUDC due to project extended timeline.
2021 & 2022 AFUDC	$500,000	$-	$500,000	Additional accrual of AFUDC due to project extended timeline and increased budget.
Project Total:	**$9,388,758**	**$3,569,000**	**$6,239,338**	

Explanation as to why the total cost has increased as described in Table 2, and why the initial cost estimate provided in the 2017-18 GRA was less than half the current estimate, requires review of the context for the 2017-18 GRA forecast including Champagne and Aishihik First Nations' (CAFN) historic grievances relating to the facility and other key factors affecting the relicensing of the Aishihik Generating Station.

Background re: 2017-18 Cost Forecast

The 2017-18 GRA filing addressed a project that was to remain in WIP for the test years and therefore did not affect the revenue requirement during the test years. When the GRA was filed in June 2017, the relicensing process was still at an early stage of development. The forecast cost provided in the GRA reflected a preliminary budget approved by the YEC Board in September 2015.

However, the 2017-18 GRA filing noted that the last Aishihik licence renewal (2002) cost approximated $8.791 million. That cost reflected protracted processes related to stakeholder engagement, first nation compensation, environmental assessment, and the Yukon Water Board. These processes underscored major issues CAFN had with the Aishihik facility dating back well before Yukon Energy acquired these assets from Canada in 1987.

The initial 2015 budget assumed that these issues would not once again cause similar protracted time and cost problems if a shared work plan approach for the relicensing assessment studies was adopted between Yukon Energy and CAFN (and other stakeholders).

In that regard, the 2017-18 GRA filing recognized that the Aishihik hydro facility has had long term impacts on CAFN, that Yukon Energy and CAFN were working in partnership on proposed terms and conditions for the new Aishihik water license, and that in January of 2016 Yukon Energy and CAFN entered into a Protocol Agreement which established shared objectives, procedures and governance of the new relationship.

During the 2017/2018 GRA Application process, when YEC forecast the project to be completed by the end of 2019 (when the then existing water use licence expired), YEC identified in YUB-YEC-1-77 that the forecast costs could not be accurately estimated at the time given the material uncertainties relating to the First Nation and regulatory issues surrounding this project. This was clearly articulated as follows:

> "Largely due to the known increased quantum and scope of the impact assessment studies required for the project proposal to YESAB, as well as the funding of the CACAC and CAFN traditional knowledge project, the project is expected to exceed the initial budget of $3.569 million. Due to unknown costs related to potential increase in the scope of regulatory proceedings, and compensation to the CAFN, the final project cost cannot be accurately estimated at this time. YEC will continue to monitor the development of costs related to unknowns and adjust the budget accordingly."

Experience during 2017 through 2018 confirmed that the uncertainties and issues surrounding this project since its inception remained. It became evident during this time that considerably more time and costs would be required than forecast in the initial budget. This experience revealed amongst other things the challenges that CAFN and YEC faced in trying to carry out the shared work plan.

As reviewed below - because of these difficulties and other related matters --, Yukon Energy had to suspend its 25 year relicensing project in early 2019 in order to secure a three year licence renewal while reconciliation discussions between the Yukon government and CAFN relating to amongst other things CAFN's historical grievances were ongoing.

Overview of Key Factors for Cost & Schedule Change

In summary, the two key factors accounting for the added time and cost requirements for this project are:

- The long-standing concerns of Champagne and Aishihik First Nations (CAFN) with regard to this facility's origins and ongoing impacts; and

- The Yukon Government's decision by early 2019 to engage in negotiation of an agreement with CAFN to address issues of concern including reconciliation.

Overlaying the above key factors is the critical importance of the AGS facility (and its successful relicensing) for the Yukon Integrated System and the strong interest that Yukon Energy has in establishing an improved long-term relationship with CAFN. See Appendix A to this response for summary of the key features of the Aishihik facility.

CAFN's Longstanding Concerns

Yukon Energy was aware of CAFN's long standing and ongoing concerns related to the AGS. These concerns were front and center in the 2002 renewal process and they have not abated.

To try to deal with these issues -- at the start of the current AGS relicensing in 2016 -- Yukon Energy and CAFN worked together to develop a shared work plan for the AGS long term licence renewal through implementation of a Protocol Agreement.

- Through the Protocol Agreement the parties agreed to work together, on a without prejudice basis, to pursue common objectives for the AGS Water Licence renewal.

- The Protocol Agreement (2016) did not expand CAFN's rights under the Final Agreement, but it confirmed that CAFN retained the right to participate freely in the regulatory review and Government consultation processes (i.e., under *YESAA* and the *Waters Act*) and to oppose any or all parts of what may be proposed.

- The shared work planning process provided a framework for extensive engagement with CAFN and other relevant stakeholders that commenced in 2016 and extended throughout the Project planning phase until the fall of 2018. This

included Yukon Energy and CAFN working jointly to direct the consulting team regarding the Project work plan and schedule, including the scope of the baseline studies, a structured decision making process to jointly attempt to determine a preferred operating regime, and the opportunity to review and comment on initial Project Proposal draft documentation.

- The shared work planning process under the Protocol Agreement ended in October 2018 as the parties were unable to obtain consensus regarding the operating range for Aishihik Lake. Due to the impending licence renewal deadline Yukon Energy proceeded with preparing and filing a YESAA Project Proposal that reflected key elements of Water Use Licence HY99-011. CAFN indicated that it was not in agreement with Yukon Energy's decision to move ahead with its preferred operating alternative.

The above experience between 2016 and the end of 2018 resulted in a greatly expanded and prolonged impact assessment study and CAFN engagement processes that delayed initiation of required YESAA evaluation and subsequent permitting activities. YEC attempted to move ahead by the start of 2019 with its 25-year YESAA Project Proposal – but - as outlined below - work on this project had to be deferred to address a three-year short-term relicensing project.

Yukon Government Reconciliation Discussions – Three Year Licence

Yukon Energy brought forward the AGS Relicensing Project Proposal in February 2019 for a three-year renewal term. This was done to allow the YG and YEC to engage with CAFN on reconciliation related issues including historic grievances CAFN had with the Aishihik facility and to avoid a lapse in Yukon Energy's water use licence for the AGS and termination of Yukon's encumbering rights related to this project under the CAFN Final Agreement.[2]

The three year licence approved by the Yukon Water Board in early 2020 outlined a number of additional regulatory requirements for the 2020-2022 period that have driven added costs for completion of the long-term relicensing project. The regulatory requirements included: additional collaborative monitoring and studies during the three

[2] Due to delays in filing the YESAA Project Proposal to accommodate Yukon Government discussions with Champagne and Aishihik First Nations (CAFN), Yukon Energy had to address material risks that the regulatory review timelines could extend beyond 2019.

year licence; development of a collaborative downstream monitoring and adaptive management plan; and reporting on collaboration with CAFN and other parties in relation to the required monitoring and adaptive management specified in the licence.

After the three year licence renewal was secured in early 2020, Yukon Energy engaged in a further collaborative process with CAFN and YG to develop a Monitoring and Adaptive Management Plan (MAMP) for the long-term licence renewal. Concurrently, CAFN, YG and Yukon Energy continue to work on concluding a reconciliation agreement to address long-standing issues of mutual interest. These activities were also not anticipated in the initial September 2015 project budget, and result in further material schedule extensions and cost increases.

At the time of filing this IR response, negotiations for the reconciliation agreement have substantively progressed, but have yet to be concluded.

In summary, the use of a collaborative process with CAFN from 2016 to 2018, prior to the 2019 filing and over 2020 and 2021 has led to very material increases in effort and related costs to date and a significantly longer process than originally envisioned.

The only way to reduce costs would have been to reduce the level of collaboration with CAFN regarding the relicensing process and avoid the 3-year renewal requirement by completing the 25-year relicensing proposal in accordance with the initial schedule. However, in the context of the Water Use Licence and a Yukon government led agreement process with CAFN related to this project and other outstanding issues, this was not feasible – and any such option would not have had any assurance that the end result would have secured the required licence.

YEC plans to conduct a comprehensive ‘lessons learned’ analysis prior to the initiation of similar future relicensing projects in order to increase the estimation of project costs by increasing the accuracy of estimated technical effort and engagement requirements.

Appendix A: Importance of AGS for the Yukon Integrated System

The Aishihik Generating Station (AGS) is a critical asset for the Yukon Integrated System (YIS); and ensuring that the regulatory instruments required for its ongoing operation are sustained is an essential requirement and responsibility for Yukon Energy.

- The AGS provides the only material annual storage in the Yukon and load following power, after non-dispatchable generation resources (e.g., any existing wind or run-of-river hydro generation facilities) have been utilized.

- Under long-term average water conditions, the AGS supplies approximately 25% of the total annual YIS generation – and about 40% of annual YIS winter generation concentrated in the months from November through May when peak YIS loads occur and run-of-river hydro supplies are constrained.

- The AGS also provides 37 MW of dependable capacity[3] to the YIS, which is more than one quarter of Yukon Energy's maximum generation capacity.

- Cessation or reduction of AGS operation would require that the current generation capability of AGS be replaced with some other source of energy that could be relied upon during the winter months. No such renewable alternative is in place today.

- Prior to planning, permitting and development of any new alternative generation capability, including renewable supply options, YEC would need to rely on existing thermal generation to replace the energy supplied currently by the AGS. Reliance on thermal generation to replace AGS hydro generation would have ongoing and very significant added generation operation costs (for fuel and non-fuel O&M) as well as added GHG emissions.[4]

[3] Dependable capacity, expressed in MW, is the maximum generation output that a resource can reliably provide in a specific timeframe, typically during the period of greatest demand. YEC defines dependable capacity as the maximum output that a resource can reliably provide over two consecutive weeks during the four winter months (November to February) based on the inflows in the five driest inflow years in history.

[4] Implications are discussed at a high level in Appendix 6C of YEC's 2020 YESAB Project Proposal, which provides estimates of added capital and O&M costs as well as added GHG emissions associated with an alternative (Alternative 7) that removes AGS storage capability as proposed by CAFN and limits operating to the pre AGS Aishihik Lake LSL and FSL levels, i.e., the high added capital costs (+$100 million), O&M costs (~$12 million per year long-term average for thermal generation) and GHG emissions (+32 kt/year CO2e long-term average) for this alternative compared with the existing licence under 2021 grid loads and grid configuration which still retains run-of-river hydro generation benefits from the AGS.

- Yukon Energy assessments also indicate that the 37 MW of AGS dependable capacity would also likely need to be replaced with new thermal generation capacity in order to maintain dependable winter supply capability, which would require time for planning and permitting and a capital cost for new thermal generation capacity in excess of $100 million (a significantly higher capital cost would be required for similar new dependable renewable capacity even if such an alternative was available in the near to medium term).

In light of the above considerations, renewal of the AGS water use licence under terms substantially similar to the 2002 water use licence has been (and continues to be) considered the only reasonable option for Yukon Energy to pursue at this time.

REFERENCE: **Application, Appendix 5.3, page 5.3-3**

ISSUE: **Whitehorse Generating Station Water Use Licence Renewal Project**

QUOTE: "The existing water use licence for the Whitehorse Rapids Generating Station (WRGS) expires at end of 2025 and must be renewed in order to ensure ongoing, lawful operation of the WRGS hydro facilities. This is a multi-year project to renew the existing long-term project authorizations for the WRGS Hydro Plants and associated infrastructure. Project activities include conducting required baseline studies (e.g. environmental, socio-economic, engineering), and undertaking environmental and socio-economic effects assessment, First Nation engagement and consultation, other stakeholder engagement as required to submit a YESAA project proposal to the Whitehorse Designated Office. Project activities will also include completing the YESAA review process, the water use renewal process with the Yukon Water Board, and Fisheries Act Authorization (DFO) regulatory process."

QUESTION:

a) Is the $260,000 cost for 2021 the full expected cost of this project? If not, please provide the full expected cost of this project along with a breakdown of that cost into individual cost components. Please also include a description of why each cost component is a necessary part of the project.

b) What measures is YEC undertaking to ensure that the cost of this project does not increase by a similar magnitude as the costs for the Aishihik licence renewal?

c) What efforts have been made to streamline planning work for the Southern Lakes Enhanced Storage to avoid duplication with this water licence renewal project?

ANSWER:

(a)

No. The estimated cost of the full project is approximately $5,000,000. A detailed workplan and budget will be developed as part of the project initiation work in 2021.

(b)

YEC plans to conduct a “lessons learned’ exercise regarding the Aishihik licence renewal to identify areas for improvement and lessons to apply to the Whitehorse generating station renewal.

(c)

The scope of the assessment and permitting for the Southern Lakes Enhanced Storage Project will include an examination primarily of the storage component of the Whitehorse Rapids Generating Station operations. The subsequent water use licence renewal for the whole facility and operations, including an extension to the term of the project authorizations, will have a broader scope. It is expected that most of the issues that will be examined during the assessment and permitting for the Enhanced Storage Project will be able to stand as evidence for the assessment and permitting for the long-term licence renewal and will effectively limit the scope of the water use licence renewal project to primarily those things that were not otherwise assessed during the Enhanced Storage Project just a few years earlier. Accordingly, it is anticipated that redundancy will be minimized and the scope of the water relicensing project will be reduced via the work done on the Enhanced Storage Project.

REFERENCE: **Application, Appendix 5.3, page 5.3-3 to 5.3-4**

ISSUE: **Diesel Retirement Replacement Project**

QUOTE: "The 2016 Resource Plan identified a dependable capacity shortfall for the Yukon Integrated System under its single contingency (N-1) capacity reliability criterion that approximates 6 MW in 2017, increasing to 10-11 MW by 2019. YEC is required to provide sufficient dependable winter capacity to meet the single contingency capacity reliability criterion, i.e., there is no acceptable "do nothing" option given the need to maintain reliable service and to address an ongoing and growing dependable capacity shortfall.

The 2016 Resource Plan identified a new 20 MW greenfield diesel plant as one of the preferred options for addressing the dependable capacity shortfall gap in a cost effective manner in the near term. The YUB reviewed planning for the project during the 2017/18 GRA, and noted it was not persuaded that the project was the only way to address the predicted capacity shortfall, and that YEC should not proceed with the project without a detailed business case that considers the alternatives to the project.

Following the Board's direction in Order 2018-10, YEC proceeded with the additional work as required to evaluate project alternatives. This included identifying and evaluating a number of options for a new 20 MW thermal plant. In October 2019, it was determined that considering the results of the technical, environmental and socio- economic research, as well as public feedback, YEC would focus potential options to add or replace capacity at existing generation facilities on an incremental basis as diesel engines are retired.

This includes consideration of the following near term activities:

- Installation of 5 MW of thermal capacity at the Whitehorse Diesel Plant (P126);

- Replacement of 5.1 MW of diesel to be retired at the Faro Diesel Plant with a 5 MW diesel unit;

- Retirement of the existing 2.5 MW of diesel capacity in Dawson City with installation of 2.5 MW of diesel capacity at the Callison Substation.

Efforts in 2020 have focused on preliminary engineering and finalizing a procurement strategy, defining vendor contracts and milestones, and updating the overall project schedule.

The deferred costs forecast in the Application assume that the project continues, with spending in WIP increasing from $0.041 million at the end of 2018 to $6.395 million by the end of 2021. Dependable capacity from these projects is expected to be available by winter 2023/24. In the interim, YEC will continue to rent diesel generators each winter to ensure an adequate supply of back-up power in case of an emergency."

QUESTION:

a) Is the $6.395 million estimate for the end of 2021 the full estimated cost of this project? If not, please provide the full estimated cost.

b) Please provide a breakdown of the $6.395 million into the various components of this project, including a description of why each component is required.

c) Please provide the results of the analysis YEC carried out to compare the costs and benefits of the various alternatives considered in response to the Board's finding that it "requires a detailed evaluation of alternatives to this project included in the business case."

ANSWER:

(a)

The full cost of the project is estimated to be $45 million.

(b)

Subsequent to the submission of the Application the project cost for 2021 has been adjusted to $1,920,000 based on updated project planning. This change will be reflected in YEC's Compliance Filing.

A breakdown of all actual costs from 2018 WIP to 2020, and forecast 2021 costs, is shown in Table 1 below.

Table 1: Estimated Project Costs

	Actuals - 2018WIP	**Actuals - 2019**	**Actuals - 2020**	**2021 Forecast**
Feasibility Engineering	$6,775	$349,724	$238,654	$-
Preliminary Engineering & Procurement	$-	$-	$86,101	$1,100,000
Assessment & Permitting	$-	$20,541	$78,166	$220,000
Public & First Nations Engagement	$-	$98,764	$-	$50,000
Project Management	$33,897	$78,758	$50,914	$500,000
AFUDC	$334	$6,437	$21,947	$50,000
Total	**$41,006**	**$554,224**	**$475,783**	**$1,920,000**

(c)

The use of a 20 MW greenfield thermal plant as the reference point for comparison was originally based on the findings of the 2016 Resource Plan, which included a 20 MW greenfield diesel plant in the recommended portfolio to address the forecast N-1 dependable capacity shortfall on the Yukon Integrated System (YIS). The initial analysis did not assess options (including requirements) involving replacement and/or addition of diesel units at existing plant facilities on the YIS, and assumed a need to rely primarily on new thermal generation to address the N-1 dependable capacity shortfall.

Ongoing Yukon Energy review and consultation on 20 MW plant options, including potential addition of units at the Whitehorse diesel plant, indicated a wide range of concerns regarding development of a new large greenfield diesel plant – as well as higher costs and uncertainties if similar scaled development was to be focused at the existing Whitehorse diesel plant. The resultant reconsideration of the new thermal generation recommended in the 2016 Resource Plan led to increased reliance on short-term diesel rentals to address the near-term capacity shortfall and provide time to assess a wider range of options.

Ongoing review of YEC diesel facilities at Faro, Dawson and Mayo indicated site-specific requirements and opportunities that needed to be addressed when assessing optimum overall new diesel unit planning on the YIS to address forecast N-1 dependable capacity shortfalls. For example, assessments indicated a potential need to relocate diesel capacity required at Dawson and Mayo for reasons unrelated to the N-1 dependable capacity deficit, with resultant opportunities in each case (including planned retirement of two units at Dawson in 2023) to provide cost-effective new diesel capacity to the YIS. Recent studies also highlighted opportunities to provide new cost-effective incremental diesel capacity at the existing Faro diesel plant where a unit is planned to be retired in 2023. The Whitehorse diesel plant also provides ongoing opportunities to replace the three retired Mirrlees diesel units.

Updated resource plans also separately identified potential renewable generation options that could significantly reduce the need to rely primarily on new thermal generation to address the forecast N-1 dependable capacity shortfall.

Based on the above reviews, the 2016 Resource Plan has now been superseded by YEC's 10 Year Renewable Electricity Plan, which includes the development of 12.5 MW of replacement diesel capacity at three different existing plant sites (Faro, Dawson and Whitehorse) in the recommended portfolio of projects as well as planning for potential development of a major pumped storage dependable capacity option and a near-term Atlin Hydro Expansion dependable capacity project. Therefore, the development of a new 20 MW greenfield thermal plant is no longer a relevant option for current planning given the Corporation's current business plan as reflected in the 10 Year Renewable Electricity Plan, i.e., developing 20 MW of new thermal generation today would be inconsistent with consideration of the renewable pumped storage option combined with the Atlin Hydro Expansion project.

The 12.5 MW of diesel retirement replacement now being planned involves three separate diesel plant projects, each with its own cost prudence assessment based on plant site requirements and options. Economic assessment for each facility focuses on levelized cost of capacity (LCOC) for each option, given the need to provide dependable capacity that is not expected to have material long term average levels of thermal energy generation. Ongoing cost experience with rented diesels provides a benchmark to assess an option to development of new permanent diesel replacement capacity.

REFERENCE: **Application, Appendix 5.3, page 5.3-4**

ISSUE: **Southern Lakes Enhanced Storage Project (Marsh Lake Storage Project)**

QUOTE: "Forecast MLSEP project costs and actual expenditures were reviewed in detail in the 2012/13 and the 2017/18 GRAs. The 2012/13 GRA, identified the project as a relatively small project, with earliest in-service assumed in 2014 (first full year 2015) at a capital cost (2010$) of $10.5 million, with mitigation design (shoreline erosion and surface water) expected to comprise about one-half of this total cost (actual costs for mitigation were stated in the 2012/13 GRA as an item that at that time could not be known with any certainty). In the 2017/18 GRA, forecast total project costs increased to $15.377 million ($9.795 million forecast for effects assessment; $0.300 million forecast for YESAA assessment and permitting; and $7.127 million forecast for mitigation implementation).

"YEC completed an additional round of engagement in 2019 to confirm the level of support for the project. This included engagement with local residents in the Southern Lakes area, and Yukoners generally; as well as a further round of First Nations engagement to confirm the position of the affected First Nations (Carcross/Tagish First Nation, Kwanlin Dun First Nation and Ta'an Kwach'an Council). Prior to the end of 2020, YEC will make a determination regarding whether to advance the project to the YESAA assessment phase.

The deferred costs forecast in the Application assumes that the project continues, with spending in WIP increasing from $7.319 million at the end of 2018 to $9.379 million by the end of 2021. Potential in service for the Project is 2023."

QUESTION:

a) Please provide an update on the status of this project including but not limited to the outcome of First Nations and public engagement and YEC's decision on whether to proceed with this project.

b) If YEC is proceeding with this project, please provide:

i. updated cost forecasts along with detailed explanations for any cost increases relative to the forecast provided in 2017-18;

ii. a detailed work plan for completion of the project, including timing for individual components of the project;

iii. a breakdown of the costs forecast for the various work components comprising the project, including all plans for shoreline erosion and property owner septic upgrades and other mitigations;

iv. steps YEC is taking to prevent cost increases for the project; and

v. results of analysis performed by YEC examining the costs and benefits of the project relative to any alternatives considered by YEC.

ANSWER:

(a)

In 2019 and early 2020 YEC conducted a final round of public engagement regarding the project. Based on the results of this engagement and the estimated economics of the project, YEC's Board of Directors decided to advance the project into the next stage: preparing a proposal to submission to the YESAA Designated Office.

(b)

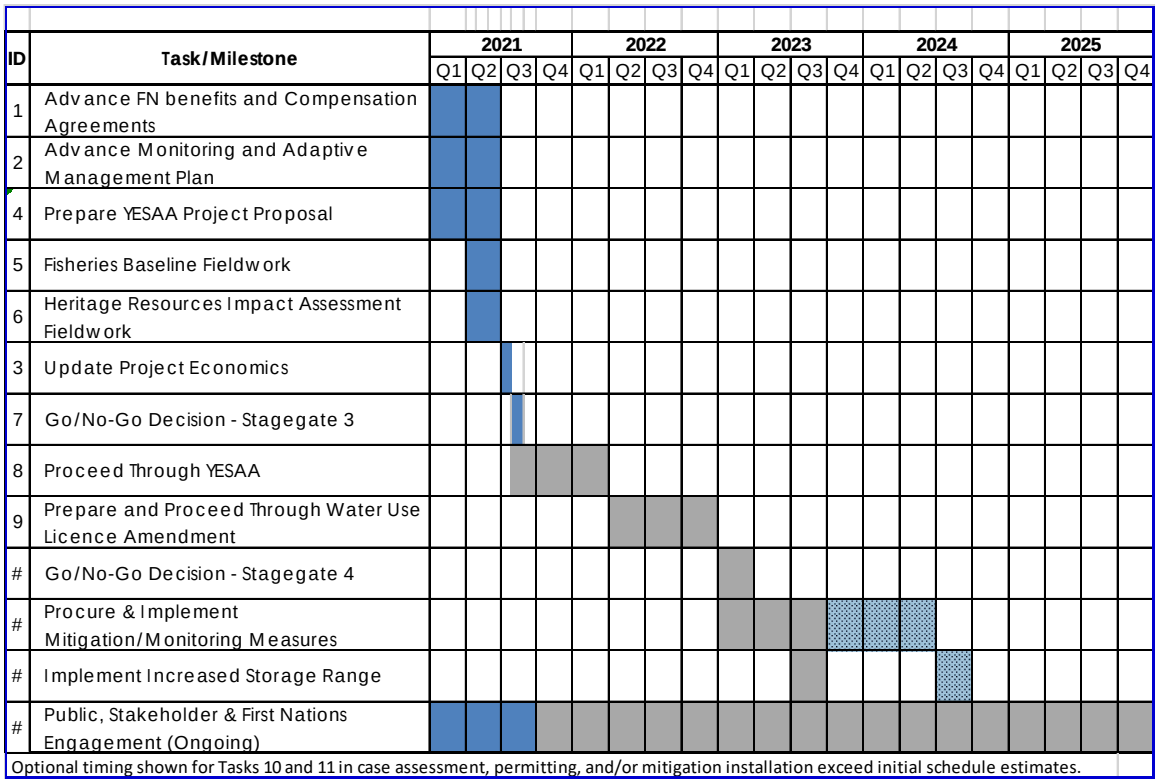
(i)

The current total project cost estimate is $17.1 million.

(ii)

The current workplan as outlined below includes collaboration with impacted First Nations who contribute to the development of the Monitoring & Adaptive Management Plan and

conducting required fieldwork such as the Heritage Resources Impact Assessment. This workplan will inform the finalization of the overall project timeline.



ID	Task/Milestone	2021				2022				2023				2024				2025			
		Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
1	Advance FN benefits and Compensation Agreements																				
2	Advance Monitoring and Adaptive Management Plan																				
4	Prepare YESAA Project Proposal																				
5	Fisheries Baseline Fieldwork																				
6	Heritage Resources Impact Assessment Fieldwork																				
3	Update Project Economics																				
7	Go/No-Go Decision - Stagegate 3																				
8	Proceed Through YESAA																				
9	Prepare and Proceed Through Water Use Licence Amendment																				
#	Go/No-Go Decision - Stagegate 4																				
#	Procure & Implement Mitigation/Monitoring Measures																				
#	Implement Increased Storage Range																				
#	Public, Stakeholder & First Nations Engagement (Ongoing)																				

Optional timing shown for Tasks 10 and 11 in case assessment, permitting, and/or mitigation installation exceed initial schedule estimates.

(iii)

The estimated cost components are provided in the table below.

($000's)	Forecast Total Project Costs
Concept Definition & Baseline Studies (2009-2012)	4,305
Preliminary Effects Assessment (2013-2014)	1,229
Mitigation Design & Consultation (2015-2020)	2,234
Additional Engagement & Assessment Prep (2020-2021)	1,314
Assessment & Permitting	800
Project Implementation (Mitigation construction)	7,200
Total Estimated Project Costs	**17,082**

(iv)

YEC is working to confirm mitigation plans for impacted properties and refine estimates to ensure costs are fully understood before moving forward with the project. Using a stagegate approach to assess a "go" or "no go" decision after more information is known from the results of the YESAA assessment will enable a decision to be made regarding the project with refined information on the economics.

(v)

An updated analysis of the Project economics was completed in early 2020 using the estimated Project costs available at the time. The added water storage is forecast to produce an additional ~6.5 GWh/year of winter energy, which would reduce thermal generation costs for ratepayers.

From an economic perspective, the Project provides energy at a levelized cost of $0.17/kWh over an economic life of 25 years (WACC of 5.9%) which compares favorably to the marginal cost of thermal generation (blend fuel price of $0.184/kWh in 2021 GRA forecast).

Given the favorable economics of the SLESP, the Project was included in the recommended project portfolio from both the 2016 Resource plan and the 2020 10 Year

Renewable Electricity Plan, as a near term project to increase the support of cost effective winter energy on the YEC system.

REFERENCE: **Application, Appendix 5.3, page 5.3-6**

ISSUE: **Mayo Lake Storage Enhancement Project**

QUOTE: "In 2018, Northwest Hydraulic Consultants (NHC) was retained to provide a technical assessment regarding whether sediment remediation steps in the Mayo Outlet Channel were feasible and cost effective. This assessment determined that removal of a coffer dam remnant in the outlet channel would improve flow in the near term and, through scouring activity, could potentially also remove the sediment from the channel; if required, as a next step, dredging the channel upstream of the coffer dam could improve hydraulic benefit for power generation. YEC has subsequently proceeded with preparing a YESAA assessment for the project (including the two-phase outlet channel work) which is targeted to be filed with the Mayo Designated Office before the end of 2020.

The deferred costs forecast in the Application assume that the project continues, with spending in WIP increasing from $3.373 million at the end of 2018 to $4.621 million by the end of 2021. Provided licencing processes commence in late 2020/early 2021, potential in service of the amended licence would be in 2023. Work to remove the coffer dam remnant would then proceed as a separate project."

QUESTION:

a) A detailed work plan for completion of the project, including timing for individual components of the project;

b) A total forecast costs for the project and a breakdown of the costs forecast for the various work components comprising the project;

c) Steps YEC is taking to prevent cost increases for the project; and

d) Results of analysis performed by YEC examining the costs and benefits of the project relative to any alternatives considered by YEC.

ANSWER:

(a)

The estimated work plan for completion of the project is shown below. This is subject to FNNND's confirmation of ability to complete review as proposed.

Task	Proposed Completion Date
Assessment and Permitting	
Baseline Studies	Ongoing
YESAA Assessment	
Project Proposal reviewed by FNNND completed	March 1, 2021
FNNND Chief & Council reconfirmation of support to submit	March 15, 2021
File of YESAA Project Proposal	March 31, 2021
Issuance of Decision Document[1]	November 18, 2021
Water Use Licence	
File Water Use License Amendment Application	June 1, 2021
Receipt of amended Water Use License[2]	March 2022
Fisheries Act Authorization	
File Request for Fisheries Act Authorization	June 30, 2021
Receipt of Fisheries Act Authorization[3]	July 2022
Consultation and Engagement	
Consultation and Engagement with FNNND[4]	Ongoing through assessment and permitting
Engineering	
Boat Ramp Extension Design	December 2021
Construction and Implementation	
Boat Ramp Extension	May 2022
Phase 1 Dredging (Cofferdam Removal)	August 2022
Phase 2 Dredging (if required)[4]	2025/2026

Assumptions:

1. Assuming a DO filing no later than March 31, 2021 and that the DO will take maximum time at each stage.
2. Assuming a filing to the Yukon Water Board for a Water Use License amendment no later than June 1, 2021.
3. Assuming a filing to Fisheries and Oceans Canada no later than June 30, 2021.
4. Phase 2 Dredging is dependent on the results of the Phase 1 Dredging. Following the Phase 1 Dredging, two to three years of monitoring will be conducted to monitor results of Phase 1 Dredging and determine if Phase 2 Dredging is required.

(b)

The total forecast costs to project completion are shown below.

Task	Forecast at Completion
Planning (Pre-YESAA)	$4.5M
Assessment & Licensing	$500k
Phase 1 Dredging	$1.1M
Phase 2 Dredging (if required)	$6.5M to $9.7M
Overall Project Total	**$6.1M to $15.8M**

(c)

YEC continues to employ project management practices to manage budget and scope, including review of project costs and benefits at each stage of decisions.

(d)

An economic analysis has examined the project value based on a capital investment amortization period of 45 years and 65 years, across several project scenarios. Three scenarios were run for each of the project added storage ranges (0.5 m and 1 m) with different Phase 2 dredging disposal options, and for each of the 45 year and 65 year project life assumptions. The project life is based on the durability of the proposed dredging and the expected frequency of the future channel dredging:

- A 65 year project life is based on the fact that the control structure has existed since the early 1950s (approximately 70 years) and that this duration would be a reasonable estimate of the expected life of the proposed dredging.

- A more conservative case uses a shorter, 45-year project life in the instance that dredging is required more frequently.

The 2019 estimated levelized cost of energy (LCOE) for the matrix of cases is presented below. As can be seen from the results, the project has a competitive LCOE under even the most conservative of the scenario (45 year project life, 0.5 m storage range extension) when compared to the marginal cost of natural gas generation (approximately $0.18/kWh). Updated LCOE analysis will be provided for the 2021 regulatory submissions.

Project Life	Added Storage Assumption (m)	LTA Added Winter Energy (GWh/yr)	Phase 1 Dredging Only LCOE ($/kWh)	Phase 1 + Phase 2 Dredging LCOE ($/kWh)	
				Lake Disposal	Land Disposal
45 years	0.5	~3.7	$0.05	$0.11	$0.13
	1	~6.3	$0.03	$0.07	$0.08
65 years	0.5	~3.7	$0.05	$0.09	$0.11
	1	~6.3	$0.03	$0.06	$0.07

REFERENCE: **Application, Appendix 5.4, page 5.4-2**

ISSUE: **IPP Standing Offer Program Implementation**

QUOTE: "YEC and ATCO Electric Yukon (AEY) are responsible for implementing the Yukon Government's Independent Power Producers (IPP) Policy … The project is to be closed in 2020 with total expenditures of $232,039 to be amortized over five years. The Standing Offer Program (SOP) was developed based on the model used in British Columbia and required development of the following key documents: (1) SOP Program Guide; (2) SOP Program Rules); (3) SOP Application Process; (4) SOP Application Form; (5) Interconnection Standards; and (6) Electricity Purchase Agreement Template."

QUESTION:

a) Please provide a summary of the legislative requirements, any policy directives or government directives which support the statement "YEC and ATCO Electric Yukon (AEY) are responsible for implementing the Yukon Government's Independent Power Producers (IPP) Policy".

b) Please explain what YEC means when they say the project will be "closed" in 2020. Does this mean it will be completed, cancelled or put on hold?

c) Please provide a copy of the documentation for the British Columbia model used by YEC as well as the "key documents" listed in the quote above.

d) Please provide a breakdown of the project components comprising the $232,039.

ANSWER:

(a)

The referenced statement simply reflects the direction by YG in the IPP policy that YEC and AEY are the two public utilities responsible for implementing all contracts and connections with IPPs as required to implement the Yukon Government's IPP Policy.[1]

(b)

In this instance, the term "closed" means that the project will be completed.

(c)

Please see Attachment 1 to this response which provides relevant documents for the YEC SOP program. Attachment 2 to this response provides documentation for the British Columbia model that is available from BC Hydro's website.

(d)

Please see Table 1 below for the actual cost breakdown for project components, which include an increase in actual over forecast of $50k. The following is noted:

1. ATCO's Legal costs to develop the Standing Offer Program rules were cost shared.

2. DLA Piper provided legal services to YEC regarding review the SOP Rules, development of the Electricity Purchase Agreement template, development of systemic responses to address initial inquiries from three early SOP applicants; and developing additional documents to support the EPA such as a Lenders Consent Agreement.

[1] Yukon's IPP Policy is available at the following link: https://yukon.ca/sites/yukon.ca/files/emr/emr-yukon-independent-power-production-policy.pdf.

3. Teshmont developed the System Interconnection Guidelines which is a foundational technical document providing guidance and requirement to the SOP proponent to connect to the grid.

4. Info session food reflects costs for an information session for interested IPP Proponents held on April 25, 2019.

STANDING OFFER PROGRAM APPLICATION FORM

Standing Offer Program Application Form

[Revised: January 2019]

General Instructions

- For the purposes of this Standing Offer Application Form, capitalized terms not otherwise defined herein shall have the meaning given thereto in the SOP Rules available at the "Documents" page of the SOP Website located at www.yukon.ca/standingoffer.

- To complete the Application Form, fill out each field that is represented by a blue box. Use drop down menus to make selections, where provided.

- A Developer should be fully responsive to each instruction, as applicable to the Developer and its Project. If a Developer is in any doubt as to the requirements contained in these instructions, it should seek clarification from the SOP Administrator at the address specified in Section 9 of the Rules.

- When completed, name the Application Form "Application" and save in Adobe ("PDF") format for inclusion in the electronic copy of your Application submission.

- Name the Exhibits according to the labelling of Exhibits in the Application Form and save the Exhibits in PDF, MS Excel or MS Word format for inclusion in the electronic copy of your Application submission. Insert "N/A" for Exhibits not applicable to your Project.

- Yukon Energy Corporation and/or ATCO Electric Yukon reserves the right to request additional information in relation to any information requested in this Application Form.

Application Submission Instructions

To apply for the Standing Offer Program, the Developer must submit the following:

- a scanned copy of the completed Standing Offer Program Application signed by the Developer with applicable Exhibits, in electronic form; and

- if required, a scanned copy of the completed Confidentiality and Compliance Agreement signed by the Developer (if not previously submitted with a pre-application meeting or preliminary assessment request);

by email to the SOP Administrator at IPPAdministrator@gov.yk.ca or delivered on one (1) disk or USB flash drive to:

Yukon Government
Energy Branch
206A Lowe Street
Whitehorse, Yukon, Y1A 2C6
Attention: SOP Administrator

by email to YEC at IPP@yec.yk.ca or delivered on one (1) disk or USB flash drive to:

Yukon Energy Corporation
#2 Miles Canyon Road
Box 5920, Whitehorse, Yukon Y1A 6S7
Attention: President

by email to AEY at AEY_SOP@atco.com or delivered on one (1) disk or USB flash drive to:

ATCO Electric Yukon
Standing Offer Program
100 – 1100 Front Street

1.2 Developer Identity

Form of organization (e.g., corporation, general partnership, limited partnership, joint venture, local government, public institution, etc.):

Jurisdiction in which the Developer is incorporated or formed:	Date of incorporation or formation: incorporated or formed (YYYY-MMM-DD):	Incorporation (or similar) number:

Member Details

Member's full name:

Form of organization (e.g., corporation, general partnership, limited partnership, joint venture, local government, public institution, etc.):

Jurisdiction in which the Developer is incorporated or formed:	Date of incorporation or formation: incorporated or formed (YYYY-MMM-DD):	Incorporation (or similar) number:
Date of registration in Yukon (YYYY-MMM-DD):		Registration number:

1.3 Project of Ownership Structure

Provide an organization chart that shows all direct and indirect owners to the ultimate controlling owner(s) of the Project.

☐ Included and named Exhibit 1.

1.4 Project Team

Provide a list of Project development team members including key outside contractors and consultants. Add additional rows if necessary.

Team Member	Role

1.5 Conflict of Interest

As required under Yukon Energy Corporation's and/or ATCO Electric Yukon's Contractor Standards for Ethical Conduct, the Developer must provide on its own behalf and on behalf of each member of the Developer's team a declaration in relation to the potential to be in an actual, apparent or deemed conflict of interest as a result of entering into an EPA with Yukon Energy Corporation and/or ATCO Electric Yukon, as described in Section 3.15 of the Rules.

Complete the Conflict of Interest Statement Form.

☐ Included and named Exhibit 2.

2. PROJECT INFORMATION

2.1 Project Description

(a) Provide a short, general description of the Project		
(b) Provide the Nameplate Capacity of each new generator		
Generator	MW	
Total (MW)		
Comments		
(c) Location		
Project Region:	Nearest Community:	
The approximate latitude and longitude of the project site is (in degrees minutes seconds)	Latitude (99°99'99" North):	
	Longitude (99°99'99" West):	
Parcel Identifier Number	Ownership Status	Describe if "Other"
Provide a geographical map of the Project location ☐ Included and named Exhibit 3.		
Provide the expected layout of the key facilities comprising the Project ☐ Included and named Exhibit 4.		
Is the Project described in the Application located on the same site or in the vicinity of a Project Cluster?		

Does the Project share any facilities with a Project Cluster?	
If "Yes" to either of the above two questions:	
i) Does any project that is part of a Project Cluster have an EPA with Yukon Energy Corporation and/or ATCO Electric Yukon or another party?	
ii) Complete Project Clusters Supplementary Information available on the Documents page of the SOP Website. ☐ Included and named Exhibit 5.	
Does any part of the Project require access to a Yukon Energy Corporation and/or ATCO Electric Yukon right of way?	
(d) The Target COD for the project is (YYYY-MMM-DD):	
(e) The requested Term of the EPA for the Project is (years):	
(f) Provide the Project schedule ☐ Included and named Exhibit 6	
(g) Total estimated Project energy volume	

Month	Average monthly energy output (MWh)
January	
February	
March	
April	
May	
June	
July	
August	
September	
October	
November	
December	

Total:	

Provide calculations supporting the average monthly energy output.

☐ Included and named Exhibit 7.

(h) Project Type

The energy delivered to Yukon Energy Corporation and/or ATCO Electric Yukon under the EPA must be Eligible Clean Energy. Select the Project type:

☐ Biomass ☐ Geothermal	☐ Hydro ☐ Solar	☐ Wind

2.2 Generation Technology

(a) Describe the complete generation process that converts raw fuel into electricity. If necessary, include diagrams in Exhibit 8.

☐ Included and named Exhibit 8.

Provide the location and date of initial operation for at least one generation plant that is using the same generation technology proposed for the Project:	Date of initial operation (YYYY-MMM-DD):

2.3 Existing and Previous Electricity Purchase Agreements

(a)	Is the Project currently subject to an EPA with Yukon Energy Corporation and/or ATCO Electric Yukon?	
(b)	Has the Project ever previously been subject to an EPA with Yukon Energy Corporation and/or ATCO Electric Yukon?	
	If "Yes", describe and provide the effective date of termination of the EPA (YYYY-MMM-DD):	
	Did the Project reach commercial operation while the EPA was in effect?	
(c)	Is the Project currently subject to an EPA with a party other than Yukon Energy Corporation and/or ATCO Electric Yukon?	

If "Yes", describe and provide the EPA (pricing information may be kept confidential). ☐ Included and named Exhibit 9.

2.4 Preliminary Feasibility Assessment

Has a preliminary feasibility assessment of the Project and/or the Developer as described in Section 5.2 of the Rules been conducted?	

3. PERMITS, SITE CONTROL AND ZONING

The Developer must comply with all laws, statutes and regulations relating to the Project whether federal, provincial and/or municipal and must obtain all permits, licenses and approvals required for the development, construction and operation of the Project. The following list is not a complete list of all permits, licenses and approvals required for any Project. Developers are solely responsible for determining the permitting and other legal requirements for their Projects.

The information provided by the Developer in response to this part of the Application should address all parts of the Project site (including all areas where the generating facility and related access roads, transmission lines and other Project facilities will be built).

Yukon Energy Corporation and/or ATCO Electric Yukon may request the Developer to provide confirmation from the relevant regulatory authority that a permit or approval is not required for a Project.

☐ If requested, included and named Exhibits 10-13.

3.1 Supplementary Information

(a) Are any of the permits, licenses and approvals for the Project under appeal or judicial review?

If "Yes", describe:

(b) Is there any outstanding order, judgment, litigation or other proceeding with respect to the Project?

If "Yes", describe:

(c) Is there any significant opposition to the Project?

If "Yes", describe:

4. INTERCONNECTION

(a) Has a System Impact Study application been submitted to Yukon Energy Corporation and/or ATCO Electric Yukon?

(b) Have any other interconnection studies been completed for this Project?

If "Yes", provide the study.

(c) Point of Interconnection (e.g. nearest substation), if known:

(d) Interconnection voltage level (kV):

(e) Interconnection to:

(f) Describe the proposed point of delivery of energy to Yukon Energy Corporation and/or ATCO Electric Yukon on the Distribution System or the Transmission System.

5. FIRST NATIONS

Describe all First Nations consultations and engagement conducted relative to the Project. Provide a copy of all executed agreements with First Nations with respect to the Project. Include any letters of support from First Nations for the Project, if available.

☐ Included and named Exhibit 14.

6. REPRESENTATIONS, WARRANTIES AND COVENANTS

The Developer represents, warrants, and covenants with Yukon Energy Corporation and/or ATCO Electric Yukon as follows and understands that Yukon Energy Corporation and/or ATCO Electric Yukon is relying on these representations, warranties and covenants in deciding whether to offer an EPA to the Developer:

6.1 The Developer has reviewed carefully and fully understands the Rules, the Standard Form EPA and all related documents posted to the SOP Website and has taken legal, accounting, engineering and other professional advice as the Developer considers necessary for it to understand its rights and obligations under the EPA if an EPA is offered to the Developer.

6.2 In preparing and submitting this Application, the Developer has not relied on any information given to it by Yukon Energy Corporation and/or ATCO Electric Yukon, whether orally, in writing, electronically or in any other form whatsoever, except information disclosed in the Rules, the SOP Website or advised in writing by the SOP Administrator.

6.3 In consideration for Yukon Energy Corporation and/or ATCO Electric Yukon reviewing the Developer's Application, the Developer agrees to the terms, conditions and exclusions and limitations of liability set out in the Rules in effect at the time the Application was submitted.

6.4 The information contained in the Application is true and correct in all material respects and there is no material information omitted from the Application that makes the information in the Application misleading or inaccurate in any material respect.

6.5 The Developer is duly incorporated, organized, validly existing and in good standing under the laws of the jurisdiction of its incorporation, is registered or otherwise lawfully authorized to carry on business in Yukon, and has full power, capacity and authority to own its assets and to carry on its business as now conducted and to enter into and to perform its obligations under the EPA if an EPA is offered to the Developer. If the Developer is a joint venture or partnership, this representation is true and correct for each of the participants in the joint venture or partnership.

6.6 No actions have been taken or authorized by the Developer or any other person to initiate proceedings for, or in respect of, the bankruptcy, insolvency, liquidation, dissolution or winding-up of the Developer or to appoint a receiver, liquidator, trustee or assignee in bankruptcy in respect of the Developer.

6.7 No appropriation, expropriation or seizure of all or any portion of the Project, or the assets required to construct, operate or maintain the Project, is pending or threatened.

6.8 Neither the signing of the EPA, nor the carrying out of the Developer's obligations under the EPA will: (i) constitute or cause a breach of, default under, or violation of, the constating documents or bylaws of the Developer, any permit, franchise, lease, license, approval or agreement to which the Developer is a party, or any other covenant or obligation binding on the Developer or affecting any of its properties, (ii) cause a lien or encumbrance to attach to any of the assets included in the Project (as defined in the Standard Form EPA), other than a security interest granted in respect of financing the design, construction or operation of the Project, or (iii) result in the acceleration, or the right to accelerate, any obligation under, or the termination of, or the right to terminate, any permit, franchise, lease, license, approval or agreement related to the Project.

6.9 In consideration for Yukon Energy Corporation and/or ATCO Electric Yukon reviewing the Developer's Application, the Developer agrees that: (A) Yukon Energy Corporation and/or ATCO Electric Yukon has

no liability to the Developer or any affiliates of the Developer for any failure by Yukon Energy Corporation and/or ATCO Electric Yukon prior to the effective date of an EPA to adequately consult with, and/or accommodate, any First Nations in relation to: (i) any decision to offer or not to offer an EPA to the Developer, (ii) the Project, (iii) the Developer's Plant, or (iv) the interconnection of the Developer's Plant to the Transmission System or the Distribution System (excluding matters arising on Yukon Energy Corporation's and/or ATCO Electric Yukon's side of the point of interconnection to the Transmission System or Distribution System); and (B) Yukon Energy Corporation's and/or ATCO Electric Yukon's liability, if any, for any failure by Yukon Energy Corporation and/or ATCO Electric Yukon after the effective date of an EPA to adequately consult with, and/ or accommodate any First Nations in relation to the foregoing matters will be determined in accordance with the EPA as if it was still in effect notwithstanding any expiry, termination, declaration by any order of a court or regulatory authority that the EPA is invalid, void or unenforceable, or any other means by which the EPA ceases to be in effect.

6.10 The Developer has read carefully, and it is in compliance with, the Yukon Energy Corporation and/or ATCO Electric Yukon Contractor Standards for Ethical Conduct which is current at the time of the Application. The Yukon Energy Corporation and/or ATCO Electric Yukon Contractor Standards for Ethical Conduct is available on the SOP Website.

EXHIBIT "E"

CONFLICT OF INTEREST STATEMENT FORM

Project Name: _____

Developer Name: _____

The Developer declares on its own behalf and on behalf of each member of the Developer's Team that:

1. this declaration is made to the best of the knowledge of the Developer and, with respect to relationships of each member of the Developer's Team, to the best of the knowledge of that member;

2. the Developer and the members of the Developer's Team have reviewed the Contractor Standards for Ethical Conduct as set out in Exhibit "F" to the SOP Rules;

3. the following is:

   (a) a full disclosure of all members of the Developer's Team who have been directors, officers or employees of the Government of Yukon or ***[insert the applicable Utility]*** or its subsidiaries at any time in the two years preceding the date of this disclosure;

   (b) a full disclosure of all known relationships the Developer and each member of the Developer's Team has, or has had, with:

      i. the Government of Yukon or ***[insert the applicable Utility]*** or its subsidiaries;

      ii. any current directors, officers or employees, as applicable, of the Government of Yukon or ***[insert the applicable Utility]*** or its subsidiaries;

      iii. any former directors, officers or employees, as applicable, of the Government of Yukon or ***[insert the applicable Utility]*** or its subsidiaries, who ceased to hold such position within two years from the date of this disclosure; and

      iv. any other person who, on behalf of the Government of Yukon or ***[insert the applicable Utility]*** or its subsidiaries, has participated in or been involved in the design of the Standing Offer Program under the SOP Rules or any past competitive energy acquisition process of the the Government of Yukon or ***[insert the applicable Utility]*** or its subsidiaries; and

   (c) a full description of the actions that the Developer has undertaken or offers to undertake to address any actual, perceived or potential conflict of interest or unfair advantage arising from the relationships disclosed pursuant to subsections 3(a) and (b) above; and

4. if no such relationships are disclosed by the Developer, the Developer is not aware of any former directors, officers or employees as described in subsection 3(a) above nor any relationships between the Developer or any member of the Developer's Team, and any of the persons described in subsection 3(b) above, and the Standing Offer Program Application has not been/is not being prepared with any involvement from any of those persons.

5. Disclosures pursuant to section 3 above are as follows:

Name of Member of Developer's Team (e.g. John Smith)	Name of Party with Relationship (e.g. employee name)	Details of the Nature of the Relationship with • (e.g. John Smith was a • employee from [date] to [date])

6. For the purposes of this Conflict of Interest Statement Form, capitalized terms not otherwise defined herein shall have the meaning given thereto in the SOP Rules available at the "Documents" page of the SOP Website located at *www.yukon.ca/standingoffer* and:

"**Developer's Team**" means:

(a) all persons who have been involved in the preparation of the Developer's Proposal; and

(b) all persons who the Developer proposes to perform work or services under any resulting Electricity Purchase Agreement.

7. The Developer has undertaken or offers to undertake the following actions to address any actual, perceived or potential conflict of interest or unfair advantage arising from the relationships disclosed pursuant to subsections 3(a) and (b) above:

[insert agreed actions]

EXHIBIT "F"

CONTRACTOR STANDARDS FOR ETHICAL CONDUCT

STANDARDS

1. At all times in the course of its performance of the Contract, the Contractor will conduct itself with fairness, integrity and honesty.

2. At all times during the term of the Contract, the Contractor will avoid any actual, or apparent conflict of interests, in which its interests outside of the Contract (including any engagements the Contractor may have with third parties), and its obligations to • under the Contract and these Standards conflict.

3. The Contractor will promptly disclose to • in writing, to the best of its knowledge, any actual or apparent conflicts between its interests and those of • during the term of the Contract, including:

   (a) the name of any current director, officer or employee of • who is an Owner, or representative of the Contractor;

   (b) any business relationship that the Contractor or any of its Owners or officers has with a director or officer of • or with an employee of • who may have actual or apparent involvement in any • procurement process, or the Contract; and

   (c) the name of any director, officer or employee of • who is connected by frequent or close association to the Contractor, any of its Owners or officers, or any representatives of the Contractor who may have actual or apparent involvement in any • procurement process, or the performance or administration of the Contract.

   For the purposes of this section, •'s interests include non-economic considerations such as reputation.

4. In addition to disclosure required above, the Contractor will take any steps reasonably required by • to address or mitigate any actual or apparent conflict of interest.

5. Subject to the terms of the Contract, the Contractor will keep confidential all non-public, confidential information provided to it by • or developed during performance of the Contract. The Contractor will not use that information for any purpose unrelated to performance of its obligations under the Contract.

6. If • gives the Contractor access to any • property during the term of the Contract, the Contractor will use that property solely for purposes of the Contract.

7. The Contractor will not attempt to secure preferential treatment with • by offering gifts, entertainment, or benefits to •'s directors, officers or employees. Reasonable gifts, entertainment, or benefits common to business relationships, **[as described in the • Code of Conduct]**, are acceptable.

8. Unless the Contractor has the express permission of •, the Contractor will not solicit or recruit any • employee during the term of the Contract. This obligation does not prevent the Contractor from

hiring a • employee who responds to a public and broadly issued job advertisement without prompting or encouragement from the Contractor.

9. The Contractor must treat its employees and subcontractors performing work under the Contract respectfully and in a manner free of discrimination and harassment. The Contractor will provide those employees and subcontractors with a safe and healthy workplace.

10. The Contractor and its employees and subcontractors must treat individuals they encounter in the course of performing work under the Contract respectfully and in a manner free of discrimination and harassment.

11. When the Contractor is participating in any public discussions or taking a position of leadership in other organizations, it must not represent itself as a spokesperson of • unless • has specifically retained or instructed the Contractor to act in that capacity.

12. Contractors who would like further information or advice on the application of these Standards are encouraged to speak to **[name of representative]**'s contract representative.

13. A Contractor's failure to adhere to the provisions of these Standards may be a breach of Contract and could result in termination of the Contract.

DEFINITIONS

"•" means **[*insert applicable utility*]** or any of its subsidiaries that has entered into the Contract;

"Contract" means a contract with • in which these Standards are included directly or by reference as a terms or condition;

"**Contractor**" means the contractor, consultant, supplier or business associate who has a Contract; and

"**Owner**" means any person who, individually or together with relatives, directly or indirectly owns 20% or more of the voting rights of the Contractor.

EXHIBIT "G"

CONFIDENTIALITY AND COMPLIANCE AGREEMENT

THIS CONFIDENTIALITY AND COMPLIANCE AGREEMENT (the "**Agreement**") is made as of the ____ day of _____, 20__.

BETWEEN:

[SELLER], a corporation incorporated under the laws of _____
("**Seller**")

-and-

[UTILITY], a corporation incorporated under the laws of the Yukon
("**Utility**")

(individually, a "**Party**" or collectively, the "**Parties**")

WHEREAS:

Utility and Seller wish to enter into discussions, which may include negotiations concerning an electricity purchase agreement (an "**EPA**"), pursuant to the Government of Yukon's Standing Offer Program ("**SOP**").

NOW THEREFORE, in consideration of the Parties entering into this Agreement and the mutual promises and agreements contained in this Agreement, the Parties agree as follows:

1. DEFINITIONS

1.1 "**Confidential Information**" means any of the Seller's confidential technical or financial information provided by the Seller to Utility in confidence in connection with the SOP and/or any related EPA with express written notice to Utility of the confidential nature of the information, whether such confidential information is provided orally, in writing, electronically or by any other media, but excluding any executed and delivered EPA or related securities delivered thereunder or any agreement collateral thereto, and also excluding information that:

(a) is or becomes in the public domain, other than as a result of a breach of this Agreement by Utility;

(b) is known to Utility before disclosure to it by the Seller, or becomes known to Utility thereafter by way of disclosure to Utility by any other person who, to Utility's knowledge, is not under an obligation of confidentiality with respect thereto; or

(c) is, or has been, disclosed by the Seller to any government authority in connection with any permit, approval or tenure for any project proposed by the Seller in the SOP and any information that is directly related to or that is based on or derived from that information, other than any financial information relating to the Seller or any such project;

1.2 "**Affiliate**" has the meaning given in the Standard Form Electricity Purchase Agreement for the SOP;

1.3 "**Discussions**" means discussions, including negotiations, whether orally, in writing, electronically or by any other media, between the Parties pertaining to the SOP and/or any related EPA from the effective date of this Agreement to the termination of such discussions or an EPA, if any, between the Parties is fully executed and delivered, whichever shall first occur and "discussions" includes but is not limited to, the Seller's questions and Utility's responses thereto in the Q & A process under the SOP and any preliminary assessment of eligibility for the SOP provided by Utility to the Seller;

1.4 "**SOP Rules**" means the SOP Rules available on the SOP Website at *www.Yukon.ca/apply-independent-power-producer*, as amended or replaced from time to time.

2. CONFIDENTIALITY OBLIGATION

2.1 **Confidentiality Obligation**. Utility shall treat as confidential, and shall not disclose to any third person, Confidential Information, and both Parties shall treat as confidential and shall not disclose to any third person, all or any part of the Discussions, provided however that the foregoing obligations, and nothing in this Agreement, prevents or restricts:

(a) disclosure of the fact that Discussions, if any, are occurring, or have occurred, and/or the fact that this Agreement exists and the general nature hereof:

(b) in the case of Utility, disclosures of the Discussions and/or Confidential Information:

(i) to any ministers, deputy ministers, servants or employees of the Yukon Territory; and

(ii) to Utility's directors, officers, employees, subsidiaries, consultants and advisors;

provided that each of the foregoing to whom Discussions and/or Confidential Information is disclosed is advised of the confidential nature thereof;

(c) in the case of Utility, disclosure of Discussions and/or Confidential Information in any regulatory proceeding, whether in respect of an EPA entered into with the Seller pursuant to the SOP or in respect of other matters, to the extent that Utility considers disclosure necessary or desirable to support its position in any such proceeding, provided that, to the extent reasonably practicable, Utility gives reasonable notice to the Seller before making disclosure, and, to the extent requested by the Seller, requests the relevant tribunal to treat all or any part of the disclosure as confidential or to limit its further disclosure;

(d) in the case of Utility, disclosure:

(i) of the Seller's questions and Utility's response thereto under the SOP without attribution to the Seller;

(ii) to a third person of Confidential Information that was known by that third person before disclosure thereof by Utility, including information that originated from that third person or that the Seller or any other person has given to the third person, in each case as indicated on the face of any document or as acknowledged by the Seller; and

(iii) such information as Utility considers necessary to provide any publicly available report on the conduct and outcome of the SOP, including the Seller's participation in the SOP and conclusion of an EPA with the Seller (if applicable), the location and capacity of any project proposed by the Seller, and the energy associated with any project proposed by the Seller;

(e) in the case of the Seller, disclosure of Discussions to its directors, officers, employees and affiliates, consultants and advisors, provided that each of the foregoing to whom Discussions are disclosed is advised of the confidential nature thereof and undertakes in writing to respect such confidentiality on the terms of this Agreement, provided that the Seller shall give to Utility, at its request, a copy of each such undertaking;

(f) without limiting Utility's disclosure rights under section 2.1(c) above, disclosures required to be made by Utility or the Seller by an order of a court or tribunal or under any law, regulatory requirement or requirement of any stock exchange that is binding upon it, provided that, (i) to the extent reasonably practicable, the Party making such disclosure gives reasonable notice to the other Party before making the disclosure, and (ii) limits the disclosure to that required by the applicable order, law, or regulatory or stock exchange requirement;

(g) disclosures in any legal proceedings for the enforcement of this Agreement and/or any EPA or in the defense of any legal proceedings brought by any third person(s) against either or both the Parties in any way relating to the SOP; or

(h) disclosures of the Discussions and/or Confidential Information by agreement or consent of both Parties.

2.2 **Disclosures of EPA**. Disclosure of any executed EPA, or any summary thereof or information contained therein, will be governed by the EPA.

2.3 **[Freedom of Information and Protection of Privacy Act**. The Seller acknowledges that Utility is subject to the Yukon *Access to Information and Protection of Privacy Act* and associated regulations, and agrees that Utility's non-disclosure obligations under this Agreement are subject to the provisions of that legislation, as the same may be amended or replaced from time to time.]

2.4 **Term**. Utility's obligation of confidentiality with respect to Confidential Information expires three years after the date hereof.

3. PROGRAM RULES BINDING

The Seller acknowledges and agrees that it is bound by, and will comply with, the terms and conditions of the SOP Rules.

4. MISCELLANEOUS

4.1 **Liability Exclusion**. No Party will be liable to the other Party in connection with any breach of this Agreement for any indirect, incidental or consequential damages, including loss of profits.

4.2 **Governing Law**. This Agreement shall be interpreted, governed and construed under the laws of Yukon and the law of Canada applicable therein as if it were executed, and to be performed wholly, within Yukon.

4.3 **Equitable Relief**. Each Party agrees that in the event of a breach of this Agreement, or to prevent a breach or contemplated breach, by that party, the other Party shall be entitled to equitable relief, including injunction and specific performance, in addition to all other remedies available at law or equity.

4.4 **Entire Agreement**. The Agreement constitutes the entire agreement between the Parties with respect to the subject matter hereof and supersedes and cancels all prior agreements and communications relative to such subject matter.

4.5 **No Implied Terms**. No terms or conditions whatsoever may be implied in this Agreement.

4.6 **Amendments**. This Agreement shall not be modified, except by a written agreement dated after that date of this Agreement and signed by both Parties.

4.7 **Assignment**. This Agreement may not be assigned by either Party without the prior written consent of the other Party.

4.8 **Enurement**. This Agreement is binding upon and enures to the benefit of the Parties and their respective successors and permitted assigns.

4.9 **Execution in Counterparts**. This Agreement may be executed in counterparts, and each counterpart shall for all purposes be an original, and all such counterparts shall together constitute one and the same Agreement.

4.10 **Facsimile Signature**. This Agreement may be executed and delivered by signatures transmitted by facsimile or other electronic means.

4.11 **Relationship**. Entering into this Agreement shall in no way be construed to:

(a) preclude in any way either Party from pursuing any business opportunities;

(b) establish any relationship between Utility and the Seller with respect to such business opportunities; or

(c) establish any other relationship between Utility and the Seller with respect to any project proposed by the Seller under the SOP.

[Remainder of page left intentionally blank]

IN WITNESS WHEREOF, the Parties have entered into this Agreement effective as of the date first above written.

GLOSSARY – STANDING OFFER PROGRAM RULES i

STANDING OFFER PROGRAM RULES

1. INTRODUCTION

The Government of Yukon (**YG**) issued the *Independent Power Production Policy* in October 2015 as reviewed and updated by the YG in October, 2018 (**IPP Policy**). One of the key elements of the IPP Policy was to create a framework for the Standing Offer Program (**SOP**) designed by YG to achieve the following principles:

(a) encourage the development of new, small and renewable energy Projects in Yukon by multiple Developers interconnecting into the Yukon Integrated System (**YIS**) or the Watson Lake Grid (**WLG**);

(b) streamline the process for the sale by such Projects of electricity to Yukon Energy Corporation (**YEC**) on the YIS or to ATCO Electric Yukon (**AEY**) on the WLG (YEC and AEY being the Utilities);

(c) provide for a Standard Form Electricity Purchase Agreement (**Standard Form EPA**), being the contract for the sale by such Projects of electricity by the Developer to the applicable Utility;

(d) decrease transaction costs for Developers and the Utilities participating under the SOP; and

(e) achieve the policy objectives of the IPP Policy in a manner which is cost-effective for ratepayers.

