YUKON ENERGY CORPORATION

2021 GENERAL RATE APPLICATION
ROUND 1 INTERROGATORY RESPONSES FILED

March 4, 2021

City of Whitehorse
(CW)

TOPIC: **Peak Load**

REFERENCE: **2021 General Rate Application, Table 2.2**

PREAMBLE: On line 29, YEC indicates the integrated system peak.

QUESTION:

a) Please provide the peaks for each of (i) Wholesale, (ii) Industrial, and (iii) the balance of the YEC system for each of 2018 Approved, 2018 Actual, 2019 Actual, 2020 Forecast and Forecast 2021.

b) Please provide the reason for changes in peak demands for each of the years in each of (i) Wholesale, (ii) Industrial, and (iii) the balance of the YEC system.

c) Please fully explain the impact of changes in peak demand on required capital investment.

ANSWER:

(a) and **(b)**

Table 1 provides the non-industrial and the industrial peaks for 2018/19 to 2021/22 winters – additional splits requested are not readily available.

Table 1: Non-Industrial and Industrial Peak (kW)

	2018/19 Forecast*	**2018/2019 Actual**	**2019/20 Actual**	**2020/21 Forecast**	**2021/22 Forecast****
Non-Industrial	86,400	89,040	97,651	100,653	104,102
Industrial	6,500	1,900	6,200	12,035	9,262
Total	**92,900***	**90,940**	**103,851**	**112,689**	**113,364****

*No specific 2018/19 winter peak was "approved'. The forecast shown was provided for 2018 in the 2017-18 GRA.

** This winter peak is expected in 2022, i.e., beyond the 2021 test year.

Peak demand is subject to a variety of external factors, including weather, population, and saturation of electric heating. The peak record in 2019/20 reflected cold weather in particular.

(c)

Yukon's isolated grid must self-supply all its own capacity and energy, including securing reserve capacity in order to meet grid loads during winter peak periods, as it has no access to any external North American power grid to secure extra power when it is needed, or to sell surplus renewable generation when it occurs.

Seasonal generation constraints also present additional challenges to the Yukon Integrated System (YIS). Electricity demand on the YIS is highly variable with seasonal mismatch between the timing of maximum available electricity production from renewable generation (which peaks in the summer months) and maximum customer demand (which peaks during a cold period during winter months). The result is surplus renewable generation during summer (which cannot be used or sold to other jurisdictions) and reliance on thermal generation to supply peak load requirements during winter.

Yukon Energy's generation capacity planning criterion for the YIS is based on the single contingency (N-1) dependable capacity criterion, under which the YIS is required to have enough dependable capacity to supply the forecast non-industrial peak winter demand (i.e., excluding major industrial demand) under the largest single contingency.[1] Inability to supply the non-industrial peak winter demand, which is expected to occur during a period of the coldest winter temperatures, presents an obvious and acute risk to human health and safety and public and private infrastructure. Therefore, YEC's planning, including capital planning must include measures that address capacity shortfalls under capacity planning criteria.

As noted in the Application non-industrial peak load has increased from 86.4 MW in the 2018 GRA forecast to 100.7 MW forecast for 2021 (14 MW increase), accounting for most of the 17 MW growth in the N-1 dependable capacity shortfall. Diesel rental unit costs of approximately $3.8 million are forecast for the diesel rental units expected to be required for the 2021 GRA test year, Yukon Energy's ongoing capital program costs include infrastructure to accommodate the rented diesels as well as work to address longer term solutions (e.g., battery energy storage system [BESS], diesel replacement at various grid

[1] YEC also uses Loss of Load Expectation (LOLE) as system capacity planning criteria where the system is planned not to exceed a LOLE of 2 hours/year. The LOLE criterion includes industrial loads as part of the assessment. At the forecast industrial load, however, the LOLE criterion was satisfied in the test year so long as the single contingency, N-1, criterion was met.

locations, Atlin Hydro Expansion Project, and the potential development of pumped storage at Moon Lake).

TOPIC: **Sales**

REFERENCE: **2021 General Rate Application, Table 2.2**

PREAMBLE: YEC provides Actual Sales. CW requires normalized data as well.

QUESTION:

a) Please provide an updated Table 2.1, with sales, sales per customer, revenues, and cents per KWh normalized for weather.

b) Please provide the working papers that were used to do the weather normalization, and the supporting analysis and data.

ANSWER:

(a) and **(b)**

YEC does not prepare weather normalized version of its actual sales to retail and industrial customers. Therefore, YEC is unable to provide updated version of Table 2.1 as requested.

TOPIC: **Sales Forecasts – Wholesale Sales to ATCO Electric Yukon (AEY)**

REFERENCE: **2021 General Rate Application, page 2-5 (PDF page 30 of 441)**

PREAMBLE: YEC discusses its determination of its forecast sales to AEY on page 30.

QUESTION:

a) On lines 15-16, YEC discusses the AEY Fish Lake Generation Facility (AEY Facility). Please provide the maximum capacity of the AEY Facility, and the annual production, on a normalized and actual basis for 2018 and 2019.

b) Please fully explain how the AEY Facility is used in providing service. Is it the first resource that is engaged, or does it only provide peak supply?

c) On lines 18-19 YEC discusses multi-variate regression assessments of wholesale changes at normal weather conditions. Please provide the multi-variate analysis in Excel format. In the response, please also provide the source of all supporting data.

d) Please provide the calculation of normal weather.

e) On lines 19-20, YEC discusses Micro Generation. CW also notes footnote 4. Please provide:
   i. The detailed analysis of the source of the 1.5 GWh forecast for 2021.
   ii. The impact of the AEY Facility on peak demand.

ANSWER:

(a) and **(b)**

YEC does not have information such as the maximum capacity, weather normalized generation, or operation regarding AEY's Fish Lake facility nor does YEC have operational control of this plant. AEY will be in an better position to provide a response to these questions.

YEC receives Fish Lake's annual generation information from AEY for forecasting purposes as well as for the purposes of determination of LWRF and ERA. As noted in the Application [page 2-5], the actual generation from Fish Lake was at about 5.5 GW.h for 2018 and about 5.0 GW.h for 2019; the forecast for 2021 is 3.6 GWh.

(c)

Please see Attachment 1 to this response.

(d)

Please see response to YUB-YEC-1-16 (a).

(e)

(i)

The micro-generation program forecast for total delivered energy was provided by Yukon government. The actual 2020 program total is embedded in historical sales and is included in the regressed forecasted load. Therefore, only the 2021 incremental program total of 1.5 GWh has been used to reduce the 2021 load. No adjustment are made to the peak forecast related to microgen as solar installations do not provide energy during peak winter hours. Please see YUB-YEC-1-13 for the information provided by Yukon government.

(ii)

The AEY Fish Lake facility impact on peak is included in the historical actuals which are subsequently accounted for via the regression analysis used to forecast peak load.

Year	Month	Avg. Temp.	HDD 13	CDD 13	Days with Avg. Temp < -20 oC	Commercial Count	January Dummy	July Dummy	December Dummy	Darkness	Stat/Weekend

TOPIC: **Sales Forecasts – Wholesale Sales to ATCO Electric Yukon (AEY)**

REFERENCE: **2021 General Rate Application, page 2-6 (PDF page 31 of 441)**

PREAMBLE: On lines 1-3, YEC discusses the AEY forecast for 2021.

QUESTION:

a) Please provide copies of all communication between AEY and YEC regarding the 2020 and 2021 forecast wholesale sales.

b) Please provide a calculation of the impact on customer rates if the AEY forecast of 345.9 GW.h were used for 2021.

ANSWER:

(a)

Please see CW-YEC-1-4 Attachment 1 for the copy of the letter sent by YEC to AEY regarding 2021 test year forecast. YEC did not include the information on 2020 forecast considering Jan-June numbers for 2020 are based on preliminary actuals.

Please see CW-YEC-1-4 Attachment 2 for the copy of the AEY forecasts for 2020 and 2021, including annual power purchase forecasts as shown in Schedule 3.2, Line 10.

(b)

Based on a high level estimates the incremental wholesale sales [345.9 GW.h as noted in the question compared to 343.5 GW.h forecast by YEC for the 2021 test year = 2.6 GW.h incremental wholesale] would add approximately $0.40 million thermal fuel cost compared to approximately $0.31 million added revenues resulting in a $0.09 million incremental revenue shortfall or 0.09% additional rate increase for 2021.

Chris Cullingham
Manager, Regulatory
ATCO Electric Yukon

August 31, 2020

Re: 2021 Yukon Energy GRA Wholesale Sales Forecast

Dear Chris,

This letter is an update of the letters sent to ATCO Electric Yukon (AEY) on May 16, 2019, November 26, 2019 and December 18, 2019. In those letters, Yukon Energy Corporation (YEC) stated that the Yukon Utilities Board (YUB) Order 2018-10 directed YEC to refine its methodology of forecasting Wholesale Sales to ensure its forecasts align closely with the AEY forecasts in future GRA submissions. Subsequent to that Board Order, YEC has had communications with you via email and telephone, as well as the letters sent to you referenced above. Those communications had the purpose of informing AEY of YEC's intention to file a GRA, and to directly address the YUB's direction to ensure our forecasts align closely with yours. This letter is to further formally document our discussions and determine whether or not we need to amend our forecasts.

AEY Forecast
Due to the expected timing of our 2021 GRA submission, we plan to use actuals for 2020 up to June 30, 2020 and forecasts for the remainder of 2020. The GRA year of 2021 will be based fully on forecasts. Pursuant to our previous communications, AEY indicated that your forecast was for business plan purposes and it did not necessarily undergo the same rigor as a forecast that you would file in the GRA.

You indicated that your load forecasting methodology has two key inputs, being net customer additions and forecast use per customer (UPC). Net customer additions are based on input from AEY staff that is obtained through their work in the communities, as well as consultations with the City of Whitehorse, Yukon Government and other various local stakeholders and developers. Forecast UPC is based on average, weather-normalized, historical usage.

A summary of key forecasts that AEY provided YEC is below. It is our understanding that our previous interpretation of your forecasts for 2019 and 2020 was that we quoted your Retail Sales, rather than your Purchased Power. Therefore, the below table has been updated to reflect your Purchased Power and Fish Lake Generation.

	2021
AEY Purchased Power (GW.h)	345.9
Fish Lake Generation (GW.h)	3.6

YEC Forecast
YEC's current forecast for Wholesales sales to AEY is 343.5 GW.h in 2021.

Forecast Differences
The difference between AEY and YEC's forecast is 2.4 GW.h higher by AEY, or 0.69%.

#2 Miles Canyon Road
Box 5920, Whitehorse
Yukon Y1A 6S7
yukonenergy.ca

YEC uses a similar forecasting methodology, so inputs are they key area where differences can arise. YEC performed a detailed review of AEY's inputs. The main difference for residential is AEY used a different residential number of accounts growth factor as compared to YEC. YEC used Yukon Government's number of households' growth for the residential growth factor.

Summary
The above represents YEC's understanding of the communications between YEC and AEY. Please let us know if AEY has a different interpretation. In addition, if you have any significant concerns about our forecasts, please provide to us.

We appreciate your continued support in the Yukon regulatory process.

Regards,

Jason Epp CPA, CA
Controller

Schedule 2.1

ATCO Electric Yukon
Summary of Customers, Energy Sales and Revenue

Line No.	Description	2020	2021
1	**Residential**		
2	Customers (average during year)	16,088	16,301
3	Sales in MWh	180,816	174,769

TOPIC: **Sales Forecasts – Major Industrial**

REFERENCE: **2021 General Rate Application, page 2-6 (PDF page 31 of 441)**

PREAMBLE: CW notes that YEC discusses its industrial sales forecasts, and also notes footnotes 5, 6, and 7.

QUESTION:

a) For each industrial customer, please fully discuss all communication with the customer regarding load projections and potential changes in load for 2021.

b) Please provide copies of the Power Purchase Agreement referenced in Footnote 6.

ANSWER:

(a)

Finance, Operations and/or Senior Management will have communications with each Industrial on an ongoing basis. As YEC gets closer to finalizing a GRA, YEC will reach out to the Industrial customer to determine if any changes to previous forecasts are required. Communications can be in person, by email or by telephone.

(b)

Please see Attachment 1 to this response.

POWER PURCHASE AGREEMENT

This Agreement dated November 9, 2017 is between:

YUKON ENERGY CORPORATION, a Yukon Territory corporation, having an office at P.O. Box 5920, #2 Miles Canyon Road, Whitehorse, Yukon Territory, Y1A 6S7

("**YEC**")

and:

VICTORIA GOLD CORP., a British Columbia corporation registered in the Yukon Territory under number 634192, having an office at 1050 West Pender Street, Vancouver, British Columbia, V6E 3E7

("**VGC**")

and:

STRATAGOLD CORPORATION., a British Columbia corporation registered in the Yukon Territory under number 631012, having an office at 1050 West Pender Street, Vancouver, British Columbia, V6E 3E7

("**StrataGold**")

(VGC and StrataGold are jointly and severally, the "**VGC Group**")

BACKGROUND:

A. StrataGold is a wholly-owned subsidiary of VGC;

B. VGC Group owns the Mine Site and is in the process of developing the Mine with the intent of commencing initial gold production by June 30, 2019;

C. YEC has agreed to sell to VGC Group and VGC Group has agreed to purchase from YEC Grid Electricity required by VGC Group to operate the Mine, with Commencement of Delivery in March, 2019; and

D. The Parties have agreed to enter into this Agreement to set out their respective rights and obligations with respect to the sale and purchase of Grid Electricity by YEC to VGC Group for the Mine.

AGREEMENTS:

The Parties agree:

PART 1
DEFINITIONS AND INTERPRETATION

1.1 **Definitions**. In this Agreement and in the Schedules which are attached to and form a part of this Agreement:

(a) "**Act**" has the meaning in Section 8.1;

(b) "**Affiliate**" has the meaning set out in the *Business Corporations Act* (Yukon Territory);

(c) "**ampere**" means the unit of measurement of electric current in the International System of Units;

(d) "**Business Day**" means any day which is not a Saturday, Sunday, or a statutory holiday in the Yukon Territory or the Province of British Columbia;

(e) "**Commencement of Delivery**" means for the Mine Facilities the later of the:

(i) McQuesten Substation Operation Date;

(ii) date VGC Group provides notice to YEC to confirm that the VGC Group Power Facilities are complete and the Mine Facilities and the Mine Facilities Spur are available to receive Grid Electricity from YEC; and

(iii) date the Parties execute and deliver the Operating Agreement;

(f) "**Commercial Operation Cessation Date**" means the earlier of the:

(i) Mine Facilities Shut Down Date; and

(ii) date VGC Group provides notice to YEC that the Mine Facilities no longer require, acting reasonably under normal market and operating conditions, an Electric Demand at the Point of Delivery in excess of 1,000 kW;

(g) "**Conditions**" mean the conditions listed in Section 3.1;

(h) "**Confidential Information**" has the meaning in Section 15.1;

(i) "**Defaulting Party**" has the meaning in Section 11.1;

(j) "**Dispute**" means any dispute, difference, or disagreement between the Parties as to:

(i) the meaning, application, or implementation of this Agreement; or

(ii) whether an Event of Default has occurred;

(k) "**Electric Demand**" means the capacity at which Grid Electricity is delivered by YEC to VGC Group expressed in kVA or kW, averaged over a rolling 15 minute period following YEC billing and metering practice for industrial customers receiving Grid Electricity;

(l) "**Electric Energy**" means electric energy, expressed in kWh, delivered by YEC to VGC Group under this Agreement;

(m) "**Electricity**" means Electric Energy and Electric Demand delivered by YEC to VGC Group under this Agreement;

(n) "**Event of Default**" has the meaning in Section 11.1;

(o) "**Event of Insolvency**" means any one or more of the following:

(i) if a Party files a petition for reorganization or for an arrangement under any applicable bankruptcy law or under any similar laws, now or hereafter in effect, is adjudged by a court of competent jurisdiction bankrupt, becomes insolvent,

makes an assignment for the benefit of its creditors, admits in writing its inability to pay its debts generally as they become due, is dissolved, or suspends payment generally of its obligations;

(ii) if a petition is filed proposing the adjudication of a Party as a bankrupt or its re-organization under any applicable bankruptcy law or any similar law, now or hereafter in effect and:

A. the Party consents to the filing thereof;

B. the petition is not discharged or denied within 60 days after the filing thereof; or

C. the petition is not diligently defended against; and

(iii) if a receiver, receiver-manager, trustee, monitor, or liquidator (or other similar official) is appointed to take charge of all or substantially all of the business or assets of a Party and:

A. that Party consents to such appointment; or

B. the appointment is not discharged or withdrawn, or action is not taken by that Party to secure the discharge of that official, within 60 days after the appointment;

(p) "**Firm Mine Rate**" means the rate set out in Schedule A, as may be amended by YUB from time to time;

(q) "**Fixed Charge**" means the fixed charge rate each month applicable to the VGC Group Mine Site under the Firm Mine Rate, equal to one-twelfth of the annual amount determined under Section 7.7;

(r) "**Force Majeure**" means any event or circumstance suffered by a Party which is not within the reasonable control of the Party claiming Force Majeure and includes, without limitation:

(i) acts of God, including wind, ice and other storms, forest fires, lightning, floods, earthquakes, volcanic eruptions, and landslides;

(ii) strikes, lockouts, and other industrial disturbances, it being acknowledged that the settlement of strikes, lockouts, and other labour disturbances depends upon the agreement of employees and other third Persons and therefore is not wholly within the discretion of the Party involved;

(iii) epidemics, war (whether or not declared), terrorism, blockades, acts of public enemies, acts of sabotage, civil insurrection, riots, and civil disobedience;

(iv) acts or omissions of Governmental Authorities; and

(v) explosions and fires;

(s) "**Government Approvals**" means all licences, permits, consents, authorizations, or approvals from, withholding of objection on the part of, or filing, registration or qualification with, any and all Governmental Authorities required for any particular decision, act, or event;

(t) "**Governmental Authority**" means the government of Canada, the government of the Yukon Territory, a municipality or other political subdivision thereof, including any applicable First Nations, and any entity exercising executive, legislative, judicial, regulatory, or administrative functions including, without limitation, the YUB, if applicable;

(u) "**Grid Electricity**" means Electricity delivered under this Agreement at the Point of Delivery by YEC to VGC Group from the Transmission Facilities , through the Mine Facilities Spur to the Mine Facilities;

(v) "**Initial YEC System Improvements**" means the initial system improvement facilities for YEC's power system that YEC is to design, engineer, procure, construct, and commission on YEC's power system under Schedule C;

(w) **"Interest Rate**" means the interest rate charged by the lead banker of YEC from time to time on unsecured commercial loans made to YEC or if YEC does not have any unsecured commercial loans outstanding at such time, the variable nominal interest rate per annum being the prime interest rate of Canadian Imperial Bank of Commerce (or its successor) for Canadian dollar commercial loans in Canada as publicly declared from time to time as its prime rate;

(x) "**International System of Units"** means the international system of weights and measures adopted at the 11th General Conference on Weights and Measures in 1960;

(y) "**kV**" means a kilovolt and one kilovolt equals 1,000 volts;

(z) "**kVA**" means a kV ampere and one kV ampere equals 1,000 volt-amperes;

(aa) "**kW**" means a kilowatt and one kilowatt equals 1,000 watts;

(bb) "**kWh**" means a kW hour, the common unit of electrical energy, equal to one kilowatt of power supplied to or taken from an electric circuit for one hour;

(cc) "**Major Industrial Customer**" means a customer of YEC, or of any other regulated electric utility in the Yukon Territory, engaged in manufacturing, processing, or mining whose electrical service is inter-connected with electrical service provided to any other customer of such electric utilities and whose peak Electric Demand exceeds 1,000 kW or any future replacement definition or replacement service capacity threshold applicable to manufacturing, processing, or mining activities of the VGC Group, as approved by the YUB;

(dd) "**Maximum Electric Demand**" means the maximum Electric Demand for Mine Firm Electricity that YEC is obligated to deliver to the VGC Group at the Point of Delivery under Part 5;

(ee) "**McQuesten Substation**" means the substation located along Transmission Facilities between Mayo and Keno City at approximately the junction of the South McQuesten Road and the Silver Trail Highway, and to be developed by the Parties, but owned and operated by YEC, in accordance with Schedule B and the provisions of this Agreement;

(ff) "**McQuesten Substation Operation Date**" means the date that YEC provides notice to VGC Group to confirm that the Initial YEC System Improvements are complete and the McQuesten Substation is available to deliver Grid Electricity to the Mine Facilities through the Mine Facilities Spur;

(gg) "**Mine**" means the VGC Group's "Eagle Gold Project" located on the Mine Site;

(hh) "**Mine Facilities**" means any mining or other facilities developed or operated by VGC Group at the Mine Site, which Mine Facilities include the Mine;

(ii) "**Mine Facilities Operation Date**" means the date on which VGC Group provides notice to YEC, after commissioning of the Mine Facilities, the Mine Facilities Spur, and the VGC Group Power Facilities to confirm the start of commercial operation of the Mine;

(jj) "**Mine Facilities Shut Down Date**" means the date provided by VGC Group to YEC on which YEC is to initiate permanent termination of any further delivery of Grid Electricity to the Mine Facilities under this Agreement;

(kk) "**Mine Facilities Spur**" means the approximate 44km, 69kV transmission line that VGC Group will construct, own, and operate to connect the Mine Facilities to the Point of Delivery to receive Grid Electricity from YEC under this Agreement;

(ll) "**Mine Firm Electricity**" means Grid Electricity delivered by YEC to the Mine on a firm basis;

(mm) "**Mine Site**" means those lands and premises to be used for the Mine and located on the Dublin Gulch property approximately 40 kilometers from Mayo, Yukon Territory and approximately 25 km straight line northwest from the McQuesten Substation with an approximate 44 km road access to the Mine Site from the Silver Trail Highway along the South McQuesten and Haggart Creek Roads;

(nn) "**MVA**" means thousands of kV amperes;

(oo) "**MW**" means a megawatt, being the electrical unit of power which is equal to 1,000 kW or 1,000,000 watts;

(pp) "**MWh**" means a MW hour, being the electrical energy equal to one megawatt of power supplied or taken from an electric circuit for one hour;

(qq) "**MOU"** has the meaning in Section B.2 of Schedule B;

(rr) "**Non-Defaulting Party**" has the meaning in Section 11.2;

(ss) "**Operating Agreement**" means the operating agreement for the YEC power system and the VGC Group Power Facilities that the Parties will implement under Schedule E, and any amendments to the Operating Agreement made under this Agreement;

(tt) "**Other Industrial Customer"** means a YEC Major Industrial Customer, other than the VGC Group, that receives Grid Electricity from the Transmission Facilities;

(uu) "**Other YEC System Improvements**" means system improvements for YEC's power system undertaken under this Agreement to supply Grid Electricity to the Mine Facilities in response to an agreed increase in the Maximum Electric Demand as provided for in Section 5.5, and excludes the Initial YEC System Improvements;

(vv) "**Parties**" means YEC, VGC, and StrataGold and "**Party**" means any one of them;

(ww) "**Person**" means an individual, firm, partnership, body corporate, or other legal entity, a government or any department or agency thereof, a trustee, any unincorporated organization and the heirs, executors, administrators, or other legal representatives of an individual, as the case may be;

(xx) "**Point of Delivery**" means the point at the McQuesten Substation where the slack span from the McQuesten Substation connects to the deadend insulator at the first Mine Facilities Spur transmission structure, with the insulator and jumper and all of their components being on the VGC Group side and the conductor being on the YEC side, with revenue metering for Grid Electricity located inside the McQuesten Substation at the breaker that the Mine Facilities Spur connects;

(yy) "**Power Factor**" means the ratio at the Point of Delivery of the highest metered kW demand in a billing period to the highest metered kVA demand in that same billing period;

(zz) "**Power Quality Requirements**" means YEC's power quality requirements, as set out in Schedule F, applicable to the VGC Group's operation of the Mine Facilities when receiving Grid Electricity from YEC;

(aaa) "**RAS**" remedial action schemes;

(bbb) "**SCC**" means YEC's system control centre;

(ccc) "**SPS**" means special protection schemes;

(ddd) "**Service Charge**" means the late payment charge on any overdue account of YEC as provided for in the Terms and Conditions;

(eee) "**Step Down Transformer**" means a transformer located in the McQuesten Substation and designed to step down from 138 kV to 69kV;

(fff) "**SPS**" has the meaning in Section c.1(e) of Schedule C;

(ggg) "**Stewart Crossing Substation**" means the YEC substation located south of the Stewart River at Stewart Crossing;

(hhh) "**StrataGold**" has the meaning on page one;

(iii) "**SVC/Statcom**" means voltage support equipment for reactive compensation, consisting of either a static-var compensator (SVC) or a static synchronous compensator (statcom), located at the Stewart Crossing Substation;

(jjj) "**Term**" has the meaning in Section 2.1;

(kkk) "**Terms and Conditions**" means the Terms and Conditions of Service applicable to YEC, or any future replacement terms and conditions applicable to YEC, as approved by the YUB;

(lll) "**Transmission Facilities**" means the Mayo to McQuesten Substation segment of YEC's 69 kV Mayo to Keno City transmission facilities located north of Mayo, Yukon Territory, or any Transmission Facilities Development;

(mmm) "**Transmission Facilities Development**" means any future transmission facilities developed by YEC to replace existing Transmission Facilities and to connect the McQuesten Substation with a substation at either Mayo or Stewart Crossing;

(nnn) "**Transmission Facilities Development Operation Date**" means the date provided by YEC to VGC Group to confirm that the Transmission Facilities Development has been completed and is in service to deliver Grid Electricity to the Mine Facilities through the Mina Facilities Spur;

(ooo) "**Transmission Facilities Fixed Cost**" means YEC's annual cost, as approved by the YUB from time to time, for depreciation and return on rate base related to the Transmission Facilities plus the SVC/Statcom if and when it is installed;

(ppp) "**VGC**" has the meaning on page one;

(qqq) "**VGC Group**" has the meaning on page one;

(rrr) "**VGC Group Capital Costs**" means all of the VGC Group's reasonably incurred costs incurred in the design, engineering, procurement, construction, and commissioning of the Mine Facilities Spur;

(sss) "**VGC Group Forecasts**" has the meaning in Section 5.2;

(ttt) "**VGC Group Power Bill**" means the monthly bill sent by YEC to VGC Group under Section 7.1;

(uuu) "**VGC Group Power Facilities**" means the power facilities that VGC Group is to install and operate as part of the Mine Facilities under Schedule D;

(vvv) "**VGC Group Share**" has the meaning in Section 7.7;

(www) "**volt**" means the unit of electrical potential, electrical potential difference, and electromotive force in the International System of Units;

(xxx) "**watt**" means the electrical unit of power or rate of energy transfer in the International System of Units;

(yyy) "**YEC**" means has the meaning on page one;

(zzz) "**YEC Capital Costs**" means all of YEC's reasonably incurred costs incurred in the design, engineering, procurement, construction, and commissioning of the McQuesten Substation as set out in Schedule B and the Initial YEC System Improvements as set out in Schedule C, YEC's costs reasonably incurred to negotiate and conclude this Agreement, YEC's costs reasonably incurred for the Step Down Transformer if required, and YEC's costs reasonably incurred for any Other YEC System Improvements if required;

(aaaa) "**YEC McQuesten Substation Costs**" means the VGC Group's capital costs for the McQuesten Substation development as specified in Schedule B that VGC Group will incur and recover from YEC under this Agreement;

(bbbb) "**YEC Owner's Costs**" means YEC's capital costs for the McQuesten Substation development as set out in Table B-1 of Schedule B that YEC will recover from VGC Group under this Agreement; and

(cccc) "**YUB**" means the Yukon Utilities Board.

1.2 **Schedules**. The following Schedules are attached to and form a part of this Agreement:

(a) Schedule A – Firm Mine Rate and Fixed Charge;

(b) Schedule B –McQuesten Substation;

(c) Schedule C - Initial YEC System Improvements;

(d) Schedule D - VGC Group Power Facilities;

(e) Schedule E - Operating Agreement; and

(f) Schedule F - Power Quality Requirements.

1.3 **Interpretation**. Under this Agreement:

(a) references to voltage are approximate;

(b) words importing the masculine gender include the feminine and neuter genders, and Persons, and words in the singular include the plural, and vice versa, wherever the context requires;

(c) all references to designated Parts and Sections are to the designated Parts and Sections of this Agreement;

(d) using separate Parts and Sections, providing a table of contents, and inserting headings are for convenience only and will not affect how this Agreement is interpreted;

(e) unless otherwise indicated, any reference to a currency is a reference to Canadian currency;

(f) except where otherwise specified, any reference to a statute includes a reference to such statute and to its regulations, with all amendments in force from time to time, and to any statute or regulation that may be passed which has the effect of supplementing or superseding the statute or regulation; and

(g) any reference to a Person includes a reference to any Person that is a successor to that Person.

PART 2
DURATION

2.1 **Term**. This Agreement will commence as of the date of this Agreement and, unless terminated earlier under this Agreement, will terminate on the Mine Facilities Shut Down Date (the "**Term**").

PART 3
CONDITIONS PRECEDENT

3.1 **Conditions**. The obligations of the Parties to proceed with their obligations under this Agreement (except for obligations of the Parties under this Section 3.1) are subject to fulfilment of the following conditions:

(a) on or before February 28, 2018, the YUB will have approved the VGC Group payments under Section 6.1, the Transmission Facilities Fixed Cost of $118,621, the provisions under Section 7.7 for amending the Transmission Facilities Fixed Cost and for setting the annual amount of the Fixed Charge, and amendments to the Firm Mine Rate as required to conform to Schedule A and this Agreement;

(b) on or before February 15, 2018 VGC Group will have provided evidence satisfactory to YEC, acting reasonably, that VGC Group has sufficient funds or financing available and adequate approvals to proceed with the design, engineering, procurement, construction, and commissioning of the McQuesten Substation, the Mine, the Mine Facilities, and the

Mine Facilities Spur, on the schedule set out in this Agreement to enable the Mine Facilities Operation Date to occur on or before June 30, 2019;

(c) on or before May 15, 2018 VGC Group will have provided evidence satisfactory to YEC, acting reasonably, that VGC Group has commenced site construction of the Mine Facilities, the Mine Facilities Spur, and the McQuesten Substation and is proceeding diligently and in good faith such that VGC Group is expected to achieve the Mine Facilities Operation Date under Section 3.1(b); and

(d) on or before September 30, 2018 YEC will have received all approvals reasonably required by YEC from Yukon Development Corporation, the Yukon Territorial Government, and such other approvals as YEC may reasonably require to proceed with and complete the design, engineering, procurement, construction, and commissioning of the Transmission Facilities Development as set out in Section 4.5.

Conditions 3.1(a) and (b) are for benefit of both Parties and may only be waived, altered, or the time period extended by agreement between the Parties. Conditions 3.1(c) and (d) are for the benefit of YEC with regard to YEC's obligations under Sections 4.3 and 4.5 and each of these Conditions may be waived, altered, or the time period extended by YEC, in its absolute discretion, by notice by YEC to VGC Group at any time prior to the expiry of the applicable Condition. The Parties will exercise commercially reasonable efforts, to ensure that the Conditions for which they are responsible are fulfilled on or before the date specified. If any of the Conditions set out in Sections 3.1(a), (b), or (c) are neither fulfilled, waived, altered, or the time period extended, on or before the date specified, this Agreement will terminate with immediate effect and neither Party will have any further right or obligation under this Agreement, except for the fulfilment of those obligations which arose prior to the date of termination and except for any rights or obligations which are expressly stated to survive the termination of this Agreement. If Condition 3.1(d) is not fulfilled, waived, altered, or the time period extended before the date specified, this Agreement will not terminate, but YEC will have no obligation to proceed with the Transmission Facilities Development under Section 4.5.