These Standing Offer Program Rules (**Rules**) have been developed by YG together with the Utilities in accordance with the IPP Policy to establish the Application Process governing the SOP as well as the SOP eligibility requirements, standards, applicable EPA term or duration and purchase price for energy delivered under the SOP. By OIC, YG has required that the Utilities implement the SOP in accordance with these Rules and YG will perform certain administrative functions contemplated by these Rules.

The IPP Policy supports the principles established in the *Energy Strategy for Yukon* released by YG in January 2009. YG intends to review the IPP Policy every 2 years. YG may make any amendments to the IPP Policy at any time. The Utilities are authorized to make any amendments to these Rules (including any Reference Documents) and the Standard Form EPA at any time to support the SOP and IPP Policy. Prior to making any amendments to the IPP Policy including any amendments that may require the Utilities to make corresponding amendments to these Rules (including any Reference Documents) or the Standard Form EPA, YG shall consult with the Utilities. Neither YG nor the Utilities shall have any obligation to consult with any Developers or potential applicants regarding such amendments or potential amendments. All such amendments made by YG or the Utilities (including, without limitation, amendments to the applicable purchase price) shall apply to any Developer or potential applicant which has not signed an EPA with a Utility in accordance with these Rules at the time of such amendments, whether or not such Developer has been registered in the SOP Queue. Such amendments shall not affect any EPA that has been entered into by a Developer prior to the amendment.

Capitalized terms used but not otherwise defined in these Rules have the meaning given to such term in the Glossary at the end of these Rules.

Actions of YG under the IPP Policy and these Rules may be carried out by any department or agency of YG, including YDC.

2. APPLICATION PROCESS OVERVIEW

The Application Process is comprised of the following phases each of which are described in greater detail in these Rules below:

(a) **Pre-Application Phase** – The Pre-Application Phase shall commence upon submission by the Developer to the YG and the applicable Utility of the Pre-Application Form and other documents outlined in more detail in Section 5.1 below. During the Pre-Application Phase, YG will conduct a Pre-Application Completeness Review to assess whether the potential applicant and Project will be able to meet the eligibility requirements and are prepared to submit a complete Application to the Utility. Following the results of such review by YG, the Utility will complete the assessment on a preliminary basis and shall have the right to reject any potential applicant and Project which, in the Utility's Discretion, will not be able to meet the eligibility requirements.

(b) **Preliminary Feasibility Assessment Phase** – During this phase, the potential applicant may conduct more detailed Project assessment, commence the process required to receive the YESAB Adequacy Confirmation, if required, and may, at its cost, initiate a System Interconnection Study with the Utility.

(c) **Application Phase** – During this phase, a potential applicant that:

(i) is issued a Preliminary Eligibility Approval by the Utility under the Pre-Application Phase; and

(ii) has received the YESAB Adequacy Confirmation for its Project, if required,

shall be entitled to submit an Application outlined in more detail in Section 5.3 below and the applicable Utility will complete the Application Review. Following the Application Review by the Utility, the Utility will either retain or reject the Application. The applicant and the Utility will commence the System Interconnection Study, at the applicant's cost, if not already completed in the Preliminary Feasibility Assessment Phase.

(d) **EPA Execution Phase** – During this phase, if the Utility has retained the Developer's Application, the Utility may make an offer of an EPA to the Developer at which point the Developer must sign the EPA, failing which the Utility's offer of an EPA will be withdrawn.

YG and the Utilities make no representations or warranties as to the amount of time that will be required to complete these phases, whether each such party will complete all or any such phases or whether any potential applicant will be successful or rejected in this Application Process. Rejection of an applicant or a potential applicant may be determined by the applicable Utility in its Discretion in accordance with these Rules. Potential applicants are advised to read these Rules carefully and retain their own financial, engineering, legal and other technical advisors in the event they wish to participate in the Application Process.

3. ELIGIBILITY REQUIREMENTS

To be eligible for the SOP, the Developer and the Project must meet the eligibility requirements outlined below. The satisfaction of such eligibility requirements will be reviewed in each of the Pre-Application Phase and the Application Phase as follows:

(a) **Pre-Application Phase Eligibility Assessment** - During the Pre-Application Phase, YG will conduct a Pre-Application Completeness Review to assess whether the potential applicant and Project will be able to meet the eligibility requirements and are prepared to submit a complete application to the Utility. Following the results of such review by YG, the Utility will complete the assessment on a preliminary basis and shall have the right to reject any potential applicant and Project which, in the Utility's Discretion, will not be able to meet the eligibility requirements.

(b) **Application Phase Eligibility Assessment** - During the Application Phase, the applicable Utility to which the Application has been made as contemplated in Section 5.3 below will conduct an assessment of whether the Developer and Project meet the eligibility requirements and such Utility shall have the right to reject any Developer and the Project which, in such Utility's Discretion, do not meet the eligibility requirements. For clarity, this assessment will be conducted by YEC in respect of Projects to be interconnected into the YIS and by AEY in respect of Projects to be interconnected into the WLG. References to a Utility below means such applicable Utility having the authority to assess eligibility requirements for a specific Project.

3.1 Generation Technology

The generation technologies and energy sources must be proven to be reliable, as determined by the applicable Utility in its Discretion. Developers will be required to provide all such information as the Utility determines is necessary to assess such reliability. New generation technologies may be considered from time to time by the Utilities in their Discretion.

3.2 Eligible Energy

Energy delivered to a Utility under the EPA must be Eligible Clean Energy.

3.3 Location and System Constraints

Projects must be located in Yukon and connecting to the YIS or the WLG.

If a Developer proposes that a Project be located in part of the YIS or WLG which is in an area where a Utility has system constraints, it is anticipated that any such constraints can be addressed through System Upgrades which will become part of the System Upgrade Costs and paid for by the Developer; provided, however, that the Utilities shall have the right to reject a Project if it is proposed to be located in part of the YIS or WLG which is in an area where a Utility has system constraints.

3.4 System Wide Limits

The following system-wide limits (**System-wide Limits**) for all EPAs entered into under the SOP have been established by YG in order to meet the policy objectives of the SOP, while observing the technical limitations of each of the YIS and WLG:

System/Grid	System-Wide Limit
YIS	20,000 MWh/year
WLG	2,100 MWh/year

The Utilities shall have no Discretion to exceed the System-wide Limits contemplated above.

Each Developer shall submit the annual energy volume which is expected to be generated by the Project determined based on the maximum number of MWh which the applicable Project would generate assuming that it generated in accordance with the Nameplate Capacity after taking into account a reasonable capacity factor for the applicable Eligible Clean Energy source (the **Project Energy Volume**). A Project will be rejected if the total of the Project Energy Volume for the applicable Project together with the Project Energy Volumes of all other projects registered in the SOP Queue or contracted under signed EPAs (without duplication) would result in the Utility exceeding the System-wide Limit set out above for YIS or WLG, as applicable. The Utility shall have the right to reject or modify a Developer's proposed Project Energy Volume where it determines in its Discretion that it is not reasonable. The Utility may request any additional information it requires to assess the reasonableness of Project's Nameplate Capacity or expected generation specified in the Application, including verification by a qualified Yukon registered professional engineer.

Such System-wide Limits may be increased or decreased from time to time by YG in accordance with changes to the IPP Policy and in consultation with the Utilities. In the event that the System-wide Limits are, at any time, decreased, any Developer that has not executed an EPA shall be subject to having their Application rejected if the total of the Project Energy Volume for the applicable Project together with the Project Energy Volumes of all other projects registered in the SOP Queue or contracted under signed EPAs (without duplication) would result in the Utility exceeding the revised System-wide Limit set out above for YIS or WLG, as applicable. In such circumstances, the Utility may determine, in its Discretion, which Projects shall have their Application rejected and such Discretion may be exercised without regard to, among other things, the date on which a Developer has submitted its Application relative to other Applications. Neither YG nor the Utilities shall have any liability to a Developer or any other Person resulting from such rejection of an Application.

YG will maintain the SOP Website which shall contain updates of (i) each Project (including the applicable Developer, the Project Energy Volumes and Target Developer's COD for the Project) for which a Utility has entered into an EPA and (ii) the SOP Queue which shall specify each Project (including the applicable Developer, the Project Energy Volumes and Target Developer's COD for the Project) which has been registered by a Utility under the Application Process. The order in which a Project is placed in the SOP Queue shall not grant a priority to any Project over another Project in the SOP Queue and the Utilities shall have no liability to a Developer or any other Person resulting from the entering into of an EPA for a Project that was registered in the SOP Queue after another Project. Utilities have the right to work with, evaluate or otherwise negotiate with any Developer individually or simultaneously with multiple Developers and regardless of the order of the applicable Projects in the SOP Queue. Once an EPA has been entered into in respect of a Project, such Project shall be removed from the SOP Queue.

Developers are expected to review the SOP Website for available energy volumes in the System-wide Limits. Neither YG nor the Utilities represent or warrant that the available energy volume posted on the SOP Website for System-wide Limits will be or remain available at the time Developers submit an Application or at any time during the Application Process. Developers are encouraged to contact the applicable Utility prior to submitting an Application to verify available energy volumes in the System-wide Limits.

The applicable Utility shall have the Discretion to close, at any time, the SOP Queue for YIS or WLG at which time the applicable Utility shall not accept further Applications from Developers, and, in such case, the Utilities shall have no liability to a Developer or any other Person resulting from such closure of the SOP Queue.

3.5 Project Size

Where a Project is located on the YIS, such Project may have multiple generators and must have a combined total Nameplate Capacity between 30 kW up to and including 2000 kW. Where a Project is located on the WLG, such Project may have multiple generators and must have a combined total Nameplate Capacity between 30 kW up to and including 500 kW. Such limits shall also apply to each eligible Project in a Project Cluster.

The Utility shall have no Discretion to allow a Project to exceed the limits contemplated above.

3.6 Project Clusters

Project Clusters are permitted, provided that each Project within a Project Cluster must have a separate Revenue Meter.

3.7 Yukon Incentives

A Project is not eligible for the SOP if the Project has a reasonable expectation of receiving future funding from the Micro-gen Program or other generation program with the YG; provided that, for clarity, receipt by a Project of funding under the Micro-gen Program or other generation program with the YG prior to an Application under the SOP shall not make such Project ineligible for the SOP.

3.8 Permits, Site Control and Zoning

The Application Form identifies the permits, site control and evidence of zoning that are key or standard eligibility requirements that must be satisfied by the Project.

3.8.1 Permits

If the Project is an assessable activity under YESAA, (i) prior to the Application to the Utility, the Developer must have received the YESAB Adequacy Confirmation; and (ii) prior to the execution of the EPA, the Developer must have obtained all Regulatory Agency Authorizations for the Project.

The EPA may establish certain minimum permits, licenses and approvals required under applicable laws for the EPA to be effective and whether such permits are required prior to execution of the EPA or will be required to be satisfied as a condition precedent to the EPA becoming effective. However, neither the provisions of the EPA nor any other

communication with the Utility will be construed as the Utility advising the Developer in any manner whatsoever on the nature or extent of the permits, licenses and approvals required under applicable laws by the Developer and the Developer will be solely responsible for securing all such permits, licenses and approvals required under applicable laws prior to the EPA becoming effective.

3.8.2 Site Control

The Developer must demonstrate that it has obtained the right to use the site for the Project (including, unless otherwise acceptable to the Utility in its Discretion, all areas where the generating facility and related access roads, transmission lines and other Project facilities will be built) for a period generally consistent with the Term of the EPA or a shorter period if acceptable to the Utility in its Discretion.

3.8.3 Zoning

If local government land use requirements apply to all or any part of the Project site (including all areas where the generating facility and related access roads, transmission lines and other Project facilities will be built), that part of the Project site must be appropriately zoned for the applicable Project use.

Where the Project forms part of a Project Cluster, the Utility may require the Developer to provide evidence that the permits, site control and zoning requirements are satisfied for the entire Project Cluster.

3.9 Public Utility Status

The Project must not be owned, in whole or in part, by a "public utility" for purposes of the *Public Utilities Act* (Yukon).

3.10 Target Developer's Commercial Operation Date

The Target Commercial Operation Date (**Target Developer's COD**) submitted by the Developer in the Application must be:

(a) a reasonable estimate of the date on which the Project is expected to achieve COD with considerations for the SOP application review process, and the results of the System Interconnection Study; and

(b) unless otherwise agreed to by the Utility, not later than three years following signing the EPA.

The Utility may request any additional information it requires to assess the reasonableness of the Target Developer's COD for the Project. If the Utility determines, in its Discretion, that the Target Developer's COD is not achievable, the Utility may reject the Application.

3.11 Projects Behind a Utility Customer Load

Projects located Behind a Utility Customer Load are not eligible to apply under the SOP.

3.12 Previous, Current and Future EPAs with the Utilities

If the Utility previously signed an EPA with respect to a Project, that Project is eligible for the SOP, provided that (i) the Project did not achieve commercial operation while the original EPA was in effect, and (ii) the original EPA has been terminated in accordance with its terms and all other post-termination conditions and restrictions in that EPA have been satisfied.

The Utility may determine in its Discretion whether or not a Project submitted to the SOP constitutes the same project as a project for which an EPA was previously signed with the Utility. Factors the Utility may consider include, but are not limited to, the location, permits, licenses and site tenure, and the Developer (including ownership structure) of the Project submitted to the SOP, relative to the prior project.

If a Project is determined to be part of a Project Cluster, and the Utility has entered into an EPA(s) for generation from any project in that Project Cluster:

(a) where the Project is located on the YIS, the Project is eligible for the SOP provided each Project in that Project Cluster has a Nameplate Capacity between 30 kW up to and including 2000 kW; and

(b) where the Project is located on the WLG, the Project is eligible for the SOP provided each Project in that Project Cluster has a Nameplate Capacity between 30 kW up to and including 500 kW.

If the Utility accepts an Application from a Project that is part of a Project Cluster, the Developer shall be required to pay for all System Upgrades and New Interconnection Facilities which the Utility requires to address any constraints or limitations on the delivery of energy resulting from such Project Cluster identified in the System Interconnection Study.

3.13 Environmental Attributes

All Environmental Attributes for the energy delivered to the Utility under the EPA must be transferred to the Utility. The value of the Environmental Attributes is included in the price paid for energy delivered under the SOP and is not paid separately to the Developer.

3.14 EPAs with Third Parties

A Project is not eligible for the SOP if there are any agreements with a third party or parties for the purchase and sale of electricity, or any Environmental Attributes or other ancillary services from such electricity, from any generator in the Project. Any such third party agreements must be terminated prior to submitting an Application for the SOP.

3.15 Conflicts of Interest

The Developer must not be in or have the potential to be in an actual, apparent or deemed conflict of interest as a result of entering into an EPA with the Utility. The Developer must inform the Utility, by completing and submitting a Conflict of Interest Statement form, of any disclosures required under the Utility's Contractor Standards for Ethical Conduct and any potential conflicts of interest it may have with the Utility or the Utility's directors, officers or employees. The Conflict of Interest Statement Form and the Utility's Contractor Standards for Ethical Conduct are

attached to these Rules as Exhibit "E" and Exhibit "F", respectively, and can also be found at the "Documents" page of the SOP Website.

If the Developer has any directors, officers, owners (with 20 per cent or more direct or indirect ownership in the Developer or its affiliates), or Project team members who have been directors, officers or employees of YG or the applicable Utility or its subsidiaries at any time in the two years preceding the submission of the Application, the Utility will deem there to be a conflict of interest.

The applicable Utility will review the Conflict of Interest Statement Form and each shall determine, in its Discretion, whether there is any actual, apparent or deemed conflict of interest.

3.16 Interconnection

All Projects must be interconnected to the YIS or the WLG directly through a New Interconnection Facility. Projects that would require the Utility to transmit energy other than directly to either the YIS or the WLG through the New Interconnection Facilities are not eligible for the SOP.

In the case of Projects to be interconnected to a portion of the YIS owned by AEY, AEY shall own the New Interconnection Facilities and the Developer shall be required to enter into an Interconnection Agreement with AEY. In such case, YEC shall coordinate with AEY development of the New Interconnection Facilities by AEY and the Developer shall not coordinate such activities/work directly with AEY unless otherwise agreed to by the Utilities.

The System Interconnection Study will be completed by the Utility at the Developer's cost in accordance with these Rules, whether completed during the Preliminary Feasibility Assessment Phase or during the Application Phase.

Whether the System Interconnection Study is completed during the Preliminary Feasibility Assessment Phase or during the Application Phase, following completion of such study and review and assessment of the same by the Utility, the Utility shall have the right to reject such Developer and the Project if the Utility determines in its Discretion that a Project is not technically feasible.

3.17 Consultation

Notwithstanding YG's duty to consult with First Nations, Developers are required to engage with any applicable First Nations and residents of applicable communities to seek their views and inputs early in the process. Developers must document their engagement efforts, including keeping reports, logs, letters of support, and correspondence. Developers will be responsible for all consultation with applicable First Nations and residents of applicable communities in respect of the Project, including the New Interconnection Facilities and System Upgrades. Other than in respect of System Upgrades, the Utilities shall have no responsibility for such consultation in respect of the Projects, nor will the Utilities have any obligation to assess the adequacy of such consultation by the Developer.

YG and the Utilities strongly encourage all Developers to confirm they have all of the necessary permits or permit amendments in place and to obtain information on any consultation with First Nations that may be required in relation to the Project.

4. ENERGY PRICE AND LINE LOSSES

All payments under an EPA will be administered by the applicable Utility entering into the EPA. All EPAs with Developers of Projects proposing to interconnect to the YIS shall be entered into with YEC and all EPAs with Developers of Projects proposing to interconnect to the WLG shall be entered into with AEY.

4.1 Purchase Price for Energy

The purchase price for energy (the **Energy Price**) per kWh delivered under an EPA shall be determined as follows:

(a) for an EPA with a Developer in which the Project is interconnected to the YIS, the Energy Price for the initial calendar year shall be equal to applicable Base Fuel Price determined for such EPA in accordance with Section 4.2 below and thereafter the Energy Price for a particular calendar year shall be determined by increasing the Energy Price paid in the immediately preceding calendar year by 50% of the percentage increase, if any, in the CPI in such preceding calendar year; and

(b) for an EPA with a Developer in which the Project is interconnected to the WLG, the Energy Price for the initial calendar year shall be equal to applicable Base Fuel Price determined for such EPA in accordance with Section 4.2 below and thereafter the Energy Price for a particular calendar year shall be determined by increasing the Energy Price paid in the immediately preceding calendar year by 100% of the percentage increase, if any, in the CPI in such preceding calendar year.

The Energy Price is the only amount payable by the Utility. There is no additional payment for Environmental Attributes, for environmental certification (as defined in the Standard Form EPA) or any other expenses.

4.2 Calculation of Base Fuel Price

The applicable **Base Fuel Price** means the following amount determined by the Utilities:

(a) **YIS EPA** - for an EPA with a Developer in which the Project is interconnected to the YIS, the Base Fuel Price is to be equal to the YEC's average blended fuel price per kWh for thermal generation most recently approved by the YUB before the date on which the EPA takes effect; and

(b) **WLG EPA** - for an EPA with a Developer in which the Project is interconnected to the WLG, the Base Fuel Price is to be expressed in cents per kWh and will be equal to the weighted average cost of fuel purchased by AEY for the purpose of producing electricity by means of thermal generation for the five years immediately preceding the date on which the EPA takes effect divided by the weighted average heat rate for the plant for the five years immediately preceding the date on which the EPA takes effect and, if applicable, shall account for any reduction in the maintenance, capital or other costs arising from the displacement of thermal generation as a result of the electricity generated by the Project.

4.3 Seasonal Adjustment on YIS

For Developers of Projects proposing to interconnect to the YIS, the escalated Energy Price referred to in Section 4.1 may be further adjusted based upon the month when the energy is delivered to establish the payment price for each kWh of energy delivered to the POI. The monthly delivery adjustments are contained in the Standard Form EPA.

4.4 Line Losses

The price described above applies to the quantity of energy delivered at the Point of Interconnection (**POI**) adjusted for Line Losses. Developers shall be responsible for all Line Losses between (i) the POI and (ii) the point of interconnection between the New Interconnection Facilities and the YIS or WLG, as applicable. As the applicable Revenue Meter is located at the POI, the calculation of Line Losses is based on the formula to be established in the EPA, if and when executed, based on the System Interconnection Study.

5. APPLICATION PROCESS AND REVIEW

All aspects of the application process and review contemplated below shall be administered by YG and (i) YEC in respect of Developers of Projects proposing to interconnect to the YIS and (ii) AEY in respect of Developers of Projects proposing to interconnect to the WLG.

The Application Process must be completed sequentially in the following phases, the purpose of which is to ensure that Projects that are being advanced to the Application Phase have been well scoped, appropriate study work has been conducted and the Utility's assessment of such Project in the Application Phase is streamlined so as to minimize the administrative burden on the Utilities and the Developers.

The phases of this Application Process (outlined in Figure 1 at the end of this Section 5) are:

(a) Pre-Application Phase;

(b) Preliminary Feasibility Assessment Phase;

(c) Application Phase; and

(d) EPA Execution Phase.

5.1 Pre-Application Phase

The Pre-Application Phase shall commence upon submission by the Developer to the YG and the applicable Utility of the Pre-Application Form and, if required by either party, the completed Confidentiality and Compliance Agreement signed by the Developer. The Pre-Application Form and the Confidentiality and Compliance Agreement form are attached to these Rules and can also be found at the "Documents" page of the SOP Website. The applicable Utility shall have the right to reject any Developer and the Project which, in the Utility's assessment, has failed to submit a fully completed Pre-Application Form and, if required, the signed Confidentiality and Compliance Agreement.

5.1.1 Pre-Application Completeness Review by YG

YG will conduct a preliminary assessment of whether the potential applicant and Project will be able to meet the eligibility requirements and are properly prepared to submit a complete application to the Utility (the **Pre-Application Completeness Review**). YG shall assess the information which is available to YG including through the Pre-Application Form and advise the applicable Utility if the Pre-Application Completeness Review has been satisfied.

5.1.2 Preliminary Eligibility Approval by the Utility

Prior to proceeding to the Preliminary Feasibility Assessment Phase, a potential applicant shall require confirmation from the applicable Utility that it may proceed (a **Preliminary Eligibility Approval)**. The applicable Utility shall have the right to not issue such Preliminary Eligibility Approval to any potential applicant and Project which YG has advised has not satisfied the Pre-Application Completeness Review or which otherwise, in the Discretion of the Utility, will not be able to meet the eligibility requirements. Notwithstanding that a Utility issues a Preliminary Eligibility Approval to a potential applicant, such Utility reserves the right to reject at any time any potential applicant and the Project which such Utility subsequently determines, in its Discretion, will not be able to meet the eligibility requirements.

Potential applicants should be careful to include complete and accurate information in this Pre-Application Phase as any variance between the information received and assessed in this preliminary assessment and the information contained in an Application or actual Project conditions may result in a final decision that is different from the preliminary assessment. As set out in Section 1 of these Rules, the Utilities may amend the SOP Rules at any time. A change in the SOP Rules may also result in a final decision that is different from the preliminary assessment.

The preliminary assessment by YG and the Utility in the Pre-Application Phase is based on the information provided to YG and the Utility and the SOP Rules in effect at the date of the preliminary assessment. A preliminary assessment is not binding on YG or either Utility and shall in no way give any potential applicant any rights in the Application Process or any right to enter into an EPA with the Utility.

5.1.3 Pre-Application Meeting

Potential applicants to the SOP are strongly encouraged to request a meeting or conference call with YG and the applicable Utility at any time prior to submitting a Pre-Application Form. The purpose of the pre-application meeting is to review the SOP Rules, the Application Process, the Standard Form EPA, the interconnection requirements and study costs, First Nations consultation requirements and other matters required to facilitate the Application Process, such as available energy volume within the System-wide Limits, basic interconnection information and other topics that may be the subject of a preliminary assessment. To arrange a pre-application meeting or conference call, Developers should submit a request for such meeting by email to the SOP Administrator at *IPPAdministrator@gov.yk.ca*. The SOP Administrator shall then coordinate with the Utility.

5.2 Preliminary Feasibility Assessment Phase

A potential applicant that is issued a Preliminary Eligibility Approval by the Utility shall be entitled to proceed to the Preliminary Feasibility Assessment Phase. The purpose of this phase is to facilitate more detailed Project assessment by the potential applicant. Potential applicants are strongly encouraged to contact the Utility early in the planning process to discuss the interconnection concept and feasibility for their Project.

During this phase, the potential applicant may conduct more detailed Project assessment, commence the process required to receive the YESAB Adequacy Confirmation, if required, and may, at its cost, initiate a System Interconnection Study with the Utility.

During this phase, the Utility shall have the right to reject any potential applicant and Project which, in the Utility's assessment, is not technically feasible.

5.3 Application Phase

A potential applicant that is issued a Preliminary Eligibility Approval and has received the YESAB Adequacy Confirmation, if required, for its Project shall be entitled to proceed to the Application Phase described below.

5.3.1 Submitting an Application

To apply for the SOP, the Developer must submit the following:

- a completed Application signed by the Developer, with applicable exhibits, in electronic form; and
- if required by either the Developer or the applicable Utility, a completed Confidentiality and Compliance Agreement signed by the Developer (if not previously submitted with a pre-application meeting or preliminary assessment request),

by email to the SOP Administrator and the applicable Utility in accordance with Section 9 of these Rules or by designated upload site specified by the SOP Administrator.

The Application Form and Confidentiality and Compliance Agreement are attached to these Rules and can also be found at the "Documents" page of the SOP Website.

5.3.2 Application Review

(a) **Completeness Review** – Upon receipt of the Application, the Utility will provide the Developer with a written acknowledgement and will perform a completeness review to ensure that it has all the information required to proceed with the Application Review. At a minimum, the Developer will have submitted the following in order to commence the Application Review:

- a signed Application;
- all exhibits marked for inclusion by the Developer;
- if required, a signed Confidentiality and Compliance Agreement; and

- the YESAB Adequacy Confirmation, if required.

The Utility reserves the right to require additional information and/or documents including verification as to the good standing of the Developer before commencing the Application Review. The Utility may reject the Application in the event the Developer fails to provide such additional information and/or documents.

In the event the Application is incomplete, the Utility may request additional information or clarification from the Developer. Depending upon how much information is missing from the Application, the Utility will either (1) keep the Application and request submission of the missing information subject to Section 5.7 of these Rules or (2) reject the Application.

The Utility will notify the Developer in writing upon completion of the completeness review.

(b) **Eligibility Review and Application Review** – The Utility will perform an eligibility review and the Application Review.

An eligibility review assesses whether the Developer and the Project meet, or will be able to meet, the eligibility requirements described in Section 3 of these Rules. Except in respect of Outstanding Permits described below, the Utility will reject an Application that has not met the eligibility requirements upon submission of the Application.

The Utility recognizes that the eligibility requirements in Section 3 of these Rules require that all necessary permits, licenses or approvals have been received by the Developer and that receipt of certain of such permits, licenses or approvals may not be achievable by the time of submission of the Application (**Outstanding Permits**). Accordingly, the Utility has the right to conduct the Application Review notwithstanding that such Outstanding Permits have not been received by the Developer and require that such Outstanding Permits be received prior to the EPA becoming effective. Where a Project is an assessable activity under YESAA, in no circumstances will the Application Review commence prior to the Developer receiving the YESAB Adequacy Confirmation.

In the event the Utility is unable to confirm the Project's eligibility under the SOP, the Utility may request additional information or clarification from the Developer. Depending upon how much information is missing from the Application, the Utility will either (1) keep the Application and request submission of the missing information subject to Section 5.7 of these Rules or (2) reject the Application.

The Utility will notify the Developer in writing of the results of the Application Review and whether the Application is retained or rejected following completion of this step.

(c) **Registration Under the Available System-wide Limits** – For each Application that is retained following completion of the steps described in Section 5.3.2(b) of these Rules, the Utility will notify YG and YG shall register the Project (including the applicable Developer, the Project Energy Volumes and Target Developer's COD for the Project) in the SOP Queue on the SOP Website. The Utility will notify the Developer in writing upon completion of the registration by YG, provided that neither YG nor the Utility make any representation or warranty that such registration provides the Developer any right to enter into an EPA.

5.3.3 Review of System Interconnection Study

(a) For each Application that is retained following completion of the steps described in Section 5.3.2 of these Rules, the Utility will, at the Developer's cost, conduct the System Interconnection Study, unless such System Interconnection Study has been previously completed by the Utility for the Developer during the Preliminary Feasibility Assessment Phase under Section 5.2 of these Rules. The Developer must file a complete System Interconnection Study application with the Utility for the System Interconnection Study and pay the applicable study fees specified by the Utility within 28 Days following the request by the Utility, or the Application may be rejected. The Utility shall not be required to perform or commit to perform any work relating to the System Interconnection Study unless and until the Developer has paid in advance the estimated amount of such costs required by the Utility delivered a complete System Interconnection Study application.

(b) If the Developer submits a System Interconnection Study application with a Plant Capacity and Nameplate Capacity or other material information that is not the same as the Plant Capacity and Nameplate Capacity or other information described in the Application, the Application will be rejected.

(c) Upon completion of the System Interconnection Study, the Utility will review the System Interconnection Study to determine whether the Utility is ready to support the Project's interconnection to the YIS or WLG, as applicable. Without limiting any other rights of the Utility to reject an Application under these Rules, the Utility may reject an Application if the System Interconnection Study indicates that the proposed New Interconnection Facilities and System Upgrades are not capable of being completed at least 90 Days prior to the Target Developer's COD specified by the Developer in the Application.

(d) Developers should note that a System Interconnection Study may become out-of-date and invalid if further studies or steps are not commenced within the time required by the Utility.

(e) The Developer shall notify the Utility and other Governmental Authorities, including YESAB and other permitting or licensing agencies, having jurisdiction over the Project of any changes to the Project arising from the System Interconnection Study or other work completed since the submission of the original Application or the YESAB Adequacy Confirmation. In such case, the Developer will be required to submit a Statement of Project Changes to the Utility and the Utility will determine whether the Application needs to be re-submitted by the Developer for review based on the nature of any changes submitted in the Statement of Project Changes. If the Developer is required to re-submit the Application, the Utility shall notify YG that the Application has been rejected and YG shall remove the Developer and the Project from the SOP Queue.

5.4 EPA Execution Phase

Provided (i) the Developer's Application has not been rejected following completion of the steps described in Section 5.3 of these Rules and (ii) where a Project is an assessable activity under YESAA, the Developer has received such Regulatory Agency Authorizations for the Project, the Developer shall be entitled to proceed to the EPA Execution Phase described below.

5.4.1 EPA Preparation

The following shall apply to the EPA preparation:

(a) The Utility expects that the Standard Form EPA will not be modified except as may be necessary for a Project. (See Section 7.2 of these Rules)

(b) Developers are encouraged to carefully review the Standard Form EPA prior to submitting an Application. The Utility will not consider any changes proposed by Developers to the Standard Form EPA in their Application or otherwise. The Utility may reject an Application that contains proposed changes to the Standard Form EPA.

(c) The Utility may advise the Developer of required changes to the Standard Form EPA based on a review of the Application. The Utility then expects to provide the Developer with a draft EPA for the Developer's review and comment. If required, the Utility may also exchange subsequent drafts with the Developer. Once the Utility sends a draft EPA to the Developer, the Developer is expected to provide its response and comments to the Utility within a commercially reasonable period of time. Failure to do so may result in rejection of the Application.

(d) For each Application that is retained following completion of the steps described above in this Section 5.4.1:

(i) the Utility will request that the Developer completes and submits a Statement of Project Changes that identifies any changes to any information in the Application; and

(ii) the Utility will prepare a final draft EPA and present it to the Developer for review and comment.

The Developer is required to submit such a Statement of Project Changes and provide comments on the final draft EPA within a commercially reasonable period of time or the Application may be rejected.

5.4.2 EPA Offer and Acceptance

(a) After completion of the process described in Section 5.4.1 of these Rules, including the filing of all required documents, the Utility will send the Developer either an offer of an EPA or a notice of rejection of the Application.

(b) If the Developer wishes to accept the offer of an EPA, the Developer must sign the EPA and deliver it to the Utility at the address specified in Section 9 of these Rules. If the Developer has not delivered the signed EPA within 28 days following the offer, the Utility's offer of an EPA may be withdrawn upon notice by the Utility.

(c) Subject to Section 5.4.2(d) of these Rules, the Utility will send a fully signed EPA to the Developer after receipt by the Utility of the signed EPA from the Developer.

(d) The Utility may withdraw an offer of an EPA, without liability, at any time prior to delivery of the fully-signed EPA to the Developer.

5.5 Amending Applications

Developers may amend an Application at any time prior to delivery of an offer of an EPA by the Utility to the Developer. Any such amendment may extend the Utility's Application review and EPA offer timelines.

Developers should note that any amendments that may result in a change to a System Interconnection Study may invalidate or impact the System Interconnection Study. If the System Interconnection Study is impacted (as determined by the Utility) or the Project Energy Volume available from the Project is impacted prior to execution of an EPA by both the Utility and the Developer, the Application may be rejected.

5.6 Withdrawing Applications

Developers may, by written notice to the Utility, withdraw a submitted Application, without liability, at any time prior to signing an EPA; provided that Developers shall remain liable for all costs incurred by the Utility under Sections 5.2, 5.3.3, 6.1 and 6.5 of these Rules.

5.7 Request for Further Information/Meetings

The Utility may, but is not required to, request further information, clarification or verification concerning an Application or other communication received from a Developer. Failure to respond to such a request within 28 Days after the date of the request may result in rejection of an Application. The Utility may telephone or meet with any Developer or group of Developers at any time prior to or following submission of any Application or Applications.

5.8 Due Diligence and Consultation

The Utility may, but is not required to, undertake any investigation or inquiries and/or undertake any consultation with any Governmental Authority or any other Person or group as the Utility considers necessary in its Discretion with respect to a Developer, a Project, and/or an Application and may, in reviewing an Application, consider any information received as a result of such investigation, inquiry and/or consultation.

5.9 Rejecting Applications

The Utility may accept or reject any Application and may decide to offer or not to offer an EPA to a Developer at its Discretion. The Utility may reject an Application at any stage in the Application Review process notwithstanding any prior decision by the Utility in the Application Review process or prior completion of any step in the Application Review process. Without limiting any other rights of the Utilities to reject an Application under these Rules, the reasons for rejection of an Application and/or a decision not to offer an EPA to a Developer may include, but are not limited to:

(a) an incomplete Application;

(b) an Application does not meet the eligibility requirements set out in Section 3 of these Rules;

(c) failure to respond to a request by the Utility for additional information, failure to respond to or accept Project-specific EPA changes requested by the Utility and/or failure to file a System Interconnection Study application or Statement of Project Changes within the required time limits;

(d) a System Interconnection Study becomes invalid at any time prior to execution of an EPA by both the Utility and the Developer;

(e) a System Interconnection Study indicates that the proposed New Interconnection Facilities and System Upgrades are not capable of being completed at least 90 Days prior to the Target Developer's COD specified by the Developer in the Application;

(f) an Application proposes Standard Form EPA amendments that are not acceptable to the Utility, in its Discretion;

(g) an Application for a Project that the Utility determines requires material Standard Form EPA amendments or that is too complex to be an appropriate Project for the SOP;

(h) an Application for a Project that will result in any costs being borne by the Utility that are not acceptable to the Utility;

(i) a Developer fails to pay costs required to be paid by it in accordance with these Rules;

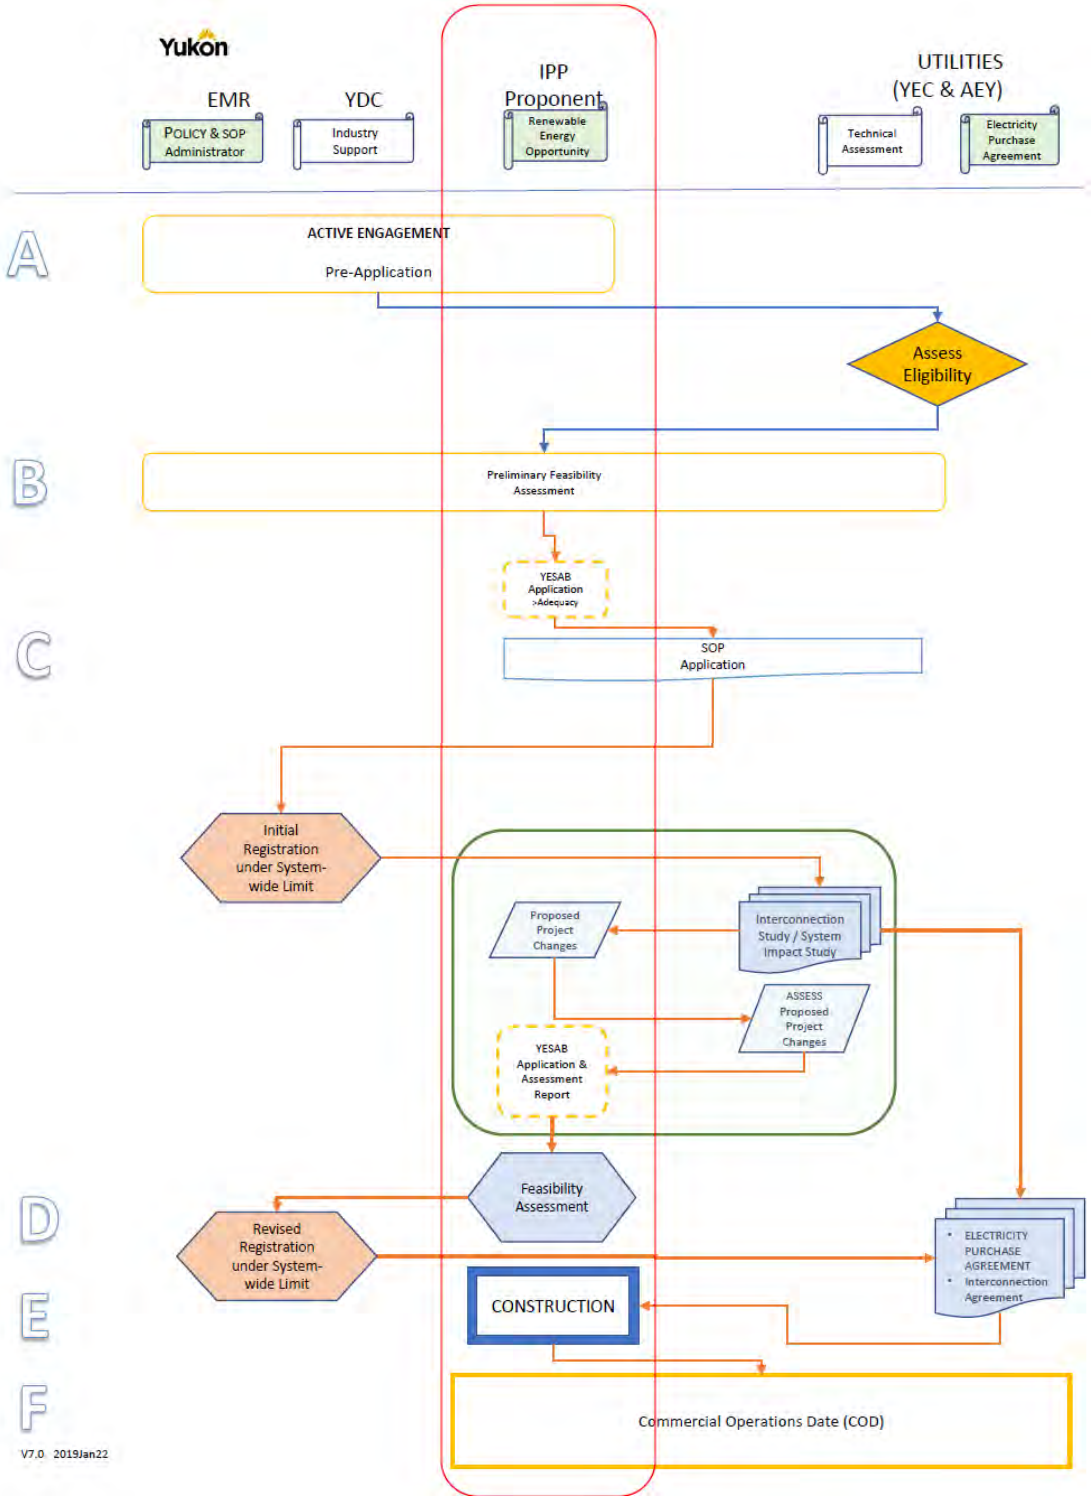
(j) an Application in respect of which any of the information included in the Application is not satisfactory to the Utility in any respect; or

(k) an Application in respect of which the Utility determines that the Developer has, or by entering into an EPA, would have, an actual, apparent, or deemed conflict of interest.

If the Application is rejected, the Developer can request an information meeting with the Utility to discuss the reasons for the rejection.

A rejected Application can be resubmitted at a later date provided the deficiencies or issues noted as reasons for rejection have been addressed. A rejected Application will have its Project Energy Volume deregistered from the SOP Queue.

Figure 1 – Application Process



6. INTERCONNECTION

All aspects of the interconnection process shall be administered by YEC for Projects on the YIS or AEY for Projects on the WLG. All inquiries should be directed to the applicable Utility in accordance with Section 9 of these Rules.

INTERCONNECTION REQUEST PROCESS

6.1 Interconnection Requirements

All generators connected to the YIS or WLG are required to meet the applicable Utility's technical interconnection requirements. In order to determine these requirements and assess the impacts to the Utility's system from the proposed interconnection for the purpose of identifying the required network upgrades, technical studies, including a System Interconnection Study, must be performed. These studies provide cost estimates of the required upgrades. Following the completion of these studies, the Utilities may adjust the Target Developer's COD proposed by any Developer for a Project.

The System Interconnection Study will be completed by the Utility at the Developer's cost in accordance with these Rules. Following completion of the System Interconnection Study and review and assessment of the same by the Utility, the Utility shall have the right to reject such Developer, the Project and the applicable Application (if the Developer has proceeded to the Application Phase) set out in Section 3.16 of these Rules.

6.2 Direct Interconnections

All Projects are required to be directly interconnected to the Transmission System or Distribution System. A valid System Interconnection Study is required for all Projects. The Plant Capacity in the System Interconnection Study must be equal to the Plant Capacity in the Application and EPA.

All interconnection studies are a part of the interconnection process. For further information regarding the System Interconnection Study referred to above, please contact the applicable Utility at the address described in Section 9 of these Rules.

6.3 Early Contact and System Interconnection Study Timing

Developers are strongly encouraged to contact the Utility early in the planning process to discuss the interconnection concept and feasibility for their Project.

As previously noted, a System Interconnection Study may become invalid if further studies or further steps are not commenced within the time required by the Utility. Accordingly, the Utilities recommend Developers file their System Interconnection Study application with the Utility at the time they submit their Application.

6.4 Interconnection Issues

For questions related to interconnection including the process for completion of a System Interconnection Study, please contact the applicable Utility in accordance with Section 9 of these Rules.

Complete details on the interconnection process can be found at:

https://yukonenergy.ca/energy-in-yukon/standing-offer-program

RESPONSIBILITY FOR COSTS

6.5 Interconnection Study Costs

The Developer will be responsible for the costs of the System Interconnection Study and any other studies required for the interconnection of the Project to the YIS or WLG, as applicable. The Developer shall be required to pay the Utility, in advance, the estimated costs of such studies. The Utility and the Developer will true up such costs to actuals within a reasonable period of time following completion of the studies.

6.6 Transmission Costs

Subject to the provisions of Section 4.4 respecting Line Losses, the Developer will not be responsible for the cost to transmit power sold under the EPA from the POI.

6.7 New Interconnection Facilities Costs and Ownership

The Developer will be responsible for all New Interconnection Facilities Costs. An estimate of these costs will be provided in the System Interconnection Study. The Developer shall be required to pay the Utility, in advance, the estimated costs of the New Interconnection Facilities. The Utility shall not be required to perform or commit to perform any work relating to the New Interconnection Facilities unless and until the Developer has paid in advance the estimated amount of such costs required by the Utility in respect of the New Interconnection Facilities. The Utility and the Developer will true up such costs to actuals within a reasonable period of time following completion of the New Interconnection Facilities.

The Utility will construct (or cause to be constructed), own and operate the New Interconnection Facilities. All New Interconnection Facilities located within the service area of a Utility will be owned by such Utility and will become part of the YIS or WLG, as applicable. For certainty, in respect of Projects to be interconnected to a portion of the YIS which is the service area of AEY, AEY shall own the New Interconnection Facilities and YEC shall coordinate with AEY development of the New Interconnection Facilities by AEY.

6.8 System Upgrade Costs and Ownership

The Developer will be responsible for all costs of the System Upgrade Costs. An estimate of these costs will be provided in the System Interconnection Study. The Developer shall be required to pay the Utility, in advance, the estimated costs of the System Upgrade Costs. The Utility shall not be required to perform or commit to perform any work relating to the System Upgrade Costs unless and until the Developer has paid in advance the estimated amount of such costs required by the Utility in respect of the System Upgrade Costs. If such amounts are paid in advance by the Developer, the Utility and the Developer will true up such costs to actuals within a reasonable period of time following completion of the System Upgrade Costs.

The Utility will construct (or cause to be constructed), own and operate the System Upgrades. All System Upgrades located within the service area of a Utility will be owned by such Utility and will become part of the YIS or WLG, as applicable. For certainty, in respect of Projects to be

interconnected to a portion of the YIS which is the service area of AEY, AEY shall own the System Upgrades constructed in the service area of AEY, and YEC shall coordinate with AEY development of the System Upgrades by AEY.

6.9 Cost Sharing of New Interconnection Facilities and System Upgrade Costs

In the event that a new Developer connects to existing New Interconnection Facilities which were paid for by one or more other Developers (the **Prior Developers**) within the five years prior to the date of the new Developer's Commercial Operation Date, such new Developer will be required to pay to the Utility a share of the costs paid by such Prior Developers for such New Interconnection Facilities and/or any System Upgrades, such share to be determined by the Utility in its Discretion. The Utility will pay such amount paid by the new Developer to the Prior Developers.

6.10 Revenue Meters

The Utility shall be responsible to install and maintain an appropriate revenue class Revenue Meter for the Project which is tested and sealed and approved for revenue purposes by Measurement Canada. The costs of such Revenue Meter shall be included in the New Interconnection Facilities and paid for by the Developer. An estimate of these costs will be provided in the System Interconnection Study. The Revenue Meter shall be located at the POI between the Developer's Project and the New Interconnection Facilities installed by or on behalf of the Utility and installed in accordance with the Utility's revenue metering requirements. Disputes in respect of the accuracy of such meter shall be resolved in accordance with the EPA.

7. ELECTRICITY PURCHASE AGREEMENT

Developers of Projects (i) proposing to interconnect to the YIS shall enter into the EPA with YEC and (ii) proposing to interconnect to the WLG shall enter into the EPA with AEY. All aspects of the Standard Form EPA will be administered by the applicable Utility and references to a Utility below means such Utility.

7.1 Standard Form EPA

The Standard Form EPA is in the form attached to these Rules and is also available at the "Documents" page of the SOP Website.

The Standard Form EPA is based on a "standard" type of Project and Developer. For example, the Standard Form EPA assumes that the Project consists of a new generator that has a direct and independent interconnection through the New Interconnection Facilities to YIS or WLG, as applicable, and will have a Revenue Meter that measures output only from the Project and no other electricity generators. The Standard Form EPA also assumes that the Developer is a corporation. If a Project is part of a Project Cluster, separate EPAs shall be required in respect of each Project within the Project Cluster.

7.2 EPA Changes

The Utility does not anticipate that any changes will be necessary to the Standard Form EPA with respect to any Application, however, if determined by the Utility in its Discretion due to the technical aspects of the Project, the Utility may change the Standard Form EPA as required based on the information in the Application.

As outlined in Section 5.4.1 of these Rules, Developers are encouraged to carefully review the Standard Form EPA prior to submitting an Application. The Utility, in its Discretion, shall have the right to reject any changes proposed by Developers to the Standard Form EPA in their Application or otherwise. The Utility may reject an Application that contains proposed changes to the Standard Form EPA which are not acceptable to the Utility, in its Discretion.

7.3 EPA Term

Developers may elect a single term under an EPA of up to the following number of years for the applicable Eligible Clean Energy:

Eligible Clean Energy	Term Limit
Wind	25 years
Hydro	40 years
Geothermal	40 years
Biomass	20 years
Solar	25 years

After the term of the EPA expires, the Utility will determine whether it is prepared to enter into negotiations with the owner of the Project regarding a new EPA for the Project. The Utility's determination will be based on its need for the electricity, prevailing market conditions, energy price, and power procurement practices at the time. If the Utility wishes to enter into a new EPA for the Project, the Utility expects that the price it offers for energy will assume that all initial capital costs for the Project have been recovered during the term of original EPA. The Utility shall not be required to enter into a renewal or new EPA and the terms of the prior EPA shall not limit the terms on which the Utility may negotiate such renewal or new EPA.

8. ADDITIONAL RULES

8.1 Costs

Developers are responsible for all costs incurred by them in connection with the SOP and this Application Process, including the costs of preparing an Application and any other submission required under the SOP, all System Interconnection Study costs and the execution and delivery of any EPA.

8.2 Nature of Process

The SOP is not a call for tenders. No legal offer, legal contract or legal duties (including any duty of fairness) or obligations of any kind whatsoever, whether express or implied, are intended to be created by or under these Rules, or by the filing of an Application, or the acceptance of an Application for review, or the review of an Application, or in any other manner whatsoever under or in connection with the SOP except for those arising under an EPA that has been signed and delivered by both the Developer and a Utility. A Utility shall have no liability whatsoever for the actions of YG or the other Utility.

8.3 Waiver

A Utility may waive any provision of these Rules, including any of the eligibility requirements, in respect of any Project which proposes to interconnect into the Distribution System or Transmission System owned by such Utility where the Utility determines in its Discretion that

such waiver would be consistent with the objectives of the SOP or is otherwise in the public interest or the ratepayers' interest. A waiver by a Utility in respect of one Project shall not bind any Utility in respect of any other Project.

8.4 Program Suspension/Cancellation

The Utilities may cancel or suspend the SOP at any time, without any liability of either YG or the Utilities to any Developer or to any other Person, where the Utilities are required to cancel or suspend the SOP by YG or as the Utilities may determine is required by the IPP Policy, the SOP OIC or any amendments thereto.

8.5 Program Amendments

As noted above, YG intends to review the IPP Policy every 2 years. YG may make any amendments to the IPP Policy at any time. The Utilities are authorized to make any amendments to these Rules (including any Reference Documents) and the Standard Form EPA at any time to support the SOP and IPP Policy all in accordance with Section 1 to these Rules.

8.6 No Liability

Neither YG nor the Utilities (including its affiliates, and their respective directors, officers, employees, contactors, subcontractors, consultants, agents and representatives) has any liability of any nature or kind whatsoever to any Person in connection with the SOP or the administration of the SOP, or information provided with respect to, or in the course of, the SOP, or the acceptance, rejection, or review of any Application, or any other decision, assessment, determination, statement, act or omission whatsoever, whether negligent or not, relating to the SOP or its administration.

8.7 Unsolicited Information Not Considered

The Utilities are not required to consider any information with respect to an Application that is not contained in the Application, or any written response to a request from a Utility for further information, clarification or verification.

8.8 Ownership of Documents

All Applications and all documents filed with an Application and all other submissions by a Developer under or in relation to the SOP will be retained by, and become the property of the applicable Utility, provided however that the applicable Utility shall not thereby acquire any ownership interest in intellectual property embedded therein.

8.9 Other Utility Power Procurement Processes

A Utility may at any time reject an Application for a Project that is the subject of a submission in any other Utility power procurement process.

8.10 Filing Requirements

If the last day for completing any act required or contemplated under these Rules falls on a day that is a Saturday, Sunday or other day recognized as a statutory holiday in Yukon, the time for

completing that act will be extended to the next day that is not a Saturday, Sunday or other day recognized as a statutory holiday in Yukon.

9. COMMUNICATION UNDER SOP

9.1 General

Communication from Developers should originate from the contact person(s) specified in the Application. Developers may change their contact persons by notice to the SOP Administrator and the applicable Utility. Developers should communicate in writing (which may include email). Developers should note that any questions or communications submitted and subsequent answers by YG and/or the Utilities respecting the SOP may be posted by YG on the SOP Website.

To avoid any potential misunderstandings and for administrative ease, Developers shall not contact the YG or the Utilities in respect of the SOP except (a) in the case of YG, through the SOP Administrator, and (b) in the case of each Utility, through the designated Utility contact person, as set out below:

(a) to the SOP Administrator

by email to: *IPPAdministrator@gov.yk.ca*

or by mail to: Yukon Government
Energy Branch
Box 2703 (EMR-206)
Whitehorse, Yukon, Y1A 2C6
Attention: SOP Administrator

(b) to YEC

by email to: *IPP@yec.yk.ca*

or by mail to: Yukon Energy Corporation
Standing Offer Program
#2 Miles Canyon Road
Box 5920
Whitehorse, Yukon, Y1A 6S7
Attention: President

(c) to AEY

by email to: *AEY_SOP@atco.com*

or by mail to: ATCO Electric Yukon
Standing Offer Program
100-1100 Front St
Whitehorse, Yukon, Y1A 3T4
Attention: Manager

YG may change the SOP Administrator at any time. The SOP Administrator and each Utility may change their contact persons at any time by notice to Developers.

10. REFERENCE DOCUMENTS

The following Reference Documents are attached to these Rules and can also be found at the "Documents" page of the SOP Website.

EXHIBIT "A"	Pre-Application Form
EXHIBIT "B"	Application Form
EXHIBIT "C"	Statement of Project Changes Form
EXHIBIT "D"	Standard Form EPA
EXHIBIT "E"	Conflict of Interest Statement Form
EXHIBIT "F"	Contractor Standards for Ethical Conduct
EXHIBIT "G"	Confidentiality and Compliance Agreement

GLOSSARY – STANDING OFFER PROGRAM RULES

All references to section numbers are to sections of these Rules, not the Application Form or Standard Form EPA, unless otherwise expressly stated.

1. **AEY** and **ATCO Electric Yukon** means Yukon Electrical Company Limited, doing business as ATCO Electric Yukon.

2. **Application** means the Application Form for a Project as submitted by the Developer to the Utility together with all amendments thereto filed by the Developer and all supporting documents and information filed by the Developer with the Utility with respect to the Project, including the System Interconnection Study or other studies required by the Utility and Statement of Project Changes.

3. **Application Form** means the form titled "Standing Offer Program Application Form" in the form attached to these Rules and which is also available at the "Documents" page of the SOP Website.

4. **Application Phase** means the Application Phase described in Section 5.3 of these Rules.

5. **Application Process** means all 4 phases of the process described in these Rules being the Pre-Application Phase, Preliminary Feasibility Assessment Phase, Application Phase and EPA Execution Phase.

6. **Application Review** means the review process conducted by the Utility once a completed Application has been received, as outlined in Section 5.3.1 of these Rules.

7. **Base Fuel Price** has the meaning given to it in Section 4.2 of these Rules.

8. **Behind a Utility Customer Load** means a Project with an indirect interconnection to the YIS or WLG through a facility of a Utility customer which purchases power from the Utility.

9. **Commercial Operation Date** or **COD** has the meaning given in the Standard Form EPA.

10. **CPI** means the "Canada All Items (Not Seasonally Adjusted)" Consumer Price Index as published by Statistics Canada or any successor agency thereto.

11. **Day** means any calendar day including Saturday, Sunday or Yukon statutory holiday.

12. **Developer** means the developer or owner of a Project that submits an Application under the SOP.

13. **Discretion** (whether or not capitalized) means sole, absolute and unfettered discretion unless these Rules expressly state otherwise.

14. **Distribution System** means the distribution, protection, control and communication facilities in the Yukon that are or may be used in connection with, or that otherwise relate to, the transmission of electrical energy at 35 kV or less, and includes all additions and modifications thereto and repairs or replacements thereof.

15. **Eligible Clean Energy** means wind, hydro, geothermal, biomass and solar energy sources permitted under the IPP Policy for the SOP generated by a Project located in Yukon which is directly connected into the YIS or the WLG through the New Interconnection Facilities.

16. **Energy Price** has the meaning given to it in Section 4.1 of these Rules.

17. **Environmental Attributes** has the meaning given to that term in the Standard Form EPA.

18. **EPA** means an electricity purchase agreement offered to a Developer under the Standing Offer Program.

19. **EPA Execution Phase** means the EPA Execution Phase described in Section 5.4 of these Rules.

20. **First Nation** means any one of the 14 First Nations in the Yukon.

21. **Governmental Authority** means any federal, territorial, local or foreign government or any of their boards or agencies, or any regulatory authority.

22. **Interconnection Agreement** means an agreement with a Utility for the interconnection of the Project to the New Interconnection Facilities.

23. **IPP Policy** means the documents entitled the *Independent Power Production Policy* released in October 2015 by YG, as amended in October, 2018, as may be further amended by YG from time to time.

24. **kV** means kilovolt.

25. **kW** means kilowatt.

26. **kWh** means kilowatt-hour.

27. **Line Losses** means losses of electricity associated with the transmission and transformation of energy and other electricity, if applicable.

28. **Micro-gen Program** means a Yukon program that allows residents of Yukon to offset their electrical consumption by connecting small-scale (less than 50 kW) renewable energy technologies to their homes or businesses while remaining connected to Yukon's electrical grid.

29. **MVA** means megavolt ampere.

30. **MW** means megawatt.

31. **MWh** means megawatt-hour.

32. **Nameplate Capacity** means the aggregate of the nameplate capacities of all the generators included in the Project. For each generator, nameplate capacity is expressed in kW and consistent with the equipment manufacturer's maximum rated generating capacity. Where the nameplate capacity is expressed in MVA, the nameplate capacity will be multiplied by the power factor stated on a generator's nameplate to determine the nameplate capacity in MW.

33. **New Interconnection Facilities** means those additions, modifications and upgrades required to interconnect the Project to the YIS or WLG, as applicable, identified in the System Interconnection Study (and as further refined in subsequent interconnection studies, if required by the Utility) and approved by the Utility, but excluding any System Upgrades. All New Interconnection Facilities become part of the YIS or WLG once the facility becomes operational.

34. **New Interconnection Facilities Costs** means all costs for the design, engineering, procurement, construction, installation and commissioning of the New Interconnection Facilities. See Section 6.7 of these Rules.

35. **OIC** means Order in Council.

36. **Outstanding Permits** means the Outstanding Permits described in Section 5.3.2(b) of these Rules.

37. **Permits** means permits, certificates, licences, approvals and other authorizations issued by any Governmental Authorities as may be required for the design, construction, ownership, operation, maintenance and decommissioning of (i) the Project and (ii) the New Interconnection Facilities.

38. **Person** means an individual, body corporate, firm, partnership, joint venture, trust, legal representative or other legal entity.

39. **Plant Capacity** means the Nameplate Capacity of the generators for a new project or a portion of the Nameplate Capacity of the generators that is allocated to the SOP where a new generator is added to existing project, expressed in kW.

40. **Point of Interconnection** or **POI** means the point at which the Project interconnects with the New Interconnection Facilities.

41. **Pre-Application Phase** means the Pre-Application Phase described in Section 5.1 of these Rules.

42. **Pre-Application Completeness Review** means the review conducted by YG in accordance with Section 5.1.1 of these Rules.

43. **Preliminary Eligibility Approval** means the preliminary eligibility assessment approval by the Utility issued pursuant to Section 5.1.2 of these Rules.

44. **Preliminary Feasibility Assessment Phase** means the Preliminary Feasibility Assessment Phase described in Section 5.2 of these Rules.

45. **Prior Developers** has the meaning given to it in Section 6.9 of these Rules.

46. **Project** means an electrical generation facility and includes all land and interests in land, buildings, equipment and material related to the generation facility as required for the generation and delivery of electrical energy to the point of delivery under the EPA. In the case of a Project that consists of incremental new generation, the "Project" for the purposes of the SOP consists of the new generator(s) and related facilities that are added to an existing generating facility.

47. **Project Cluster** means two or more existing or proposed Projects that a Utility determines in its Discretion are so closely related to each other that they should be considered a project cluster for the purposes of the SOP. A Utility will generally determine that a Project Cluster exists where the existing or proposed Projects have the following characteristics (although the Utility may conclude otherwise in its Discretion): (i) have common direct or indirect ownership or control; (ii) have common development timelines; (iii) are being developed by the same or an affiliated developer; (iv) are located in close proximity (e.g., in same watershed); and/or (v) share any tenures, permits, facilities or other infrastructure such as roads, power lines, interconnection facilities.

48. **Project Energy Volume** has the meaning given in Section 3.4 of these Rules.

49. **Reference Documents** means the documents listed in Section 10 of these Rules.

50. **Regulatory Agency Authorizations** means the issuance of those Permits which are specified as required for the Project in the YESAB assessment report recommendation to proceed issued in respect of the Project.

51. **Revenue Meter** means a meter that measures energy output and/or consumption for purposes of calculating payments under an EPA and that meets the requirements specified in the EPA.

52. **Rules** has the meaning given in Section 1 of these Rules.

53. **SOP** means the Standing Offer Program as described in these Rules.

54. **SOP Administrator** means the person appointed by YG to act as the SOP Administrator for the purposes of these Rules.

55. **SOP OIC** means that Order in Council issued by YG on January 24, 2019 regarding, among other things, the Standing Offer Program.

56. **SOP Queue** means the SOP queue maintained by YG on the SOP Website which shall specify each Project (including the applicable Developer, the Project Energy Volumes and Target Developer's COD for the Project) which has been registered by a Utility under the Application Process. The SOP Website shall maintain separately from the SOP Queue information for each Project (including the applicable Developer, the Project Energy Volumes and Target Developer's COD for the Project) for which a Utility has entered into an EPA. YG reserves the right to modify the information it maintains in the SOP Queue at any time.

57. **SOP Website** means the website with respect to the Standing Offer Program maintained by YG located at *www.Yukon.ca/apply-independent-power-producer*.

58. **Standard Form EPA** means the Standard Form Electricity Purchase Agreement in the form attached to these Rules and which is also available at the "Documents" page of the SOP Website.