PART 4
INITIAL ACTIVITIES

4.1 **Filing with YUB**. Upon execution and delivery of this Agreement, YEC will proceed diligently and in good faith to file an application with the YUB seeking YUB approval of the VGC Group payments under Section 6.1, the Transmission Facilities Fixed Cost of $118,621, the provisions under Section 7.7 for amending Transmission Facilities Fixed Cost and for setting the annual amount of the Fixed Charge, and amendments to the Firm Mine Rate as required to conform with Schedule A and this Agreement. YEC will provide the YUB with such supporting documentation as required by the YUB for such application. VGC Group will support the YEC application to YUB as YEC may reasonably require to obtain the approval of the YUB under this Section 4.1.

4.2 **McQuesten Substation**. Upon execution and delivery of this Agreement, the Parties will proceed diligently and in good faith and will exercise commercially reasonable efforts to design, engineer, procure, construct, commission and turnover of the McQuesten Substation to YEC under the terms and conditions set out in Schedule B to achieve the McQuesten Substation Operation Date on or before February 28, 2019.

4.3 **Initial YEC System Improvements**. Upon execution and delivery of this Agreement, YEC will proceed diligently and in good faith and will exercise commercially reasonable efforts to design, engineer, procure, construct, and commission the Initial YEC System Improvements under the terms and conditions set out in Schedule C as required to accommodate Commencement of Delivery on a date mutually agreed to by the Parties in March 2019.

4.4 **Mine Facilities, Mine Facilities Spur, and VGC Group Power Facilities.** Upon execution and delivery of this Agreement, VGC Group will proceed diligently and in good faith and will exercise commercially reasonable efforts to design, engineer, procure, construct, and commission the:

(a) Mine Facilities;

(b) Mine Facilities Spur; and

(c) VGC Group Power Facilities as set out in Schedule D;

so as to be able to achieve Commencement of Delivery on a date mutually agreed to and presently estimated by the Parties to be in March 2019. VGC Group will from time to time, and at least once every two months, provide notice to YEC of VGC Group's progress and material milestones under this Section 4.4. VGC Group will provide notice to YEC of the date when the VGC Group Power Facilities are completed and the date when the Mine Facilities and the Mine Facilities Spur are available to receive Grid Electricity from YEC. The Parties will use commercially reasonable efforts to cooperate and coordinate their activities under this Section 4.4 to ensure the Commencement of Delivery occurs on a date mutually agreed to and presently estimated by the Parties to be in March, 2019.

4.5 **Transmission Facilities Development**. VGC Group acknowledges that the Transmission Facilities are at or near their end of life, and the Transmission Facilities must be upgraded before YEC can reliably deliver Grid Electricity to the Mine Facilities. Upon execution and delivery of this Agreement, YEC will, subject to the Condition in Section 3.1(d) being fulfilled, proceed diligently and in good faith and will exercise commercially reasonable efforts to commence, on or before October 1, 2018, the design, engineering, procurement, construction, and commissioning of the Transmission Facilities Development with the expectation that the Transmission Facilities Development Operation Date will occur within:

(a) 21 months of October 1, 2018 if the Transmission Facilities Development includes new Transmission Facilities located between McQuesten Substation and the existing Mayo substation that are to be operated at 69 kV; or

(b) 30 months of October 1, 2018 if the Transmission Facilities Development includes new 138 kV Transmission Facilities connecting the McQuesten Substation with a substation at Stewart Crossing.

YEC will, from time to time, and at least once every two months, provide notice to VGC Group of YEC's progress and material milestones under this Section 4.5. YEC will provide notice to VGC Group of the Transmission Facilities Operation Date. VGC Group will provide to YEC such support as YEC may require, acting reasonably, for YEC to secure funding for the Transmission Facilities Development.

4.6 **Step Down Transformer**. If the Transmission Facilities Development includes a 138 kV transmission line connecting the McQuesten Substation with a substation at Stewart Crossing, YEC will design, engineer, procure, construct, and commission the Step Down Transformer as part of the Transmission Facilities Development.

4.7 **SVC/Statcom**. YEC will design, engineer, procure, construct, and commission the SVC/Statcom at the Stewart Crossing Substation as part of the Transmission Facilities Development that is developed under Section 4.5.

4.8 **Operating Agreement**. Upon execution and delivery of this Agreement the Parties will proceed diligently and in good faith to negotiate, execute, and deliver the Operating Agreement substantially in the form attached to this Agreement as Schedule E on or before the Commencement of Delivery.

PART 5
ELECTRICITY

5.1 **Electricity to be Delivered and Accepted**. From the Commencement of Delivery, YEC will deliver to VGC Group and VGC Group will purchase from YEC Grid Electricity as Mine Firm Electricity at the Firm Mine Rate until the Commercial Operation Cessation Date has occurred, subject to the Maximum Electric Demand and a load Power Factor requirement of 96% leading, as follows:

(a) from the Commencement of Delivery until the Transmission Facilities Development Operation Date, Maximum Electric Demand of up to 10,100 kVA;

(b) after the Transmission Facilities Development Operation Date, Maximum Electric Demand of up to 14,300 kVA; and

(c) subject to the specified Maximum Electric Demand and its constraints on Electric Energy delivered by YEC to the VGC Group, Electric Energy of approximately 51,800 MWh/year in the first twelve months after the Mine Facilities Operation Date, approximately 63,600 MWh/year in the second twelve months after the Mine Facilities Operation Date, approximately 67,400 MWh/year in the third twelve months after the Mine Facilities Operation Date, approximately 70,200 MWh/year in the fourth twelve months after the Mine Facilities Operation Date, approximately 72,600 MWh/year in the fifth twelve months after the Mine Facilities Operation Date, and approximately 74,100 MWh/year thereafter until the Commercial Operations Cessation Date; and

(d) during an approximate 90 day period that falls between December 1 and March 31 of every year during the Term, Electric Demand will be reduced so as not to exceed approximately 6,000 kVA.

5.2 **VGC Group Forecasts**. VGC Group will provide to YEC annual forecasts ("**VGC Group Forecasts**") of the Grid Electricity requirements of the Mine Facilities at the Point of Delivery in accordance with the following provisions:

(a) VGC Group Forecasts for each of the succeeding calendar years that the Mine Facilities are expected to require Grid Electricity, so as to allow YEC to forecast the future Electric Demand and Electric Energy loads on the Mine Facilities. The VGC Group Forecast will be provided to YEC eight months in advance of each calendar year end, starting upon execution and delivery of this Agreement, and will include load patterns showing the characteristics of the expected Mine Firm Electricity, including the characteristics for Electric Demand and Electric Energy on a monthly basis. With regard to Grid Electricity requirements after year six of Mine Facilities operation, the VGC Group Forecasts will update YEC on VGC Group plans related to changes in Mine Facilities, the steps and schedule to implement these plans, and the expected impacts of Grid Electricity requirements for the Mine Facilities.

(b) VGC Group will advise YEC by notice forthwith of any material change to the VGC Group Forecasts for Mine Firm Electricity, including the characteristics for Electric Energy or Electric Demand.

(c) During the first week of each month after Commencement of Delivery, VGC Group will advise YEC by notice of its estimated daily requirements for Mine Firm Electricity during the following month.

5.3 **Point of Delivery** . YEC will deliver Grid Electricity to VGC Group and VGC Group will receive Grid Electricity from YEC at the Point of Delivery.

5.4 **Maximum Electric Demand**. YEC's obligation to supply Mine Firm Electricity to VGC Group will not exceed the Maximum Electric Demand in effect at any time at the Point of Delivery, and, in accordance with Schedule E, YEC is entitled to cease delivery of Grid Electricity to the Mine Facilities if VGC Group continues to receive Mine Firm Electricity in excess of the Maximum Electric Demand after notice from YEC that VGC Group's load is exceeding the Maximum Electric Demand cap. Notwithstanding such Maximum Electric Demand, if VGC Group receives from YEC Mine Firm Electricity in excess of the Maximum Electric Demand, VGC Group will pay for the billing demand charge on all metered kVA billing demand recorded at the Firm Mine Rate.

5.5 **Increase in Maximum Electric Demand**. If VGC Group requires an increase to its Maximum Electric Demand in excess of that under Section 5.1, the following will apply:

(a) VGC Group will provide YEC with notice of the specified amount of the requested increase together with the period of time during which the increase is required and the related increase in Mine Firm Electricity requirement together with such information and documents as YEC may reasonably require to consider the request;

(b) after receipt of such notice, YEC will have a reasonable period of time to determine whether or not the Transmission Facilities and YEC's other facilities have the ability to supply and maintain that increased Electric Demand, as well as any potential requirement for an increase to the Mine Firm Rate, Other YEC System Improvements, and new YEC Capital Costs related to such increase in Mine Firm Electricity, and YEC will forthwith provide notice to VGC Group of YEC's determination;

(c) following such notice by YEC to the VGC Group, if the Parties are unable to agree on the matters set out under Section 5.5(b) within a period of 90 days from the date of such written notice by YEC to the VGC Group, no increase in Maximum Electric Demand will be provided. For greater certainty the Parties' failure to agree on the matters set out in this Section 5.5(c) will not be a Dispute and will not be subject to Part 12; and

(d) if the Parties are able to agree on the matters set out in Section 5.5(b) within 90 days then the Parties will enter such amendments to this Agreement as the Parties may reasonably require to reflect such agreements, including provision for YUB approval of any changes required to the Firm Mine Rate. If the Parties are unable to execute and deliver such agreements within a period of 120 days of the notice under Section 5.5(c), no amendments to this Agreement will occur. For greater certainty the Parties' failure to agree on such agreements will not be a Dispute and will not be subject to Part 12.

5.6 **VGC Group Standards for Usage of Electricity**. The Parties will comply with the Operating Agreement and VGC Group will regulate its electrical load in accordance with the Power Quality Requirements, including the requirement to maintain a 96% leading load Power Factor for Grid Electricity delivered to VGC Group at the Point of Delivery, or as otherwise agreed to by the Parties from time to time, acting reasonably. VGC Group will operate its equipment and use the Grid Electricity at the Mine so as not to endanger any of YEC's plant or equipment or cause any unacceptable fluctuations of YEC's electrical system. VGC Group will comply with reasonable standards of operation under the Operating Agreement or the Power Quality Requirements or as otherwise provided by YEC to VGC Group by notice from time to time. If VGC Group fails to comply with these requirements or standards of operation so as to endanger any of YEC's plant or equipment or cause any unacceptable fluctuations on YEC's electrical system, YEC may by notice to VGC Group require that VGC Group remedy the situation. Should VGC Group fail to immediately comply with this Section 5.6 upon receiving such notice regarding the Point of Delivery, YEC may immediately suspend the supply of Grid Electricity to VGC Group at such Point of Delivery and continue such suspension until the situation is remedied. Upon receipt of such notice VGC Group may provide notice to YEC that VGC Group wishes YEC to operate any such equipment endangering YEC's plant, or equipment, or electrical system at VGC Group's sole cost and expense. Upon receipt of such notice YEC will provide notice to VGC Group as to whether YEC will operate such

AGH

equipment and in such case VGC Group will indemnify and save harmless YEC against any costs, damages, or losses associated with such operations.

5.7 **Terms and Conditions of Service**. The Terms and Conditions apply to the Parties with regard to Grid Electricity delivered by YEC to VGC Group under this Agreement including, without limitation, the provisions regarding the responsibility and liability of each Party. If there is an inconsistency between the Terms and Conditions and this Agreement the Terms and Conditions will govern.

5.8 **Commercial Operation Cessation Date**. VGC Group will provide notice to YEC of a Commercial Operation Cessation Date within 30 days of the occurrence of such Commercial Operation Cessation Date.

5.9 **Suspension of Commercial Operation**. VGC Group will provide notice to YEC as provided for in Section 4 of Schedule E of planned maintenance and scheduling for the Mine Facilities. Such notice will include the date on which Commercial Operation will cease, VGC Group's reasonable estimate of the length of the period during which Commercial Operation will be suspended, and the related adjustments to VGC Group Forecasts as required under Section 5.2. If VGC Group suspends Commercial Operation and such suspension continues for five consecutive years without VGC Group providing notice to YEC of a Mine Facilities Shut Down Date during this suspension, VGC Group will then be deemed to have provided notice to YEC that the Mine Facilities Shut Down Date has occurred as of the last day of the five years of continuous suspension. VGC Group will provide copies to YEC of any VGC Group notice to the Minister under the Quartz Mining Act regarding specified events at the Mine where such notice is required, including commencement of active operations, discontinuance or resumption of operations, and plans to bring the Mine back into operations.

5.10 **Planned YEC Maintenance**. YEC may, from time to time, for planned annual maintenance of its transmission and generation facilities, require a curtailment or suspension in the Grid Electricity supplied to the Mine for a period of up to 14 days per calendar year and YEC will provide notice to VGC Group, as provided for in Section 4 of Schedule E, of any such planned maintenance. Such notice will include the date on which such maintenance will commence, YEC's expected duration of the maintenance, and the impact on YEC's obligations to deliver Grid Electricity to VGC Group under this Agreement.

PART 6
YEC CAPITAL COSTS

6.1 **YEC Capital Costs**.

(a) As of the date of this Agreement YEC's estimate for the YEC Capital Costs not paid to date by VGC Group for the negotiation and conclusion of this Agreement is $200,000. Within 15 days of the execution and delivery of this Agreement YEC will invoice VGC Group for 50% of YEC's estimated YEC Capital Costs under this Section 6.1(a), and within 15 days of receipt of said invoice VGC Group will pay such amount to YEC. YEC will invoice VGC Group for the balance of the amount owing as soon as is reasonably practicable after YEC determines the actual amount of YEC Capital Costs incurred under this Section 6.1(a) and VGC Group will pay such amount within 15 days of receipt of such invoice.

(b) As of the date of this Agreement YEC's estimate of the YEC Capital Costs that YEC is to recover from VGC Group for the Initial YEC System Improvements is $1,677,883. Within 15 days of the execution and delivery of this Agreement YEC will invoice VGC Group for 50% of YEC's estimated YEC Capital Costs under this Section 6.1(b), and within 15 days of the date of the approval of this Agreement by the YUB VGC Group will pay such amount to YEC. YEC will invoice VGC Group for the balance of the amount owing as soon as is reasonably practicable after YEC has completed the Initial YEC System Improvements as required by Section 4.3 and has determined the actual cost of the Initial YEC System Improvements under this Section 6.1(b), and VGC Group will pay such

amount within 15 days of receipt of such invoice. Provided however that if the amount to be invoiced VGC Group for the Initial YEC System Improvements exceeds $1,677,883 then YEC will provide VGC Group with details of the increase in cost and confirm to VGC Group that such increase in cost is not caused by a change to the scope of the work for the Initial YEC System Improvements as set out in Schedule C and was otherwise a reasonably necessary increase in cost to complete the Initial YEC System Improvements.

(c) As of the date of this Agreement YEC's estimate for the YEC Owner's Costs that YEC is to recover from VGC Group for the McQuesten Substation is $483,240. Within 15 days of the execution and delivery of this Agreement YEC will invoice VGC Group for 50% of YEC's estimated YEC Owner's Costs under this Section 6.1(c), and within 15 days of the date of the approval of this Agreement by the YUB, VGC Group will pay such amount to YEC. YEC will invoice VGC Group for the balance of the amount owing as soon as is reasonably practicable after the Commencement of Delivery and after YEC has determined the actual cost of the YEC Owner's Costs, and VGC Group will pay such amount within 15 days of receipt of such invoice. Provided however that if the amount to be invoiced to VGC Group for the YEC Owner's Costs exceeds $483,240 then YEC will provide VGC Group with details of the increase in cost and confirm to VGC Group that such increase in cost is not caused by a change to the scope of the work for the YEC Owner's Costs as set out in Schedule C and was otherwise a reasonably necessary increase in cost to complete the YEC Owner's Costs.

(d) The YEC McQuesten Substation Costs under Section B.4 of Schedule B associated with the McQuesten Substation being able to operate at 138 kV is $930,563. At the time that the McQuesten Substation is transferred to YEC by VGC Group under Schedule B, VGC Group will invoice YEC for, and within 15 days after Commencement of Delivery, YEC will pay VGC Group, $930,563 for the YEC McQuesten Substation Costs. Provided however that if there is a change in the scope of the McQuesten Substation work that:

(i) is approved by YEC; and

(ii) results in VGC Group incurring an increase in the YEC McQuesten Substation Costs;

VGC Group will:

(iii) provide YEC with details of the increase in the costs due to the change in scope; and

(iv) confirm to YEC that such increase in costs was a reasonably necessary increase to complete the YEC McQuesten Substation Costs.

Subject to YEC's review and confirmation of the VGC Group submission, YEC will pay to VGC Group the reasonable increase in the costs due to the change in scope affecting the YEC McQuesten Substation Costs.

(e) If the Step Down Transformer is required to be provided by YEC under Section 4.6, YEC will invoice VGC Group when YEC orders the Step Down Transformer for 50% of all of YEC's estimated costs and expenses reasonably required for design, engineering, procurement, construction, and commissioning of the Step Down Transformer and VGC Group will pay such invoice within 15 days of receipt. YEC will invoice VGC Group for the remainder of YEC's reasonably incurred costs and expenses to design, engineer, procure, construct, and commission the Step Down Transformer within 30 days of when the Step Down Transformer is commissioned and VGC Group will pay such invoice within 15 days of receipt.

(f) If YEC incurs Other System Improvement capital costs caused by an increase in Maximum Electric Demand under Section 5.5, the related amendments to this Agreement will provide for YEC to recover from VGC Group any reasonably incurred YEC Capital Costs for the required Other System Improvements.

PART 7
BILLING/PAYMENT

7.1 **VGC Group Power Bill**. As soon as practicable following the last day of each month after the Commencement of Delivery, YEC will deliver the VGC Group Power Bill to VGC Group setting out the amount payable to YEC by VGC Group under this Agreement for all Electricity delivered by YEC to VGC Group during such month. VGC Group will pay YEC the amount set out in each VGC Group Power Bill within 15 Business Days of the date of delivery of the VGC Group Power Bill to VGC Group. Electricity provided by YEC to VGC Group will be charged to VGC Group at the rates provided for in this Agreement.

7.2 **Canadian Funds**. All payments by VGC Group to YEC will be made in Canadian funds to an office or banker of YEC, as YEC may direct to VGC Group in writing, at Whitehorse, Yukon Territory.

7.3 **Failure to Render Invoice**. Failure to render an invoice within the time periods set out in this Agreement will not abrogate YEC's right to receive payment of the VGC Group Power Bill, VGC Group Capital Cost, Decommissioning Costs, or other amounts payable under this Agreement.

7.4 **Late Payment** Any payment to be made by VGC Group to YEC under this Agreement that remains unpaid, in whole or in part, when due will be subject to a late payment charge at a rate of interest equivalent to the Service Charge calculated on the amount unpaid from the due date of payment until payment is made in full.

7.5 **Prepayments**. Any payments to be made by VGC Group to YEC under this Agreement may be prepaid by VGC Group at any time in whole or in part without penalty.

7.6 **Taxes**. All sales taxes, excise taxes, or similar charges payable on Electricity delivered to VGC Group under this Agreement will be added to the VGC Group Power Bill and paid by VGC Group under Section 7.1.

7.7 **Fixed Charge**. The Fixed Charge will be determined as follows:

(a) Prior to the Transmission Facilities Development Operation Date, the Transmission Facilities Fixed Cost used to determine the Fixed Charge is $118,621, or any amended amount approved by the YUB from time to time.

(b) After the Transmission Facilities Development Operation Date, YEC will apply to the YUB to amend the Transmission Facilities Fixed Cost based on YEC's adjusted annual costs for depreciation and return on rate base related to the Transmission Facilities plus the SVC/Statcom and YEC's McQuesten Substation Costs. The adjusted Transmission Facilities Fixed Cost will apply until otherwise amended by the YUB.

(c) The annual Fixed Charge amount will be determined by YEC as follows:

(i) in calendar years when there is no Other Industrial Customer, the annual amount for the Fixed Charge will equal 85% of the Transmission Facilities Fixed Cost as last determined by the YUB; and

(ii) in calendar years when there is one or more Other Industrial Customers, the estimated VGC Group portion of the Major Industrial Customer MWh load on the

Transmission Facilities during the calendar year (the "**VGC Group Share**") will be estimated by YEC and the Fixed Charge for months during the calendar year will equal the VGC Group Share of 85% of the Transmission Facilities Fixed Cost as last determined by the YUB. Within 60 days of the calendar year end, YEC will adjust the Fixed Charge based on the actual VGC Group Share as determined by actual MWh load during the calendar year for VGC Group and any Other Industrial Customers. The fixed charge applicable to each Other Industrial Customer in any calendar year will be determined in the same manner, based on each such customer's share of the Major Industrial Customer MWh load on the Transmission Facilities during the calendar year.

(iii) With regard to securing any required YUB approvals related to Fixed Charge amounts, including any approvals related to the VGC Group Share or the Transmission Facilities Fixed Cost, YEC will provide the YUB with such supporting documentation as required by the YUB, and will use commercially reasonable efforts to obtain the approval of the YUB, and VGC Group will use commercially reasonable efforts to support such application by YEC.

PART 8
METERING

8.1 **Metering**. The Grid Electricity purchased by VGC Group under this Agreement will be measured and recorded at the Point of Delivery by revenue meters having one hour integrating intervals, which meters, will be types approved for revenue metering by Industry Canada and will comply with the *Electricity and Gas Inspection Act* (the "**Act**").

8.2 **Testing**. YEC will test its metering equipment under Section 8.1 and field test the metering installation in compliance with the Act. If requested to do so by VGC Group, YEC will make additional tests or inspections of such installations, the expense of which will be paid by VGC Group, unless VGC Group has confirmed by such testing that the metering is faulty in which case such testing will be paid for by YEC. YEC will give reasonable written notice to VGC Group of the time when any such test or inspection is to be made. VGC Group may have representatives present at such test or inspection. Any component of such installations found to be defective or inaccurate will be adjusted, repaired, or replaced by YEC to provide accurate metering. If a meter is found not to be functioning within the prescribed limit of error, the Electricity purchased will be determined under the Act.

8.3 **Backup Metering**. VGC Group may, at its cost and expense, install a backup metering system to check YEC's metering system performance and, if so, VGC Group will own, operate, and maintain this system, at VGC Group's sole cost and expense.

8.4 **Costs**. All costs and expenses incurred by YEC, beyond normal reading and testing of meters and other costs that YEC is to pay under Section 8.2, in complying with its obligations under Section 8.2 will be invoiced separately to VGC Group by YEC and will be paid by VGC Group upon receipt.

PART 9
FORCE MAJEURE

9.1 **Force Majeure**. Subject to Section 9.3, neither Party will be liable to the other Party for any delay in or inability of the first Party to perform its obligations under this Agreement if any such delay or inability is a direct result of Force Majeure.

9.2 **Notice of Force Majeure**. If a Party suffers a Force Majeure it will promptly notify the other Party in writing and within 10 days of becoming so aware will give written notice to the other Party:

(a) describing the Force Majeure in reasonable detail and stating, to the extent reasonably practicable at such time, its estimate of the duration of the Force Majeure;

(b) setting out in reasonable detail the obligations under this Agreement which it is unable to perform or will be delayed in performing as a direct result of the Force Majeure;

(c) containing particulars of the circumstances causing the Party to be unable to perform or delayed in performing its obligations under this Agreement as a direct result of the Force Majeure; and

(d) describing what needs to be done and what will be done to end the Force Majeure.

(e) During a Force Majeure a Party invoking the Force Majeure will exercise commercially reasonable efforts to end the Force Majeure.

9.3 **Exclusions**. A Party may not invoke Force Majeure:

(a) for lack of money or credit;

(b) if the Force Majeure is the result of a breach by the Party seeking to invoke Force Majeure of a permit, certificate, licence, approval, or of any applicable laws, regulations, or orders;

(c) if the Party seeking to invoke Force Majeure has failed to use commercially reasonable efforts to prevent or remedy the situation and remove, so far as possible and with reasonable dispatch, the effects of the Force Majeure; or

(d) if the Force Majeure was caused by a breach of, or default under this Agreement or a wilful or negligent act or omission by the Party seeking to invoke Force Majeure.

If a Party is required to perform an obligation by a certain date or with a specified time period and the Party is delayed in performing that obligation by a Force Majeure the date or time for the performance of that obligation will be extended by a period of time equal to the length of the Force Majeure.

PART 10
REPRESENTATIONS AND WARRANTIES

10.1 **YEC Representations and Warranties**. To induce VGC Group to enter into this Agreement YEC hereby represents and warrants to VGC Group as of the effective date of this Agreement, upon each of which representations and warranties VGC Group specifically relies, as follows:

(a) YEC Corporate Organization and Authority: YEC has been duly incorporated and is a validly existing corporation under the laws of the Yukon Territory, is in good standing with respect to all required filings in the office of the Registrar of Companies and has the full corporate power and capacity to execute and deliver this Agreement and perform its obligations under this Agreement.

(b) Authorization, Consents, and Enforceability: The execution and delivery of this Agreement by YEC and the consummation by YEC of the transactions contemplated hereby have been duly authorized by the Board of Directors of YEC and this Agreement constitutes valid and binding obligations of YEC, enforceable against YEC in accordance with its terms, subject to the availability of equitable remedies and enforcement of creditors' rights generally.

(c) Compliance: The entering into and compliance by YEC with this Agreement is legal, does not violate any provisions of any requirement of law and does not result in any breach of any of the provisions of, or constitute a default under any charter document, by-law, unanimous shareholder agreement, loan agreement, or other agreement or instrument to which YEC is a party or by which it is or its property may be bound.

10.2 **VGC Group Representations and Warranties**. To induce YEC to enter into this Agreement VGC Group hereby represents and warrants to YEC as of the effective date of this Agreement, upon each of which representations and warranties YEC specifically relies, as follows:

(a) VGC Group Corporate Organization and Authority: Each of the members of the VGC Group has been duly incorporated and is a validly existing corporation under the laws of the Province of British Columbia and is in good standing with respect to all required filings in the office of the Registrar of Companies and has the full corporate power and capacity to perform business in the Yukon Territory and to execute and deliver this Agreement and perform its obligations under this Agreement.

(b) Authorization, Consents, and Enforceability: The execution and delivery of this Agreement by VGC Group and the consummation by VGC Group of the transactions contemplated hereby have been duly authorized by the respective Boards of Directors of VGC Group and this Agreement has been duly executed and delivered by VGC Group and constitutes valid and binding obligations of VGC Group, enforceable against VGC Group in accordance with its terms, subject to the availability of equitable remedies and enforcement of creditors' rights generally.

(c) Compliance: The entering into and compliance by VGC Group with this Agreement is legal, does not violate any provisions of any requirement of law and does not result in any breach of any of the provisions of, or constitute a default under any charter document, by-law, loan agreement, or other agreement or instrument to which VGC Group is a party or by which they or their property are or may be bound.

PART 11
DEFAULT

11.1 **Event of Default**. Each of the following events constitutes an "**Event of Default**" for a Party in question (the "**Defaulting Party**"):

(a) an Event of Insolvency of such Party; or

(b) any representation or warranty of such Party contained in this Agreement being untrue in any material respect unless the default is of a nature that can be cured and it is cured within 30 days, or such reasonable time period as may be required given the default, following receipt by the Defaulting Party of written notice from the other Party specifying the nature of the default and requiring that the default be cured; or

(c) any default (other than defaults of a non-material nature) by such Party in the performance or observance of any of the covenants, agreements, and obligations on its part to be performed or observed under this Agreement, unless the default is of a nature that can be cured and it is cured within 30 days, or such reasonable time period as may be required given the default, following receipt by the Defaulting Party of written notice from the other Party specifying the nature of the default and requiring that the default be cured.

11.2 **Remedies**. If an Event of Default under Section 11.1 occurs, any Party not in default (the "**Non-Defaulting Party**") may do one or more of the following:

(a) pursue any remedy available to it in law or equity, it being acknowledged by the Parties that specific performance, injunctive relief (mandatory or otherwise), or other equitable relief may be the only adequate remedy for an Event of Default; or

(b) if the Event of Default is curable, take all actions in its own name or in the name of the Defaulting Party as may reasonably be required to cure the Event of Default, in which event all payments, costs, and expenses incurred therefore will be payable by the Defaulting Party to the Non-Defaulting Party on demand with interest at the Interest Rate; or

(c) waive the Event of Default, provided any waiver of the particular Event of Default will not operate as a waiver of any subsequent or continuing Event of Default; or

(d) in the case of an Event of Default by VGC Group under Section 7.1 YEC may upon 15 days' notice to VGC Group suspend or discontinue the supply of Grid Electricity to VGC Group, but no such suspension or discontinuance by YEC will relieve VGC Group of its obligations under this Agreement, including the obligation to make payment of any sum, nor will any such suspension or discontinuance constitute or be deemed to constitute rescission of this Agreement.

PART 12
DISPUTE RESOLUTION

12.1 **Confidentiality of Process**. The Parties will maintain the dispute resolution process set out in this Part 12 as confidential and such process will not be disclosed, unless otherwise required by law, by any Party to any other Person unless previously discussed and agreed to in writing by the Parties. For greater certainty, no part of the dispute resolution process will be open to the public.

12.2 **Stages**. Disputes that arise among the Parties will progress, until resolved, through the following stages of the dispute resolution process:

Step 1: Within 10 days of one Party providing written notice to the other Parties that a Dispute exists, the Presidents of each of the Parties, or their nominees in the first instance or themselves if they cannot resolve the Dispute, will meet and make good faith efforts to resolve the Dispute through collaborative negotiation by:

(i) identifying underlying interests;

(ii) isolating points of agreement and disagreement;

(iii) exploring alternative solutions;

(iv) considering compromises or accommodations; and

(v) taking any other measures that may assist in resolution of the Dispute.

Step 2: If the Presidents of each of the Parties are unable to resolve the Dispute themselves within 30 days of the written notice under Step 1, either Party may give written notice to the other Party of a desire to commence mediation and the Parties will jointly appoint a mutually acceptable mediator within 30 days after the date that such notice is given. If the Parties are unable to agree upon the appointment of a mediator within 30 days after a Party has given notice of a desire to mediate the Dispute, either Party may apply to the British Columbia Mediator Roster Society for appointment of a mediator. The Parties agree that the mediation will be conducted under the Mediation Rules of the British Columbia Mediator Roster Society.

Step 3: If a Dispute has not been resolved through mediation under Step 2 within 30 days of the appointment of a mediator, either Party, by notice in writing to the other Party, may refer such unresolved Dispute to binding arbitration under the *Arbitration Act*, (R.S.Y., 2002, c.8). The Parties will agree upon an Arbitrator within 30 days of the notice of arbitration being provided, failing which the Arbitrator will be selected under the *Arbitration Act*, (R.S.Y., 2002, c.8). The decision of the arbitrator will be final and binding on the Parties.

12.3 **Availability of Argument**. In any Dispute, a Party may raise any defence or argument that it would otherwise have been able to raise at law, equity, or otherwise, had the Dispute been referred to a court of competent jurisdiction, including a defence that the Dispute is statute-barred by the *Limitation of Actions Act*, (R.S.Y., 2002, c.139).

12.4 **No Further Claims**. When Disputes are settled among the Parties to the Agreement under this Part 12 no further:

(a) claim may be made; and

(b) compensation will be payable by any Party,

for the same Dispute.

12.5 **Continued Payment**. Pending resolution of any Dispute, VGC Group will continue to pay to YEC any sums payable under this Agreement and YEC may avail itself of its remedy under Section 11.2(d) in relation to a failure by VGC Group to do so.

PART 13
INDEMNITY

13.1 **Limitation of Liability**. No Party will be liable to the other Party in contract, tort, warranty, strict liability, or any other legal theory for any indirect, consequential, incidental, punitive, or exemplary damages arising under or in connection with this Agreement or in connection with the failure to perform or observe obligations under this Agreement. No Party will have any liability to the other Party except under, or for breach of, this Agreement provided, however, that this Section 13.1 is not intended to constitute a waiver of any rights of one Party against the other Party for matters which are unrelated to this Agreement.

13.2 **Indemnification**

(a) VGC Group will indemnify and save YEC harmless for any loss or damage to property, death, or injury to Persons (or any claim against YEC in respect thereof) and all expenses relating thereto (including without limitation reasonable legal fees) suffered or incurred by YEC in connection with this Agreement resulting from any negligence or wilful default of VGC Group in connection with the performance of its obligations under this Agreement or a breach by VGC Group of its obligations under this Agreement. The indemnity will not extend to any loss, damage, death, or injury (or any claim in respect thereof) or any expenses relating thereto to the extent that it was caused by the negligence or wilful default of YEC or the failure of YEC to take reasonable steps in mitigation thereof. Notwithstanding anything to the contrary contained in the preceding sentence, nothing in this Section 13.2(a) will apply to any loss, damage, cost, or expense in respect to which, and to the extent that, YEC is compensated under any insurance, agreement, or through any other means.

(b) YEC will indemnify and save VGC Group harmless for any loss of or damage to property, death or injury to person (or any claim against VGC Group in respect thereof) and all expenses relating thereto (including without limitation reasonable legal fees) suffered or

incurred by VGC Group in connection with this Agreement from any negligence or wilful default of YEC in connection with the performance of its obligations under this Agreement or a breach by YEC of its obligations under this Agreement. The indemnity will not extend to any loss, damage, death, or injury (or any claim in respect thereof) or any expenses relating thereto to the extent that it was caused by the negligence or wilful default of VGC Group or the failure of VGC Group to take reasonable steps in mitigation thereof. Notwithstanding anything to the contrary contained in this preceding sentence, nothing in this Section 13.2(b) will apply to any loss, damage, cost or expense in respect of which, and to the extent that, VGC Group is compensated under any insurance, agreement, or through any other means.

(c) If such injury or damage results from the joint or concurrent negligent or intentional acts of the Parties each will be liable under this indemnification in proportion to its relative degree of fault.

13.3 **Assertion of Claims**. No Party will be entitled to assert any claim for indemnification until such time as all claims of such Party for indemnification under this Agreement exceed an amount equal to $10,000, in the aggregate, at which time all claims of such Party for indemnification under this Agreement may be asserted; provided, however, that when such claims have been asserted the same rule will apply in respect of future claims. Notwithstanding the preceding sentence, a Party may assert a claim for indemnification regardless of amount upon the expiry or earlier termination of this Agreement or if such claim would otherwise be barred by the *Limitation of Actions Act*, (R.S.Y., 2002, c.139).

13.4 **Defence of Claims**. The indemnified Party will have the right, but not the obligation, to contest, defend, and litigate any claim, action, suit, or proceeding by any Person alleged or asserted against such Party in respect of, resulting from, related to, or arising out of any matter for which it is entitled to be indemnified under this Agreement, and the reasonable costs and expenses thereof will be subject to the indemnification obligations of the indemnifying Party under this Agreement provided, however, that if the indemnifying Party acknowledges in writing its obligations to indemnify the indemnified Party in respect of loss to the full extent provided by Section 13.2, the indemnifying Party will be entitled, at its option, to assume and control the defence of such claim action, suit, or proceeding at its expense and through counsel of its choice if it gives prompt notice of its intention to do so to the indemnified Party and, reimburses the indemnified Party for the reasonable costs and expenses incurred by the indemnified Party prior to the assumption by the indemnifying Party of such defence, and provides reasonably adequate security for any judgment for costs that might be imposed on the indemnified Party. The indemnified Party will not be entitled to settle or compromise any such claim action, suit, or proceeding without the prior written consent of the indemnifying Party, which consent will not be unreasonably withheld or delayed. The indemnified Party will have the right to employ its own counsel and such counsel may participate in such action (but the fees and expenses of such counsel will be at the expense of such indemnified Party), provided that the:

(a) employment of counsel by such indemnified Party has been authorized in writing by the indemnifying Party;

(b) indemnified Party will have reasonably concluded that there may be a conflict of interest between the indemnifying Party and the indemnified Party in the conduct of the defence of such action;

(c) indemnifying Party will not in fact have employed independent counsel reasonably satisfactory to the indemnified Party to assume the defence of such action and will have been so notified by the indemnified Party; or

(d) indemnified Party will have reasonably concluded and specifically notified the indemnifying Party either that there may be specific defences available to it which are different from or additional to those available to the indemnifying Party or that such claim

action, suit, or proceeding involves or could have a material adverse effect upon it beyond the scope of this Agreement.

If Sections 13.4(a), (b), (c), or (d) are applicable, then counsel for the indemnified Party will have the right to direct the defence of such claim, action, suit, or proceeding on behalf of the indemnified Party and the reasonable fees and disbursements of such counsel will constitute legal or other expenses under this Agreement.

PART 14
ASSIGNMENT

14.1 **Assignment**. No Party may assign this Agreement without the prior written consent of the other Party, such consent not to be unreasonably withheld.

14.2 **Sale of the Transmission Facilities** . If YEC disposes of all or any interest in the Transmission Facilities, YEC will ensure that the obligation to sell Grid Electricity from the Transmission Facilities, on the same basis as provided for in this Agreement will continue and be assumed by the purchaser of such interest, for the Term. YEC will require, as a condition of the closing of the disposition of such interest, that the purchaser sign an agreement in a form satisfactory to VGC Group, acting reasonably, which provides that the purchaser agrees to be bound by this Agreement.

14.3 **Sale of the Mine**. If VGC Group disposes of all or any interest in the Mine, the Mine Facilities, or the VGC Group Power Facilities, VGC Group will ensure that the obligation to purchase Grid Electricity from YEC on the same basis as provided for in this Agreement will continue and be assumed by the purchaser of the Mine, the Mine Facilities, or the VGC Group Power Facilities for the Term. VGC Group will require as a condition of the closing of the disposition of the Mine, the Mine Facilities, or the VGC Group Power Facilities that the purchaser sign an agreement in a form satisfactory to YEC, acting reasonably, which provides that the purchaser agrees to be bound by this Agreement for the Term.

PART 15
CONFIDENTIALITY

15.1 **Confidentiality**. Except as required by law, and subject to Section 15.1, a Party will not disclose to a third person who is not a Party any information, data, or documents, supplied by one Party to the other Parties under this Agreement (collectively, the "**Confidential Information**") without the consent of the other Party, such consent not to be unreasonably withheld.

15.2 **Exceptions**. Section 15.1 will not:

(a) extend to information that is already in the public domain or becomes, after having been disclosed to a Party, generally available to the public unless the disclosure was made directly or indirectly by a Party in breach of this Agreement;

(b) prevent a Party from divulging Confidential Information in confidence to its Affiliates and to its or their officers, directors, employees, agents, or other representatives on a "need-to-know" basis;

(c) prevent a Party from divulging Confidential Information in confidence to third parties (provided the third party is subject to similar confidentiality restrictions), in order to permit the operation of the Mine or the Transmission Facilities, as the case may be, in the ordinary course, all on a "need-to-know" basis;

(d) prevent a Party from divulging Confidential Information to the extent required by applicable legislation or stock exchange requirements;

(e) prevent a Party from divulging Confidential Information to the extent necessary in connection with any dispute resolution commenced under this Agreement or any litigation commenced in respect of this Agreement;

(f) prevent a Party from divulging Confidential Information to the extent necessary, in confidence, to any financial institution for the purpose of obtaining financing for such Party or any of its Affiliates;

(g) prevent a Party from divulging Confidential Information to the extent required by any Governmental Authority having jurisdiction to require the production of such Confidential Information; and

(h) prevent a Party from divulging Confidential Information to the extent necessary, in confidence, to a prospective purchaser of the Mine or the Transmission Facilities or YEC's other assets required to meet YEC's obligations under this Agreement, as the case may be, on a "need to know" basis.

If any Party is required to disclose Confidential Information under Sections 15.2(d), (e), or (g), such Party will advise the other Party in writing in advance of any such disclosure where reasonable so that the other Party may take such action as they consider necessary to maintain the confidentiality of such Confidential Information, and will take reasonable steps to limit the extent of the disclosure and to make such disclosure confidential under the applicable legislation, stock exchange rules, or rules of any governmental or regulatory authority having jurisdiction, as the case may be.

15.3 **Survival**. The obligations of confidentiality in Section 15.1 will survive the termination or expiry of this Agreement indefinitely, and any Party who ceases to be a Party will continue to be bound by such obligations following such termination or expiry.

15.4 **Injunctive Relief**. Each Party acknowledges that all Confidential Information is proprietary to the disclosing Party and that breach of this Agreement by a Party may result in irreparable injury to the other Party. Accordingly, in the event of any breach of Section 15.1 by a Party, the other Party will be entitled to seek and obtain an order of specific performance, restraining order, or injunctive relief, in addition to any other legal or equitable remedies provided under this Agreement.

PART 16
GENERAL

16.1 **Notices**. Except as otherwise provided in this Agreement, any notice, direction, demand, request, or document required or permitted to be given by any Party to any other Party under this Agreement will be in writing and deemed to have been sufficiently given if signed by or on behalf of the Party giving the notice and delivered or transmitted by facsimile to the other Party's address or facsimile number as shown below:

(a) To YEC:

Yukon Energy Corporation
P.O. Box 5920, #2 Miles Canyon Road
Whitehorse, YT Y1A 6S7

Attention: President

Facsimile: 867-393-5323

with a copy to:

DLA Piper (Canada) LLP
2800 - 666 Burrard Street
Vancouver, BC V6C 2Z7

Attention: John Landry

Facsimile: 604-605-3588

(b) To VGC:

Victoria Gold Corp.
1050 West Pender Street
Vancouver, BC V6E 3E7

Attention: Mark Aryanto

Facsimile: 604-682-5232

(c) To StrataGold:

StrataGold Corporation
1050 West Pender Street
Vancouver, BC V6E 3E7

Attention: Mark Aryanto

Facsimile: 604-682-5232

or to such other address or facsimile number or to the attention of such other official or individual as a Party will have most recently notified the other Party of in the manner hereinbefore provided. Any such notice, direction, request, or document will conclusively be deemed to have been received by the intended recipient on the date of delivery or transmission, as the case may be, except that if it is not received at such address or at the facsimile device by 5:00 P.M. on a Business Day (at the place of receipt) it will conclusively be deemed to have been received by the intended recipient on the next Business Day immediately following its receipt at such address or at such facsimile device.

16.2 **Coordination of Communications**. Each Party agrees to cooperate with the other Parties in order to coordinate all press, news, or other releases to private or public media groups in connection with this Agreement. Each Party will use all reasonable efforts to allow the other Parties to review such releases in advance of release and will comply with all reasonable requests from the other Parties as to the content or manner of publication of such releases.

16.3 **Amendment**. The only amendments, which may be made to this Agreement are amendments in writing which have been approved by the Parties.

16.4 **Governing Law and Language**. This Agreement will be governed by and construed under the laws of the Yukon Territory and applicable Canadian law and will be treated in all respects as a Yukon Territory contract.

16.5 **Submission to Jurisdiction**. Each of the Parties will:

(a) submit to the jurisdiction of the Yukon Territory courts;

(b) if not incorporated or registered in the Yukon Territory appoint an agent to receive service of any process in the Yukon Territory; and

(c) if any appointed agent is required, notify the others of the name and address of its appointed agent.

16.6 **Severability**. Each provision of this Agreement is intended to be severable and if any provision is illegal or invalid, such illegality or invalidity will not affect the validity of this Agreement or the remaining provisions.

16.7 **Entire Agreement**

(a) This Agreement and any other arrangement in writing between any of the Parties, which is entered into substantially contemporaneously with this Agreement constitute the entire agreement between the Parties relating to the subject matter of this Agreement and supersedes all prior negotiations and agreements, whether written, oral, implied or collateral, between the Parties, provided, however, that any confidentiality agreements, or confidentiality provisions contained in any agreements, executed between the Parties in connection with the transactions contemplated in this Agreement will continue in full force and effect and will survive any termination of this Agreement.

(b) No representation or inducement whether made by statement or delivery of data or other information of any kind or nature whatsoever and whether in writing, orally or in any other manner conveyed by any Party to any other Party survives the execution of this Agreement unless expressly made in this Agreement.

16.8 **Further Assurances**. As and so often as any Party may reasonably require, the Parties agree to execute and deliver further and other documents, assurances and conveyances as may be necessary to properly carry out the intention of this Agreement.

16.9 **Successors and Assigns**. This Agreement enures to the benefit of and will be binding upon the Parties and their respective permitted successors and permitted assigns.

16.10 **Waivers**. No provision of this Agreement may be waived except by a written instrument and any waiver of a provision:

(a) is valid only in respect of the specific instance to which it relates and is not a continuing waiver; and

(b) is not to be construed as a waiver of any other provision.

16.11 **Time**. Subject to Part 9, time is of the essence of this Agreement.

16.12 **Counterparts**. This Agreement may be executed in any number of counterparts with the same effect as if the Parties had signed and delivered the same document. All counterparts will be construed together and will constitute one and the same agreement. This Agreement will be duly executed and delivered if facsimile signature pages are exchanged by the Parties.

16.13 **Joint and Several**. The obligations of VGC Group under this Agreement are joint and several obligations of VGC and StrataGold.

This Agreement is executed by the Parties in multiple originals effective as of the day and year first written above.

SCHEDULE A

RATE SCHEDULE 39

INDUSTRIAL PRIMARY

AVAILABLE: Throughout the service areas of Yukon Energy Corporation ("**YEC**") and The Yukon Electrical Company Limited ("**YECL**") served by the Yukon Integrated Grid.

APPLICABLE: To all major industrial customers engaged in manufacturing, processing or mining with an electric service capacity in excess of 1,000 kW.

RATE: Charges in any one billing month will be the sum of the following:

(a) Demand Charge of $15.94/kVA of Billing Demand

(b) Energy Charge of 8.08¢/kWh for all energy used.

(c) Fixed Charge

For service to Minto mine site, the Fixed Charge each month shall equal the payments required under the amended Power Purchase Agreement (the "**Minto PPA**") dated May 14, 2007 between YEC and Minto Explorations Ltd. ("**Minto**") for monthly Capital Cost Contributions for transmission connection to the mine.

For service to Alexco mine and mill sites, the Fixed Charge each month will equal the amounts under the Power Purchase Agreement (the "**Alexco PPA**") dated September 1, 2010 between YEC and Alexco Resource Corp. ("**Alexco**") for existing transmission connection to the mine and mill sites, until such time as this amount is amended by the YUB based on the VGC Group PPA.

For service to VGC Group mine site, the Fixed Charge each month will equal the amounts under the Power Purchase Agreement (the "**VGC Group PPA**") dated November 9, 2017 between YEC, Victoria Gold Corp., and StrataGold Corporation ("Victoria Gold Corp. and StrataGold Corporation are collectively, the "**VGC Group**") for transmission connection to the mine site, subject to

amendment from time to time as provided for in Section 7.7 of the VGC Group PPA.

PEAK SHAVING CREDIT:

For customers with an established Winter Contract Load in good standing, a Peak Shaving Credit in each billing month equal to 50% of the Demand Charge times the Peak Shaved Load.

MINIMUM MONTHLY BILL:

The minimum monthly bill will be the sum of the Demand Charge and the monthly Fixed Charge, less any applicable Peak Shaving Credit.

PEAK SHAVED LOAD:

Peak Shaved Load in any billing month is the amount by which then nominated Winter Contract Load is less than the Billing Demand for the month.

BILLING DEMAND:

The Billing Demand will be the greater of:

(a) the highest metered kVA demand recorded in the current billing month; or

(b) the highest metered kVA demand recorded in the previous 12-month period including the current billing month, excluding the months April through September; or

(c) the contract minimum demand.

WINTER CONTRACT LOAD:

A customer may, by six month written notice to YEC, nominate a Winter Contract Load at not less than two-thirds of the customer's contract maximum demand subject to the following conditions:

(a) The customer will thereby contract with YEC not to exceed the nominated Winter Contract Load whenever the temperature at Whitehorse is below -30 degrees Centigrade, based on YEC informing the customer by phone, fax or e-

mail as to forecast and actual winter temperatures at Whitehorse as provided for in paragraph (b);

(b) YEC will inform the customer at least one hour in advance, and not more than one day in advance, of a forecast temperature at Whitehorse being below -30 degree Centigrade; thereafter, until YEC informs the customer otherwise, the customer will be responsible for ensuring that its metered kVA demand does not exceed the Winter Contract Load during any hour when the actual temperature at Whitehorse is below -30 degrees Centigrade; YEC will inform the customer forthwith when the temperature at Whitehorse is no longer forecast to be below -30 degree Centigrade within the next 24 hours;

(c) The customer agrees that the contract for the nominated Winter Contract Load will continue until terminated by written notice of not less than 12 months by the customer to YEC;

(d) If during such contract period for the Winter Contract Load the customer's metered kVA demand recorded, after YEC has provided notice as specified in paragraph (b) above, exceeds the Winter Contract Load when the temperature at Whitehorse is less than -30 degrees Centigrade, the Winter Contract Load contract will be terminated forthwith, the customer will forthwith be required to repay to YEC all Peak Shaving Credits determined within the previous 12 billing months, and the customer will also pay for that billing month to YEC as penalty an amount equal to four times the Demand Charge on the metered kVA demand recorded in excess of the Winter Contract Demand; in addition, YEC reserves the right if so required to meet system loads when the temperature at Whitehorse is less than - 30 degrees Centigrade during the then current month and the following 12 months to interrupt electricity supplied to the customer in excess of the previous Winter Contract Load.

BASE LOAD ENERGY:

A Base Load Energy amount per month may be established for a customer at 90% of forecast use when YEC expects to require diesel fuel generation to service use in excess of such a Base Load Energy amount. At such time, Rate Schedule 39 will be submitted to the Yukon Utilities Board for amendment to adjust the Energy rate as required for a two part rate that yields the same overall energy charge at forecast energy use, with all energy consumed in excess of the Base Load being charged at a rate reflecting the

incremental cost of service using diesel fuel generation and all other energy being charged at the reduced rate required to yield the same overall energy charge at forecast energy use.

RATE MODIFICATIONS APPLICABLE:

For fuel adjustment rider, see Rider F. Rider F applied to energy charges only, set to $0.0 for fuel price forecast filed November 20, 2006 and changed as follows:

a) Fixed Rider F of 0.211 cents per kWh charged only to Rate Schedule 39 customers to account for fuel price variance from price forecast filed November 20, 2006 to fuel price forecasts for 2009 as approved by the Board in Order 2009-08 and Order 2009-10 for Yukon Energy; plus

b) Ongoing Rider F per kWh as required to ensure consistency, after consideration of the Fixed Rider F as provided for in (a) herein, with the Rider F applied to all applicable rate schedules to account for fuel price variance from price forecasts as last approved by the Board for Yukon Energy and Yukon Electrical GRAs.

TERMS AND CONDITIONS OF SERVICE :

The Company's Terms and Conditions of Service approved by the Yukon Utilities Board form part of this rate schedule and apply to the Company and every customer supplied with electric service by the Company in the Yukon and British Columbia. Copies of the Terms and Conditions of Service are available for inspection in the offices of the Company during normal working hours.

Schedule B

McQuesten Substation

B.1 **McQuesten Substation Planning to Date.** The McQuesten Substation project to be connected to the existing grid powerline between Mayo and Keno City is designed to accommodate the future Transmission Facilities Development. The McQuesten Substation project and the Transmission Facilities Development have completed Yukon Environmental and Socio-economic Assessment Act screening followed by a decision document issued by the Yukon Government to allow all required construction and operating permits for the Stewart-Keno City Transmission Project (or components thereof) to be issued. YEC can secure access from the Yukon Government to use of the required right of way. Detailed engineering design of the McQuesten Substation project has been largely with funding from the Yukon Government and VGC Group.

B.2 **McQuesten Substation MOU**. A copy of the McQuesten Substation MOU (the "**MOU**") that was signed by VGC and YEC on September 19, 2017 is attached in Appendix B-1 to this Schedule B, setting out a formal relationship between the Parties and commitments to enable the Parties to work together on the successful tendering, procurement, construction, commissioning and turnover of the McQuesten Substation to YEC. The MOU notes that the McQuesten Substation design has been directed and reviewed by YEC, and has been frozen after the 85% design review and the agreement of the Parties to the design. VGC Group is authorized under the MOU to order long lead equipment, and is responsible under the MOU for issuing request for tender proposals, construction management, and pre-commissioning activities. YEC is responsible under the MOU for actual commissioning of the McQuesten Substation. The MOU provides for the Parties to develop an acceptance test or protocol for determining that the McQuesten Substation has been commissioned, and that deficiencies identified during commissioning will be rectified by VGC and approved by YEC before the McQuesten Substation is released to YEC for commercial operation. When the Substation has passed the agreed upon acceptance test or protocol and all deficiencies are rectified by VGC to the satisfaction of YEC, the MOU specifies that VGC will execute and deliver a document agreed to by the Parties transferring legal and beneficial title to the McQuesten Substation to YEC free and clear of all liens, charges, and encumbrances.

B.3 **McQuesten Substation Capital Costs funded by VGC Group:** Except as otherwise specified in this Agreement, VGC Group will fund all of the costs, fees and expenses for development of the McQuesten Substation, including actual final YEC's Owners Costs (see Table B-1 for YEC's estimate of these costs as of the current date). The YEC's Owner's Costs will be recovered from VGC Group after the Commencement of Delivery under Section 6.1(c) of this Agreement.

Table B-1: YEC's Owner's Costs for McQuesten Substation Development

Project Manager	$68,640
Owner's Engineer	$93,600
Site Supervision	$186,000
SCC SCADA	$16,000
Overhead (management, reporting)	$15,000
Commissioning (Internal)	$44,000
Commissioning (External)	$60,000
Total	**$483,240**

B.4 **McQuesten Substation Capital Costs funded by YEC**: YEC is responsible for the YEC McQuesten Substation Costs for incremental fees, costs and expenses associated with the McQuesten Substation being able to operate at 138 kV voltage at such time after the Commencement of Delivery when the Transmission Facilities Development is completed and energized at 138 kV YEC McQuesten Substation Costs are set at **[$930,563]**, as detailed in Table B-2. The YEC McQuesten Substation Costs will be payable by YEC to VGC Group after the Commencement of Delivery under Section 6.1(d) of this Agreement.

Table B-2: YEC McQuesten Substation Costs

5258 McQuesten & 5249 Mayo	YEC	
Construction	**$**	**605,931**
Supervision	$	36,000
Site Prep (Civil works)	$	325,350
Foundations	$	174,081
Structure and Bus Work	$	8,000
Electrical / Telecontrol / Telecom	$	62,500
Material	**$**	**240,036**
Switch Yard	$	132,770
Major Equipment	$	87,266
Delivery	$	20,000
Commissioning	**$**	-
On-site		
Owner's Costs	**$**	-
Overall owner's costs		
Subtotal	$	845,967
Contingency (10%)	$	84,597
TOTAL	**$**	**930,563**

Appendix B-1: McQuesten Substation MOU

Eagle Gold Project – McQuesten Substation

Memorandum of Understanding ("MOU")

BETWEEN

YUKON ENERGY CORPORATION (**"YEC"**)

AND

VICTORIA GOLD CORP. (**"VGC"**)

(collectively the **"Parties"**)

WHEREAS, VGC is a leading gold exploration and development company whose Eagle Gold Project (the "**Project**") is located within proximity to YEC's grid, is fully permitted and under construction to be Yukon's next and largest gold mine;

WHEREAS, YEC is a crown owned, regulated utility with a mandate to plan, generate, transmit, and distribute a continuous and adequate supply of energy in the Yukon;

WHEREAS, VGC and YEC have finalized detailed design of the McQuesten Substation (the "**Substation**"), finalized a system impact study and are actively working on the development of a power purchase agreement which provides the technical and commercial terms for connecting the Project to YEC's grid;

WHEREAS, YEC is currently planning for the replacement and upgrade of the Stewart-Keno Transmission Line; and

WHEREAS, YEC and VGC seek to work together on the successful tendering, procurement, construction, commissioning and turnover of the Substation to YEC.

NOW THEREFORE, YEC and VGC agree to the Eagle Gold Project – McQuesten Substation MOU as outlined below:

Objective

The objective of the Parties is to construct a quality Substation on scope as per the detailed design through quality workmanship in supply and installation, on schedule to meet the Project schedule, and in the most cost-effective manner possible.

Intent

The intent of this MOU is to establish a formal relationship between the Parties and secure commitments to enable the Parties to work together on the successful tendering, procurement, construction, commissioning and turnover of the Substation to YEC by:

- Sharing and exchanging information that is relevant to discussions as outlined in this MOU,
- Committing to the principles of collaboration and time is of the essence,
- Developing a work plan to track and summarize all responsibilities and activities undertaken through this MOU,
- Scheduling regular meetings to ensure ongoing meaningful dialogue, resolution of any issues, formalizing key decisions and reporting on progress,
- Implementing the Substation Construction Execution Plan with the schedule, file No. S258 Construction Schedule R2,
- Developing a genuine atmosphere of collaboration and alliance in the support of an effective and efficient partnership and leadership meant to maintain, safeguard and sustain sound and optimal managerial, financial and administrative commitment with regards to all matters related to the Substation,
- Recognizing that by implementing any contract, license, or other agreement entered into between the Parties subsequent hereto shall supersede any conflicting provision of this MOU.

Workplan

A workplan will be established to detail the implementation of the Substation through the draft Work & Responsibility Matrix attached to this MOU as Schedule 1.

Workplan Assumptions

1. Funding

Except as set out below VGC will fund all the full fees, costs, and expenses, including YEC's non-executive labour costs, external fees, costs, and expenses of the design, engineering, procurement, construction, project management, site supervision, SCADA changes, operations orientation and commissioning of the Substation. Notwithstanding the foregoing YEC will be responsible for all incremental fees, costs, and expenses associated with Substation being able to operate at 138 kV voltage, which amount will be payable by YEC to VGC at the time the Substation is transferred to YEC under Section 7 below.

2. Design Approval

The Substation design has been directed and approved by YEC.

The 85% design review of August 22, 2017, has frozen the design fully meeting YEC's requirements and both Parties agree to the design.

3. Long Lead Equipment Procurement

Orders for long lead equipment are, as of Aug. 22, 2017, being progressed by VGC, which ATCO will issue for tender with ordering prior to year-end 2017. The equipment will be ordered for delivery to ensure the Substation project schedule is maintained.

All of the long lead equipment vendors, save the E-house, have already been approved by YEC and VGC.

4. Preparation of Installation Tender Documents

A tender document for the contract is required. The type of contract (fixed price lump sum, cost plus, unit rate, etc.) to be mutually agreed by the Parties. ATCO will provide a construction work package which includes substation drawings, technical specifications, and tendering documents. YEC may require general and special conditions of contract and evaluation criteria, including provisions which provide for the assignment of all manufacturer warranties to YEC when YEC becomes the owner of the Substation under Section 8 below. YEC will provide VIT with any special conditions prior to VIT ordering any long lead equipment and prior to VGC preparing the tender document. VGC will be responsible for assembly of the document.

5. Tendering & Evaluation of Proposals

VGC, in conjunction with YEC, will be responsible for assembling a list of pre-approved tenderers. Tendering will be on the basis that any or no successful tenderer may be accepted, but in general the principle will be to select a complying proposal that meets all technical and construction requirements, has a competitive price and is by a tenderer with a good utility performance record and is in a solid financial position.

The subject of bid and performance bonds is to be mutually agreed upon by the Parties.

VGC will be responsible for issuing the request for tender proposals (RFPs) and formally answering questions as may arise during tendering.

VGC, with assistance of ATCO, will be responsible for the tender technical and schedule evaluation, with approval from YEC pursuant to the tender document.

VGC will be transparent with YEC for the economic evaluation of the tenders.

6. Permits

The Parties will identify all permits required for the construction and operation of the Substation and allocate responsibility for obtaining such permits.

7. Construction Management & QA/QC

VGC will be responsible for construction management. YEC may review the construction materials and methods and will be kept fully up to date, receive all reports, and make site visits as required and appropriate.

The contractor will be required to retain a pre-approved substation electrical testing contractor. Concrete and similar civil testing will be made available to YEC.

VGC will be responsible for oversight of the QA/QC process, from the results of which will be made available to YEC.

VGC will, in conjunction with the testing subcontractor, be responsible for pre-commissioning and preparation of "punch lists." (See also Section 8, Acceptance & Commissioning below.) This list will be reviewed and approved by YEC.

8. Acceptance & Commissioning

VGC or its designate will complete "pre-commissioning" which consists of all the tests done by the testing subcontractor. These tests will be specified and recorded by VGC, and approved by YEC before proceeding to substation commissioning.

Actual commissioning will be the responsibility of YEC, with assistance from Substation contractor and other parties as involved in Substation installation and testing. The Parties will develop an acceptance test or protocol for determining that the Substation has been commissioned. Deficiencies identified during commissioning will be rectified by VGC and approved by YEC before the Substation is released to YEC for commercial operation. When the Substation has passed the agreed upon acceptance test or protocol and all deficiencies are rectified by VGC to the satisfaction of YEC, VGC will execute and deliver a document agreed to by the Parties transferring legal and beneficial title to the Substation to YEC, free and clear of all liens, charges, and encumbrances.

Duration

The term of this MOU shall extend until March 31, 2019.

Extent of the Agreement

The signing of this MOU doesn't create any legal or financial obligations on the part of either Party. No rights or limitation of rights shall arise or be assumed between the Parties as a result of the terms of this MOU.

Assignment

Neither Party to this MOU may assign or transfer the responsibilities or agreements made herein without the prior written consent of the non-assigning Party, which approval shall not be unreasonably withheld.

Legal and Regulatory Authority

Any future agreements and projects will be subject to any and all legal and regulatory approvals under any applicable legislation.

Acts of Parties and Agents

Each Party shall be responsible for the acts of its own employees, agents and contractors in carryout the provisions of the MOU.

Amendment

Any amendments to the MOU will be made in writing upon the consent of both Parties.