59. **Standing Offer Program** and **SOP** means the Standing Offer Program as described in these Rules.

60. **Statement of Project Changes** means a Statement of Project Changes in the form attached to these Rules and which is also available at the "Documents" page of the SOP Website.

61. **System Interconnection Study** means a detailed interconnection study which evaluates the impact of a proposed Project on the reliability of the Utility's system and provides a planning-level estimate of the required System Upgrades and New Interconnection Facilities and associated costs.

62. **System Upgrades** means those additions, modifications and upgrades to the YIS or WLG, as applicable, identified in the System Interconnection Study (and as further refined in subsequent interconnection studies) determined by the Utility to be "interconnection network upgrades" under the applicable policies of the Utility, but excluding New Interconnection Facilities.

63. **System Upgrade Costs** means all costs for the design, engineering, procurement, construction, installation and commissioning of System Upgrades. See Section 6.8 of these Rules.

64. **System-wide Limits** has the meaning given in Section 3.4 of these Rules.

65. **Target Developer's Commercial Operation Date** or **Target Developer's COD** means the date when the Developer expects the Project to achieve COD as specified by the Developer in the Application.

66. **Term** means the term of the EPA as specified by the Developer in the Application.

67. **Transmission System** means the transmission, substation, protection, control and communication facilities owned and operated by a Utility in Yukon, and includes all additions and modifications thereto and repairs or replacements thereof.

68. **Utility** means YEC or AEY, as applicable, and **Utilities** means both such parties.

69. **WLG** means the Watson Lake Grid owned and operated by AEY.

70. **YDC** means Yukon Development Corporation.

71. **YEC** means Yukon Energy Corporation.

72. **YESAA** means the *Yukon Environmental and Socio-economic Assessment Act*, SC 2003, c 7.

73. **YESAB** means the Yukon Environmental and Socio-economic Assessment Board.

74. **YESAB Adequacy Confirmation** means, where required, the confirmation by the YESAB under YESAA that a Developer's proposal for the Project is adequate and ready to be advanced to the evaluation stage.

75. **YG** means the Government of Yukon.

76. **YIS** means the Yukon Integrated System, which is the composite of Yukon Energy's grid assets and connected AEY generation, transmission and distribution assets.

[UTILITY]

STANDARD FORM ELECTRICITY PURCHASE AGREEMENT

STANDING OFFER PROGRAM

THIS ELECTRICITY PURCHASE AGREEMENT ("**EPA**") is made as of the __ day of ____, 20__

BETWEEN:

[SELLER], a corporation incorporated under the laws of _____ ("**Seller**")

- and -

[UTILITY], a corporation incorporated under the laws of the Yukon ("**Buyer**")

WHEREAS:

A. The Government of Yukon issued the *Energy Strategy for Yukon* in January 2009 and in October 2015 issued the *Independent Power Production Policy* as reviewed and updated in October, 2018 (the "**IPP Policy**") as part of the strategy's priority action to "update and develop a policy framework for electricity that emphasizes efficiency, conservation and renewable energy". The IPP Policy created a framework for the development of the Standing Offer Program. In support of the objectives of the IPP Policy, the Government of Yukon issued the SOP OIC and, together with the Utilities, developed the SOP Rules;

B. Seller has proposed the development of the Project on the Electrical Grid pursuant to the Standing Offer Program and such Project has been reviewed and approved in accordance with the SOP Rules; and

C. This EPA is being entered into by the Parties in respect of the Project under the Standing Offer Program in accordance with the SOP Rules.

NOW THEREFORE Seller and Buyer agree as follows:

ARTICLE 1
DEFINITIONS, INTERPRETATION AND SCHEDULES

1.1 Definitions and Interpretation

The definitions and certain principles of interpretation that apply to this EPA are set out in Schedule "A".

1.2 Schedules

The following Schedules attached hereto are incorporated into and made a part of this EPA:

Schedule "A"	-	Definitions and Interpretation
Schedule "B"	-	Project Description

Schedule "C"	-	Form of Annual Operating Plan
Schedule "D"	-	System Interconnection Study Report
Schedule "E"	-	Monthly Energy Shortfall Payment
Schedule "F"	-	Termination Payment
Schedule "G"	-	System Interconnection Guidelines
Schedule "H"	-	Joint Operating Procedure
Schedule "I"	-	Delivery Time Adjustment Table

ARTICLE 2
CONDITIONS PRECEDENT AND TERM

2.1 Conditions Precedent

(a) Except as provided in this Section, this EPA has no legal force until the Conditions Precedent described in Schedule "B" are satisfied by Seller or waived by Buyer. The Conditions Precedent may only be waived by Buyer by notice in writing to Seller.

(b) Seller will:

(i) seek to satisfy each of the Conditions Precedent on or before the Condition Date;

(ii) keep Buyer informed of any circumstances which may result in any of those Conditions Precedent not being satisfied in accordance with their terms; and

(iii) promptly notify Buyer upon satisfaction of any of those Conditions Precedent and provide such supporting evidence as may be reasonably required by Buyer.

(c) If the Conditions Precedent are not satisfied or waived on or before the Condition Date, or it becomes apparent that the Conditions Precedent will not, in the reasonable opinion of Buyer, be satisfied by the Condition Date, the Conditions Precedent will be taken to have failed and Buyer shall be entitled to terminate this EPA, in which event each Party shall release the other from any and all claims, damages, costs, expenses or liabilities whatsoever incurred by it and its Affiliates in relation this EPA provided that (i) Seller shall remain liable for all costs incurred by Buyer in respect of the System Interconnection Study Report, System Upgrade Costs or New Interconnection Facilities Costs and (ii) otherwise each Party shall be responsible for its own costs incurred by it in connection with this EPA.

(d) Section 2.1(a) does not apply to this Article 2, Section 3.5 and Articles 10, 11, 12, 13 and 15 which shall be in full force and effect from the date of this EPA.

2.2 Term

Subject to Section 2.1, this EPA shall commence on the Effective Date and continues for the period specified in Schedule "B", unless it is terminated earlier in accordance with this EPA.

ARTICLE 3
CONSTRUCTION AND OPERATION

3.1 Construction and Operation Costs, Liabilities and Actions

Seller will be fully responsible for the permitting, design, engineering, construction, Interconnection, commissioning, operation, maintenance, reclamation and decommissioning of the Seller's Plant and shall be responsible for all costs, expenses, liabilities and other obligations associated with such activities.

3.2 Standard of Construction and Operation

Except as otherwise consented to in writing by Buyer, such consent not to be unreasonably withheld, conditioned or delayed, Seller will ensure that the location, design, engineering, construction, Interconnection, commissioning, operation and maintenance of the Seller's Plant, are and will be carried out at all times during the Term:

(a) in accordance with the description of the Seller's Plant in Schedule "B" and the information in the Application in all material respects;

(b) in compliance with the Project Standards; and

(c) by qualified and experienced individuals.

The Parties shall conduct their respective operations in accordance with the Joint Operating Procedure.

3.3 Project Changes

Without Buyer's prior written consent, not to be unreasonably withheld, conditioned or delayed Seller will not make any change to:

(a) the Seller's Plant as described in Schedule "B"; or

(b) any other aspects of the Seller's Plant or the information in any System Interconnection Study Report completed for Seller's Plant prior to the Effective Date which would require changes by Buyer to the System Upgrades where such change would increase Buyer's liability for any costs or otherwise increase the obligations or risks of Buyer with respect to the Seller's Plant or any other project.

Seller acknowledges that Buyer may require, as a condition of its consent to any change described in this Section, that Seller agree in writing to reimburse Buyer for any reasonable incremental liability for any losses, costs and damages incurred by Buyer or any third party, with respect to the Seller's Plant or any other project, as a result of any change described in this Section. Buyer may also require that Seller provide performance assurance or security to Buyer in order to ensure that Buyer has no financial exposure in respect of such reimbursement obligation.

3.4 Development Progress Reports

Seller will deliver a Development Progress Report to Buyer on each January 1, April 1, July 1 and October 1 after the Effective Date until Seller's COD. Buyer shall be entitled to request such

additional information as it may reasonably require from time to time in respect of Seller's development of Seller's Plant.

3.5 Responsibility for Upgrade Costs

Seller will be responsible for and shall pay Buyer for all System Upgrade Costs and New Interconnection Facilities Costs in accordance with the following:

(a) the System Interconnection Study Report sets out Buyer's estimate of System Upgrade Costs and the New Interconnection Facilities Costs. Seller shall (i) pay to Buyer in advance an amount equal to such estimate of System Upgrade Costs and New Interconnection Facilities Costs ("**Upgrade Costs Advance**") and/or (ii) provide such other security in form, substance and amount as may be acceptable to Buyer in its Discretion to secure the obligation of Seller to pay such costs ("**Upgrade Costs Security**"). Buyer shall not be required in any circumstances to accept Upgrade Costs Security except in its Discretion. Buyer shall not be required to perform any work or incur any System Upgrade Costs or New Interconnection Facilities Costs where Buyer determines in its Discretion that the amount of Upgrade Costs Advance it has received together with any Upgrade Costs Security is not sufficient to adequately secure the obligation of Seller to pay all System Upgrade Costs and New Interconnection Facilities Costs and Seller shall forthwith provide to Buyer such additional Upgrade Costs Advance and/or Upgrade Costs Security as may be reasonably required by Buyer;

(b) Buyer will exercise Good Industry Practice to perform, or cause to be performed, the work required in respect of the System Upgrades and the New Interconnection Facilities for the Project. Buyer shall be entitled to draw upon the Upgrade Costs Advance and Upgrade Costs Security from time to time in its Discretion to satisfy any System Upgrade Costs and New Interconnection Facilities Costs as and when incurred by Buyer; and

(c) notwithstanding the estimate of System Upgrade Costs and New Interconnection Facilities Costs provided by Buyer to Seller contemplated in Section 3.5(a) or the amount of any Upgrade Costs Advance and Upgrade Costs Security provided by Seller, Seller shall be responsible for and shall pay Buyer the actual System Upgrade Costs relating to the System Upgrades incurred by Buyer. Following the completion of the System Upgrades and the payment in full by Seller of all System Upgrade Costs incurred by Buyer for such work, Buyer shall release to Seller any undrawn portion of the Upgrade Costs Advance and Upgrade Costs Security**.**

3.6 Metering

As part of the System Upgrades and New Interconnection Facilities, Buyer will install and maintain an appropriate Meter installation at the POI, and ensure that such Meter is tested and sealed according to any Measurement Canada standards. Seller will allow Buyer to access the Seller's Plant as may be necessary from time to time to install and maintain the Meter at the POI. If there is any dispute regarding the accuracy of the Meter, either Party may give notice to the other Party of the dispute. In that case, the Parties will resolve the matter in accordance with the *Electricity and Gas Inspection Act* (Canada).

3.7 Insurance

Seller will, at its cost, obtain and maintain (a) policies of commercial general liability insurance with a per occurrence limit of liability not less than $5,000,000, and (b) property insurance, with limits of liability and deductibles consistent with those a prudent owner of a facility similar to the Seller's Plant would maintain and those the Facility Lender may require. All commercial general liability policies must include Buyer, its directors, officers, employees and agents as additional insureds and must contain a cross liability and severability of interest clause. All policies of insurance must include a waiver of subrogation in favour of Buyer. All policies of insurance must be placed with insurers that have a minimum rating of A- (or equivalent) by A.M. Best Company and are licensed to transact business in the Yukon and must be endorsed to provide to Buyer 30 days' prior written notice of cancellation, non-renewal or any material amendment that results in a reduction in coverage. Seller will give Buyer a copy of the insurance certificate(s) for the insurance required to be maintained by Seller under this Section not more than 30 days after the effective date of coverage and promptly upon renewal thereafter. Seller will be responsible for the full amount of all deductibles under all insurance policies required to be maintained by Seller under this Section.

3.8 Seller's COD

(a) Except with Buyer's prior written consent, Seller's COD may not occur earlier than 90 days prior to Target Seller's COD.

(b) Buyer will not be required to incur any incremental expense or other liability of any kind to enable Seller's COD to occur prior to Target Seller's COD.

3.9 Change in Target Seller's COD

If the estimated date for completing the System Upgrades or the New Interconnection Facilities as required to achieve Buyer's COD is later than 90 days prior to the Target Seller's COD, Buyer shall provide notice to Seller of such delay and, provided Seller is not responsible for any delay in completing the System Upgrades or the New Interconnection Facilities (including a failure to pay amounts contemplated in Section 3.5), upon Seller's written request that the Target Seller's COD be postponed, Buyer will postpone the Target Seller's COD to the estimated date for completing the System Upgrades and the New Interconnection Facilities plus 90 days.

3.10 No Liability For Delay

Buyer shall exercise reasonable commercial efforts to achieve Buyer's COD prior to Target Buyer's COD. Buyer will have no liability under this EPA for delays in completion of (a) any System Upgrades or the New Interconnection Facilities, or (b) other work undertaken by Buyer or any of Buyer's Affiliates on the Seller's Plant side of the POI, in each case howsoever arising.

3.11 Outages

(a) **Notice of Seller's Outage** - Seller will notify Buyer of any Outages in Seller's Plant, or changes in any such Outages, by delivering to Buyer an Outage Notice or revised Outage Notice:

(i) promptly in the case of a Forced Outage or a Maintenance Outage;

(ii) not less than 90 days in advance of any Planned Outage, or such shorter time period with Buyer's written consent, such consent not to be unreasonably withheld, delayed or conditioned; and

(iii) promptly in the case of any changes to the duration, start time or end time of any Outage.

(b) **Notice of Buyer's Outage** - In addition to Buyer's reporting requirements under Section 4.8(d), Buyer will notify Seller of any Planned Outages that will result in a Buyer's Distribution/Transmission Constraint or changes in any such Planned Outages, by delivering to Seller an Outage Notice or revised Outage Notice:

(i) not less than 90 days in advance of any such Planned Outage, or such shorter time period with Seller's written consent, such consent not to be unreasonably withheld, delayed or conditioned; and

(ii) promptly in the case of any changes to the duration, start time or end time of any Outage.

(c) **Coordination and Scheduling of Outages -** Seller will coordinate all Planned Outages or Maintenance Outages with Buyer's maintenance schedule or other requirements where such schedule or requirements are publicly available or otherwise notified to Seller.

3.12 Annual Operating Plan

On or before October 31 in each year during the Term, Seller will provide to Buyer its Annual Operating Plan, including any required update to the then current Annual Operating Plan, for the 12-month period commencing on January 1 of the next year. Seller will promptly provide Buyer with a revised Annual Operating Plan from time to time upon Seller becoming aware of any expected material change in the original Annual Operating Plan for that period. The Parties agree the Annual Operating Plan is provided for planning purposes and does not guarantee or limit the quantity or timing of Delivered Energy to the POI.

ARTICLE 4
PURCHASE AND SALE OBLIGATIONS

4.1 Energy prior to Buyer's COD

Subject to satisfaction of all obligations of Seller under this EPA, upon the occurrence of Seller's COD but prior to the occurrence of Buyer's COD, Buyer will not be obligated to purchase, or accept delivery from Seller of, any Energy, provided if Buyer does accept, in its sole discretion, delivery of Energy at the POI, Buyer will pay for such Energy accepted by Buyer prior to Buyer's COD in accordance with Section 5.1.

4.2 Energy after Buyer's COD

From and after Buyer's COD for the remainder of the Term, Seller will sell and deliver all Energy to Buyer at the POI and Buyer will, subject to Sections 4.3 and 4.4, purchase and accept delivery of all Delivered Energy. Buyer will pay for Delivered Energy from and after Buyer's COD in accordance with Section 5.1.

4.3 Limit on Delivered Energy and Capacity

Notwithstanding the foregoing provisions of this Article 4:

(a) in any hour, Buyer will not be obligated at any time to purchase or accept delivery from Seller at the POI of any Energy generated in excess of the Seller's Plant Capacity in such hour (as measured in KWh) and no amount will be payable by Buyer for Delivered Energy in excess of the Seller's Plant Capacity in such hour, whether prior to or after COD, and regardless of whether Buyer consented to and accepted delivery of such Energy at the POI;

(b) in any calendar year, Buyer will not be obligated to purchase or accept delivery from Seller at the POI of any Energy generated in excess of the Project Energy Volume and no amount will be payable by Buyer for Delivered Energy in any such calendar year in excess of the Project Energy Volume in such calendar year, whether prior to or after COD, and regardless of whether Buyer consented to and accepted delivery of such Energy at the POI; and

(c) in determining the total amount of Delivered Energy for a year, month, hour or any other time period under this EPA for any purpose, the amount of Delivered Energy in each hour of such time period will not exceed the Seller's Plant Capacity in such hour, even if Seller delivered to the POI Energy in excess of such amounts, or the Seller's Plant was capable of generating Energy in excess of such amounts.

4.4 Distribution/Transmission Constraints

Buyer will not be in breach or default of its obligations under Sections 4.1, 4.2 or 5.1 if Buyer is not able to accept delivery of Energy at the POI as a result of a Distribution/Transmission Constraint. Buyer will have no liability with respect to a Distribution/Transmission Constraint, except as set out in Section 4.8, if applicable.

4.5 Exclusivity

(a) Seller will not at any time during the Term commit, sell or deliver any Energy (or related Environmental Attributes) to any Person other than Buyer under this EPA. Seller will not use any Energy (or related Environmental Attributes) for any purpose whatsoever except for sale to Buyer under this EPA. These prohibitions do not apply if, and for so long as, Buyer is in breach of its obligations under Section 4.2.

(b) Seller shall not be entitled to interconnect a generating facility to the Seller's Plant and transmit electricity via the Seller's Plant to the POI.

4.6 Custody, Control, Risk of and Title To Energy

Custody, control, risk of, and title to, all Energy (including any Delivered Energy exceeding the limits set out in Section 4.3 even where Buyer has not paid for such excess Delivered Energy) shall pass from Seller to Buyer at the POI. Seller will ensure that all Energy delivered to Buyer under this EPA is free and clear of all liens, claims, charges and encumbrances.

4.7 Line Losses

Seller will be responsible for all Line Losses, costs and liabilities relating to the transmission of Energy and other electricity, if applicable, from the POI to the interconnection point between the New Interconnection Facilities and the Electrical Grid. Such Line Losses shall be determined in accordance with the Line Loss Methodology.

4.8 Distribution/Transmission Constraint

(a) If, in any month after Buyer's COD, Seller is unable to deliver Energy at the POI or Seller's ability to deliver Energy at the POI is reduced solely as a result of a continuous Distribution/Transmission Constraint which exceeds 30 minutes in duration and which:

(i) is not caused by a Planned Outage by Buyer of the Distribution System or Transmission System;

(ii) is not caused by an event beyond the reasonable control of Buyer; and

(iii) is not caused by Seller, the Seller's Plant or anything on Seller's side of the POI;

(a "**Non-Permitted Distribution/Transmission Constraint**") then, notwithstanding that Buyer is excused under Section 4.4 from its obligations under Section 4.2, Buyer shall pay Seller, for each calendar month in which the Non-Permitted Distribution/Transmission Constraint has occurred, the Monthly Energy Shortfall Payment calculated in accordance with Schedule "E" less any costs Seller avoided or, acting reasonably, could have avoided during the Non-Permitted Distribution/Transmission Constraint.

(b) Buyer will not be required to pay any Monthly Energy Shortfall Amount under this Section in any of the following circumstances:

(i) during any period specified as a Seller's Outage in any Outage Notice, revised Outage Notice or in the Annual Operating Plan or during any other period where the Seller's Plant would otherwise not have been operating;

(ii) during any period when either Party is or would be excused, in accordance with Section 14.1, from its obligation to deliver or to accept delivery of Energy as a result of Force Majeure; or

(iii) if Seller has not provided Buyer with an Annual Operating Plan in accordance with Section 3.12 for the year in which the Non-Permitted Distribution/Transmission Constraint occurs.

(c) Seller will maintain accurate and complete Records of all costs Seller avoided or, acting reasonably, could have avoided during the Non-Permitted Distribution/Transmission Constraint and will report all such costs to Buyer and provide Buyer with all information required to calculate such costs.

(d) Buyer will give Seller notice of all Distribution/Transmission Constraints in each month which individually exceed 30 minutes in duration when it provides its monthly statements in accordance with Section 5.3.

(e) In the event of a Dispute by the Parties in respect of the amount of any Monthly Energy Shortfall Amount, the matter shall be resolved in accordance with Article 12.

4.9 Buyer Dispatch/Turn-Down Right

(a) Buyer may at any time during the Term deliver notice to Seller requiring Seller to Dispatch/Turn-Down and Seller will promptly comply with any such direction except to the extent that any operational, technical or regulatory constraint prevents or limits Seller's ability to comply with such direction.

(b) For each hour of the applicable Dispatch/Turn-Down, Buyer will pay Seller an amount equal to:

(i) the price payable for post-COD Delivered Energy under Section 5.1 multiplied by (A) the aggregate of the duration of the applicable Dispatch/Turn-Down (measured as a fraction determined as the aggregate number of minutes in such Dispatch/Turn-Down period divided by 60) multiplied by (B) an amount equal to the positive difference, if any, of (1) the "Non-Permitted Distribution / Transmission Constraint Hourly Deemed Energy" set out in Table E-1 of Schedule "E" for the applicable calendar month less (2) the amount of Delivered Energy in such hour of Dispatch/Turn-Down (the positive difference being the "**Dispatch/Turn-Down Deemed Energy**"); less

(ii) any costs Seller avoided or, acting reasonably, could have avoided during the period of the Dispatch/Turn-Down.

(c) Buyer will not be required to pay any amount in respect of Dispatch/Turn-Down Deemed Energy under this Section in any of the following circumstances:

(i) during any period specified as a Seller's Outage in any Outage Notice, revised Outage Notice or in the Annual Operating Plan or during any other period where the Seller's Plant would otherwise not have been operating;

(ii) during any period when either Party is or would be excused, in accordance with Section 14.1, from its obligation to deliver or to accept delivery of Energy as a result of Force Majeure;

(iii) if Seller has not provided Buyer with an Annual Operating Plan in accordance with Section 3.12 for the year in which the Dispatch/Turn-Down occurs;

(iv) during any other hour when the Seller's Plant would otherwise not have been operating if there had been no Dispatch/Turn-Down notice; or

(v) where Buyer's requirement for Seller to Dispatch/Turn Down is the result of the operation of the Seller's Plant in a manner inconsistent with Section 3.2.

(d) Where Buyer requires the Dispatch/Turn-Down as result of a Non-Permitted Distribution/Transmission Constraint, Section 4.8 will apply.

4.10 Electric Service to Seller

If at any time Buyer delivers electrical energy to service Seller's Plant Load, then such electrical energy shall be accounted and paid for separately under the applicable agreement for such electricity energy services and will not be netted off of Delivered Energy for the purposes of determining amounts payable by Buyer in accordance with Section 5.1.

ARTICLE 5
PRICE AND PAYMENT TERMS

5.1 Energy Price

In each billing period, Seller shall pay to Buyer, for each KWh of Delivered Energy, the Energy Price calculated in accordance with Schedule "B".

5.2 No Further Payment

The amount payable by Buyer as specified in Section 5.1 is the full and complete payment and consideration payable by Buyer for Delivered Energy and for Environmental Attributes.

5.3 Statements and Payment

(a) **Statements**

(i) Buyer will, by the 15th day of each month after the Buyer's COD, deliver to Seller a statement for the preceding month. The statement must indicate, among other things:

(A) the amount of, and price payable for, Delivered Energy for that month;

(B) any amount owing by Buyer in respect of a Non-Permitted Distribution/Transmission Constraint pursuant to Section 4.8;

(C) any Final Amounts owing by either Party to the other Party.

Where there has been any Delivered Energy purchased by Buyer in the period prior to Buyer's COD, the first statement following Buyer's COD shall also account for all amounts payable by Buyer to Seller for such period prior to Buyer's COD. The statement must set out in reasonable detail the manner by which the statement and the amounts shown thereon were computed and be accompanied by sufficient data to enable Seller, acting reasonably, to satisfy itself as to the accuracy of the statement.

(ii) Either Party may give notice to the other Party of an error, omission or disputed amount on a statement within 36 months after the statement was first issued together with reasonable detail to support its claim. After expiry of that 36 month period, except in the case of willful misstatement, fraud or concealment, amounts on a previously issued statement will be considered accurate and amounts which were omitted will be considered to be nil, other than amounts disputed in accordance with this Section within the 36 month period, which will be resolved in accordance with this EPA.

(iii) If Seller gives notice to Buyer of an error, omission or disputed amount on a statement as described in Section 5.3(a)(ii), Seller may direct Buyer to promptly produce new statements for the relevant month(s). The new statements will show the undisputed amount and disputed amount each in a separate statement or will otherwise separate the amounts in a single statement in a manner acceptable to Seller, acting reasonably.

(b) **Payment**

(i) Within 30 days after receipt of a statement delivered under Section 5.3(a), and subject to Section 5.5, Buyer will pay to Seller or Seller will pay to Buyer the amount set out in the statement, except to the extent Seller in good faith disputes all or part of the statement by notice to Buyer as described in Section 5.3(a)(ii).

(ii) If Seller disputes any portion of a statement, the applicable Party must pay the undisputed net amount payable by it pursuant to the statement or, if applicable, the new statement of the undisputed amount described in Section 5.3(a)(iii).

(iii) The Parties will endeavor to resolve any error, omission or disputed amount on a statement amount within 30 days of the notice described in Section 5.3(a)(ii).

(iv) Any amount required to be paid in accordance with this EPA, but not paid by either Party when due, will accrue interest at an annual rate equal to the Prime Rate plus 2%, compounded monthly. Any disputed amount that is found to be payable will be deemed to have been due within 30 days after the date of receipt of the statement which included or should have included the disputed amount.

(c) **Payment Calculations**

(i) For the purpose of all payment calculations under this EPA:

(A) all payment calculations will be rounded to the nearest cent; and

(B) Energy will be expressed in KWh rounded to two decimal places.

(ii) For the purpose of all payment calculations under this EPA, where CPI is to apply, if Statistics Canada (or the then recognized statistical branch of the Canadian Government):

(A) computes, at any time after the Effective Date, the CPI on a basis different to that employed at the Effective Date, then the CPI will be converted using the appropriate formula recommended by Statistics Canada (or the then recognized statistical branch of the Canadian Government);

(B) at any time ceases to publish or provide the CPI, then the provisions of Section 2.7 of Schedule "A" will apply;

(C) has not published the CPI for a relevant period at the time Buyer is required to provide Seller with a statement, Seller will prepare the invoice based on the CPI in effect at the time the invoice is issued and

when the CPI for the relevant period is published, Buyer will recalculate the invoice amounts in the next succeeding invoice and will include a credit or debit, without interest, in the next succeeding invoice based on the results of the recalculation; or

(D) recalculates the CPI within 36 months after an invoice affected by that CPI calculation has been issued, then Buyer will recalculate the invoice amounts for the relevant period in the next succeeding invoice and will include a credit or debit, without interest, in the next succeeding invoice based on the results of the recalculation.

5.4 Taxes

All dollar amounts in this EPA do not include any value added, consumption, commodity or similar taxes, including GST and any successor thereto, which, if applicable, will be added to each statement and paid by Buyer.

5.5 Set-off

If Buyer and Seller each owe the other an amount under this EPA in the same month, then such amounts with respect to each Party will be aggregated and the Parties may discharge their obligations to pay through netting, in which case the Party, if any, owing the greater aggregate amount will pay to the other Party the difference between the amounts owed, provided that this Section applies only to any purchase price for Delivered Energy and any Final Amount owing by either Party to the other Party. Except as otherwise expressly provided herein, each Party reserves all rights, counterclaims and other remedies and defenses which such Party has, or may be entitled to, arising from or related to this EPA.

5.6 Change in Law and GRA Cost Recovery

(a) If at any time after the Effective Date:

(i) the costs to Buyer of complying with its obligations under this EPA are, as a result of one or more Changes in Law, increased or decreased (including, for greater certainty, any increase of the obligations or risks of Buyer with respect to the Seller's Plant, but excluding any increase of the obligations or risks of Buyer with respect to the System Upgrades or New Interconnection Facilities); or

(ii) the costs to Buyer of complying with its obligations under this EPA which were of a category or type previously recovered under a General Rate Application are determined under a General Rate Application to no longer be approved for recovery from Buyer's customers in such General Rate Application;

then, to the extent that Buyer would not have incurred such costs except for the Seller's Project and/or the entering into of this EPA, the amount payable by Buyer as specified in Section 5.1 shall be adjusted by the amount necessary to reflect those changed costs which Buyer is unable to recover from Buyer's customers in a General Rate Application.

(b) For each relevant event in Section 5.6(a)(i) or 5.6(a)(ii), Buyer shall provide Seller with a statement setting out such information as is reasonably necessary to demonstrate that such an event has occurred, the reasonableness and necessity of the measures taken by

Buyer in relation to the event, its efforts to mitigate the costs associated with such event including reasonable efforts of Buyer to recover such costs from its customers in a General Rate Application, the nature and extent of any increase or decrease in the amount payable by Seller as specified in Section 5.1, and any such other information as may be reasonably requested by Seller.

(c) If in Seller's view there has been a Change in Law that may decrease Buyer's costs, Seller may request Buyer to demonstrate how such Change in Law has affected its costs under this EPA by providing the applicable information contemplated in Section 5.6(b).

(d) The payments between the Parties shall thereafter be adjusted effective as of the date such event in Section 5.6(a)(i) or 5.6(a)(ii) affects the costs of Buyer hereunder.

(e) If there is any Dispute between the Parties with respect to this Section 5.6, including as to the appropriate increase or decrease in any payments between the Parties under this Agreement, the Dispute shall be resolved in accordance with Article 12.

ARTICLE 6
ENVIRONMENTAL ATTRIBUTES

6.1 Environmental Attributes

Seller hereby transfers, assigns and sets over to Buyer all right, title and interest in and to the Environmental Attributes. Seller will ensure that all Environmental Attributes transferred to Buyer under this EPA are free and clear of all liens, claims, charges and encumbrances. Seller shall use commercially reasonable efforts to (i) provide information reasonably requested by Buyer in relation to such Environmental Attributes, including as may be required to allow Buyer to verify or certify that such Environmental Attributes exist or have been created and (ii) assist in having Seller's Plant certified, licensed, qualified or approved under any rules, regulations, programs or applicable Laws of any Governmental Authority or independent certification agency in respect of Environmental Attributes, provided that Buyer shall pay Seller all costs reasonably incurred by Seller in respect of the same. Any failure by Seller to exercise such commercially reasonable efforts under this Section 6.1 is a "material default" for the purposes of this EPA, and Buyer may terminate this EPA under Section 9.1(j).

ARTICLE 7
EPA ADMINISTRATION, RECORDS AND AUDITS

7.1 Records

Each of Buyer and Seller will prepare and maintain all Records, or duplicates of such Records, at Buyer's head office or local Yukon office or the Seller's Plant, as applicable, or following the expiry of the Term or the earlier termination of this EPA, at such other location as may be agreed in writing between the Parties, for a period of not less than 7 years from the date on which each such Record is created. The Audit Parties may take copies of such Records for the purposes of an inspection or audit under Section 7.2.

7.2 Inspection and Audit Rights

For the sole purpose of verifying:

(a) compliance with this EPA;

(b) the accuracy of statements, supporting information and calculations delivered by a Party under this EPA;

(c) the qualification of the Seller's Plant and the Energy for the Environmental Certification; or

(d) the liability of Seller for System Upgrades Costs and New Interconnection Facilities Costs,

Buyer or Seller, as applicable, will, on reasonable prior written notice from either Party desiring to conduct an audit, provide the Audit Parties with prompt access during normal business hours to (i) in respect of Buyer, Buyer's records solely relating to this EPA, or (ii) in respect of Seller, Seller's Plant and all records relating to the Seller's Plant, including any Seller Confidential Information, as applicable, to enable the Audit Parties to conduct an inspection or audit thereof. The Audit Parties will exercise any access and audit rights under this Section in a manner that minimizes disruption to the operation of the Party subject to the audit. The audit rights contained in this Section 7.2 shall be subject to the limitations set forth in Section 5.3.

7.3 Seller Consents

Seller will promptly provide any consents required to enable any of the Audit Parties to make enquiries with any Governmental Authority or any Person administering the Environmental Certification concerning any or all of the following: (a) the qualification of the Seller's Plant and the Energy for Environmental Certification, the status of the Environmental Certification and copies of any audits, inspections or reports prepared in connection with the Environmental Certification; and (b) compliance by Seller with Laws and Permits applicable to the Seller's Plant.

ARTICLE 8
FIRST NATION CLAIMS

8.1 Notification of First Nation Claim

Given the ownership and location of the Project, Seller and Buyer do not expect any First Nation Claims. However, if Buyer or Seller receives or obtains evidence of a First Nations Claim, it will notify the other Party as soon as practicable.

8.2 Obligation to Consult

If Buyer receives, obtains evidence or becomes aware of a First Nations Claim, it may direct Seller, at Seller's cost, to:

(a) consult with the First Nations making the First Nation Claim, or, if requested by Buyer, assist Buyer in the consultation process;

(b) take any measures Seller deems necessary to address, prevent, mitigate, compensate or otherwise accommodate any Potential Impacts provided the measures are consented to in advance by Buyer and the First Nations making the First Nation Claim; and

(c) provide regular written reports to Buyer concerning Seller's compliance with this Section, as may be reasonably requested by Buyer.

8.3 Seller Termination for First Nation Claim

At any time prior to Buyer's COD, if:

(a) within 60 days of Buyer receiving, obtaining evidence or becoming aware of a First Nations Claim, Buyer does not make a direction to Seller as contemplated in Section 8.2;

(b) Buyer notifies Seller in writing that it will not make a direction to Seller as contemplated in Section 8.2; or

(c) after consultation with the First Nations making the First Nation Claim it becomes clear that the measure(s) necessary for Seller to resolve the First Nation Claim or to address, prevent, mitigate, compensate or otherwise accommodate any Potential Impacts would, in Seller's discretion, impose a commercially unreasonable cost on Seller, or would require the consent of Buyer under this EPA or agreement by Buyer to amend this EPA in order to address any Potential Impacts and such consent or agreement to amend is not provided within 60 days after Seller's request to Buyer,

then Seller may terminate this EPA on notice to Buyer. Such termination will be effective 30 days after the date of delivery of such notice of termination unless otherwise agreed by the Parties. A termination by Seller under this Section will, for all purposes of this EPA, be treated in the same manner as a termination by Seller under Section 9.3(c) of this EPA (including the obligations of Seller under Section 9.7). The termination of this EPA is the exclusive remedy to which Seller may be entitled to if Seller elects to terminate this EPA under this Section.

8.4 Buyer Termination for First Nation Claim

At any time prior to Buyer's COD, if Buyer receives, obtains evidence or becomes aware of a First Nations Claim, Buyer may, at its sole discretion, terminate this EPA on notice to Seller. Such termination will be effective 30 days after the date of delivery of such notice of termination unless otherwise agreed by the Parties. Upon a termination by Buyer under this Section 8.4, Seller shall reimburse Buyer for costs or liabilities described in Sections 9.7(a), (b) and (c). The reimbursement by Seller of such costs or liabilities, the indemnification by Seller contemplated in Section 8.5 and the termination of this EPA are the exclusive remedies to which Buyer may be entitled to if Buyer elects to terminate this EPA under this Section.

8.5 Seller Indemnity for First Nation Claim

Seller shall indemnify and hold Buyer and its Affiliates harmless from any and all claims, damages, costs, expenses, or liabilities whatsoever incurred by Buyer and its Affiliates in relation to such First Nation Claim and such indemnity shall survive termination of this EPA.

ARTICLE 9
TERMINATION

9.1 Termination by Buyer

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Buyer may have under this EPA or at law or in equity in respect of any of the following events, Buyer may terminate this EPA by notice to Seller if:

(a) Seller's COD does not occur within 730 days following Target Seller's COD for any reason whatsoever (including Force Majeure), provided that Buyer may terminate this EPA under this provision only if Buyer delivers a termination notice prior to Seller's COD; or

(b) at any time after Buyer's COD, Seller fails to deliver at least an average of 25% of the aggregate Projected Monthly Energy as set out in Schedule "E" to Buyer over all hours in a period of 730 continuous days for any reason whatsoever (including Force Majeure, a Distribution/Transmission Constraint), but excluding a Non-Permitted Distribution/ Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(c) at any time after Buyer's COD, Buyer is unable to accept delivery of Energy at the POI for a period of 730 continuous days due to Force Majeure invoked by Buyer or a Distribution/ Transmission Constraint other than a Non-Permitted Distribution/ Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(d) Seller breaches Section 4.5; or

(e) Seller fails to complete any application, payment, filing, study, document or other step in the process for interconnecting the Seller's Plant to the Distribution System, Transmission System or New Interconnection Facilities, as applicable, in accordance with the requirements of, and within the time limits, including any cure periods, specified by Buyer, and such failure could reasonably be expected to have an adverse impact on Buyer or any third party; or

(f) any System Interconnection Study Report completed after the Effective Date contains information that is inconsistent with the description of the Seller's Plant in Schedule "B" and Seller has not received Buyer's consent under Section 3.3 for the change to Schedule "B"; or

(g) Seller is Bankrupt or Insolvent; or

(h) Seller, as a result of an act or omission of Seller, ceases to be exempt from regulation as a "public utility" as defined in the *Public Utilities Act* with respect to the Seller's Plant and the sale of Energy to Buyer under this EPA, and the loss of such exemption could reasonably be expected to have an adverse effect on the benefit to Buyer of this EPA; or

(i) an amount due and payable by Seller to Buyer under this EPA remains unpaid for 30 days after its due date and such default has not been cured within 30 days after Buyer has given notice of the default to Seller; or

(j) Seller is in material default of any of its covenants, representations and warranties or other obligations under this EPA (other than as set out above), unless within 30 days after the date of notice by Buyer to Seller of the default Seller has cured the default or, if the default cannot be cured within that 30 day period, Seller demonstrates to the reasonable satisfaction of Buyer that Seller is working diligently and expeditiously to cure the default and the default is cured within a further reasonable period of time. A "material default" includes any purported Assignment of this EPA without the consent of Buyer.

Any termination pursuant to this Section will be effective immediately upon delivery of the notice of termination to Seller.

9.2 Notice of Termination Event

Seller will notify Buyer promptly if Seller is Bankrupt or Insolvent or if there is a material risk that Seller will become Bankrupt or Insolvent or if Seller has defaulted under any agreement with a Facility Lender or if any Permit or land tenure agreement for the Seller's Plant is terminated or expires.

9.3 Termination by Seller

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Seller may have under this EPA or at law or in equity in respect of any of the following events, Seller may terminate this EPA by notice to Buyer if:

(a) after Buyer's COD, Buyer has not accepted delivery of Energy for a period of 730 continuous days due to an event described in Section 4.4 or any event of Force Majeure and Seller is not entitled to receive any payment pursuant to Section 4.8 in respect of that period; or

(b) the Seller's Plant has suffered major damage where the cost to repair the damage exceeds the net present value (using the Present Value Rate) of the expected revenues under the EPA for the remainder of the Term less the net present value (using the Present Value Rate) of the estimated operating and maintenance costs for the Seller's Plant for the remainder of the Term; or

(c) Seller has been unable to achieve Seller's COD for a period of 730 days after Target Seller's COD or has been unable to deliver Energy to the POI for a period of 730 continuous days after Seller's COD in either case solely as a result of Force Majeure invoked by Seller or a Distribution/Transmission Constraint other than a Non-Permitted Distribution/Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(d) Buyer is Bankrupt or Insolvent; or

(e) except where an amount has been disputed in the manner specified in Section 5.3(a)(ii), an amount due and payable by Buyer to Seller under this EPA remains unpaid for 30 days

after its due date and such default has not been cured within 30 days after Seller has given notice of the default to Buyer; or

(f) Buyer is in material default of any of its covenants, representations and warranties or other obligations under this EPA (other than as set out above), unless within 30 days after the date of notice by Seller to Buyer of the default Buyer has cured the default or, if the default cannot be cured within that 30 day period, Buyer demonstrates to the reasonable satisfaction of Seller that Buyer is working diligently and expeditiously to cure the default and the default is cured within a further reasonable period of time.

Any termination pursuant to this Section will be effective immediately upon delivery of the notice of termination to Buyer.

9.4 Termination by Buyer for Convenience

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Buyer may have under this EPA or at law or in equity in respect of any of the following events, Buyer may terminate this EPA for convenience upon 90 days prior notice to Seller.

9.5 Effect of Termination

Upon expiry of the Term or earlier termination of this EPA in accordance with its terms:

(a) the Parties may pursue and enforce any rights and remedies permitted by law or equity in respect of any prior breach or breaches of this EPA and may enforce any liabilities and obligations that have accrued under this EPA prior to the expiry of the Term or the date of termination or that are stated to arise on termination of this EPA, subject to any express restrictions on remedies and limitations or exclusions of liability set out in this EPA;

(b) both Parties will remain bound by Section 3.5 with respect to the satisfaction of residual obligations for the period prior to termination or that are specified to arise on, or continue following, termination, and Sections 12.1 and 13.1 associated with Delivered Energy prior to termination of this EPA; and

(c) Seller will remain bound by Sections 7.1 and 7.2 for a period of 36 months following expiry or termination of this EPA;

and, in all such cases, both Parties will remain bound by any other provisions necessary for the interpretation and enforcement of the foregoing provisions.

9.6 Buyer Payment on Termination

If Seller terminates this EPA under any of Sections 9.3(d), 9.3(e) or 9.3(f) or Buyer terminates this EPA for convenience under Section 9.4, Buyer will pay to Seller an amount equal to the applicable Termination Payment due at the time of termination determined in accordance with Schedule "F".

9.7 Seller Payment on Termination

If Buyer terminates this EPA on or before 90 days after Seller's COD or Seller terminates this EPA on or before Buyer's COD under any of Sections 9.3(a), 9.3(b) or 9.3(c), Seller will, within 30 days after receipt of an invoice from Buyer, reimburse Buyer for:

(a) all System Upgrade Costs and New Interconnection Facilities Costs incurred by Buyer, or which Buyer has become contractually obligated to pay, prior to the termination of the EPA including System Upgrade Costs and New Interconnection Facilities Costs Seller would otherwise be responsible for under Section 3.5;

(b) any incremental liability for System Upgrade Costs and New Interconnection Facilities Costs which Buyer will incur as a result of the termination of this EPA; and

(c) any System Upgrade Costs and New Interconnection Facilities Costs which Seller is responsible for under any reimbursement agreement pursuant to Section 3.3.

9.8 Calculation and Payment

Buyer will pay any amount which it owes under Section 9.6 within 30 Business Days after the date of delivery of an invoice by Seller to Buyer. Any amounts owing by Seller to Buyer under this EPA will be netted against any amount owing by Buyer to Seller under Section 9.6.

9.9 Exclusive Remedies

Payment by Buyer of the amount determined under Section 9.6 is the exclusive remedy to which Seller is entitled, and Buyer's limit of liability, for termination of this EPA by Seller pursuant to any of Sections 9.3(d), 9.3(e) or 9.3(f). Subject to Section 9.4 and 9.7, termination of this EPA is the exclusive remedy to which Buyer or Seller, as the case may be, is entitled if Buyer or Seller elects to exercise its right to terminate this EPA under any of Section 9.1, 9.3(a), 9.3(b) or 9.3(c). For greater certainty, subject to Section 9.4 and 9.7, Seller will not be required to pay any termination payment on termination by Buyer of this EPA. Neither Party will have any right to terminate this EPA except as expressly set out herein.

ARTICLE 10
REPRESENTATIONS AND WARRANTIES

10.1 Seller's Representations

Seller represents and warrants to Buyer, and acknowledges that Buyer is relying on those representations and warranties in entering into this EPA, as follows:

(a) Seller is a corporation formed under the laws of _____, is validly existing and is in good standing under the laws of ____, is lawfully authorized to carry on business in _____, and has full corporate power, capacity and authority to enter into and to perform its obligations under this EPA;

(b) this EPA constitutes a valid and binding obligation of Seller enforceable against Seller in accordance with its terms; and

(c) this EPA has been duly authorized, executed and delivered by Seller.

10.2 Buyer's Representations

Buyer represents and warrants to Seller, and acknowledges that Seller is relying on those representations and warranties in entering into this EPA, as follows:

(a) Buyer is a corporation formed under the laws of the Yukon, is validly existing and is in good standing under the laws of the Yukon, is lawfully authorized to carry on business in the Yukon, and has full corporate power, capacity and authority to enter into and to perform its obligations under this EPA;

(b) this EPA constitutes a valid and binding obligation of Buyer enforceable against Buyer in accordance with its terms; and

(c) this EPA has been duly authorized, executed and delivered by Buyer.

ARTICLE 11
LIABILITY LIMITATIONS

11.1 Limit of Liability

Buyer's liability for damages for any failure to take or pay for Delivered Energy under this EPA is limited to the amount payable by Buyer for that Delivered Energy under Article 5, amounts owing under Sections 4.8 and any interest thereon calculated under this EPA.

11.2 Consequential Damages

Neither Party will be liable to the other Party for any special, incidental, exemplary, punitive or consequential damages with respect to, arising out of, relating to or in any way connected with a Party's performance or non-performance under this EPA.

ARTICLE 12
DISPUTES

12.1 Dispute Resolution Procedure

Any dispute, controversy or claim arising out of or relating to this EPA ("**Dispute**") shall be exclusively and finally resolved in accordance with the dispute resolution procedure set forth in this Article 12 (the "**Dispute Resolution Procedure**").

12.2 Commencement of the Dispute Resolution Procedure

The Parties shall make reasonable efforts to first resolve any Dispute. If a Dispute cannot be resolved by the Parties, then either Party may initiate the Dispute Resolution Procedure by giving notice of the Dispute to the other Party (the "**Notice of Dispute**"). The Notice of Dispute shall contain a brief statement of the nature of the Dispute, set out the relief requested, and request that the Dispute Resolution Procedure be commenced.

12.3 Negotiations

Upon the submission of a Notice of Dispute pursuant to Section 12.2, each of the Parties shall refer the Dispute to a designated senior management executive with the authority to negotiate a

settlement of the Dispute for that Party (the "**Senior Management Executives**"). The Senior Management Executives of the Parties shall attempt to resolve the Dispute within 30 days from the date on which the Notice of Dispute was issued, or such longer period as the Senior Management Executives may otherwise unanimously agree. If the Senior Management Executives unanimously agree upon a resolution of the Dispute, such resolution shall be memorialized in a written settlement agreement mutually acceptable to the Parties and shall be binding on the Parties.

12.4 Arbitration

If a Dispute is not resolved by Senior Management Executives within 30 days from receipt of a Notice of Dispute (or such longer period as the Senior Management Executives may otherwise agree in writing), the Dispute shall, at the request of either Party, be resolved by binding arbitration under the Rules of Arbitration of the International Chamber of Commerce (the "**ICC Rules**"), except to the extent of conflicts between the ICC Rules and the provisions of this EPA, in which event the provisions of this EPA shall prevail. The following provisions shall apply to an arbitration commenced pursuant to this Section 12.4:

(a) the number of arbitrators shall be one;

(b) the place, or legal seat, of the arbitration shall be Whitehorse, Yukon;

(c) the language to be used in the arbitral proceedings shall be English;

(d) all awards issued by the arbitrator shall be final, non-appealable and binding on the Parties. Any award may be filed in any court of competent jurisdiction and may be enforced by a Party as a final judgment in such court. The Parties expressly waive, to the maximum extent permitted by law, any right of appeal of any award or reference of any matter to any court, other than as may be necessary to recognize or enforce an award;

(e) the arbitrator shall be guided by the International Bar Association's Rules on the Taking of Evidence in International Commercial Arbitration;

(f) the Parties shall request that the arbitrator render its final award within 12 months of the commencement of the arbitration, or as soon as possible thereafter, provided that no award shall be invalid if it is not rendered within the time period herein specified;

(g) any award for monetary damages shall be made and payable in Canadian Dollars and may include interest from the date of any breach or violation of this EPA until paid in full at the rate determined by the arbitrator;

(h) the Parties agree that any arbitration carried out hereunder shall be kept private and confidential, and that the existence of the proceedings and any element of it (including all awards, the identity of the Parties and all witnesses and experts, all materials created for the purposes of the arbitration, all testimony or other oral submissions, and all documents produced by a Party that were not already in the possession of the other Party) shall be kept confidential, except (i) with the consent of the Parties, (ii) to the extent disclosure may be lawfully required in bona fide judicial proceedings relating to the arbitration, (iii) where disclosure is lawfully required by a legal duty, and (iv) where such information is already in the public domain other than as a result of a breach of this clause. The Parties

also agree not to use any information disclosed to them during the arbitration for any purpose other than in connection with the arbitration;

(i) where a Dispute relates to the EPA, the Parties shall agree to consolidate the matters in Dispute under such agreements in a single arbitration;

(j) the Parties agree that during the resolution of a Dispute pursuant to this Article 12, the Parties shall continue to perform their obligations under this EPA, provided that such performance shall be without prejudice to the rights and remedies of the Parties and shall not be read or construed as a waiver of a Party's right to claim for recovery of any loss, costs, expenses or damages suffered as a result of the continued performance of this EPA; and

(k) each Party will be responsible for its own costs under this Article 12, subject to the award of an arbitrator.

ARTICLE 13
CONFIDENTIALITY

13.1 Confidentiality

(a) **Additional Confidentiality Obligation** - During the Term and for two years thereafter:

(i) Buyer will treat as confidential, and will not disclose to any third Person, Seller Confidential Information, and

(ii) Seller will treat as confidential, and will not disclose to any third Person, Buyer Confidential Information.

(b) **Disclosure of Confidential Information** - Notwithstanding Section 13.1(a) above:

(i) Seller may also disclose Buyer Confidential Information and Buyer may disclose Seller Confidential information in the following circumstances:

(A) disclosures expressly authorized under this EPA or otherwise set out in this EPA;

(B) disclosures to enable a Party to fulfill its obligations under the EPA;

(C) disclosure in any arbitration or legal proceedings for the enforcement of the EPA;

(D) disclosure to the Party's directors, officers, employees, Facility Lenders, consultants and advisors, and purchasers of the Environmental Attributes, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality;

(E) subject to Section 13.1(b)(ii)(D), disclosure required to be made by a Party by an order of a court, a regulatory agency or a tribunal or under any law, regulatory requirements or any requirement of any stock exchange that is binding upon a Party, provided that (i) to the extent

reasonably practicable, the Party intending to make such disclosure gives reasonable notice to the other Party before make the disclosure, and (ii) limits the disclosure to that required by the applicable order, Laws or regulatory or stock exchange requirement;

(F) disclosure to a third Person if such information was known by that third Person before disclosure by Buyer or Seller, as the case may be, provided the third Person did not know of the information as a result of a breach of the non-disclosure obligations in this EPA; or

(G) disclosure with the consent of Buyer, in the case of Buyer Confidential Information, or Seller, in the case of Seller Confidential Information.

(ii) Buyer may disclose Seller Confidential Information in the following circumstances:

(A) disclosure to Buyer's Affiliates or to a third Person, and their respective employees, consultants and advisors, for the purpose of reselling or marketing any Energy, including disclosure of Seller Confidential Information by such Affiliate or third Person to those who have purchased or may purchase the Energy;

(B) for purposes other than those described in Section 13.1(b)(i), to Buyer's Affiliates and to any directors, officers, employees, consultants and advisors of any Affiliates, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality;

(C) to any ministers, deputy ministers, servants or employees of the Yukon or the federal government, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality; or

(D) disclosure in any regulatory proceeding, whether related to this EPA or not, to the extent that Buyer considers disclosure is necessary or desirable to support its position in such proceeding.

ARTICLE 14
FORCE MAJEURE

14.1 Force Majeure

(a) If there is a Force Majeure affecting a Party's ability to perform an obligation under this EPA, and that Party wishes to declare a Force Majeure, that Party will promptly notify the other Party of the Force Majeure. The notice of Force Majeure must identify the nature of the Force Majeure, the date the Force Majeure commenced, the expected duration of the Force Majeure, and the particular obligations affected by the Force Majeure. If (i) a notice of Force Majeure is provided in accordance with this Section, (ii) the event in question is in fact an event of Force Majeure as defined in this EPA, and (iii) the event of Force Majeure commenced on the commencement date in the notice of Force

Majeure, then the Force Majeure will be deemed to have been invoked as of the commencement date stated in the notice.

(b) Neither Party will be in default of any obligation under this EPA if a Party is unable to perform that obligation due to an event or circumstance of Force Majeure, provided notice is delivered in accordance with this Section and the circumstances are, in fact, an event or circumstance of Force Majeure.

(c) Subject to any limitations expressly set out in this EPA, the time for performance of such obligation will be extended by the number of days that Party is unable to perform such obligation as a result of the event or circumstance of Force Majeure. The Party invoking Force Majeure will make commercially reasonable efforts to promptly remove the Force Majeure and will promptly respond to any inquiry from the other Party regarding the efforts being undertaken to remove the Force Majeure and will give prompt notice of the end of the Force Majeure.

ARTICLE 15
GENERAL PROVISIONS

15.1 Independence

The Parties are independent contractors, and nothing in this EPA or its performance creates a partnership, joint venture or agency relationship between the Parties.

15.2 Enurement

This EPA enures to the benefit of the Parties, their successors and their permitted assigns.

15.3 Assignment

(a) Seller may not assign this EPA except with the prior consent of Buyer, which consent may not be unreasonably withheld, conditioned or delayed provided such Assignment is to a Facility Lender. Any Assignment (other than an Assignment to a Facility Lender) is subject to the assignee entering into and becoming bound by this EPA, assuming all the obligations and liabilities of Seller under this EPA arising both before and after the Assignment, and providing the representations and warranties set out in Section 10.1 effective as at the time of Assignment, and Seller not being in default under this EPA. Unless agreed to in writing by Buyer, Seller shall remain jointly and severally liable with the assignee for all obligations of Seller under this EPA.

(b) Any request by Seller for Buyer's consent under Section 15.3(a) must be delivered to Buyer not less than 30 days before the date of the proposed Assignment. A request under this Section must be accompanied by such information as reasonably required by Buyer to assess the request for consent including the name, address and ownership structure of the assignee, details of any consultation with First Nations that may be impacted by the Seller's Plant or the Assignment with respect to the proposed Assignment, list of the directors and officers of the assignee and information concerning the assignee's operations, experience and financial status.

(c) If Seller seeks consent to Assign this EPA to a Facility Lender, Buyer may require, as a condition of its consent to the Assignment, that Seller and the Facility Lender enter into a

Lender Consent Agreement with Buyer containing customary provisions. If required by a Facility Lender, Buyer will enter into a Lender Consent Agreement with the Facility Lender and Seller containing customary provisions. Seller will reimburse Buyer for all costs reasonably incurred by Buyer in connection with any request by Seller for Buyer's consent pursuant to Section 15.3(a).

15.4 Entire Agreement

This EPA contains the entire agreement between the Parties with respect to the purchase and sale of Energy and supersedes all previous communications, understandings and agreements between the Parties with respect to the subject matter hereof. There are no representations, warranties, terms, conditions, undertakings or collateral agreements express, implied or statutory between the Parties other than as expressly set out in this EPA. **[Note to Developers – as described in the SOP Rules, to the extent that a Project interconnects into AEY's portion of the YIS, there may be additional agreements required between AEY and Seller, in which case this section may need to be modified]**

15.5 Amendment

This EPA may not be amended except by an agreement in writing signed by both Parties.

15.6 No Waiver

Other than in respect of the specific matter or circumstance for which a waiver is given, and except as otherwise specified in this EPA, no failure by a Party to enforce, or require a strict observance and performance of, any of the terms of this EPA will constitute a waiver of those terms or affect or impair those terms or the right of a Party at any time to enforce those terms or to take advantage of any remedy that Party may have in respect of any other matter or circumstance.

15.7 Notices

Any notice, consent, waiver, declaration, request for approval or other request, statement or bill that either Party may be required or may desire to give to the other Party under this EPA must be in writing addressed to the other Party at the address for that Party stated in Schedule "A" and:

(a) notices under Section 14.1, Article 8 and Article 9 must be delivered by hand or by a courier service during normal business hours on a Business Day and a notice so delivered will be deemed to have been delivered on that Business Day;

(b) all notices other than notices described in Section 15.7(a) may be delivered by email during normal business hours on a Business Day and a notice so delivered will be deemed to have been delivered on that Business Day; and

(c) either Party may change its address for notices under Section 3 of Schedule "A" to this EPA by notice to the other Party.

15.8 Interconnection Notices

Nothing in the System Interconnection Guidelines and no exercise of any right thereunder, restricts or otherwise affects any right, obligation or liability of either Party under this EPA,

except to the extent set out expressly herein, and no notice, consent, approval or other communication or decision under or in relation to the System Interconnection Guidelines will constitute or be relied upon as a notice, consent, approval or communication or decision under this EPA.

15.9 Commodity Contract/Forward Contract

The Parties agree and intend that this EPA constitutes an "eligible financial contract" under the *Bankruptcy and Insolvency Act* (Canada) and *Companies' Creditors Arrangement Act* (Canada).

15.10 Further Assurances

Each Party will, upon the reasonable request of the other Party, do, sign or cause to be done or signed all further acts, deeds, things, documents and assurances required for the performance of this EPA including, in the case of Seller, completing any registration process required in respect of Environmental Attributes as requested by Buyer.

15.11 Severability

Any provision of this EPA which is illegal or unenforceable will be ineffective to the extent of the illegality or unenforceability without invalidating the remaining provisions of this EPA.

15.12 Counterparts

This EPA may be executed in counterparts, each of which is deemed to be an original document and all of which are deemed one and the same document.

[Signature Page Follows]

IN WITNESS WHEREOF each Party by its duly authorized representative(s) has signed this EPA effective as of the date set out on page one of this EPA.

SCHEDULE "A"

DEFINITIONS AND INTERPRETATION

1. DEFINITIONS

References in a Schedule to a section or Section mean a section or Section of this EPA, and not a Schedule, unless otherwise stated. The following words and expressions wherever used in this EPA have the following meaning:

1.1 "**Affiliate**" means, with respect to any Party or any third Person, any Person directly or indirectly Controlled by, Controlling, or under common Control with, such Party or the third Person.

1.2 "**Annual Operating Plan**" means a 12-month operating plan for the Seller's Plant that includes for term of each operating plan, (a) a schedule of the expected total deliveries of Energy at the POI in each month and (b) a schedule of any Planned Outages of the Seller's Plant expected by Seller. The Annual Operating Plan will be consistent with Good Industry Practice and shall be substantially in the form attached hereto as Schedule "C", subject to such modifications thereto as may be reasonably required by Buyer.

1.3 "**Application**" means the application and all supporting documents and information with respect to the Seller's Plant filed by Seller with Buyer in the Standing Offer Program.

1.4 "**Assign**" or "**Assignment**" means to assign or dispose of this EPA or any direct or indirect interest in this EPA, in whole or in part, for all or part of the Term and, without limiting the foregoing, each of the following is deemed to be an Assignment of this EPA by Seller:

(a) any sale or other disposition of all or a substantial part of Seller's ownership interest in the Seller's Plant, or of all or any interest of Seller in this EPA or revenue derived from this EPA;

(b) any mortgage, pledge, charge or grant of a security interest in all or any part of the Seller's Plant or Seller's ownership interest therein; and

(c) any change of Control, merger, amalgamation or reorganization of Seller.

1.5 "**Audit Parties**" means the applicable Party conducting an audit under this EPA and its Affiliates, representatives, consultants, advisors and any other third Person retained in respect of the applicable audit.

1.6 "**Bankrupt or Insolvent**" means, with respect to a Person:

(a) the Person has started proceedings to be adjudicated a voluntary bankrupt or consented to the filing of a bankruptcy proceeding against it;

(b) the Person has filed a petition or similar proceeding seeking reorganization, arrangement or similar relief under any bankruptcy or insolvency law;

(c) a receiver, liquidator, trustee or assignee in bankruptcy has been appointed for the Person or the Person has consented to the appointment of a receiver, liquidator, trustee or assignee in bankruptcy;

(d) the Person has voluntarily suspended the transaction of its usual business; or

(e) a court of competent jurisdiction has issued an order declaring the Person bankrupt or insolvent.

1.7 "**Business Day**" means any calendar day which is not a Saturday, Sunday or Yukon statutory holiday.

1.8 "**Buyer**" means _____ and its successors and permitted assigns.

1.9 "**Buyer Confidential Information**" means technical or commercial information disclosed by Buyer to Seller that Buyer directs, and clearly marks, as confidential, including the System Interconnection Guidelines and this EPA but excluding information that (i) is or becomes in the public domain, other than as a result of a breach of this EPA by Seller, or (ii) is known to Seller before disclosure to it by Buyer, or becomes known to Seller, thereafter by way of disclosure to Seller by any other Person who is not under an obligation of confidentiality with respect thereto.

1.10 "**Buyer's COD**" shall occur when the System Upgrades have been completed and Buyer provides a notice of completion of the same to Seller.

1.11 "**Change in Law**" means (a) the enactment, adoption, promulgation, modification or repeal of any applicable Laws or any change in the interpretation or administration of any applicable Laws resulting from a decision of a Governmental Authority which occurs after the Effective Date; but in each case excluding a Change in Law relating to income tax, or (b) the requirement for a new Permit (including due to a change in the circumstances in which a Permit is required), a change in the terms of any Permit after the date such Permit is granted, or any change in the interpretation or administration of any Permits resulting from a decision of a Governmental Authority.

1.12 "**Condition Date**" means the date specified as such in Schedule "B".

1.13 "**Conditions Precedent**" means those conditions precedent set out in Schedule "B".

1.14 "**Control**" of any Person means:

(a) with respect to any corporation or other Person having voting shares or the equivalent, the ownership or power to vote, directly or indirectly, shares, or the equivalent, representing 50% or more of the power to vote in the election of directors, managers or Persons performing similar functions;

(b) ownership of 50% or more of the equity or beneficial interest in that Person; or

(c) the ability to direct the business and affairs of any Person by acting as a general partner, manager or otherwise.

1.15 "**CPI**" means the "Canada All Items (Not Seasonally Adjusted)" Consumer Price Index as published by Statistics Canada or any successor agency thereto.

1.16 "**Delivered Energy**" means in each month after Buyer's COD the amount of Energy delivered by Seller at the POI in that month as recorded by Buyer's Meter less the applicable Line Losses.