Termination

Either Party may terminate this MOU by providing thirty (30) days written notice to the other Party.

The Parties have executed, and made effective, this MOU as of the ____ day of September, 2017.

Schedule 1

Work & Responsibility Matrix

[NTD: Matrix to be reviewed and updated by Parties.]

Item	Description	Responsibility / Approval Milestones
1	Design completion including S258 and by-pass lines. The design is now 85% with all significant items agreed to by all.	VGC and YEC
2	Purchase of long lead "engineered" equipment	VGC
3	Preparation of tender documents	VGC, YEC
4	Pre-qualification of tenderers	VGC and YEC
5	Installation contract: tendering, contractor selection, and award.	VGC and YEC
6	Construction management	VGC
7	Strategy for QA/QC, third party inspection, etc.	VGC, YEC
8	Strategy to meet the recently published schedule	VGC
9	First Nations participation	VGC
10	Coordination with Northwestel and others	VGC (construction manager)
11	Temporary facilities as required	VGC (construction manager)
12	Contractor mobilization to site	VGC (construction manager)
13	Contractor invoicing and payment	VGC (construction manager)
14	Schedule maintenance	VGC
15	Safety plan with zero accidents objective	VGC (construction manager)

Item	Description	Responsibility / Approval Milestones
16	Field material and free issue equipment, control plan	VGC (construction manager)
17	Parties to identify additional permits required for the Substation and allocate responsibility for obtaining permits.	VGC and YEC
18	Environmental including temporary site drainage control, etc.	VGC (construction manager)
19	Contractor detailed schedule, labour (manpower) plan, review and approve	VGC (construction manager)
20	Site security	VGC (construction manager)
21	Testing & pre-commissioning (by approved subcontractor)	VGC (construction manager), YEC
22	Final inspection and turn over	YEC & VGC
23	Commissioning	YEC
24	Transfer of legal title of Substation to YEC	VGC and YEC
24	Keno outage and line change-over	YEC

Schedule C

Initial YEC System Improvements

C.1 The Initial YEC System Improvements that YEC is to design, engineer, procure, construct and commission on YEC's existing power system prior to Commencement of Delivery, to accommodate the sale of Grid Electricity by YEC to VGC Group for the Mine, are as follows:

a) Update YEC Under Frequency Load Shedding (UFLS) Scheme:

UFLS settings changes are to be implemented in certain locations throughout the YEC system, as set out in Table C-1 (the specific settings in this table are subject to ongoing change by YEC at its sole discretion as needed for system impact management). Some changes are required to third party equipment (Minto and ATCO). Mayo F1 and Minto will both require relay installations. Testing and tuning will be completed as required following real life system contingencies.

Table C-1: Under Frequency Load Shedding Settings

Item Tripped	Relay Settings			Simulation Parameters		
	f (hz)	df/dt (hz/s)	T_d (4)	T_m+T_d (s)(3)	T_b (s)(2)	T_t (s)(1)
Minto Block 1 – 50% of Load	59.5	-3.4		.25	.083	0.333
Minto Block 1 – 50% of Load	56	----		.25	.083	0.333
Minto Block 2 – 50% of Load	59.5	-4.2		.1	.083	0.183
Minto Block 2 – 50% of Load	56	----		.75	.083	0.183
Minto Capacitor Bank	59.5	-3.4		.1	.083	0.183
Minto Capacitor Bank	56	----		.25	.083	0.183
S170 S6838	59.5	-1.0		0.6	.083	0.683
S150-52-22, S150-52-21	59.5	-1.8		0.4	.083	0.483
S170 S6837	59.5	-2.6		0.2	.083	0.283
S164 52-7	56.5	----		0.1	.083	0.183
EG F1 Block 1– 50% of F1Load + Caps(5)(6)	59.5	-1.0		0.55	.083	
EG F1 Block 2 – 50% of F1 Load +Caps	59.5	-2.4		0.25	.083	
EG F2 Block 3– 50% of F2 Load + Caps	59.5	-3.2		0.10	.083	
EG F2 Block 4 – 50% of F2 Load + Caps	59.5	-1.8		0.4	.083	.483
Dawson F1	56	----	1.		.083	
Dawson F2	56	----	2.		.083	
Mayo F1	58	----	5.		.083	
Callison (Hunker Creek)	56	----	1.		.083	
Keno/Elsa	59.5	-3.4		0.4	.083	.483
McQuesten Capacitor Stage1 (2 MVAr)	59.5	-1.8		.25	.083	.333
McQuesten Capacitor Stage2 (2 MVAr)	59.5	-2.4		.10	.083	.183

(1) Total clearing time. Includes all intentional and non-intentional delays and breaker interrupting time.
(2) Breaker interrupting time. This may be reduced to observed times.
(3) T m+Td is the relay measurement delay plus the delay set on the relay. Tm will vary with the specific relay and the settings and must be determined.
(4) Td must be determined by the relay engineer to achieve to Tt indicated (TBD).
(5) F1- Crusher & Conveyers, F2 – Process Plant and Pumping.
(6) Capacitors are shed in proportion to the amount of load shed so the resulting load power factor remains close to unity.

b) Confirm timing of Mayo Breaking Resistors:

Timing test to be performed on the breaking resistors for both insertion and removal.

There are two banks of resistors (2 MW each) each with four stages of 250 kW and two stages of 500 kW. They engage and disengage on frequency and have a limited insertion time of 70 and 12 seconds for the 250 and 500 kW units respectively. Once the thermal limit is reached they disconnect and then are precluded from engaging for the next 15 minutes.

Once timing is determined they are to be compared to the desired settings. Settings changes may be required which will require additional modeling. Current estimated settings are as follows (the specific settings provided below are subject to ongoing change by YEC at its sole discretion as needed for system impact management):

- Stage 1 – >61.5 Hz, >+0.2 Hz/s, >0.1 s (250 kW, 60 seconds).
- Stage 2 – >61.8 Hz, >+0.2 Hz/s, >0.1 s (250 kW, 60 seconds).
- Stage 3 – >62.1 Hz, >+0.2 Hz/s, >0.1 s (250 kW, 60 seconds).
- Stage 4 – >62.4 Hz, >+0.2 Hz/s, >0.1 s (250 kW, 60 seconds).
- Stage 5 – >62.7 Hz, >+0.2 Hz/s, >0.1 s (500 kW, 10 seconds).
- Stage 6 – >63.0 Hz, >+0.2 Hz/s, >0.1 s (500 kW, 10 seconds).

c) Commission LV Reactor Insertion/Trip (Minto/Faro):

The purpose of this is to add or remove the reactors from the system during system contingencies. The existing protection relays at Faro and Minto do not have the functionality to accommodate this. They will need to be replaced. There is limited space in the Minto e-house meaning that the panels will need to be reworked. The Minto relay installation will require more than average engineering and installation time. The required scheme is as follows:

- Automatic insertion of the 2.5 MVAr reactors at Minto and Faro on detection of sustained voltages greater than 107% (positive sequence or phase-to-phase) with time delays of not less than 2 seconds and less than the over-voltage trips set on L178 at Carmacks, L173 at Minto and L174 at Stewart (staggered insertions). Initial settings can be 2 and 2.5 seconds.
- With two 2.5 MW reactors in service at Minto a trip of either L173 or the trip of L174 at Minto must also cross-trip one reactor with no intentional delay. One of two reactors should also be tripped upon detection of open breaker contacts opening for L173 or L174 breakers at Minto. With only one 2.5 MVAr reactor in service at Minto no action is taken.

d) Confirm Aishihik/Mayo over-frequency trips:

Over-frequency trips for Mayo-B units and Aishihik units to limit over-frequency in the event of a separation south of Takhini. This work requires settings changes and testing only. Over frequency trips as set are to remain:

- Aishihik1 - >62.7Hz, >0.3 seconds
- Mayo B1 - >66Hz, >0.3 seconds

e) Engage Over frequency trips on WG1,2,3:

As backup and to cover isolations south of Minto where SPS and RAS are not practical due to lack of communications. This is due to the increases in the south to north flow resulting from the Mine development and generation supplied from Whitehorse. This work requires equipment replacement, testing and settings changes as per the following current assessments (the specific settings provided below are subject to ongoing change by YEC at its sole discretion as needed for system impact management):

- LNG1>61.5 Hz, >+1.8Hz/s, >.6s AND Also >63.5 Hz, 0.6s.
- LNG2>61.5 Hz, >+2.4Hz/s, >.4s, AND Also >63.5 Hz, 0.4s.
- LNG3>61.5 Hz, >+3.2Hz/s, >.2s, AND Also >63.5 Hz, 0.2s.

f) Confirm over-voltage trips on MD interconnect and L173:

This work requires settings changes and testing only. Protection settings to be set as follows (the specific settings provided below are subject to ongoing change by YEC at its sole discretion as needed for system impact management):

L174 or L175 at Stewart - 138kV Voltage

- 140% for 0.15s OR
- 127% for 7s OR
- 117% for 40s

L173 at Minto - 138kV Voltage

- 140% for 0.15s OR
- 127% for 6s OR
- 117% for 30s

L178 at Carmacks - 138kV Voltage

- 140% for 0.10s OR
- 127% for 5s OR
- 117% for 30s

g) SPS/RAS1 - Shed Mine load for loss of Mayo:

The loss of units at Mayo can cause unacceptable voltage depressions. SPS/RAS1 executes a high speed load rejection on L250, L180 and the Mine feeders. Operating instructions will need to be written for the YEC System Control Centre. Mayo B and S249 will need some fiber work (fiber already existing but not connected). Programmable Logic Controller (PLC) will need to be

installed at S249. Assuming that no work needed at MH0. Heavy engineering is needed for design and programing of this scheme. SCADA component is also significant.

h) SPS/RAS2 – L172 Riverside Generation Rejection Whitehorse

Ensures that system frequency deviation is limited to within tolerable bounds and can be brought back to 60 Hz. SPS/RAS2 monitors L172 MW at Whitehorse and arms selected units for rejection upon detection of trip or open breakers on the Whitehorse end of L172. Units available for selection are three LNG units (preferred trip - assumes LNG third unit installed) and WH3. This work requires some equipment changes to accommodate fiber communications (fiber is already installed). PLC needed at Riverside substation and engineering is needed for design and programing of this scheme. SCADA component is also significant.

i) SPS/RAS3 – L172 Takhini: Generation Rejection Whitehorse
SPS/RAS4 – L170 Takhini: Generation Rejection Whitehorse

Ensures that system frequency deviation is limited to within tolerable bounds and can be brought back to 60 Hz. SPS/RAS3 and SPS/RAS4 monitors L172 and L170 MW at Takhini and arms selected units for rejection upon detection of trip or open breakers on the Whitehorse end of L172 and L170. Units available for selection are three LNG units (preferred trip) and WH3. This work requires some equipment changes to accommodate fiber communications (fiber from Whitehorse to Takhini is being installed by another YEC project, however if that project is canceled then this project would need to pick up that work). PLC needed at Takhini substation and heavy engineering is needed for design and programing of this scheme. SCADA component is also significant.

j) SPS/RAS5 – MacIntyre: Generation Rejection Whitehorse

Ensures that system frequency deviation is limited to within tolerable bounds and can be brought back to 60 Hz. SPS/RAS5 Monitors load at MacIntyre substation and arms selected units at Whitehorse for rejection upon detection of trip or open breakers that disconnect the load from the system. Rejection would include the three LNG units (preferred trip) and WH3. This work requires some equipment changes to accommodate fiber communications (fiber from Whitehorse to MacIntyre is being installed by another YEC project, however if that project is canceled then this project would need to pick up that work). PLC needed at MacIntyre substation and heavy engineering is needed for design and programing of this scheme. SCADA component is also significant.

k) SPS/RAS6 Loss of Mine Load – Tripping Mayo Generators

The loss of load at the Mine can cause unacceptable voltage spikes. SPS/RAS6 monitors L250 at Mayo substation and arms selected Mayo units for rejection upon detection of trip or open breakers for L250, L180 and the Mine. Operating instruction will need to be written for the YEC SCC. Mayo B and S249 will need some fiber work (fiber already existing but not connected). PLC will need to be installed at S249. Significant programming time. Assuming that no work needed at MH0. Mayo Diesel requires SCADA and Automation systems to be installed along with some fiber work.

l) Verify the Mine SPS design, settings and commissioning

YEC to verify VGC Group design, settings and commissioning of SPS's at the Mine as required pursuant to Schedule D.

m) Out of Step – Protection Review L171

The Mine development increases the speed requirements of protection and backup protection operations for faults near Takhini and in particular L171. Settings, backup clearing times and coordination to be reviewed. This requires system studies, installation of new settings and testing.

n) SPS/RAS7 L172 Riverside Trip: On High Load - Cross Trip Takhini Terminal L172

SPS/RAS7 mitigates lower transient voltages that result for certain contingencies with the reactors in service. Monitors L172 MW at Riverside and Takhini. The setting will depend on the amount of generation on line in the north.

- Arming Parameter = L172 North at Riverside – L172 North at Takhini
- Arm at 0 MW with Aishihik off line
- Arm at the lesser of 4 MW or the regulating reserve at Aihihik when Aishihik is on line
- Requires high-speed communications between Whitehorse and Takhini

o) Dispatch YEC thermal generators to limit MD Import from south <11 MW

Programmed alarms for YEC SCC; minimal effort required.

C.2 The estimated YEC Capital Costs of $1,677,883 for the Initial YEC System Improvements are provided in Table C-2.

Table C-2: Estimated YEC Capital Costs for Initial YEC System Improvements

	Initial YEC System Improvements	Estimated Capital Cost				
		Contractor	Labour	Material	Contingency	Total
a	Update YEC UFLS Scheme	$94,200	$24,880	$7,000	$50,432	$176,512
b	Mayo Breaking Resistors	$19,400	$4,000	$0	$9,360	$32,760
c	Minto/Faro LV Reactor Intersection/Trip	$81,000	$8,880	$2,500	$36,952	$129,332
d	Aishihik/ Mayo Over-frequecy Trips	$11,200	$1,600	$0	$5,120	$17,920
e	Over-frequecy trips on WG 1,2,3	$17,600	$5,600	$10,000	$13,280	$46,480
f	Over-voltage trips on MD interconnect and L173	$17,600	$4,000	$2,500	$9,640	$33,740
g	SPS/RAS1 - Shed EG load for loss of Mayo	$54,025	$12,880	$10,000	$30,762	$107,667
h	SPS/RAS2 - L172 Takhini: Generation Rejection WH	$100,200	$28,400	$40,000	$67,440	$236,040
i,j	SPS/RAS3/4/5 - L172/L170 Takhini & MacIntyre: Generation Rejection WH	$240,000	$78,800	$20,000	$135,520	$474,320
k	SPS/RAS6 - Loss of EG Load - Trip Mayo	$85,000	$40,000	$50,000	$70,000	$245,000
l	Verify EG SPS Design, Settings, Commissioning	$6,400	$6,800	$2,500	$6,280	$21,980
m	Out of Step - Protection Review L171	$48,000	$20,880	$2,500	$28,552	$99,932
n	SPS/RAS7 L172 Riverside Trip: On High Load - Cross Trip Takhini Terminal L172	$0	$30,500	$2,500	$13,200	$46,200
0	Dispatch YEC Thermal Generators to Limit MD Impart from south <11 MW	$0	$10,000	$0	$0	$10,000
	Total	$774,625	$277,220	$149,500	$476,538	$1,677,883

Schedule D

VGC Group Power Facilities

D.1 The VGC Group Power Facilities that VGC Group is to install at the Mine Facilities prior to Commencement of Delivery, and to operate thereafter as set out herein as part of the Mine Facilities in order to manage impacts on the YEC power system from the sale of Grid Electricity by YEC to VGC Group for the Mine, are as follows:

a) Measures in Substitution of McQuesten Capacitor Bank Installation

The following equipment-related measures will be undertaken in substitution of McQuesten Capacitor Bank installation:

- Ensure that Mine UFLS sheds capacitors in proportion to the Mine load.
- Trip Mine load in response to capacitor bank trips. (i.e., loss of capacitor bank trips two main feeders).

b) Coordinate Mine Voltage and Tap Changer Controls

Normally the transformer tap-changers will regulate the 13.8kV bus (presumably to nominal voltage). This approach cannot be applied with the Mine generation online. The following operation will be adopted at the Mine Facilities and can be changed if mutually agreed by YEC and VGC Group:

- Mine capacitor banks are switched to produce a net load power factor of unity measured on the feeders or on the LV side of transformers but netting out the reactive load on the generators.
- Tap-changers control 13.8 kV bus voltage with generation off.
- With the Mine generators on, the tap-changers are moved to nominal taps and further operation blocked.
- The Mine generators regulate the 13.8 kV bus voltage between 100 and 105% of nominal and YEC has control of this set-point. Generators reactive output will be adjusted by YEC in real time, to regulate the 69kV system voltage, by pulsing the AVR voltage set-points. The Mine sets the acceptable range that YEC can adjust voltage within it.
- YEC must have full SCADA visibility of the Mine substation and control of critical elements.

c) Install over-voltage protection

To prevent feeder/load trips at the Mine from creating sustained over-voltages the following protections are required at the Mine Facilities:

- On loss of either of the two main Mine feeders, directly trip a proportionate share of the Mine capacitors with no intentional delay.
- Capacitor stages also must have over-voltage protection set to trip when voltage exceeds threshold on the 69kV bus. The trips are to be staggered with time delays settable, as specified by YEC. The delays are expected to be in the 0.1 to 20 second range. Initial settings are 108% for 1 second and 1.25 and 1.75 seconds assuming shedding in blocks, one allocated to each main feeder.

- Trip of capacitor bank blocks must also trip associated feeder with no intentional delay.

d) Mine Reactive support

VGC Group will install and operate the following as part of the Mine Facilities:

- Capacitors must be shed with load and load shed with capacitors
- Install SPS and RAS Loss of the Mine capacitors – Trip Mine load
- Install SPS/RAS Loss of the Mine Load – Trip Mine capacitors pro-rata
- Maximum size of switched elements 1.4 MVAr
- Subject to Power Quality requirements, VGC Group may choose to maintain 1MW of load when shedding in order to maintain power supply to critical loads.

e) SPS/RAS6 Loss of Mine Load – Tripping Mayo Generators

The loss of load at the Mine can cause unacceptable voltage spikes. SPS/RAS6 monitors L250 at Mayo substation and arms selected Mayo units for rejection upon detection of trip or open breakers for L250, L180 and the Mine. Equipment with the necessary metering and communication capabilities including high speed communication to be installed at the Mine Site or McQuesten Substation as required.

f) Mine Generators equipped with Utility Grade Speed and Voltage Controls

The Mine Facilities generators must provide the same frequency and voltage ride-through as utility generators. In addition the controls must provide the same operational modes as those found on similar utility generators as follows:

- AVR/Exciters will operate in voltage control mode. This is the mode they will invariably operate in.
- Speed Governor – The governor will operate in speed droop (not kW-droop). Any constant kW mode that is included (for troubleshooting) must have trips to Droop that are set by YEC. The governors must be set up to maximize response to frequency deviation, both loading and unloading. YEC must receive test results and modeling information.

g) Under Frequency Protection

Under Frequency Load Shedding (UFLS) is required at the Mine site to minimize the negative effects of contingency events on the YEC system. The settings will be as per YEC discretion.

h) YEC Inspections

YEC will have access to the Mine equipment for periodic testing and verification of the SPS/RAS functionality.

Schedule E

Operating Agreement

E.1 **Operating Agreement.** Prior to the Commencement of Delivery and throughout the balance of the Term, YEC and VGC Group will maintain an operating agreement (the "**Operating Agreement**") to coordinate electric power operations of YEC and the Mine.

E.2. **Draft Operating Agreement.** Appendix E-1 to this Schedule E provides a draft Operating Agreement that the Parties will finalize prior to the Commencement of Delivery. The following are noted regarding terms used in the Draft Operating Agreement:

- "L251" means the Mine Facilities Spur; and
- "Operational Boundary/Interface Point of Point of Common Coupling (PCC)" means the Point of Delivery

E.3 **Amendments to Operating Agreement**. The Parties will review the provisions of the Operating Agreement on a regular basis, and amend the Operating Agreement form time to time as required to reflect changing conditions and requirements.

Appendix E-1: Draft Operating Agreement

YUKON ENERGY	OPERATING AGREEMENT	DEPARTMENT:	INQUIRIES TO:	TOPIC:
		ISSUED DATE	Review Date	Victoria Gold / Yukon Energy Operating Agreement

1.0 Purpose

1.1 This procedure outlines the steps to take to ensure a reliable and safe supply of power to the Mine through a variety of circumstances.

2.0 General Information

2.1 Breaker Identification
S258 52-1 – Connection between the McQuesten bus and S249 (Mayo) bus
S258 52-2 – Connection between the McQuesten bus and S257 (Keno) bus
S258 52-3 – Connection between the McQuesten bus and L251
VGC 52-T1 – Connection between L251 and the VGC bus
VGC 52-T2 – Connection between L251 and the VGC bus

2.2 Interlocks
Identified break interlocks with sequence information

Operating Authority: The organizational unit assigned responsibility for operating a portion of the electrical system. For YEC the SCC operator is the operating authority. For the VGC Group the ??? is the operating authority.

Operational Boundary/Interface Point or Point of Common Coupling (PCC): The location on the electrical system at which responsibilities between Operating Authorities meet. The breaker S258 52-3 is the interface point between the Mine and YEC.

2.3 Contact Information
SCC – phone 867-393-5355 or 867-393-5324 (recorded lines)

Mike Hannah (Leadhand SCC)	393-5399, cell 334-6759
Myles O'Brien (Operation Coordinator)	393-5352
Ed Peake (Manager Operations)	393-5383, cell 334-6586
Guy Morgan (Director of Operations)	393-5366, cell 334-6904

Mine – Contact Information ########

2.4 Normal Operation
Under normal operating conditions the Mine will be supplied from the YEC grid. The breakers status under normal operating conditions is as follows.

Breaker	**Status**
S258 52-1	Closed
S258 52-2	Closed

S258 52-3	Closed
VGC 52-T1	Closed
VGC 52-T2	Closed

3.0 Operating Procedures

3.1 L### (S258 to the Mine Site) Isolation

L### isolation requires the minimum notification defined in section 4.3, with the exception of emergency repairs. YEC will provide a condition guarantee on breaker S258 52-3. The condition guarantee is used in communications between external parties. It is a formal method of communication that switching has been completed. It ensures the status of the breaker/device will not change until the work is complete, the lock out tag out is surrendered and all workers are clear.

3.2 Voltage Support/Load Reduction

Based on the power quality conditions defined in Schedule F of this Agreement and system security requirements, SCC may request voltage support and/or a mine load reduction. Voltage support and a Mine load reduction can be accomplished by placing the Mine generation on line, or other means such as capacitor banks or transformer tap changing.

- When the Mine has generation online, the generators regulate the 13.8 kV bus voltage between 100 and 105% of nominal and YEC will have control of this set-point. Generators reactive output will be adjusted by YEC in real time, to regulate the 69kV system voltage, by pulsing the AVR voltage set-points. VGC Group sets the acceptable range that YEC can adjust voltage within it.
- YEC must have full SCADA visibility of the Mine substation and control of critical elements.

3.3 SCC Remote Monitoring and Control

SCC will have visual indication of the Mine breakers, generator status, capacitor status and electrical measurement information for the Mine Site Single Line Diagram (SLD) including transformers, feeders and breakers. Control will be limited to approving load step requests from the Mine to SCC. Load step requests will be approved by SCC based on the generation dispatch and system status. Load changes of more than 1000 kW must be communicated and approved by YEC.

YEC will have control (open and close) of incoming 69kV line breakers at the Mine.

If VGC Group exceeds the Maximum Electric Demand load limitations specified in Section 5.1 of this Agreement, the following procedure will be followed.

a) SCC will contact VGC Group to notify them that their load is exceeding the cap.
b) VGC Group has 30 min to reduce load below the cap.
c) If VGC Group does not comply within 30 mins, SCC will contact VGC Group again to provide a final warning.
d) If the Mine still does not comply within 30 mins, SCC operator may exercise the right to disconnect the Mine by opening S258 52-3.

4.0 Operational Notification

4.1 Daily Operating Communications
Under normal operating conditions the Mine will be supplied from the YEC grid. Load changes supplied to the Mine of more than 1000 kW must be communicated and approved by YEC.

4.2 The transition from winter to summer and conversely summer to winter loading needs to be established with SCC with a minimum of 30 days' notice.

4.3 Mine Planned Maintenance and Scheduling
To meet changing operating conditions and coordinate maintenance efforts, maintenance shutdowns by the Mine need to be communicated to SCC at least one week in advance for shutdowns of up to 12 hours and 30 days for shutdowns longer than 12 hours.
Changes in the availability and capacity of the onsite generation needs to be communicated to SCC at least 30 days in advance of such changes.
The Parties will share annual shutdown/maintenance plans in February of each year.

4.4 YEC Transmission and Generation Maintenance and Scheduling
YEC performs annual line maintenance on the transmission lines and generation facilities, during which Grid Electricity to the Mine may be curtailed or suspended. The duration of this annual transmission and generation maintenance can be up to 14 days per calendar year.
YEC will provide a minimum of 30 days' notice of the start date and expected duration of work that will curtain or otherwise interrupt the supply of Grid Electricity to the Mine.

5.0 Loss of Supply Procedures

5.1 Loss of Supply - Short Term
In the event of a disturbance that results in the loss of Grid Electricity to the Mine Site, SCC will make one attempt to re-energize the line to the Mine Site. If successful the following steps apply to resume the Mine operation with Grid Electricity.

a) SCC will confirm the status of the breakers located in the S258 switching station.

Breaker	Expected Status
S258 52-1	Closed
S258 52-2	Closed
S258 52- 3	Closed
VGC 52-T1	Open
VGC 52-T2	Open

b) SCC will request closed breakers VGC 52-T1 and VGC 52-T2.

c) Once complete and with confirmation from SCC the Mine may proceed with the restarting of their operation. VGC Group will communicate to SCC on load pickups greater than 1000 kW. The request to load up may be communicated verbally or via SCADA.

5.2 Loss of Supply - Long Term
In the event of a disturbance that results in the loss of Grid Electricity to the Mine Site and SCC is unsuccessful in re-energizing the line the following steps will apply.

b) SCC will confirm the status of the breakers.

Breaker	Expected Status
S258 52-1	Closed
S258 52-2	Closed
S258 52- 3	Open
S258 52-4	Closed
VGC 52-T1	Open
VGC 52-T2	Open

c) At the direction of SCC the Mine personnel will start and stage their diesels on line supplying power to the Mine.

d) Once the line to the Mine has been re-energized, with confirmation that breaker S258 52-3 is closed.

e) SCC will request the Mine synchronize and close breakers VGC 52-T1 and VGC 52-T2.

f) The Mine is now connected to YEC Grid Electricity. Once complete and with confirmation from SCC the Mine may proceed with the restarting of their operation. VGC Group will communicate to SCC on load pickups greater than 1000 kW. The request to load up may be communicated verbally or via SCADA.

g) At the direction of SCC the Mine personnel will be requested to unload and shutdown some or all Mine Site diesel generation

7.0 Revision and Approval

7.1 This Agreement comes into effect once it is signed by VGC Group and YEC.

7.2 This Agreement will remain in effect unless cancelled upon the mutual agreement of both Parties.

7.3 The Parties will provide 90 days notice in writing of the intention to modify this Agreement.

7.4 The Agreement may be revised upon mutual agreement of both Parties. This agreement will be formally reviewed every two (2) years.

Schedule F

Power Quality Requirements

F.1 **Power Quality Requirements**. Starting with the Commencement of Delivery and throughout the Term when receiving Grid Electricity from YEC, VGC Group will operate the Mine Facilities in accordance with the power quality requirements of YEC as set out in this Schedule F and in Section 5.6 of this Agreement. In this Schedule F "PCC" means the Point of Delivery.

F.2 **Power Factor**. VGC Group will maintain a 96% leading load power factor for Grid Electricity supplied to the Mine at the PCC, that is computed from real load (total 13.8 kV real load less the power generated) and reactive load (total 13.8 kV reactive load net of the capacitors and ignoring any reactive power produced by on-line generators) and will be controlled, as nearly as possible, by the capacitor bank steps of 1.4MVAR.

F.3 **Frequency Variation.** The continuous or quasi-continuous variations in the Mine load should not create a variation in system frequency by more than 0.25 Hz. This includes jogging and variation in load. Infrequent load pickups and trips should not cause more than a 0.5 Hz deviation. This is set to ensure that variations do not risk under-frequency load shedding operations without the SCC having to operate with frequency above 60 Hz.

F.4 **Perceptible Lamp Flicker**: Lamp flicker results from voltage variations caused by the operation and switching of equipment and load variations. The short-circuit strength of the 69 kV bus at the Mine can be between 50 and 33 MVA. At McQuesten Substation, the PCC, short-circuit levels vary between 65 and 40 MVA. The Mine shall design equipment and manage operations to meet the following requirements for flicker at the PCC:

a) Pst < 0.8, Plt<0.6 at McQuesten Substation with the 65 MVA normal YEC short-circuit conditions.

b) Pst< 0.9, Plt<0.7 at the McQuesten Substation with reduced 40 MVA normal YEC short-circuit conditions.

c) Based on standards IEEE 1546 (adopted from IEC 61000).

d) Based on 120v 60Hz lamps.

e) Should the Mines operation produce unacceptable variations then dynamic voltage control equipment can be installed.

TOPIC: **Sales Forecasts – Residential Sales.**

REFERENCE: **2021 General Rate Application, page 2-7 (PDF page 32 of 441)**

PREAMBLE: YEC provides one paragraph explaining its residential sales forecast.

QUESTION:

a) Please provide the monthly actual and normal sales, monthly actual and normal sales per customer, and monthly customers for each community for 2015, 2016, 2017, 2018, and 2019 in Excel format.

b) Please provide an explanation for changes in use per customer and number of customers in each community.

c) Please provide the forecast sales, sales per customer, and customers for each community for 2020 and 2021 in excel format.

d) Please provide the calculation of historical averages referred to in line 18,

e) Please provide the actual and normal weather (Temperatures and degree days) by month for each community.

f) Please YEC's definition of normal weather, and the calculation of normal weather for each month for each community.

ANSWER:

(a) through **(d)**

Please see CW-YEC-1-6 Attachment 1 for YEC retail sales for 2018 and 2019 actuals, 2020 and 2021 forecasts. The actuals sales for 2015 through 2017 are not included in Table 2.1 for the 2021 GRA.

As illustrated in CW-YEC-1-6 Attachment 1 the annual sales and sales per customer are steady without any notable changes year over year, except for two instances:

- The annual changes for Mayo general service sales are impacted by Alexco sales. As noted on page 2-8, for the years 2018 through 2020 Alexco was a general service customer with 2.4 GW.h sales in 2018, 1.8 GW.h sales in 2019 and 1.6 GW.h sales forecast in 2020. Starting in 2021 Alexco was included as an industrial customer which resulted in a decrease in average sales per customer for general service in this community in 2021.

- The increase in Faro general service sales reflects changes for the largest General Service customer - Faro Mine remediation project. As noted on page 2-7, the sales for this customer are forecast to grow to 14.4 GW.h in 2020 and 2021 resulting in an increase in average sales per customer.

(e) and **(f)**

YEC does not prepare weather normalized level sales for retail and industrial sales. Therefore, the requested information cannot be provided.

Yukon Energy uses the Environment Canada Canadian Climate Normal for Whitehorse Airport for the definition of normal weather as noted in response to YUB-YEC-1-16 (a). See also CW-YEC-1-3(d) which provides YEC's definition of normal weather.

TOPIC: **Sales Forecasts – General Service Sales**

REFERENCE: **2021 General Rate Application, page 2-7 (PDF page 32 of 441)**

PREAMBLE: YEC provides one paragraph explaining its General Service sales forecast in general and one discussing Faro Mine remediation.

QUESTION:

a) Please provide the monthly actual and normal sales, monthly actual and normal sales per customer, and monthly customers for each community for 2015, 2016, 2017, 2018, and 2019 in Excel format.

b) Please provide an explanation for changes in use per customer and number of customers in each community.

c) Please provide the forecast sales, sales per customer, and customers for each community for 2020 and 2021 in Excel format.

d) Please provide the calculation of historical averages referred to in lines 23-24.

e) If different than residential, please provide the actual and normal weather (Temperatures and degree days) by month for each community.

f) If different than for residential, please YEC's definition of normal weather, and the calculation of normal weather for each month for each community.

ANSWER:

(a) through **(f)**

Please see response to CW-YEC-1-6.

TOPIC: **Sales Forecasts – General Service Sales – Faro Mine remediation**

REFERENCE: **2021 General Rate Application, page 2-7 (PDF page 32 of 441)**

PREAMBLE: YEC provides one paragraph explaining its General Service sales forecast in general and one discussing Faro Mine remediation.

QUESTION:

a) Please provide the referenced "forecasts provided to Yukon Energy by the customer, the Government of Canada". In the response please fully explain any efforts undertaken by YEC to vet or validate the forecasts.

ANSWER:

(a)

The customer provided YEC with forecasts for fiscal 2019 and 2020 (see Attachment 1 to this response). Subsequently by email, the customer provided an update that "our 2021 projection should be in line with what we projected for 2020." YEC reviewed the reasonableness of the forecast and compared it to actual historical results.

Email: cam.malloch@canada.ca
Attention: Cam Malloch, P.Eng.
Senior Engineer - Faro Mine Remediation Dear Mr. Malloch:

Re: Draft Electrical Demand Forecast, FY2019 and FY2020
Faro Mine Complex, Faro, Yukon

INTRODUCTION

Pursuant to your request, Parsons Inc. (Parsons) is pleased to provide the following information pertaining to the estimated future demand for electricity at the Faro Mine Complex (FMC). New electrical equipment such as that associated the X13 pumping and conveyance system is now operable and certain other electrical components will be operational over a longer period of time; both activities will increase the amount of electricity consumed at FMC. Although certain older equipment such as the existing IP pumping system will be retired in future years, the demand of the new equipment exceeds the previous demand so the annual cost of the electricity will increase.

This forecast identifies the existing demand and predicts the forecast demand for certain operational scenarios. The forecast is based on actual consumption since April 2016.

EXISTING AND FORECAST DEMAND

The current and future demand is based on the operation of site facilities as summarized in the following tables for FY2019 and FY2020, respectively.

Cam Malloch
Crown-Indigenous Relations and Northern Affairs Canada October 10, 2019

Based on the assumed equipment and operation schedule we predict that the FMC will consume approximately 12,300 MWh in FY2019 and approximately 13,800 MWh in FY 2020. At historic rates, the FY2019 and FY2020 annual cost for electricity should be approximately $2.40million and $2.60million, respectively.

CLOSURE

We trust that the information presented herein is satisfactory for your present requirements. If you have any questions, please do not hesitate to contact the undersigned.

Respectfully submitted,
PARSONS INC.
James Carss, P.Eng.

TOPIC: **Power Generation**

REFERENCE: **2021 General Rate Application, page 2-9 (PDF page 34 of 441) and Table 2.2**

PREAMBLE: CW notes that there is a pattern of increased thermal generation in 2019 and 2020, but this is forecast to decline in 2021. Further, CW notes that the LTA predicts a higher use of thermal. CW requires information as to how the different forecasts would impact customers.

The following table is taken from data in Table 2.2

	2018 Approved	2018 Actual	2019 Actual	2020 Forecast	Forecast 2021
Actual					
Hydro Generation	411,397	413,052	370,819	436,725	506,483
Wind Generation	0	0	0	0	0
IPP Generation	0	0	0	56	1,983
Thermal Generation	11,109	37,316	69,858	71,199	30,260
Total Actual Generation	422,506	450,368	440,676	507,980	538,726
Total Sales	388,332	412,470	403,492	465,788	495,151
Losses	34,173	37,898	37,185	42,193	43,575
	422,506	450,368	440,676	507,980	538,726
LTA

IPP Generation	0	0	0	56	1,983
LTA Thermal Generation	16,355	31,391	25,300	69,019	84,306
Total LTA Generation	420,265	450,086	440,676	507,980	538,726
Actual					
Hydro Generation	97.37%	91.71%	84.15%	85.97%	94.01%
Wind Generation	0.00%	0.00%	0.00%	0.00%	0.00%
IPP Generation	0.00%	0.00%	0.00%	0.01%	0.37%
Thermal Generation	2.63%	8.29%	15.85%	14.02%	5.62%
Total Actual Generation	100.00%	100.00%	100.00%	100.00%	100.00%
LTA					
LTA Hydro Generation	96.11%	93.03%	94.26%	86.40%	83.98%
LTA Wind Generation	0.00%	0.00%	0.00%	0.00%	0.00%
IPP Generation	0.00%	0.00%	0.00%	0.01%	0.37%
LTA Thermal Generation	3.89%	6.97%	5.74%	13.59%	15.65%
Total LTA Generation	100.00%	100.00%	100.00%	100.00%	100.00%

QUESTION:

a) Please fully explain why the LTA forecasts were not used in the preparation of the GRA forecast.

b) Please explain the impact of a scenario where the actual is closer to the LTA, yet the GRA forecast is approved. What will the impact be on the various deferral accounts and on base rates?

c) CW notes that on lines 21-26 of page 2-9, CW [sic] briefly discusses its sourcing strategy. This addresses years with normal water conditions. Please fully explain the YEC strategy for sourcing energy in years that do not have normal water conditions. What assets are engaged first, second, third, etc. Why is this the appropriate strategy?

d) On lines 17-20 of page 2-9, YEC discusses that 2018 and 2019 experienced unfavourable water conditions, and that actual hydro generation is currently forecast to reflect water availability at about LTA in 2020 and above LTA in 2021. Please fully explain the current water levels, and the likelihood that the GRA forecast generation mix will be achieved.

ANSWER:

(a)

The LTA forecasts as provided in Table 2.2 were used to prepare the GRA forecast, as stated in Sections 2.3 and 3.2 of the Application. Section 3 of OIC 2021/16 also now directs that forecast fuel costs to be included in rates for thermal generation to meet forecast customer requirements are to be based on long-term average annual renewable resource availability.

(b)

The GRA forecast is based on LTA hydro. The scenario in this question cannot occur.

(c)

Yukon Energy optimizes the hydro system within the license requirements to maximize the hydro system capabilities and minimize thermal energy. The typical dispatch order used by Yukon Energy for the system is: (1) hydro, (2) LNG, and (3) diesel, subject to operational restrictions and reliability limitations. This dispatch order is based on minimizing generation costs for ratepayers while maintaining system reliability.

(d)

As quoted above, YEC currently expects better than LTA hydro generation in 2021. However, the GRA forecast is based on LTA hydro generation. To the extent that actual hydro generation results differ from LTA and are caused by water supply issues, these amounts will be charged to the LWRF in accordance with the rules established for that fund and approved by the YUB. The 2021 GRA rate determination is not affected by the current reservoir conditions.

Please also see responses to CW-YEC-1-43 (c) and YUB-YEC-1-27 (a).

TOPIC: **Resource Plan**

REFERENCE: **2021 General Rate Application, page 2-14 (PDF page 39 of 441)**

PREAMBLE: On lines 5-8. YEC discusses a 2016 resource plan that was used in the 2017-18 GRA. CW requires information regarding how the 2016, or subsequent, resource plan was used in the preparation of this GRA.

QUESTION:

a) Please confirm that there is no newer resource plan that was prepared by YEC subsequent to the referenced 2016 Resource Plan. If not confirmed, please provide the most recent resource plan.

b) Please fully discuss how the 2016 (or more recent) resource plan was used in the preparation of this GRA.

ANSWER:

(a)

The 10 Year Renewable Electricity Plan was developed in 2020 (referenced as "10 Year Renewable Energy Plan" in Appendix 5.4, Section 5.4.3). Please see Attachment 1 to response to CW-YEC-1-36(a) for a copy of this most recent plan.

(b)

The 10-Year Renewable Electricity Plan has guided Yukon Energy in selection of potential new renewable generation and related transmission projects to be pursued over the coming decade. In this regard, it has influenced some of the capital and deferred projects being planned and addressed in Tab 5 of this GRA Application – however, in all important instances (beyond the Plan itself) the relevant capital and deferred costs are forecast to remain in WIP through the 2021 test year and therefore do not affect the forecast 2021 revenue requirement.

TOPIC: **Long-Term Average Hydro Generation (2021)**

REFERENCE: **2021 General Rate Application, Appendix 2.1, Table 2.1-1**

PREAMBLE: In Appendix 2.1, YEC discusses its LTA forecasts. CW requires information to assess the LTA and how it is used.

QUESTION:

a) Please provide the year that each line number in Table 2.1-1 relates to. In the response, please also provide Table 2.1-1 in Excel format.

b) Please confirm that the LTA is a simple average of years. If not confirmed, please fully explain.

c) If (b) above is confirmed, please fully discuss whether any trend or regression analysis was conducted on the LTA data. If any such analysis was conducted, please provide it.

ANSWER:

(a) through **(c)**

Please see CW-YEC-1-11 Attachment 1 for the copy of Table 2.1-1 in MS Excel format. There are no years associated with line numbers. The lines just reflect the loads with 5 GW.h increments. The table is designed to show long-term average hydro and thermal generations at various load ranges. No trend or regression analysis was conducted on the LTA data.

Please see the detailed example included in the notes to the table with steps on how to use the table and identify thermal generation based on long-term average hydro generation to the given load.

Table 2.1-1:
Expected Thermal Generation Based on Long-Term Average Hydro Generation (2021)

Line Number	YEC Grid Load Net of Wind (GWh)	YEC Hydro Generation (GWh)	YEC Thermal Generation (GWh)	Increase in Load (GWh)	Increase in Thermal Generation (GWh)	Thermal as % of Increased Load
	Column A	Column B	Column C	Column D	Column E	Column F = E/D
1	475.0	433.735	41.265			
2	480.0	435.293	44.707	5.0	3.441	69%
3	485.0	436.810	48.190	5.0	3.484	70%
4	490.0	438.277	51.723	5.0	3.532	71%
5	495.0	439.690	55.310	5.0	3.587	72%
6	500.0	441.043	58.957	5.0	3.647	73%
7	505.0	442.334	62.666	5.0	3.710	74%
8	510.0	443.557	66.443	5.0	3.776	76%
9	515.0	444.713	70.287	5.0	3.844	77%
10	520.0	445.800	74.200	5.0	3.913	78%
11	525.0	446.819	78.181	5.0	3.982	80%
12	530.0	447.769	82.231	5.0	4.049	81%
13	535.0	448.654	86.346	5.0	4.115	82%
14	540.0	449.477	90.523	5.0	4.177	84%
15	545.0	450.242	94.758	5.0	4.235	85%
16	550.0	450.954	99.046	5.0	4.288	86%
17	555.0	451.618	103.382	5.0	4.335	87%
18	560.0	452.243	107.757	5.0	4.375	88%
19	565.0	452.836	112.164	5.0	4.407	88%
20	570.0	453.406	116.594	5.0	4.430	89%
21	575.0	453.963	121.037	5.0	4.443	89%
22	580.0	454.519	125.481	5.0	4.444	89%
23	585.0	455.085	129.915	5.0	4.434	89%

Notes:
1. "YEC Grid Load" is annual YEC generation load on the Integrated Grid net of IPP generation, secondary sales related generation and Fish Lake hydro generation. The load will also be adjusted for WH2 and WH4 uprates as noted in #7 below.
2. The thermal generation and increase for the added load are based on a polynomial equation derived from "YECSIM" - the simulation model developed for the Integrated Grid by KGS Group.
3. The model calculates expected hydro plant generation for each load scenario. It incorporates, on a weekly time step, 38 "water years" on record (1981-2018) and 20 "load years" (each examines a different hypothetical scenario to evaluate generation under different sequences of the recorded water years), of which 13 load years (load years 7-19) are used for the final averaging (this removes results distorted by starting or ending year volumes). "Hydro Generation" is long-term average hydro generation as estimated by YECSIM.
4. The simulation model results used for this table assume the current operation rule in effect at Aishihik Lake (i.e., 10-year rolling average spring elevation no lower than 913.7 m), current Mayo Lake operation rule (no additional storage, impact of sedimentation at the outlet of Mayo Lake) and restricted Mayo GS winter flows (based on new Mayo Ice Protocol Mayo GS outflows are restricted at max 19 cms in November and 15 cms in December, after which restrictions are relaxed by 1.75 cms/week reaching 20 cms by early January and 24 cms by February [compared to 20 cms restriction through winter used in the 2017/18 GRA]. The model aslo assumes Whitehorse GS winter max flows at 170 cms compared to 160 cms in 2017/18 GRA.

5. The simulation model results are based on 2021 forecast load and IPP distributions, and requires modifications when new mines, industrial loads or IPP generation are connected to [or disconnected from] the grid.

6. The table assumes max YEC Grid Load (i.e., excluding IPP generation) at 585 GW.h and minimum YEC Grid Load at 475 GW.h. If the YEC Grid Load exceeds these limits then the table needs to be updated.

7. YEC is undertaking capital projects that will increase hydro generation output in Whitehorse GS [WH2 and WH4 uprates]. The preliminary estimates show that these capital projects will increase generation output by 7.1 GW.h/year [4.2 GW.h for 2021 considering expected in service date effective July 1, 2021 - monthly allocation based on Whitehorse GS monthly generation forecast]. Therefore, the YEC Grid Load is reduced to reflect increased output from these capital projects [not all incremental generation will directly displace LTA thermal].
8. Numbers are subject to rounding.

Example
Expected YEC Thermal Generation for the YEC generation at 536.743 GW.h (net of expected IPP & Fish Lake)

Remove Expected Generation for WH uprates [estimate for 2021 at 4.213 GW.h] to get net load at 532.530 GW.h

Step 1. Find the closest load from Column A that is less than 532.530 GW.h = 530 GW.h (Line 12).

Step 2. Find the thermal generation from Column C = 82.231 GW.h (Line 12).

Step 3. Find the difference between the given load (532.530 GW.h) and load from Step 1 (530 GW.h) = 2.530 GW.h

Step 4. Apply the percentage from Column F (Line 12, 82%) to the difference from Step 3 (2.530 GW.h) = 2.075 GW.h

Step 5. Add numbers from Step 2 (82.231 GW.h) and Step 4 (2.075 GW.h) = 84.306 GW.h

The expected thermal generation at 536.743 GW.h load [net of Fish Lake and IPPs] is 84.306 GW.h.

TOPIC: **Fuel Costs**

REFERENCE: **2021 General Rate Application, Table 3.2.1 and Table 2.2**

PREAMBLE: In Table 2.2, it appears that the forecast 2021 generation is based on a forecast that is different than the LTA, yet in Table 3.2.1, it appears that the fuel costs are based on LTA thermal generation. The following table taken from Table 2.2 demonstrates the difference between the 2021 forecast and the LTA.

	2018 Approved	2018 Actual	2019 Actual	2020 Forecast	Forecast 2021
Actual					
Hydro Generation	411,397	413,052	370,819	436,725	506,483
Wind Generation	0	0	0	0	0
IPP Generation	0	0	0	56	1,983
Thermal Generation	11,109	37,316	69,858	71,199	30,260
Total Actual Generation	422,506	450,368	440,676	507,980	538,726
Total Sales	388,332	412,470	403,492	465,788	495,151
Losses	34,173	37,898	37,185	42,193	43,575

Total LTA Generation	420,265	450,086	440,676	507,980	538,726
Actual					
Hydro Generation	97.37%	91.71%	84.15%	85.97%	94.01%
Wind Generation	0.00%	0.00%	0.00%	0.00%	0.00%
IPP Generation	0.00%	0.00%	0.00%	0.01%	0.37%
Thermal Generation	2.63%	8.29%	15.85%	14.02%	5.62%
Total Actual Generation	100.00%	100.00%	100.00%	100.00%	100.00%
LTA					
LTA Hydro Generation	96.11%	93.03%	94.26%	86.40%	83.98%
LTA Wind Generation	0.00%	0.00%	0.00%	0.00%	0.00%
IPP Generation	0.00%	0.00%	0.00%	0.01%	0.37%
LTA Thermal Generation	3.89%	6.97%	5.74%	13.59%	15.65%
Total LTA Generation	100.00%	100.00%	100.00%	100.00%	100.00%

QUESTION:

a) Please fully explain and reconcile the apparent discrepancy.

b) Please provide an adjusted fuel cost forecast using the generation mix incorporated in the 2021 forecast in Table 2.2.

ANSWER:

(a) and **(b)**

There is no discrepancy; fuel cost for rate making purposes is based on LTA thermal generation as previously approved by the YUB and consistently applied in this application. Table 2.2 shows hydro and thermal generation levels for 2018-2021 years based on the following:

- **"Actual":** These reflect actual generation for 2018 and 2019 years as well as forecast generation for 2020 and 2021 based on known/expected reservoir conditions for these years at the time of preparation of forecasts.

- **"LTA":** These generation numbers reflect hydro and thermal generations based on long-term average water conditions [1981-2018].

Section 2.3 of the Application provides explanations for actual and LTA generation. The LTA forecasts as provided in Table 2.2 were used to prepare the GRA forecast, as stated in Sections 2.3 and 3.2 of the Application. Section 3 of OIC 2021/16 also now directs that forecast fuel costs to be included in rates for thermal generation to meet forecast customer requirements are to be based on long-term average annual renewable resource availability as stated in response to CW-YEC-1-9 (a).

TOPIC: **Labour**

REFERENCE: **2021 General Rate Application, page 3-8 and 3-9 (PDF pages 54-55) and Table 3.4**

PREAMBLE: On page 3-9 YEC provides a discussion of reasons for increases in labour. In Table 3.4, YEC provides a summary of employment history. On lines 11-13 of page 3-8, YEC discusses overtime, vacancies and capital allocation. CW requires information to analyse the employment levels and verify the assertions of the causes of increases in headcount.

QUESTION:

a) Please fully explain whether the headcount in Table 3.4 is total complement, O&M only, includes vacancies or excludes vacancies, and whether it includes or excludes allocations to capital.

b) Please provide the calculation of total headcount, allocations to capital, and vacancies arriving at total O&M headcount, net of vacancies, in a form similar to Table 3.4, and in Excel format.

c) Please provide an analysis that lists the positions that directly work in:
   i. Reading meters;
   ii. Maintaining and operating assets;
   iii. Customer billing and responding to customer calls;
   iv. Providing customer service in the field;
   v. Transmission;
   vi. Generation; and
   vii. Other administrative functions.

d) For each of the positions listed in the response to (c) above for please provide the headcount for each YEC community in Excel format for each of:
   i. 2018 Approved;
   ii. 2018 Actual;
   iii. 2019 Actual;
   iv. 2020 Forecast; and
   v. Proposed 2021

Please ensure that the total reconciles to the totals related to O&M as provided in response to (b) above. Where a position provides a number of the functions listed in (c) above, please allocate the headcount between the functions, and provide an explanation of the allocation.

e) Please provide total customers by community and by customer class for each of:
   i. 2018 Approved;
   ii. 2018 Actual;
   iii. 2019 Actual;
   iv. 2020 Forecast; and
   v. Proposed 2021.

f) Please provide the kilometres of line, number of transformers, number of meters, number of substations, number of poles, number of towers, and number of generation assets by community and/or location of facility for each of:
   i. 2018 Approved;
   ii. 2018 Actual;
   iii. 2019 Actual;
   iv. 2020 Forecast; and
   v. Proposed 2021

ANSWER:

(a)

The headcount in Table 3.4 is total complement; it includes permanent, casual and temporary employees, regardless of whether their time is spent on admin, O&M or capital. Vacancies are not deducted from this headcount.

(b)

For forecasting purposes, YEC translates the expected vacancy rate into a percentage reduction which is applied to each position's loaded charge out rate. There is no obvious method to apply this rate to the position counts in Table 3.4. Actual vacancies for 2018 and 2019 are noted in Table 1 that follows.

Table 1: Actual Vacancies for 2018 and 2019

	Actual 2018	Vacancy Allocation 2018	Net 2018 Allocation	Actual 2019	Vacancy Allocation 2019	Net 2019 Allocation
President	5.14	(0.25)	4.89	4.82	(0.45)	4.37
First Nations Relations	-	-	0.00	-	-	-
Communications & Customer Acct.	1.00	-	1.00	1.00	(0.04)	0.96
Human Resources & Info. Mgmt.	5.27	(0.64)	4.63	5.34	(0.07)	5.27
Resource Planning & Environment	5.00	(0.41)	4.59	5.75	(2.04)	3.71
Finance & Purchasing	16.89	(0.47)	16.42	17.24	(0.57)	16.67
Operations	46.58	(2.07)	44.51	47.12	(3.86)	43.26
Engineering Services	13.03	(2.21)	10.82	15.16	(2.88)	12.28
Health, Safety & Environment	2.00	-	2.00	2.00	-	2.00
Total	**94.91**	**(6.05)**	**88.86**	**98.44**	**(9.91)**	**88.53**

Capital allocation is forecast on an employee by employee basis based on the supervisors' assessment of hours worked in O&M v. Capital. As such, YEC is not able to provide an employee complement with adjustments for capital allocation on a departmental basis. However, YEC can provide the capital allocation on a company wide basis (see Table 2 below):

Table 2: Capital Allocation

	Capital	Maintenance
2018 Approved	17.0%	83.0%
2018 Actual	14.7%	85.3%
2019 Actual	16.0%	84.0%
2020 Actual	18.2%	81.8%
2020 Forecast	17.5%	82.5%
2021 Forecast	17.6%	82.4%

(c)

A position analysis is provided as Attachment 1 to this response.

(d)

As the table requested in part (b) is not possible, it is not possible to provide a Table in part (d) that reconciles to it. However, a headcount per community is provided as Attachment 1 to this response.

(e)

The sales and number of customers are not approved by community level. Please see response to CW-YEC-1-6 for actual and forecast sales and number of customer by community.

(f)

Please see the tables that follow which provide a list where feasible of the different equipment requested by location as of December 31, 2020. The data provided is for equipment commissioned by end 2020. No historical trend or growth data exists for previous years.

The following information is available on number of meters by community[1]:

- Dawson = 1501
- Faro = 402
- Mayo = 398
- Johnson's Crossing = 12
- Mendenhall = 76
- Braeburn = 39
- Other = 39

Separate tables have not been provided for 2018 approved or actual, 2019 actual, 2020 forecast, or 2021 forecast. Adjustments to reflect 2018 and 2019 actual are as follows:

- In 2018 LNG unit #3 was added
- In 2019 the McQuesten Substation was added
- In 2020 the Faro Substation to connect rental diesel units was added
- In 2020 the Van Gorda Substation was added
- In each year a number of distribution poles and transformers were added

[1] A number of customers disconnect power on a seasonal basis. The total of 2736 in the attached table includes all meters (including seasonally disconnected) whereas the count by community of 2467 meters only includes "active" meters.

Forecasted changes to equipment list for 2021 are as follows:

- Commission new Mayo-McQuesten Transmission line and decommission old line.
- Net addition of poles for L177 re-route

TOPIC: **Labour**

REFERENCE: **2021 General Rate Application, page 3-8 (PDF page 54) and Table 3.4**

PREAMBLE: On page 3-8 YEC provides a discussion of reasons for increases in labour. On lines 11-13 of page 3-8, YEC mentions overtime, vacancies and capital allocation. In Table 3.4, YEC provides total labour. CW requires information to analyse the employment levels and verify the assertions of the causes of increases in headcount.

QUESTION:

a) Please provide the total Labour provided in Table 3.4 separating base labour, overtime, benefit costs and incentive compensation.

b) For each new position where YEC asserts that the increased position is needed as a result of overtime, please provide an analysis that clearly demonstrates that there was a pattern of overtime, and that there is a reduction in overtime that is included in the forecast for 2021 to offset that new position.

ANSWER:

(a)

Table 3.4 Employee Complement History as defined is total position count (number of employees). Table 1 below provides the Employee Complement with Total Labour by Department. Please note that it is not possible to provide Table 3.4 broken out by employee base labour, benefits and overtime, as YEC does not track employee actual benefits at the employee level. The cost of benefits are pooled and spread across all departments; and each employee base labour rate is multiplied by a F&B (fringe and burden) rate to get the labour expense. The F&B rate is determined by forecasting all employee's annual benefits in Business Planning process.

Also, as some departments have one or a few employees providing the level of detail requested may raise privacy concerns.

Table 1: Employee Complement with Total Labour by Department

	Approved 2018	Actual 2018	Actual 2019	Forecast 2020	Proposed 2021
President	$ 964	$ 936	$ 952	$ 959	$ 953
First Nations Relations	$ -	$ -	$ -	$ -	$ 248
Communications & Customer Acct.	$ 177	$ 185	$ 181	$ 382	$ 522
Human Resources & Info. Mgmt.	$ 811	$ 687	$ 825	$ 815	$ 858
Resource Planning & Environment	$ 918	$ 840	$ 667	$ 932	$ 1,266
Finance & Purchasing & Customer Acct. & Property Mang.	$ 2,355	$ 2,299	$ 2,459	$ 1,760	$ 1,942
Operations & Property Mang.	$ 6,443	$ 6,643	$ 6,659	$ 7,415	$ 7,528
Engineering Services	$ 2,417	$ 2,011	$ 2,071	$ 2,627	$ 2,517
Health, Safety & Environment	$ 310	$ 311	$ 325	$ 325	$ 317
Total	**$ 14,394**	**$ 13,912**	**$ 14,139**	**$ 15,215**	**$ 16,152**

(b)

As stated in the Application, none of the new positions are created solely to reduce overtime. YEC noted there were increases in positions in an effort to reduce overtime per employee for the Operations department (Maintenance Mechanic and Plant Operators), as well as in the Engineering department (Electrical Engineer). Below is a table of actual overtime cost for the last three years.

Table 2: Actual Overtime Costs: 2018-2020

	Overtime $
2018	$ 901,416
2019	$ 938,858
2020	$ 992,155

Notwithstanding wage rate increases, overall overtime is forecast to reduce in 2021 to a cost of $761,000.

TOPIC: **Labour**

REFERENCE: **2021 General Rate Application, page 3-10 (PDF page 56)**

PREAMBLE: On line 21, YEC discusses an increase related to a meter reader. CW requires information to assess efforts to improve productivity.

QUESTION:

a) Please fully discuss all research, analysis or other investigations that YEC has done in the areas of Automated Meter Reading (AMR) or Advanced Metering Infrastructure (AMI). In the response please fully discuss any plans YEC has to implement AMR or AMI, and the timeframes for any implementation. If YEC is not planning on implementing any AMR or AMI technology please fully explain why not, and provide all economic analysis that YEC has performed related to AMR or AMI.

ANSWER:

(a)

YEC has no plans at the current time to implement AMI or AMR and no current analysis of this technology. The request for additional staffing in this area reflects current need; any technology implementation would be several years away in Yukon. YEC notes that previous utility applications to implement AMR in Yukon have been denied by the YUB.

In the future, YEC expects that, as greater understanding of grid modernization unfolds, including progress on YG's "Our Clean Future" strategy actions and a broader deployment of demand-side management programs, YEC will continue to assess AMR/AMI and its potential to provide a cost-effective alternative for ratepayers, its benefits and potential barriers.

TOPIC: **Labour Rates**

REFERENCE: **2021 General Rate Application, page 3-8 (PDF page 54)**

PREAMBLE: In lines 2-8, YEC states:

> Labour Rates – This includes factors such as base pay, benefit cost, annual increments (performance increments, cost of living adjustments), etc. This is heavily influenced by collective bargaining agreements (CBA). The last settled CBA covered fiscal periods 2017 to 2019 inclusive; the actual annual negotiated increase in base pay from 2018 to 2019 was 2.0%. To date, the CBA has not been settled for fiscal periods 2020 and 2021; an arbitration hearing is scheduled for April 2021. Forecast 2020 and 2021 labour rates include estimated economic increments of 2%; these estimates were developed by YEC management based on prior settlements.
>
> CW requires information to understand how increases have been applied.

QUESTION:

a) Please provide a working paper that identifies the cost of living adjustment, performance increments and any other adjustments for each of:
   i. 2018 Approved;
   ii. 2018 Actual;
   iii. 2019 Actual;
   iv. 2020 Forecast; and
   v. Proposed 2021.

b) Please fully discuss the increases awarded to employees not subject to the CBA.

ANSWER:

(a)

Cost of Living and Performance Increments are rolled up in overall wage costing.

Regarding performance increments, employees subject to the Collective Bargaining Agreement can have up to two increments per year (every six months) if they are not capped at their maximum salary level. With many new hires recently this means a lot of performance increments. Management and Professional employees are eligible for performance increments annually if they are not capped at their maximum salary level. As union employees can have different dates for increments based on their start dates throughout the year, YEC forecasts performance increments by using an average wage for that position for the year. Additionally, due to the timing of the performance increase being dependent on the timing of the performance review, we also get into situations were increments are late and run between different years, but the retro ends up in year it is paid. As such, a calculation of cost of performance increments would be extremely difficult.

For GRA forecast purposes, performance increments are similar to cost of living as they are buried in the overall costs, which are referred to as economic increments. For 2018, the cost of living increase was 1.50%, equal to the 2018 approved amount. The 2019 cost of living increase was 2.00%, equal to the rate required in the collective bargaining process. YEC has forecast an economic increase (cost of living and performance increment) of 2.00% for 2020 and 2021.

(b)

For the 2017 to 2019 CBA, increases awarded to employees not subject to the CBA were consistent with increases awarded to employees subject to the CBA. For the 2021 forecast, the assumption is the same.

TOPIC: **Production**

REFERENCE: **2021 General Rate Application, Section 3.3.2, and Table 3.5**

PREAMBLE: On lines 4-8 of page 3-14, YEC discusses diesel rentals, and an increase of $3.834 million.

QUESTION:

a) Please provide copies of all analysis or business cases that YEC has done or prepared comparing the cost of owning diesel generation compared to rentals. If no such analysis or business cases have been prepared, please fully explain why not.

b) Please provide the number of diesel generation units that would be rented, and the amount of use each would experience (Months per year).

c) Please describe the rental terms. As an example, are the units rented on a month to month basis or on an annual basis? In the response, please provide an analysis that clearly identifies the number of months of rental payments YEC has forecast for each unit it is renting in 2021. Also, are the rentals under long term leases, or can the rental be cancelled with 30 days notice or no notice at all?

d) Please provide the capacity of each unit.

e) Please explain what operating costs YEC is responsible for, compared to the costs the lessor is responsible for.

f) Please describe the characteristics of each unit, for example, are the all the units mobile or are any fixed in place?

g) Please provide YEC's estimated cost of purchasing each rental unit that is forecast to be rented in 2021.