1.17 "**Development Progress Report**" means a report describing the progress of the financing, design, engineering, construction, Interconnection, and commissioning of the Seller's Plant, that is in form and content acceptable to Buyer, acting reasonably.

1.18 "**Discretion**" (whether or not capitalized) means sole, absolute and unfettered discretion unless this EPA expressly states otherwise.

1.19 "**Dispatch/Turn-Down**" means for Seller to turn down or shut off the Seller's Plant.

1.20 "**Dispatch/Turn-Down Deemed Energy**" has the meaning given to such term in Section 4.9(b)(i).

1.21 "**Distribution System**" means the distribution, protection, control and communication facilities in the Yukon that are or may be used in connection with, or that otherwise relate to, the transmission of electrical energy at 35 kilovolts or less, and includes all additions and modifications thereto and repairs or replacements thereof.

1.22 "**Distribution/Transmission Constraint**" means any disconnection of the Seller's Plant from the Distribution System or Transmission System, or any outage, suspension, constraint or curtailment in the operation of the Distribution System or Transmission System preventing or limiting deliveries of Energy at the POI or within the Distribution System or Transmission System or any direction from Buyer to reduce generation of the Seller's Plant as a result of any outage, suspension, constraint or curtailment in the operation of the Distribution System or Transmission System.

1.23 "**Effective Date**" shall mean the date on which all Conditions Precedent have been satisfied or waived in accordance with Section 2.1.

1.24 "**Electrical Grid**" means the electrical grid into which the Seller's Plant will be interconnected, as identified in Schedule "B"**.**

1.25 "**Eligible Clean Energy**" means wind, hydro, geothermal, biomass and solar energy sources permitted under the IPP Policy for the SOP generated by a Project located in Yukon which is directly connected into the YIS or the WLG through the New Interconnection Facilities.

1.26 "**Energy**" means all electrical energy expressed in KWh generated by the Seller's Plant, excluding electrical energy generated by the Seller's Plant which is required to service the Seller's Plant Load.

1.27 "**Energy Price**" has the meaning given to such term in Schedule "B".

1.28 "**Environmental Attributes**" means the following as attributable to Energy delivered to Buyer under this EPA:

(a) all attributes directly associated with, or that may be derived from, the Energy delivered to Buyer under this EPA having decreased environmental impacts relative to certain other generation facilities or technologies including any existing or future credit, allowance, "green" tag, ticket, certificate or other "green" marketing attribute or proprietary or contractual right, whether or not tradeable;

(b) any credit, reduction right, offset, allowance, allocated pollution right, certificate or other unit of any kind whatsoever, whether or not tradeable and any other proprietary or contractual right, whether or not tradeable, resulting from, or otherwise related to the actual or assumed reduction, displacement or offset of emissions at any location other than the Seller's Plant as a result of the generation, purchase or sale of the Energy delivered to Buyer under this EPA;

(c) any credit, reduction right, off-set, allowance, allocated pollution right, certificate or other unit of any kind whatsoever whether or not tradeable resulting from or otherwise related to the reduction, removal, or sequestration of emissions at or from the Seller's Plant; and

(d) all revenues, entitlements, benefits and other proceeds arising from or related to the foregoing, but for certainty not including:

i. benefits or proceeds from environmental incentive programs offered by Governmental Authorities that do not require a transfer of the attributes in (a) to (c) above; and

ii. benefits or proceeds from social programs, including programs relating to northern or rural development, employment or skills training, or First Nations, that do not require a transfer of the attributes in Sections (a) to (c) above.

1.29 "**Environmental Certification**" means any certification Buyer requires Seller to obtain under Section 6.1.

1.30 "**Facility Lender**" means any lender(s) providing any debt financing or debt hedging facilities for the design, engineering, construction and/or operation of the Seller's Plant and any successors or assigns thereto and any Person taking any mortgage, pledge, charge or grant of a security interest in all or any part of the Seller's Plant.

1.31 "**Final Amount**" means an amount owing by either Party to the other Party under this EPA, including as a result of a breach of this EPA, where such amount is: (a) undisputed by the Party owing such amount; or (b) has been finally determined by an arbitration award under Section 12.1 of this EPA or by a court order and all rights of appeal in respect of such award or order have been exhausted or have expired.

1.32 "**First Nation Claim**" means a legal claim or proceeding or written threat to commence a legal claim or proceeding from or on behalf of First Nations where such claim or threat alleges a breach or potential breach of, or an impact to: any First Nations' Treaty rights, rights under a Settlement Agreement (as that term is defined in the Yukon Umbrella Final Agreement), or rights under section 35 of the *Constitution Act*, 1982, by (a) this EPA, (b) the Seller's Plant, (c) the Interconnection or any works related to the Interconnection, or (d) any authorization granted by the Yukon or federal government relating to the Seller's Plant and its operations.

1.33 "**First Nations**" means any one of the 14 First Nations in the Yukon.

1.34 "**Force Majeure**" means any event or circumstance not within the control of the Party, or any of its Affiliates, claiming Force Majeure, but does not include:

(a) any economic hardship or lack of money, credit or markets;

(b) an event or circumstance that is the result of a breach by the Party seeking to invoke Force Majeure of a Permit or of any applicable Laws;

(c) a mechanical breakdown or control system hardware or software failure, unless the Party seeking to invoke Force Majeure can demonstrate by clear and convincing evidence that the breakdown or failure was caused by a latent defect in the design or manufacture of the equipment, hardware or software, which could not reasonably have been identified by normal inspection or testing of the equipment, hardware or software;

(d) an event or circumstance caused by a breach of, or default under, this EPA or a willful or negligent act or omission by the Party seeking to invoke Force Majeure;

(e) any Distribution/Transmission Constraint unless such event is caused by an event or circumstance not within the control of Buyer; or

(f) any acts or omissions of: (i) any Affiliate, employee, director, officer, agent or other representative of the Party invoking Force Majeure; (ii) any vendor, supplier, contractor, subcontractor, consultant or customer of or to the Party invoking Force Majeure; or (iii) any other Person for whom the Party invoking Force Majeure is responsible at law, unless the act or omission is caused by an event or circumstance that would constitute Force Majeure if the Person described above was a party to this EPA in place of a Party invoking Force Majeure.

1.35 "**Forced Outage**" means the immediate removal of one or more generating units of the Seller's Plant or transmission or distribution infrastructure of the Seller's Plant from service in response to equipment alarms or any damage identified during a Planned Outage or Maintenance Outage requiring extension of those Planned Outage or Maintenance Outage.

1.36 "**General Rate Application**" means any application, review, process, or procedure in which the YUB sets and approves rates to be charged by Buyer for the supply of the service for which it is franchised in accordance with the *Public Utilities Act*.

1.37 "**Good Industry Practice**" means:

(a) in respect of Buyer, any of the practices, methods and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition; provided such practices, methods and acts are not intended to be limited to the optimum practice, method or act to the exclusion of all others, but rather to be acceptable practices, methods or acts generally accepted in the Yukon; and provided that Buyer shall be in compliance with Good Industry Practice in respect of any equipment comprising the Distribution System or Transmission System, if it operates such equipment in accordance with all applicable original equipment manufacturer guidelines and requirements provided to Buyer by supplier of such equipment; and

(b) in respect of Seller, any of the practices, methods and acts engaged in or approved by a significant portion of the electric generation industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in

light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition; provided such practices, methods and acts are not intended to be limited to the optimum practice, method or act to the exclusion of all others, but rather to be acceptable practices, methods or acts generally accepted in Western Canada.

1.38 "**Governmental Authority**" means any federal, provincial, local or foreign government or any of their boards or agencies, or any regulatory authority other than Buyer and Seller and entities controlled by Buyer or Seller.

1.39 "**GST**" means the goods and services tax imposed under the *Excise Tax Act* (Canada) as that Act may be amended or replaced from time to time.

1.40 "**Interconnection**" means the POI.

1.41 "**IPP Policy**" has the meaning given to such term in the recitals to this EPA.

1.42 "**Joint Operating Procedure**" means the joint operating procedure attached as Schedule "H" as may be modified by Buyer from time to time. **[Note to Developer - where the Project is located on AEY's portion of the YIS, the EPA will be entered into between Seller and YEC, however the System Interconnection Guidelines and the Joint Operating Procedure will be established under a 3 party agreement among Seller, YEC and AEY]**

1.43 "**KW**" means kilowatt.

1.44 "**KWh**" means kilowatt-hour.

1.45 "**Laws**" means any and all statutes, laws (including common law), ordinances, rules, regulations, codes, orders, bylaws, policies, directions, standards, guidelines, protocols and other lawful requirements of any Governmental Authority in effect from time to time.

1.46 "**Lender Consent Agreement**" means a lender consent agreement in the form and substance acceptable to Buyer, acting reasonably.

1.47 "**Line Losses**" means losses of electricity associated with the transmission and transformation of Energy and other electricity, if applicable, from the Seller's Plant to the POI that are recorded by the Meter or reasonably estimated by Buyer.

1.48 "**Line Loss Methodology**" means the Line Loss Methodology set forth in the System Interconnection Study Report for the purposes of this Project.

1.49 "**Maintenance Outage**" means any outage of Buyer's Distribution System or Transmission System or the Seller's Plant that is not a Planned Outage or a Forced Outage that typically has a flexible start and end time and of shorter duration than a Planned Outage.

1.50 "**Meter**" means a meter owned by Buyer that is: (a) capable of accurately measuring the quantity of Energy generated by the Seller's Plant and delivered to the POI independent of all other generation equipment or facilities, (b) capable of being remotely interrogated; and (b) calibrated to measure on an hourly basis the quantity of Energy delivered by Seller to the POI.

1.51 "**Monthly Energy Shortfall Payment**" has the meaning given to such term in Schedule "E".

1.52 "**New Interconnection Facilities**" means those additions, modifications and upgrades required to interconnect the Project to the Electrical Grid which are identified in the System Interconnection Study Report (and as further refined in subsequent interconnection studies, if required by Buyer) and approved by Buyer, but excluding any System Upgrades.

1.53 "**New Interconnection Facilities Costs**" means all costs incurred by Buyer for the design, engineering, procurement, construction, installation and commissioning of the New Interconnection Facilities, including applicable studies required by Buyer, an estimate of which is set out in the System Interconnection Study Report.

1.54 "**Non-Permitted Distribution/Transmission Constraint**" has the meaning given to such term in Section 4.8(a).

1.55 "**Outage**" means a Forced Outage, Maintenance Outage, or Planned Outage of Buyer's Distribution System or Transmission System or Seller's Plant.

1.56 "**Outage Notice**" means a notification of any Outage or revised notification of any Outage required to be delivered by Seller to Buyer or Buyer to Seller under this EPA that describes the timing, frequency, nature and duration of the Outage and that is in a format that may be prescribed by Buyer from time to time.

1.57 "**Party**" means Buyer or Seller, and "**Parties**" means both Buyer and Seller.

1.58 "**Permits**" means permits, certificates, licences, approvals and other authorizations issued by any Governmental Authorities as may be required for the design, construction, ownership, operation, maintenance and decommissioning of (i) the Seller's Plant and the delivery of Energy to the POI, and (ii) the System Upgrades and the New Interconnection Facilities.

1.59 "**Person**" means an individual, body corporate, firm, partnership, joint venture, trust, legal representative or other legal entity.

1.60 "**Planned Outage**" means an outage that is scheduled well in advance for purposes of inspections, maintenance, or repair of Buyer's Distribution System or Transmission System or Seller's Plant, that typically has a predetermined duration and scope of work, occurs only once or twice per year, and may last for several days.

1.61 "**POI**" or "**Point of Interconnection**" means the point at which the Seller's Plant interconnects with the Distribution System or Transmission System, as identified on the Single Line Diagram.

1.62 "**Potential Impacts**" means any adverse or potentially adverse impact on the established or potential aboriginal rights (including title) of First Nations as a result of:

(a) this EPA;

(b) the Project;

(c) the interconnection of the Seller's Plant to the Distribution System or Transmission System; or

(d) any activities directly related to the Seller's Plant that enable Seller to comply with its obligations under this EPA that are carried out by Seller, any Affiliate, consultant or contractor of Seller, or any other Person for whom Seller is responsible at law.

1.63 "**PPT**" means Pacific Prevailing Time, which means Pacific Daylight Time or Pacific Standard Time as applicable.

1.64 "**Present Value Rate**" means the annual yield on a Government of Canada bond having a term and maturity date that most closely matches the remaining Term (as at the date of the applicable calculation) and expiry date of this EPA, plus 3%.

1.65 "**Prime Rate**" means the floating prime interest rate announced from time to time by the main branch of Bank of Montreal in Whitehorse, Yukon, or any successor thereto, expressed as an annual rate, as the reference rate it will use to determine rates of interest payable on Canadian dollar commercial loans made in Canada.

1.66 "**Project**" means the financing, design, engineering, procurement, construction, commissioning, operation and maintenance of the Seller's Plant.

1.67 "**Project Cluster**" means two or more existing or proposed Projects under the SOP Rules that Buyer determines in its Discretion are so closely related to each other that they should be considered a project cluster for the purposes of the Standing Offer Program.

1.68 "**Project Energy Volume**" (in KWh) means the maximum annual Energy which Buyer may sell to Seller from the Project in any calendar year as set out in Schedule "B"; provided that where the Term does not commence on January 1, such amount shall be prorated for the first and last contract year which do not reflect a full calendar year. **[Note to Developers – this amount will be set when the EPA is executed. It will be determined based on the annual energy volume which is expected to be generated by the Project in a calendar year determined based on the maximum number of KWh which the applicable Project would generate assuming that it generated in accordance with the Nameplate Capacity after taking into account a reasonable capacity factor for the applicable Eligible Clean Energy type]**

1.69 "**Project Standards**" means:

(a) all applicable Laws;

(b) the terms and conditions of all Permits, including land tenure agreements, issued in connection with the Seller's Plant;

(c) Good Industry Practice;

(d) the description of the Seller's Plant in Schedule "B";

(e) the requirement that Energy must qualify as Eligible Clean Energy; and

(f) the terms and conditions of this EPA (including the System Interconnection Guidelines).

1.70 "**Public Utilities Act**" means the *Public Utilities Act* (Yukon) and any successor or replacement legislation.

1.71 "**Records**" means all records and logs required to properly administer this EPA, including:

(a) Energy generation records and operating logs;

(b) Meter readings;

(c) maintenance reports;

(d) invoice support records;

(e) documents concerning compliance with Project Standards, but excluding any such documents that are protected by solicitor-client privilege;

(f) records related to System Upgrade Costs and New Interconnection Facilities Costs;

(g) all information reasonably required to establish the amount of Energy Seller could have sold during a Distribution/Transmission Constraint including logs of all Outages of the Seller's Plant and other reductions in Energy output (specifying the date, time, duration and reasons for each such outage and each reduction in Energy output); and

(h) information relating to the Environmental Certification, information relating to the existence, nature and quality of Environmental Attributes, information required for the purposes of any Environmental Attributes or energy certification or tracking system, and any other information Buyer requires to enable it or any of its Affiliates to obtain and realize the benefit of the Environmental Attributes,

all consistent with Good Industry Practice.

1.72 "**Regulatory Agency Authorizations**" means the issuance of those Permits which are specified as required for the Project in the YESAB assessment report recommendation to proceed issued in respect of the Project.

1.73 "**Seller**" means the Party so identified on page one of this EPA, and its successors and permitted assigns.

1.74 "**Seller Confidential Information**" means any of Seller's confidential technical or financial information provided by Seller to Buyer in confidence with express written notice to Buyer of the confidential nature of the information, but excluding:

(a) this EPA; and

(b) information that (i) is or becomes in the public domain, other than as a result of a breach of this EPA by Buyer, or (ii) is known to Buyer before disclosure to it by Seller, or becomes known to Buyer thereafter by way of disclosure to Buyer by any other Person who is not under an obligation of confidentiality with respect thereto.

1.75 "**Seller's COD**" means the commercial operation date of Seller's Plant which is the date on which all of the following conditions have been satisfied in respect of the Seller's Plant:

(a) Seller has obtained all Permits required for the construction, commissioning, and operation of the Seller's Plant and all such Permits are in full force and effect;

(b) the Seller's Plant has been fully constructed in accordance with the Project Standards;

(c) Seller is not: (A) Bankrupt or Insolvent; (B) in default of any payment obligation or requirement to post security under this EPA; (C) in material default of any of its other covenants, representations, warranties or obligations under this EPA; or (D) in material default under any Permit or Law applicable to the construction, commissioning or operation of the Seller's Plant or under any land tenure agreement for the site on which the Seller's Plant is located;

(d) a Meter has been installed at the POI in accordance with Section 3.6 of this EPA;

(e) Seller has delivered to Buyer a written notice together with certificate of Seller's professional registered engineer confirming that Seller's COD has been achieved; and

(f) Buyer has delivered a Commission Notice to Operate, or such other document(s) of similar effect as may be substituted therefor, which evidences no material deficiencies, in respect of the Seller's Plant Capacity and Seller's Plant operations;

and for purposes of this EPA, Seller's COD will be deemed to have occurred at 24:00 PPT on the later of the dates set out above.

1.76 "**Seller's Plant**" means Seller's plant described in Schedule "B" and all assets required to interconnect that plant to the Distribution System or Transmission System; all rights, property, facilities, assets, equipment, materials, Permits and contracts required to design, engineer, procure, construct, commission, operate and maintain the plant described in Schedule "B" and to interconnect that plant to the Distribution System or Transmission System, whether real or personal and whether tangible or intangible including all land tenure and all books, Records and accounts with respect to the Seller's Plant described in Schedule "B"; and shall include replacement parts or equipment which are of the same or similar nature as the parts or equipment being replaced and which do not materially increase the amount of Energy available from Seller's Plant.

1.77 "**Seller's Plant Capacity**" means the electrical generating capacity of the Seller's Plant set out in Schedule "B".

1.78 "**Seller's Plant Load**" means any electrical energy consumed by Seller's Plant.

1.79 "**Single Line Diagram**" means the simplified electrical representations of the Seller's Plant, the Interconnection, the Distribution System and Transmission System attached hereto in Schedule "B".

1.80 "**SOP OIC**" means that Order in Council issued by the Government of Yukon on January 24, 2019 regarding, among other things, the Standing Offer Program.

1.81 "**SOP Rules**" means the Standing Offer Program Rules developed by the Government of Yukon which governed this EPA as at the date of this EPA.

1.82 "**Standing Offer Program**" or "**SOP**" means the Standing Offer Program as described in the IPP Policy.

1.83 "**System Interconnection Guidelines**" means those system interconnection guidelines in the form attached as Schedule "G" hereto, as amended or replaced by Buyer from time to time. **[Note to Developer - where the Project is located on AEY's portion of the YIS, the EPA will be entered into between Seller and YEC, however the System Interconnection Guidelines and the Joint Operating Procedure will be established under a 3 party agreement among Seller, YEC and AEY]**

1.84 "**System Interconnection Study Report**" means the detailed interconnection study issued to Seller by Buyer which, among other things, (i) evaluates the impact of the Project on the reliability of Buyer's system, (ii) provides a planning-level estimate of the required System Upgrades and New Interconnection Facilities and associated costs, and (iii) establishes the Line Loss Methodology for this Project, a copy of which is attached as Schedule "D".

1.85 "**System Upgrades**" means additions, modifications and upgrades to the Distribution System, Transmission System or any portion of Buyer's generation system that are determined by Buyer to be required in order to facilitate the interconnection and to allow such Distribution System, Transmission System or any portion of Buyer's generation system to support the integration of the Energy produced by the Seller's Plant in accordance with this EPA and the System Interconnection Guidelines, which are identified in the System Interconnection Study Report (and as further refined in subsequent interconnection studies, if required by Buyer) and approved by Buyer, but excluding any New Interconnection Facilities.

1.86 "**System Upgrade Costs**" means all costs incurred by Buyer for the design, engineering, procurement, construction, installation and commissioning of the System Upgrades, including applicable studies required by Buyer, an estimate of which is set out in the System Interconnection Study Report.

1.87 "**Target Buyer's COD**" means the target date for achieving Buyer's COD, being the date specified for such term in Schedule "B", as may be extended pursuant to Section 3.9, if applicable.

1.88 "**Target Seller's COD**" means the target date for achieving Seller's COD, being the date specified for such term in Schedule "B", as may be extended pursuant to Section 3.9, if applicable.

1.89 "**Term**" has the meaning given to such term in Section 2.1.

1.90 "**Termination Payment**" has the meaning given to such term in Schedule "F".

1.91 "**Transmission System**" means the transmission, substation, protection, control and communication facilities owned and operated by Buyer, and includes all additions and modifications to those facilities and repairs or replacements of those facilities.

1.92 "**Upgrade Costs Advance**" has the meaning given to such term in Section 3.5(a).

1.93 "**Upgrade Costs Security**" has the meaning given to such term in Section 3.5(a).

1.94 "**Utilities**" means both Yukon Energy Corporation or Yukon Electrical Company, doing business as ATCO Electric Yukon, as applicable.

1.95 "**YESAA**" means the *Yukon Environmental and Socio-economic Assessment Act*, SC 2003, c 7.

1.96 "**YESAB**" means the Yukon Environmental and Socio-economic Assessment Board.

1.97 "**YUB**" means the Yukon Utilities Board and any successor thereto appointed from time to time under the *Public Utilities Act*.

2. INTERPRETATION

2.1 **Headings** - The division of this EPA into Articles, sections, Sections, paragraphs and Schedules and the insertion of headings are for convenience of reference only and do not affect the interpretation of this EPA.

2.2 **Plurality and Gender** - Words in the singular include the plural and vice versa. Words importing gender include the masculine, feminine and neuter genders.

2.3 **Governing Law** - This EPA is made under, and will be interpreted in accordance with, the Laws of the Yukon. Subject to Section 12.1, any suit, action or proceeding (a "**Proceeding**") arising out of or relating to this EPA may be brought in the courts of the Yukon at Whitehorse, and those courts have non-exclusive jurisdiction in respect of any Proceeding and the Parties hereby irrevocably attorn to the jurisdiction of such courts in respect of any Proceeding.

2.4 **Industry Terms** - Technical or industry specific phrases or words not otherwise defined in this EPA have the well-known meaning given to those terms as of the date of this EPA in the industry or trade in which they are applied or used.

2.5 **Statutory References** - Reference to a statute means, unless otherwise stated, the statute and regulations, if any, under that statute, in force from time to time, and any statute or regulation passed and in force which has the effect of supplementing or superseding that statute or those regulations.

2.6 **Currency** - References to dollars or $ means Canadian dollars, unless otherwise stated.

2.7 **Reference Indices** - If any index, tariff or price quotation referred to in this EPA ceases to be published, or if the basis therefor is changed materially, there will be substituted an available replacement index, tariff or price quotation that most nearly, of those then publicly available, approximates the intent and purpose of the index, tariff or quotation that has so ceased or changed. This EPA will be amended as necessary to accommodate such replacement index, tariff or price quotation, all as determined by written agreement between the Parties, or failing agreement, by arbitration under Section 12.1 of this EPA.

2.8 **Conversions** - If a value used in a calculation in this EPA must be converted to another unit of measurement for purposes of consistency or to achieve a meaningful answer, the value will be converted to that different unit for purposes of the calculation.

2.9 **Additional Interpretive Rules** - For the purposes of this EPA, except as otherwise expressly stated:

(a) "this EPA" means this EPA as it may from time to time be supplemented or amended and in effect, and includes the Schedules attached to this EPA;

(b) the words "herein", "hereof" and "hereunder" and other words of similar import refer to this EPA as a whole and not to any particular section, Section or other subdivision;

(c) the word "including" or "includes" is not limiting whether or not non-limiting language (such as "without limitation" or "but not limited to" or words of similar import) is used with reference thereto;

(d) the words "year" and "month" refer to a calendar year and a calendar month;

(e) any consent, approval or waiver contemplated by this EPA must be in writing and signed by the Party against whom its enforcement is sought, and may be given, withheld or conditioned in the unfettered discretion of the Party of whom it is requested, unless otherwise expressly stated;

(f) all rights and remedies of either Party under this EPA are cumulative and not exclusive of any other remedies to which either Party may be lawfully entitled, and either Party may pursue any and all of its remedies concurrently, consecutively and alternatively; and

(g) any notice required to be given, or other thing required to be done, under this EPA on or before a day that is not a Business Day, will be deemed to be given or done when required hereunder if given or done on or before the next following Business Day.

3. ADDRESSES FOR NOTICES

3.1 Notices to Buyer - Except as noted below, all notices addressed to Buyer will be delivered to the following address:

To: [BUYER]
_____
Whitehorse, YT
_____
Attention: Attention: Manager
Email: _____

3.2 Notices to Seller - All notices addressed to Seller will be delivered to the following address:

To: [SELLER]
_____
Whitehorse, YT
_____
Attention: Attention: Manager
Email: _____

SCHEDULE "B"

PROJECT DESCRIPTION

CONTRACT PARTICULARS:

1. **Condition Date:**

[Insert the date on which the Conditions Precedent must be satisfied by Seller]

2. **Conditions Precedent:**

The Conditions Precedent are as follows:

(a) *[Seller shall have received all of the Permits described below in form and substance acceptable to Seller and Buyer, acting reasonably:*

(i) *[Regulatory Agency Authorizations]*

(ii) *[Other]*

(b) *[provision of security under Section 3.5 for System Upgrade Costs and New Interconnection Facilities Costs]; and*

(c) *[others Conditions Precedent]*.

3. **Term:**

The "**Term**" of this EPA commences on the Effective Date and continues for a period of __ years following Buyer's COD.

[Note to Developers: Developers may elect a single term under an EPA of <u>up to</u> the following number of years for the applicable Eligible Clean Energy:

<u>Eligible Clean Energy</u>	**<u>Term Limit</u>**
Wind	**25 years**
Hydro	**40 years**
Geothermal	**40 years**
Biomass	**20 years**
Solar	**25 years]**

4. **Energy Price and Seasonal Adjustment:**

(a) In each billing period, Seller shall pay to Buyer, for each KWh of Delivered Energy the "**Energy Price**" calculated as follows:

[Note to Developers: For Projects connected to the YIS, the Energy Price will be calculated as follows. The first and third blanks above will be completed with the applicable Base Fuel Price as described in Section 4.2 of the SOP Rules. The blank in the subscript will be completed with the year in which the EPA is signed.

Energy Price$_n$ = (.5 * $__/KWh * CPI$_{\text{January 1, n}}$ / CPI$_{\text{January 1, __}}$) + (.5 * $__/KWh)]

[Note to Developers: For Projects connected to the WLG, the Energy Price will be calculated as follows. The first blank above will be completed with the applicable Base Fuel Price as described in Section 4.2 of the SOP Rules. The blank in the subscript will be completed with the year in which the EPA is signed.

Energy Price$_n$ = ($__/KWh * CPI$_{\text{January 1, n}}$ / CPI$_{\text{January 1, __}}$)]

Where:

n = the year for which the relevant calculation is being conducted

CPI $_{\text{January 1, n}}$ = the CPI for December in the year immediately prior to the year for which the relevant calculation is being conducted;

(b) For each hour, the Energy Price determined above for Delivered Energy during that hour will be adjusted to an amount (expressed in $/KWh) equal to the percentage of that Energy Price applicable for that hour as set out in the table in Schedule "I".

SELLER'S PLANT

1. **Location of Control Building:**

[Insert nearest latitude and longitude]

2. **Eligible Clean Energy Type:**

[Describe Eligible Clean Energy utilized]

3. **Seller's Plant Capacity:**

[Insert Project Nameplate Capacity]

4. **Project Energy Volume:**

[Insert Project Energy Volume in KWh in any year, being the annual energy volume which is expected to be generated by the Project determined based on the maximum number of KWh which the applicable Project would generate assuming that it generated in accordance with the Seller's Plant Capacity after taking into account a reasonable capacity factor for the applicable Eligible Clean Energy type]

5. **Seller's Plant Description:**

[Insert Project description]

Please refer to Seller's single line diagram in Exhibit B-1.

Total AC Power:
Primary AC line voltage:
Total AC line current:

Total DC power:
Open-circuit DC voltage:
Operating DC voltage:
Total DC operating current:

6. **Target Seller's COD:**

[Insert]

7. **Electrical Grid:**

[Insert Yukon Integrated System (YIS) or Watson Lake Grid (WLG)].

BUYER'S SYSTEM UPGRADES

[Note to Developers – These System Upgrades will be more fully scoped in the System Interconnection Study Report]

1. **System Upgrades:**

[Description to come]

Please refer to Buyer's single line diagram in Exhibit B-2.

2. **New Interconnection Facilities:**

[Description to come]

Please refer to Buyer's single line diagram in Exhibit B-2.

3. **Target Buyer's COD:**

[To come]

BREAKERS/SWITCHES AND SYNCHRONIZATION

[Note to Developers – To be developed for each Project]

EXHIBIT B-1

Seller's Single Line Diagram

[Note to Developers – To be developed for each Project]

EXHIBIT B-2

Buyer's Single Line Diagram

[Note to Developers – To be developed for each Project]

SCHEDULE "C"

FORM OF ANNUAL OPERATING PLAN

DATE: _____, 20__.

TO: _____ ("Buyer")

RE: Electricity Purchase Agreement between _____ ("Seller") and Buyer dated the ___ day of _____, 20__ (the "EPA")

The following sets out the Annual Operating Plan of Seller for the 12 months commencing on January 1, 20__ (the "**Applicable Period**").

(a) The following (from Table E-1 of Schedule "E" of the EPA) is the schedule of the expected total deliveries of Energy at the POI in each month of the Applicable Period:

	Projected Hourly Energy (KWh/h) **(A)**	**Projected Monthly Energy (KWh)** **(B)**
January		
February		
March		
April		
May		
June		
July		
August		
September		
October		
November		
December		

(b) The following is the schedule of any Planned Outages of the Seller's Plant expected by Seller for the Applicable Period:

[to come]

(c) The following is the schedule of operations and maintenance activities planned for the Seller's Plant expected by Seller for the Applicable Period:

[to come]

Dated effective as of the date set forth above.

[SELLER]

Per: _____
[Name]
[Title]

Per: _____

[Title]

SCHEDULE "D"

SYSTEM INTERCONNECTION STUDY REPORT

SCHEDULE "E"

MONTHLY ENERGY SHORTFALL PAYMENT

Monthly Energy Shortfall Payments

In any calendar month in which there has occurred a Non-Permitted Distribution/Transmission Constraint then Buyer shall pay Seller Monthly Energy Shortfall Payment,

where:

"**Monthly Energy Shortfall Payment**" means the Monthly Constraint Shortfall multiplied by the price which is payable for Delivered Energy under Section 5.1 of the EPA; and

"**Monthly Constraint Shortfall**" (expressed in KWh) means, for each calendar month, means the aggregate of the duration of each Non-Permitted Distribution/Transmission Constraint (measured as a fraction determined as the aggregate number of minutes in such Non-Permitted Distribution/Transmission Constraint divided by 60) multiplied by the "Non-Permitted Distribution/Transmission Constraint Hourly Deemed Energy" set out in Table E-1 below for the applicable calendar month.

Table E-1

	Projected Hourly Energy (KWh/h) (A)	**Projected Monthly Energy (KWh) (B)**	**Non-Permitted Distribution/Transmission Constraint Factor (F1)**	**Non-Permitted Distribution/Transmission Constraint Hourly Deemed Energy (KWh/h) (A x F1)**
January			_%	
February			_%	
March			_%	
April			_%	
May			__%	
June			__%	
July			__%	
August			__%	
September			__%	
October			__%	
November			__%	
December			__%	

Revisions to Projected Hourly Energy and Projected Monthly Energy

Within 90 days following the end of the 2nd year after Buyer's COD, the Parties shall review and revise the values in Table E-1 above for Projected Hourly Energy and Projected Monthly Energy to reflect the average actual amount of Delivered Energy sold to Buyer in the 2 years following Buyer's COD for the applicable months.

SCHEDULE "F"

TERMINATION PAYMENT

The "**Termination Payment**" at any time shall be equal to (a) the Gross Termination Payment set out below for the Contract Year in which the termination occurred, less (b) the actual amounts paid or owing by Buyer to Seller for Delivered Energy for the Contract Year in which the termination occurred.

Table F-1

Termination Year	**Gross Termination Payment**

Executive Summary

The purpose of the Interconnection Technical Guide is to provide guidelines for Independent Power Producers (IPP) who wish to interconnect a generation facility of greater than 50 kW and up to 10 MW to the Yukon Integrated System (YIS) via the Yukon Energy Corporation (YEC) or ATCO Electrical Yukon (AEY) distribution systems. The maximum allowable generation at the Point of Interconnection (POI) between the distribution system and IPP will depend on the results of a system impact study conducted by YEC. This guide details the technical and operational requirements of the facility and is not intended to be used as a design guide.

The purpose of this document is to:

- Provide technical specifications for the interconnection of IPP generation to the YIS (via YEC or AEY distribution systems).
- Clarify, where necessary, the technical requirements in CSA Standard C22.3 No. 9-08 (R2015) "Interconnection of Distributed Resources and Electricity Supply Systems" [1] and to provide an outline for how each section applies to interconnections with the YIS.

1. Introduction and Scope

1.1. Purpose

This guide establishes criteria and technical requirements for Independent Power Producers (IPP) who wish to interconnect generation, with a net capacity greater than 50 kW and up to 10 MW, to the Yukon Integrated System (YIS), at the distribution level (35 kV and below), or at the transmission level (above 35 kV). This guide has been developed considering CSA Standard C22.3 No. 9-08 (R2015) [1] and IEEE Standard 1547-2018 [2] and is subject to regular review and revision due to evolving standards.

The technical guide is intended to assist IPPs who apply to connect to the YIS through the Standing Offer Program, Call for Power, or through other unsolicited requests to connect.

1.2. Limitations

The criteria and technical requirements described within this section apply to the following generation interconnections:

- Interconnections to the Yukon Energy Corporation (YEC) and ATCO Electric Yukon (AEY) distribution systems at voltages of 34.5 kV and below, and
- Interconnections to the YEC transmission system at voltages over 34.5 kV by means of an existing or new substation. Transmission interconnections will require specific detailed review and approval by YEC and all interconnection costs will be borne by the IPP.

This Guide establishes the minimum requirements for the Point of Interconnection (POI). The IPP generation may be subject to additional requirements to ensure the project meets all applicable standards.

This Guide is not to be used:

- As an Operating Agreement and does not address the following:
    - Joint operating agreements
    - Costs
    - Tariffs
    - Other contractual issues
- As an Interconnection Process and Procedures Guide, and does not include the following:
    - Protection of the IPP's generation facilities
    - Transmission system impact and upgrades
    - System planning and design
    - Operation of the distribution system
    - Other system related issues
- As a design handbook for a generation facility.
- For any IPP generation not connected indirectly or directly to the YIS, i.e. an island grid.

2. Terms, Definitions, and Abbreviations

2.1. Definitions

Accredited Certification Organization – An organization that has been accredited by the Standards Council of Canada to operate a certification program for electrical equipment, such as the Canadian Standards Association (CSA).

Anti-islanding – A means of detecting and preventing a DR from energizing a part of the distribution system that becomes disconnected from the grid.

ATCO Electric Yukon – A private investor-owned utility, and member of the ATCO Group of Companies.

Automatic Circuit Recloser (ACR) – An overcurrent protection device used by utilities to detect faults on distribution system feeders, which has the ability to open and then reclose after a specified time delay allowing adequate time for temporary faults to clear.

Bi-directional Meter – A meter that measures real and reactive power and energy in both directions.

Cease to Energize – The cessation of energy outflow capability.

Clearing Time – The time from the start of the abnormal condition to when the distributed resource ceases to energize the distribution system.

Dispensated Metering Equipment – Any metering equipment that has received Measurement Canada approval under Section 9(2) or 9(3) of the Electricity & Gas Inspection Act.

Disconnecting Means – A device or group of devices that allows the conductors of a circuit to be disconnected from their source of supply.

Distributed Generation (DG) – Small, decentralized electric power generation facilities, typically interconnected to the distribution system.

Distribution System – The portion of the electrical system that operates at a nominal voltage of 34.5 kV line to line and below, and which distributes electric power between distribution substations and customers.

Effectively Grounded Distribution System – Distribution facilities where the neutral conductor is solidly grounded and the ratio of the zero sequence reactance to the positive sequence reactance is less than or equal to 3 and the ratio of the zero sequence resistance to the positive sequence reactance is less than 1.

Electromagnetic Interference (EMI) – Any electromagnetic disturbance that interrupts, obstructs, or otherwise degrades or limits the effective performance of a device, equipment or system.

Exporting – supplying power into the distribution system through the POI.

Facilities – A physical plant including, without limitation, generating plants, transmission and distribution lines, transformers, meters, equipment and machinery.

Flicker – The subjective impression of fluctuating luminance caused by voltage fluctuations.

Frequency – The number of cycles through which an alternating current passes in a second. The North American standard is 60 cycles per second, known as 60 hertz (Hz).

Generation – The process of converting solar, thermal, wind, hydro, or chemical energy into electric energy.

Independent Power Producer (IPP) – An agency or individual other than a public utility (as defined by the Public Utilities Act) who generates electricity to sell (to the utilities). An independent power producer does not own transmission facilities and is dependent on the utilities to purchase and distribute the power it produces.

Interconnection – The physical connection of DG to YEC's distribution system so that parallel operation can occur.

Island Grid – A community power system which is energized solely by one or more local power producers and is separated electrically from the YIS.

Islanding – A condition where a portion of the utility's distribution system is energized exclusively by one or more power producers through their DR interconnection.

Operating Interface Point – See Point of Interconnection.

Parallel Operation – the simultaneous energization at a POI by the generating facility and the utility distribution system.

Point of Interconnection (POI) – The location of the electrical connection between an IPP facility and the utility's distribution system. This will be the point where the ownership changes from the utility to the IPP.

Power Factor – The ratio of active power to apparent power. It is the cosine of the phase angle difference between the current and voltage of a given phase.

Protection Scheme – The protection functions, including associated sensors, relays, and power supplies, intended to protect a distribution system or interconnection equipment.

Public Utility – As defined by the Public Utilities Act and Regulations (i.e., YEC and/or AEY).

Ride-through – The ability to withstand voltage or frequency disturbances inside defined limits and to continue operating as specified.

Secondary Injection Testing – A method in which low level signals obtained from current and voltage signal generators are injected into a power system protective device to test device response.

Stabilized – The state of the distribution system after voltage and frequency has returned to normal range for a period of at least five minutes (or another period of time, as agreed with YEC) following a disturbance.

Stand Alone – The state where a distributed generation can operate by controlling the frequency and voltage of their facility while in islanded or isolated mode.

Telemetering – Transmission of measurable quantities using telecommunications systems.

Total Demand Distortion (TDD) – The ratio of the root mean square of the harmonic content, considering harmonic components up to the 50th order and specifically excluding interharmonics, expressed as a percent of the maximum demand current. Harmonic components of order greater than 50 may be included when necessary.

Total Harmonic Distortion (THD) –The ratio of the root mean square of the harmonic content, considering harmonic components up to the 50th order and specifically excluding interharmonics, expressed as a percent of the fundamental. Harmonic components of order greater than 50 may be included when necessary.

Transfer Trip – A remote signal directed from an upstream device to command a DG to cease to energize the distribution system upon detection of an islanding condition and to prevent re-energization.

Transmission System –The portion of the system that operates above a nominal voltage of 34.5 kV line to line and transmits electric power between YEC substations.

Trip Time – The time between the start of the abnormal condition and the interconnection device ceasing to energize the distribution system.

Type Test – A test performed on a sample of a particular model of a device to verify specific aspects of its design, construction and performance.

Utility – See Public Utility (i.e., YEC and/or AEY).

Visible-Break Disconnect – A switch or circuit breaker by means of which the generator and all protective devices and control apparatus can be simultaneously disconnected under full load entirely from the circuits supplied by the generator. All blades or moving contacts must be connected to the generator side, and the design of the disconnect switch must allow adequate visible inspection of all contacts in the open position.

Voltage Flicker – A condition of fluctuating voltage on a power system that can lead to noticeable fluctuations in the output of lighting systems.

Yukon Energy Corporation (YEC) – A publicly-owned electrical utility that is the main generator and transmitter of electrical energy in Yukon.

Yukon Integrated System – The integrated Whitehorse-Aishihik-Faro and Mayo-Dawson electrical grids which are owned by YEC.

YEC	Yukon Energy Corporation
YIS	Yukon Integrated System
YUB	Yukon Utilities Board

3. Party Responsibilities

Refer to the IPP Policy as released in January 2019 for the individual responsibilities of the Government of Yukon, utilities (YEC and AEY), Yukon Utilities Board and the IPP during the generation interconnection process.

3.1. IPP Responsibilities

The IPP is responsible to:

- Provide technical information to the utility as specified in Appendix A and Appendix B;
- Assume ownership of the facility including the design, installation, operation, and maintenance of all equipment, station and distribution line facilities from the POI to the IPP facility, unless otherwise agreed to in writing;
- Pay the costs of system interconnection in accordance with the commercial terms established by the utilities;
- Obtain all regulatory approvals, including environmental assessment approvals, if necessary, for the construction and operation of its facilities. The IPP facilities shall be designed, constructed, operated and maintained in compliance with the applicable statutes, regulations, by-laws, codes and technical requirements specified by the utility (e.g. remote monitoring etc.);
- Submit all specifications of its facilities and detailed plans to the utility for review prior to receiving permission to connect to their distribution system;
- Ensure the technical requirements given in the standards and codes in Appendix D are met;
- Ensure metering requirements are met (see section 12); and
- Negotiate the timing and any testing requirements for the commissioning process with YEC

3.2. YEC Responsibilities

YEC is responsible for the operation of the Yukon Integrated System (YIS) and for certain local distribution systems interconnected with the YIS. This guide applies to all transmission and YEC distribution system interconnections.

YEC is responsible for all system studies performed on the YIS. The IPP and AEY, in the case of an AEY interconnection, shall provide all necessary information to YEC for the interconnection of the IPP facility. The system studies conducted by YEC will be paid for by the IPP.

After receiving the application for interconnection, YEC shall provide the IPP, at the IPP's cost, the information specified in Appendix C.

3.3. AEY Responsibilities

AEY is responsible for the operation of certain local distribution systems interconnected with the YIS. This guide applies to these AEY distribution system interconnections.

After receiving the application for interconnection, AEY shall, in consultation with YEC, provide the IPP, at the IPP's cost, the information specified in Appendix C.

4. General Requirements

4.1. Standards

When planning, designing, and operating an IPP Generation Facility, the IPP shall meet all applicable national, territorial and local construction and safety codes and standards.

The interconnection facility must comply, as a minimum, with the following:

- All CSA Standards, including the Canadian Electrical Code (CEC),
- Applicable YEC and AEY standards and the requirements set forth in this Guide,
- National, Territorial and local Governing law, acts, by-laws and codes, and
- Alberta Electrical Utility Code (AEUC) [4].

Applicable standards are located in Appendix D, however not all may be applicable for the IPP facility and additional standards may apply.

The interconnection of new generation can adversely affect the electric service to existing or future customers. The IPP must work with the utility to mitigate any adverse effects.

The facility must be constructed and maintained to provide a safe environment for employees as well as the public. If the generation facility adversely affects other customers, the utility may disconnect it until such time as the concern has been mitigated. The IPP is responsible for any costs incurred as a result.

The IPP is required to install, operate and maintain the facility and to ensure it is in sufficiently good order and repair at all times. Maintenance shall conform to good electrical practice, adequate for safe parallel operation when connected to the YIS. The utility and the IPP shall share commissioning reports, operating procedures and annual shutdown, maintenance, and inspection reports.

4.2. Operating Requirements

A joint operating agreement template will be developed in conjunction with the utility. The agreement requirements are not included within the scope of this Guide. A sample operating agreement is located in Appendix E.

5. Site Specific Conditions and Capacity Limitations

During the preliminary stage of project development any limitations regarding the proposed interconnection, and any additional system upgrades required, will be determined in consultations between the IPP, YEC and AEY, if interconnected via an AEY distribution system.

A system impact study will be necessary to identify any site-specific conditions and capacity limitations of the distribution and/or transmission system. To facilitate the study, the utility and the IPP will exchange information concerning load, feeder characteristics, protection philosophies, station layouts, capacities, ratings and other relevant information of the distribution and/or transmission system. The utility controls reliability design and reliability standards.

Under certain circumstances, YEC and AEY may limit the size or reconfigure the proposed connection arrangement of the IPP facility in order to maintain the integrity of their system.

6. YIS Transmission and Distribution System Characteristics

6.1. YEC Transmission System

6.1.1. General System Configuration

The YIS is an 'Islanded grid' which has no interconnection with the main North American electric grid. The Yukon must produce all of its own power, and cannot generate more electricity than is there is load, since there are no neighboring markets into which to sell surplus energy.

The YIS includes the 138 kV Whitehorse – Aishihik – Faro (WAF) grid, the 69 kV Mayo-Dawson-Keno (MD) grid, and the 138 kV Carmacks-Stewart Transmission Line (CSTL) which interconnects the WAF and MD grids. YEC provides power to major industrial customers connected to the 69 kV and 138 kV grids.

A map of the YIS is shown in Figure 6–1.

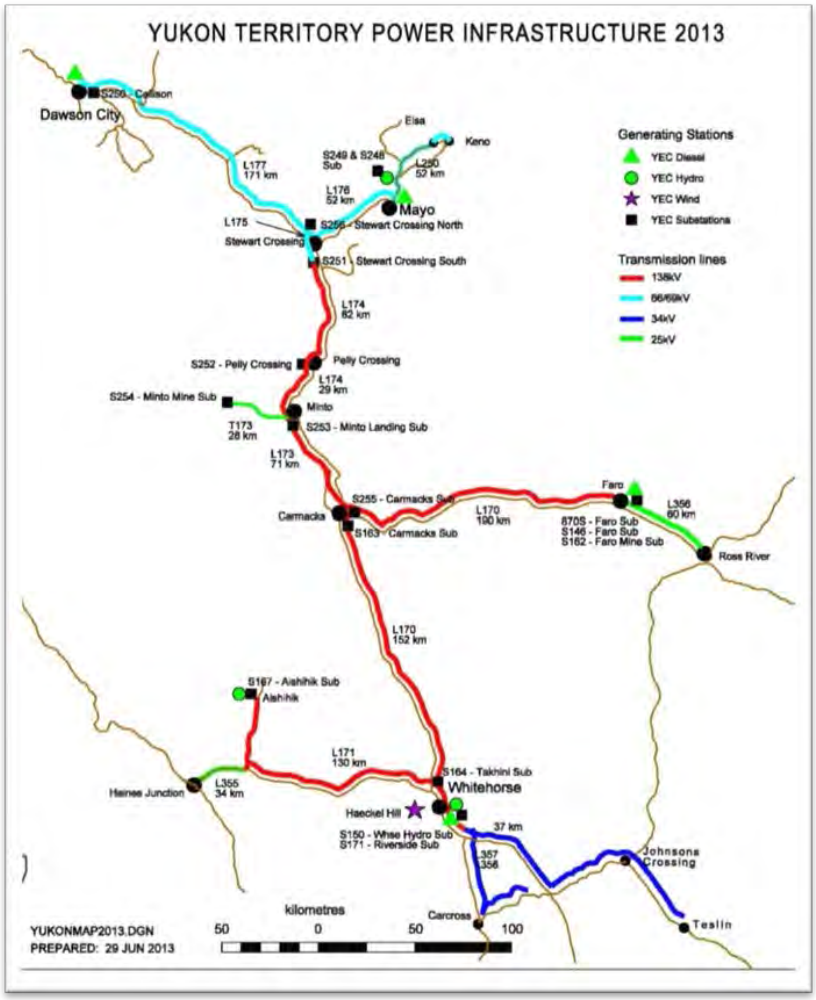

Figure 6–1: YIS Map

6.1.2. System Unbalance

Voltage unbalance on the transmission system is minimal during normal operation. The voltage unbalance under normal operating conditions will be less than three (3) percent. The IPP facilities may be subjected to voltage unbalance and negative sequence current during system disturbances. The generation connected to the transmission system must be able to withstand significantly unbalanced voltages with high negative phase sequence currents for short periods of time.

6.1.3. Frequency

The YEC transmission system operates at 60 Hertz (Hz) Alternating Current (AC) with equipment standard for this frequency. Frequency variations are typically in the range between 59.0 Hz to 61.0 Hz for small contingencies that cause modest disturbances, however variations between 58 Hz to 66 Hz or greater can occur for larger contingencies.

The frequency of the electric system is controlled by synchronous generator governor systems. Such governor systems respond automatically to changes in system frequency to prevent further deviation. These variations are system dependent and subject to change.

6.1.4. Steady State Voltage Levels

During normal steady state conditions, the 69 kV and 138 kV systems can vary between 90% and 105% of nominal voltage. However, under extreme conditions, the 69 kV and 138 kV systems can vary between 85% and 110% of nominal voltage with some 138 kV facilities designed to operate continuously up to 110% of nominal voltage.

6.1.5. System Fault Levels and System Impedances

The IPP generation facilities connecting directly to the transmission system shall be designed for operation at short circuit (fault) levels that take into account reasonable future development of the YIS transmission system. The short circuit levels to be used in the design depend on the point(s) of interconnection and future planned development and are available on request from YEC.

6.1.6. Fault Clearing and Automatic Reclosing

The YIS does not implement auto-reclosing at the transmission level.

6.1.7. System Grounding

The transmission system is effectively grounded.

6.2. YIS Distribution System Characteristics

6.2.1. General

Both YEC and AEY operate distribution systems in the Yukon which are interconnected with the YIS. The systems are predominantly three phase, wye connected, with nominal voltages of 4.16/2.4 kV, 6.9/4 kV, 12.5/7.2 kV, 13.8/8 kV, 25.00/14.4 kV and 34.5/20 kV.

AEY also operates a number of distribution systems which are not interconnected to the YIS, and are not covered by this Guide:

- Watson Lake
- Old Crow
- Beaver Creek
- Destruction Bay / Burwash Landing
- Swift River

For information on connecting to the AEY distribution systems which are isolated from the YIS, refer to AEY's document entitled, "ATCO Electric Yukon's Isolated Community Generation System Interconnection Guidelines".

6.2.2. Voltage Levels

The YEC and AEY distribution systems operate to meet CSA Standard CAN3 C235.83 – "Preferred Voltage Levels for AC Systems 0 to 50,000V" which defines the preferred operating voltage levels for normal and extreme operating conditions. The distribution system steady state voltage is typically maintained between + 5% to 7% and - 5% to 7%.

6.2.3. Power Quality (Harmonics and Voltage Flicker)

The YEC and AEY distribution systems operate to limit the maximum individual frequency voltage harmonics to 3% of the fundamental frequency and the voltage total harmonic distortion (THD) to 5% on the utility side of the POI.

6.2.4. Voltage Regulation

The operating voltages on the low voltage buses of YEC distribution substations are generally regulated by transformer automatic load tap changers (LTC), bus voltage regulators or feeder voltage regulators. YEC will provide set-points for the equipment upon request.

6.2.5. Voltage Unbalance

Distribution facilities are typically three-phase systems, incorporating single-phase distribution taps. The voltage unbalance on a distribution system under normal operating conditions may exceed 3%, due to the unbalanced loading and single-phase regulation. Voltage unbalance will be calculated using the following formula, as derived from CSA Standard C22.3 No. 9-08 (R2015) [1]:

Voltage Unbalance (%) = 100 x (negative sequence voltage of the fundamental frequency component) / (positive sequence voltage of the fundamental frequency component)

6.2.6. Fault Levels

Fault levels and maximum allowable fault currents vary significantly through the distribution system and must be considered in the design of the IPP interconnection.

6.2.7. System Grounding

The utility distribution facilities are typically three phase, four wire, multi-grounded systems that incorporate single phase distribution taps. The lines are normally operated as effectively (solidly) grounded with grounded-wye connected sources at the distribution substation secondary bus.

6.2.8. Phasing

The phase sequence on the utility system may vary, and must be confirmed between the IPP and the utility during the design phase of the installation.

6.2.9. Fault and Line Clearing and Automatic Reclosing

The YEC distribution systems do not currently include auto reclosing. The AEY distribution systems may have auto reclosing and this will be confirmed during the design phase of the application.

7. Power Quality Requirements for the System Interconnection

7.1. Harmonics

The following industry standards may provide guidance for appropriate performance.

- IEEE 1547-2018 – IEEE Standard for Interconnection and Interoperability of Distributed Energy Resource with Associated Electric Power Systems Interfaces, IEEE, 2018 [2]
- IEEE 519-2014 – IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems [5]
- IEC 61000-4-15 – Testing and Measurement Techniques – Flickermeter - Functional and Design Specifications [6]

The generation facility shall not inject harmonic currents such that will cause objectionable voltage distortion as per standard IEEE 519 Harmonic current injections cause intolerable voltage distortions on the distribution system and may damage equipment.

The Utility, at the IPP's expense, shall conduct a Power Quality Assessment of the distribution system in the immediate vicinity of the interconnection using a measurement technique compliant with IEC 61000-4-7.

When performing a Power Quality Benchmark, the measurements at the customer's POI shall be taken over a one week (168 hour) period during typical production load levels.

7.2. Flicker

The generation facility shall meet the requirements of Section 6.2.3 and shall not cause unacceptable levels of flicker on the distribution system. The utility, at the IPP's expense, shall measure the flicker level using a power quality measuring device that meets the requirements of the IEC Flickermeter Standard 61000-4-15.

When performing a Flicker assessment, the measurements at the customer POI shall be taken over a representative load cycle of one day or greater.

7.3. Speed Regulation and Frequency Control

The frequency of the YIS is controlled by the generators operated by YEC.

The YIS operates at 60 Hertz (Hz) Alternating Current (AC). The nominal frequency variations are typically 59.0 Hz to 61.0 Hz for small contingencies that cause modest disturbances, and the frequency may drop to 58 Hz or rise to 66 Hz or higher for larger contingencies.

The frequency of the YIS is automatically controlled by the governor systems of the generators operated by YEC, within the specified limits.

IPP generators rated at 1 MVA and greater are required to have a governor system, capable of operating in droop mode, to respond to system frequency changes. The droop setting of the governor will typically be in the range of 5%.

IPP generators rated less than 1 MVA may operate in base load mode rather than in frequency control mode.

The utility will define frequency requirements on a project by project basis and may require the control of these parameters directly via the YEC SCC.

Equipment connected to the YIS shall be capable of withstanding the dynamic frequency performance criteria listed in Table 1.

Table 1: Transmission Minimum Frequency Performance

Under Frequency Limit	Over Frequency Limit	Minimum Time
60.0-59.0 Hz	60.0-61.0 Hz	N/A (continuous operating range)
58.9-58.5 Hz	61.1-61.5 Hz	3 minutes
58.4-57.9 Hz	61.6-61.7 Hz	30 seconds
57.8-57.4 Hz		7.5 seconds
57.3-56.9 Hz		45 cycles
56.8-56.5 Hz		7.2 cycles
less than 56.4 Hz	greater than 61.7 Hz	Instantaneous trip

Under-frequency and over-frequency relaying that automatically disconnects generators from YIS must not operate for frequencies in the range of 59.0 to 61.0 Hz if no other abnormal system event is underway.

7.4. Voltage Regulation and Power Factor

The IPP is responsible for ensuring that the voltage levels at the POI are maintained within this guidelines prescribed by the utility. The IPP interconnection must maintain the voltage levels, under all feeder load conditions, at the same values as they were prior to the interconnection.

Synchronous generators connected to the distribution system must be equipped with adequate excitation controllers. The IPP shall operate generators with Automatic Voltage Regulators (AVR) adjustable from 95% to 105% of nominal bus voltage. The Generation should be run in Voltage control unless required to run in power factor (pf) mode by the Utility. Operation in MW or MVAR control is not acceptable. The AVR response should with no intentional delay when in Voltage Control mode.

Induction generators do not have voltage or reactive power control capability and consume reactive power (VAR). In this case, the generator must provide reactive compensation to correct the power factor to 0.9 lagging or better at the POI, unless other terms are specified by the utility.

Inverter type generating equipment can control the power factor over a wide range, typically ± 0.75. An inverter type generator connected to the distribution facility must be capable of adjusting the power factor in the range of ± 0.9. The IPP may operate outside that range only by prior agreement with the utility.

The utility will define voltage and reactive power requirements on a project by project basis and may require the control of these parameters directly via the YEC SCC. The IPP and utility will identify and

agree on the exact transformer ratio to allow optimal voltage regulation on the system and the IPP will determine whether an on-load tap changer is needed.

In order to coordinate with its existing voltage control devices, the utility may require that the generator operate in a power factor control mode. This means operating within a constant power factor set point range. The voltage/power factor regulator must be capable of controlling the power factor of the generator. The utility shall determine the actual set point between these limits.

In power factor control mode, the voltage regulator must have a voltage override that causes it to reduce excitation if the voltage at the POI exceeds an upper limit to be specified by the utility. The normal upper limit is 105% of nominal; however, the voltage regulator shall have the provision to adjust this upper limit between 100% and 110% of nominal. The voltage regulator must also have provision for a time delay between sensing an excursion of the upper voltage and initiating control action. The power factor control equipment must have the capability to allow for the adjustment of this time delay from between 0 and 180 seconds. The utility will specify the required time delay for each project.

7.5. Voltage Unbalance

Unbalanced phase voltages and currents can affect protective relay coordination and cause high neutral currents and thermal overloading of transformers. Of particular concern is negative sequence voltage and the resulting effect, particularly on rotating generators and motors connected to the system.

To protect the utility and the IPP equipment, the 3-phase generation contribution at the POI should not cause a voltage unbalance greater than 1% or a current unbalance greater than 5%.

If the existing unbalance at the POI is shown to be already close to the maximum unbalance condition, the IPP contribution may cause the unbalance to exceed the specified amount. This will be considered on a case-by-case basis.

7.6. Voltage and Frequency Transients

The IPP is responsible for the cost of any necessary transient or dynamic stability studies, which must be performed in a manner approved by YEC.

7.7. Resonance and Self-Excitation of Induction Generators

The potential effects of resonance should be considered as part of the design of the generating facility. The effects include:

- Ferro-resonance in the transformer,
- Sub-synchronous resonance due to the presence of capacitor banks, and
- Harmonic resonance with other customers when capacitors are being added as part of the installation.

When induction generators are used, the potential for self-excitation should be assessed and addressed as part of the system impact study and mitigated accordingly.

The IPP shall be responsible for the engineering analysis as part of the design process to evaluate the existence of, and to eliminate the harmful effects of resonance and the assessment of the self-excitation effects of induction generators. The engineering analysis of resonance and the assessment of the self-excitation effects of induction generators must be submitted to YEC for approval or further evaluation.

7.8. DC Current Injection

The IPP facility system shall not inject a dc current at the POI.

7.9. Fault Levels

The utility will provide the IPP with the anticipated fault levels or the data necessary for the IPP to calculate the distribution system fault contributions at the POI.

The IPP facility must not increase the fault levels on the utility distribution or transmission system above their design levels for maximum faults.

8. Physical Interconnection

8.1. Safety

The safety of the public, operating personnel and the environment is of primary concern in the design, construction, operation and maintenance of the interconnection facilities.

8.2. Point of Interconnection (POI)

The POI is the point at which the utility (YEC or AEY) distribution facilities or conductors are connected to the IPP's facilities or conductors, and where any transfer of electric power between the IPP and the utility takes place. The POI must be identified in the design and on the Single Line Diagram (SLD).

Depending on ownership, YEC or AEY will coordinate the design, construction, maintenance and operation of the facility on the distribution system side of the POI. The IPP is responsible to coordinate the design, construction, maintenance and operation of the facility on the generation side of the POI.

All voltage and frequency parameters specified in this section must be met at the POI unless otherwise stated.

The IPP is responsible for any incremental costs to the electric systems caused by the interconnection. The responsible utility will carry out the engineering, design and construction required for these installations and charges those costs back to the IPP. Ongoing O&M costs incurred on the distribution feeder side will also be recovered by the utility.

There may be cases where either the utility or the IPP may own equipment located on the other's side of the POI. For example, the utility may own and operate communications, supervisory, or metering equipment, which is located on the IPP side of the POI. The IPP must provide a site with the necessary space for utility to install current transformers, potential transformers, switching equipment, meters, and any other AC and DC auxiliaries, protection and controls, SCADA or communications equipment required to interconnect with the generating facility. The site is to be approved by the utility and a 120-volt AC power service is to be available for the use of portable tools.

8.3. Point of Disconnection

For transmission interconnections, the visible-break disconnect switch shall be located on the high voltage side of the interconnection transformer.

For distribution interconnections, the visible-break disconnect switch may be located on the high or low voltage side of the interconnection transformer.

The disconnect switch must be gang operated to simultaneously isolate all three phases.

If the IPP site interconnects multiple generators, one disconnect switch must be capable of isolating all of the generators simultaneously. There may be other means of meeting this requirement; however the approval of the utility must be obtained before using other means.

The IPP must follow the utility switching, clearance and tagging procedures. The utility is responsible to instruct the IPP in this regard.

8.3.1. High Side and Low Side Disconnect Switches

For transmission interconnections the disconnect switch on the high voltage side of the interconnection transformer shall be installed, owned and maintained by the IPP.

For distribution interconnections the disconnect switch, if on the high voltage side of the interconnection transformer shall be installed, owned and maintained by the utility, and if on the low voltage side of the interconnection transformer shall be installed, owned and maintained by the IPP.

8.3.2. Disconnect Switch Specification

The disconnect switch must be a manual, visible-break disconnect that provides safe isolation for the utility's personnel from the generators and all other possible customer sources of energy.

The disconnect switch must:

- Be adequately rated to break the connected generation/load;
- Be located within five meters (horizontal) of the POI, unless otherwise approved by the utility;
- Provide a direct, visible means to verify contact operation;
- Allow simultaneous disconnection of all ungrounded conductors of the circuit;
- Plainly indicate whether the switch is in the "open" or "closed" position;
- Be lockable in the "open" position;
- Be capable of being energized from both sides;
- Be readily accessible to the utility's operating personnel;
- Be externally operable without exposing the operator to contact with live parts;
- Be capable of being closed without risk to the operator while there is a fault on the system;
- Be labeled with utility's switch number;
- Meet all applicable CSA Part II standards and all applicable codes; and
- Undergo annual inspections and maintenance, with reports submitted to the utility for approval.