ANSWER:

(a)

Yukon Energy's 2016 Resource Plan included action plans focusing on short and long-term options to reduce the capacity shortfalls, including building a new 20 MW diesel plant.

However, based on feedback received from Yukoners as well as to address impacts of the Yukon government Climate Change Strategy Yukon Energy's Board of Directors decided not to pursue a new 20 MW thermal plant at this time and look at options to replace capacity at Yukon Energy's existing generation facilities as diesel engines reach end-of-life.

Yukon Energy is pursuing the new renewable generation capacity options as outlined in the 10-Year Renewable Electricity Plan [please see CW-YEC-1-36 (a) Attachment 1 for the copy of the Plan], including battery energy storage system, Atlin Hydro Expansion Project, and the potential development of pumped storage at Moon Lake. Until the new renewable resource options are developed, diesel rentals are continuing to be the best available option at this time to address capacity shortfalls.

Please also see YUB-YEC-1-40 (a).

(b)

For the 2021/22 winter YEC forecast to rent 17 diesel units, including a spare unit in each location [Faro and Whitehorse]. The usage of the units will depend on peak in the system and condition of the existing generation capacities. The diesel rentals are primarily in place to provide for the N-1 contingency event and would not normally be called upon to use fuel in order to generate electricity.

(c)

The diesel units are rented through an annual contract for the winter heating season period, from December through April. The rental rates are based on a 28 day cycle.

(d)

Each diesel unit has a capacity of 1.8 MW.

(e)

Per the supply contract, YEC is responsible for periodic operations checks including monitoring and maintaining consumables (fuel, oil, antifreeze, etc.). YEC is not charged maintenance if the individual units are run less than 100 hours per 28 day rental cycle. At the end of the contract, YEC pays a maintenance charge based on the pro rata hours run. CAT is responsible for the cost of any breakdowns.

(f)

The units are installed at the beginning of rental period [November/December] in two locations with rental unit infrastructure [Faro and Whitehorse] and decommissioned at the end of rental period [April].

(g)

YEC is not planning to purchase the rental diesel units and, as far as YEC is aware, the vendor is not offering these units for sale.

TOPIC: **Brushing Costs**

REFERENCE: **2021 General Rate Application, page 3-15 (PDF page 61) Table 3.6.1 and following paragraph**

PREAMBLE: CW notes that YEC discusses brushing and its related policy. Also, CW notes that there appears to be a marked reduction in costs in 2019 for distribution. CW is concerned that there be no arbitrary reductions in brushing to maintain corporate profits.

QUESTION:

a) Please fully explain the YEC brushing policy, and how the 2019 actual Distribution brushing expenditure was consistent with the policy.

b) CW notes that the 2019 actual Distribution brushing was only $28,000. Please fully explain why the 2019 Distribution Brushing was so low. In the response please also confirm that YEC follows its brushing policy, and does not reduce brushing to avoid costs and maintain returns. If not confirmed, please fully explain.

ANSWER:

(a) and **(b)**

The YEC brushing policy was developed at the direction of the YUB (Order 2013-01) and was reviewed as part of the 2017/18 GRA (Order 2018-10).

The policy was developed as follows: utilizing the information gathered in aerial and ground surveys and supplemented with line maintenance history provided by YEC, ECI (contractor) developed a recommended cyclic maintenance schedule based on 10 year cycle guideline for each line. The growth rates vary per line and per year so the priorities are adjusted based on line patrols.

ECI recommended the following:

1. Remove trees under the conductors in locations designated as Critical as soon as possible.

2. Remove trees under the conductors in locations designated as Priority before the next growing season (June 2011).

3. Remove all trees designated as Hazard over the next two years.

4. Establish a schedule of cyclic maintenance by right-of-way including separate schedules for Critical, Priority and Hazard tree locations.

5. Budget funds to address Critical locations as they are identified. This will be reduced each subsequent year of the maintenance cycle.

6. Establish a list or database of danger and hazard tree locations and develop a priority program to determine which trees should be removed first.

7. Develop vegetation maintenance clearance specifications for transmission and sub-transmission voltages and policy and standards specific to YEC needs and conditions. ECI has developed a draft TVMP for YEC"s consideration.

8. Consider contracting alternatives to reduce maintenance cost as well as developing additional qualified vendors to perform vegetation maintenance on the YEC system (including herbicide application).

9. Implement Integrated Vegetation Management (IVM) as the guiding maintenance principle on the YEC system.

10. Establish an herbicide test plot area. Develop specification and guidelines on the use of herbicides on the YEC system. After an initial test period of various products and application methods and upon development of specification/procedures for herbicide use, (2012-2013), integrate the use of herbicides as a major component of the YEC vegetation maintenance program.

Distribution brushing priorities are identified using ground patrol data.

The vegetation management budget is typically about 80/20 split transmission/distribution. In 2019, the distribution portion was less due to the TLR work and the requirement to prioritize the brushing on the transmission system where the work was to take place.

TOPIC: **Distribution Costs**

REFERENCE: **2021 General Rate Application, page 3-16 (PDF page 62) Table 3.7 and following paragraph.**

PREAMBLE: CW notes that YEC has forecast "Other Non-Labour" to increase from $204,000 in the 2018 approved forecast to $279,000 in 2021. This is an increase of approximately 37%.

QUESTION:

a) Please fully explain why "Other Non-Labour" reduced to $80,000 in 2019. In the response, please fully explain why that level of costs could not be maintained in 2021.

b) Please fully explain what costs are included in "Other Non-Labour" and why the forecast increased by 37% from 2018 to 2021.

ANSWER:

(a)

There was an error in the table that affected the 2019 actuals. The corrected table is below.

	2018 Approved	Actual 2018	Actual 2019	Forecast 2020	Forecast Existing 2021	Forecast Proposed 2021
Labour	$ 856	$ 801	$ 625	$ 617	$ 629	$ 629
Brushing Cost	331	212	28	249	212	212
Other Non-Labour	204	236	265	287	279	279
Total Distribution	$ 1,391	$ 1,250	$ 918	$ 1,154	$ 1,120	$ 1,120

With this correction, the 2019 actual cost of Other Non-Labour is in line with previous and subsequent results. The low brushing total for 2019 is explained in CW-YEC-1-18.

(b)

Costs included in 'Other Non-Labour' include the following:

- Response to distribution events (i.e., trees on lines, distribution transformer/pole replacement);

- Call outs (i.e., customer complaints, refusing, house fires, power quality);

- High loads; and

- Outage response.

This work is forecast to be higher in 2021 as compared to 2018 as we expect 2021 to be fairly similar to costs in 2020.

TOPIC: **General Operating and Maintenance**

REFERENCE: **2021 General Rate Application, pages 3-16 and 3-17 (PDF pages 62 and 63) Table 3.8 and following paragraph.**

PREAMBLE: In the paragraph following Table 3.8, YEC explains what areas the cost increases are in, but now why the costs increase.

QUESTION:

a) Please fully explain why costs related to Transportation, Maintenance of Company Owned Properties, and Scada Communication are forecast to increase by 10%, 18%, and 15% respectively.

ANSWER:

(a)

See response to YUB-YEC-1-42.

TOPIC: **Administration**

REFERENCE: **2021 General Rate Application, pages 3-17 and 3-18 (PDF pages 63 and 64) Table 3.9 and following paragraph.**

PREAMBLE: YEC discusses changes in Administration costs.

QUESTION:

a) On lines 1-5 of page 3-18, YEC discusses cost increases due to a 3 year water license. Please provide the term of the referenced license (i.e. what years are covered by the license).

ANSWER:

(a)

The term of Aishihik Generating Station Water Use License HY19-016 is from March 1, 2020 to December 31, 2022.[1]

[1] Water Use Licence HY19-057 was effective January 1, 2020 to February 29, 2020.

TOPIC: **LWRF Stabilization Mechanism**

REFERENCE: **2021 General Rate Application, page 3-31 (PDF page 77)**

PREAMBLE: On lines 11-19, YEC discusses why it has not updated its LWRF Term Sheet.

QUESTION:

a) Please fully explain what COVID conditions prevented the completion of an updated term sheet.

b) Please fully explain what other factors prevented the completion of the updated term sheet.

c) Please fully explain when YEC expects to complete an updated term sheet.

d) Please fully explain why YEC did not file to be given relief from filing an updated term sheet.

ANSWER:

(a) through **(d)**

As reviewed in Section 1.1 of the Application, Yukon Energy faced ongoing difficulties in proceeding with the next GRA required as soon as feasible after final approvals for the 2017-18 GRA. After having to cancel a 2019/20 GRA, the effort to implement any rate change in 2020 had to be suspended in response to COVID-19 conditions.

Late in 2020, Yukon Energy was able to develop and proceed with the proposed approach for the 2021 GRA as set out in the Application. As stated at the referenced lines on page 3-31, in order to get the Application filed in November, Yukon Energy was required to focus first on completion and filing of its 2021 forecast revenue requirement and rates Application.

The Application recognizes the need to file an updated LWRF Term Sheet to assess the reasonableness of the LWRF for addressing transactions or amounts with respect to the LWRF deferral account following the end of the 2021 test year. The LWRF Term Sheet,

however, does not have any impact on review and assessment of the 2021 GRA revenue requirement forecasts.

Yukon Energy is working to provide an updated LWRF Term Sheet in March 2021, along with related LWRF Annual Reports for 2019 and 2020.

TOPIC: **Timing of Rate Increases**

REFERENCE: **2021 General Rate Application Introduction, page 2 (PDF page 3)**

PREAMBLE: YEC states that it proposes to implement interim rates on July 1, to coincide with the expected reduction in Rider F. Further, YEC proposes to implement final rates on December 1 to coincide with the removal of Rider J1.

QUESTION:

a) Please provide a detailed analysis of Rider F, and the expected rate for July 1, 2021.

b) Please provide the current Rider F.

c) Please fully explain why Rider J1 is still being used in 2021, some 3 years after the last test period.

d) Please confirm that Rider F could increase in the future, depending on fuel prices. If not confirmed, please fully explain.

ANSWER:

(a) and **(b)**

The current Rider F rate is at 1.371 cents/kW.h.

Please see CW-YEC-1-23 Attachment 1 and Attachment 2 for the copies of the Advisory of Rate Change filed with the Board on September 23, 2020. Although, the actual balance of the Fuel Price Variance Account will depend on volume of actual thermal generation and fuel prices for YEC and AEY, the advisory filed by the companies on September 23, 2020 was the best information available for the companies at the time of filing which aimed to get Fuel Price Variance Account balance to zero by July 1, 2021.

(c)

A true-up rider Rider J1 relates to the 2017-18 GRA shortfalls which is in effect until November 30, 2021, or such earlier month end when the $12.557 million 2017-18 GRA shortfall has been recovered. In the 2017/18 GRA Compliance Filing YEC proposed to collect the shortfall over 24 months period to reduce bill impact to customers which was accepted by the Board.

(d)

Confirmed - Rider F will increase or decrease in future in response to change in actual fuel prices relative to approved forecast fuel prices.

ATCO Electric
YUKON

yukon energy

September 22, 2020

Bonnie King, Vice Chair
Yukon Utilities Board
Box 31728
Whitehorse, Yukon Y1A 6L3

Dear Ms. King:

RE: Rate Change- Rider F, Fuel Adjustment Rider

On January 1, 2020, ATCO Electric Yukon and Yukon Energy Corporation (the "Companies") adjusted the Diesel Fuel Price Variance Rider ("Rider F') from a refund of 0.011 cents per kWh to a charge of 0.970 cents per kWh.

Pursuant to the Rider F Policy, if the Companies' Fuel Price Variance Account ("FPVA") is fluctuating over a broad range, the Companies must refine the forecast to reflect changing economic conditions to arrive at a new Rider F rate.

Accordingly, the Companies have determined that Rider F rate is required to change from a charge of 0.970 cents per kWh to a charge of 1.371 cents per kWh, effective November 1, 2020.

The Companies have enclosed an Excel spreadsheet to provide further detail regarding this rate change. We trust that if the Board or any interested party has questions regarding this Rider F rate change, they will contact one of the undersigned.

Sincerely,

ATCO ELECTRIC YUKON

Jaspreet Kaur

	New Rider F Rate (¢/kWh) effective November 1, 2020				**1.371**	

Notes:
1. Positive balances represent amounts to the benefit of ratepayers.
2. Negative balances are amounts owing to the utilities.

TOPIC: **Depreciation**

REFERENCE: **2021 General Rate Application, page 3-22 (PDF page 68), Alliance Consulting Group Depreciation Study, PDF pages 241, 249, and 250.**

PREAMBLE: On lines 18-21 of page 3-22, YEC states:

> Forecast "Existing" fixed asset depreciation expense in 2021 of $12.945 million (as compared to $12.196 million in 2018 approved), reflects changes in the assets in service. Forecast "Proposed" fixed asset depreciation expense in 2021 of $13.581 million also reflects changes resulting from the depreciation study.

On PDF page 241, Alliance Consulting Group states:

> The term "depreciation" as used in this study is considered in the accounting sense, that is, a system of accounting that distributes the cost of assets, less net salvage (if any), over the estimated useful life of the assets in a systematic and rational manner. It is a process of allocation, not valuation. This expense is systematically allocated to accounting periods over the life of the properties. The amount allocated to any one accounting period does not necessarily represent the loss or decrease in value that will occur during that particular period. The Company accrues depreciation on the basis of the original cost of all depreciable property included in each functional property group. On retirement the full cost of depreciable property, less the net salvage value, is charged to the depreciation reserve.

On PDF page 249, Alliance Consulting Group states no net salvage analysis was performed.

On PDF page 250, Alliance Consulting Group provides a flowchart of the process.

QUESTION:

a) Please fully explain why no net salvage analysis was performed. In the response please fully explain how any actual net salvage is treated in YEC asset accounts, and how it was dealt with in the Alliance Consulting Group study.

b) Please confirm that the difference between $12.945 million in 2021 based on existing rates and $13.581 million on proposed rates is solely due to the impact of the Alliance Consulting Group depreciation study. If not confirmed, please fully explain.

c) Please provide an analysis that separates the impact of (i) changes in lives, (ii) amortization of reserve differences, (iii) any consideration of net salvage, and (iv) other. For any other, please fully explain what it is.

d) Please fully discuss all life extension efforts or initiatives that YEC:
   i. Is considering;
   ii. Is planning on implementing after the test period;
   iii. Is planning on implementing in the test period; or
   iv. Has implemented prior to 2021.

   In the response please fully explain the costs of each initiative, and the expected impact, including lengthening service lives, and impact on reduced depreciation.

e) If there are no life extension efforts or initiatives, please fully explain why not.

ANSWER:

(a)

YEC does not accrue or book net salvage in their accumulated provision for depreciation and no provision for net salvage is incorporated in the Company's current depreciation rates. As such, Alliance did not include net salvage in its depreciation rate calculations so no net salvage analysis was necessary or performed. In YEC actual accounts, when an item is disposed of that has salvage value, that salvage value becomes part of the calculation of net gain or loss on disposal.

(b)

Confirmed

(c)

The details of (i) changes in lives and (ii) amortization of reserve differences are shown in the Application in Tab 7, Schedule 3A, on a Class line item basis and can be calculated by comparing the '2021 Existing Forecast Depreciation' column with the '2021 Proposed Forecast Depreciation' column. The summation of the impact of changes in lives is $0.458 million and the impact of depreciation study differences is $0.178 million.

(d) and **(e)**

As part of YEC's annual capital budgeting process, a portion of the budget is set aside for Maintenance Capital, which overall has the purpose of maintaining assets in healthy operating conditions. In addition, as discussed in the Application at section 5.4.1.1 on page 5-28, YEC details its Enterprise Asset Management System Purchase and Implementation which will also assist in this initiative.

TOPIC: **Rate Relief**

REFERENCE: https://globalnews.ca/news/7584771/altalink-alberta-refund

PREAMBLE: In Alberta, AltaLink has proposed to refund over collected depreciation and future income taxes in an effort to provide rate relief to customers. CW understands that YEC, as a crown corporation will not have any income taxes. Having said that, CW is interested in understanding what efforts YEC has undertaken to identify and implement measures that would provide rate relief to customers.

QUESTION:

a) Please fully discuss and provide copies of any and all research YEC has conducted into ways to provide rate relief to customers, including, but not limited to extending service lives for utility assets.

ANSWER:

(a)

YEC has not conducted research specifically into ways to provide rate relief to customers. However, YEC has completed depreciation update studies for this and prior GRAs to assess (among other matters) opportunities to extend service lives for utility assets (see Tab 9 of GRA Application). YEC also continues to assess least cost resource options for future development of required generation and transmission - including options to secure federal and other government funding that will reduce ratepayer costs, e.g., as demonstrated for the proposed Battery Energy Storage Project and the Atlin Hydro Expansion Project.

TOPIC: **LNG Third Engine/ Critical Spares**

REFERENCE: **2021 General Rate Application, page 5-8 (PDF page 121)**

PREAMBLE: On lines 5-6 of page 5-8, YEC states, with respect to the Faro Thermal Rental Site Infrastructure project, "[t]he project is expected to be completed in 2020 at an estimated budget of $2.037 million. The project is on track for a mid-November 2020 in service date."

QUESTION:

a) Please confirm that the project is complete. If not please provide the estimated completion date.

b) Please provide the actual cost of the project, and an explanation of any variances.

ANSWER:

(a)

Confirmed.

(b)

Please see response to YUB-YEC-1-49 for project cost breakdown.

Actual project costs totaled $2.446 million, compared to the estimated budget of $2.037 million included in the application (approximately $0.408 million increase in costs). Major variances are noted as follows:

- Additional materials were needed after completion of the detailed design, including: power and control cables, cold shrink cable terminations, rigid bus bar connectors, PTs for ground fault protection, lightening arrester and materials for line and gantry construction.

- Higher market prices were also a factor, the cost to procure of a 138kV disconnect switch, 25kV breaker and the refurbishment of the spare transformer were higher than budgeted, the lowest prices were selected through RFQ process.

- The added scope was due to a safety requirement to install a ground grid in the generator area, and an environmental requirement to install generator berms for the purpose of containing fuel and/or oil spill from the generators.

- The added scope of work included: relocation of warehouse materials at the substation and generator bay area, cost to install ground grid in generator area, rental generator prep, pulling and termination of cables to rental generators, and unit transformers and installation of generator berms.

- Construction and installation were also impacted by higher market prices, the budget for crane rental and SCADA commissioning were higher than budget.

- A rented crane was needed on site for an additional day due to the delayed arrival of the rental tanks. Furthermore, 3.5 additional days were needed to establish communication with the Finning units.

- Overage for internal cost is because more internal manpower for construction, testing and commissioning was required than initially envisioned at the beginning of the project.

- Project management overage is because more responsibility was assigned to an external consultant during a 4 week absence of the YEC Project Manager, due to unforeseen circumstances.

While the actual costs exceeded the estimate included in the application, it is important to note that the final project costs of $2.446 million were lower than the lowest bid received from the EPC RFP process ($3.335 million).

TOPIC: **Mayo – McQuesten Transmission Line Upgrade**

REFERENCE: **2021 General Rate Application, Section 5.2.1.3**

PREAMBLE: On line 11 of page 5-9 (Pdf page 122), YEC indicates this project was reviewed in the 2017/18 GRA. In Table 5.2.1-2, YEC provides project costs and contributions.

QUESTION:

a) Please provide specific reference to where this project was approved in the 2017/18 GRA.

b) Please provide the cost estimates that were reviewed and approved in the 2017/18 GRA.

c) Please provide a variance analysis comparing the cost estimates approved in the 2017/18 GRA to the forecast costs included in Table 5.2.1-2. In the response please provide explanations for all material variances.

ANSWER:

(a) and **(b)**

The reference provided notes that the project details have previously been subject to review by the Board as part of two separate proceedings: the 2017 VGC Group Power Purchase Agreement proceeding; and as part of the 2017/18 General Rate Application. As the project was not complete and in service during the 2017/18 GRA, project costs were not approved as part of that proceeding.

(c)

Detailed cost estimates were not reviewed as part of the 2017/18 GRA. The 2017 VGC Group PPA proceeding estimated costs for the L180 Mayo to McQuesten 138 kV line

(assumed to be operated at 69 kV) at $32.2 million, including costs that VGC Group and/or YEC will have funded for the McQuesten Substation pursuant to the PPA.[1]

Tab 5, page 5-8 notes a total project cost for the Mayo – McQuesten Transmission Line Upgrade of $31.701 million, offset by contributions of $23.674 million.

[1] See response provided in the VGS Group PPA proceeding to YUB-YEC-1-14.

TOPIC: **Transmission Line Refurbishment**

REFERENCE: **2021 General Rate Application, Section 5.2.1.5**

PREAMBLE: On lines 2-4 of page 5-15 (PDF page 128), YEC states "[t]he Transmission and Distribution Line replacement project was initially reviewed as part of the 2017/18 GRA; and project components were capitalized as completed and placed into service, with approved costs forecast to the end of 2018 included in ratebase." CW requires information to understand the prudence of the investment.

QUESTION:

a) Please provide an analysis that compares approved costs and actual costs with explanations of significant variances.

b) Please provide an analysis that compares the approved assets and components to be replaced with the actual assets and components that were replaced.

ANSWER:

(a)

Actual 2018 costs were materially higher than approved costs. The quantity of work accomplished in 2018 was significantly more than was forecasted, as a large portion of the overall 5 year planned work was completed in one year. The increase in work scope and 2018 spending was justified due to lower unit costs; the reduced customer impact of the transmission outage number and duration; and reduced mobilization and demobilization costs for the contractor.

Table 1: Approved and Actual Transmission Line Refurbishment Costs

	Cost
2018 Approved	$ 2,000,000
2018 Actual	$ 6,280,165

(b)

Table 2 below compares the approved assets and components to be replaced with the actual assets and components that were replaced.

Table 2: Approved and Actual Scope of Work (2018)

	Full structure replacement	Crossarm replacement	Insulator replacement
2018 Approved	21	112	251
2018 Actual	61	254	489
Change (Actual vs Approved)	40	142	238

TOPIC: **Transmission Line Refurbishment – L178**

REFERENCE: **2021 General Rate Application, Section 5.2.1.6**

PREAMBLE: On line 12 of page 5-15 (PDF page 128), YEC states "[t]he final phase of the Transmission Line Refurbishment Project will commence in 2021."

QUESTION:

a) Please provide evidence from the 2017/18 GRA that clearly demonstrates that this component of the line was NOT included in the costs approved in the 2017/18 GRA.

ANSWER:

(a)

Section 5.2.1.8 of the YEC's 2017/18 GRA noted that the T&D Line Replacement project would address replacement of key components of the following YEC transmission lines which are approaching the end of their economic life:

Line #	Route	Install Date
L170	Takhini Sub to Carmacks	1968
L171	Aishihik plant to Takhini Sub	1975
L178	Carmacks to Faro	1968

In that section, YEC also noted that the required replacements would be carried out over five years beginning in 2018 at an estimated total cost of $11.5 million. YEC forecast spending in the 2018 test year at $2.0 million [the remaining estimated $9.5 million spending was forecast after 2018].

On page 5-15 of the 2021 GRA Application, YEC provides an update to the project noting that remaining components requiring replacement on lines L170, L171 and L172 were completed by the end of 2019 with total cost of $4.272 million and included refurbishment of 255 structures (58 full structures, 80 crossarms, and 117 insulators) and the final phase

of the Transmission Line Refurbishment Project will commence in 2021 for the Carmacks to Faro Transmission Line (L178).

As reviewed above, Transmission Line Refurbishment – L178 project is part of $11.5 million Transmission and Distribution Line Replacement Project noted in the 2017/18 GRA section 5.2.1.8, however, the cost for this project was not included in the 2017 or 2018 test year revenue requirements as the 2018 test year included only $2 million out of $11.5 million total project cost estimate at that time.

TOPIC: **Breaker Replacement Program**

REFERENCE: **2021 General Rate Application, Section 5.2.1.7**

PREAMBLE: On line 12 of page 5-16 (PDF page 129), YEC states the project "was reviewed as part of the 2017/18 GRA".

QUESTION:

a) Please provide an analysis that compares approved costs and actual costs with explanations of significant variances.

ANSWER:

(a)

The approved 2017 and 2018 budgets were $110,519.61 and $1,250,000, respectively. The actual expenditures for 2017 and 2018 were $110,519.61 and $1,167,329.46 respectively. No significant variances for this project are noted.

TOPIC: **Replacement of P125 Head Gate**

REFERENCE: **2021 General Rate Application, Section 5.2.1.8**

PREAMBLE: On page 5-18 (PDF page 131), YEC states "[i]t is expected that the WH2 headgate will be completed in 2020 at a forecast cost of $2.3 million; and that the WH1 and WH3 headgates will be completed in 2021 at a forecast cost of $3.5 million."

QUESTION:

a) Please provide the status of the WH2 headgate. Is the project complete, and what is the actual cost?

b) Please provide the status of the 2021 project.

ANSWER:

(a)

The project to replace the WH2 headgate (1 of 3) is complete and the total cost was $1,958,118.

(b)

The 2021 project has been delayed. YEC is in the early planning and design stages for the WH1 and WH3 Headgate Replacements which will commence in 2022.

TOPIC: **WH2 Uprate**

REFERENCE: **2021 General Rate Application, Section 5.2.1.9**

PREAMBLE: On line 19 of page 5-18, YEC refers to the 2016 Resource Plan. On lines 23-27 of page 5-18 (PDF page 131), YEC states:

> In 2017, Hatch completed an economic assessment of various uprate options at the Whitehorse Rapids Generating Station (WRGS). The report concluded that the uprating of the WH1 or WH2 units would be the most cost-effective option and provide the best payback of the WRGS hydro units. Management selected the uprating of WH2 over WH1 since there are existing known issues with the WH2 governor, and the uprating project would resolve these issues.

CW requires information to understand what was approved compared to what was actually implemented.

QUESTION:

a) Please provide the evidence from the 2017/18 GRA, and related decision sections, that clearly indicate what was requested and approved in the 2017/18 GRA.

b) Please provide an analysis of the forecast and approved costs from the 2017/18 GRA compared to the actual costs incurred for 2017, 2018, and 2019 with variances explained.

ANSWER:

(a) and **(b)**

The 2017/18 GRA included $0.450 million forecast spending in 2018 for the Whitehorse Hydro Uprate [see page 5.4-4 of Appendix 5.4 of the 2017/18 GRA]. The following was noted:

> As part of the Resource Plan, a preliminary assessment of the Whitehorse hydro units was completed which identified a number of potential uprating (or re-runnering) scenarios. An uprate project was identified to provide both additional

firm energy and dependable capacity. Additional benefits of the project could potentially include an improved efficiency curve allowing increased operational flexibility.

Spending of $0.450 million in 2018 will be used for a detailed investigation of which alternative to proceed with as well as selecting an owner's engineer to represent YEC throughout the project. A scope of work will be created and the construction contract could possibly be awarded by the end of the year. This project is expected to be complete and in service by 2020.

In Tab 5, Table 5.8 of the 2017/18 GRA notes the forecast cost of $0.450 million remained in WIP, i.e., it was not part of the requested 2017/18 revenue requirement. The project was forecast to be complete and come into service in 2020 (Appendix 5.4 of 2017/18 GRA). In paragraph 527 of Appendix A to Board Order 2018-10, the Board stated that it denied YEC's proposed Whitehorse hydro uprate project and directed YEC to remove any forecast expenditures and cost recovery related to this project in its compliance filing. As YEC had not applied to include these costs in rates, this Order had no effect on final approved recoveries.

The actual spending for this preliminary assessment in 2018 was at $0.208 million as shown in Tab 5, Table 5.3 of the current GRA [see "WH2 Uprate Assessment"] compared to $0.450 million forecast in the 2017/18 GRA. The 2018 actual costs covered procurement of an Owner's Engineer and the issuance of an RFP for the turbine & generator contractor.

By end of 2019, the cost incurred for this project is $3.297 million [$3.044 million as shown in Table 5.2-1 plus $0.252 million in Table 5.4].

TOPIC: **WH2 Uprate**

REFERENCE: **2021 General Rate Application, Section 5.2.1.9**

PREAMBLE: In lines 28-30 of page 5-18 (PDF page 131), YEC states:

> The project is planned to be implemented over a three year period (2019-21), and is expected to add 6.4 GWh/yr additional hydraulic generation to the grid [starting in the third quarter of 2021]. The project is also expected to increase dependable capacity of WH2 by 0.94 MW.
>
> CW requires information to understand how distributed energy was factored into the need for a capacity increase.

QUESTION:

a) Please provide a copy of the business case for the project. In the response please provide specific references to how YEC considered the implementation and use of distributed and micro generation over the life of the asset.

ANSWER:

(a)

The 2016 Yukon Energy Resource Plan (YEC, 2017) identified hydro uprate projects as an economically attractive option to help address YEC's existing and forecast capacity shortfall, as well as providing a cost effective incremental source of firm renewable energy. As such, uprating of the Whitehorse hydro units were included in the recommended near-term action plan under the 'base case' load scenario. Table 1 below summarizes WH2 Uprating economics and alternatives reviewed. Distributed generation and microgeneration were not considered in the assessment.

The economics of the WH2 uprating project were calculated for a number of scenarios in order to assess the sensitivity of the project economics to the following factors:

1. **Unit Output:** incremental energy production of 6.4, 6.2 and 3.2 GWh/year were assessed as 'High', 'Expected' and 'Low' output scenarios. The 'Expected' unit

output 6.2 GWh/year was based on the performance of the new turbine guaranteed by Litostroj Power.

2. **Deferred Maintenance Costs:** Since the WH2 Uprating project has a benefit of deferring planned maintenance on the WH2 unit to a later time, the economics of this benefit was also assessed.

A summary of the WH2 Uprating economics when compared to near thermal and renewable generation is provided below. The 'Base Case' scenario is shaded in blue. The calculated increases in annual energy and capacity for the project under the base case assumptions are 5.6 GWh and 0.94 MW respectively. The data shows that the WH2 Uprating project is an economic option to add firm energy and dependable capacity to YEC's portfolio in the near term. This is favourable when compared with other options presented in the 2016 Resource Plan.

See also Hatch study provided as YUB-YEC-1-57 (d) Attachment 1.

Table 1: WH2 Uprating Economics and Summary of Alternatives

WH2 uprating economics and summary of alternatives available

Source	Increase in Dependable Capacity	Increase in Firm Energy	LCOE ($/kWh)	LCOC ($/kW.yr)
WH-2 Uprate 2016 Resource Plan	0.3 MW	1.4 GWh/yr	0.04	361
WH2 Uprate 2017 Hatch Study	0.4 MW	1.9 GWh/yr	N/A	N/A
WH2 Uprate Case 1: High Output With Contingency With Deferred Maintenance Benefit OEM Quoted Performance[1]	0.94 MW	6.4 GWh/yr	0.052	387.49
WH2 Uprate Case 2: Expected Output With Contingency Without Deferred Maintenance Benefit OEM Quoted Performance[1]	0.94 MW	6.2 GWh/yr	0.072	482.60
WH2 Uprate Case 3: Expected Output With Contingency With Deferred Maintenance Benefit OEM Quoted Performance[1,2]	0.94 MW	6.2 GWh/yr	0.059	387.49
WH2 Uprate Case 4: Low Output With Contingency With Deferred Maintenance Benefit OEM Quoted Performance[1]	0.94 MW	3.2 GWh/yr	0.109	387.49
Takhini LNG Plant – Incremental Capacity 2016 Resource Plan	5 MW	41.6 GWh/yr	0.26	812
Takhini Diesel Permanent Installation – Midgard 2019 Thermal Generation Planning Report	20 MW	5 GWh/yr	0.83	138
Drury Small Hydro	8.1 MW	31.7 GWh/yr	0.19	700
Atlin/Pine Creek Small Hydro	5 MW	22.3 GWh/yr	0.13	806

Notes:

[1] Based on total project budget including contingency

[2]Based on post uprate performance guarantees from Litostroj Power.

TOPIC: **Demand Side Management (DSM)**

REFERENCE: **2021 General Rate Application, Section 5.3.1.2**

PREAMBLE: On lines 1-2 of page 5-23 (PDF page 136), YEC states "[t]he 2016 Resource Plan determined that DSM programs are a cost-effective way to meet energy and capacity demand that should be included in the proposed future portfolio of energy supply projects." Pursuant to government direction, YEC has included DSM costs. CW requires information to assess how DSM benefits have been factored into YEC cost forecasts.

QUESTION:

a) Please provide a copy of all research, studies, business cases, and other analysis that YEC has conducted that demonstrates DSM is "a cost-effective way to meet energy and capacity demand."

b) Please provide an analysis that demonstrates how DSM will reduce the need for incremental assets and capacity over the next 40 years.

c) Please fully explain how YEC has factored the potential benefits of DSM into each capital project that results in increased capacity of the asset or system.

ANSWER:

(a)

Please see response to YUB-YEC-1-47(a) and (b).

(b) and **(c)**

Yukon Energy's 10-Year Renewable Electricity Plan provides updated analysis as to forecast DSM impacts on reducing the need for incremental assets and capacity over the next decade, demonstrating that YEC has factored the potential benefits of DSM into each major capital project that is being considered to provide increased capacity.

Please see response to CW-YEC-1-36 (a) [Attachment 1] and (b).

TOPIC: **Investments to Ensure Dependable Capacity**

REFERENCE: **2021 General Rate Application, Appendix 5-1, Section 5.1-2**

PREAMBLE: YEC proposes to spend $25,000,000 in 2021 (with a $16,500,000 contribution) on a Battery Energy Storage System.

QUESTION:

a) Please provide a full business case for the Battery Energy Storage System.

b) Please provide a detailed analysis that clearly demonstrates how the inclusion of a Battery Energy Storage System was considered in determining the need for each capital project that results in increased capacity of the asset or system.

ANSWER:

(a)

Please see the response to YUB-YEC-1-71.

(b)

The Battery Energy Storage System project has been designated by OIC 2020/180 as a "regulated project" under Part 3 of the *Public Utilities Act.* Based on this requirement, Yukon Energy has filed an application for an energy project certificate and an energy operation certificate with the Minister of Justice.

Section 4.2.1 of the Part 3 Application reviews "Alternatives to the Project". Table 4-1 from the Application summarizes Forecast Non-Industrial Peak and Dependable Capacity under N-1 Capacity Planning Criterion: 2021/22-2030/31 Winter (MW) and is excerpted below.

Table 1: Forecast Non-Industrial Peak and Dependable Capacity under N-1 Capacity Planning Criterion: 2021/22-2030/31 Winter (MW)

	2021/22	2022/23	2023/24	2024/25	2025/26	2026/27	2027/28	2028/29	2029/30	2030/31

Moon Lake Pump Storage Phase 1	*0*	*0*	*0*	*0*	*0*	*0*	*0*	*35,000*	*35,000*	*35,000*
Capacity Shortfall/Surplus under N-1	**-26,355**	**-20,419**	**-14,087**	**-8,926**	**-11,936**	**-15,352**	**-19,285**	**11,087**	**6,603**	**1,767**

The discussion in Section 4.2.1 of the Part 3 Application notes, “Many of these options do not provide dependable capacity; and the new resources that will provide dependable capacity would generally not displace what the BESS option can provide, i.e., the identified permanent resource capacity options are generally all needed to remove reliance on rented diesels for addressing the forecast capacity shortfall reviewed in Table 4-1. Moon Lake pumped storage, when developed, is the only identified resource option aside from default new thermal fossil fuel generation that has the capability to remove the forecast N-1 dependable capacity shortfall.”

Further, Section 4.2.1 of the Part 3 Application notes: “aside from the potential Moon Lake pumped storage project in the future, the temporary rental diesel option or permanent new diesel development remain the only feasible alternatives that would provide dependable capacity required to address the N-1 shortfall.”

TOPIC: **Investments to Ensure Dependable Capacity**

REFERENCE: **2021 General Rate Application, Appendix 5.1, Section 5.1-2, page 5.1-7 (PDF page 164)**

PREAMBLE: YEC proposes to spend $3,000,000 on a "Whitehorse Interconnection." In the explanation YEC discusses a 10-year Renewable Energy Plan and a number of new projects being planned over the next decade.

QUESTION:

a) Please provide a copy of the 10-year Renewable Energy Plan.

b) Please provide a list of the "number of new projects being planned over the next decade." In the response, please provide YEC's assessment of the probability of each project proceeding.

ANSWER:

(a)

See Attachment 1 to this response.

(b)

The quote references the 10-Year Renewable Electricity Plan's outline of "a number of potential new projects being planned over the next decade to meet Yukon's growing electricity needs." The potential future resources for the Plan portfolio include the following:

- Atlin Hydro Expansion (6 MW) – for 2024/25.
- A potential 20 MW wind resource for 2025/26 under only the High Case.
- Tutshi-Moon Pumped Storage Project – Phase 1 – 2028/29 (this includes upgrade and expansion of transmission in the Southern Lakes region).

The Action Plan includes the following:

- **Stage 1: Committed resources –** Includes Whitehorse Hydro #2 and #4 (WH2 and WH4) Uprate projects, Battery Storage System, SOP IPP and Micro-Generation projects.

- **Stage 2: Completion of planned work and final decisions to proceed with planned resources –** Includes SLESP (Southern Lakes Enhanced Storage Project), MLESP (Mayo Lake Enhanced Storage Project), the Incremental Diesel Replacement, and DSM (Demand Side Management).

- **Stage 3: Development and implementation of the Future Potential Projects –** Includes the three future potential projects outlined above (Atlin Hydro Expansion, Moon-Tutshi Pumped Storage, and (for the High Case only) a potential 20 MW Wind Project. The Plan highlights that these projects are dependent on securing significant federal funding in order to proceed. Other risks are also identified for these projects. YEC at this time has no specific assessment of the probability of each project proceeding – the Atlin Hydro Expansion is the first of these potential projects, and YEC during 2021 is in active discussions and planning to address the requirements that would enable this project to be committed prior to the end of 2021.

10-Year Renewable Electricity Plan Technical Report

DECEMBER 2020

yukon energy

Executive Summary

Demand for electricity is growing in Yukon. There is an existing gap today between the available dependable capacity on the grid and the amount of electricity Yukoners require during a winter peak under emergency conditions. To continue providing most of the territory's energy from renewable sources and to accommodate the increased demand for electricity, Yukon Energy Corporation (YEC, Yukon Energy) must invest in new dependable renewable electricity sources that add firm winter capacity to the grid. This will allow YEC to continue meeting Yukoners' growing demands for renewable electricity – even on the coldest and darkest of days – while also supporting Yukon government's emission reduction targets.

This plan outlines a portfolio of key projects and partnerships needed by 2030 to address the substantial demand for renewable electricity that will result from ongoing economic growth of the Territory, and from the policies and actions outlined in the Yukon government's draft *Our Clean Future: A Yukon strategy for climate change, energy and a green economy*. In this strategy, the government has mandated that an average of 93% of electricity generated on the grid must be produced from renewable sources and includes specific actions to electrify the territory's transportation and heating sectors.

In order to conduct this analysis, YEC updated its load forecast (the projected energy and demand requirements of Yukoners) based on recent learnings from cold weather peaks and incorporated the electrification actions of the Yukon government's *Our Clean Future* strategy to estimate the resulting increased demand. YEC used this load forecast, along with the inventory of existing generation and projects under development, to calculate the gap between the energy and demand requirements and available resources. Using updated technical and cost information on potential resources, the company then conducted a portfolio analysis to evaluate which renewable resource options could best address this gap, across a range of scenarios. The goal of this portfolio analysis was to develop an optimal set of projects capable of addressing both the energy and peak capacity shortfalls over the 10-year planning horizon.

The result is the updated Future-Focused Portfolio. Included in this portfolio are resources which are planned or currently under development. These ongoing projects include: Whitehorse Hydro uprates at WH2 and WH4, the battery energy storage system, renewable energy purchases from Independent Power Producers through the Standing Offer Program, solar energy from the Micro-Generation program, the Southern Lakes and Mayo Lake enhanced storage projects, replacement of diesel generators as they retire, and demand side management programs. The three new projects YEC is proposing are: electricity purchases from the planned Atlin Expansion Project, construction of a pumped storage facility at Moon Lake, and upgrading and expansion of the Southern Lakes Transmission Network. The combination of these three future potential projects not only stores and uses excess renewable power generated in the summer to decrease dependency on fossil fuels during the winter, but also makes connecting potential sources of First Nations-owned renewables in the Southern Lakes region more viable, and creates potential future electricity sales opportunities.

First Nations governments, development corporations and Citizens will have a key role in helping to shape and deliver this plan over the next 10 years. YEC recognizes First Nations as governments and potential energy proponents, partners and investors. In developing this plan, YEC will work pro-actively and collaboratively with First Nations governments and development corporations to forge partnerships and create opportunities for project ownership, investment, contracting, employment and training. First Nations will also be at the forefront of project assessments, permitting and approvals.

The cost of projects in this plan are estimated to be in excess of $500 million, one of the largest investments ever in the Yukon electricity system. Federal funding for the plan will be key to keeping the plan affordable and minimizing risks for Yukon customers.

The 10-Year Renewable Electricity Plan presents a generational opportunity for Yukon to invest in the critical renewable electricity projects needed to fuel Yukoners' lives, work and economy with clean energy. It creates opportunities for Yukon Energy, First Nations governments and development corporations, the Yukon and federal governments, and Yukoners to jointly shape the territory's electricity future.

A clean future lies ahead. Let's work together to meet Yukon's climate goals.

Glossary of Key Terms

CAPACITY (DEMAND)	The supply (or consumption) of electrical power at a given instant in time. Usually measured in megawatts (MW) in long-term planning context.
DEMAND SIDE MANAGEMENT (DSM)	The attempt to reduce overall electrical consumption at customer sites via initiatives or implementation of codes/standards. Demand side management, if used during peak demand periods, can provide an alternative to supply-side dependable capacity additions.
DEPENDABLE CAPACITY	The maximum generation output that a resource can reliably provide in a specific time frame, expressed in megawatts (MW), typically during the period of greatest demand. YEC defines dependable capacity as the maximum output that a resource can reliably provide over two consecutive weeks during the four winter months (November to February) based on the inflows in the five driest inflow years in history. For thermal resources, dependable capacity was assumed to be equal to the installed capacity, since fossil fuels can be stored. For wind resources, dependable capacity is considered zero, as there is no guarantee that there will be the required wind speeds for the two consecutive weeks within the winter period.
DISPATCHABLE GENERATION	Refers to sources of electricity that can be dispatched at the request of power grid operators; that is, generating plants that can be turned on or off, or can adjust their power output on demand. Resource options such as thermal power plants and hydro power plants with reservoirs are dispatchable and they can meet changing electricity loads. In contrast, intermittent resources, such as wind are non-dispatchable because they can only generate electricity while their energy source is available.

ENERGY	The supply (or consumption) of electrical power over a period of time. Usually measured in kilowatt-hours (kWh) for residential usage or gigawatt-hours (GWh) for territorial usage. The annual energy supply must at least cover the annual energy consumption.
GENERATION RESOURCE	Refers to sources of energy that are converted to electrical power and provide energy and/or dependable capacity. Common generation resources include hydro, wind, solar, or thermal (e.g. natural gas or diesel).
INDEPENDENT POWER PRODUCER (IPP)	An energy producer who generates electricity for sale to utilities or consumers.
INSTALLED CAPACITY	The maximum amount of generating capacity that a generation resource is capable of providing, expressed in megawatts (MW).
LOAD	The electrical energy required to power homes, businesses and industrial processes. Sometimes referred to as demand.
N-1 (SINGLE CONTINGENCY) PLANNING CRITERION	A reliability planning criterion used to determine the capacity requirements of the system. YEC's N-1 criterion requires that each part of the YEC transmission grid should be able to carry the forecast peak winter demand, excluding major industrial demand, under the largest single contingency. The single largest contingency is defined as loss of the largest single element which could be either a transmission line or generating station. This criterion considers the ability to interrupt large industrial customers during an emergency event, which is why only non-industrial peak demand is included.
RENEWABLE ENERGY	Energy that comes from sources renewed on an ongoing basis through natural processes. Examples include sun (solar), wind, and flowing water (hydro).

1 Introduction

1.1 Yukon Energy Corporation

Yukon Energy Corporation (YEC) is a public electric utility owned by the Yukon Government through the Yukon Development Corporation (a Crown Corporation). YEC's mandate is to plan, generate, transmit and distribute a continuing and adequate supply of cost-effective, sustainable, clean and reliable electricity for customers in Yukon.

YEC owns and operates the Yukon's integrated transmission system, generating almost 100% of the electricity on this isolated, northern Canadian, electric grid. It is the electric utility with primary responsibility for planning and development of new generation and transmission facilities in Yukon. YEC is incorporated under the Business Corporations Act and regulated by the Public Utilities Act and the Yukon Waters Act.

1.2 Background: Drivers for a 10-Year Renewable Electricity Plan

In July 2019, YEC released its 5-year strategic plan with a bold 10-year vision to be a Canadian leader in sustainable energy by 2030. Later that year, based on the input of Yukoners, YEC's Board of Directors also decided not to move forward with the development of a new 20-megawatt thermal generation facility that would address Yukon's current and forecast capacity shortfall. This decision commenced the re-examination of potential renewable capacity resources.

In November 2019, Yukon government released a draft of its *Our Clean Future* strategy, with a vision for addressing climate change by building thriving, resilient communities powered by clean energy and supported by a sustainable green economy. In it, the government proposed that an average of 93% of electricity generated on the grid be produced from renewable sources and included specific actions to promote the electrification of the territory's transportation and heating sectors. These policy actions triggered the need for an update to YEC's long term load forecast.

These increased electricity requirements to enable a clean Yukon future and the Corporation's commitment to provide renewable capacity solutions to serve this demand formed the need to develop an updated plan for future renewable generation and transmission projects.

1.3 Yukon Integrated System

At present, the Yukon electrical system shown in Figure 1 comprises:

» One (1) large hydroelectric based grid called the Yukon Integrated System (YIS);

» One (1) medium-sized diesel-based grid serving Watson Lake; and

» Three (3) smaller isolated communities with diesel generation (Beaver Creek and Destruction Bay/ Burwash Landing) and solar/diesel generation (Old Crow).

Figure 1: Yukon Electrical Systems

1.4 YEC Resource Planning Criteria

Reliability means that electricity is available when customers demand it. Generation resources exist to supply electricity, and transmission resources exist to move electricity from generators to customers. Planning generation resources involves consideration of two primary supply aspects: energy and capacity. Energy is the total quantity of electricity produced over a period of time (e.g. a day or a year), while capacity is how much electricity can be produced at one time.

Being an islanded system, YEC must ensure there is always an adequate supply of both energy and capacity, including in the event of contingencies (i.e. loss of generation or transmission). Achieving these supply objectives is made more challenging by the islanded nature of the YIS, since YEC cannot rely on its neighbours to provide additional energy and capacity in times of need.

To address YEC's planning requirements, YEC used the following criteria in the resource planning process:

- **Energy Planning Criterion.** This criterion is defined as having firm energy equal to or greater than forecast future energy loads. The energy planning criterion must be met on an annual basis. It should be noted that although YEC plans for firm energy, YEC has excess firm energy available from thermal generation resources to meet the firm energy planning criterion over the planning period. As a result, the 10-Year Renewable Electricity Plan has been modeled on the basis of average energy for renewable generation resources which assumes average water, wind and solar irradiance.
- **Capacity Planning Criterion.** This criterion ensures that the system has sufficient capacity to meet peak demand (peak capacity) for two consecutive weeks under extreme cold winter conditions. The capacity planning criterion is based on the single contingency (N-1) criterion, which states that each part of the YEC transmission grid shall supply the forecast non-industrial peak winter demand, excluding major industrial demand, under the largest single contingency. Yukon's current largest single contingency corresponds to the loss of the 37 MW Aishihik Generation Station, either through an outage of the generating station itself or an outage of the L171 transmission line that interconnects the Aishihik Generating Station to the Takhini Substation.

Please refer to *Section 4.3: Resource Planning and Reliability Criteria* in the 2016 Integrated Resource Plan (IRP) for further details.

2 Context

2.1 Yukon Challenges

» **Islanded Grid.** Yukon cannot rely on adjacent Canadian provinces, territories or the State of Alaska to supply electricity, and must self-supply all its own capacity and energy.

» **Predominantly Hydroelectric Energy Generation.** Most Yukon electricity is generated using renewables, and as recently as 2016 more than 98% of Yukon's electric energy was supplied by renewable (primarily hydroelectric) generation, with the remaining 2% provided by thermal generation (diesel and natural gas fired generation). Hydroelectricity relies on the availability of water to generate electricity, and as a result YEC must anticipate and plan for potential drought conditions.

» **Mismatched Generation Supply and Electricity Demand.** Electricity demand in the Yukon is highly variable, and changes considerably over the course of each day and across seasons. Primarily driven by residential demand for services such as space heating, lighting, cooking and appliance loads, Yukon's electricity demand typically peaks during cold winter days during and shortly after dinner time (typically between 4pm and 6pm). There is a seasonal mismatch between the timing of maximum available electricity production from hydroelectric generation (which peaks in the summer months) and maximum customer demand (which peaks in the winter months). As a result, YEC regularly relies on thermal generation to fill the gap between available hydroelectric generation and electricity demand during the winter peak periods.

» **Industrial Load Changes & Ratepayer Protections.** Yukon's small customer base means that the addition or loss of a major industrial load (e.g. a mine) on the grid has a substantial effect on both overall electricity demand and the total electricity sales volumes. This impacts how YEC's costs are divided amongst ratepayers. This volatility in industrial customer demand makes it challenging for YEC to forecast its future generation supply requirements, or to mitigate potential step changes in electricity rates which can occur with the loss of industrial customer demand.

2.2 Federal Funding to Enable Renewable Capacity

YEC is subject to price regulation and may only charge electricity prices approved by the Yukon Utilities Board (YUB). Since the YUB is an economic regulator, this implies that YEC must select the lowest cost resource options to meet future demand, while still meeting applicable regulations and laws.

Planning for future capacity resource investments is a key outcome of the 2016 Integrated Resource Plan and this current plan. Since thermal generation resources typically offer the lowest cost source of new capacity, this typically leads to the inclusion of new thermal facility investments. For example, a new 20 MW diesel plant was included in the recommended portfolio of the 2016 Integrated Resource Plan.

YEC's 2016 Resource Plan involved a "blank sheet" planning process that evaluated all generation options available to YEC without being constrained or influenced by planning pre-conditions. The 10-Year Renewable Electricity Plan, however, is focused on prioritizing renewable electricity solutions, which strongly influenced the generation resource options that were considered.

Accordingly, in order to meet the objectives of the 5 Year Strategic Plan and the policy objectives set out in the Yukon government's *Our Clean Future* strategy, Federal funding was assumed to support the development of renewable capacity sources that would otherwise not be selected as the lowest cost capacity resources. Federal funding also serves to reduce the impact of large infrastructure development on Yukon electrical rates, thus keeping residential and industrial rates affordable. This will allow Yukon to maintain an affordable quality of life, and ensure Yukon remains a competitive jurisdiction for future industrial development.

In Yukon, there is a long history of the Federal government funding support for large electrical infrastructure development (e.g. Carmacks-Stewart Transmission Project, Mayo B, etc.) to protect ratepayers and keep rates affordable. For the purposes of this plan, it is assumed that new generation and transmission projects will receive Federal funding, to a typical maximum of 75% of total capital cost.

2.3 Relevant Government Policy and Initiatives

YEC is accountable for meeting policy directives issued by the Yukon government and its agencies. Key recent policy developments include:

1) Micro-Generation Policy

2) Independent Power Producer Policy

3) Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy

2.3.1 Micro-Generation Policy

Issued by the Yukon government in October 2013, this policy aims to encourage the small-scale generation of electricity by individuals, small businesses and communities to meet their own needs, as alternatives or supplements to centralized grid-connected power. The policy is applicable to micro-generation projects up to 50 kW. YEC has included micro-generation-sourced energy in its committed resource assumptions for future supply options in the 10-Year Renewable Electricity Plan.

2.3.2 Independent Power Producer (IPP) Policy

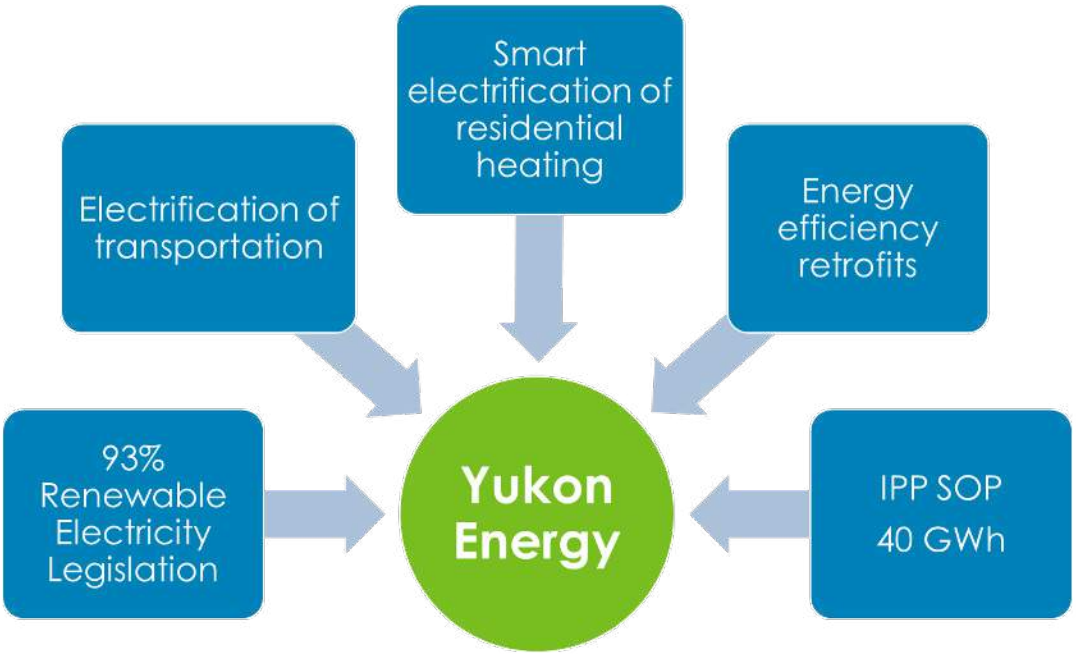
Issued by the Yukon government in October 2015, the IPP policy aims to provide opportunities for non-utility entities to develop new generation resources that can assist the utilities in meeting the demand for affordable, reliable, flexible and clean electrical energy.

YEC and ATCO are actively working with the government to structure a Standing Offer Program (SOP), which is a key element of the IPP Policy. The SOP is intended to provide a standardized technical and commercial framework to facilitate grid connection of new small capacity generation (in the 30 – 2,000 kW range). YEC included 40 GWh of annual IPP-sourced energy in its committed resource assumptions for future supply options in the 10-Year Renewable Electricity Plan.

2.3.3 Our Clean Future: A Yukon Strategy for Climate Change, Energy and a Green Economy

Yukon government released a draft of its *Our Clean Future* strategy for public review in November, 2019. The strategy was formally launched in September, 2020. Key goals of the strategy include reducing greenhouse gas emissions, ensuring Yukoners have access to reliable, affordable and renewable energy, adapting to the impacts of climate change, and building a green economy. Figure 2 provides an overview of the various elements of the Yukon government strategy which influenced YEC's expected load and generation requirements.

Figure 2: *Our Clean Future* Strategy Influence on YEC 10-Year Renewable Electricity Plan



The *Our Clean Future* strategy states that Yukon government will develop legislation by 2023 that will require at least 93% of the electricity generated on the Yukon Integrated System to come from renewable sources, calculated as a long-term rolling average, while aiming for an aspirational target of 97% renewable electricity by 2030. This minimum requirement, and the long-term aspirational target, impacted the generation requirements used in the development of the 10-Year Renewable Electricity Plan.

The electrification of transportation and smart heating called for by the strategy is expected to increase the amount of electricity required by Yukoners, while energy efficiency retrofits may reduce or change electricity requirements for some entities. The impact of these actions was reflected in the load forecasts developed for this Plan. The changes to the IPP Standing Offer Program, and the support of Demand Side Management (DSM) programming, were also reflected in the energy portfolio modeling.

The *Our Clean Future* strategy is focused on six priorities: Transportation; Homes and Buildings; Energy Production; Communities; Innovation; and Leadership. Within these priorities, a number of strategies and related actions for energy conservation and the development of renewable energy resources were identified. Table 1 summarizes the key electricity-related initiatives relevant to YEC which were accounted for in the development of the 10-Year Renewable Electricity Plan.

Table 1: Government Energy & Climate Change Strategy: Electricity-Related Initiatives for YEC

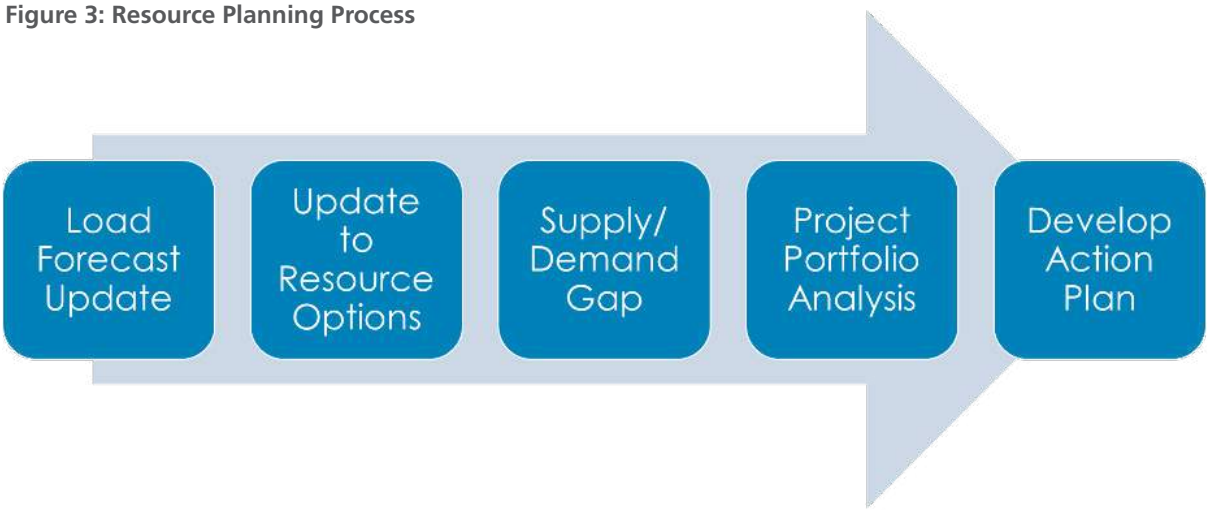
PRIORITY	ACTION NUMBER	ELECTRICITY RELATED INITIATIVE	TARGET	ACCOUNTED FOR IN 10-YEAR RENEWABLE PLAN?
Transportation	Actions #T1, #T2, #T4, and #T6	Increase the availability and use of zero emission vehicles, install fast-charging stations across Yukon, and require new residential buildings in greater Whitehorse area to support Level 2 electric vehicle charging.	4,800 EVs by 2030	Yes (included 5,000 EVs by 2030, based on November 2019 Draft Strategy).
Homes and Buildings	Action #H18, #H21, #H22	Replace residential fossil fuel heating systems with smart electric heating systems.	1,300 buildings over 10 years	Yes
Homes and Buildings	Action #H26, #H27, #H28	Allow Yukon's public utilities to partner with Government of Yukon to pursue cost-effective demand-side-management measures, and collaborate on delivery of capacity and energy DSM programs.	No specific target.	Yes

PRIORITY	ACTION NUMBER	ELECTRICITY RELATED INITIATIVE	TARGET	ACCOUNTED FOR IN 10-YEAR RENEWABLE PLAN?
Energy Production	Action #E7, #E8, #E10	Continue to implement the IPP Policy and the Micro-generation Program and increase the SOP limit to support additional community-based renewable energy projects.	Increase the SOP limit from 20 GWh to 40 GWh, 7 MW of installed Micro-generation capacity by 2030	Yes
Energy Production	Action #E1	While aiming for an aspirational target of 97% by 2030, develop legislation by 2023 that will require at least 93% of the electricity generated on the Yukon Integrated System to come from renewable sources, calculated as a long-term rolling average.	93% long-term rolling average	Yes
Energy Production	Action #E12	Conduct research into the potential to use geothermal energy in Yukon for heating and/or electricity.	No specific target.	No

3 Resource Planning Methodology

The goal of the resource planning process is to develop recommended actions for meeting Yukon's energy and capacity electricity demand requirements over the 10-year horizon.

Figure 3: Resource Planning Process



The planning process was built on the 2016 Resource Plan and followed these steps:

1. **Load Forecast Update**. Forecast future electricity demand for both energy and peak capacity (Section 4);
2. **Supply/Demand Gap.** Create an inventory of existing, committed and planned generation resources (Section 5), then determine potential shortfalls between future demand and generation supply resources in terms of both energy and capacity (Section 6);
3. **Update to Resource Options.** Create an inventory of future potential generation resource options (Section 7);
4. **Project Portfolio Analysis.** Analyze and develop a portfolio of options to address the energy and capacity shortfalls (Section 8); and
5. **Action Plan**. Develop a recommended action plan (Section 9).

It should also be noted that although the planning horizon for the 10-Year Renewable Electricity Plan is from 2020 to 2030, the resource planning process was completed based on a longer timeframe (i.e. 2020 to 2035) to allow for the phased development of certain resource options included in the portfolio analysis. Each step of the planning process is described further in the following sections.