8.4. Interconnection Transformer

A generator step-up transformer boosts the voltage of the DG to match the voltage of the utility distribution feeder. The transformer winding configuration impacts how system faults are detected and what type of protection is required (see Section 9.10). The IPP must submit their transformer connection proposal to the utility for review and approval prior to placing an order for purchase.

8.5. Interconnection Grounding

The IPP facility must be grounded in accordance with the latest revisions of the CEC and AEUC. A ground grid of sufficient size to handle the maximum available ground fault current must be designed and installed in order to limit ground potential rise (GPR) step and touch potentials to safe levels as set forth in ANSI/IEEE Std. 80 IEEE Guide for Safety in AC Substation Grounding.

The ground grid will be designed for foreseeable future fault levels obtainable from the System Impact Study.

Grounding of the interconnection shall be designed to provide:

- Solid grounding of the distribution feeder neutral connection,
- Fault detection that isolates all sources of ground fault contribution,
- A circuit to block the transmission of harmonic currents and voltages, and
- Protection of the low voltage side from damage due to high side faults.

The preferred configuration, for an IPP owned interconnection transformer, is delta connection on the generator side of the transformer and a grounded-wye configuration on the utility's side of the transformer. If this configuration is not technically feasible, the configuration chosen must still address the above concerns. Grounding must conform to the AEUC [4].

Sample single line diagrams are shown in Appendix F.

8.6. Phasing and Phasing Sequence

Since phasing is not standardized across distribution facilities, the phase sequence must be coordinated between the IPP and utility's distribution system.

8.7. Interrupting Device Ratings

The design of the generation facility must consider the fault contributions from both the distribution system and the IPP generation facility, to ensure that all circuit fault interrupters are adequately sized. The utility will inform the IPP of the present and anticipated future fault contribution from the interconnected electric system.

9. Interconnection Protection

9.1. General

The purpose of the IPP facility protection is to reduce the risk of damage to IPP and utility equipment and maintain the reliability of supply.

The protection scheme shall be designed to detect the following conditions at the POI:

- Balanced and unbalanced system faults (i.e. line-ground, line-line and three phase faults)
- Frequency variations
- Voltage variations
- Reverse power flow
- Islanding conditions
- Out of synchronism

Depending upon location, the protection scheme may be required to detect additional conditions such as open phase, ferro-resonance, negative sequence voltage, or zero sequence currents.

The protection scheme must fully coordinate with any existing distribution system protective devices. The IPP must submit a complete protection design package, including all relay settings, tripping schemes and schematics, to the utility for review and approval prior to installation. Both existing and ultimate bus fault levels should be considered. A sample Protective Setting Commissioning Sheet with guideline limits is included in Appendix G.

The point of measurement for voltage and frequency shall be at the POI or as agreed upon with the utility.

The IPP must revise and re-submit the protection information for any proposed modification.

9.2. Device Ratings

Equipment shall be rated to carry and interrupt the fault levels that are, or will be, present at the IPP facility - this includes the ultimate fault currents specified by the utility. The IPP's equipment covers all station and distribution facilities, including but not limited to all protection equipment forming the entrance and distribution line protection: circuit breakers, current transformers, potential transformers, secondary cabling, dc system/battery charger, switchboard wiring and protective relays.

9.3. Minimum Protection Requirements

The following minimum protection requirements shall be provided for an interconnected IPP facility:

- Overcurrent
- Over-frequency
- Under-frequency
- Over-voltage
- Under-voltage

Additional protection requirements are dependent upon the transformer configuration and the distribution system characteristics.

9.4. Phase and Ground Fault Protection

The IPP must install utility grade protective devices to detect and promptly isolate the generation facility for faults occurring either in the DG facility itself or on the distribution system. Virtual devices (i.e., computer or programmable-logic controller systems) are acceptable provided they meet standard utility practice for system protection and they have been type tested and approved by an independent testing laboratory.

The protective devices in the IPP generation facility must fully coordinate with the protective relays on the distribution system unless otherwise agreed. The IPP must calculate the protective device settings and submit the relay characteristics and settings to YEC for review and approval.

The generation facility must be able to detect the following situations and isolate itself from the distribution system:

- A short circuit between any phase(s) and ground (if distribution system is a grounded system)
- A short circuit between phase(s)

9.5. Over-Frequency and Under-Frequency Protection

Each synchronous generator must be capable of continuous operation between 59.0 Hz and 61.0 Hz and of limited time operation for larger deviations from normal frequency, as shown in Table 1.

Over/under frequency relays are normally installed to protect the generators from extended off-nominal operation. It is expected that larger (> 1 MW) synchronous generators shall remain connected to the system during frequency excursions. To ensure that the generator is not tripped prematurely, YEC will specify the minimum required time delays and levels for setting the IPP over/under frequency protection relays.

9.6. Over-Voltage and Under-Voltage Protection

The IPP must operate its generation facility such that the voltage levels on the utility's system are not significantly altered by the connection of the generation facility. IPP facility paralleling shall not cause voltage fluctuations of more than ± 5% at the POI.

The IPP must install necessary relays to trip the circuit breaker when the phase-to-ground voltage, measured on any one of the three phases, deviates outside predetermined limits. Under-voltage relays should be adjustable and should have a settable time delay to prevent unnecessary tripping of the generator on external faults. Over-voltage relays should be adjustable and may be instantaneous.

The interconnection facility must cause the generator to cease to energize the utility's system within the trip times indicated in Table 2. "Trip time" refers to the period of time between the start of the abnormal condition and the moment the interconnection device ceases to energize YEC's system.

To ensure that the generator is not tripped prematurely, the utility will specify the minimum required time delays and levels for setting the IPP over/under frequency protection relays.

Table 2: Response to Abnormal Voltages

RMS Voltage (based on 120V nominal)	Trip Time
RMS Voltage: V=<50%	Trip time: Instantaneous

RMS Voltage (based on 120V nominal)	Trip Time
RMS Voltage: 50% < V < 90%	Trip time: 120 cycles
RMS Voltage: 90% < V < 105%	Normal Operation
RMS Voltage: 105% < V < 120%	Trip time: 30 cycles
RMS Voltage: V >= 120%	Trip time: Instantaneous

The IPP may reconnect when the system is stabilized (i.e. voltage and frequency have returned to normal range for a time as identified by the utility).

9.7. Additional Protection

The utility may require additional protection on a case by case basis. Possible protection may include:

- **Unbalance or negative sequence protection**: The IPP generator is tripped on excessive current unbalance. This is important if fuse protection is used on the primary of the generator step-up transformer or for any other open phase condition
- **Broken delta protection (59G)**: Using a grounded wye-broken delta potential transformer, this protection can facilitate detection of ground faults on ungrounded systems.
- **Rate of change of frequency**: Protection to detect a power island condition.
- **Reverse power protection**: Protection to detect a generator motoring condition.

9.8. Anti-Islanding Protection

Islanding is the condition where the generation facilities and a portion of the distribution system have become isolated from the rest of the system, and continue to operate in isolated mode. Unless agreed upon by the utility, generating facilities shall not be permitted to remain connected to an islanded system, i.e. islanding is not generally allowed. Generation facilities may continue to supply station service loads while disconnected from the interconnection system.

Anti-islanding protection is required to:

- Prevent power quality issues to customers connected to the island,
- Avoid out-of-phase reclosing between the utility and the DR facility, and
- Prevent safety hazards created as a result of back feeding isolated portions of the utility distribution system.

For rotating generators, the IPP must install a transfer tripping scheme using tele-protection signals from the system to separate the DG facility from the distribution system in the event of an islanding condition.

Transfer tripping requirements are also applicable to induction generators, unless the IPP can demonstrate that that there is no potential for self-excitation. For inverter-based generation a detection scheme designed in accordance with the requirements of IEEE 1547 [2] may be acceptable.

The IPP is responsible for damage to the YIS caused as a result of failure to safely separate from the system during an islanding event or subsequently during reconnection to the system following the event.

9.9. Transformer Winding Configuration

The winding configuration of any three phase transformer will have an influence on the location of the protection measurement points and the level of protection required for the IPP interconnection. See Appendix F for examples for typical synchronous generator protection single line diagrams for different transformer configurations.

9.10. Conditions for Connecting to an Energized Distribution System

The IPP system must not energize the utility distribution system when the distribution system is de-energized or following the operation of any interconnection protection functions. The utility will inform the IPP facility when it is safe to reconnect to the distribution system.

Where transfer trip protection is installed, the transfer trip protection must ensure that the generator disconnects before a substation feeder breaker or intermediate automatic circuit reclose (ACR) operation. General requirements are:

- Generator lockout within 0.6 seconds of breaker or ACR opening; and
- Fail-safe lockout within 6 seconds of communication loss.

These conditions will be finalized via the operating agreement between the utility and the IPP.

9.11. Synchronization

Any DG facility able to generate voltage while disconnected from the YIS requires synchronization facilities before connection is permitted.

The IPP facility shall maintain in synchronism with the system while operating in parallel. The generating facility has the responsibility of maintaining synchronization with the system. The utility cannot synchronize to the generating facility. Any proposed synchronizing scheme must be submitted to the utility, prior to the installation.

For synchronous generators, an approved automatic synchronizing device must be provided in all cases where the plant is to be operated unattended. Automatic synchronizing shall be supervised by a synchronizing check relay. Synchronizing controls should satisfy the conditions in Table 3 for synchronous generators.

Table 3: Synchronization Criteria for Synchronous Generators

Aggregate Rating of Generators (kVA)	Frequency Difference (Hz)	Voltage Difference (%)	Phase Angle Difference (degrees)
0-500	0.3	10	20
>500 – 1500	0.2	5	15
>1500	0.1	3	10

Induction generators do not require synchronization since there is no generated voltage prior to connecting to the distribution system. The generator speed shall be brought to within 0.5% of its rated value. These units may be started as induction motors using power from the distribution system provided that these units do not cause unacceptable voltage flicker as specified in Section 7.2 on start - up or on connect/disconnect. The interconnection process of the induction generator shall not create a voltage drop pf greater than 5 percent.

Inverter-type or line-commutating voltage-following equipment does not require synchronization facilities. Operation of the interconnection (or disconnecting of the DR facility) shall not cause voltage drop greater that 5 percent and shall meet the flicker requirements

9.12. Protection from Electromagnetic Interference (EMI)

The influence of EMI must not result in a change in state or mis-operation of the interconnection facility.

9.13. Surge Withstand Performance

The interconnection facility must have the capability to withstand voltage and current surges in accordance with the environments described in IEEE/ANSI C62.41 or C37.90.1

9.14. Batteries and Auxiliaries

Batteries and auxiliaries shall have sufficient capacity to ensure the operation of all DC loads during loss of AC supply. Typically the batteries must be capable of supplying the substation DC load for 8 hours.

9.15. Mitigation of Protection Scheme Failure

Relays with self-diagnostic features, which provide information on the integrity of the protection scheme, should be used whenever possible.

The protection scheme must be designed by a qualified professional engineer, or a competent technical person working with the utility's engineers, to ensure that the self-diagnostic feature is integrated into the overall protection scheme for the safe and reliable operation of the system.

Depending on the scheme and its design, where relays with the self-diagnostic feature do not trip the appropriate breaker(s), sufficient redundant or backup protection must be provided for the system. The malfunctioning relay must also send a signal to notify operating personnel to investigate the malfunction.

9.16. Instrument Transformers used for Protection

Instrument transformers used for protection must comply with CAN/CSA-C60044-6 or IEEE C57.13 [8].

10. Remote Monitoring and Information Exchange

The IPP facility shall provide information in real-time to YEC SCC regarding:

a. Connection or circuit breaker status,
b. Real and reactive power output in kW and kVAR,
c. Load Tap Changer (LTC) position of the interconnecting transformer,
d. Communication and RTU failure alarm,
e. Intelligent Electronic Device (IED)/Relay failed status, and
f. Voltage at the POI.

The communication protocol and the equipment required will be specified by YEC.

The IPP facility shall log the operation of any protective device, including which protection elements operated, and the status of the DG facility including power output, voltage, and current waveforms.

YEC may have additional requirements on a case by case basis.

If it is determined that the IPP facility will have an impact on YEC's Transmission Network, the IPP will be required to provide a Remote Terminal Unit (RTU) or Data Link to a YEC RTU capable of exchanging Supervisory Control and Data Acquisition (SCADA) information with the YEC Control Centre. The protocol for data exchange via the RTU shall be compatible with that used for communications used by YEC. The communication protocol and the equipment required will be specified by YEC.

The IPP will be required to provide the following typical data needed by the (SCADA) system:

a. Individual generator(s) MW and MVAR
b. Individual generator(s) MWh and MVARh
c. Generator(s) breaker status
d. Individual generator on/off status, if no generator breaker exists
e. Total station MW and MVAR
f. Station service MW, MVAR, hourly MWh and MVARh
g. Generator transformer(s) high voltage side breaker(s) and isolator(s) status
h. Bus voltage at high voltage bus
i. PSS status, if applicable
j. AVR status, if applicable
k. AVR voltage setpoint, if requested
l. Total plant MW setpoint, if requested
m. Generator step-up transformer tap setting, if requested

11. Construction

The construction and installation of the IPP's generating facility must meet all applicable statutes, regulations, by-laws and codes. The IPP is responsible for obtaining all permits and complying with all safety and environmental regulations, codes and assessment approvals, if necessary, for the construction and operation of its facilities. Copies of all permits, compliance reports and inspection documents must be provided to the utility prior to energizing the POI.

All single line diagrams provided to the utility must be drawn in accordance with IEEE standards and conventions, and must be stamped by a professional engineer assuming responsibility for the design.

12. Metering

12.1. General

Two meters, primary meter and backup meter, will be required at the IPP facility:

- The utility shall install, own, operate and maintain one meter (primary) necessary for measuring the energy and demand supplied to the YIS, unless otherwise specifically provided in a contract with the IPP. This meter shall remain the sole property of YEC. The meter will comply with Measurement Canada requirements and will be owned and maintained by YEC.
- The IPP shall install, own, operate and maintain the other meter (backup) which does not necessarily have to comply with Measurement Canada requirements.

Generators exporting power onto the distribution system shall be equipped with bi-directional meters with four-quadrant measurement capability. An appropriate number of channels are required for four-quadrant meters to separately record active and reactive power in both the export and the import directions.

The high voltage side of the interconnection transformer is designated as the Measured Billing Point for all energy imported and exported from the IPP facility.

The metering equipment will be:

- Suitable for use in the environmental conditions reasonably expected to occur at the installation site; and
- Appropriate for measuring the power system characteristics reasonably expected to exist at the installation under all power system conditions and events.

The IPP shall provide Measurement Canada Approved instrument transformers. Each meter shall be connected to its own individual core/winding. For the utility meter the IPP shall wire from the instrument transformers to the meter receptacle using CSA-approved tamper resistant conduit and accessories suitable for the utility meter or metering equipment.

For transmission interconnections the IPP will provide burden calculations for proposed instrument transformer secondary wiring, for approval by YEC. If necessary the wiring burden may have to be reduced, by increasing the CT secondary conductor size, to meet Revenue Meter requirements.

The IPP shall supply and install the meter base to meet the utility requirements. The utility will provide the specifications for the meter base during the design phase.

12.2. Meter Requirements

The primary meter supplied by the utility will:

- Be Measurement Canada Approved for revenue metering;
- Be dispensated, with accuracy class ratings for active and reactive energy management as per Table 4;
- Be verified and sealed in accordance with the Electricity and Gas Inspection Act;
- Be capable of maintaining the interval boundaries within 60 seconds of the hour and every quarter hour thereafter;

- Measure all quantities required to determine active energy and reactive energy transferred in the required directions at the Measured metering point;
- Provide a separate register to maintain the continuously cumulative readings of the active energy and reactive energy transferred in the required directions at the Measured metering Point;
- Retain readings and, if applicable, all clock functions for at least 14 days in the absence of line power;
- Be equipped with meter failure alarm and communication failure alarm;
- Communicate all metering and equipment status to the YEC system control centre via the IPP's communication equipment;
- Apply loss compensation (such as line losses) factors where applicable to the revenue meters; and
- The meter shall have an accuracy class of 0.2% or better.

The backup meter supplied by IPP will:

- The backup metering will be of the same accuracy class and capability as the primary metering and shall include all equipment to provide the necessary billing data.
- Be non- dispensated, with accuracy class ratings for active and reactive energy management as per Table 5;
- .

Table 4: Schedule of Accuracies for Dispensated Metering Equipment Approved Under Section 9(2) or Section 9(3) of the Electricity and Gas Inspection Act

Metering Point Capacity (MVA)	Points of Delivery	Points of Supply	Measurement Transformers Accuracy Class
10 and above	1.0%	1.0%	0.3%
10	1.0%	1.0%	0.3%

Table 5: Schedule of Accuracies for Non-Dispensated Metering Equipment Approved Under Section 9(2) or Section 9(3) of the Electricity and Gas Inspection Act

Metering Point Capacity (MVA)	Watthour Meter Accuracy Class	Varhour Meter Accuracy Class
10 and above	0.2%	0.5%
10	0.5%	1.0%

12.3. Measurement Transformers

The applicable winding(s) of the current and potential instrument transformers supplied and installed by the IPP must:

- Be approved by Measurement Canada for revenue metering.
- Be burdened to a degree that does not compromise the accuracy required by this guideline.
- Have a minimum of two cores per instrument transformer. One core connection for the utility meter and the other core connection for the IPP meter.
- Be used solely for metering and not to be used for any other purposes.
- Have an accuracy class rating that equals or exceeds the values specified in Table 4.

12.4. Remote Communications Equipment

The remote communications equipment may or may not be an integral part of the meter or the recorder. However, it must incorporate protocol schemes that will prevent the corruption of data during interval data transmission. The protocol must be suitable for the communications equipment type and nature of the communications media and path.

12.5. Password Protection

Two or more levels of password protection will be required for each meter data collection agency. One level is for full access to set time functions and a second level is for read only access to interval data and event logs.

12.6. Safety Requirements

The facility installation must conform to:

- Measurement Canada Standard Drawings;

- AEUC [4];
- CSA Standard C22.2 General requirements - Canadian electrical code, part II [7] ; and
- ANSI/IEEE C57.13-2016 IEEE Guide for Grounding of Instrument Transformers [8].

13. Interconnection Tests

13.1. General Testing Requirements

The IPP must notify YEC (and AEY if the interconnection is via the AEY distribution system) in writing at least three weeks prior to the initial energization and start-up testing of the IPP generation facility. YEC may witness any testing of the equipment and protection schemes associated with the interconnection. Tests must align with the requirements specified in IEEE 1547 and CSA 22.3 No 9-08.

13.2. Type Testing

Type testing is considered an acceptable method of verification where suitable and applicable equipment standards exist, and must be performed once for each specific protection scheme. All interconnection equipment must include a type testing procedure as part of the documentation in order to determine the protection settings meet the requirements set forth within this technical guide. A type test may be performed on one device of a combination of devices. In a case of a combination of devices which comprise a system, the testing will demonstrate that the devices are able to operate as a system.

The type tests shall be performed on a representative unit or system, either in a factory, testing laboratory, or in the field. Results from a resource within a similar product family or design, including hardware or software, shall be acceptable as a representative within the same product family where ratings are within 50% to 200% of the tested resource.

The following type tests must be performed in accordance with IEEE 1547.1 [9]:

- Temperature stability
- Response to abnormal frequency
- Response to abnormal voltage
- Synchronization
- Interconnection integrity
- Unintentional islanding
- Open phase
- Reconnect following abnormal condition disconnect
- DC injection (for inverters without interconnection transformers)
- Harmonics

13.2.1. Temperature Stability

The temperature stability test verifies the interconnection equipment maintains measurement accuracy of parameters over its specified voltage range.

13.2.2. Response to Abnormal Frequency

This test verifies the interconnected generation facility ceases to energize the connected system as specified to IEEE 1547.1 with regards to abnormal frequency.

13.2.3. Response to Abnormal Voltage

This test verifies the interconnected generation facility ceases to energize the connected system as specified to IEEE 1547.1 with regards to abnormal voltage.

13.2.4. Synchronization

This test verifies the interconnected IPP facility will accurately and reliably synchronize with the utility as per IEEE 1547.1.

13.2.5. Interconnection Integrity

The interconnection integrity test verifies the IPP facility meets the surge withstand requirements as specified in Section 9.14 when tested in accordance with IEEE 1547.1.

13.2.6. Unintentional Islanding

Where YEC requires an anti-islanding protection function (other than transfer trip) or minimum import power levels, this test verifies that an IPP facility will cease to energize in accordance with IEEE 1547.1.

13.2.7. Open Phase

The open phase test verifies that the IPP facility will cease to energize the utility interconnection upon the loss of an individual phase on the distribution network when tested in accordance with IEEE 1547.1.

13.2.8. Reconnect following Abnormal Condition Disconnect

This test verifies the functionality of the IPP facility interconnection component or system reconnect timer, which shall delay the reconnection to the utility following a trip event prior to the distribution system stabilization, as specified in Section 9.11.

13.2.9. DC Injection (for Inverters without interconnection transformers)

This test verifies that an inverter-based IPP facility will comply with the DC current inject limit specified in Section 7.9 when tested in accordance with IEEE 1547.1.

13.2.10. Harmonics

The individual current harmonics and the total demand distortion (TDD) of the IPP facility shall be measured and recorded under normal operating conditions to ensure the values are within the limits specified in Section 7.1

13.3. Production Tests

Production tests shall be conducted on each IPP generating unit and interconnection equipment prior to delivery to verify they meet the applicable standards and verify the operability of every generating unit manufactured for customer use.

The tests assume the equipment has met the applicable interconnection and interoperability requirements of the applicable standards and may be conducted as a factory test or performed as part of an evaluation or commissioning test. Facilities with adjustable set points shall be tested at a single

series of test points specified by the manufacturer. The summary report must provide a list of normal and abnormal performance category capability, final function settings, and final operating mode settings.

The following production tests are specified within IEEE 1547.1:

1. Response to abnormal frequency
2. Response to abnormal voltage
3. Synchronization

14. Commissioning Tests and Verifications

14.1. General

Commissioning tests are tests and verification on the IPP facility equipment to confirm the system as delivered, designed, and installed meets the interconnection and interoperability requirements of this guide and the applicable standards. These tests include visual inspections, and may include operability and functional performance tests as required.

Prior to the energization of the IPP facility, or changes to the facility, verification testing must be performed and coordinated with the utility. After the equipment is installed and ready for operation, the testing must be performed by a qualified individual in accordance the manufacturer's published test procedures, or IPP developed procedures that have been approved by the utility. Qualified individuals include: licensed, professional engineers; factory-trained and certified technicians and licensed electricians experienced in testing protective equipment. The utility reserves the right to witness the verification test or to require written certification that the test was performed.

Verification testing must also be performed annually or when major system upgrades or modifications are carried out.

14.2. Interconnection Verifications and Inspections

The following commissioning tests and inspections shall take place:

a. Final IPP facility protection settings shall be verified, recorded, and provided to the utility. A sample protective settings commissioning report is located in Appendix G.

b. Visual inspection shall ensure the grounding coordination requirements in Section 8.5 have been met.

c. Visual inspection shall ensure the presence of a disconnecting means in accordance with Section 8.3 has been met.

d. The polarities, burdens, and ratios of field wired instrument transformers shall be verified as correct and in accordance with the design documentation.

e. Field installed power and control wiring shall be verified to be in compliance with drawings and manufacturer requirements.

f. For three-phase systems, the phase rotation of the distribution system and the IPP facility as installed shall be verified as compatible.

g. All monitoring and information exchange provisions shall be verified as functional in accordance with Section 10.

h. Calibration checks of each protective relay or the equivalent protection device shall be performed using injection of appropriate ac quantities, secondary injection, or set-point adjustment verification.

i. Functionality of the protective relays or the equivalent protection device, circuit breakers, and telecommunications equipment shall be tested to verify the system operates as intended.

j. Load tests of protective relays or the equivalent shall be conducted immediately after energization, where applicable.

k. The ohmic value and connection of the transformer neutral impedance grounding device shall be verified as correct.

l. Upon loss of DC power supply to the protective relays or the equivalent protection device, it shall be verified the protection scheme activates the interconnection circuit breaker.

m. Upon loss of a communication signal, it shall be verified the fail-safe transfer trip occurs when required by the utility in accordance with Section 9.8.

n. Inverter operation must be verified annually by operating the load break disconnect switch and verifying the generation facility shuts down and does not restart for five minutes after the disconnect switch has closed.

o. Any system depending on a battery for trip power must be checked for proper voltage and logged monthly. Once every four years, the battery must be replaced or a discharge test performed.

p. The IPP shall submit to the utility the station LAN design architecture for review during the conceptual design phase of the project.

q. The IPP is responsible for all hardware design, RTU drawings, installation, testing and commissioning.

r. The IPP shall prepare a preliminary but tested version of the RTU Configuration and a preliminary version of the Point Assignment, and send them to the YEC SCC, together with all RTU drawings, P&C drawings and DNP point lists of all LAN devices, at least ten weeks before the in service date.

s. The IPP and YEC SCC shall jointly test all control, status and analog points and confirm visibility at the SCC.

14.3. Disconnection Means Operability

Prior to the operation of the IPP facility, the disconnecting means provided in accordance with Section 8.3 operates as intended.

14.4. Energization Cessation

Tests shall be conducted in accordance with IEEE 1547.1 to verify the functionality of the protection that ensures the IPP facility does not energize the utility under the following conditions described within this standard:

1. Abnormal frequency
2. Abnormal voltage
3. Protection scheme failure

Additional protection functions shall also be verified in accordance with IEEE 1547.1 as needed. The following protective functions must be verified if used at the IPP facility:

1. If available, the anti-islanding function must be checked by operating a load break disconnect switch and verifying that the IPP facility ceases to energize the output terminals and does not restart once the load break disconnect switch has reclosed.
2. If reverse power or minimum power function is used to meet the interconnection requirements, the functionality must be tested using secondary injection techniques. Alternatively, this

function can be tested by the means of a local trip test or by adjusting the IPP output and local loads to verify that the applicable non-export criterion are met.

14.5. Re-Verification

Re-verification of the interconnection and interoperability requirements may be required when any of the following occurs:

- Functional software of firmware changes have been made to the IPP facility equipment;
- Any hardware component of the facility has been modified in the field, been replaced or repaired with parts that are not substitutive components compliant with the applicable standards;
- Protection settings have been changed after factory testing; or
- Protection functions have been adjusted after the initial commissioning / verification process.

15. Maintenance

The IPP has full responsibility for the maintenance of its equipment, up to the Point-of-Interconnection, consistent with the Interconnection Agreement and this Guide. The IPP shall maintain the facilities in accordance with Rule 2-300 of the Canadian Electrical Code to ensure safe parallel operation with the YEC or AEY system. Failure to do so may result in disconnection of the IPP generation facility.

The IPP must present to the utility the planned maintenance procedures and a maintenance schedule for the interconnection protection equipment, and keep records of such maintenance.

The utility reserves the right to periodically inspect the interconnection protection system to verify that it meets the requirements outlined in this document.

Maintenance procedures up to the POI will be performed in accordance with good utility practice and the utility's policies and procedures.

16. Marking and Tagging

The disconnect switch must be clearly marked as the "IPP Disconnect Switch" and tagged with an identification number approved by the utility. The IPP must follow the utility's switching, clearance and tagging procedures. The utility is responsible to instruct the IPP in this regard.

The IPP switchgear equipment must include the manufacturer name and the manufacturer's serial number.

17. Modification of Installation

The IPP shall obtain written approval from the utility before commencing any modification to the generation facility. If the change requires the installation or modification of equipment, the IPP shall provide documentation that the new equipment meets the requirements of Type and Production tests.

If the changes require modifications to the protection and controls information the IPP must obtain approval from the utility for the proposed modifications. Whenever changes are made to interconnection hardware or software that can affect the functions listed below, the potentially affected functions must be retested:

- Over-voltage and under-voltage
- Over-frequency and under-frequency
- Non-islanding function (if applicable)
- Reverse or minimum power function (if applicable)
- Inability to energize dead line
- Time delay restart after utility outage
- Fault detection, if used
- Synchronizing controls (if applicable)

To ensure that commissioning tests are performed correctly, the utility may require the ability to witness the tests and receive written certification of the results.

18. Technical Data Requirements

The following outlines the minimum data required at various stages for planning, design and commissioning the IPP's project. This data is required by YEC (and AEY if connected to AEY distribution system) to ensure suitable steps are taken to interconnect the IPP facility to the YEC system. Expanded data requirements for the proposal and design stages are located in Appendix A and Appendix B. The IPP Policy (in development as of June 2018) shall apply.

18.1. Proposal Stage

During the proposal stage the IPP Facility conceptual design must be submitted before any further detailed studies is approved by the utility. The list of information to be provided for this approval may be the result of preliminary discussions with the utility. Based on the information provided by the IPP, the utility will provide their proposition, their commitment and their own requirements concerning the connection of the IPP facility.

The following list of drawings and data required for the proposal stage of the project includes, but is not limited to:

- A Single Line Diagram (SLD)showing the following :
    - The proposed protection relays, circuit and fuses with fuse type and rating,
    - The connections of all substation equipment with voltage levels and equipment ratings
    - The location of the revenue metering equipment.
- Description of protection scheme
- Generating station site plan showing the layout and location (coordinates) of the generating plant and the location of lockable, "visible" disconnect device
- Based on the size of the project the utility may require more additional generator, exciter and speed governor data for a preliminary interconnection study.

18.2. Approval (Design) Stage

Once the project has been approved by the utility the IPP will proceed to submit the facility detailed design.

The following list of drawings and data required for approval stage of the project includes, but is not limited to:

- Single Line Diagram
- Description of protection scheme
- Control schematic
- Protection and control philosophy
- Major equipment nameplate schedules and statements
- Fuse and protective relay coordination study and settings
- Current transformer characteristic curve
- Measurement Canada approval numbers for instrument transformers

- Generating station site plan showing the layout and land location coordinates and legal description. The drawing should also show the proposed terminal pole or service manhole with the routing of aerial line or underground cables from utility to the generating station.
- SCADA Diagram
- Obtaining all permits and complying with all safety and environmental regulations, codes and assessment approvals, if necessary, for the construction and operation of its facilities.
- Proposed In-Service Date

18.3. Verified Stage

When the project is nearing completion, the IPP must submit the proposed testing, commissioning and start-up procedures to be performed before the facility is connected to the YIS.

The following list of drawings and data required for commissioning and verification stages of the project includes, but is not limited to:

- Commissioning report
- Copies of all permits, compliance reports and inspection documents
- Final Single Line Diagram
- Final protection scheme
- Final control schematic
- Protection and control philosophy
- Major equipment nameplate schedules, statements, test reports and data sheets
- Final fuse and protective relay coordination settings
- Current transformer characteristic curve
- Final generating station site plan showing the layout and land location coordinates and legal description

D.1 Modelling Information

In some cases, a generator (or the aggregate generation on a line) is large enough that adjacent customers or the dynamic stability of utility's distribution system could be affected. The IPP is responsible for the cost of any required transient or dynamic stability studies, and the studies must be done in a manner suitable to, and approved by, the utility.

IPPs are responsible for ensuring the data they submit provides an adequate mathematical representation of the facility's electric behavior. If the data is not available prior to purchasing equipment, it must be submitted as soon as it becomes available.

The studies must accurately determine:

1. The impact of the IPP's facility on adjacent customers of the utility.
2. The dynamic stability, in aggregate, of the utility system.

Data may be supplied by the manufacturer or acquired directly by testing. It must include generator characteristics (i.e., speed, reactance, resistance, excitation system etc.) and governor characteristics (i.e., lead time/lag time constants, valve or gate opening data etc.).

The information requirements vary for induction generators and inverter generators, and for hydro or thermal systems.

Appendix C

Information Provided by the Utility

Appendix C

Information Provided by the Utility

After receiving the application for interconnection, the utility will provide the following information to the IPP, if required:

a. Single Line Diagram or maps of the system up to the POI.
b. Minimum and maximum 60 Hz source impedances (positive-sequence, negative- sequence and zero-sequence) at the POI.
c. Maximum and minimum normal and emergency system operating voltage ranges at the POI.
d. Harmonic impedance envelope at the POI if available.
e. Planning, operating and reliability criteria, standards and policies.
f. The results of a planning study (e.g. the System Impact Study) documenting the availability of the requested amount of system capacity and any other specific technical issues to be addressed.
g. Cost estimates and time schedule to build the upstream facilities.
h. Characteristics and settings of protection on the distribution system.
i. Costs to implement any required changes to the distribution system that are identified by the System Impact Study.

Some or all of this information will be required by the IPP to properly design the interconnection protection. The utility will identify when the costs of producing this information are to be assigned to the IPP.

Appendix D

Applicable Codes and Standards

Appendix D
Applicable Codes and Standards

D.1 Primary Standards

CSA Standard C22.3 No. 9-08 (R2015) Interconnection of Distributed Resources and Electricity Supply Systems

IEEE Standard 1547-2018 Standard for Interconnecting Distributed Resources with Electric Power Systems with Associated Electric Power Systems Interfaces

Power Quality Standards

ANSI C84.1-2016 American National Standards for Electric Power Systems and Equipment Ratings (60 Hertz). Establishes nominal voltage ratings and operating tolerances for 60 Hz electric power systems from 100 V through 1200kV.

IEEE Std. 493-2007 IEEE Recommended Practice for Design of Reliable Industrial and Commercial Power Systems (IEEE Gold Book).

IEEE Std. 519-2014 IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems.

IEEE Std. 1100-2005 IEEE Recommended Practice for Powering and Grounding Sensitive Electronic Equipment (IEEE Emerald Book).

IEEE Std. 1159-2009 IEEE Recommended Practice for Monitoring Electric Power Quality.

IEEE Std. 1250-2011 IEEE Guide for Identifying and Improving Voltage Quality in Power Systems.

In addition to the power quality standards, the following standards are applicable to the interconnection of generation facilities to YEC's system:

IEEE Std. 100 - 2000 IEEE Standard Dictionary of Electrical and Electronics Terms.

IEEE Std 315-1975 (Reaffirmed 1993) ANSI Y32.3-1975 (R1989) CSA Z99-1975 Graphic Symbols for Electrical and Electronics Diagrams (including Reference Designation Letters).

IEEE Std 929-2000 IEEE Recommended Practice for Utility Interface of Residential and Intermediate Photovoltaic (PV) Systems.

C37.1-2007 ANSI/IEEE Standard Definitions, Specifications and Analysis of Systems Used for Supervisory Control, Data Acquisition and Automatic Control.

C37.2-2008 IEEE Standard Electrical Power System Device Function Numbers, Acronyms, and Contact Designations.

C37.18-1979 ANSI/IEEE Standard Enclosed Field Discharge Circuit Breakers for Rotating Electric Machinery.

C37.20.1-2015 ANSI/IEEE Standard for Metal-Enclosed Low-Voltage (1000 Vac and below, 3200 Vdc and below) Power Circuit Breakers Switchgear.

C37.20.3-2001 ANSI/IEEE Standard for Metal-Enclosed Interrupter Switchgear.

C37.24-2017 ANSI/IEEE Standard for Evaluating the Effect of Solar Radiation on Outdoor Metal-Enclosed Switchgear.

C37.27-2015 ANSI/IEEE Standard Application Guide for Low-Voltage AC (635 V and below) Power Circuit Breakers with Separately Mounted Current-Limiting Fuses.

C37.29-1981 ANSI/IEEE Standard for Low-Voltage AC Power Circuit Protectors Used in Enclosures.

C37.50-1989 ANSI Standard Test Procedures for Low-Voltage AC Circuit Breakers Use In Enclosures.

C37.51-1989 ANSI Standard Conformance Test Procedure for Metal Enclosed Low- Voltage AC Power Circuit-Breaker Switchgear Assemblies.

C.52-1974 ANSI Standard Test Procedures for Low-Voltage AC Power Circuit Protectors Used in Enclosures.

C57.12-2015 IEEE Standard General Requirements for Liquid Immersed Distribution, Power and Regulating Transformers.

C57.12.13-1982 Conformance Requirements for Liquid Filled Transformers Used in Unit Installations including Unit Substations.

Appendix E

Sample Operating Agreement

Appendix E
Sample Operating Agreement

1. Purpose

This agreement outlines the steps to take to ensure a reliable and safe interconnection between the IPP and YEC and/or AEY through a variety of circumstances.

2. Definitions

Operating Authority: The organizational unit assigned responsibility for operating a portion of the electrical system. For each utility the YEC System Control Center (SCC) operator is the operating authority. For the IPP, the *<IPP Contact>* is the operating authority.

Operational Boundary/Interface Point or Point of Interconnection: The location on the electrical system at which responsibilities between Operating Authorities meet. The breaker *<Breaker ID>* is the interface point between the IPP and the utility.

3. Operational Information

Circuit Breaker Identification

List circuit breakers providing interconnection between IPP and the utility.

3.1 Interlocks

List identified circuit breaker interlocks with sequence information

3.2 Contact Information

SCC – Phone (867) *XXX-XXXX* or (867) *XXX-XXXX* (recorded lines)

Contact Name	Title	Phone Number
<Utility Contact>	Leadhand SCC	(867) *XXX-XXXX*
<Utility Contact>	Operation Coordinator	(867) *XXX-XXXX*
<Utility Contact>	Manager Operations	(867) *XXX-XXXX*
<Utility Contact>	Director of Operations	(867) *XXX-XXXX*
<IPP Contact>	<Contact Position>	(867) *XXX-XXXX*

3.3 Normal Operation

Under normal operating conditions the IPP facility will be connected to the utility grid. The breakers status under normal operating conditions is as follows.

Breaker	**Status**
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*

4. Operating Procedures

4.1. Line L### (<Utility Line> to <IPP Facility>) Isolation

L### isolation requires the minimum notification defined in section 4.3, with the exception of emergency repairs. The utility will provide a Condition Guarantee on breaker <Breaker ID>. The Condition Guarantee is used in communications between external parties. It is a formal method of communication that switching has been completed. It ensures the status of the breaker/device will not change until the work is complete, the lock out tag out is surrendered and all workers are clear.

4.2. Voltage Support

Based on the power quality conditions defined in Schedule *<X>* of the Power Purchase Agreement (PPA) and system security requirements, SCC may request voltage support. Voltage support can be accomplished by placing IPP generation on line, or other means such as capacitor banks or transformer tap changing. If such support is part of the operating agreement then:

- When the IPP has generation online, the generators regulate the generator bus voltage between 100 and 105% of nominal and the utility shall have control of this set-point. Generators reactive output will be adjusted by the utility in real time, to regulate the system voltage, by pulsing the AVR voltage set-points. The IPP sets the acceptable range within which the utility can adjust voltage.
- The utility must have full SCADA visibility of the IPP substation and control of critical elements.

4.3. SCC Remote Monitoring and Control

- SCC will have visual indication of the IPP breakers, generator status, capacitor status and electrical measurement information for the IPP facility.
- The utility control will be limited to:
    - Approving requests from the IPP to connect and disconnect from the utility system
    - Approving requests from the IPP for changes in generation output
    - Requesting the IPP to disconnect from the utility system for operational and safety reasons
- All IPP requests must be communicated and approved by the utility
- The utility shall have control (open and close) of incoming line breaker *<Breaker ID>* at the IPP facility.

5. Operational Notification

5.1. Daily Operating Communications

Under normal operating conditions IPP will be supplying *<XXX>* kW to the YIS. Generation changes of more than *<XXX>* kW must be communicated and approved by the utility.

5.2. The transition from winter to summer and conversely summer to winter generation levels must be established with SCC with a minimum of 30 days' notice.

5.3. IPP Facility Planned Maintenance and Scheduling

The IPP shall operate under the utility approved maintenance procedures established.

To meet changing operating conditions and coordinate maintenance efforts, maintenance shutdowns by the IPP need to be communicated to SCC at least one week in advance for shutdowns of up to 12 hours and 30 days for shutdowns longer than 12 hours. Changes in the availability and capacity of the onsite generation need to be communicated to SCC. The utility and the IPP shall share annual shutdown/maintenance plans in February of each year.

5.4. Transmission and Distribution Maintenance and Scheduling

The utility performs annual line maintenance on its transmission and distribution lines, during which grid power to the IPP facility may be curtailed or suspended. The duration of this annual maintenance can be up to 14 days per calendar year.

The utility will provide a minimum of 30 days' notice of the start date and expected duration of work that will curtain or otherwise interrupt the supply of grid power to the IPP facility.

6. Loss of Supply Procedures

6.1. Loss of Supply - Short Term

In the event of a disturbance that results in the loss of grid power to the IPP facility, SCC will make one attempt to re-energize the line to the IPP facility. If successful the following steps apply to resume the IPP facility operation with grid power.

a) SCC will confirm the status of the breakers located at the IPP's POI.

b) SCC will request closed breaker <Breaker ID>.

c) Once complete and with confirmation from SCC the IPP facility may proceed with the restarting of their operation. The IPP will communicate to SCC on generation greater than <XXX> kW. The request to increase generation may be communicated verbally or via SCADA.

6.2. Loss of Supply - Long Term

In the event of a disturbance that results in the loss of grid power to the IPP facility and SCC is unsuccessful in re-energizing the line the following steps will apply.

a) SCC will confirm the status of the breakers.

b) At the direction of SCC the IPP personnel will start and stage their generation on line supplying power to the IPP facility.

c) Once the line to the IPP facility has been re-energized, SCC will request the IPP synchronize and close its POI breaker.

d) The IPP facility is now connected to YEC system. Once complete and with confirmation from SCC the IPP facility may proceed with resuming generation. The IPP will communicate to SCC on generation increases greater than *<XXX>* kW. The request to load up may be communicated verbally or via SCADA.

7. Revision and Approval

7.1. This Agreement comes into effect once it is signed by the IPP and the utility.

7.2. This Agreement will remain in effect unless cancelled upon the mutual agreement of both Parties.

7.3. The Parties shall provide 90 days' notice in writing of the intention to modify the Agreement.

7.4. The Agreement may be revised upon mutual agreement of both Parties. The agreement will be formally reviewed every two (2) years.

Standing Offer Program Rules

1. Introduction

BC Hydro's Standing Offer Program ("SOP") encourages the development of new small and clean or renewable energy Projects by multiple developers throughout British Columbia. The SOP was developed to streamline the process for selling electricity to BC Hydro for Projects that will be connected to BC Hydro's Distribution System, and to simplify the contract, called the Standard Form Electricity Purchase Agreement ("Standard Form EPA"), between BC Hydro and the Developer. The SOP is also intended to decrease transaction costs for Developers while remaining cost-effective for ratepayers, and embodies the principles and policies set out in the BC Energy Plan and the *Clean Energy Act*. BC Hydro intends for the SOP to provide Project development opportunities to a broad range of experienced and new Developers alike.

The SOP Rules ("the Rules") explain the SOP eligibility requirements, the payment price offered by BC Hydro for energy delivered under the SOP, and the Application process. Additional information about the SOP, including Frequently Asked Questions ("FAQs") on a number of topics and how the SOP was developed, can be found at www.bchydro.com/standingoffer.

2. Eligibility Requirements

To be eligible for the SOP, the Developer and the Project must meet both the key eligibility requirements and the standard eligibility requirements outlined below. If an Application is submitted without meeting the key eligibility requirements, it will be rejected immediately. The Developer must also meet the standard eligibility requirements before the Application Review process is completed in order to be offered an EPA for the Project.

KEY ELIGIBILITY REQUIREMENTS

2.1 Generation Technology

- The generation technologies meets the requirements to be considered either Commercial Operation Generation Technology or Completed Prototype Generation Technology; and

- The generators are new. Projects with existing generation are not eligible to apply under the SOP. At sites where there is existing generation, only incremental generation from one or more additional new generating units is eligible to apply under the SOP, provided the new generation is measured, or is capable of being measured, separately from existing generation.

2.2 Eligible Energy

Energy delivered to BC Hydro under the EPA must be Clean Energy generated from a Clean or Renewable Resource.

Energy that does not qualify as Clean Energy due to the use of some Auxiliary Fuel for Start-up or for other limited operational requirements may be eligible for the SOP at BC

BC Hydro
Power smart

Hydro's discretion. When BC Hydro exercises its discretion to allow a Project that uses Auxiliary Fuel to participate in the SOP, the use of Auxiliary Fuel in each calendar year must not exceed the Auxiliary Fuel Annual Baseline.

2.3 Location

- Projects must be located in British Columbia, which includes Canadian and British Columbia territorial waters; and
- Projects must not be located in a Protected Area.

2.4 Project Size

The generators must have a combined total Nameplate Capacity over 100 kW up to and including15 MW. Where a Project is part of a Project Cluster or Common Generation Facility, the aggregate nameplate capacity of all generators in the Project Cluster or Common Generation Facility must not exceed 15 MW. This rule supports the objective of creating opportunities for many developers in the SOP.

If the Project is expected to be connected to the Distribution System in an area where BC Hydro has system constraints, BC Hydro Generator Interconnections may require that the Project has a Maximum Power Injection that is less than 15 MW. In that case, BC Hydro will not accept an Application with a Nameplate Capacity that is greater than the maximum permitted by BC Hydro's Generator Interconnections for the Project.

BC Hydro may request any additional information it requires to assess the reasonableness of Project's Nameplate Capacity or expected generation specified in the Application, including verification by a qualified B.C. registered professional engineer.

2.5 BC Hydro Incentives

A Project is not eligible for the SOP if the Project has received funding or has a reasonable expectation of receiving funding from BC Hydro through a Load Displacement or Demand Side Management program. Projects that have been subject to BC Hydro funding other than through a Load Displacement or Demand Side Management program may be eligible for the SOP at the discretion of BC Hydro.

2.6 Permits, Site Control and Zoning

The Application Form identifies the permits, site control and evidence of zoning that are key or standard eligibility requirements that must be satisfied by the Project.

2.6.1 Permits – The Developer must have obtained the permits specified in the Application Form to the extent required for the Project under applicable laws.

Where the Project consists of a Completed Prototype Generation Technology, BC Hydro reserves the discretion to identify the permits that are required prior to an offer of an EPA following a review of the Project.

BC Hydro
Power smart

2.6.2 **Site Control** – The Developer must demonstrate that it has obtained the right to use the site for the Project (including, unless otherwise acceptable to BC Hydro in its discretion, all areas where the generating facility and related access roads, transmission lines and other Project facilities will be built) for a period generally consistent with the Term of the EPA or a shorter period if acceptable to BC Hydro in its discretion.

2.6.3 **Zoning –** If local government land use requirements apply to all or any part of the Project site (including all areas where the generating facility and related access roads, transmission lines and other Project facilities will be built), that part of the Project site must be appropriately zoned for the applicable Project use. Please refer to section 121 of the *Utilities Commission Act* and the Public Utility Regulation.

Where the Project forms part of a Common Generation Facility, BC Hydro may require the Developer to provide evidence that the permits, site control and zoning requirements are satisfied for the entire Common Generation Facility.

2.7 Public Utility Status

If a Developer is a "public utility" for purposes of the *Utilities Commission Act* it must have an exemption from regulation as a public utility under Part 3 of the *Utilities Commission Act* with respect to the sale of energy to BC Hydro under the EPA (e.g., Minister's Order No. M-22-0205). A Developer that is otherwise a public utility, such as one actively serving customers, is not eligible to apply under the SOP.

2.8 Customers of Public Utilities Other than BC Hydro

Customers taking electrical service from a public utility other than BC Hydro are not eligible to apply under the SOP, with the exception of customers that take only back-up or start-up electricity service from that public utility.

2.9 Target Commercial Operation Date

The Target Commercial Operation Date ("Target COD") submitted by the Developer in the Application must be:

a) a reasonable estimate of the date on which the Project is expected to achieve COD with considerations for the SOP application review process, interconnection study and any implications there may be on the Project maintaining its generator interconnection queue position as per the Open Access Transmission Tariff or established Distribution Generator Interconnection practices.

b) in a year where there is sufficient room available for the Project's annual energy volume in BC Hydro's Energy Volume Target at the time of application; and

c) within three years, but not earlier than six months, after signing the EPA [please note that BC Hydro's interconnection agreements require COD to occur within three years of execution].

Developers are expected to review the SOP Website for available annual energy volumes and use this information to select their Projects' Target COD year. BC Hydro does not represent or warrant that the available volume posted on the SOP Website will be or remain available at the time developers submit an Application. Developers are encouraged to contact BC Hydro prior to submitting an Application to verify the energy volume expected to be available in their Target COD year.

The Target COD selected by a Developer for a Project will be eligible for registration in the corresponding COD year after BC Hydro has determined, in its discretion, that the Developer and Project have met the key eligibility criteria as described in section 2 of these Rules. Target CODs will be registered on a first-come, first-served basis.

BC Hydro may request any additional information it requires to assess the reasonableness of the Project's Target COD or the Project's estimated energy specified in the Application. If BC Hydro determines, in its discretion, that the Target COD is not achievable, BC Hydro may reject the Application.

If the Developer's selected Target COD year has insufficient room in the Energy Volume Target to allow for the Project's annual energy, BC Hydro will give the Developer the opportunity to postpone their Target COD to the next COD year with sufficient available energy volume. If the Developer declines to postpone their Target COD, BC Hydro may reject the Application.

BC Hydro may, at its discretion, allow a Project to exceed the available energy volume in its Target COD year. In determining whether to allow a Project to exceed the available energy volume in the Target COD year, BC Hydro may consider:

- the extent to which all or part of the Project's energy exceeds the available energy volume in the Target COD year;
- if a majority of the Project's energy is available in its Target COD year;
- if BC Hydro's available energy volume is already expected to be exceeded by other projects registered in the Target COD year;
- if the available energy volume was exceeded in the year before the Target COD year; and
- if there is available energy volume in the year following the Project's Target COD year to apply any excess energy to.

STANDARD ELIGIBILITY REQUIREMENTS

2.10 Projects Behind a BC Hydro Customer Load

Projects located Behind a BC Hydro Customer Load are eligible to apply under the SOP; however, BC Hydro will only purchase energy on a Net-of-Load basis.

2.11 Previous, Current and Future EPAs with BC Hydro

If BC Hydro signed an EPA with respect to a Project, that Project is eligible for SOP, provided that (i) the Project did not achieve commercial operation while the original EPA was in effect, and (ii) the original EPA has been terminated in accordance with its terms and all other post-termination conditions and restrictions in that EPA have been satisfied.

BC Hydro may determine in its discretion whether or not a Project submitted to the SOP constitutes the same project as a project for which an EPA was previously signed with BC Hydro. Factors BC Hydro may consider include, but are not limited to, the location, permits, licenses and site tenure, and the Developer (including ownership structure) of the Project submitted to the SOP, relative to the prior project.

If a Project is part of a Common Generation Facility or a Project Cluster, and BC Hydro has entered into an EPA(s) for generation from that Common Generation Facility or from any project in that Project Cluster, the Project is eligible for the SOP provided the aggregate nameplate capacity of all generators in the Project Cluster or Common Generation Facility does not exceed 15 MW and the Project otherwise meets the eligibility requirements. If BC Hydro accepts an Application from a Project that is part of a Common Generation Facility or Project Cluster, any EPA will contain provisions to address delivery limitations and priorities.

If the existing generation in a Common Generation Facility or Project Cluster is the subject of a BC Hydro SOP EPA, BC Hydro will determine, in its discretion, if the new, incremental generation will be offered a separate EPA or whether the pre-existing EPA will be amended to include the new generation.

2.12 Environmental Attributes

All Environmental Attributes for the energy delivered to BC Hydro under the EPA must be transferred to BC Hydro. The value of the Environmental Attributes is included in the price paid for energy delivered under the SOP and is not paid separately to the Developer. For Projects where Greenhouse Gas ("GHG") emissions can be reduced in the process of methane capture and combustion, such as biogas, landfill gas control systems, and other similar projects, the term "Environmental Attributes" excludes any rights associated with GHG reductions arising from the methane capture and combustion process for those projects. Those credits will be retained by the Developer. For biomass Projects, the term "Environmental Attributes" excludes rights derived from the harvest, collection or delivery of fuel to the Project. Those rights will be retained by the Developer.

2.13 EPAs with Third Parties

A Project is not eligible for the SOP if there are any agreements with a third party or parties for the purchase and sale of electricity from any generator in the Project or, from any generator in the Common Generating Facility or Project Cluster if the Project is part of a Common Generating Facility or Project Cluster. Any such third party agreements must be terminated prior to submitting an Application for the SOP.

2.14 Conflicts of Interest

The Developer must not be in or have the potential to be in an actual, apparent or deemed conflict of interest as a result of entering into an EPA with BC Hydro. The Developer must inform BC Hydro, by completing and submitting a Conflict of Interest Statement form, of any disclosures required under BC Hydro's Contractor Standards for Ethical Conduct and any potential conflicts of interest it may have with BC Hydro or BC Hydro's directors, officers or employees. The Conflict of Interest Statement form and BC Hydro's Contractor Standards for Ethical Conduct can be found on the Documents page of the SOP Website at www.bchydro.com/standingoffer.

If the Developer has any directors, officers, owners (with 20 per cent or more direct or indirect ownership in the Developer or its affiliates), or Project team members who have been employed by BC Hydro or its subsidiaries at any time in the two years preceding the submission of the Application, BC Hydro will deem there to be a conflict of interest.

BC Hydro will review the Conflict of Interest Statement form and determine, in its discretion, whether there is any actual, apparent or deemed conflict of interest.

2.15 Interconnection

All Projects must be interconnected to the Transmission System or the Distribution System through a direct interconnection or an Indirect Interconnection.

Projects located outside the Integrated System Area in another utility's service territory may be eligible for the SOP, but the delivery of energy must be at a specified point of delivery on the Integrated System, and the Developer must bear all costs of transmission and energy losses to that point of delivery.

Projects that would require BC Hydro to transmit energy to the Lower Mainland through another jurisdiction or another utility's service territory, including Projects in the Fort Nelson service area, are not eligible for the SOP.

For Projects with an Indirect Interconnection:

- the Developer will be required to deliver energy to BC Hydro at a specified Point of Interconnection ("POI") on the Transmission System or Distribution System and the Developer will be responsible for all risks, costs and energy losses associated with transmission of energy to that POI;

- BC Hydro must be satisfied that adequate arrangements are in place to enable BC Hydro to accurately determine the quantity of energy delivered to that POI;

- the Developer must demonstrate to BC Hydro that it has obtained the right to transmit energy to the POI for the Term of the EPA from any owner(s) of the transmission or distribution facilities the Project will use (e.g., by providing a copy of private line agreement between the line owner and the Developer);

- before BC Hydro offers an EPA for the Project, BC Hydro will amend the Standard Form EPA to address the Developer's responsibilities associated with the Indirect Interconnection. If the owner(s) of the transmission or distribution facilities the Project will use to transmit its energy to the POI are seeking to enter into an EPA with BC

Hydro for their project(s) at the same time, their EPAs may similarly be amended and the parties may be required to enter into a joint Interconnection Agreement;

- if the owner(s) of the transmission or distribution facilities that the Project will use to transmit its energy to the POI have already entered into an EPA(s) with BC Hydro, BC Hydro may require the Developer to secure the owner's agreement to amend its EPA(s) and Interconnection Agreement to address the risks, costs and energy losses associated with the Indirect Interconnection;

- BC Hydro is likely to require additional time to review the Application, make necessary amendments to the Standard Form EPA, make amendments to EPA(s) of the owner(s) of the transmission or distribution facilities that the Project will be using, and conduct the System Impact Study. Developers are expected to take these anticipated delays into consideration when selecting a Target COD; and

- Developers should be aware that if the Indirect Interconnection is overly complicated or would be burdensome for BC Hydro to administer, the Application may be rejected.

2.16 First Nations

BC Hydro will assess the adequacy of First Nations consultation before it makes a decision to offer an EPA for the Project. In its assessment, BC Hydro will consider a number of factors, which may include:

- information on how the Developer determined which First Nations to consult;

- the extent to which the Project has gone through the B.C. permitting and land tenure processes and any permit(s) or licence(s) of occupation issued for the Project. BC Hydro will consider the issuance of land tenure, permits and licenses to indicate that a Crown agency has completed First Nations consultation. Permits and tenures issued by the Ministry of Forests, Lands and Natural Resource Operations will also indicate that the Crown agency has considered impacts of the sale of power to BC Hydro in its consultation process;

- information on the potential impact from the Project on asserted Aboriginal rights and title, and information on how the Developer reached this impact assessment; and

- information on the level of consultation as evidenced by consultation reports, logs, letters of support, correspondence and any other material submitted demonstrating consultation with First Nations for the Project.

For a Project being developed by one or more First Nations, BC Hydro will also consider:

- The consultative boundaries of other First Nations overlapping with the Project area. Depending on the circumstances of the Project, BC Hydro may require the First Nation(s) to consult with other First Nations whose consultative boundaries include the Project area.

- Where a Project is being developed by a First Nation(s) owned company, the First Nation(s) must provide information about how its Chief and Council is kept informed of the Project development including the Project ownership information provided in response to section 1.3 of the Application.

BC Hydro strongly encourages all Developers to contact their local FrontCounter BC office to confirm they have all of the necessary permits or permit amendments in place and to obtain information on any First Nations consultation that may be required in relation to the Project. FrontCounter BC is the Provincial government's "single window service" within the Ministry of Forests, Lands and Natural Resource Operations for natural resource authorizations and permits. Developers should include any information obtained from FrontCounter BC in the Application.

3. Energy Price

To determine the price BC Hydro will pay for energy delivered under an EPA, the SOP uses a base price in 2016$ determined by the region of the POI for the Project. The base price is set out in the table below.

Figure 1 – Base Price

Region of POI	Base Price (2016$/MWh)
Vancouver Island	110.01
Lower Mainland	111.56
Kelly/Nicola	104.39
Central Interior	106.80
Peace Region	102.06
North Coast	103.47
South Interior	106.50
East Kootenay	109.94

One hundred percent of the base price will be escalated at CPI annually up to the year in which an EPA is signed; escalation will be effective as of January 1st in each year. If CPI data is not available when the EPA is signed, the EPA will provide for a base price adjustment when the CPI data is released. After the EPA is signed, 50 per cent of the escalated base price is further escalated annually at CPI effective as of January 1st in each year.

The escalated base price is further adjusted based upon the time of day and month when the energy is delivered to establish the payment price for each MWh of energy delivered to the POI. The time of delivery adjustments are contained in the Standard Form EPA.

The price described above applies to the quantity of energy delivered at the POI.

The price per MWh described above is the only amount payable by BC Hydro. There is no additional payment for Environmental Attributes, for environmental certification (as defined in the Standard Form EPA) or any other expenses. The price will apply for one non-renewable EPA term of the duration selected in the Application.

Developers should note that BC Hydro is currently reviewing SOP pricing, including escalation and adjustments. BC Hydro expects that new pricing will take effect for Projects with Target CODs beginning in 2020.

4. Application Process and Review

4.1 Pre-Application Meeting and Preliminary Assessment

Potential applicants to the SOP are strongly encouraged to request a meeting or conference call with BC Hydro at any time prior to submitting an Application. The purpose of the pre-application meeting is to review the SOP Rules, the Application process, the Standard Form EPA, the interconnection requirements and study costs, First Nations consultation requirements and other matters required to facilitate the Application process, such as available annual energy volume, basic interconnection information and other topics that may be the subject of a preliminary assessment.

To arrange a pre-application meeting or conference call, Developers should submit:

- a completed Pre-Application Meeting Form, available on the Documents page of the SOP Website at www.bchydro.com/standingoffer; and
- a scanned copy of the completed Confidentiality and Compliance Agreement signed by the Developer, also available on the Documents page of the SOP Website at www.bchydro.com/standingoffer.

by email to the SOP Administrator at standing.offer@bchydro.com.

Potential applicants to the SOP may also request a preliminary assessment of whether the Developer and/or the Project meet certain eligibility requirements of the SOP. To request a preliminary assessment of specific eligibility requirements for the SOP, Developers should submit:

- a written request for a preliminary assessment of one, or more, specific eligibility requirement(s) for the SOP including a description of the Developer and the Project. For a Project Cluster preliminary assessment, include a completed Appendix 1 – Project Cluster and/or Common Generation Facilities available on the Documents page of the SOP Website; and
- a scanned copy of the completed Confidentiality and Compliance Agreement signed by the Developer, available on the Documents page of the SOP Website at www.bchydro.com/standingoffer.

by email to the SOP Administrator at standing.offer@bchydro.com.

A preliminary assessment is based on the information provided to BC Hydro in the request for the preliminary assessment and the SOP Rules in effect at the date of the preliminary assessment. A preliminary assessment is not binding on BC Hydro. Any variance between the information contained in a request for a preliminary assessment and the information contained in an Application or actual Project conditions may result in

a final decision that is different from the preliminary assessment. As set out in Section 7.5 of the Rules, BC Hydro may amend the SOP Rules at any time. A change in the SOP Rules may also result in a final decision that is different from the preliminary assessment.

4.2 Submitting an Application

To apply for the SOP, the Developer must submit the following:

- a scanned copy of a completed SOP Application signed by the Developer, with applicable exhibits, in electronic form; and
- a scanned copy of the completed Confidentiality and Compliance Agreement signed by the Developer (if not previously submitted with a pre-application meeting or preliminary assessment request).

by email to the SOP Administrator at standing.offer@bchydro.com or delivered on one (1) disk or USB flash drive to:

Vancouver, BC V6B 5R3
Attention: SOP Administrator

The Application Form and Confidentiality and Compliance Agreement are available on the Documents page of the Standing Offer Program Website at www.bchydro.com/standingoffer.

4.3 Review and EPA Process

4.3.1 Application Review

a) Completeness Review – Upon receipt of the Application, BC Hydro will provide the Developer with a written acknowledgement and will perform a completeness review to ensure that it has all the information required to proceed with the Application Review. At a minimum, the Developer will have submitted:

- a signed application;
- all exhibits marked for inclusion by the Developer; and
- a signed Confidentiality and Compliance Agreement.

In order to commence the Application Review, the Confidentiality and Compliance Agreement must be valid – that is, it must be with the appropriate entity which needs to be in good standing.

In the event the Application is incomplete, BC Hydro may request additional information or clarification from the Developer. Depending upon how much information is missing from the Application, BC Hydro will either (1) keep the Application and request submission of the missing information subject to Section 4.6 of the Rules or (2) reject the Application.

BC Hydro will notify the Developer in writing upon completion of the completeness review.

b) Initial Eligibility Review and Application Review – BC Hydro will perform an initial eligibility review and the Application Review.

An initial eligibility review assesses whether the Developer and the Project meet the key eligibility requirements as described in Section 2 of the Rules. BC Hydro will reject an application that has not met the key eligibility requirements upon submission of the Application.

Once BC Hydro determines that the Developer and Project meet the key eligibility requirements, the Application Review continues with the assessment of whether the Developer and the Project meets all eligibility requirements.

In the event BC Hydro is unable to confirm the Project's eligibility under the SOP, BC Hydro may request additional information or clarification from the Developer. Depending upon how much information is missing from the Application, BC Hydro will either (1) keep the Application and request submission of the missing information subject to Section 4.6 of the Rules or (2) reject the Application.

BC Hydro will notify the Developer in writing of the result of the Application Review, and if the Application is retained or rejected following completion of this step. If retained, BC Hydro will also advise the Developer on the status of registering the Project's energy volume under its Target COD year.

c) Registration Under the Energy Volume Target – For each Application that is retained following completion of the steps described in Section 4.3.1 b) of the Rules, BC Hydro will register the Project's energy volume under its Target COD year as described in Section 2.9 of the Rules. BC Hydro will notify the Developer in writing upon completion of the registration.

4.3.2 Review of System Impact Study

a) For each Application that is retained following completion of the steps described in Section 4.3.1 of the Rules, BC Hydro will request that the Developer begin the System Impact Study (or other study if applicable). The Developer must file a complete application with BC Hydro Generator Interconnections for the System Impact Study and pay the applicable study fees within 28 Days after the request, or the Application may be rejected.

b) If the Developer submits a System Impact Study application with a Plant Capacity and Nameplate Capacity or other material information that is not the same as the Plant Capacity and Nameplate Capacity or other information described in the Application, the Application will be rejected.

c) Upon completion of the System Impact Study, BC Hydro will review the System Impact Study to determine whether BC Hydro is ready to support the Project's interconnection to the Distribution System or Transmission System. BC Hydro may reject an Application if the System Impact Study indicates that the proposed interconnection and Interconnection Network Upgrades are not capable of being completed at least 90 Days prior to the Target COD specified by the Developer in the Application, or it indicates Interconnection Network Upgrade Costs that are not acceptable to BC Hydro.

Developers should note that a System Impact Study may become out-of-date and invalid if further studies or steps are not commenced within the time required by BC Hydro Generator Interconnections.

4.3.3 EPA Preparation

a) Following completion of the steps described in Section 4.3.2 of the Rules:

i) BC Hydro will review any Project-specific EPA changes requested by the Developer in the Application. BC Hydro may request additional information or clarification regarding proposed changes; and

ii) BC Hydro may advise the Developer of required changes to the Standard Form EPA based on a review of the Application.

BC Hydro then expects to provide the Developer with a draft EPA for the Developer's review and comment. If required, BC Hydro may also exchange subsequent drafts with the Developer. Once BC Hydro sends a draft EPA to the Developer, the Developer is expected to provide its response and comments to BC Hydro within a commercially reasonable period of time. Failure to do so may result in rejection of the Application.

Developers should note that Projects with an Indirect Interconnection or that are otherwise unusually complicated, will require an extended time for BC Hydro to review and make changes to the Standard Form EPA.

b) For each Application that is retained following completion of the steps described in Section 4.3.3 a) of the Rules:

i) BC Hydro will request that the Developer completes and submits a Statement of Project Changes that identifies any changes to any information in the Application; and

ii) BC Hydro will prepare a final draft EPA and present it to the Developer for review and comment.

The Developer is required to submit a Statement of Project Changes and provide comments on the final draft EPA within a commercially reasonable period of time or the Application may be rejected.

4.3.4 EPA Offer and Acceptance

a) After completion of the process described in Section 4.3.3 of the Rules, including the filing of all required documents, BC Hydro will send the Developer either an offer of an EPA or a notice of rejection of the Application.

b) If the Developer wishes to accept the offer of an EPA, the Developer must sign the EPA and deliver it to BC Hydro at the address specified in Section 4.2 of the Rules. If the Developer has not delivered the signed EPA within a commercially reasonable period of time, BC Hydro's offer of an EPA will be withdrawn.

c) Subject to Section 4.3.4 d) of the Rules, BC Hydro will send a fully signed EPA to the Developer after receipt by BC Hydro of the signed EPA from the Developer.

d) BC Hydro may withdraw an offer of EPA, without liability, at any time prior to delivery of the fully-signed EPA to the Developer.

4.4 **Amending Applications** – Developers may amend an Application at any time prior to delivery of an offer of an EPA by BC Hydro to the Developer. Any such amendment may extend BC Hydro's Application review and EPA offer timelines.

Developers should note that any amendments that may result in a change to an interconnection queue position or System Impact Study may invalidate the interconnection queue position or the System Impact Study. If the generator interconnection queue position or System Impact Study become invalid (as determined by BC Hydro Generator Interconnections) prior to execution of an EPA by both BC Hydro and the Developer, the Application may be rejected.

4.5 **Withdrawing Applications** – Developers may withdraw a submitted Application, without liability, at any time prior to signing an EPA on written notice to BC Hydro.

4.6 **Request for Further Information/Meetings** – BC Hydro may, but is not required to, request further information, clarification or verification concerning an Application or other communication received from a Developer. Failure to respond to such a request within 28 Days after the date of the request may result in rejection of an Application. BC Hydro may telephone or meet with any Developer or group of Developers at any time prior to or following submission of any Application or Applications.

4.7 **Due Diligence and Consultation** – BC Hydro may, but is not required to, undertake any investigation or inquiries and/or undertake any consultation with any governmental or regulatory authority or any other person or group as BC Hydro considers necessary in its discretion with respect to a Developer, a Project, and/or an Application and may, in reviewing an Application, consider any information received as a result of such investigation, inquiry and/or consultation.

BC Hydro
Power smart

4.8 Rejecting Applications – BC Hydro may accept or reject any Application and may decide to offer or not to offer an EPA to a Developer at its discretion. BC Hydro may reject an Application at any stage in the Application Review process notwithstanding any prior decision by BC Hydro in the Application review process or prior completion of any step in the Application review process. Reasons for rejection of an Application and/or a decision not to offer an EPA to a Developer may include, but are not limited to:

i) an incomplete Application;

ii) an Application that does not meet the eligibility requirements set out in Section 2 of the Rules;

iii) failure to respond to a request by BC Hydro for additional information, failure to respond to or accept Project-specific EPA changes requested by BC Hydro and/or failure to file a System Impact Study or Statement of Project Changes within the required time limits;

iv) a generator interconnection queue position or System Impact Study that become invalid at any time prior to execution of an EPA by both BC Hydro and the Developer;

v) a System Impact Study and generator interconnection queue position (if applicable) that indicate that the proposed interconnection and Interconnection Network Upgrades are not capable of being completed at least 90 Days prior to the Target COD specified by the Developer in the Application;

vi) an Application that proposes Standard Form EPA amendments that are not acceptable to BC Hydro;

vii) an Application for a Project that BC Hydro determines requires material Standard Form EPA amendments or that is too complex to be an appropriate Project for the SOP;

viii) an Application for a Project that will result in Interconnection Network Upgrade Costs that are not acceptable to BC Hydro;

ix) an Application in respect of which any of the information included in the Application is not satisfactory to BC Hydro in any respect;

x) an Application in respect of which BC Hydro determines that the Developer has, or by entering into an EPA, would have, an actual, apparent, or deemed conflict of interest; or

xi) an Application in respect of which BC Hydro determines that the Project and/or the Developer are unsuitable for the SOP or that it would not be in the public interest to offer an EPA for the Project or to the Developer.

If the Application is rejected, the Developer can request an information meeting with BC Hydro to discuss the reasons for the rejection.

BC Hydro
Power smart

A rejected Application can be resubmitted at a later date provided the deficiencies or issues noted as reasons for rejection have been addressed. A rejected Application will have its Target COD deregistered.

BC Hydro

5. Interconnection

INTERCONNECTION REQUEST PROCESS

The interconnection process will be conducted by BC Hydro Generator Interconnections. All inquiries should be directed to distribution.generators@bchydro.com.

5.1 **Interconnection Requirements –** All generators connected to BC Hydro's Transmission System or Distribution System are required to meet BC Hydro's technical interconnection requirements. In order to determine these requirements and assess the impacts to BC Hydro's system from the proposed interconnection for the purpose of identifying the required network upgrades, technical studies must be performed. These studies provide cost estimates of the required upgrades.

5.2 **Direct Interconnections** – A valid System Impact Study is required for all Projects that are expected to be directly interconnected to the Transmission System or Distribution System. For Projects under 1 MW that are expected to be directly interconnected to the Distribution System, BC Hydro Generator Interconnections may, in its discretion, accept an interconnection study for the Project other than a System Impact Study (e.g., a screening study). The Plant Capacity in the System Impact Study or, other interconnection study if applicable, must be equal to the Plant Capacity in the SOP Application and EPA.

For Projects that are interconnected directly to the Distribution System, the Developer may obtain an optional screening study prior to submitting an Application to the SOP which provides a conceptual level estimate of the interconnection requirements for the Project. For Projects that are interconnected directly to the Transmission System, the Developer may obtain an optional feasibility study prior to submitting an Application to the SOP that provides a high level assessment of technical requirements and potential interconnection costs. These studies are available prior to investing in a System Impact Study but do not replace the requirement for a valid System Impact Study prior to entering into an EPA.

Following the completion of the System Impact Study, Developers will typically be required to apply for a Facilities Study. A Facilities Study is generally required before the Developer enters into an Interconnection Agreement for the Project. While a Facilities Study is not required before an EPA is offered, BC Hydro encourages developers to begin the Facilities Study application as soon as reasonably practical after the completion of the System Impact Study..

All interconnection studies are a part of the interconnection process. For further information regarding any of the studies referred to above, please contact BC Hydro Generator Interconnections (see Section 5.5 of the Rules).

5.3 **Indirect Interconnections** – A valid System Impact Study is required for all Projects with an Indirect Interconnection to the Distribution System or the Transmission System through a BC Hydro Customer facility or a private transmission line. The Developer must arrange for the BC Hydro Customer or the owner of the private line to contact BC Hydro

Generator Interconnections to obtain the required System Impact Study and any required Facilities Study.

A System Impact Study is not required for Projects with an Indirect Interconnection to the Distribution System or the Transmission System through a public utility such as the FortisBC system. The Developer will need to contact that public utility regarding the interconnection of the Project to the public utility's system. The INU Threshold, as described in Section 5.9 of the Rules, does not apply to Projects interconnected through a public utility such as FortisBC.

5.4 **Early Contact and System Impact Study Timing** –Developers are strongly encouraged to contact BC Hydro Generator Interconnections early in the planning process to discuss the interconnection concept and feasibility for their Project.

As previously noted, a System Impact Study may become invalid if further studies or further steps are not commenced within the time required by BC Hydro Generator Interconnections. Accordingly, BC Hydro recommends Developers file their System Impact Study application with BC Hydro Generator Interconnections at the time they submit their Application to the SOP.

5.5 **Interconnection Issues** – For questions related to interconnection, please contact BC Hydro Generator Interconnections at:

BC Hydro Generator Interconnections
6911 Southpoint Drive, Edmonds B03
Burnaby, B.C. V3N 4X8
Email: distribution.generators@bchydro.com or
transmission.generators@bchydro.com

Complete details on the interconnection process can be found at www.bchydro.com/distributiongenerators or www.bchydro.com/transmissiongenerators.

RESPONSIBILITY FOR COSTS

5.6 **Interconnection Study Costs** – The Developer will be responsible for the costs of all studies required for the interconnection of the Project to the Distribution System or Transmission System.

5.7 **Transmission Costs** –The Developer will be responsible for the cost to transmit power sold under the EPA to the POI. BC Hydro will be responsible for the cost to transmit power acquired under the EPA from the POI to BC Hydro's Integrated System.

5.8 **Interconnection Costs** – Interconnection costs refer to the cost of any modifications or additions to the Distribution System or Transmission System arising from the direct or indirect interconnection of the Project to the Distribution System or Transmission System as the case may be. An estimate of these costs will be provided in the System Impact Study. The System Impact Study will (1) identify those costs that are the responsibility of the Developer and (2) provide an estimate of Interconnection Network Upgrade Costs ("INU Costs").

BC Hydro
Power smart

5.9 **INU Costs and INU Threshold** – Unless the EPA is terminated prior to 90 Days after COD, BC Hydro is responsible for all INU Costs incurred after the effective date of an EPA up to the INU Threshold. The INU Threshold will be escalated at CPI annually up to the year in which an EPA is signed, effective as of January 1st, starting in 2017. BC Hydro will also be responsible for INU Costs in excess of the INU Threshold resulting from a change in the Base Case after the effective date of the EPA, but excluding any changes to the Base Case caused by the Developer or the Project. The Developer is responsible for all costs in excess of the INU Threshold, except as described above.

5.10 **Transmission Network Upgrade (TNU) Costs** – BC Hydro is responsible for TNU Costs, except for TNU Costs that arise as a result of any Project changes made by the Developer relative to the information provided as part of the Application, including the System Impact Study.

5.11 **Network Upgrade (NU) Security** – After receipt by the Developer of the interconnection Facilities Study, and prior to entering into any agreement for construction of Interconnection Network Upgrades with BC Hydro Generator Interconnections, the Developer must deliver the NU Security to BC Hydro for 100 per cent of the INU Costs as estimated in the System Impact Study.

The required amount of NU Security may change from time to time to reflect the full amount of INU Costs estimated plus any TNU Costs that are the responsibility of the Developer due to Project changes made by the Developer relative to the information provided as part of the Application, including the System Impact Study.

The required form of NU Security can be found on the Documents page on the SOP Website.

The NU Security will be returned to the Developer within 15 Days after the date that is 90 Days after COD after deducting any amounts payable by the Developer for INU Costs and Base Case liabilities, as prescribed by BC Hydro Generator Interconnections.

5.12 **Revenue Meters –** Developers are required to have a revenue class Revenue Meter for the Project which is sealed and approved for revenue purposes by Measurement Canada.

The Revenue Meter must be leased from BC Hydro and its installation must be in accordance with BC Hydro's revenue metering requirements. Developers should contact BC Hydro Generator Interconnections as early as possible in the Project development process, and in advance of the Target COD, to make arrangements for the location, installation and testing of the Revenue Meter, with a copy to BC Hydro's Contract Management group at ipp.contract@bchydro.com.

6. Electricity Purchase Agreement

6.1 **Standard Form EPA** – The Standard Form EPA for the SOP is available at www.bchydro.com/standingoffer.

The Standard Form EPA is based on a "standard" type of Project and Developer. For example, the Standard Form EPA assumes that the Project consists of a new generator

that is not part of a Common Generation Facility, has a direct and independent interconnection to the Distribution System or the Transmission System and will have a Revenue Meter that measures output only from the Project and no other electricity generators. The Standard Form EPA also assumes that the Developer is a corporation.

6.2 **EPA Changes** – BC Hydro may require changes to the Standard Form EPA with respect to any Application where BC Hydro considers in its discretion that changes to the Standard Form EPA are required based on the information in the Application.

Developers are encouraged to carefully review the Standard Form EPA prior to submitting an Application. Developers may propose changes to the Standard Form EPA in their Application. BC Hydro may in its discretion accept or reject any proposed changes to the Standard Form EPA. BC Hydro may reject an Application that contains proposed changes to the Standard Form EPA that are not acceptable to BC Hydro. Developers should make every effort to limit the number of proposed changes to the Standard Form EPA.

6.3 **EPA Term** –The EPA will have a single term of 20 to 40 years, as selected by the Developer, or 10 to 40 years for Projects Behind a BC Hydro Customer Load, commencing on the Commercial Operation Date (as defined in the Standard Form EPA).

After the term of the EPA expires, BC Hydro will determine whether it is prepared to enter into negotiations with the owner of the Project regarding a new EPA for the Project. BC Hydro's determination will be based on its need for the electricity, prevailing market conditions, energy price, and power procurement practices at the time. If BC Hydro wishes to enter into a new EPA for the Project, BC Hydro expects that the price it offers for energy will assume that all initial capital costs for the Project have been recovered during the term of original EPA.

7. Additional Rules

7.1 **Costs –** Developers are responsible for all costs incurred by them in connection with the SOP, including the costs of preparing an Application and any other submission required under the SOP, all interconnection study costs and the execution and delivery of any EPA.

7.2 **Nature of Process** – The SOP is *not* a Call for Tenders. No legal offer, legal contract or legal duties or obligations of any kind whatsoever, whether express or implied, are intended to be created by or under the Rules, or by the filing of an Application, or the acceptance of an Application for review, or the review of an Application, or in any other manner whatsoever under or in connection with the SOP except for those arising under an EPA that has been signed and delivered by both the Developer and BC Hydro.

7.3 **Waiver** – BC Hydro may waive any provision of these Rules, including any of the eligibility requirements, where BC Hydro determines in its discretion that such waiver would be consistent with the objectives of the SOP or is otherwise in the public interest or the ratepayers' interest.

7.4 **Program Suspension/Cancellation** – BC Hydro may cancel or suspend the SOP at any time without any liability to any Developer or to any other person.

7.5 **Program Amendments** – BC Hydro may amend the SOP Rules, the Application Form, the Standard Form EPA and any Reference Documents in any respect in whole or in part at any time, provided that any such amendments shall not affect any EPA that has been offered to a Developer prior to the amendment. Any amendment will apply to all EPAs offered after the amendment.

7.6 **No Liability** – BC Hydro (including its affiliates, and their respective directors, officers, employees, contactors, subcontractors, consultants, agents and representatives), incurs no liability of any nature or kind whatsoever to any person in connection with the SOP or the administration of the SOP, or information provided with respect to, or in the course of, the SOP, or the acceptance, rejection, or review of any Application, or any other decision, assessment, determination, statement, act or omission whatsoever, whether negligent or not, relating to the SOP or its administration.

7.7 **Unsolicited Information Not Considered** – BC Hydro is not required to consider any information with respect to an Application that is not contained in the Application, or any written response to a request from BC Hydro for further information, clarification or verification.

7.8 **Ownership of Documents** – All Applications and all documents filed with an Application and all other submissions by a Developer under or in relation to the SOP will be retained by, and become the property of, BC Hydro, provided however that BC Hydro does not thereby acquire any ownership interest in intellectual property embedded therein.

7.9 **Other BC Hydro Power Procurement Processes** – BC Hydro may at any time reject an Application for a Project that is the subject of a submission in any other BC Hydro power procurement process.

7.10 **Filing Requirements** – If the last day for completing any act required or contemplated under the Rules falls on a day that is a Saturday, Sunday or other day recognized as a statutory holiday in British Columbia, the time for completing that act will be extended to the next day that is not a Saturday, Sunday or other day recognized as a statutory holiday in British Columbia.

8. Further Information

Developers should direct any questions regarding the SOP in writing to the SOP Administrator as follows:

by email to: standing.offer@bchydro.com

or by mail to: BC Hydro
Standing Offer Program
17th Floor, 333 Dunsmuir Street
Vancouver, BC V6B 5R3
Attention: SOP Administrator

Any questions submitted and subsequent answers may be posted at www.bchydro.com/standingoffer.

To avoid any potential misunderstandings and for administrative ease, Developers must not contact any BC Hydro director, officer or employee on any matter pertaining to the SOP except as set out above or, in the case of inquiries with respect to the interconnection process, as set out in Section 5 of the Rules.

Communication from Developers should originate from the contact person(s) specified in the Application. Contact persons can be changed by notice to the SOP Administrator. Developers should communicate in writing (which may include email).

Glossary – Standing Offer Program Rules

All references to section numbers are to sections of the SOP Rules, not the Application Form or Standard Form EPA, unless otherwise expressly stated.

1. **Application** means the Application Form for a Project as submitted by the Developer to BC Hydro together with all amendments thereto filed by the Developer and all supporting documents and information filed by the Developer with BC Hydro with respect to the Project, including the interconnection study or studies and Statement of Project Changes. [back]

2. **Application Form** means the form titled "Standing Offer Program Application Form" available at www.bchydro.com/standingoffer. [back]

3. **Application Review** means the review process conducted by BC Hydro once a completed Application has been received, as outlined in Section 4.3.1 of the Rules. [back]

4. **Auxiliary Fuel** means any combustible fuel that would render the energy generated as a result of such combustion ineligible for acceptance as energy generated by a Clean or Renewable Resource. [back]

5. **Auxiliary Fuel Annual Baseline** means 3 per cent of the total fuel, excluding Start-up Fuel, and determined in GJ, used to generate the energy sold to BC Hydro under an EPA in each calendar year. [back].

6. **Base Case** means the base case power flow, short circuit, and stability data models used as the basis for the Interconnection Study. [back]

7. **BC Energy Plan** means the document titled "The BC Energy Plan: A Vision for Clean Energy Leadership" published by the B.C. Ministry of Energy in 2007. [back]

8. **BC Hydro** means British Columbia Hydro and Power Authority. [back]

9. **BC Hydro Customer** means a customer of BC Hydro as defined in the BC Hydro Electric Tariff. However, the following are not customers for the purpose of the SOP: (i) a public utility, as defined in the *Utilities Commission Act*; including any affiliates; an entity that has as its primary business or purpose generation and sale of electricity, including independent power producers (IPPs); an entity that takes only back-up or start-up electricity service from BC Hydro. [back]

10. **Behind a BC Hydro Customer Load** means a Project with an Indirect Interconnection through a facility that purchases power from BC Hydro. [back]

11. **Clean Energy** means energy that is generated from a Clean or Renewable Resource. [back]

12. **Clean Energy Act** means the *Clean Energy Act,* SBC 2010, c. 22, as amended from time to time. [back]

BC Hydro
Power smart

13. **Clean or Renewable Resource** has the meaning given in the *Clean Energy Act* and regulations from time to time which at the date of publication of the Rules is biomass, biogas, geothermal heat, hydro, solar, ocean, wind or any biogenic waste, waste heat and any additional prescribed resources. [back]

14. **Commercial Operation Date ("COD")** has the meaning given in the Standard Form EPA. [back]

15. **Commercial Operation Generation Technology** means that the generation technology is readily available in commercial markets and in commercial use (not demonstration use only), as evidenced by at least one generation plant (which need not be owned or operated by the Developer) generating energy for a period of not less than one year, to a standard of reliability generally required by Good Utility Practice (as defined in the Standard Form EPA). [back]

16. **Common Generation Facility** – see definition of "Project Cluster and Common Generation Facilities". [back]

17. **Completed Prototype Generation Technology** means that the generation technology has completed a program of testing, with satisfactory results, using a sub-scale or full-scale prototype of the technology to simulate real-world conditions, which sufficiently demonstrates technical viability and safe performance of the technology at full-scale and under real-world conditions, as evidenced by the certification of a professional engineer (or equivalent engineering designation) registered or licensed in a jurisdiction that regulates the practice of engineering. [back]

18. **CPI** means the British Columbia Consumer Price Index, All Items (Not Seasonally Adjusted) as published by Statistics Canada or any successor agency thereto. [back]

19. **Day** means any calendar day including Saturday, Sunday or British Columbia statutory holiday. [back]

20. **Demand Side Management** means actions that modify customer demand for electricity, helping to defer the need for new energy and capacity supply additions. [back]

21. **Developer** means the developer or owner of a Project that submits an Application under the SOP. [back]

22. **Discretion** (whether or not capitalized) means sole, absolute and unfettered discretion unless the Rules expressly state otherwise. [back]

23. **Distribution System** means the distribution, protection, control and communication facilities in British Columbia that are or may be used in connection with, or that otherwise relate to, transmission of electrical energy at 35 kV or less and that are owned by BC Hydro, and includes all additions and modifications thereto and repairs and replacements thereof. [back]

24. **Energy Volume Target** means the target in GWh that BC Hydro will set from time to time for the annual amount of energy to acquire from the SOP and Micro-Standing Offer Program. [back]

BC Hydro
Power smart

25. **Environmental Attributes** has the meaning given to that term in the Standard Form EPA. [back]

26. **EPA** means an electricity purchase agreement offered to a Developer under the Standing Offer Program. [back]

27. **Facilities Study** means a detailed interconnection study that consists of a project plan which includes the detailed design for the network upgrades required for interconnection, and specifies and estimates the cost of the equipment, engineering, procurement and construction work required to implement the conclusions of the System Impact Study. [back]

28. **GJ** means gigajoule. [back]

29. **Greenhouse Gas or GHG** means: (i) one or more of the following gases: carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride; and (ii) any other gas that is identified as having significant global warming potential and is added, at any time before the expiry of the Term, to Schedule 1 to the *Canadian Environmental Protection Act, 1999*, or to the *Greenhouse Gas Reduction Targets Act* (British Columbia), or to any other regulation(s) governing the emission of the gases noted in (i) from the Project. [back]

30. **Indirect Interconnection** means the indirect interconnection of a Project to the Distribution System or Transmission System through (i) a configuration involving generating equipment interconnected through a BC Hydro customer facility, or (ii) a private transmission line or distribution line owned by a party other than the proposed Seller under the EPA, such as an existing independent power producer, or (iii) a public utility transmission/distribution system owned and operated by any party other than BC Hydro, such as the FortisBC system; or (iv) a transmission/distribution system that is owned by the proposed Seller under the EPA or one of its affiliates that transmits energy in addition to the energy generated by the Project. [back]

31. **Integrated System** means the Transmission System and the Distribution System, both within British Columbia, excluding the Fort Nelson service area and certain remote areas where electricity supply is provided by local generation which is isolated from the provincial transmission system. [back]

32. **Integrated System Area** means that part of British Columbia within which Projects may be connected directly to the Integrated System as determined by BC Hydro Generator Interconnections. [back]

33. **Interconnection Agreement** means an agreement with BC Hydro for the interconnection of the Project to the BC Hydro Distribution System or Transmission System**.** [back]

34. **Interconnection Network Upgrades or INU** means those additions, modifications and upgrades to the Transmission System or Distribution System identified in the interconnection study (and as further refined in subsequent interconnection studies) determined by BC Hydro to be “interconnection network upgrades” under the applicable policies of BC Hydro or under the OATT in effect from time to time. [back]

BC Hydro
Power smart

35. **Interconnection Network Upgrade Costs or INU Costs** means all costs for the design, engineering, procurement, construction, installation and commissioning of Interconnection Network Upgrades. See Section 5.9 of the Rules. [back]

36. **Interconnection Network Upgrade Threshold or INU Threshold** means $157.59 (2016$) per kilowatt of Plant Capacity as defined in Appendix 2 of the EPA or the Maximum Power Injection, whichever is lower. [back]

37. **kV** means kilovolt**.** [back]

38. **kW** means kilowatt. [back]

39. **Load Displacement** means a reduction in electricity sales by the electricity provider to the customer due to electricity conservation or customer self-generation, although the customer's pattern of peak and off-peak periods (load shape) may not have changed. [back]

40. **Maximum Power Injection** means the maximum amount of power the Project can inject on the Distribution System, expressed in MW, as specified by BC Hydro Generator Interconnections. [back]

41. **MVA** means megavolt ampere. [back]

42. **MW** means megawatt. [back]

43. **MWh** means megawatt-hour. [back]

44. **Nameplate Capacity** means the aggregate of the nameplate capacities of all the generators included in the Project. For each generator, nameplate capacity is expressed in MW and consistent with the equipment manufacturer's maximum rated generating capacity. Where the nameplate capacity is expressed in MVA, the nameplate capacity will be multiplied by the power factor stated on a generator's nameplate to determine the nameplate capacity in MW. [back]

45. **Net-of-Load** means that, in a given hour, only the generation (MWh) produced by a Developer (including a BC Hydro Customer) that is in excess of the energy consumed (MWh) by a BC Hydro Customer during the same hour will be eligible for sale to BC Hydro under the EPA at the prevailing SOP price ($/MWh). [back]

46. **Network Integration Transmission Service Study** has the meaning given in the OATT. [back]

47. **Network Upgrade Security or NU Security** means a letter of credit in the amount described in Section 5.11 of the Rules, in the form found on the Documents page of the SOP Website, with such modifications as approved by BC Hydro in writing and issued and advised as required under Section 5.11 of the Rules. [back]

48. **Open Access Transmission Tariff or OATT** means the tariff that governs both wholesale transmission services and generator interconnection services offered by BC Hydro to its customers. [back]

BC Hydro
Power smart

49. **Plant Capacity** means the Nameplate Capacity of the generators for a new project or a portion of the Nameplate Capacity of the generators that is allocated to the SOP where a new generator is added to existing project, expressed in MW. [back]

50. **Point of Interconnection or POI** means:

a. for a Project with a direct interconnection to the Distribution System or the Transmission System, the point at which the Project interconnects with the Distribution System or Transmission System;

b. for a Project with an Indirect Interconnection through a BC Hydro Customer facility, the point at which the customer's load interconnects with the Distribution System or Transmission System; or

c. for a Project with an Indirect Interconnection through: (i) a private transmission or distribution line owned by a party other than the proposed Seller under the EPA; or (ii) a public utility transmission/distribution system owned and operated by any person other than BC Hydro, or (iii) a transmission or distribution system owned by the Seller or any of its affiliates that transmits energy in addition to the energy generated by the Project, the point at which the private line or the public utility line interconnects with the Distribution System or Transmission System, as specified in the EPA. [back]

51. **Project** means an electrical generation facility and includes all land and interests in land, buildings, equipment and material related to the generation facility as required for the generation and delivery of electrical energy to the point of delivery under the EPA. In the case of a Project that consists of incremental new generation, the "Project" for the purposes of the SOP consists of the new generator(s) and related facilities that are added to an existing generating facility. [back]

52. **Project Cluster and Common Generation Facilities:**

a. A Project Cluster means two or more existing or proposed Projects that BC Hydro determines in its discretion are so closely related to each other that they should be considered a project cluster for the purposes of the SOP.

   BC Hydro will generally determine that a Project Cluster exists where the existing or proposed Projects have the following characteristics (although BC Hydro may conclude otherwise in its discretion): (i) have common direct or indirect ownership or control; (ii) have common development timelines; (iii) are being developed by the same or an affiliated developer; (iv) are located in close proximity (e.g., in same watershed); and/or (v) share any tenures, permits, facilities or other infrastructure such as roads, power lines, interconnection facilities or POI. Projects with common development timelines that are in close proximity may be considered as a Project Cluster despite having separate majority owners.

b. A Common Generation Facility means the Project together with any other existing or proposed generator that BC Hydro determines in its discretion is so closely connected

with, or related to, the Project that the Project and the other existing or proposed generator should be considered a single generation facility for the purposes of the SOP.

BC Hydro will generally determine that a Common Generation Facility exists where a Project together with another existing or proposed generator have the following characteristics (although BC Hydro may conclude otherwise in its discretion): (i) are located on the same site or in close proximity to each other and use the same fuel source; (ii) share common facilities and infrastructure; and/or (iii) the energy generated is metered by a single Revenue Meter.

BC Hydro may determine that a Project Cluster or a Common Generation Facility exists even if there are no shared tenures, permits, ownership, facilities or other infrastructure. This situation would arise if BC Hydro considers in its discretion that such separation was put in place for the purpose of meeting the SOP eligibility requirements.

There may be certain exceptional cases where, notwithstanding the existence of limited shared infrastructure, BC Hydro may determine, in its discretion that a Project Cluster or a Common Generation Facility does not exist.

Furthermore, there may be some instances where BC Hydro may require two or more Projects or generators to share interconnection facilities and/or a POI in order to provide BC Hydro with technical or other benefits. In such cases, BC Hydro will use its discretion to determine whether the Projects or generators are eligible to apply under the SOP notwithstanding the shared infrastructure.

The foregoing does not limit the circumstances in which BC Hydro may in its discretion determine that a project cluster exists. [back]

53. **Protected Area** has the meaning given in British Columbia's *Clean Energy Act* which at the date of publication of the Rules is: (a) a park, recreation area, or conservancy, as defined in section (1) of the *Park Act*; (b) an area established under the *Environment and Land Use Act* as a park or protected area, or (c) an area established or continued as an ecological reserve under the *Ecological Reserve Act* or by the *Protected Areas of British Columbia Act*. [back]

54. **Reference Documents** means the documents listed in Section 9 of the Rules. [back]

55. **Revenue Meter** means a meter that measures energy output and/or consumption for purposes of calculating payments under an EPA and that meets the requirements specified in the EPA. [back]

56. **Rules** has the meaning given in Section 1 of the Rules.

57. **Seller** means a Developer that enters into an EPA with BC Hydro. [back]

58. **SOP** means the Standing Offer Program as described in these Rules. [back]

59. **SOP Administrator** means the person appointed by BC Hydro to act as the SOP Administrator as described in Section 4 of these Rules.

60. **Standard Form EPA** means the Standard Form Electricity Purchase Agreement for the Standing Offer Program available at www.bchydro.com/standingoffer. [back]

61. **Standing Offer Program ("SOP")** means the Standing Offer Program as described in these Rules.[back]

62. **Standing Offer Program Website** means the website with respect to the Standing Offer Program located at www.bchydro.com/standingoffer. [back]

63. **Start-up** means a "black start" or "cold start" of generation facilities, from the time when fuel is first combusted until the time when generation is stabilized. [back]

64. **Start-up Fuel** means that quantity of Auxiliary Fuel, expressed in GJ, used in a Start-up. [back]

65. **Statement of Project Changes** has the meaning given in Section 4.3.3 of the Rules. [back]

66. **System Impact Study** means a detailed interconnection study which evaluates the impact of a proposed Project on the reliability of BC Hydro's system and provides a planning-level estimate of the interconnection costs and Interconnection Network Upgrades. [back]

67. **Target Commercial Operation Date or Target COD** means the date when the Developer expects the Project to achieve COD as specified by the Developer in the Application. [back]

68. **Term** means the term of the EPA as specified by the Developer in the Application. [back]

69. **Transmission Network Upgrades or TNU** means those additions, modifications and upgrades to the Transmission System identified in the Network Integration Transmission Service Study as determined by BC Hydro.

70. **Transmission Network Upgrade Costs or TNU Costs** means all costs incurred by BC Hydro after an EPA is entered into for the design, engineering, procurement, construction, installation and commissioning of Transmission Network Upgrades. [back]

71. **Transmission System** means the transmission, substation, protection, control and communication facilities (transmitting energy at voltages greater than 35 kV) owned and operated by BC Hydro in British Columbia, and includes all additions and modifications thereto and repairs or replacements thereof. [back]

Contractor standards for ethical conduct

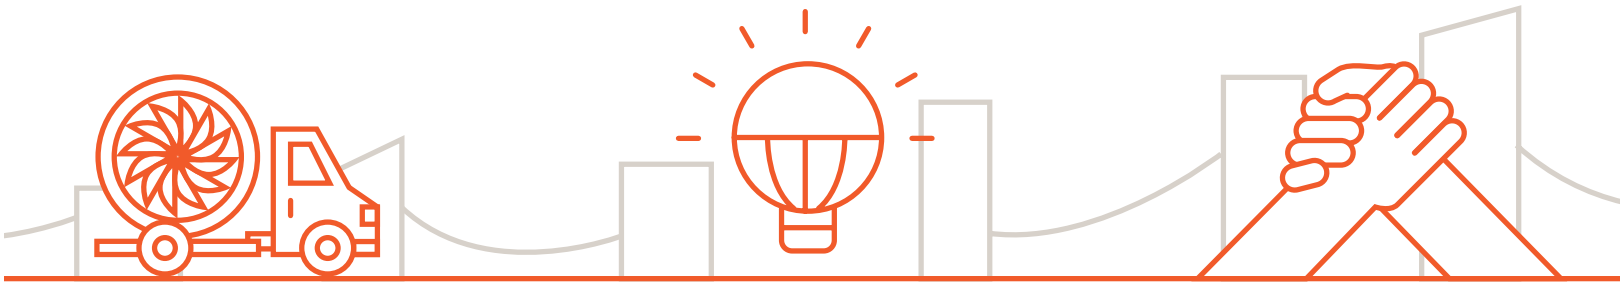
In these Standards:

"**BC Hydro**" means BC Hydro and Power Authority or any of its subsidiaries that has entered into the Contract.

"**Contract**" means a contract with BC Hydro in which these Standards are included directly or by reference as a term or condition.

"**Contractor**" means the contractor, consultant, supplier or business associate who has a Contract.

"**Owner**" means any person who, individually or together with relatives, directly or indirectly owns 20% or more of the voting rights of the Contractor.



February 2016

BC Hydro
Power smart

1. At all times in the course of its performance of the Contract, the Contractor will conduct itself with fairness, integrity and honesty.

2. At all times during the term of the Contract, the Contractor will avoid any actual, or apparent conflict of interests, in which its interests outside of the Contract (including any engagements the Contractor may have with third parties), and its obligations to BC Hydro under the Contract and these Standards conflict.

3. The Contractor will promptly disclose to BC Hydro in writing, to the best of its knowledge, any actual or apparent conflicts between its interests and those of BC Hydro during the term of the Contract, including:

   (a) the name of any current director or employee of BC Hydro who is an Owner, or representative of the Contractor;

   (b) any business relationship that the Contractor or any of its Owners or officers has with a director or officer of BC Hydro or with an employee of BC Hydro who may have actual or apparent involvement in any BC Hydro procurement process, or the Contract; and

   (c) the name of any director or employee of BC Hydro who is connected by frequent or close association to the Contractor, any of its Owners or officers, or any representatives of the Contractor who may have actual or apparent involvement in any BC Hydro procurement process, or the performance or administration of the Contract.

   For the purposes of this section, BC Hydro's interests include non-economic considerations such as reputation.

4. In addition to disclosure required above, the Contractor will take any steps reasonably required by BC Hydro to address or mitigate any actual or apparent conflict of interest.

5. Subject to the terms of the Contract, the Contractor will keep confidential all non-public, confidential information provided to it by BC Hydro or developed during performance of the Contract. The Contractor will not use that information for any purpose unrelated to performance of its obligations under the Contract.

6. If BC Hydro gives the Contractor access to any BC Hydro property during the term of the Contract, the Contractor will use that property solely for purposes of the Contract.

7. The Contractor will not attempt to secure preferential treatment with BC Hydro by offering gifts, entertainment, or benefits to BC Hydro directors or employees. Reasonable gifts, entertainment, or benefits common to business relationships, as described in the BC Hydro Code of Conduct, are acceptable.

8. Unless the Contractor has the express permission of BC Hydro, the Contractor will not solicit or recruit any BC Hydro employee during the term of the Contract. This obligation doesn't prevent the Contractor from hiring a BC Hydro employee who responds to a public and broadly issued job advertisement without prompting or encouragement from the Contractor.

9. The Contractor must treat its employees and subcontractors performing work under the Contract respectfully and in a manner free of discrimination and harassment. The Contractor will provide those employees, and subcontractors with a safe and healthy workplace.

10. The Contractor and its employees and subcontractors must treat individuals they encounter in the course of performing work under the Contract respectfully and in a manner free of discrimination and harassment.

11. When the Contractor is participating in any public discussions or taking a position of leadership in other organizations, it must not represent itself as a spokesperson of BC Hydro unless BC Hydro has specifically retained or instructed the Contractor to act in that capacity.

Contractors who would like further information or advice on the application of these Standards are encouraged to speak to BC Hydro's contract representative.

A Contractor's failure to adhere to the provisions of these Standards may be a breach of Contract and could result in termination of the Contract.

BC Hydro Distributed Generation Interconnection Practices (distribution-connected projects only**)

	Program Type	Interconnections					
		Size	Required Studies	Study Costs	Agreements	Customer Upgrades	Interconnection and System Upgrades
BC Hydro Offered Programs – Clean or Renewable Generation	**Net Metering (RS 1289)** • open to BC Hydro customers • load displacement plus NM energy price paid for annual excess • tariffed process (Rate Schedule 1289)	0 kW to 50 kW	Simple Net Metering: None Required[1] Complex Net Metering: Technical screen	$0[2]	No Interconnection Agreement (terms and conditions are in RS 1289)	Customers are required to upgrade their service at their cost.	System upgrades are paid by BC Hydro
		Over 50 kW to 100 kW	Technical screen[3]	Incremental costs[4]			System upgrades are paid by the Customer[5]
	Micro-SOP • for First Nations and community projects • single energy price for all energy • simplified Electricity Purchase Agreement	Over 100 kW to 1 MW	Basic Distribution Information Request.	First two requests per year – free. Additional requests - $200	Simplified Interconnection Agreement	Customers are required to upgrade their service/build their interconnection facilities at their cost.	• Customers will provide a deposit of $7,500 with their Distribution Micro-Generator Project Design Application, which will be refunded when we receive the security (Letter of Credit) for the estimated network upgrade costs. • Customers provide security (Letter of Credit) in the amount of the estimated network upgrades costs. • BCH covers $150,000 per MW of installed capacity. • Reduction of security is governed by the applicable Interconnection Agreement. See also Interconnection Security Methodology posted at https://www.bchydro.com/accounts-billing/new-electrical-connections/generator-interconnections.html • Network upgrades costs and construction schedules are project-specific. Estimates of costs and schedules will be provided in the design stage during the interconnection process.
			Screening Study If the project passes the screens in the Screening Study, then the project proceeds to the next step: the Distribution micro-generator project design stage application form. If the project fails the screens in the Screening Study, then the project proceeds through the standard generator interconnection process.[6]	$5,000 flat fee $7,500 deposit Deposit is refunded when Letter of Credit (LOC) is received for the network upgrades			
	SOP • open to clean energy producers and BC Hydro customers (net of load) • energy price varies at time of delivery • Electricity Purchase Agreement	Over 1 MW to 15 MW	Basic Distribution Information Request	First two requests per year – free. Additional requests - $200	Standard Interconnection Agreement		
			Screening Study (optional)	$5,000 flat fee			
			System Impact Study	$20,000 - $80,000[7]			
			Facilities Study	$40,000 - $175,000[7]			
Other	**Other Customer Generation Projects** • for projects that do not fit into programs above • open to research, pilot/educational projects, projects generating intermittent energy as a result of existing industrial process • no payment for energy	Up to 100 kW	Technical Screen	Same as Net Metering Incremental costs[4]	Simplified Interconnection Agreement	Customers are required to upgrade their service at their cost.	• Customers provide advanced payment in the amount of the estimated network upgrades costs. Final costs are based on actuals. • Network upgrades costs and construction schedules are project-specific. Estimates of costs and schedules will be provided in study reports during the interconnection process.
		Over 100 kW to 1 MW	Same as Micro-SOP	Same as Micro-SOP	Simplified Interconnection Agreement	Customers are required to upgrade their service/build their interconnection facilities at their cost.	
		Over 1 MW to 15 MW	Same as SOP	Same as SOP	Standard Interconnection Agreement		

* This table is intended as an overview of current practices only. Project-specific requirements may vary.

** Interconnection requests for transmission-connected projects follow the Standard Generator Interconnection Procedures found in Appendix M-2 of BC Hydro's Open Access Transmission Tariff (OATT). For more information, see https://www.bchydro.com/accounts-billing/new-electrical-connections/transmission-generator-interconnections.html

1 Basic technical screen – no detailed studies. For areas of high penetration, BC Hydro may reject project.

2 For synchronous generators and customers connected at a primary potential and customers with generating facilities with a nameplate rating greater than 50 kW, customers are responsible for incremental costs.

3 Technical Screen scope for DG >50 kW includes a review of power flows and BC Hydro equipment ratings, a comparison of generator size to minimum feeder section load, a check of total generation on the feeder, and a short circuit study and protection review.

4 Typical range of interconnection review costs for Net Metering applications up to 50 kW, other than at primary potential or with synchronous generators:

Project Type	Technical Review
Simple Projects	Minimal
Complex Projects	$500-$1,000

5 Costs are dependent on location, generator size, feeder available capacity, condition/limitations of the substation. Note: There are no pioneer rights.

6 Projects that fail any of the screens will be required to complete the System Impact Study and/or Facilities Study.

7 Costs may be less or greater depending on project specifics.

Pre-Application Meeting Request Form

Thank you for your interest in the Micro- SOP or Standing Offer Program. To ensure that the meeting is productive and to help us respond to your questions, please complete the following.

Project Information

Developer Name: _____

Project Name: _____

Nearest Community: _____

The approximate latitude and longitude of the project site is (in degrees minutes seconds)

Latitude: 99°99'99" North Longitude: 999°99'99" West

Potential point of interconnection (if known):

_____

Interconnecting to (if known): _____

Approximate size of the Project: _____ ◯ kW ◯ MW _____ GWh/yr

Generation technology the Project will use: _____

Describe if "Other": _____

Target application date: YYYY-MMM-DD Target commercial operation date: YYYY-MMM-DD

Meeting Information

Please check the box(es) corresponding to the topic(s) that you would like to discuss at the pre-application meeting and, if applicable, include questions in the space provided.

☐ Application Process

Questions: _____

☐ Eligibility Requirements

Questions: _____

☐ Interconnections

Questions: _____

☐ Permitting

Questions: _____

☐ First Nations consultation requirements

Questions: _____

Other questions you would like addressed:

_____

Names and positions of meeting participants:

_____

Please indicate how you would prefer to meet:

◯ a meeting at BC Hydro's corporate headquarters in downtown Vancouver

◯ a conference call

Please provide a selection of preferred dates and times for the meeting:

Standing Offer Program Application Form

Revised: August 2016

General Instructions

- Words and phrases used in this Application Form and defined in the Rules have the meanings given in the Glossary to the Rules, unless otherwise defined herein.
- To complete the Application Form, fill out each field that is represented by a blue box. Use drop down menus to make selections, where provided.
- A Developer should be fully responsive to each instruction, as applicable to the Developer and its Project. If a Developer is in any doubt as to the requirements contained in these instructions, it should seek clarification from the SOP Administrator at the address specified in Section 8 of the Rules.
- When completed, name the Application Form "Application" and save in Adobe ("PDF") format for inclusion in the electronic copy of your Application submission.

  Name the Exhibits according to the labelling of Exhibits in the Application Form and save the Exhibits in PDF, MS Excel or MS Word format for inclusion in the electronic copy of your Application submission. Insert "N/A" for Exhibits not applicable to your Project.
- BC Hydro reserves the right to request additional information in relation to any information requested in this Application Form.

Application Submission Instructions

To apply for the Standing Offer Program, the Developer must submit the following:

- a scanned copy of the completed Standing Offer Program Application signed by the Developer with applicable Exhibits, in electronic form; and
- a scanned copy of the completed Confidentiality and Compliance Agreement signed by the Developer (if not previously submitted with a pre-application meeting or preliminary assessment request);

  by email to the SOP Administrator at standing.offer@bchydro.com or delivered on one (1) disk or USB flash drive to:

  BC Hydro
  Standing Offer Program
  17th Floor, 333 Dunsmuir Street

1. Developer

1.1 Developer Information

Project name:				
Developer's full legal name:				
Address:	City:	Province/State:	Country:	Postal/Zip Code:
Developer / Project website address:				

Main Contact Person
(All Correspondence and Agreements will be sent to the Main Contact Person)

First name:	Last name:	
Title:	Email:	
Phone:	Alternate phone:	Fax:

Alternate Contact Person (optional)

First name:	Last name:	
Title:	Email:	
Phone:	Alternate phone:	Fax:

1.2 Developer Identity

Form of organization (e.g., corporation, general partnership, limited partnership, joint venture, local government, public institution, etc.):		Is the Developer a Public Utility, as defined in Section 2.7 of the Rules?
Jurisdiction in which the Developer is incorporated or formed:	Date of incorporation or formation: YYYY-MMM-DD	Incorporation (or similar) number:
Date of registration in British Columbia: YYYY-MMM-DD	Registration number:	

For a limited partnership, general partnership, joint venture or other entity with more than one member, provide the same information with respect to each member of the above entity. Use the "Add a Member" button opposite this text to add additional "member" sections.

Member Details

Member's full name:
Form of organization (e.g., corporation, general partnership, limited partnership, joint venture, local government, public institution, etc.):

Jurisdiction in which the Member is incorporated or formed:	Date of incorporation or formation: YYYY-MMM-DD	Incorporation (or similar) number:
Date of registration in British Columbia: YYYY-MMM-DD		Registration number:

1.3 Project Ownership Structure

Provide an organization chart that shows all direct and indirect owners to the ultimate controlling owner(s) of the Project.

☐ Included and named Exhibit 1.

1.4 Project Team

Provide a list of Project development team members including key outside contractors and consultants. Add additional rows if necessary.

Team Member	Role

1.5 Conflict of Interest

As required under BC Hydro's Contractor Standards for Ethical Conduct, the Developer must provide on its own behalf and on behalf of each member of the Developer's team a declaration in relation to the potential to be in an actual, apparent or deemed conflict of interest as a result of entering into an EPA with BC Hydro, as described in Section 2.14 of the Rules.

Complete the Conflict of Interest Statement form found on the Documents page of the SOP Website.

☐ Included and named Exhibit 2.

BC Hydro
Power smart

2.Project Information

2.1 Project Description

a) Provide a short, general description of the Project:

b) Provide the Nameplate Capacity of each new generator.

Add additional rows if necessary.

Generator(s)	
1	MW

Total: 0 MW

Comments:

c) Location

Project region: Nearest community:

The approximate latitude and longitude of the project site is (in degrees minutes seconds):

Latitude: 99°99'99" North Longitude: 999°99'99" West

Provide the parcel identifier number for all legal parcels on which the Project will be located:

Parcel Identifier Number	Ownership Status	Describe if "Other"

Provide a geographical map of the Project location.
☐ Included and named Exhibit 3.

Provide the expected layout of the key facilities comprising the Project.
☐ Included and named Exhibit 4.

Is the Project described in the Application located on the same site or in the vicinity of a Project Cluster or Common Generation Facility?

Does the Project share any facilities with a Project Cluster or Common Generation Facility?

If "Yes" to either of the above two questions:

i) Does any project that is part of a Project Cluster or Common Generation Facility have an EPA with BC Hydro or another party?

BC Hydro
Power smart

ii) Complete Project Clusters and/or Common Generation Facilities - Supplementary Information available on the Documents page of the SOP Website.

☐ Included and named Exhibit 5.

Is any part of your Project located in a Protected Area, as defined in the Glossary to the Rules? ☐

Does any part of the Project require access to a BC Hydro right of way? ☐

d) The Target COD for the project is: YYYY-MMM-DD
Please refer to www.bchydro.com/standingoffer for information on available energy volume under the target for your target COD year, and on the target management process.

e) The Term of the EPA for the Project is ☐ years.

f) Provide the Project schedule.
☐ Included and named Exhibit 6.

g) Total estimated Project energy.

Month	Average monthly energy output (MWh)
January	
February	
March	
April	
May	
June	
July	
August	
September	
October	
November	
December	
Total:	

Provide calculations supporting the average monthly energy output.
☐ Included and named Exhibit 7.

h) Project Type
The energy delivered to BC Hydro under the EPA must be Clean Energy. Select the Project type:

☐ Biogas ☐ Ocean - tidal

- ☐ Biogenic waste
- ☐ Biomass
- ☐ Geothermal heat
- ☐ Hydro
- ☐ Ocean - wave
- ☐ Solar
- ☐ Waste heat
- ☐ Waste hydrogen
- ☐ Wind

☐ Other prescribed resource. Describe:

i) Fuel

Complete the table for all fuel types used in the Project:

Fuel	Describe if "Other"	% of annual fuel [1]
	Total:	0

[1]The percentages should total to 100%, including Start-up Fuel.

If there is any fuel listed above that qualifies as Auxiliary Fuel as defined in the Glossary to the Rules, provide the % amount of annual fuel that is used for Start-up: ☐ %

j) Are all Environmental Attributes owned by the Developer? ☐

BC Hydro may request further information to verify ownership of Environmental Attributes.

k) For biogas, landfill gas control systems, and other similar projects, are there any GHG reduction rights associated with the project? ☐

If "Yes", describe: (BC Hydro may request further information to verify GHG reduction claims.)

2.2 Generation Technology

a) Describe the complete generation process that converts raw fuel into electricity. If necessary, include diagrams in Exhibit 8.

☐ Included and named Exhibit 8.

b) Is your technology considered a Commercial Operation Generation Technology or a Completed Prototype Generation Technology as defined in the Glossary to the Rules?

If Commercial Operation Generation Technology, go to c), if Completed Prototype Generation Technology, go to d).

c) Commercial Operation

Describe how the generation technology meets the requirements of Commercial Operation Generation Technology as defined in the Glossary to the Rules:

Provide the location and date of initial operation for at least one generation plant that is using the same generation technology proposed for the Project:

Date of initial operation: YYYY-MMM-DD

d) Completed Prototype

Describe how the generation technology meets the requirements of Completed Prototype Generation Technology, as defined in the Glossary to the Rules:

Complete Completed Prototype Generation Technology Certification form available on the Documents page of the SOP Website.

☐ Included and named Exhibit 9.

2.3 Generation Type

Is the Project described in the Application located Behind a BC Hydro Customer Load?

If "Yes", provide the following information:

Facility Name:

Customer Name:

Customer Account Number:

Describe the involvement of the BC Hydro customer in the Project:

Provide Electricity or Energy Service Agreement.

☐ Included and named Exhibit 10.

2.4 Existing and Previous Electricity Purchase Agreements

a) Is the Project currently subject to an EPA with BC Hydro?

b) Has the Project ever previously been subject to an EPA with BC Hydro?

If "Yes", describe and provide the effective date of termination of the EPA: YYYY-MMM-DD

Did the Project reach commercial operation while the EPA was in effect?

c) Is the Project currently subject to an EPA with a party other than BC Hydro?

If "Yes", describe and provide the EPA (pricing information may be kept confidential).

☐ Included and named Exhibit 11.

BC Hydro
Power smart

2.5 BC Hydro Incentives

Has any of the energy offered for sale under the SOP received, or will it receive, funding through a Load Displacement or Demand Side Management ("DSM") program with BC Hydro or otherwise become available due to funding by BC Hydro? ☐

If "Yes", provide information relating to the funding, including any relevant agreements.

☐ Included and named Exhibit 12.

2.6 Preliminary Assessment

Has BC Hydro completed a preliminary assessment of the Project and/or the Developer as described in Section 4.1 of the Rules? ☐

BC Hydro
Power smart

3.Permits, Site Control and Zoning

The Developer must comply with all laws, statutes and regulations relating to the Project whether federal, provincial and/or municipal and must obtain all permits, licenses and approvals required for the development, construction and operation of the Project. The following list is not a complete list of all permits, licenses and approvals required for any Project. Developers are solely responsible for determining the permitting and other legal requirements for their Projects.

The information provided by the Developer in response to this part of the Application should address all parts of the Project site (including all areas where the generating facility and related access roads, transmission lines and other Project facilities will be built).

BC Hydro may request the Developer to provide confirmation from the relevant regulatory authority that a permit or approval is not required for a Project.

KEY REQUIREMENT is indicated beside each relevant item in the list below. Key eligibility requirements must be in place and evidenced at the time of SOP Application submission or the Application will be rejected. All other permits applicable to the Project must be in place and evidenced before an Electricity Purchase Agreement is executed for the Project.

Indicate if the item listed below is applicable or not-applicable. Provide a copy of all of the applicable documents.

3.1 Federal Permits

a) Approval or exemption under section 5 of the *Navigation Protection Act*.
☐ Applicable and included and named Exhibit 13a.

b) Approvals under the *Fisheries Act* (including authorizations under section 35(2)(b) of the *Fisheries Act*) or a review demonstrating that such an approval is not required.
☐ Applicable and included and named Exhibit 13b.

c) Approvals under the *Aeronautics Act* and Canadian Aviation Regulations (e.g. lighting schemes, aeronautical safety for structures over 90 meters).
☐ Applicable and included and named Exhibit 13c.

d) Permit(s) or exemption(s) under the *Migratory Birds Convention Act* and Migratory Birds Regulations.
☐ Applicable and included and named Exhibit 13d.

e) Permit(s) or exemption(s) under the *Species at Risk Act*.
☐ Applicable and included and named Exhibit 13e.

f) **KEY REQUIREMENT** (for Projects that are reviewable under this Act) – Evidence of completion of assessment under the *Canadian Environmental Assessment Act 2012*, if applicable.
☐ Applicable and included and named Exhibit 13f.

3.2 Provincial Permits

a) Change approval under section 11 of the *Water Sustainability Act*.
☐ Applicable and included and named Exhibit 14a.

b) **KEY REQUIREMENT** (for hydro projects) – Licence under section 9 of the *Water Sustainability Act*.
☐ Applicable and included and named Exhibit 14b.

c) Permit(s) under section 14 or Operational Certificate(s) under section 28 of the *Environmental Management Act* (air, effluent and refuse, as required for the Project).
☐ Applicable and included and named Exhibit 14c.

d) Permit under section 12 of the *Heritage Conservation Act*.

☐ Applicable and included and named Exhibit 14d.

e) **KEY REQUIREMENT** (for geothermal projects) – Lease under section 8 of the *Geothermal Resources Act*.

☐ Applicable and included and named Exhibit 14e.

f) **KEY REQUIREMENT** (for Projects located on the Agricultural Land Reserve) – Permission under section 25 of the *Agricultural Land Commission Act*.

☐ Applicable and included and named Exhibit 14f.

g) Certificate issued under section 25 of the *Oil and Gas Activities Act*.

☐ Applicable and included and named Exhibit 14g.

h) Wildlife Management Area Permit (*Wildlife Act*, section 4) and/or permit under section 3 of the Permit Regulation (*Wildlife Act*) and/or Park Use Permit and/or Resource Use Permit (*Park Act*, section 20).

☐ Applicable and included and named Exhibit 14h.

i) **KEY REQUIREMENT** (for Projects that are reviewable under this Act) – Evidence of completion of assessment under the *British Columbia Environmental Assessment Act*, if applicable.

☐ Applicable and included and named Exhibit 14i.

3.3 Site Control

a) **KEY REQUIREMENT** (for Projects on Crown Land) – Lease, licence, right of way, easement and/or permit under the *Land Act* (B.C.), *Forest Act* (B.C.), *Transportation Act* (B.C.), Federal Real Property and *Federal Immovables Act*, *Canada Marine Act*, *Indian Act* or other provincial or federal legislation requiring land tenure for any aspect of the Project.

☐ Applicable and included and named Exhibit 15a.

b) **KEY REQUIREMENT** (for Projects on private land) – Copy of fee simple title, option to purchase, lease, licence, joint venture agreement or other contract granting occupancy rights for private land.

☐ Applicable and included and named Exhibit 15b.

c) Powerline sharing agreement if sharing powerline access with another entity.

☐ Applicable and included and named Exhibit 15c.

d) Where works are located on the foreshore, a letter of consent from the upland land owner permitting the infringement of their riparian rights; or, a copy of a Statutory right of way ceding those riparian rights to the applicant; or, copy of the fee simple title to the adjacent upland identifying it is owned by the applicant.

☐ Applicable and included and named Exhibit 15d.

e) **KEY REQUIREMENT** (for geothermal projects) – Permit under section 5 of the *Geothermal Resources Act* (B.C.).

☐ Applicable and included and named Exhibit 15e.

f) Lease under section 8 of the *Geothermal Resources Act* (B.C.)

☐ Applicable and included and named Exhibit 15f.

g) Where a Project's works are located within the right-of-way, access authorizations(s) under section 62 of the *Transportation Act* (B.C.).

☐ Applicable and included and named Exhibit 15g.

BC Hydro
Power smart

h) Where a Project's works are located within the right-of-way, Road Permit(s) or Road Use Permit(s) under Part 8 of the *Forest Act* (B.C.).

☐ Applicable and included and named Exhibit 15h.

i) Where a Project's works are located within the right-of-way, agreements where a third party's infrastructure is required or crossed (e.g., road, railway, pipeline, transmission line crossings).

☐ Applicable and included and named Exhibit 15i.

3.4 Zoning / Local Government - KEY REQUIREMENT

Except for those public utilities that meet the conditions in section 2 of the Public Utility Regulation (BC Reg. 174/2006) other than the condition in subsection 2(a) of that Regulation, provide the following:

a) Letter from applicable local government confirming that those lands on which Project facilities are located and that are subject to local government land use requirements are appropriately zoned for those facilities.

☐ Applicable and included and named Exhibit 16a.

b) Development Permit issued by municipality or local government.

☐ Applicable and included and named Exhibit 16b.

3.5 Supplementary Information

a) Are any of the permits, licenses and approvals for the Project under appeal or judicial review? ☐

If "Yes", describe: ☐

b) Is there any outstanding order, judgment, litigation or other proceeding with respect to the Project? ☐

If "Yes", describe: ☐

c) Is there any significant opposition to the Project? ☐

If "Yes", describe: ☐

4.Interconnection

a) Has a System Impact Study application been submitted to BC Hydro Generator Interconnections? ☐

b) Have any other interconnection studies been completed for this Project? ☐

If "Yes", provide the study identifier, for example DGI-DSC-13.03.02.

☐

c) Point of Interconnection (e.g. nearest substation), if known.

☐

d) Interconnection voltage level: ☐ kV

e) Interconnection to: ☐

f) Interconnection type: ☐

If "Indirect", describe: ☐

g) If the Project has an Indirect Interconnection:

i) Describe the proposed point of delivery of energy to BC Hydro on the Distribution System or the Transmission System.

ii) Provide a copy of the agreement that authorizes the Developer to transmit energy from the Project to the proposed point of delivery on the Distribution System or the Transmission System.

☐ Included and named Exhibit 17.

iii) Describe the proposed method of calculating the quantity of energy delivered to BC Hydro at the point of delivery described in the response to ii) above.

iv) Complete and sign Interconnection Disclosure Consent Form available on the Documents page of the SOP Website.

☐ Included and named Exhibit 18.

5.First Nations

Provide information on how it was determined which First Nations may require consultation. Provide any information or direction Crown permitting agencies have provided in respect of consultation with First Nations.

Describe all First Nation consultations and engagement conducted relative to the Project. Provide a copy of all executed agreements with First Nations with respect to the Project. Include any letters of support from First Nations for the Project, if available.

Provide information on the potential impact from the Project on Aboriginal rights and title, and information on how this assessment was reached.

Refer to Section 2.16 of the Rules for more information on the adequacy of First Nations consultation.

☐ All the foregoing included and named Exhibit 19.

6.Proposed Project-Specific Changes to Standard Form EPA

Proposed changes to the Standard Form EPA are as follows:

EPA Section	Proposed Wording Change	Rationale

7.Representations, Warranties and Covenants

The Developer represents, warrants, and covenants with BC Hydro as follows and understands that BC Hydro is relying on these representations, warranties and covenants in deciding whether to offer an EPA to the Developer:

7.1 The Developer has reviewed carefully and fully understands the Rules, the Standard Form EPA and all related documents posted to the Standing Offer Program Website and has taken legal, accounting, engineering and other professional advice as the Developer considers necessary for it to understand its rights and obligations under the EPA if an EPA is offered to the Developer.

7.2 In preparing and submitting this Application, the Developer has not relied on any information given to it by BC Hydro, whether orally, in writing, electronically or in any other form whatsoever, except information disclosed in the Rules, the Standing Offer Program Website or advised in writing by the SOP Administrator.

7.3 In consideration for BC Hydro reviewing the Developer's Application, the Developer agrees to the terms, conditions and exclusions and limitations of liability set out in the Rules in effect at the time the Application was submitted, including without limitation those contained in Section 7 of the Rules, regardless of whether the Application is accepted, rejected or otherwise returned to the Developer.

7.4 The information contained in the Application is true and correct in all material respects and there is no material information omitted from the Application that makes the information in the Application misleading or inaccurate in any material respect.

7.5 The Developer is duly incorporated, organized, validly existing and in good standing under the laws of the jurisdiction of its incorporation, is registered or otherwise lawfully authorized to carry on business in British Columbia, and has full power, capacity and authority to own its assets and to carry on its business as now conducted and to enter into and to perform its obligations under the EPA if an EPA is offered to the Developer. If the Developer is a joint venture or partnership, this representation is true and correct for each of the participants in the joint venture or partnership.

7.6 No actions have been taken or authorized by the Developer or any other person to initiate proceedings for, or in respect of, the bankruptcy, insolvency, liquidation, dissolution or winding-up of the Developer or to appoint a receiver, liquidator, trustee or assignee in bankruptcy in respect of the Developer.

7.7 No appropriation, expropriation or seizure of all or any portion of the Project, or the assets required to construct, operate or maintain the Project, is pending or threatened.

7.8 Neither the signing of the EPA, nor the carrying out of the Developer's obligations under the EPA will: (i) constitute or cause a breach of, default under, or violation of, the constating documents or bylaws of the Developer, any permit, franchise, lease, license, approval or agreement to which the Developer is a party, or any other covenant or obligation binding on the Developer or affecting any of its properties, (ii) cause a lien or encumbrance to attach to any of the assets included in the Project (as defined in the Standard Form EPA), other than a security interest granted in respect of financing the design, construction or operation of the Project, or (iii) result in the acceleration, or the right to accelerate, any obligation under, or the termination of, or the right to terminate, any permit, franchise, lease, license, approval or agreement related to the Project.

7.9 In consideration for BC Hydro reviewing the Developer's Application, the Developer agrees that: (A) BC Hydro has no liability to the Seller or any affiliates of the Seller for any failure by BC Hydro prior to the effective date of an EPA to adequately consult with, and/or accommodate, any First Nations in relation to: (i) any decision to offer or not to offer an EPA to the Developer, (ii) the Project, (iii) the Seller's Plant, or (iv) the interconnection of the Seller's Plant to the Transmission System or the Distribution System (excluding matters arising on BC Hydro's side of the point of interconnection to the Transmission System or Distribution System); and (B) BC Hydro's liability, if any, for any failure by BC Hydro after the effective date of an EPA to adequately consult with, and/or accommodate any First Nations in relation to the foregoing matters will be determined in accordance with the EPA as if it was still in effect notwithstanding any expiry, termination, declaration by any order of a court or regulatory authority that the EPA is invalid, void or unenforceable, or any other means by which the EPA ceases to be in effect.

7.10 The Developer has read carefully, and it is in compliance with, the BC Hydro Contractor Standards for Ethical Conduct which is current at the time of the Application. The BC Hydro Contractor Standards for Ethical Conduct is available on the Standing Offer Program Website.

Exhibit 2

Conflict Of Interest Statement Form

[Form of disclosures required under BC Hydro's Contractor Standards for Ethical Conduct and any potential conflict of interests with BC Hydro, or BC Hydro's directors, officers or employees. Include and name Exhibit 2.]

Project Name: _____

Developer Name: _____

The Developer declares on its own behalf and on behalf of each member of the Developer's team that:

a) this declaration is made to the best of the knowledge of the Developer and, with respect to relationships of each member of the Developer's team, to the best of the knowledge of that member;

b) the Developer and the members of the Developer's team have reviewed the Contractor Standards for Ethical Conduct; and

c) the following is:

1) a full disclosure of all members of the Developer's team who were employees of BC Hydro at any time during the previous two year period from the date of this disclosure;

2) a full disclosure of all known relationships the Developer and each member of the Developer's team has, or has had, with:

i) BC Hydro;

ii) any current employees, shareholders, directors or officers, as applicable, of BC Hydro;

iii) any former shareholders, directors or officers, as applicable, of BC Hydro, who ceased to hold such position within two years from the date of this disclosure; and

iv) any other person who, on behalf of BC Hydro, has participated in or been involved in the design of the Standing Offer Program or any past BC Hydro competitive energy acquisition process; and

3) a full description of the actions that the Developer has undertaken or offers to undertake to address any actual, perceived or potential conflict of interest or unfair advantage arising from the relationships disclosed pursuant to subsections c)1) and c)2) above; and

d) if no such relationships are disclosed by the Developer, the Developer is not aware of any former employees as described in subsection c)1) above nor any relationships between the Developer or any member of the Developer's team, and any of the persons described in subsection c)2) above, and the Standing Offer Program Application has not been/is not being prepared with any involvement from any of those persons.

Disclosures pursuant to section c) above are as follows:

Name of Member of Developer's Team e.g.: John Smith	Name of Party with Relationship (e.g., BC Hydro; employee name) BC Hydro	Details of the Nature of the Relationship with BC Hydro John Smith was a BC Hydro employee from [date] to [date]

For the purposes of this Conflict of Interest Statement Form:

"**Developer's Team**" means:

a) all persons who have been involved in the preparation of the Developer's Proposal; and

b) all persons who the Developer proposes to perform work or services under any resulting Electricity Purchase Agreement.

The Developer has undertaken or offers to undertake the following actions to address any actual, perceived or potential conflict of interest or unfair advantage arising from the relationships disclosed pursuant to subsections c) 1) and c)2) above:

Exhibit 5

Project Clusters and/or Common Generation Facilities – Supplementary Information

[Projects that are located on the same site or in the vicinity of a Project Cluster or a Common Generation Facility. Include and name Exhibit 5.]

Provide responses to the following.

Project Name: _____

Developer Name: _____

a) Provide a geographical map which identifies the Project and the other existing or proposed generators ("the projects").

☐ Included and named Exhibit 5a.

b) Provide a brief description of the other existing or proposed generators, including the size of each generator.

c) Do the projects share common facilities, such as penstock, powerhouse, etc.?

d) Do the projects share interconnection facilities and/or a point of interconnection with the BC Hydro Integrated System?

e) Are the projects operating under common permits or tenures?

f) Do the projects share the same fuel source?

g) Are the projects under a common ownership (direct or indirect)?

h) Provide any other information that may support these projects being considered separate from the Project described in the Application.

i) Does any part of the projects (other than the Project being submitted to the SOP) have an EPA with BC Hydro or any third party?

Exhibit 9

Completed Prototype Generation Technology Certification

This form must be completed by a professional engineer (or equivalent engineering designation) registered or licensed in a jurisdiction that regulates the practice of engineering. Include and name Exhibit 9.

Project Name: _____

Developer Name: _____

a) Generally describe the innovative components or sub-systems that are included in the overall generation technology system.

b) Describe the prototype testing environment, the tests completed to date, and the relevance of the test conditions to real-world conditions.

c) Certification. By signing below, the professional engineer certifies that the generation technology has completed a program of testing, with satisfactory results, using a sub-scale or full-scale prototype of the technology to simulate real-world conditions, which sufficiently demonstrates technical viability and safe performance of the technology at full-scale and under real-world conditions, subject to any qualifications listed below.

Describe any qualifications to the above certification.

Exhibit 18

Interconnection Disclosure Consent Form

[Form of consent to disclosure of project information between BC Hydro and third party owner of transmission or distribution system. Include and name Exhibit 18.]

Where the Project has an Indirect Interconnection through any transmission or distribution system other than the BC Hydro system, such as the FortisBC system or a third party privately owned line, this Form must be completed and signed to provide the Developer's consent to disclosure of information by the third party to BC Hydro and vice versa.

Project Name: _____

Developer Name: _____

The undersigned consents to:

(i) the disclosure by [INSERT NAME OF THIRD-PARTY] to BC Hydro of all information submitted by the undersigned to [INSERT NAME OF THIRD-PARTY] relating, directly or indirectly, to the interconnection of the Project to [INSERT NAME OF THIRD-PARTY] 's electricity transmission / distribution system (including any services related to the interconnection), the interconnection between [INSERT NAME OF THIRD-PARTY] 's electricity / distribution system and BC Hydro's Transmission System, and the transmission of electricity from the Project through the transmission / distribution system to BC Hydro's Transmission System and/or the impact of the Project on the transmission / distribution system, BC Hydro's Transmission System, or the interconnection between the Project and the transmission / distribution system or between BC Hydro's Transmission System and the transmission / distribution system, including any and all study reports, calculations and other information of any kind whatsoever with respect thereto whether submitted by the undersigned to [INSERT NAME OF THIRD-PARTY] or prepared by [INSERT NAME OF THIRD-PARTY] ; and

(ii) the disclosure by BC Hydro to [INSERT NAME OF THIRD-PARTY] , at BC Hydro's sole discretion, of information submitted by the undersigned to BC Hydro relating, directly or indirectly, to the interconnection of the Project and the transmission of electricity from the Project and any and all study reports, calculations and other information of any kind whatsoever with respect thereto whether submitted by the undersigned to BC Hydro or prepared by BC Hydro.

CONFIDENTIALITY AND COMPLIANCE AGREEMENT

Revised: March 2016

This Confidentiality and Compliance Agreement (the "***Agreement***") is made as of _____, 20____ ***[Note: Date to be completed by BC Hydro at time of signing by BC Hydro.]***

BY AND BETWEEN

[INSERT FULL LEGAL NAME OF COUNTERPARTY]
of [INSERT FULL ADDRESS WITH POSTAL CODE]
("***Counterparty***")

AND

BRITISH COLUMBIA HYDRO AND POWER AUTHORITY, a British Columbia Crown Corporation, having an office at 333 Dunsmuir Street, Vancouver, British Columbia, V6B 5R3
("***BC Hydro***")

(the foregoing may be referred to individually as a "***Party***" or collectively as the "***Parties***")

WHEREAS BC Hydro and the Counterparty wish to enter into discussions, which may include negotiations concerning an electricity purchase agreement (an "**EPA**"), pursuant to BC Hydro's Micro-SOP or Standing Offer Program (the "***Program***").

NOW THEREFORE, in consideration of the Parties entering into this Agreement and the mutual promises and agreements contained in this Agreement, the Parties agree as follows:

1. DEFINITIONS

1.1 **Confidential Information**. "***Confidential Information***" means any of the Counterparty's confidential technical or financial information provided by the Counterparty to BC Hydro in confidence in connection with the Program and/or any related EPA with express written notice to BC Hydro of the confidential nature of the information, whether such confidential information is provided orally, in writing, electronically or by any other media, but excluding any executed and delivered EPA or related securities delivered thereunder or any agreement collateral thereto, and also excluding information that:

(a) is or becomes in the public domain, other than as a result of a breach of this Agreement by BC Hydro;

(b) is known to BC Hydro before disclosure to it by the Counterparty, or becomes known to BC Hydro thereafter by way of disclosure to BC Hydro by any other person who, to BC Hydro's knowledge, is not under an obligation of confidentiality with respect thereto; or

(c) is, or has been, disclosed by the Counterparty to any government authority in connection with any permit, approval or tenure for any project proposed by the Counterparty in the Program and any information that is directly related to or that is based on or derived from that information, other than any financial information relating to the Counterparty or any such project.

1.2 **Affiliate**. "***Affiliate***" has the meaning given in the Standard Form Electricity Purchase Agreement for the Program.

1.3 **Discussions**. "***Discussions***" means discussions, including negotiations, whether orally, in

©BC Hydro 2016, All rights reserved.

BC Hydro
Power smart

writing, electronically or by any other media, between the Parties pertaining to the Program and/or any related EPA from the effective date of this Agreement to the termination of such discussions or an EPA, if any, between the Parties is fully executed and delivered, whichever shall first occur and "discussions" includes, but is not limited to, the Counterparty's questions and BC Hydro's responses thereto in the Q & A process under the Program and any preliminary assessment of eligibility for the Program provided by BC Hydro to the Counterparty.

1.4 **Rules**. "***Program Rules***" means the BC Hydro document so entitled and available on the websites at www.bchydro.com/microsop and www.bchydro.com/standingoffer, as amended or replaced from time to time.

2. CONFIDENTIALITY OBLIGATION

2.1 **Confidentiality Obligation**. BC Hydro shall treat as confidential, and shall not disclose to any third person, Confidential Information, and both Parties shall treat as confidential and shall not disclose to any third person, all or any part of the Discussions, provided however that the foregoing obligations, and nothing in this Agreement, prevents or restricts:

(a) disclosure of the fact that Discussions, if any, are occurring, or have occurred, and/or the fact that this Agreement exists and the general nature hereof;

(b) in the case of BC Hydro, disclosure of the Discussions and/or Confidential Information:

(i) to any ministers, deputy ministers, servants or employees of the Province of British Columbia; and

(ii) to BC Hydro's directors, officers, employees, subsidiaries, consultants and advisors;

provided that each of the foregoing to whom Discussions and/or Confidential Information is disclosed is advised of the confidential nature thereof;

(c) in the case of BC Hydro, disclosure of Discussions and/or Confidential Information in any regulatory proceeding, whether in respect of an EPA entered into with the Counterparty pursuant to the Program or in respect of other matters, to the extent that BC Hydro considers disclosure necessary or desirable to support its position in any such proceeding, provided that, to the extent reasonably practicable, BC Hydro gives reasonable notice to the Counterparty before making the disclosure, and, to the extent requested by the Counterparty, requests the relevant tribunal to treat all or any part of the disclosure as confidential or to limit its further disclosure;

(d) in the case of BC Hydro, disclosure:

(i) of the Counterparty's questions and BC Hydro's response thereto in the Q&A process under the Program without attribution to the Counterparty;

(ii) to a third person of Confidential Information that was known by that third person before disclosure thereof by BC Hydro, including information that originated from that third person or that the Counterparty or any other person has given to the third person, in each case as indicated on the face of any document or as acknowledged by the Counterparty; and

(iii) such information as BC Hydro considers necessary to provide any publicly available report on the conduct and outcome of the Program, including the Counterparty's participation in the Program and the conclusion of an EPA with the Counterparty (if applicable), the location and capacity of any project proposed by the Counterparty, and the energy associated with any project proposed by the Counterparty;

(e) in the case of the Counterparty, disclosure of Discussions to its directors, officers, employees and affiliates, consultants and advisors, provided that each of the foregoing to whom Discussions are disclosed is advised of the confidential nature thereof and

©BC Hydro 2016, All rights reserved.

BC Hydro
Power smart

undertakes in writing to respect such confidentiality on the terms of this Agreement, provided that the Counterparty shall give to BC Hydro, at its request, a copy of each such undertaking;

(f) without limiting BC Hydro's disclosure rights under section 2.1(c) above, disclosures required to be made by BC Hydro or the Counterparty by an order of a court or tribunal or under any law, regulatory requirement or requirement of any stock exchange that is binding upon it, provided that, (i) to the extent reasonably practicable, the Party making such disclosure gives reasonable notice to the other Party before making the disclosure, and (ii) limits the disclosure to that required by the applicable order, law, or regulatory or stock exchange requirement;

(g) disclosures in any legal proceedings for the enforcement of this Agreement and/or any EPA or in the defence of any legal proceedings brought by any third person(s) against either or both the Parties in any way relating to the Program; or

(h) disclosures of the Discussions and/or Confidential Information by agreement or consent of both Parties.

2.2 **Disclosure of EPA**. Disclosure of any executed EPA, or any summary thereof or information contained therein, will be governed by the EPA.

2.3 **Freedom of Information and Protection of Privacy Act**. The Counterparty acknowledges that BC Hydro is subject to the British Columbia *Freedom of Information and Protection of Privacy Act* and associated regulations, and agrees that BC Hydro's non_disclosure obligations under this Agreement are subject to the provisions of that legislation, as the same may be amended or replaced from time to time.

2.4 **Term:** BC Hydro's obligation of confidentiality with respect to Confidential Information expires three years after the date hereof.

3. PROGRAM RULES BINDING

The Counterparty acknowledges and agrees that it is bound by, and will comply with, the terms and conditions of the Program Rules, including without limitation Section 7 and all exclusions and limitations of liability therein, in relation to its participation in the Program.

4. MISCELLANEOUS

4.1 **Liability Exclusion**. In no event will either Party be liable to the other Party in connection with any breach of this Agreement for any indirect, incidental or consequential damages, including loss of profits.

4.2 **Governing Law**. This Agreement shall be interpreted, governed and construed under the laws of the Province of British Columbia and the laws of Canada applicable therein as if it were executed, and to be performed wholly, within the Province of British Columbia.

4.3 **Equitable Relief**. Each Party agrees that in the event of a breach of this Agreement, or to prevent a breach or contemplated breach, by that Party, the other Party shall be entitled to equitable relief, including injunction and specific performance, in addition to all other remedies available at law or equity.

4.4 **Entire Agreement**. This Agreement constitutes the entire agreement between the Parties with respect to the subject matter hereof and supersedes and cancels all prior agreements and communications relative to such subject matter.

©BC Hydro 2016, All rights reserved.

BC Hydro
Power smart

4.5 **No Implied Terms**. No terms or conditions whatsoever may be implied in this Agreement.

4.6 **Amendments**. This Agreement shall not be modified, except by a written agreement dated after the date of this Agreement and signed by both Parties.

4.7 **Assignment**. This Agreement may not be assigned by either Party without the prior written consent of the other Party, without releasing the liabilities and obligations of the Counterparty hereunder.

4.8 **Enurement**. This Agreement is binding upon and enures to the benefit of the Parties and their respective successors and permitted assigns.

4.9 **Execution In Counterparts**. This Agreement may be executed in counterparts, and each counterpart shall for all purposes be an original, and all such counterparts shall together constitute one and the same Agreement.

4.10 **Facsimile Signature.** This Agreement may be executed and delivered by signatures transmitted by facsimile or other electronic means.

4.11 **Relationship**. Entering into this Agreement shall in no way be construed to:

(a) preclude in any way either Party from pursuing any business opportunities;

(b) establish any relationship between BC Hydro and the Counterparty with respect to such business opportunities; or

(c) establish any other relationship between BC Hydro and the Counterparty with respect to any project proposed by the Counterparty under the Program.

IN WITNESS WHEREOF, the Parties have entered into this Agreement effective as of the date first above written.

REFERENCE: **Application, Appendix 5.4, page 5.4-3**

ISSUE: **Mt. Sumanik Wind Feasibility Studies**

QUOTE: "From 2016 to 2017, the project work consisted mostly of data collection and management, as well as evaluating upgrades to the power system for the monitoring equipment which experienced difficulties. In 2018 work was conducted to repair the laser of the Lidar unit as the equipment was malfunctioning… The need for YEC to directly conduct resource wind monitoring and site assessments has since been eliminated due to the high likelihood that future wind resources will be developed by Independent Power Producers. As such, the project was decommissioned in 2020 with total expenditures of $775,581 to be amortized over five years."

PREAMBLE: **YEC incurred $694,427 in 2018, $31,155 in 2019 and $50,000 in 2020.**

QUESTION:

a) Please confirm that the cost to repair the laser of the Lidar unit was included in the 2018 costs, provide the exact cost of this repair and provide a breakdown of any other costs incurred in that year.

b) Please provide a breakdown of the costs for the wind feasibility projects incurred for 2019 and 2020.

c) Please explain how YEC determined that it was not required to conduct wind monitoring and site assessments. For example, did it engage in meetings with Independent Power Producers who expressed interest in wind development?

ANSWER:

(a) and **(b)**

Confirmed that cost to repair the laser of the Lidar unit was included in the 2018 costs. Please see Attachment 1 to this response for breakdown of 2018 costs, as well as of 2019 and 2020 actual costs. The following are noted with regard to this information:

- The Application's costs shown for 2018, as stated at pages 5.4-2 and 5.4-3, include all costs incurred prior to 2018; and

- The 2020 costs in Attachment at $25,005 are actual costs (and differ from the $50,000 forecast cost in the Application due to the cost for removing the unit being much lower than had been forecast).

(c)

Wind was not identified as a required resource in the 10-Year Renewable Electricity Plan, given its provision of intermittent renewable energy and no dependable capacity (which is currently at a shortfall). As YEC is not pursuing any wind projects, wind monitoring and site assessments are unnecessary at this time. It is expected wind energy will be provided from the Independent Power Producer Standing Offer Program. Proponents of this program are responsible for all development costs for their projects, including wind monitoring and site assessments.

"See Section 5.2.1.10 for a full description and business case for completing the WH2 Uprate Project before the end of 2021."

From page 5.4-3, footnote 1 of the Application:

"1 By end of 2021 WH2 Uprate Engineering costs will be transferred to Property, Plant and Equipment and added to WH2 Uprate total cost [amortized over 72 years starting in 2022]."

QUESTION:

a) Please explain why costs for the WH2 Uprating Engineering study are not included in the costs for the WH2 Uprate Project, which is classified as a Capital Works project.

b) Is a 72-year amortization period typical for projects of this nature? If not, please explain why such an amortization period was chosen for this project.

ANSWER:

(a)

WH2 Uprate Engineering costs included under Table 5.6 of Tab 5 are part of WH2 Uprate project as indicated in the footnote #1 to Appendix 5.4 and note #2 to Table 5.6 in Tab 5. This project has a separate project number and the spending maintained separately from other capital expenditures for the WH2 Uprate project. Therefore, it was presented under Table 5.6, deferred costs.

There is no impact to the revenue requirement or requested rate increases as the project is amortized starting in 2022.

(b)

The amortization rate was mis-quoted. A 72 year life applies to hydro structures, asset class 1615-200. The proper asset class is 1615-506 – Waterwheels, Turbines and Generators with an expected life of 60 years. There is no impact to the revenue requirement request in this application as this project will not enter service until 2022 (i.e., outside the test year).

REFERENCE: **Application, Appendix 5.4, page 5.4-4**

ISSUE: **Building Condition Reports 2020-2024**

QUOTE: "YEC is moving from a crisis management model (e.g. waiting for a furnace to fail in the middle of winter), towards a preventive maintenance schedule (identifying life cost cycling of a furnace) for all YEC-owned buildings. This change in approach can provide material cost savings. Building condition reports are required to formally document the structure and fabric of a property, describe the construction of the building and its current condition, and outline work required, timing and costs for completion."

QUESTION:

a) Please explain YEC's rationale for implementing a crisis management model originally.

ANSWER:

(a)

Prior to having a full wide Building Condition Reports (BCRs) in 2013 by Golder Engineering maintenance was very reactive in nature. There was no proper structured capture of property management, hence the terminology of Crisis Management, which implies repairs were being done as required. The cost implications saved by having detailed BCRs in place allows for life cycle management of equipment and replacement of required building components in a timely fashion to avoid expensive "right now" repair call-outs for individual items.

REFERENCE: **Application, Appendix 5.4, page 5.4-6**

ISSUE: **Whitehorse Diesel Rental Substation Improvements**

QUOTE: "The project is to be closed in 2021 with total expenditures of $100,000 to be amortized over 45 years."

QUESTION:

a) Is a 45-year amortization period typical for projects of this nature? If not, please explain why such an amortization period was chosen for this project.

ANSWER:

(a)

Yes. A 45 year amortization period is typical for projects of this nature.

REFERENCE: **Application, Appendix 5.5, page 5.5-1**

ISSUE: **Deferred Studies Between $100,000 and $1 Million Not Impacting Rate Base**

PREAMBLE: YEC included the expenditures for the EV Infrastructure Project and P125 Trashrack Study, forecasted at $200,000 for each study in 2021.

QUESTION:

a) Please confirm that the $200,000 for each project will not be added to rate base in this GRA. Please explain if there are plans to include costs for these projects in future GRAs.

ANSWER:

(a)

Confirmed. These projects are not forecast to be included in rate base in the test year.

See YUB-YEC-1-101 for further information regarding status of the EV Infrastructure Project; the response notes YEC has chosen to defer this project to a future year, as it is expected to take several years for the rollout of electric vehicles to take place at a larger scale in Yukon. YUB-YEC-1-102 provides further information regarding status the trash rack study.

Costs for the above studies would be included in a subsequent GRA for prudence review by the Board after the studies have been completed.

REFERENCE: **Application, Appendix 5.5, page 5.5-1**

ISSUE: **Deferred Studies, EV Infrastructure Project, Electric Vehicle Charging Stations**

QUOTE: "The Yukon government 'Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy' includes a number of actions to encourage the adoption of electric vehicles in Yukon, and the construction of public electric vehicle charging stations. The Yukon Government is forecasting 5,000 electric vehicles in the Yukon by 2030. YEC must be proactive in undertaking infrastructure upgrades and improvements to accommodate the anticipated increased demand on the electrical grid due to this planned growth. Strategy development will assess the potential impact of electric vehicles on the Yukon electrical system and identify a path forward for YEC to meet these challenges. Not addressing this could result in unforeseen costs and reactionary programs."

QUESTION:

a) Please provide a breakdown of the forecasted $200,000 for this project. More specifically, provide the activities YEC is planning to engage in and provide the cost allocated to each activity. Does YEC foresee any customer contributions related to costs for this project?

b) Please provide your preliminary view on whether the Capital Works projects discussed in this application will defer or eliminate infrastructure upgrades related to electric vehicle charging station growth.

c) How many electric vehicle charging stations have been installed by the Yukon Government and YEC?

d) What rate schedule(s) apply to these charging stations and how are these revenues accounted for in YEC's Application?

e) Please include details of the quantities of energy supplied through and any revenues for YEC resulting from the charging stations.

f) In YEC's view, why is it reasonable for system demand to be increased and the charges recovered through rates when the benefits of the charging stations would only accrue to those who own electric vehicles?

ANSWER:

(a) to **(f)**

Subsequent to the submission of the Application, YEC has chosen to defer this project to a future year, as it is expected to take several years for the rollout of electric vehicles to take place at a larger scale in Yukon. The Compliance Filing will be adjusted to reflect this decision. This change has no impact on the forecast revenue requirement for the 2021 test year, i.e., Appendix 5.5 includes only projects forecast to remain in WIP.

REFERENCE: **Application, Appendix 5.5, page 5.5-1**

ISSUE: **P125 Trashrack Study**

QUOTE: "The P125 intake is becoming blocked with debris and frazil ice. These blockages are currently being removed manually by divers and plant operators. This results in multiple outages each year to address blockages. Not addressing this issue will mean continued outages and requirement for divers to address the issue manually. A track [sic] rack must be installed that can permanently address the variety of debris encountered at the intake. The study will confirm the deck structural capacity and other details such as power supply and trash rack geometry."

QUESTION:

a) Please provide the number and duration of outages caused by the debris and frazil ice blockage in the last 10 years, on a per annum basis, and the costs incurred for these outages.

b) Please provide a breakdown of the forecast $200,000 for this project. More specifically, provide the activities YEC is planning to engage in and provide the cost allocated to each activity.

ANSWER:

(a)

Yukon Energy is in the process to complete the Trashrack Study. The initial observations for the 2018 and 2019 year was Yukon Energy had an average of 6 days of plant outages for cleaning out the trashrack. Based on this estimate, crane cost in addition to potential energy gains from the having the trashrack partly blocked in between cleanings, initial estimates show that the trashrack cleaner is potently economic and should be studied. Also, having a trashrack cleaner would help to lower the risk of frazil ice blockages on WH1,2,3,4, in the early winter, which leads to system instability. During the full study, all potential benefits will be reviewed and the last 10 years of history will be included.

(b)

Costs for the project include $100,000 for detailed design, $30,000 for project management, and $70,000 for procurement and selection of vendor(s).

REFERENCE: **Application, Appendix 5.6, page 5.6-1**

ISSUE: **ERP System Upgrades**

QUOTE: "Given YEC's role as the primary generator of electricity for an isolated grid, it is critical to maintain a modern and robust Enterprise Resource Planning (ERP) system. ERP system refers to a type of software that organizations use to manage day-to-day business activities such as accounting, procurement, project management, maintenance management and supply chain operations. Best practice is to update systems regularly to ensure that the systems are up to date. The project involves upgrades to the ERP system components to the recommended latest stable versions. System experts are contracted to help with individual components as these are critical systems and YEC has no inhouse expertise."

QUESTION:

a) Please explain the implications of not upgrading the ERP system components to the recommended latest stable versions.

b) Please explain how often YEC has updated the ERP system in the last 10 years and provide the cost of these upgrades.

c) Please provide YEC's analysis comparing the expected benefits of this project to the forecast costs. Please include an explanation of cost savings or cost avoidances that have been or are expect to be realized.

ANSWER:

(a)

There are many implications of not upgrading the ERP system components to the recommended latest stable versions, including the following:

- **Lack of support -** You can no longer get support when calling up vendors as they will only support clients with up-to-date stable systems.

- **Security concerns because security patches cannot be installed -** Security holes have been identified and these need the latest versions to be fixed.

- **System instability -** Older protocols are no longer supported; YEC can no longer get client applications (i.e., Internet explorer 8).

(b)

Prior to the upgrade in 2020, YEC has updated the ERP system once in 2016 at a cost of $66,000.

(c)

Due to the nature of the implications indicated in part (a), a financial cost/benefit analysis is not considered necessary.

REFERENCE: **Application, Tab 7 schedules, Schedule 4, page 7-8**

ISSUE: **Cost of Capital Calculation**

QUESTION:

a) Please confirm that cell G58 of Schedule 4 should equal cell N25 of Schedule 7. If not confirmed, please explain and provide the calculation of the value in cell G58.

b) Please confirm that cell M56 of Schedule 4 should equal cell M60 multiplied by cell K56. If not confirmed, please explain and provide the calculation of the value in cell M56.

c) Please confirm that cell M58 of Schedule 4 should equal cell M60 multiplied by cell K58. If not confirmed, please explain and provide the calculation of the value in cell M58.

d) Please confirm that cell M60 of Schedule 4 should yield the same value as the sum of cells M56 and M58. If not confirmed, please explain. If confirmed, please explain why it does not yield the same value and correct if necessary.

e) If any of parts (a), (b), (c) and (d) are confirmed, please provide the corrected schedules along with an explanation of any changes to YEC's revenue requirement or rates resulting from the corrections.

ANSWER:

(a) through **(e)**

Minor edits to Tab 7 schedules are noted below and then responses are provided to the specific questions.

YEC identified that the number in line 20 of Schedule 4 [cell G58 in the excel file] was not correctly linked. YEC also revised the calculations for cells M56 and M58 to use the capitalization ratios in Schedule 4, column K in the excel file to avoid impact of rounding of decimal points [the overall impact to the revenue requirement is less than $300].

Please see YUB-YEC-1-104(e) Attachment 1 for revised version of Tab 7 schedules. Please note that there is no impact to the requested rate increase from the above adjustments.

With regard to the specific questions, the following responses are provided:

(a)

Not confirmed. Cell G58 of Schedule 4 is mid-year 2021, and cell N25 of Schedule 7 is only year end 2021.

(b), **(c)** and **(d)**

Confirmed.

(e)

See Attachment 1 to this response.

REFERENCE: **Application, Tab 7 schedules, Schedule 9, page 7-13**

ISSUE: **Revenues**

QUESTION:

a) Please explain how the revenue figures in rows 5, 11, 15, 19, 23 and 32 are calculated.

b) Please provide references to where the calculation(s) for part (a) are explained in the Application.

ANSWER:

(a) and **(b)**

The revenues at existing rates are calculated as follows:

- The revenues at existing rates for YEC retail customers [lines 5, 11, 19 and 23, Schedule 9] are calculated based on forecast energy sales for the test year multiplied by average revenue per kW.h sales. The average revenues per KW.h sales are determined based on actual base rate revenues for last five years, 2015 through 2019 as shown below [please note the numbers are subject to rounding]:

    - Average base rate revenues per kW.h for residential customers at 14.71 cents/kW.h [by way of example AEY's 2016-17 GRA Compliance Filing average revenue per kW.h at 14.10 cents/kW.h].

    - Average base rate revenues per kW.h for general service customers at 16.67 cents/kW.h [by way of example AEY's 2016-17 GRA Compliance Filing average revenue per kW.h at 16.33 cents/kW.h].

    - Average base rate revenues per kW.h for streetlight and space light at 38.44 cents/kW.h and 27.18 cents/kW.h respectively.

- For wholesales [line 15, Schedule 32] – the revenues at existing rates are calculated based on forecast sales for the test year [343,537 MW.h] multiplied by the existing wholesales rate [8.298 cents/kW.h].

- For industrial customers [line 15, Schedule 9] the revenues at existing rates are calculated based on:
    - Forecast energy sales for the test year multiplied by existing energy rates, including fixed Rider F;
    - Forecast peak demand multiplied by existing demand rate; plus
    - Fixed Charge revenues based on assumed new Fixed Charges.[1]

Forecast sales and revenues are described in Section 2.2 of the Application and Table 2.1. Additional details on the calculations have been provided above.

[1] At the time of preparation of the Application YEC forecasted the new Transmission Facilities Development coming into service connecting the McQuesten Substation with a substation at Mayo in late November 2020/early December 2020 triggering new Fixed Charges effective January 1, 2021 as outlined in section 4.4.2 of the Application and Appendix 4.3. Based on this assumption the existing rate revenues for industrial customers in the Application used Fixed Charge at $35,734/month effective January 1, 2021 [subject to a separate application] compared to $8,402/month existing Fixed Charge. However, the in service date for the new Transmission Facilities Development is delayed. YEC will adjust the existing rate revenues for industrial customers in Compliance Filing.

REFERENCE: **Application, Tab 7 schedules, Schedule 11, page 7-16**

ISSUE: **Interest Costs**

QUESTION:

a) Please explain why there is no interest cost in cell N46 of Schedule 11 for new 2021 debt-2021 true up.

ANSWER:

(a)

The GRA assumes the new long-term debt for 2021 is issued in late 2021 to finance the capital projects and maintain 60/40 debt to equity ratio. Therefore, no interest expense is calculated for the 2021 new debt [the interest expense assumed to start in January 2022].

REFERENCE: **Application, Section 3.4, Rate base, page 3-22; and Tab 7, Schedule 2A, page 7-4**

ISSUE: **Working Capital**

QUOTE: "The balance of the change in net rate base from mid-year 2018 approved to mid-year 2020 reflects increased working capital ($1.8 million increase in 2021 forecast over 2018 approved of $5.3 million)."

Schedule 2A from page 7-4:

20=18+19	**Total for Working Capital Purposes**	**37,733**	**53,916**	**69,534**	**99,535**	**102,279**	Schedule 2A, Line 1

Notes:

1. Amortization expense for deferred costs are added back to calculate annual change in deferred cost balances before amortization. The amortization expense is before impact of contributions. During the review of calculations YEC noticed that amortization expense of Intangibles was not added back. However, the impact is insignificant [the revenue requirement is underestimated by less than $100].
2. AFUDC is removed for GST impact calculations.
3. LWRF transfers are estimated at the time of filing of the Application.

ISSUE: **Depreciation Expense**

QUOTE: "Depreciation and Amortization Expenses: Approval of depreciation and amortization expenses forecast of $13.125 million for 2021, including approval of the following:

i. Updated Depreciation Rates: Approval of updated depreciation rates as set out in Tab 7, with an overall increase to 2021 depreciation expense of approximately $0.636 million; and …

c. **Depreciation and Amortization Expenses:** Approval of depreciation and amortization expenses forecast of $13.125 million for 2021, including approval of the following:

i. **Updated Depreciation Rates:** Approval of updated depreciation rates as set out in Tab 7, with an overall increase to 2021 depreciation expense of approximately $0.636 million; and

Table 3.14:
Depreciation and Amortization
($000)

	2018 Approved	Actual 2018	Actual 2019	Forecast 2020	Forecast Existing 2021	Forecast Proposed 2021
Fixed Asset Depreciation	$ 12,196	$ 12,185	$ 12,677	$ 12,963	$ 12,945	$ 13,581
Less: Customer contribution	-5,652	-5,635	-6,237	-6,482	-5,911	-5,911
Less: Amortization of fire insurance recoveries	-262	-262	-262	-262	-262	-262
Less: Disallowed Depreciation	-204	-204	-204	-204	-204	-204
Plus: Amortization of deferred charges	5,063	5,020	5,079	4,992	5,921	5,921
Total Depreciation & Amortization	$ 11,141	$ 11,104	$ 11,053	$ 11,007	$ 12,489	$ 13,125

Notes:
1. Disallowed depreciation reflects fixed asset depreciation amounts for disallowed assets per YUB Orders: $0.004 million (YUB 1992-1), $0.012 million (YUB 2013-01) and $0.188 million (YUB 2018-10).

QUESTION:

a) Please clarify that the difference between Forecast 2020 ($12,963 thousand) and Forecast Existing 2021 ($12,945 thousand) fixed asset depreciation amounts represent a decrease in depreciation expense of $18 thousand that is due to decreases in fixed asset amounts subject to depreciation expense. If not confirmed, please fully explain all reasons for the $18 thousand decrease in fixed asset depreciation expense. Please include in the response the total amount of depreciable assets used in each of the Forecast 2020 fixed asset depreciation ($12,963 thousand) and Forecast Existing/Proposed 2021 fixed asset depreciation

calculations ($12,945/$13,581 thousand) and a complete reference to where those amounts can be confirmed in YEC's supporting Tabs.

b) Please clarify that the difference between Forecast Proposed 2021 ($13,581 thousand) and Forecast Existing 2021 ($12,945 thousand) fixed asset depreciation amounts represents an increase in depreciation expense of $636 thousand that is due to changes in proposed depreciation parameters of average service life and Iowa curve dispersion and mode. If not confirmed, please explain the reason for the $636 thousand increase in fixed asset depreciation expense.

c) Please provide a breakdown of the $636 thousand increase in fixed asset depreciation expense, referenced in part (b) above, between changes in average service life and changes in Iowa Curve dispersion and mode.

d) Please provide detailed calculations by asset class ID and description that support YEC's amortization of customer contributions in the amounts of Forecast 2020 ($6,482 thousand) and Forecast Existing 2021 / Forecast Proposed 2021 ($5,911 thousand). Please ensure that both asset class ID, description and working formulae are included in the requested worksheet. Alternatively, if the calculations are available elsewhere in YEC's Application, please provide a complete reference to any Tab 3, Tab 5, Tab 7 or other schedule that can be used for the same purpose of clearly arriving at the referenced amounts.

e) Please explain how YEC determines its amortization rates for contributions and its process for retiring contributions.

f) For Forecast 2020 ($4,992 thousand) and Forecast Existing 2021 / Forecast Proposed 2021 ($5,921 thousand) amortization of deferred charges amounts, please provide a list identifying each deferred charge that comprises the amounts noted and the basis of the amortization period for each deferred charge. If each constituent calculation is available elsewhere in YEC's Application, please provide a complete cross reference to any Tab 3, Tab 5, Tab 7 or other schedule that can be used for the same purpose of clearly arriving at the referenced amounts.

g) The Board has summarized YEC's reporting in Tab 3 and Tab 7 of the amortization of contributions, fire insurance recoveries and deferred charges in the following table. Please reconcile the "Variance between reporting schedule" column by

identifying the nature of the cost that constitutes the variance and by providing an explanation for why the costs are not being reported consistently by YEC between Tab 3 and Tab 7 schedules:

	Tab 3, Schedule 3.14	Tab 7, Schedule 5	Variance between reporting schedule
	($ thousands)		
Amortization of customer contributions	(6,482)	(5,291)*	(1,453)
Amortization of fire insurance recoveries	(262)		
Amortization of deferred charges/costs	4.992	$3,540	1,452
Total Forecast 2020	(1,752)	(1,751)	
Amortization of customer contributions	(5,911)	(4,723)*	(1,450)
Amortization of fire insurance recoveries	(262)		
Amortization of deferred charges/costs	5,921	4,471	1,450
Total Forecast (Exiting and Proposed) 2021	(252)	(252)	

Source: Tab 3, Schedule 3.14 and Tab 7, Schedule 5 (where * is described as "amortization of contributions and fire insurance recoveries").

h) Please explain how the lack of complete references between schedules (as noted in part (f) above) and the variance between reporting schedules for what has effectively been described as the same cost (as noted in part (g) above) has been responsive or helpful to the Board with respect to Directive #23 which addressed the Board's concerns about YEC's standard of disclosure with respect to its deferral and reserve accounts.

ANSWER:

(a)

The difference between Forecast 2020 ($12,963 thousand) and Forecast Existing 2021 ($12,945 thousand) fixed asset depreciation amounts represent a decrease in depreciation expense of $18 thousand that is due to decreases in fixed asset amounts subject to depreciation expense.

The total amount of depreciable assets used in each of the Forecast 2020 fixed asset depreciation ($12,963 thousand) and Forecast Existing/Proposed 2021 fixed asset depreciation calculations ($12,945/$13,581 thousand) are in the top section of Tab 7, Schedule 3. Specifically, these depreciation amounts can be found on Line 6 of this schedule.

(b)

Confirmed.

(c)

A breakdown of the $636 thousand increase in fixed asset depreciation expense is found in Tab 7, Schedule 3A. In this schedule, the columns labelled '2021 Existing Forecast Depreciation' and '2021 Forecast Proposed Forecast Depreciation' breakdown the differences by each asset category.

(d)

A summary of YEC's amortization of customer contributions in the amounts of Forecast 2020 ($6,482 thousand) and Forecast Existing 2021 / Forecast Proposed 2021 ($5,911 thousand) by asset class ID is below. These amounts were system generated so no additional excel calculations were done (or available to report). Amortization is based on historical cost at the appropriate amortization rate (see response to part (e)).

	($000's)
Property, Plant & Equipment Contributions	
Residential Customer Contributions	136.33
General Service Customer Contributions	68.32
Industrial Customer Contributions	20.96
Street & Sentinel Light Customer Contributions	0.96
Other Contributions	2.70
Minto Contribution 138Kv Line	189.91
Minto Spur Contribution 25 Kv Line	825.08
Victoria Gold McQuestent Contribution	961.38
Yukon Development Corporation Contributions	1,604.26
Yukon Government Contributions	228.73
Government of Canada Contributions	990.71
	5,029.35
Feasibility Contributions	1,333.82
Regulatory Contributions	118.65
	6,481.82

(e)

YEC determines its amortization rates for contributions by applying International Financial Reporting Standards (IFRS) and as reviewed by YEC's external auditor, the Auditor General of Canada. Typically, the amortization period of the contribution matches the asset to which the contribution relates to. An exception to this is the Victoria Gold McQuesten contribution as much of the assets are being amortized over their life (45 years) but IFRS and the Auditor General of Canada required the contribution to be amortized over the expected life of the Victoria Gold mine (12 years).

YEC's process for retiring contributions is to remove the contribution from its records when it is fully amortized, or whenever the asset to which it relates to is disposed of, whichever is earlier.

(f) to **(h)**

Please see YUB-YEC-1-108 Attachment 1 that provides reconciliation of the referenced amortization numbers in the questions with detailed cross-references to the Application tabs, tables and schedules.

As illustrated in YUB-YEC-1-108 Attachment 1, the forecast amortization of deferred costs for 2020 at $4.992 million and forecast for 2021 test year at $5.921 million are before contributions.

As indicated in response to part d), the total amortization of contributions of $6.482 million for 2020 forecast [Table 3.14] includes amount of deferred cost related contributions of $1.452 million. The amortization of contributions for deferred costs for 2021 test year is $1.450 million out of total amortization of contributions at $5.911 million [Table 3.14].

The following Table 1 shows revised version of Table 3.14 where amortization of contributions for fixed assets and amortization of contributions for deferred costs are shown separately. A row was also added to the end of the table to show how the referenced numbers of $5.291 million for 2020 and $4.723 million for 2021 are derived.

Table 1: Depreciation and Amortization for 2020 Forecast and 2021 Test Year

		Forecast 2020	Proposed 2021
1	Fixed Asset Depreciation	$ 12,963	$ 13,581
2	Less: Customer contribution [fixed assets]	-5,029	-4,461
3	Less: Amortization of fire insurance recoveries	-262	-262
4	Less: Disallowed Depreciation	-204	-204
5	Plus: Amortization of deferred charges	4,992	5,921
6	Less: Customer contribution [deferred charges]	-1,452	-1,450
7=Sum(1:6)	Total Depreciation & Amortization	$ 11,007	$ 13,125
8=2+3	Amortization of customer contributions and fire insurance recoveries	-5,291	-4,723

ISSUE: **Responses to Board Directives #21 and #23**

QUOTE: "Basis of Depreciation Estimates
The straight-line, broad (average) life group, remaining-life depreciation system was employed to calculate annual and accrued depreciation in this study. In this system, the annual depreciation expense for each group is computed by dividing the original cost of the asset less allocated depreciation reserve less estimated net salvage by its respective average life group remaining life. The resulting annual accrual amounts of all depreciable property within a function were accumulated, and the total was divided by the original cost of all functional depreciable property to determine the depreciation rate. The calculated remaining lives and annual depreciation accrual rates were based on attained ages of plant in service and the estimated service life and salvage characteristics of each depreciable group. The computations of the annual functional depreciation rates are shown in Appendix A."

PREAMBLE: In response to Directive #21 of Board Order 2018-10, YEC prepared "Tab 7, Schedules 3A and 3B" which it stated provided the Board-directed detailed depreciation and amortization calculations.

With respect to YEC's response to Direction #21, the Board observes that Tab 7 contains Schedule 3A only and not Schedules 3A and 3B as referenced by YEC.

Further, the Board observes that Tab 7, Schedule 3A does not consistently include working formulae that would otherwise provide confirmation of the depreciation expense calculations therein.

In response to Directive #23 of Board Order 2018-10, YEC prepared "Tab 7, Schedules 1 and 3" which it stated implemented changes to the structure of those schedules in order to improve disclosure and reporting of deferral and reserve accounts as directed by the Board.

QUESTION:

a) Please revise Tab 7, Schedule 3A to include the "Asset Class ID" for each account and corresponding working formulae supporting the depreciation expense calculations under each of the "2021 Existing Forecast Depreciation" and "2021 Proposed Forecast Depreciation" columns. Please provide references that would build to the $666,498 thousand "cost at 2020 year end" using individual line items from Tab 7, Schedule 3 or any other Tab 7 schedule.

b) Please explain why Tab 7, Schedule 3A does not appear to use a mid-year approach for the purposes of calculating depreciation expense. Please explain this observation fully and clarify whether this is a change from previously approved YEC depreciation expense calculation methodology.

c) Please explain why Tab 7, Schedule 3A appears to generally rely on the use of a depreciation rate based on "years" alone and does not appear to use a depreciation rate that includes consideration of the proposed Iowa Curve (including the associated mode and dispersion). Please explain this observation fully and clarify whether this is a change from previously approved YEC depreciation expense methodology.

d) Referring to the responses to parts (a) to (c) above, please explain any difference between the depreciation expense methodology described in those responses and the basis of the annual depreciation estimates as described in the Tab 9 Depreciation Study on page 9-6 and quoted above.

e) Please provide the calculations (including working formulae) supporting the amount of "depreciation study differences" by asset class grouping shown on Tab 7, Schedule 3A, given that the amounts to not appear to reflect the same amounts provided in the Tab 9 Depreciation Study, Appendix A at pages 9-98 and 9-99. Please also explain fully why the "depreciation study differences" on Tab 7,

Schedule 3A should not reflect the same "depreciation true-up annual provision for true-up" amounts in Appendix A on pages 9-98 and 9-99.

f) Notwithstanding the differences in dollar amounts noted in part (e) above, please explain fully whether YEC's implied method to collect or refund any required "depreciation study differences" as a set dollar amount (as indicated on Tab 7, Schedule 3A) is a change from previously approved YEC depreciation expense methodology.

g) Please clarify whether any of the information from Tab 9, Depreciation Study, Appendix A is used to inform the Tab 7, Schedule 3A depreciation expense calculations. If confirmed, please clearly cross reference the specific information originating from Tab 9, Depreciation Study, Appendix A and where it is relied on, or input, in Tab 7, Schedule 3A.

h) Referring to Tab 9, Depreciation Study, Appendix A on pages 9-98 and 9-99, please revise Appendix A to include working formulae supporting the depreciation expense calculations therein.

i) Referring to Tab 9, Depreciation Study, Appendix A on pages 9-98 and 9-99, please clarify why the columns identified as "Accumulated Depreciation," "AD difference" and "Accumulated depreciation of A/D Difference" must be added together to collectively determine the December 31, 2018 accumulated depreciation balance. Please also explain why, in the alternative, YEC did not simply provide the December 31, 2018 actual book accumulated depreciation balances.

j) Referring to the quote in the preamble, if Schedule 3B was omitted by YEC in error, please provide the schedule and ensure that it includes an "Asset Class ID" and description for each account and working formulae for any calculations contained therein.

ANSWER:

(a)

In Schedule 3A the "Asset Class ID" for each account is listed under the column labelled 'Description'. The '2021 Existing Forecast Depreciation' is system generated. The YEC fixed asset database consists of thousands of assets and excel is not used in this part of the forecast; therefore, a revised file with working formulae support is not available with excel. The system takes the cost of each of the individual assets and amortizes them individually over their respective amortization period. The depreciation system is audited by YEC's external auditor, the Auditor General of Canada.

Regarding the '2021 Proposed Forecast Depreciation' column, the formula was included in the excel file submitted with the Application. The formula can be interpreted in the following words:

Step 1:	Calculate average rate on existing Class ID	Cost at 2021 Year End / 2021 Existing Forecast Depreciation
Step 2:	Calculate existing rate to proposed rate ratio	Existing Depreciation Rate / Proposed Depreciation Rate
Step 3:	Calculate average proposed rate	Average rate on existing Class ID (Step 1) / Existing rate to proposed rate ratio (Step 2)
Step 4:	Calculate 2021 Proposed Forecast Depreciation	Cost at 2021 Year End / Average proposed rate (Step 3)

The $666,498 thousand "cost at 2020 year end" is built up from all categories and Class ID's listed on Schedule 3A. It can be reconciled to Tab 7, Schedule 3 as follows:

Forecast 2020		($M)
Schedule 3, Line 4	Property, Plant and Equipment, balance at end of year	$ 677.3
Schedule 3, Line 12	Construction-in-progress	10.8
		$ 666.5

(b)

There is no basis to calculate depreciation on a mid-year basis. YEC calculates depreciation in accordance with International Financial Reporting Standards. Each asset is depreciated monthly based on its cost. For forecast depreciation, the methodology is the same as it provides the most accurate forecast. As stated in part (a), this forecast is system generated. Our understanding is this is not a change from previously approved YEC depreciation expense calculation methodology.

(c)

YEC depreciates assets on a straight-line basis using 'Years' in accordance with International Financial Reporting Standards. As YEC uses straight-line depreciation, use of 'Years' or 'Rates' does not result in any differences in calculations. Years are the inverse of Rates. This is not a change from previously approved YEC depreciation expense methodology.

(d)

The depreciation expense methodology described in parts (a), (b) and (c) are consistent with the basis of the annual depreciation estimates as described in the Tab 9 Depreciation Study on page 9-6.

(e)

A comparison to Depreciation Study Differences as per the Depreciation Study compared to Schedule 3A is provided below:

	Per Depreciation Study	Per Schedule 3A	Variance
Land	-13	-13	0
Hydro Plant	-140,298	-140,465	167
Diesel Production	-88,166	-70,208	-17,958
Main Transmission Facilities	-79,597	-79,597	0
Sub Transmission Lines	-46,022	-45,813	-209
Distribution System	49,971	1,329	48,642
Building and Other Equipment	-67,334	-18,982	-48,352
Transportation	19,268	19,267	1
LNG Production	-13,981	-13,981	0
	(366,172)	(348,463)	(17,709)

The differences above result due to a timing difference between when the Depreciation Study was performed and the current asset base. There is a variance in the Diesel Production class as Schedule 3A was updated for the retirement of the Mirlees diesel engines which were previously included in the Diesel Production Depreciation Differences calculation. As a result, International Financial Reporting Standards and the Auditor General of Canada required the 2019 Diesel Depreciation differences from a previous amount of $101,236 per year to $80,615 per year (a reduction of 20.4%). Therefore, the adjusted amount of $80,615 is the 2021 Existing Forecast Depreciation amount found in Tab 7, Schedule 3A. YEC needed to adjust the 2021 Proposed Forecast Depreciation for this change in its actual existing depreciation study difference amount. The calculation to obtain this is as follows:

	Per Depreciation Study	Adjustment for Mirlees Retirement (%)	Adjustment for Mirlees Retirement ($)	Per Schedule 3A
Diesel Production	$ (88,166)	20.4%	$ 17,959	$ (70,208)

The other variance in depreciation differences between the Depreciation Study and Schedule 3A is a reclassification of assets, and therefore, depreciation differences between the classes of Distribution System ($48,642) and Building and Other Equipment ($-48,352) leaving an insignificant variance of $290. The amounts in Schedule 3A should be used for regulatory purposes as those amounts will be used for accounting purposes according to International Accounting Reporting Standards.

(f)

There is not a change from previously approved YEC depreciation expense methodology.

(g)

As discussed in part (e), the depreciation study Appendix A is being used as the basis for the calculation of depreciation study differences, subject to the adjustments also noted in part (e).

(h)

Appendix A is being provided in native format. Since the computations have links to other tabs in the workpaper the complete workpaper is being provided as Attachment 1 to this response.

(i)

Certain true-ups in the depreciation reserve are used to comply with prior Board actions. The format of presentation is the same as in the Company's last depreciation study.

(j)

The Application referenced Schedule 3B in error. There is no Schedule 3B.

Note: The following accounts were excluded from the depreciation study:
1615-504
1620-504
Asset 7060 removed from asset group 1615-506
Asset 8856 transferred from asset group 1645-200 to 1615-201

REFERENCE: **Application, Section 1.2, Table 1-2, footnote 1, page 1-6; Section 3.4, page 3-22**

ISSUE: **Depreciation Expense**

QUOTE: From footnote 1, Table 1-2:
"1. Excludes depreciation rate changes & impact of accelerated amortization of VGC Group contributions."

From Section 3.4:
New contributions since 2018 include $11.5 million from VGC Group to fund McQuesten Substation and system improvement capital costs, which contributions are being amortized over the expected 12 year life of the Eagle Gold mine."

"Accelerated amortization of VGC Group contributions related to McQuesten Substation and system improvement costs result in these assets reducing total depreciation and amortization costs by $0.665 million in the 2021 test year."

PREAMBLE: Referring to Table 1-2, YEC states that "depreciation (fixed asset increases)" increases by the amount of $1.154 million when comparing "2021 GRA over 2018 Approved" revenue. Further, YEC provides footnote 1 which states that the $1.154 million increase "excludes depreciation rate changes & impacts of accelerated amortization of VGC Group contributions."

QUESTION:

a) Please provide further information detailing the how the contribution amount was determined and any agreement between parties (if required) with respect to the $11.5 million contribution from VGC Group to fund McQuesten Substation and system improvement capital costs.

b) Please provide the calculation of the $1.154 million increase noted in the preamble and include a complete reference to where the information used in the requested calculation can be found in YEC's supporting Tabs.

c) Please provide the calculation of the $0.665 million decrease as quoted and include a complete reference to where all information used in the requested calculation can be found in YEC's supporting Tabs.

d) Please provide further detail with respect to the contributions being amortized on an "accelerated" basis as compared to the amortization periods and rates YEC uses for other contribution amounts. Please also explain whether the contribution assets at issue are collectively the "McQuesten Substation and system improvement costs" of [sic] some portion thereof.

e) Please clarify whether YEC had previous Board approval for the 12-year amortization period being used and, in the absence of previous Board approval of a 12-year amortization period, what the expected average service is for the contribution assets at issue.

ANSWER:

(a)

Under the VGC Power Purchase Agreement (PPA), VGC Group is responsible for funding the construction of the McQuesten Substation and certain identified system improvement capital costs. More specifically, the contribution was determined as follows:

McQuesten Substation contribution	$10.688
System Improvement contribution	$0.840
	$11.528

- McQuesten Substation responsibilities and costs are set out in Schedule B to the PPA. Except as otherwise specified in the PPA, VGC Group was responsible for developing and funding all of the costs of the McQuesten Substation (including actual final YEC Owner's Costs) prior to turning the facility over to YEC for ownership and commercial operation. The only McQuesten Substation costs funded by YEC related to the costs specifically required for the facility to be able to be operated at 138 kV voltage if so required at some future time. YEC provisions for payments to VGC Group are set out in Section 6.1 (c) and (d) of the PPA. The McQuesten Substation is required to connect the VCG Group's Mine Facilities to

YEC's Transmission Facilities. YEC's Transmission Facilities also supply electricity to other customers in the Keno region, including Alexco Resources.

- Initial system improvement costs of YEC to be funded by VGC Group are set out in Schedule C to the PPA, with an estimate of $1,677,883. Payment provisions are detailed in Section 6.1(b) of the PPA. These system improvements are required to enable YEC to provide electricity service to the VGC Group's Mine Facilities.

- The PPA provisions for VGC Group contributions were intended to result in VGC Group fully funding the costs as noted so as to ensure that other ratepayers would not be subject to any future cost risks related to these amounts.

(b)

The $1.154 million increase is the increase in depreciation costs for fixed assets prior to any changes in depreciation rates and prior to the impact of accelerated amortization of VGC Group contributions. This amount is calculated as follows (subject to rounding):

1. The increase (after customer contributions) of $0.490 million for 2021 Fixed Asset Depreciation under Existing ($7.034 million) versus 2018 Approved Fixed Asset Depreciation ($6.544 million) as provided in Table 3.14 of the Application; plus

2. The added customer contribution amount for 2021 of $0.665 million due to the accelerated amortization of VGC Group contributions (see response to "c" below).

(c)

The $0.665 million decrease in net depreciation in 2021 represents the impact of the addition of McQuesten Substation and system improvement capital costs net of contributions. The total is determined as follows:

Capital Costs - $11.5 million	
Depreciation (54 years)	$0.214
Return on rate base	$0.572
Contribution - $10.688 million	
Depreciation (12 years)	($0.961)
Return on rate base	($0.489)
Net Increase in Depreciation	**$0.665**

Return on rate base calculation is based on average 5.166% per Table 3.15 average cost of debt and equity. Additional explanation as follows:

1. Total contributions for McQuesten Substation ($10.688 million contribution – see Section 5.2.1.4 of Application) and system improvements ($0.840 million – the balance of the $11.528 million VGC contributions related to these YEC assets. These assets were in YEC rate base in 2020. The attributed value for McQuesten Substation costs as funded by VGC Group has been included in YEC's costs included in rate base and subject to depreciation.

2. Costs funded by VGC Group for these facility contributions are amortized over an approximate 54 year average asset life (see Appendix 4.3, Table 4.3-1 for confirmation of approximate 54 year amortization of YEC's net McQuesten Substation Costs), resulting in annual depreciation of $0.214 million for the $11.5 million referenced amount; 2021 return on this portion of the rate base cost approximates $0.572 million, resulting in a total annual 2021 cost in the proposed revenue requirement at $0.785 million.

3. However, the related contributions are amortized over an approximate 12 year life of the Eagle Gold mine, resulting in annual amortization of $0.961 million; 2021 return reduced on this portion of the rate base cost approximates $0.489 million, resulting in a total annual 2021 contribution impact on reducing revenue requirement at $1.450 million.

4. The difference between contribution amortization over approximately 12 years (step 3 above) versus over the approximate 54 year asset life (step 2 above) is $0.665 million for 2021, with a variance in annual amortization of $0.747 million being partly offset by a decrease in rate base return of $0.083 million.

(d) and **(e)**

The referenced VGC Group contributions are all being amortized over the approximate expected 12 year life of the mine as required by YEC's auditors (the Auditor General of Canada) in accordance with International Financial Reporting Standards (IFRS) for customer contributions. YEC has not had any prior Board approval for the 12-year amortization of these contributions, nor any direction from the Board not to follow IFRS with regard to these contributions, although this treatment aligns with the approach directed by auditors with respect to the contributions to transmission system received from the Minto Mine customer. The expected life of the related assets is as shown for the amortization of the costs, i.e., approximately 54 years.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-6 and 9-16**

ISSUE: **Depreciation Expense**

QUOTE: **"Basis of Depreciation Estimates**

The straight-line, broad (average) life group, remaining-life depreciation system was employed to calculate annual and accrued depreciation in this study. In this system, the annual depreciation expense for each group is computed by dividing the original cost of the asset less allocated depreciation reserve less estimated net salvage by its respective average life group remaining life. The resulting annual accrual amounts of all depreciable property within a function were accumulated, and the total was divided by the original cost of all functional depreciable property to determine the depreciation rate. The calculated remaining lives and annual depreciation accrual rates were based on attained ages of plant in service and the estimated service life and salvage characteristics of each depreciable group. The computations of the annual functional depreciation rates are shown in Appendix A."

"Depreciation True Up Calculation

Annual depreciation expense amounts for the depreciable accounts of Yukon Energy were calculated by the straight-line method, average life group procedure, and remaining-life technique. With this approach, remaining lives were calculated according to standard ALG expectancy techniques, using the Iowa Survivor Curves noted in the calculation. For each plant account, the difference between the book depreciation reserve and theoretical depreciation reserve, was divided by the average remaining life to yield the annual depreciation true up. These calculations are shown in Appendix A.

Depreciation Rate Calculation Process

Annual depreciation expense amounts for accounts all accounts were calculated by the straight-line, average life group procedure, whole-life technique.

These calculations are shown in Appendix A. The calculations of the theoretical depreciation reserve values and the corresponding

remaining life calculations are shown in workpapers. Book depreciation reserves were based on Company individual accounts and the theoretical reserve computation was used to compute a composite remaining life for each account."

PREAMBLE: The above quotes refer to the use of a remaining-life depreciation system; remaining-life technique and whole-life technique.

QUESTION:

a) Please fully explain the difference between each of the remaining-life depreciation system, remaining-life technique and whole-life technique references. Please also include an explanation of how each are incorporated and used within YEC's depreciation expense calculations.

b) Please provide a copy of the interview notes (as between YEC and Alliance Consulting Group) prepared during the course of YEC's depreciation study.

c) Please clarify that all data relied on during the preparation of YEC's depreciation study was actuarial-based and did not contain any simulated data.

d) YEC indicates in many instances "there was insufficient transactional data for an actuarial life analysis" notwithstanding that this statement was accompanied by other operational observations which implied the existence of actuarial data. Please provide a retirement rate analysis (observed life table) for each depreciation study account including the plotted actual data points and proposed survivor curve.

e) Please provide a calculated annual accrual and accrued depreciation for each depreciation study account.

f) Please clarify if YEC uses amortization accounting for all depreciation study accounts that have been assigned the use of a square curve (SQ). If not confirmed, please explain fully how YEC accounts for asset retirements for depreciation study accounts using an SQ.

g) Please explain the basis for YEC's asset classes and groupings. If YEC has relied on information respecting asset classes and groupings from other jurisdictions, please provide a copy of that information including a description of the assets that should be recorded into each separate asset class and grouping.

ANSWER:

(a)

The calculation of depreciation rates for YEC used the whole-life technique. The difference between the actual and calculated accumulated provision for depreciation for each group was allocated to future periods using the average remaining life for each group. Effectively, this translates into the remaining life technique. Please see the attached excerpt from Depreciation Systems for an explanation of the differences between the whole-life and remaining life techniques.

(b)

Please see Attachment 1 to this response (interview notes).

(c)

All data relied upon was actuarial.

(d)

Please see Attachment 2 to this response.

(e)

Please see response to YUB-YEC-1-109 for the requested information.

(f)

Alliance Consulting Group is interpreting the question in being vintage group amortization as set for the USA FERC accounting release 15.

https://www.ferc.gov/enforcement-legal/enforcement/accounting-matters/vintage-year-accounting-general-plant-accounts

YEC does not use amortization accounting. Asset retirements are made by YEC based on when assets are taken out of service. The SQ curve assigned in a few accounts in the depreciation study are assigned due to the lack of sufficient historical transactional data in which to determine a specific retirement dispersion. Therefore, those accounts were assigned a SQ dispersion.

(g)

YEC has developed a fixed asset catalog which details its system of accounts and the components within each account. Please see attachment 1 to this response.

Yukon Energy Interviews 5-6-19

IT – creating an integrated IT/communication asset management plan.
Communications towers – the current life is 30 years. They are there for satellite and microwave. They design for a 30-year life. The towers would likely have a longer life than 30 years.

Communication equipment (confirm that network equipment is in this account) – split network equipment (maybe 10-year life) from other communication equipment life satellite (possibly 30 years) and microwave (possibly 30 years) and phones (maybe 10 year life). Split network and set 10 year life, Other comm equip 25 year life.

Comm fencing should last longer than 20 years – maybe 30 years.

Computer hardware – servers, pcs, printers, etc. 70 percent of workstations are 4 years old or older. They don't have a solid refresh cycle or plan yet. Servers would have a longer life. The 7 year life seen is reasonable for now. They expect the life to decrease as they implement a management plan.

Computer software – they will give list of software with in-service dates and expected lives. Then we will look at buckets to separate software.

One wind monitoring site – will likely be out of this process within a year. It might be 10 years old now. At least move down to 15 years.

Operations
Transmission poles - Transmission Line Refurbishment (TLR) – Test and treat inspection and detailed line inspections. Results came back with prioritization to replace. The assets being replaced are around 50 years old. They would expect the same 50-year life for the remaining assets (with the caveat that there are no retirements). They are now using steel cross arms. Transmission poles in majority are capitalized when replaced but the original pole is not retired. New lines are capitalized.

Distribution – 25kv and less. Permafrost will put more stress on poles. ROW is narrower, closer to vehicles, shorter and lower-class poles. They would expect a shorter life than transmission – maybe 40 years. Replacements are charged to O&M. Only new lines are capitalized. They mostly use penta treatment.

Sub-transmission – 34.5kV – They have no 34.5kv lines. What is in this account? Life should follow what type. Teslin line? Built but another party operates.

Transmission – above 34.5kV. They are doing Distribution test and treat (no formal program though).

Over the last 3 years, they started using the "restoration fund" for removal cost.

What is Mnt Mn???

Brushing – capital clearing of ROW for new lines. There is a 10-year cycle for clearing brush on ROW – which is O&M. Setting the life to the life of the poles (or possibly ROW) is reasonable.

Transmission conductor – They would expect a longer life for conductor. They will replace poles without replacing conductor. Not a corrosive environment. Fire retardant will coat insulators and can cause replacements. Glass insulators are the norm. On some structures where it is anticipated that the line will be replaced within the next 20 years, they will use polymer insulators. They would expect maybe a 60-year life for transmission conductor.

Distribution conductor – Load growth would be a primary driver for replacement of conductor. There are a few extra reasons for replacing distribution conductor as compared to transmission conductor. They would expect a slightly shorter life for distribution conductor. A 50-year life is reasonable.

Distribution Services – most services are overhead. The capacity requirement for customers keep increasing (affecting both services and transformers). Many of the communities have older infrastructure. Commercial services would have a shorter life than residential services. Leaving the life at 40 years is reasonable.

Distribution UG – only substantially in 2 locations (Dawson and Farrow primarily) – They will often run a spare conduit with laying UG. Cable staying at a 40-year life is reasonable. Moving out to 50 years for conduit is reasonable.

Substation Equipment Transmission – 54 (versus 40 for distr) – transmission stations and distribution stations are in the same footprint. Differences between transmission sub equipment and distribution is primarily the voltage level – basically the same equipment in both. Distribution equipment would have a shorter life due in part to the faults that would reach distribution but not transmission, the number of operations on distribution would be higher, higher relative currents (and therefore more heat) in distribution, and the degree of attention that is focused on transmission brushing. Transformers – 40-50 year life, breakers 35 years from OCB and 50 from SF6. 7 HV breakers will be replaced in 2019 and 5 LV replaced in 2018. The 54-year life is too long considering the higher level of electronics and the move to SF6. Suggest making transmission 40 years and distribution 35 years.

Substation fencing – the 30-year life is reasonable.

Meters – 100% digital (or close). Current life is 30 years. Move to 16 years. Industry Canada Have to pull at 8 years, and if tested good, get another 5 years, and if sample is good, another 3 years. Then done. 16 years is the maximum life.

Line transformers- 40 years is a little long. Line transformers are subject to higher loading due to growth. Voltage fluctuations will also tend to shorten the life. This will shorten the life of the transformers. Suggest moving to 35 years.

Street lighting – 100% LED. There were a large number of failures at original installation. Replacement of heads would be O&M. Leaving at 40 years is reasonable.

Generation
Diesel plant – In White horse - 7 units in building (2 retired, one about to be – all three of same design - Mirrelees units) They lost vendor support for the Mirreless. 4 units remaining. 4 reciprocating diesels.

Most diesels are Catepillar engines across the system. They retire based on hrs of use. Diesels are back-up/peaking (100K until retirement) – they run very seldom. Gas is 60k hrs until engine replacement. 5-year capital plan is starting to look at retiring one unit every 5 years. Major overhauls ($350k) are capital. Gas overhauls (6k hr) are capitalized. Time between overhauls is based on use. The 5-year overhaul period is short – suggest moving to 10 years. Minto is the controls for a plant that wasn't purchased and is being amortized – continue the amortization at current. The structures and building lives are reasonable. Fuel holder life of 25 years is low. They will provide in service dates for tanks. 40 years is more reasonable. For the generators/prime movers, the block will last 40 years or more but some components will have a shorter life. Staying at the 40-year life is reasonable.

Hydro

Every 10 years, tear down and inspected. Uprating one unit in 2020. 2 run of the river and 1 multi-year storage plants. Mayo – discussions are in play to retire one of the Mayo units (not the dam – just the units) but not firm enough to use in the study.

Life of dams, overhauls, digital electrical, misc and fences as approved are reasonable. Accessory electrical should move to 40 is reasonable. Runners/generators should move to 60 years – they have already replaced runners at under 60 years and rewound generators at under 60 years. Other units are being looked at for efficiency improvements as well.

LNG Plant – 3 units, 4 day full run capacity. In-service 2 in 2015 and 1 in 2018. These are first run units. Over 7500 hours since 2015 (2018 unit has over 3k hours). They think around 4k hrs per year for each unit. Structures, accessory electrical, misc and fencing lives are reasonable. Fuel holder life of 32 years is short. They are nickel, double walled tanks with no moisture ingress. With reasonable maintenance, a 60 year life is reasonable. Their projection is that the generators will need to be replaced at 15 years (which would be 60k hours at the current projected rate). The vaporization process (NEED TO FIND OUT WHERE THIS IS BOOKED) will have a shorter life (maybe 30 years).

Transportation

IF a vehicle is 8 years or older and has 160k KM and incurred greater 15% maintenance cost in one year. They are behind on their schedule.

Utility vehicles – currently at a 7 year life. Line crews use for 7 years (that is held to well). Occasionally, a quad or snow mobile will move to a plant and have a longer life (probably around 80% do not). Moving the average out to 8 years to reflect the 20% that stay longer.

Sedans/Station wagons – currently a 7 year life. They are lasting longer – between 10-12 years years (landing on 11 with a steep dispersion is reasonable).

Pole trailers – the 25 year approved is reasonable.

Trucks – ¾ to 2 ton – 10 years is approved. Electrician($90k)/operations ($70) vehicles would only drive at a level that 10 years is reasonable. Linemen ($115k) would hit the maximum mileage in 3-4 years but other factors would let you keep them longer. They will be replaced by 8 years. There are equal numbers of each. Moving to a 9 year life for the average is reasonable.

Trucks greater than 3 ton – the approved 20 years is reasonable. They just spent $40k to overhaul a 10 year old vehicle.

Trucks – Foremost – tracked vehicle ($534k) and 2011 auger equipped Kenworth truck. The live should match the life of the greater than 3 ton trucks of 20 years.

Facilities Sean Munro Manager, Property & Projects

Furniture/Equipment – approved life is 20 years. When furniture is removed from a location, it is either transferred or disposed of. It is generally no reused. Michael can address the life.

Structures Hydro – hydro structures are on the water so they would have a little shorter life for various components. However, 40 years is shorter than expected. The newer buildings are more technology driven and have a little less longevity than the older built structures. Moving both hydro and non-hydro structures to 50 years is reasonable.

Some components of structures have a shorter life than the building itself. For example, Electrical panels (25 years), furnaces (15-20 years), fire alarm panels (20 years), flooring replacement (25 years), exterior (25-30 years),

Housing – currently 30 years is approved. The newest house is from 2005 and oldest is from pre-1980. 30 years is to low. Moving the life out to 40-year life is reasonable.

Fire protection systems – there is a large focus on fire protection and there is short life for the equipment (try to achieve 20 years maximum).

QUOTE: "Account 1615-201 Hydro Buildings and Improvements 40 R2.5

This account is a newly created group. In 2019, an asset previously booked in account 1645-200, Buildings- Structures and Improvements. The asset is an elevator at Aishihik Hydro plant. The plant balance in this account will be $10.3 million. The approved life and curve for this account is 40 R2.5. Based on information provided by Company personnel and judgment, this study recommends retaining the existing 40 R2.5 for this account."

QUESTION:

a) Please provide further rationale for the proposed 40-R2.5 life and curve for Account 1615-201, which is a "newly created group" of assets that were previously within Account 1645-200 and for which YEC is now proposing a 50-R2 life and curve.

b) Please clarify the specific information provided by Company personnel that supports a 40-R2.5 life and curve for this account.

ANSWER:

(a)

The elevator that YEC moved to this new account is dissimilar (both in characteristics and life) to other building assets in the originating account such as berms, roads, boilers, etc. Mr. Dane Watson, Managing Partner of Alliance Consulting Group is a Professional Engineer in the State of Texas and Certified Depreciation Professional. In Mr. Watson's professional opinion, the majority of elevator components would have a shorter life than the 50 years in its original account. Mr. Watson inspected those facilities on a site visit in 2019. Using his professional judgment, Mr. Watson estimated a decrease in life of 10 years as compared to its originating account and increased the amplitude of the Iowa Curve from an R2 to an R2.5 to reflect slightly more homogeneous asset characteristics.

(b)

Other than the inspection, information on the transfer and description of the asset, no other information was received by Alliance Consulting Group.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-24**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1615-506 Hydro Water Wheels, Turbines, and Generators 60 R3

This account consists of water wheels, turbines, and other related assets used in hydro production including runners, gates, regulator systems, generator cooling systems, and generators. The plant balance in this account at December 31, 2018 is $26.3 million. The approved life and curve for this account is 85 R3. Operational personnel stated the approved life is too long, and that they have already replaced runners and rewound generators prior to reaching 60 years. There was insufficient transactional data for an actuarial life analysis. Based on information provided by Company personnel, this study recommends decreasing the life to 60 years and retaining the R3 curve for this account."

PREAMBLE: YEC is proposing a significant reduction (of 25 years) in average service life for this account.

QUESTION:

a) Please provide the dollar amount of retirements by transaction year and vintage for the years 1998-2018.

ANSWER:

(a)

YEC is not able to provide the detailed information requested given the considerable time and effort it would take to collect and summarize this information and its limited relevance to the current review process.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-25**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1615-600 Hydro Accessory Electrical Equipment 40 R2.5
This account consists of generator controls, bus equipment, and other related assets used in hydro production including auxiliary generators, switching equipment, excitation systems, and station control systems. The plant balance in this account at December 31, 2018 is $26.6 million. The approved life and curve for this account is 45 R3. Based on information provided by Company personnel and the indications from the actuarial analysis, this study recommends decreasing the life to 40 years and moving to an R2.5 curve for this account."

QUESTION:

a) Please clarify the specific information provided by Company personnel that supports a reduction (of five years) in average service life for this account.

ANSWER:

(a)

Documented information is shown below.

YEC's fixed asset catalog provides the following description of various assets in this account.

> This account shall include the installation costs of auxiliary generating apparatus, conversion equipment and equipment used primarily in connection with the control and switching of electric energy produced by hydraulic power and the protection of electric circuits and equipment, except electric motors used to drive equipment included in other accounts, such motors being included in the account in which the equipment with which they are associated is included.

Note A: do not include in this account transformers and other equipment used for changing the voltage or frequency of electricity for the purpose of transmission or distribution.

Note B: when any item of equipment listed herein is used wholly to furnish power to equipment, it shall be included in such equipment accounts.

Components of cost:

1. Auxiliary generators, including boards, compartments, switching equipment, control equipment and connections to auxiliary power bus.
2. Excitation system, including motor, turbine and dual-drive exciter sets and rheostats, storage batteries and charging equipment, circuit breakers, panels and accessories, knife switches and accessories, surge arrestors, instrument shunts, conductors and conduit, special supports for conduit generator field and exciter switch panels, exciter bus tie panels, generator and exciter rheostats, special housings, protective screens, etc.

3. Generator main connections, including oil circuit breakers and accessories, disconnecting switches and accessories, operating mechanisms and interlocks current transformers, potential transformers conductors and conduit special support for generator main leads, grounding switch, special housings, protective screens, etc. station buses, including main auxiliary, transfer, synchronizing and fault ground buses, including oil circuit breakers and accessories, disconnecting switches and accessories, operating mechanisms and interlocks, reactors and accessories voltage regulators and accessories, compensators, resistors, starting transformers, current transformers potential transformers, protective relays, storage batteries and charging equipment; isolated panels and equipment, conductors and conduit, special supports, special fire extinguishing equipment and test equipment.

4. Station control system including station switchboards with panel wiring panels with instruments and control equipment only, panels with switching equipment mounted or mechanically connected, truck-type

switchboards complete, cubicles, station supervisory control devices, frequency control equipment, master clocks, watt-hour meter, station totalizing watt meter, storage batteries panels and charging sets, instrument and transformers for supervisory metering, conductors and conduit, special supports for conduit, switchboards, batteries, special housing for batteries, protective screens, etc.

During informal discussions in the interview process and site visits, Company SMEs related that they are seeing operational lives decreasing for many of the components (especially electronic) in this account. They concurred with the limited actuarial analysis indications that the overall operational life for assets in this account were decreasing slightly. The formal interview notes document that Company personnel indicated that given the components in this account, a slight reduction in the life of this account was appropriate.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-32**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1620-403 Diesel Fuel Holders, Producers, and Accessories 40 R2
This account consists of pumps, storage tanks, natural gas/fuel oil piping and other related assets at the diesel production plants. The plant balance in this account at December 31, 2018 is $1.7 million. The approved life and curve for this account is 25 R2. Discussions with operational personnel stated the existing life seems short, that many of the existing assets are approximately 15 to 20 years old, are still reliable, and not currently in need of replacement. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends increasing to a 40 year life and retaining the existing R2 curve for this account."

QUESTION:

a) Please clarify that the observations made by Company personnel supporting an increase (of 15 years) in average service life are generally applicable to all assets in this account.

ANSWER:

(a)

The statements above was not necessarily intended to apply to every component in this account. Below is an extract from the Company's capital assets accounting manual.

This account shall include the installation costs of fuel handling and storage equipment used between the point of fuel delivery to the station and the intake pipe through which fuel is directly drawn to the engine and the cost of gas producers and accessories devoted to the production of gas for use in prime movers driving main electric generators.

Components of cost:

1. Coils;

2. Heating piping and valves;

3. Pumps;

4. Fuel scrubbing equipment; and

5. Tanks and fuel oil storage.

With input from the SMEs that many of the assets are nearing the current average service life, there were no concerns with reliability and no plans in place to begin replacement, an extension in life was appropriate and found reasonable by Company SMEs. Based on SME input that some items would likely last 60 years (i.e., Nickel, double walled tanks with no moisture ingress) and Mr. Watson's experience with similar accounts over 35 years, using judgement, a 15-year increase was recommended. With group accounting for utility property, the goal is to establish an average service life for the entire group given the mix of assets and lives within the group.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-37**

ISSUE: **Depreciation expense**

QUOTE: "Account 1625-300 Dist. System - Poles and Fixtures 40 R2

This account consists of the installation costs of poles and fixtures used for supporting overhead distribution conductors and service wire. The plant balance in this account at December 31, 2018 is $8 million. The approved life and curve for this account is 35 R2. Discussions with operational personnel stated that right of ways are narrower for distribution, putting the poles closer to vehicles and making them more susceptible to being damaged. Additionally, permafrost puts more stress on the shorter, lower class poles. Overall, operations estimates the life of distribution poles to be 10 years less than transmission poles, which use a life of 50 years. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends moving to a 40 R2 for this account.

PREAMBLE: Statements in the above quote appear to conflict with YEC's proposed increase (of 5 years) in average service life for this account.

QUESTION:

a) Please clarify how the increased susceptibility to damage from narrow rights-of-way and permafrost to YEC's distribution system poles and fixtures is consistent with a proposed increase (of five years) in average service life for this account.

ANSWER:

(a)

The discussion above is contrasting the life of distribution poles with those of transmission poles. The current (and proposed) life of transmission poles is 50 years. The discussion notes the reasons that distribution poles would have a shorter life than transmission poles. A 35-year life for distribution poles is low compared to industry experience based on

Alliance Consulting Group's work across North America. A slight increase in life was discussed with operations personnel. Based on the noted discussion, a 10-year spread between transmission and distribution pole life was thought appropriate both to the Company SMEs and Alliance. The 5-year increase was to move the distribution pole life to 40 years as compared to the 50-year life of transmission poles.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-38 and 9-40**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1625-304 Dist. System - Brushing 50 R2
This account consists of costs associated with the brushing of the distribution system. The plant balance in this account at December 31, 2018 is $45 thousand. The approved life and curve for this account is 50 R2. The Company capitalizes the brush clearing of ROWs when installing new lines. Operations stated the existing life is reasonable and matches the life of O/H Conductor, which have a 50 year life."

"Account 1625-401 Dist. System – O/H Conductors 50 R2
This account consists of overhead conductors and other facilities associated with the distribution system. The plant balance in this account at December 31, 2018 is $75 thousand. The approved life and curve for this account is 35 R2. Discussions with operational personnel stated they would expect the life of distribution conductor to be shorter than transmission conductor. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends increasing the life to 50 years while retaining the R2 curve for this account."

QUESTION:

a) Notwithstanding YEC's operational personnel statement that distribution system O/H conductors should have a shorter life than transmission system O/H conductors, what other factors and rationale support a 50-R2 life and curve for this account?

ANSWER:

(a)

Factors contributing to the selection of a 50-year life include Alliance's experience in analyzing the life of conductor for numerous companies and the similarity between

transmission and distribution conductor adjusted for the higher level of exposure for distribution conductor to failure from third-party damage or trees. Typically, the characteristic of overhead conductor would suggest that the conductor would have a slightly longer life than the poles the conductor is strung on and also a slightly longer life than services. These factors, along with the input of Company SMEs all suggest that a 50-year life is reasonable for distribution conductor.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-39**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1625-305 Dist. System – Survey Costs 50 R2
This account consists of costs association with land surveys and assessments related to distribution easements. The plant balance in this account at December 31, 2018 is $600 thousand. The approved life and curve for this account is 50 R3. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends retention of the existing 50 year life with a slight change in the curve to an R2 for this account."

QUESTION:

a) On what basis is YEC able to propose a change to a 50-R2 life and curve from the approved 50-R3 life and curve without the benefit of an actuarial life analysis?

b) Please provide the directional impact of the change proposed in terms of an increase or decrease to depreciation expense for this account for the year 2021.

c) Please clarify if the proposed life and curve for this account is intended to match that of Account 1625-304 Dist. System – Brushing and Account 1625-401 Dist. System – O/H Conductors.

ANSWER:

(a)

The proposal to change the dispersion curve is based on Alliance Consulting Group's judgment and experience. We have performed more than 270 depreciation studies across North America and have had many opportunities to see the various retirement patterns of utility assets. Given the characteristics of these assets and the dispersion of the other related assets, moving to a slightly flatter dispersion would better reflect the retirement characteristics.

(b)

There is no change to depreciation as the life has not changed and YEC uses straight-line amortization.

(c)

Yes, in part. It is reasonable for the retirement pattern for survey costs to match the other asset groups mentioned in the question and the pattern matches the expectations for this type of asset.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-41 and Comparison of Life Parameters, page 9-104**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1625-401 Dist. System – O/H Services 40 R2
This account consists of installation costs associated with overhead services such as transmission line installation and upgrades. The plant balance in this account at December 31, 2018 is $2.1 million. The approved life and curve for this account is 40 R2. Discussions with Company personnel indicated the majority of services are overhead. The Company is experiencing an increased number of new services and need to update aging infrastructure. Operations stated commercial services would have a shorter life than residential services. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends retention of the 40 R2 life and curve for this account."

QUESTION:

a) Please confirm whether Tab 9, Depreciation Study, page 9-41 contains a typographical error in referencing "Account 1625-401 Dist. System – O/H Services 40 R2" and should correctly state "Account 1625-410 Dist. System – O/H Services 40 R2" as indicated on page 9-104. If not confirmed, please explain.

b) Please describe at a high level the proportion of O/H service installations that are commercial versus residential for the years 1998-2018 and explain how this information does or does not influence retention of the 40-R2 life and curve for this account.

ANSWER:

(a)

The information life of the account 1625-401 is stated incorrectly on page 9-41. The information on page 9-104 is correct. The current life of this account is 35 R2. The

proposed life for this account is 50 years with a R2 dispersion. The graph depicted on page 41 is not correct for this account.

(b)

The proposed 40-year life referenced in the question is not correct as indicated in part (a). Alliance Consulting Group did not consider the commercial versus residential load specifically. There is no evidence that the life characteristics would be materially different between the two types of services. The interview notes with Company personnel stated:

> Distribution conductor – Load growth would be a primary driver for replacement of conductor. There are a few extra reasons for replacing distribution conductor as compared to transmission conductor. They would expect a slightly shorter life for distribution conductor. A 50-year life is reasonable.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-44**

ISSUE: **Depreciation Expense**

PREAMBLE: For each of Account 1625-610 Dist. System – Meters and Account 1625 620 Dist. System – Meter Equipment, YEC has proposed a change to a 16-SQ life and curve from the approved 30-R2 life and curve in part because it "pulls meters for testing at eight years and based on test results may use the meter up to 16 years."

QUESTION:

a) Please clarify whether the decision to pull meters for testing at eight years is a change in policy from any policy that was in place when a 30-R2 life and curve was approved for this account.

b) Referring to the response to part (a) above, was the change in policy based on internal or external factors? Please explain fully.

c) Please provide observed life tables and the plotted actual data points with the approved 30 R2 survivor curve for each of the two accounts referenced in the preamble.

ANSWER:

(a)

The decision to pull meters for testing at eight years was an operational decision based on experience of the Electrical department with use of these meters and was not based on any policy.

(b)

YEC has installed AMI meters in these accounts. The changes in meter life expectancy have occurred because the new meters are different in operation than electro-mechanical meters of the past. In Alliance Consulting Group's experience, no AMI meters across North

America have a life as long as the existing 30-year life. At the time of Mr. Watson's site visit in 2019, Company experts made the following observations:

> Meters – 100% digital (or close). Current life is 30 years. Move to 16 years. Industry Canada Have to pull at 8 years, and if tested good, get another 5 years, and if sample is good, another 3 years. Then done. 16 years is the maximum life.

(c)

In the case of assets where technology or regulation has changed, historical experience does not predict the future of the Company's existing assets. Notwithstanding the above, the requested information is provided in the following attachment:

- Attachment 1 - Acct 1625-620'; and
- Attachment 2 - Acct 1625-610'.

Observed Life Table

QUOTE: "Account 1625-710 Dist. System – Substation Equipment 40 S0
This account includes all distribution substation equipment such as bus compartments, control equipment, ground rods, foundations, and conversion equipment, switching equipment, and switchboards. The plant balance in this account at December 31, 2018 is $1.3 million. The approved life and curve for this account is 40 R2. Discussions with operations indicated the Company is experiencing a shorter life due to an increased number of faults, more short-lived electronic equipment, and the move to SF6 all decreasing the lives of existing assets. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends a 40 S0 life and curve for this account."

QUESTION:

a) On what basis is YEC able to propose a change to a 40-S0 life and curve from the approved 40-R2 life and curve without the benefit of an actuarial life analysis?

b) Please explain why YEC did not propose to decrease the average service life from 40 years as opposed to changing the curve (from R2 to S0) given the statement that YEC is experiencing a shorter life for these assets.

c) Please provide the directional impact of the change proposed in terms of an increase or decrease to depreciation expense for this account for the year 2021.

ANSWER:

(a)

The proposal to change the dispersion curve is based on Alliance Consulting Group's judgment and experience. We have performed more than 270 depreciation studies across North America and have had many opportunities to see the various retirement patterns of

utility assets. Given the increasingly wide range of lives for assets within this account, the investment mix is believed to be better modeled by a symmetrical and flatter dispersion. This allows a reflection of the additional short-lived electronic components in substations.

(b)

The statements above should be clarified to say the shorter life referred to above is difference between transmission substations in account 1635-710 and distribution substations. Distribution equipment would have a shorter life due in part to the faults that would reach distribution but not transmission, the number of operations on distribution would be higher, higher relative currents (and therefore more heat) in distribution, and the degree of attention that is focused on transmission brushing. Given the different types of equipment between the functions and differences in voltage, Alliance Consulting Group's proposal is similar to that of other North American utilities in our experience.

(c)

There is no change to depreciation as the life has not changed and YEC uses straight-line amortization.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-47**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1625-730 Dist. System – Substation Fences 30 R4
This account includes the costs of fences located at distribution substations. The plant balance in this account at December 31, 2018 is $100 thousand. The existing life for this account is 20 R4. The approved life for this account is 20 years. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends moving to a 30 R4 life and curve for this account."

QUESTION:

a) Please clarify the specific information provided by Company personnel that supports an increase (of 10 years) in average service life for this account.

b) Please confirm whether Tab 9, Depreciation Study, page 9-104 contains a typographical error in referencing an existing SQ Iowa Curve for this account. If not confirmed, please explain.

ANSWER:

(a)

The statements made in Mr. Watson's interviews were opinions of experienced Company operations employees and engineers. No further documentation was provided other than the professional judgment of those individuals and the experience of Alliance.

(b)

Page 104 of Tab 9 shows the current life of this account to be 20 R4. Alliance Consulting Group does not see a reference to the SQ curve for this account.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-49**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1625-905 Dist. System – Line Transformers 35 R2.5
This account includes all line transformers, capacitors, lightning arrestors, and related equipment. The plant balance in this account at December 31, 2018 is $4 million. The approved life and curve for this account is 40 R2.5. Discussions with operations stated the transformers are subject to higher loading due to growth and expect the life of these assets to decrease as a result. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends moving to a 35 R2.5 life and curve for this account."

QUESTION:

a) Please clarify whether the higher loading due to growth in the system has led to increased asset retirements.

b) Please clarify whether the higher loading due to growth in the system has resulted in exceeding the maximum load recommended for YEC's distribution line transformers.

c) Please provide the dollar amount of retirements by transaction year and vintage for the years 1998-2018.

ANSWER:

(a)

There has not been an increase in asset retirements to date. YEC monitors the power flow and demand on the larger system transformers feeding the communities, not distribution transformers. The large transformers are recording increased peak demands, and therefore, YEC assumes a portion of the distribution transformers are also at or above capacity.

(b)

YEC does not monitor real-time small distribution transformer loading. There are circumstances where distribution transformer failures can be attributed to overload. On new customer connects YEC is now installing 25 kva transformers, where in the past 10 kva transformers would have been installed. AEY is also doing similar up rates on transformers for new connects.

(c)

YEC is not able to provide the detailed information requested given the considerable time and effort it would take to collect and summarize this information and its limited relevance to the current review process.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-51 and 9-59**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1635-300 Main Trx - Poles and Fixtures 50 R3
This account consists of poles and fixtures used for transmission purposes. The plant balance in this account at December 31, 2018 is $60 million. The approved life and curve for this account is 65 R3. Discussions with Company personnel indicated the Company has a Transmission Line Refurbishment program in place and has started replacing 50 year old poles. Yukon expects this to continue in the future to address its aging infrastructure. Periodically poles are replaced without having to replace the conductor. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends moving to a 50 R3 for this account."

"Account 1640-300 Sub Trx – Poles & Fixtures 50 R3
This account consists of poles, fixtures, and other related assets used in transmission operations, including anchors, brackets, cross arms, braces, and foundations. The plant balance in this account at December 31, 2018 is $4.1 million. The approved life and curve for this account is 45 R3. Discussions with Company personnel indicated the Company has a Transmission Line Refurbishment program in place and has started replacing 50 year old poles. Yukon expects this program to continue in the future to address its aging infrastructure. Periodically poles are replaced without having to replace the conductor. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends moving to a 50 R3 for this account."

QUESTION:

a) Please clarify whether YEC applies any treatment to its wooden poles as part of a capital maintenance program that would serve to lengthen the expected average

service life. If so, please identify the program under which this capital work is conducted.

b) Please fully explain whether it is the replacement of 50-year-old transmission poles that is the main rationale for the proposed change to a 50-R3 life and curve from the approved 65-R3 life and curve or some other factor.

c) Please provide the expected average service life of the new poles that are replacing the 50 year-old poles being retired due to the refurbishment program.

d) Please provide the dollar amount of retirements by transaction year and vintage for the years 1998-2018.

e) Given that it appears that YEC maintains O/H conductor accounts for each of the poles and towers, please clarify whether YEC is installing any towers as the pole replacement assets and, if so, identify in which account these transmission tower assets are being recorded.

f) Given that it appears that YEC maintains O/H conductor accounts for each of the poles and towers, please clarify whether YEC is installing any towers as part of a new transmission line, and identify in which account these transmission tower assets are being recorded.

g) Referring to the responses to part (e) and (f) above, please provide the expected average service life of YEC's transmission tower assets.

h) Please clarify whether there is any difference in the general type of assets in Account 1635 300 Main Trx – Poles and Fixtures 50-R3 and Account 1640-300 Sub Trx – Poles & Fixtures 50-R3. In the response, please address both poles and towers.

ANSWER:

(a)

YEC established the first Test and Treat in 2009. Test and treat is a process that determines the pole shell thickness above and below grade, treats cavities and eliminates insect infestations.

Remedial test and treat programs consist of the following:

- Test pole for shell thickness, presence of rot/pests/defects.
- Internally treat with preservative.
- Externally treat below ground ground-line with Pole-Wrap Cu Nap bandage.
- Treat exposed heartwood or cavities with Cu Nap.
- Treat and destroy existing insect infestations.
- Determine if any poles require replacement or close monitoring.

(b)

The replacement of poles at 50 years would be a factor in setting the 50-year life. The Company tests poles and routinely performs inspections. After detailed line inspections, YEC prioritizes which assets to replace factoring in those results. Expectations of Company SMEs and Alliance, as well as Alliance's experience across North America, would also be factors in setting the 50-year life.

(c)

Although there may be cases where the poles being replaced are possibly stronger old-growth trees and the replacement poles are from new-growth trees, Alliance's assumption is that new poles would generally have the same life as the poles being replaced.

(d)

YEC is not able to provide the detailed information requested given the considerable time and effort it would take to collect and summarize this information and its limited relevance to the current review process.

(e)

YEC has no plans to “replace” wooden structures with towers.

(f)

There is the potential to install a new tower structure for a future river crossing in Whitehorse Rapids to S171 Riverside substation. It’s too early in the project to confirm this.

(g)

As per the Depreciation Study, the expected life of Towers is 60 years.

(h)

Generally speaking, there is no significant difference in the general type of assets in account 1635-300 and 1640-300 other than one is connected to Main Transmission Facilities and the latter is connected to Sub Transmission Lines.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-52 to 9-55**

ISSUE: **Depreciation Expense**

PREAMBLE: For each of Account 1635-402 Main Trx – O/H Conductors/Poles and Account 1635-404 Main Trx – O/H Conductors/Towers, YEC has proposed a 60-R3 life and curve from the approved 50-R3 life curve based on: "Discussions with operational personnel estimate the life of transmission conductor to be about 10 years longer than distribution conductor, which is moving to a 50 year life." Further, life and curves for Account 1635-304 Main Trx – Brushing and Account 1635-305 Main Trx – Survey Costs are proposed to "mirror the life of overhead conductor, which uses a 60 year life."

QUESTION:

a) Notwithstanding YEC's operational personnel statement that transmission system O/H conductors should have a longer life (by ten years) than distribution system O/H conductors, what other rationale supports a 60-R3 life and curve for these four transmission accounts?

ANSWER:

(a)

In addition to observations from Operations SMEs, Alliance also relied on its experience analyzing similar assets across the utility industry and the characteristics seen in those analyses.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-56**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1635-710 Main Trx – Substation Equipment 45 S0
This account consists of bus compartments, batteries, control equipment, transformers, breakers, and other related station equipment used in transmission operations. The plant balance in this account at December 31, 2018 is $66.6 million. The approved life and curve for this account is 54 S0. Discussions with Company personnel indicated they are experiencing a shorter life for the assets in this account due to the increasing amount of short lived electronic assets at the stations. Operations also stated that transformers typically last between 40 to 50 years; breakers have a 35 year life for OCB and 50 years for SF6. Several breakers have already been replaced in 2018 and 2019. There was insufficient transactional data for an actuarial life analysis. Based on type of assets, information provided by Company personnel and judgment, this study recommends moving to a 45 S0 for this account."

QUESTION:

a) Please explain why substation equipment should not reflect a similar average service life between distribution and transmission function assets. For example, Account 1625-710 Dist. System – Substation Equipment (proposed 40-S0 life and curve) and Account 1635-710 Main Trx – Substation Equipment (proposed 45-S0 life and curve).

ANSWER:

(a)

From an engineering and operations perspective, transmission and distribution assets have materially different forces of retirement and life characteristics. Transmission assets generally have more system protection and designed with higher tolerances. Distribution assets are more subject to faults and voltage variations. Alliance Consulting Group does not normally see the same life between the two asset categories for other utilities. The

general pattern is for transmission substation accounts to have a slightly longer life than distribution substation asset accounts.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-59 to 9-67 and 9-105**

ISSUE: **Depreciation Expense**

PREAMBLE: The Board requires further detail with respect to YEC's sub transmission accounts at the referenced pages.

QUESTION:

a) Please provide detail and rationale respecting the segregation of YEC's transmission assets into a further sub transmission category, which is further segregated into accounts designated as (Minto Mine) "Mnt Mn".

b) Please clarify that, with the exception of those accounts designated by "Mnt Mn" (1640-301, 1640-306, 1640-307, 1640-407 and 1640-711), the depreciation life and curve proposed for YEC's sub transmission asset accounts (1640-300, 1640-304, 1640-401, 1640-405 and 1640 710) are intended to mirror the equivalent main transmission assets under the "1635" series of transmission asset accounts because they generally include the same types of assets subject to the same types of operating conditions. If not confirmed, please explain further.

c) Referring to the sub transmission asset accounts designated by "Mnt Mn" (1640-301, 1640 306, 1640-307, 1640-407 and 1640-711), please explain the rationale for these accounts being amortized on the basis of a 12-SQ life and curve. Please also provide the dates upon which the Minto Mine assets were installed and commenced amortization and why a 12-SQ life and curve remains applicable.

ANSWER:

(a)

Sub-transmission lines have lines designations separate from the main transmission lines. This segregation provides improved and more comprehensive asset management of the lines. Sub-transmission systems are those circuits that supply distribution substations to communities or commercial customers. Common sub-transmission voltages include 34.5, 69, 115, and 138 kV. Further segregation of the Minto Mine was required as those assets

have a different life (life of the mine) in accordance with International Financial Reporting Standards.

(b)

Confirmed.

(c)

In accordance with International Financial Standards and to obtain a clean audit opinion from the Auditor General of Canada, it was determined that these assets were required to have a life equal to the life of the mine.

ISSUE: **Depreciation Expense**

QUOTE: "Account 1645-200 Bldg & Otr – Structures and Improvements Hydro 50 R2
This account includes the cost associated with the structures and improvements associated with a hydro facility including berms, signage, roads, boilers, and other related assets used to support general operations. The plant balance in this account will be $2.2 million, which reflects a transfer of $10.3 million from this account into account 1615-201. The approved life and curve for this account is 40 R2.5. There is no historical activity to analyze. Discussions with Company personnel indicated these structures are on the water so they would have a little shorter life for various components. However, the existing 40 years is shorter than what would be expected. The newer buildings are more technology driven and have a little less longevity than the older built structures. There was insufficient transactional data for an actuarial life analysis. Based on the type and use of assets and judgment, this study proposes moving to 50 R2 at this time."

QUESTION:

a) Please clarify if the transfer of $10.3 million into Account 1615-201 was the main factor for the proposed increase (of 10 years) to a 50-R2 life and curve from the approved 40-R2.5 life and curve for this account.

b) If part (a) above is not confirmed, please provide further rationale for the increase in average service life given Company personnel statements that "these structures are on the water so they would have a little shorter life for various components" and that "the existing 40 years is shorter than what would be expected" and that "newer buildings are more technology driven and have a little less longevity than the older built structures".

ANSWER:

(a) and **(b)**

Yes, that was a material factor. The segregation of smaller, shorter-lived components into account 1645-201 would change the mix of assets in 1645-200 and would make the lives of the assets in the account more homogeneous. Increasing the life was to reflect the more homogeneous life in the account after the transfer. Input from Company SMEs and Alliance's experience also supported the move to a 50-year life.

ISSUE: **Depreciation Expense**

QUOTE: "Account 1645-201 Bldg & Otr – Building and Improvements 50 R2
This account includes the cost associated with buildings and improvements that includes staff housing, warehouses, offices, fencing, building envelopes, fish hatchery, yard work, guard rails. The plant balance in this account at December 31, 2018 is $10.1 million. The approved life and curve for this account is 55 R1. There is very limited historical activity to analyze. Discussions with Company personnel indicated many of the assets in this account have shorter lives than the building. Based on the limited indications from the actuarial analysis, mix and type of assets, and judgment, this study proposes moving to 50 R2 at this time."

QUESTION:

a) Please clarify the types of assets that Company personnel indicated "have shorter lives than the building" and the approximate per cent proportion of these assets compared to all assets in the account.

b) Please provide the dollar amount of retirements by transaction year and vintage for the years 1998-2018 and indicate the proportion of assets being retired that have been identified as those having shorter lives than the building in part (a) above.

ANSWER:

(a)

The types of assets that might retire earlier than a large building might be facilities signage, fish hatchery upgrades, security systems, guard rail extensions, car plug-ins for electric vehicles, alternate road access, paving, and or water storage closets.

(b)

YEC is not able to provide the detailed information requested given the considerable time and effort it would take to collect and summarize this information and its limited relevance to the current review process.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-77**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1645-507 Bldg & Otr – Wind Monitoring Equipment 15 SQ
This account includes costs associated with wind monitoring equipment. This includes tall towers and ultrasonic anemometers. The plant balance in this account at December 31, 2018 is $14 thousand. The approved life and curve for this account is 20 SQ. There is no historical data to analyze. Discussions with Company personnel indicated there is one wind monitoring site, which will likely be out of this process within a year. Company believes it might be 10 years old now. Based on the type of assets, existing life, Company input, and judgment, this study proposes moving to 15 SQ at this time."

QUESTION:

a) Please clarify if the reference to "one wind monitoring site, which will likely be out of this process within a year" is an indication that this asset will no longer be used and useful at the end of 2021.

b) If confirmed, please explain why YEC is proposing to continue to amortize the assets over 15 years rather than simply retire them and recover any remaining net book value at the end of 2021.

ANSWER:

(a)

All wind monitoring equipment has been disposed of, leaving no assets on record.

(b)

As disclosed in Tab 7, Schedule 3A, there is no forecast depreciation of Wind assets or Wind Monitoring Equipment as there are no assets on record. However, this does not mean YEC should not have a policy in the case it did have assets (as it did at the time of the Depreciation Study).

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-78**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1645-605 Bldg & Otr – Communication Equipment 20 L4
This account includes the installation costs of telephone, fibre optic and wireless equipment for general use in connection with utility operations and includes antennae, booths, cable, handsets, insulators, poles and fixtures, remote control equipment and line, storage batteries, switchboards, underground conduit and cable for telephone or fibre optics and other related equipment. The plant balance in this account at December 31, 2018 is $4.6 million. The approved life and curve for this account is 20 L4. Discussions with Company personnel indicated there is a variety of equipment types and varying lives. The life analysis indicates a life between 20-25 years. Based on the type and use of the equipment, Company input, life analysis indications, and judgment, this study proposes retention of 20 L4 at this time. A graph of the observed life table versus the recommended curve type is shown below."

QUESTION:

a) Please provide an observed life table and the plotted actual data points showing both a 20-L4 and 25-L4 survivor curve for this account.

ANSWER:

(a)

The requested information is provided in the following attachments:

- Attachment 1 provides the requested graphs;
- Attachment 2 provides the actual data points.
- Attachment 3 provides the actual data compared to the survivor curves propounded in the question.

ISSUE: **Depreciation Expense**

QUOTE: "Account 1645-810 Bldg & Otr – Company Owned Houses/Land 40 R3 This account includes the costs of upgrades and maintenance associated with the land of houses owned by the company. The plant balance in this account at December 31, 2018 is $59 thousand. The approved life and curve for this account is 30 R3. Discussions with Company personnel indicated the newest house is from 2005 and the oldest is pre-1980. Company believes the existing life is too low. There is not enough historical experience for analysis. Based on the type of assets, Company input, and judgment this study proposes moving to 40 R3 for this account."

QUESTION:

a) Please clarify why "costs of upgrades and maintenance associated with the land of houses owned by the company" should be capitalized into rate base as opposed to expensed annually as an operating and maintenance cost.

ANSWER:

(a)

Consistent with YEC's capitalization policy previously provided to the YUB, and consistent with International Financial Reporting Standards as audited by the Auditor General of Canada, YEC capitalizes costs in excess of $1,000 that have a life longer than one year.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-82**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1650-411 Trxptn – Utility Vehicles 8 L2
This account includes the cost of utility trailers, cargo trailers, ATVs, snowmobiles, and boats. The plant balance in this account at December 31, 2018 is $344 thousand. The approved life and curve for this account is 7 L2. Discussions with Company personnel indicated the line crews use these types of vehicles for seven years before it is retired. Company indicated that occasionally, a quad or snow mobile will move to a plant and have a longer life, but an estimated 80% of these types of assets do not. However, the life analysis indicates a longer life than existing and longer than what the Company expects, which ranges from 10 to 15 years. Giving consideration to the type and use of assets, Company input and expectations, we propose moving the average out to eight years to reflect the 20% of assets that remain longer. This study proposes 8 L2 for this account."

QUESTION:

a) Please provide the "life analysis indicat[ing] a longer life than existing and longer than what the Company expects, which ranges from 10 to 15 years".

ANSWER:

(a)

The requested information is provided as Attachment 1 to this response.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-83**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1650-412 Trxptn – Sedans and Station Wagons 11 S4
This account includes the cost of vans, cars and smaller vehicles. The plant balance in this account at December 31, 2018 is $138 thousand. The approved life and curve for this account is 7 L2. Discussions with Company personnel indicated these vehicles are lasting longer than the existing seven years. Company policy is if a vehicle is 8 years or older, has 160,000 km, and has incurred maintenance costs greater than 15% in one year, they would retire. However, they have fallen behind on this schedule. The life analysis supports Company discussion that these vehicles are lasting longer and the slippage in the schedule, with a life indication of at least 12 years or more with a steeper dispersion pattern. Giving consideration to the Company policy, recent experience, expectations and judgment, this study proposes moving from 7 L2 to 11 S4 at this time."

QUESTION:

a) Please provide the "life analysis support[ing] Company discussion that these vehicles are lasting longer and the slippage in the schedule, with a life indication of at least 12 years or more with a steeper dispersion pattern".

b) If the life analysis discussed in part (a) above was not based on actuarial data, please clarify how YEC is able to propose a change to an 11-S4 life and curve from the approved 7-L2 life and curve without the benefit of an actuarial life analysis.

c) Please provide the directional impact of the change proposed in terms of an increase or decrease to depreciation expense for this account for the year 2021.

ANSWER:

(a) and **(b)**

The life analysis is provided as Attachment 1 to this response.

(c)

As the Depreciation Study proposes to increase the life of asset class from 7 years to 11 years, the directional impact on 2021 depreciation expense is a decrease.

QUOTE: "Account 1650-420 Trxptn – Trucks and Pole Trailers 25 R1.5
This account includes the cost of large trucks and pole trailers that carry less than 10,000 lbs. The plant balance in this account at December 31, 2018 is $11 thousand. The approved life and curve for this account is 25 R1.5. Discussions with Company personnel indicated the existing 25 year life is reasonable for the assets. There is no historical experience to analyze. Giving consideration to the type of assets, existing life, Company expectations, and judgment, this study proposes retention of the 25 R1.5 at this time."

QUESTION:

a) Given that page 9-105 indicates an existing 31-R1.5 life and curve, please clarify which is the correct approved depreciation parameters and confirm that YEC continues to propose a 25-R1.5 life and curve for this account.

ANSWER:

(a)

The current approved life for this account is 25 years with a R1.5 dispersion. The information on page 105 should be corrected to 25 R1.5. YEC is proposing to retain that curve and life for this account.

ISSUE: **Depreciation Expense**

QUOTE: "Account 1650-440 Trxptn – Trucks ¾ to 2 Tons 9 L2
This account includes the cost of trucks that are ¾ to 2 Tons used by employees to perform day to day duties. The plant balance in this account at December 31, 2018 is $2.6 million. The approved life and curve for this account is 10 R2. Discussions with Company personnel indicated that electricians would drive 90,000 and operations 70,000 in approximately 10 years. Linemen would drive 115,000 and would hit the maximum mileage in 3-4 years but there are other factors that cause the Company to retain these vehicles longer. There are equal numbers of each type of vehicle. Company expects they will be replaced by 8 years. However, the life analysis indicates a life between 10 to 11 years. Giving consideration to Company policy, recent experience, expectations and judgment, this study proposes moving from 10 R2 to 9 L2 at this time."

QUESTION:

a) Please provide the "life analysis indicat[ing] a life between 10 to 11 years".

b) If the life analysis discussed in part (a) above was not based on actuarial data, please clarify how YEC is able to propose a change to a 9-L2 life and curve from the approved 10-R2 life and curve without the benefit of an actuarial life analysis.

c) Please provide the directional impact of the change proposed in terms of an increase or decrease to depreciation expense for this account for the year 2021.

d) Please provide an observed life table and the plotted actual data points showing both a 9-L2 and 10-R2 survivor curve for this account.

ANSWER:

(a) and **(b)**

The actuarial analysis for this account is provided as Attachment 1 to this response.

(c)

As the Depreciation Study proposes to decrease the life of asset class from 10 years to 9 years, the directional impact on 2021 depreciation expense is an increase.

(d)

The data provided as YUB-YEC-1-136(a) Attachment 1 give the requested plot as well as the Iowa curves propounded in the question. It should be noted that the movement to a 9 L2 was based on operational feedback from company SMEs related to recent operations and would not necessarily be fully reflected in the long-term (20-year) historical actuarial analysis.

ISSUE: **Depreciation Expense**

QUOTE: "Account 1650-490 Trxptn – Foremost 20 R3
This account includes the cost of large specialty vehicles which are usually tracked not wheeled vehicles. The plant balance in this account at December 31, 2018 is $1.0 million. The approved life for this account is 25 years. Discussions with Company personnel indicated that there is one tracked vehicle and a 2011 Kenworth truck equipped with an auger. Company personnel believe the life should match the life of the greater than 3 ton trucks of 20 years. There is no historical experience to analyze. Giving consideration to type of assets, Company input and expectations and judgment, this study proposes moving to 20 R3 at this time."

QUESTION:

a) Please explain why the life of the tracked vehicle should match that of the Kenworth truck.

b) Please clarify whether there have been any overhauls to either vehicle that would be expected to increase average service life at the time they were carried out. Please explain fully.

c) Please clarify whether there had been an Iowa Curve previously approved for this account and, if so, please provide that value.

ANSWER:

(a)

There have been no retirements in this account, so it was not possible to perform any actuarial life analysis. In the opinion of Company personnel, that asset was a reasonable proxy for items in this account.

(b)

There has been no overhaul to the tracked vehicle. However, a complete service on this unit was performed in 2017. Other than that, it has just received regular servicing as considered necessary.

The 2011 Kenworth had its 10-year overhaul in 2019. This consisted of overhaul service on the boom and outriggers. Other than that, it has just received regular servicing as considered necessary.

(c)

In the last depreciation study, no Iowa curve was specified.

REFERENCE: **Application, Tab 9, Depreciation Study, page 9-92**

ISSUE: **Depreciation Expense**

QUOTE: "Account 1665-403 LNG Plant – Fuel Holders 60 R2
This account includes the installed cost of fuel handling and storage equipment used between the point of fuel delivery to the station and the intake pipe including boilers, pumps, produces, regenerators, tanks, and vaporizers. The plant balance in this account at December 31, 2018 is $13.2 million. The approved life for this account is 32 years. The assets are new so there is limited historical data. Discussions with Company personnel indicated the tanks are nickel, double walled with no moisture ingress. The existing fuel holder life of 32 years is considered to be low and with reasonable maintenance, a 60 year life is expected. Considering the type of assets, information provided by Company personnel and judgment, this study recommends moving the life to 60 years with the R2 for this account."

PREAMBLE: YEC is proposing a significant increase (of 28 years) in average service life for this account.

QUESTION:

a) Please provide any objective evidence such as manufacturers' information available to YEC that further supports the increase (of 28 years) in average service life for this account.

ANSWER:

(a)

The designer of the LNG skid has stated:

- 10+ years ago we moved large high pressure ASME vessels (non-cryogenic) built in the 1960's for the race to the moon to the NASA Marshall Space Center that are still in service (50 years).

- I recall seeing ASME cryogenic vessels built in the 1980's still in service but could not recall where. (40 years).

- The first LNG tank install I was involved with was 1999 and it is still in-service w/o any issues. (22 years).

From an engineering perspective, LNG is noncorrosive to stainless steel, so as long as the tank is maintained properly, it should last 60 years.

ISSUE: **Depreciation Expense**

QUOTE: "Account 1665-500 LNG Plant – Generators 40 SQ
This account includes the installed cost of other prime movers including engines, piping, air-filtering system, towers, pumps, hoists, compressors, tanks, waste heat boilers, antifluctuators and other related equipment. The plant balance in this account at December 31, 2018 is $20.9 million. The approved life for this account is 40 years. The assets are new so there is limited historical data. Discussions with Company personnel indicated the current life is still applicable for this account. Considering the type of assets, information provided by Company personnel and judgment, this study retaining the life of 40 years and using a SQ dispersion for this account."

QUESTION:

a) Given that no other LNG asset class (within the 1665 series) has incorporated the use of a SQ curve, please explain why, for Account 1665-500 LNG Plant – Generators, it is appropriate to maintain an SQ curve as opposed to the R2 curve used for all other LNG accounts.

ANSWER:

(a)

No historical analytical information existed to determine a specific retirement dispersion for LNG generators and an SQ dispersion was assigned. In retrospect, modeling this account in the same way as Account 1620-500 – Diesel Generators and Prime Movers (40 R2) would also have been a reasonable approach. Using the R2 dispersion would have slightly increased the depreciation expense for the 1665-500 account.

REFERENCE: **Application, Tab 9, Depreciation Study, pages 9-22, 9-24, 9-69 and 9-102; Tab 7, Schedule 3A, Calculation of depreciation expense for Hydro overhauls and Diesel production overhauls, page 7-6**

ISSUE: **Depreciation Expense**

Note: The following accounts were excluded from the depreciation study:
1615-504 Hydro Assets Overhaul
1620-504 Diesel Assets Overhaul
1620-504 Diesel Assets Overhaul
Asset 7060 removed from asset group 1615-506
Asset 8856 transferred from asset group 1645-200 to 1615-201

QUOTE:

Note: The following accounts were excluded from the depreciation study:
1615-504 Hydro Assets Overhaul
1620-504 Diesel Assets Overhaul
1620-504 Diesel Assets Overhaul
Asset 7060 removed from asset group 1615-506
Asset 8856 transferred from asset group 1645-200 to 1615-201

PREAMBLE: Tab 7, Schedule 3A indicates that amortization periods for Hydro overhauls, Diesel production overhauls and LNG production overhauls are 10, five, and two years respectively.

QUESTION:

a) Please confirm that the amortization periods for Hydro overhauls, Diesel production overhauls and LNG production overhauls of 10, five and two years respectively, as shown on Tab 7, Schedule 3A, remain valid.

b) Referring to part (a) above, please explain how each of the amortization periods was determined and what specifically is proposed to be overhauled under each Hydro, Diesel and LNG category.

c) Please identify Asset 7060, its historical cost, and why it is necessary to remove it from asset group 1615-506 (Hydro-Wtrwhls, Trbines & Gen's) on Tab 7, Schedule 3A given that there is no indication on page 9-24 (Hydro-Wtrwhls, Trbines & Gen's) of YEC's Tab 9, Depreciation Study that any asset was excluded from consideration in the depreciation study for Account 1615-506.

i. Please clarify if Asset 7060 is depreciable and, if so, provide a complete reference to where the basis for its depreciation and related depreciation expense amount for 2021 can be confirmed within YEC's supporting Tabs; and

ii. If part (b)(i) above confirms that Asset 7060 is not depreciable, please confirm that Asset 7060 is not included in the $26,904.6 thousand cost at 2021 year end as shown on Tab 7, Schedule 3A for the Waterwheels, Turbines & Generation account and clarify whether or not Asset 7060 forms a component of rate base that is subject to a return calculation.

d) Please identify Asset 8856 and confirm that it is the elevator at Aishihik Hydro plant discussed on pages 9-22 (Hydro Buildings and Improvements) and 9-69 (Bldg & Itr – Structures and Improvements Hydro) of YEC's Tab 9, Depreciation Study.

ANSWER:

(a)

Confirmed.

(b)

Hydro and Diesel overhauls were approved in previous GRA's and YEC has no basis for requesting a change to these amortization periods.

LNG overhauls were rounded to 2 years based on an analysis of expected LNG run-time and scheduled overhauls. LNG generation is relatively new to YEC and run-time is weather dependent so it may be appropriate to perform additional analysis in the future.

(c)

Asset 7060 is Whitehorse WH4 Overhaul performed in 2007. Rather than a Hydro-Wtrwhls, Trbines & Gen's category, it is more appropriately classified as an Overhaul and subject to the hydro overhaul amortization period. This Overhaul is fully amortized, so the net book value is $0. There is no amortization forecast in 2021.

(d)

Asset 8856 is the Aishihik Elevator Shaft Structural Steel Rehabilitation as discussed on pages 9-22 (Hydro Buildings and Improvements) and 9-69 (Bldg & Itr – Structures and Improvements Hydro) of YEC's Tab 9, Depreciation Study.

REFERENCE: **Application, Section 3.4, Table 3.14.3, page 3-24; and Appendix 5.2, Section 5.2-5, Overhauls & reserve for site restoration projects, page 5.2-11**

ISSUE: **Reserve for Site Restoration Continuity Schedule**

QUESTION:

a) Please clarify whether the FD7 overhaul is related to YEC's reserve for site restoration projects and, if so, explain why the $580,000 forecast for 2021 was not included in Table 3.14.3.

b) If part (a) above is not confirmed, please fully explain how YEC proposes to treat the $580,000 expenditure for regulatory purposes in the year 2021.

ANSWER:

(a)

The FD7 Overhaul is not related to YEC's reserve for site restoration projects. It is categorized in the Application as an Overhaul.

(b)

YEC proposes to treat the FD7 Overhaul consistently with other overhauls in this Application (LNG) and other overhauls in previous Applications. The FD7 Overhaul is treated similar to other additions of Property, Plant and Equipment, and is specifically identified as being added to Rate Base in the Application in Table 5.2-1 on page 5-33.

REFERENCE: **Application, Tab 2, Section 2.2.2, page 2-6**

ISSUE: **Industrial Demand**

QUESTION:

a) Please explain how other ratepayers are protected from the effects of significant large industrial loads and potential swings in demand if those industrial loads come on and off line.

b) What are the requirements in the power purchase agreements, or other industrial electricity purchase agreements, to manage peak demand?

c) Please confirm how many times the mine load supply was curtailed due to generation issues.

d) Please provide the monthly demand for VGC since the beginning of the operation.

e) Are the requirements to manage peak demand the same for all industrial customers? Please explain.

ANSWER:

(a)

Other ratepayers can experience rate effects from significant large industrial loads, and the potential swings in demand if those large industrial loads come on and off line, only through new GRA filings to adjust existing rates. Prior to a new GRA response to such events, the revenue requirement related impacts from changes in large industrial loads are all borne by the utility.

Yukoners experienced such effects in the 1990s when the Faro mine, accounting for about 40% of overall Yukon loads, shut down its operations in 1993, then reopened it operations in 1995, and then closed permanently in early 1998. As directed by the Board, YEC addressed these significant changes through timely new GRA applications. In 1995, when the Faro mine reopened, the Board issued Order 1995-01 declaring that all YEC and YECL rates are made as interim refundable and retroactively adjustable effective July 1,

1995 other than RS 39 which continued to be interim refundable and retroactively adjustable.

As documented in the 1990s, restoration of Faro mine loads reduced rates significantly for other ratepayers; as a result, loss of the large Faro mine industrial load led to a need to increase rates significantly to other ratepayers. Restoration of much smaller industrial loads since the 1990s has tended to reduce rates for other ratepayers – but the magnitude of potential rate swings related to such loads coming on and off line are currently much smaller than the impacts associated with Faro mine load swings in the 1990s.

(b)

Power purchase agreements with industrial customers set maximum load limits and power quality requirements for each customer, absent agreement with the utility to accommodate higher peak loads, and also require each customer to provide forecast of load requirements. Otherwise, these agreements do not provide for management of the customer peak demand.

RS 39 includes provision for agreement with an industrial customer for a Winter Contract Load that enables a Peak Shaving Credit to be arranged. No industrial customer has elected to pursue this option. The VGC Group PPA specifies that this mine's operations are forecast to have a much lower peak load during the key winter period.

The N-1 dependable capacity planning criterion for Yukon Energy excludes consideration of major industrial customer peak demands. These industrial customers have on-site diesel generation capability sufficient to address emergency electricity requirements in the event that utility electricity supply is curtailed. In the event of a grid N-1 loss of generation, electricity deliveries to major industrial customers are expected to be curtailed.

(c)

Grid splits occur from lightning or failed equipment. There is insufficient generation in the north for the mine loading. During system restorations the mines are curtailed until system security is re-established. High load or events that involve Aishihik can also limit YEC's ability to feed the mines.

Total events in 2019 and 2020 was 19.

Date	Event	Duration
April 22, 2019	Major Outage	2 hr
June 8, 2019	Lightning	3 hr
June 12, 2019	Lightning	2 hr
June 25, 2019	L250 fault	30 mins
July 1, 2019	L180 fault	8 hr
July 10, 2019	L180 fault	4 hr
July 22, 2019	Lightning	1 hr
Sep 10, 2019	L180 fault	1 hr
Dec 2, 2019	L180 fault	4 hr
~Jan 14 2020	Very High Load	not sure on duration/dates.
Feb 7, 2020	WH4 Trip	10 hrs Minto 2 hr Eagle
Feb 13, 2020	WH4 Trip	2 hr
July 5, 2020	L178 outage	1 hr
July 11, 2020	Lightning	1 hr
Oct 26, 2020	Grid Split	10 hrs
Nov 14, 2020	P130 issues	1 hr
Dec 2, 2020	Grid Split	10 hrs
Dec 4, 2020	Grid Split	1 hr
Dec 26, 2020	Grid Split	120 hrs

(d)

Monthly demand for VGC since the beginning of operation is as follows:

		KVA
2019	MAY	840
	JUN	748
	JUL	3,360
	AUG	4,200
	SEP	4,480
	OCT	5,180
	NOV	5,180
	DEC	5,460
2020	JAN	5,740
	FEB	5,880
	MAR	5,880
	APR	6,440
	MAY	5,880
	JUN	5,040
	JUL	5,320
	AUG	6,160
	SEP	6,720
	OCT	7,560
	NOV	7,140
	DEC	6,440

(e)

There is no requirement to manage peak demand for industrial customers. Each mine's power purchase agreement includes terms that define the Maximum Electrical Demand allowed under the agreement.