4 Load Forecast

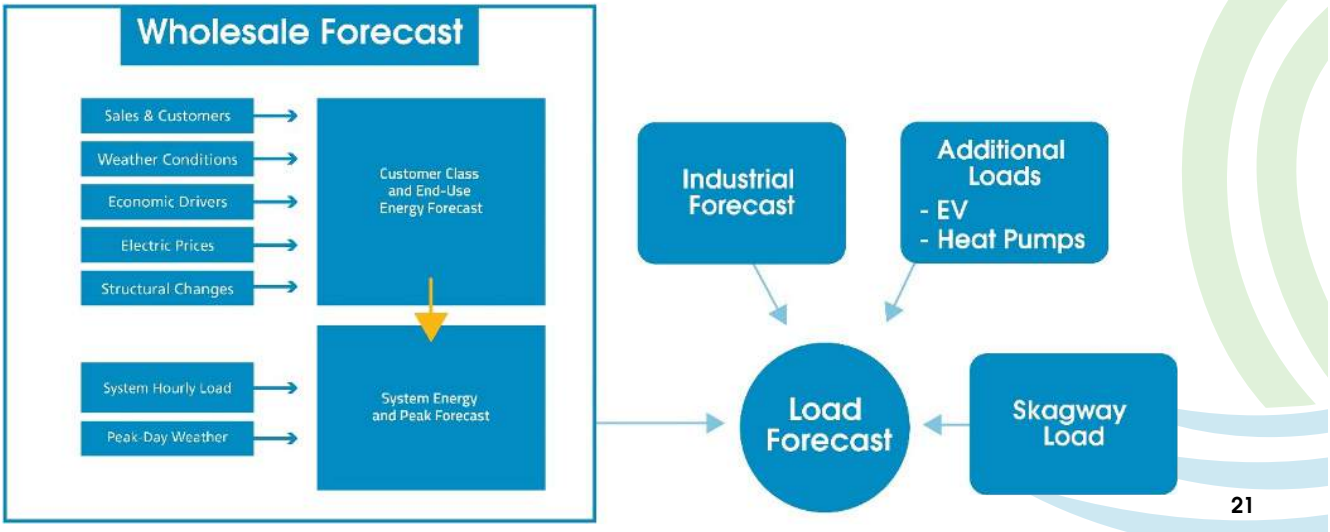
4.1 Load Forecasting Overview

The energy and peak capacity demand forecast estimates YEC's electricity needs over the planning horizon. The forecasting process used multiple inputs provided by external expert sources and inputs from the Yukon government, as well as production forecasts for major industrial customers.

Energy and peak capacity demand forecasts were developed in two parts:

1. **Part 1.** The energy and peak capacity demand forecasts from the 2016 Integrated Resource Plan were updated by Itron using their SAE MetrixND econometric model. The updated forecasts capture a range of input data, including historical sales and energy data by customer class, economic activity, population projections, average expected weather conditions, electricity prices, and improvements in end-use efficiency and standards. The economic activity input assumptions were based on the Yukon government economic model. This included an industrial activity forecast, reflection of the state of the economy in 2019 based on actual population and household numbers, and updated Gross Domestic Product (GDP) statistics.
2. **Part 2.** Additional loads not captured in Part 1 of the demand forecasts were added separately to the demand forecast output. These additional loads included industrial grid-connected mining loads, incremental loads from specific climate policy incentives such as the adoption of electric vehicles and the electrification of space heating in buildings, and the incremental load associated with the potential electrification of cruise ships in Skagway.

Figure 4: Load Forecast - Process Overview



4.2 Load Forecast Scenarios

Yukon's small customer base means that the addition or loss of a major industrial mining load on the grid has a material impact on overall energy requirements. In order to recognize and quantify this volatility, scenarios describing credible potential alternative futures were developed by making specific assumptions concerning the future loads of existing grid-connected mines. Other factors, such as increased loads from the electrification of cruise ships in Skagway and future energy policy actions, were also incorporated into the scenarios.

There are a number of prospective mining projects located far from the Yukon grid (e.g., Coffee Gold Project, BMC Minerals Kudz Ze Kayah project) that could be developed during the planning period. However, since these projects are assumed to be off-grid operations with no direct impact to on-grid electricity demand, and there is limited visibility on the probability or timing of these projects, they were not considered as part of this analysis. The scenarios also did not consider any new large on-grid mining projects being developed in the 10-year planning period as there is limited visibility on the certainty of any of these potential projects coming to fruition. Should new mining developments emerge, future long-term resource plan updates would contemplate how to address the resulting load impact.

The four (4) scenarios considered were:

1. Low Case;
2. Base Case (without Skagway);
3. Base Case (with Skagway); and
4. High Case.

The third scenario in the list, Base Case (with Skagway), represents the expected Base Case for the YEC load forecast, and is referenced as the "Base Case" throughout the remainder of this report. Note that this analysis was conducted prior to the COVID-19 pandemic. YEC will assess the timing and extent of the recovery of the cruise ship industry as part of its evaluation of the Skagway business opportunity.

Table 2: Load Forecast Scenarios - Assumptions

	LOW CASE	BASE CASE (WITHOUT SKAGWAY)	BASE CASE	HIGH CASE
Wholesale Forecast	YG Economic Model Energy Policy Actions	YG Economic Model Energy Policy Actions	YG Economic Model Energy Policy Actions	YG Economic Model Energy Policy Actions
Eagle Gold Load	Operation to 2029 2019 updated forecast	Operation to 2029 2019 updated forecast	Operation to 2029 2019 updated forecast	Operation to 2035 2018 load forecast
Minto Load	None	3 MW average to 2022	3 MW average to 2022	3 MW average to 2031
Alexco Load	None	2.5 MW average to 2035	2.5 MW average to 2035	2.5 MW average to 2035
EV Load	2,000 EVs by 2030; L2 charging; no Time of Use (TOU) rates	6,000 EVs by 2030; L2 charging; no TOU	6,000 EVs by 2030; L2 charging; no TOU	6,000 EVs by 2030; L2 charging; no TOU
Skagway Load	None	None	35 GWh/yr summer demand from 2026 to 2035	35 GWh/yr summer demand from 2026 to 2035

4.3 Energy Forecasts

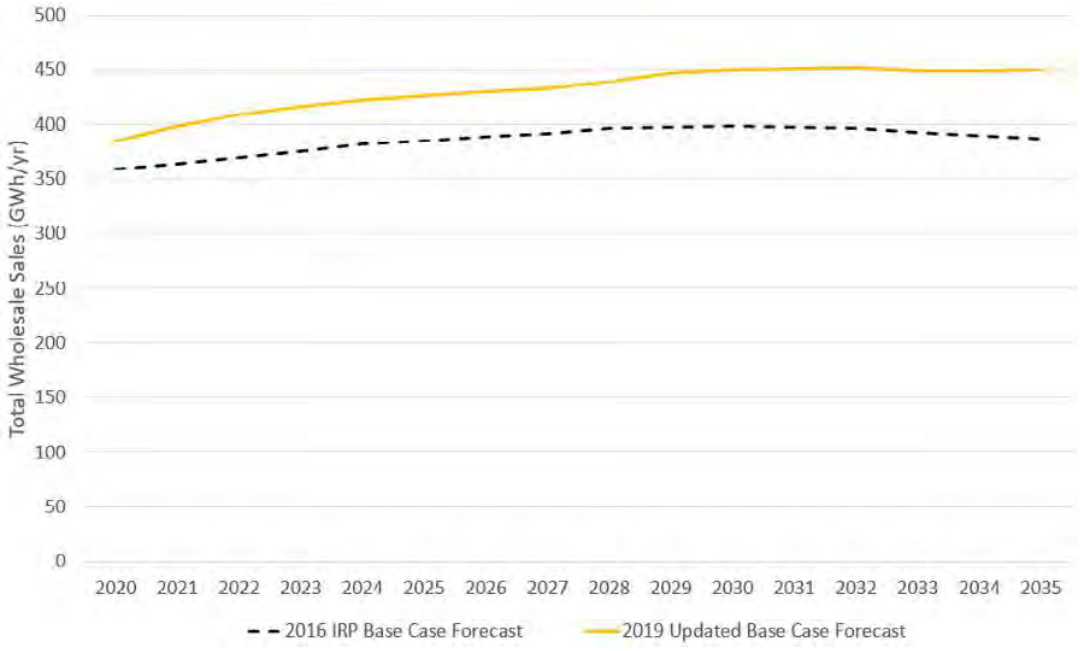
This energy forecast for the Yukon Integrated System (YIS) (see Section 1.3) is for the Base Case scenario. Energy refers to the quantity of electricity, expressed in gigawatt-hours (GWh) that is sold over a specified period of time.

The YIS energy forecast comprises two major elements, wholesale load and industrial (i.e. mining) load, which are combined to produce the total energy forecast. To show how the load forecasts have changed over time, the previous forecast values from the 2016 IRP are included in each of the following graphs.

4.3.1 Annual Energy Forecast

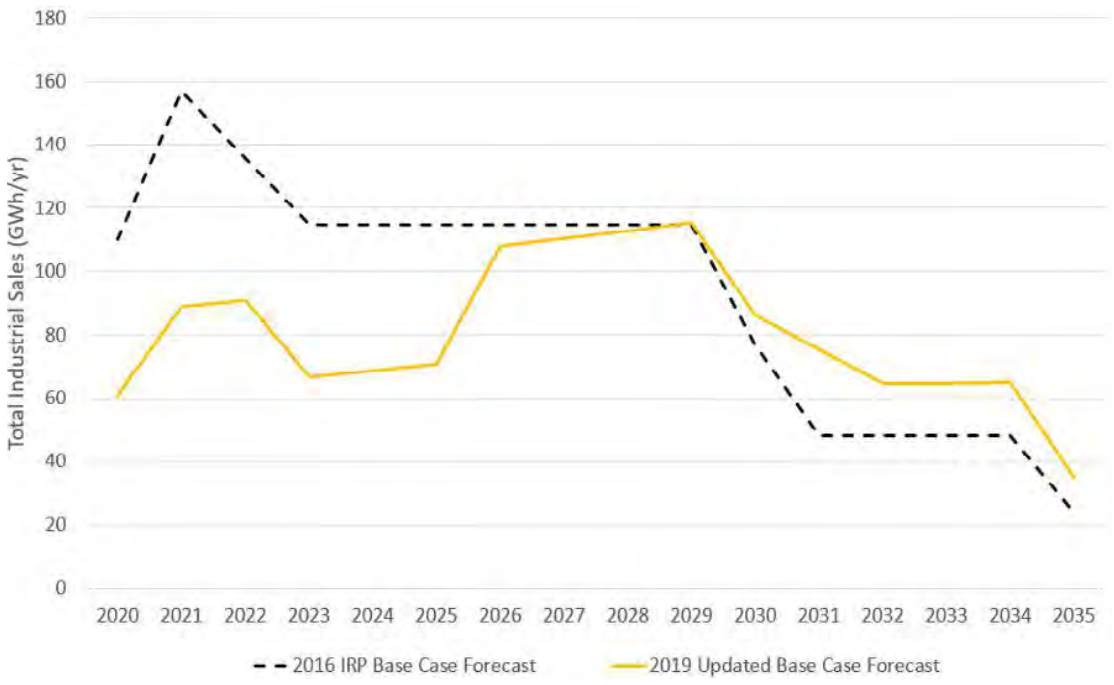
The annual wholesale energy forecast, which includes the incremental Yukon Energy Policy Action loads for the Base Case scenario relative to the 2016 IRP Base Case forecast, is shown in Figure 5. The updated 2019 energy forecast is higher than the 2016 forecast for the entire planning period, including the initial 2020 year. Energy load is higher in 2020 due to higher than forecast economic and population growth over the 2016-2019 period. In addition, the data in Figure 5 illustrates that energy demand is forecast to grow at a higher rate than forecast in the 2016 IRP due to impacts of Yukon government electrification policy actions which include electric vehicles and electrification of space heating.

Figure 5: Base Case - Wholesale Forecast Relative to 2016 IRP Base Case Forecast



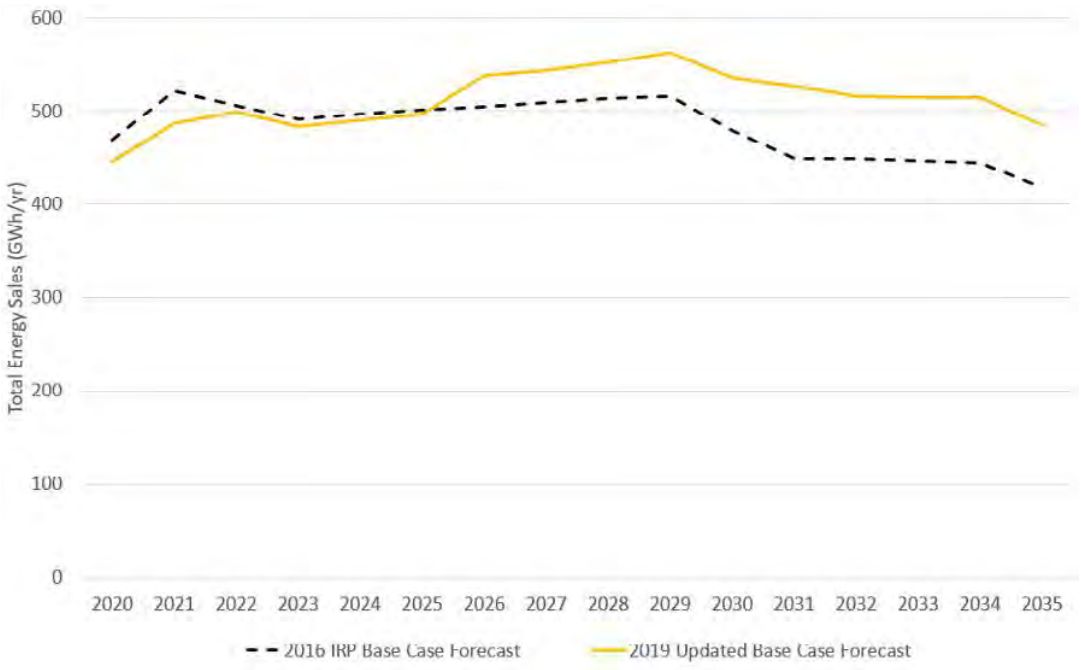
The annual industrial forecast for the Base Case scenario relative to the 2016 IRP Base Case forecast is shown in Figure 6. It should be noted that the 2019 industrial forecast also includes an additional 35 GWh/year load from year 2026 onwards for the assumed electrification of cruise ships in Skagway under this scenario. The observed decrease in forecast industrial load at the start of the planning period (2020-2025) relative to the 2016 forecast is primarily driven by a reduction in the forecast Victoria Gold mining load. The observed increase in forecast industrial load from year 2026 onwards is due to the additional load associated with the electrification of cruise ships in Skagway. Finally, the observed drop-off in industrial load from year 2029 onwards is due to the assumed shut-down of the Eagle Gold mine.

Figure 6: Base Case - Industrial + Skagway Forecast Relative to 2016 IRP Base Case Forecast



The total energy forecast (i.e. wholesale + industrial + Skagway) for the Base Case scenario relative to the 2016 IRP Base Case scenario is shown in Figure 7. The forecast increase in wholesale load is partially offset by the reduction in mining load at the beginning of the planning period, but an increase in total energy is observed from year 2026 onwards due to the addition of the Skagway load. As a result, the updated total energy forecast for the Base Case scenario remains very similar to the 2016 forecast, with slightly lower energy demand in the near-term years, and higher energy demand in the latter years of the planning period.

Figure 7: Base Case – Total Energy Forecast Relative to 2016 IRP Base Case Forecast



4.3.2 Seasonal Profiles

Seasonal energy profiles help demonstrate how energy demand changes over the course of a year and identifies which months have the highest and lowest energy demand. Figure 8 shows forecast monthly energy profiles for the year 2030 (with and without Skagway load). The figure does not account for any potential summer "load" from a pumped storage resource (e.g. energy consumption to pump water into the upper storage reservoir). Although the shape of the monthly energy profile will vary over the planning period, the YIS will remain a winter peaking system with maximum energy demand occurring in the winter months and lower energy demand in the summer months. Electricity policy changes in Yukon are not expected to change the fundamental challenge of meeting Yukon's increased energy demand in the winter months.

Figure 8: Monthly Demand Shape for 2030 (With & Without Skagway Load)

4.4 Peak Capacity Demand Forecast

Peak capacity demand is the maximum instantaneous quantity of electricity that customers require (and YEC must supply), expressed in megawatts (MW). For forecasting and planning analyses, which are conducted using the single-contingency (N-1) planning criterion, industrial demand is excluded from the peak capacity demand as it is assumed during an emergency event industrial customers could be interrupted.

A new peak capacity demand record of 103.84 MW (97.6 MW non-industrial peak) was set on January 14, 2020. The previous record peak was 92.99 MW (90.5 MW non-industrial peak). As a result of this record-breaking peak, YEC was required to update its non-industrial peak capacity demand forecasting model to account for updated information on the actual peak demand of the Yukon system during prolonged cold weather events.

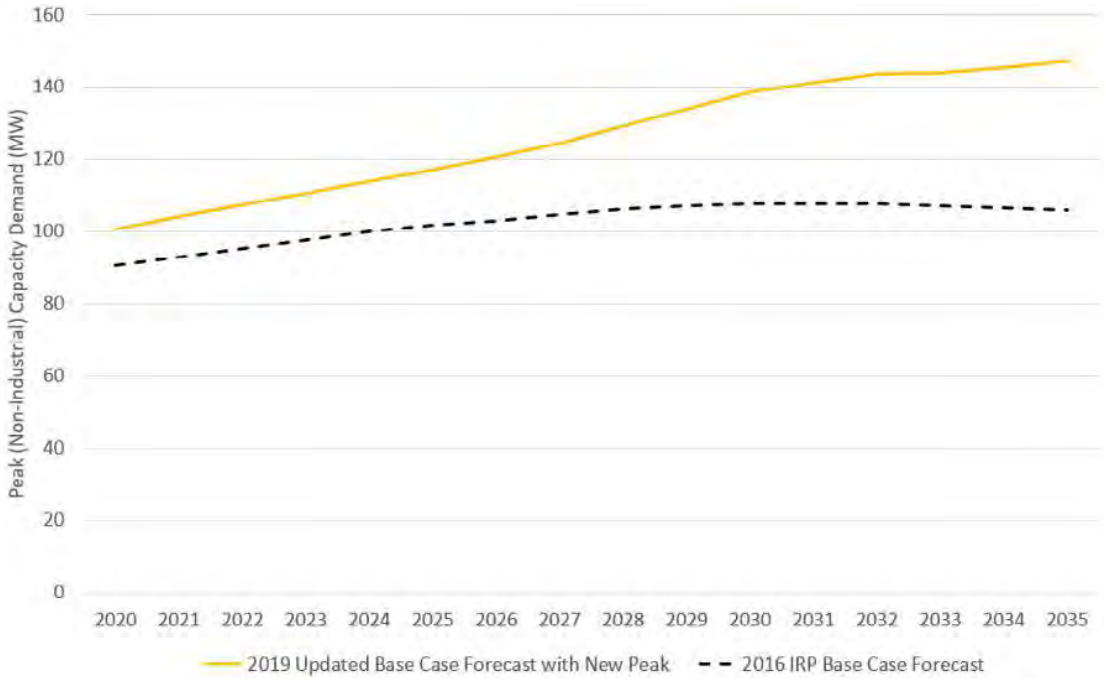
It should be noted that including Skagway in the Base Case does not impact the non-industrial peak capacity demand forecast. Skagway is assumed to add approximately 35 GWh of summer energy per year from year 2026 onwards, but it does not impact the peak capacity demand which occurs in the winter.

The updated non-industrial peak demand for the YIS relative to the 2016 IRP Base Case scenario is shown in Figure 9. The significant growth in the peak non-industrial demand forecast relative to the 2016 IRP Base Case forecast was primarily driven by:

» increased wholesale demand (e.g. population growth) and

» government policy actions related to electrification (e.g. electric heating, electric heat pumps and the adoption of electric vehicles).

Figure 9: Base Case – Updated Peak (Non-Industrial) Capacity Demand Forecast vs. 2016 IRP



5 Update to Resource Options

Generation resources considered as part of the 10-Year Renewable Electricity Plan are described in terms of their average energy and dependable capacity, where:

» **Average Energy**, expressed in GWh/year, is the total quantity of energy that the resource option produces in an average year. An average year is defined as having historically average fuel availability, such as water, wind, or solar irradiance. The fuel supply for a thermal generation station (i.e. diesel or natural gas) is available with a high degree of certainty. Because these fuels can be reliably stored, they are assumed to have 100% fuel availability.

» **Dependable Capacity**, expressed in MW, is the maximum generation output that a resource can reliably provide in a specific timeframe, typically during the period of greatest demand. YEC defines dependable capacity as the maximum output that a resource can reliably provide over two consecutive weeks during the four winter months (November to February) based on fuel availability. For hydroelectric generation this means the average of water inflows for the five driest years in the hydrological record. For thermal resources, dependable capacity is equal to the installed capacity, since fossil fuels can be reliably stored. For wind and solar resources, dependable capacity is considered zero, since there is no guarantee that there will be available fuel (e.g. sun or wind) for the two consecutive weeks within the winter period.

The four (4) categories of generation resources considered as part of the 10-Year Renewable Electricity Plan, and described further in the following sub-sections, are:

1. Existing Resources;
2. Committed Resources;
3. Planned Resources; and
4. Future Potential Resources.

5.1 Generation Resources by Type

5.1.1 Existing Resources

These include YEC's legacy hydroelectric and thermal (diesel-fired and natural gas-fired) generation resources. The thermal diesel-fired resources owned and operated by ATCO in the communities connected to the Yukon Integrated System are also included in the category of Existing Resources. ATCO's generation resources are assumed to contribute to the dependable capacity of the system, with the underlying expectation that ATCO will provide backup power whenever needed.

The retirement of diesel generators that reach end of life over the planning period were also included in this category. Over the planning period, YEC anticipates the retirement of the sole remaining Mirrlees diesel engine in Faro (FD1) and two diesel engines from the Dawson Diesel Plant (DD2 and DD5) in 2023.

The inventory of the existing and retiring YEC and ATCO resources and their technical attributes are presented in Appendix A:.

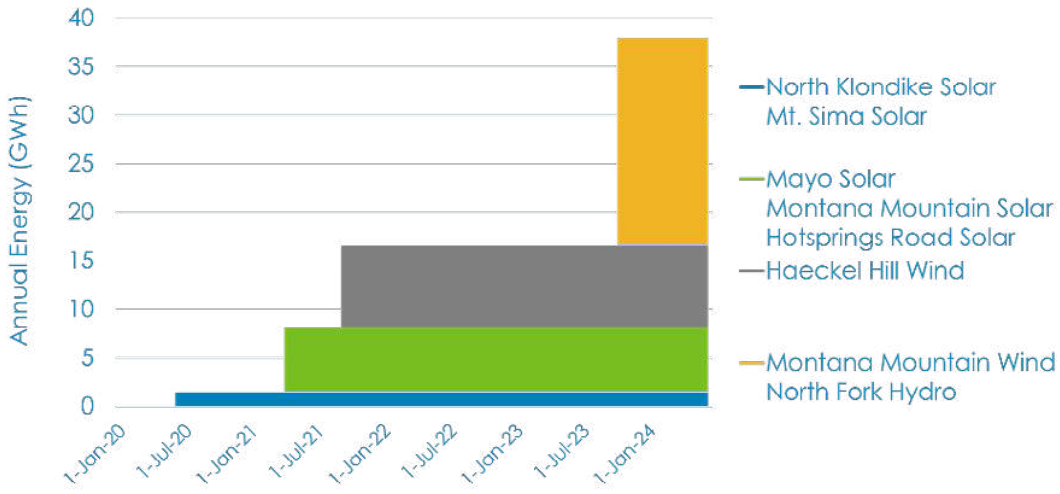
5.1.2 Committed Resources

These include generation resources that have secured YEC Board approvals and for which YEC is in the process of planning and/or constructing. That is, there is no turning back on the commitment to building these generation resources. YEC considers the following as committed resources:

1. **Whitehorse Hydro #2 (WH2) Uprate Project.** The Whitehorse Hydro WH2 Uprate Project will increase the efficiency and maximum capacity of the WH2 generation unit, resulting in more generated electricity for the same water throughput. The WH2 Uprate Project at the Whitehorse generating station will provide 6.2 GWh of annual energy and at least 0.64 MW of dependable capacity.
2. **Battery Storage System.** On September 5, 2019, the Government of Canada committed $16.5 million towards the construction of a new battery storage system in Yukon. The new battery, which is currently projected to be sized at 8 MW/ 40 MWh, will help meet growing peak demands for power while displacing diesel and improving grid reliability.

3. **Standing Offer Program (SOP).** The SOP is outlined in the Independent Power Production (IPP) Policy of the Yukon territorial government issued in 2015. The SOP included in the 10-Year Renewable Electricity Plan envisions 40 GWh/year of energy delivered by the IPP sector by the year 2024 and continuing past the end of the planning period. Figure 10 illustrates the current forecast of the projects anticipated to participate in the program and the resulting expected profile of renewable energy contribution growth from the SOP between 2020 and 2024. Since it is assumed that the SOP projects will most likely be intermittent renewable resources such as wind and solar, no dependable capacity is assigned to these resources.

Figure 10: IPP Standing Offer Program Anticipated Projects



4. **Micro-Generation Program.** The Micro-Generation policy issued by the Yukon government in October 2013 outlines this program. The policy is applicable to projects up to 50 kW. The micro-generation included in the 10-Year Renewable Electricity Plan envisions 6.5 GWh/year of delivered energy by the year 2024 and continuing past the planning period. Similar to the SOP, no dependable capacity is assigned to micro-generation projects because they will be comprised of intermittent renewable resources such as wind and solar.

5.1.3 Planned Resources

These include generation resources which have reached advanced planning stages but have yet to secure all necessary YEC Board approvals. YEC considers the following projects to be Planned Resources:

1. **Whitehorse Unit #4 (WH4) Uprate Project.** This project will increase the maximum water flow at WH4, resulting in an increased maximum output. The WH4 Uprate Project at the Whitehorse generating station will provide 0.9 GWh of annual additional energy. Although this project increases the maximum capacity of the unit, it does not provide additional dependable capacity. This is because water flow in the winter is limited by downstream Yukon River system ice flow restrictions. Subsequent to the completion of this report, the YEC Board of Directors approved the WH4 Uprate Project to proceed in May 2020.

2. **Southern Lakes Enhanced Storage Project (SLESP).** The SLESP will expand the storage range on the Southern Lakes system, which provides water (i.e. fuel) storage for the Whitehorse generating station. This will be achieved by decreasing the licensed Low Supply Level by up to 10 cm and increasing the licensed Full Supply Level by up to 30 cm. Although the SLESP is a water storage project that does not generate electricity itself, it will enable generation of an additional 6.5 GWh of electricity each year at the Whitehorse Hydro facility.

3. **Mayo Lakes Enhanced Storage Project (MLESP).** This project seeks to enhance water storage at Mayo Lake by lowering its current licensed minimum level by up to one metre. The MLESP would generate an additional 4 GWh of electricity each year.

4. **Diesel Replacement.** By replacing retired diesel generator units at existing generation facilities, YEC can reduce the need for rental diesel generators from November through March. The total replacement diesel assumed over the planning period amounts to 12.5 MW.

5. **Demand Side Management (DSM).** DSM involves using incentives, electricity rate structures, and building and appliance codes and standards to encourage customers to reduce the amount of electricity they use. In 2014, YEC and ATCO Electric Yukon jointly launched and operated a DSM program called inCharge which provided rebates and electricity savings kits. However, the YUB denied the costs of this program in its decision on YEC's 2017-2018 General Rate Application. As a result, YEC's DSM activities are on hold pending confirmation that future DSM costs will be allowed. The focus of a relaunched DSM program would be on measures that deliver peak capacity savings (i.e. reductions in peak electricity consumption). A suite of programs has been developed which will be implemented once there is regulatory certainty about allowing of future DSM-related costs. The DSM programming is forecast to provide up to 6.7 GWh of annual energy and 7 MW of dependable capacity by 2030.

For the purposes of this report, it was assumed that Planned Resources will be constructed and operational as planned, and therefore are treated similarly to Committed Resources.

5.1.4 Future Potential Resources

These are potential generation resource options available to meet the needs of YEC's customers over the next 10 years that have not yet advanced into development. These generation resources are described in Section 7.

5.2 Summary: Existing, Committed and Planned Generation Resource Forecast

In Figure 11 and Figure 12, the Existing Resources are shown as blue bars and the Committed and Planned Resources are shown in darker and lighter shades of grey, respectively.

Figure 11: Energy Forecast from Existing, Committed and Planned Resources

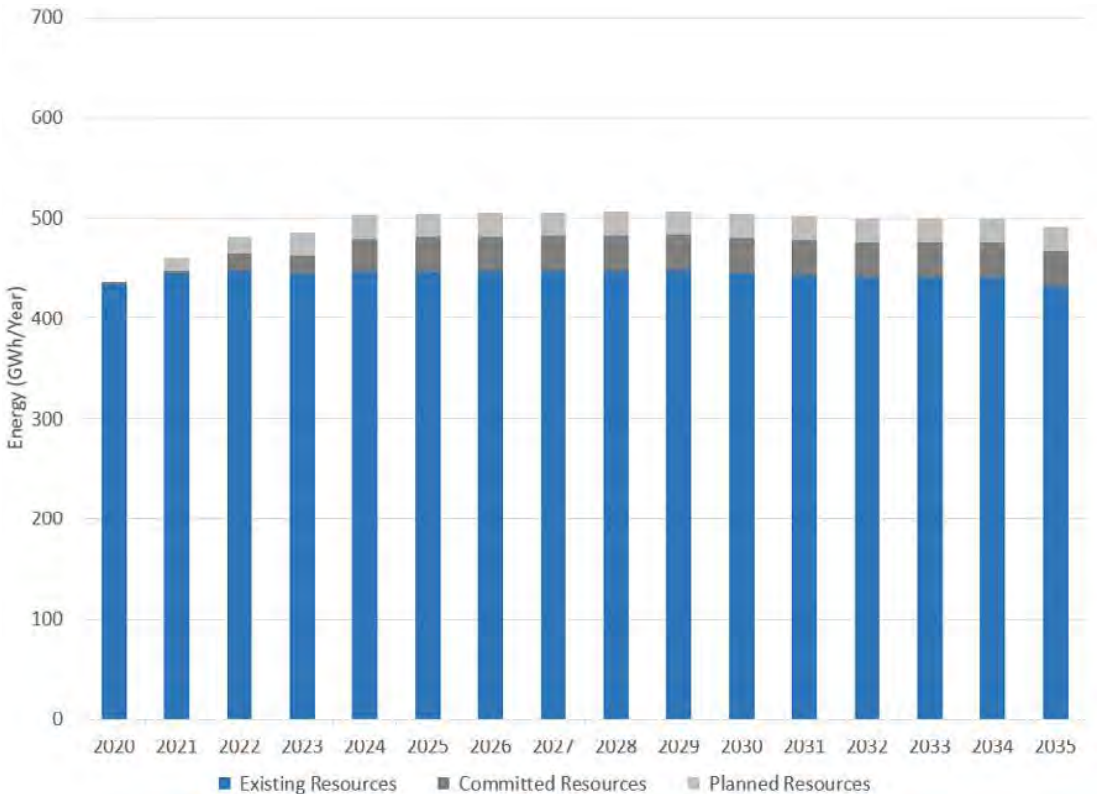


Figure 12: Dependable Capacity (N-1) from Existing, Committed and Planned Resources

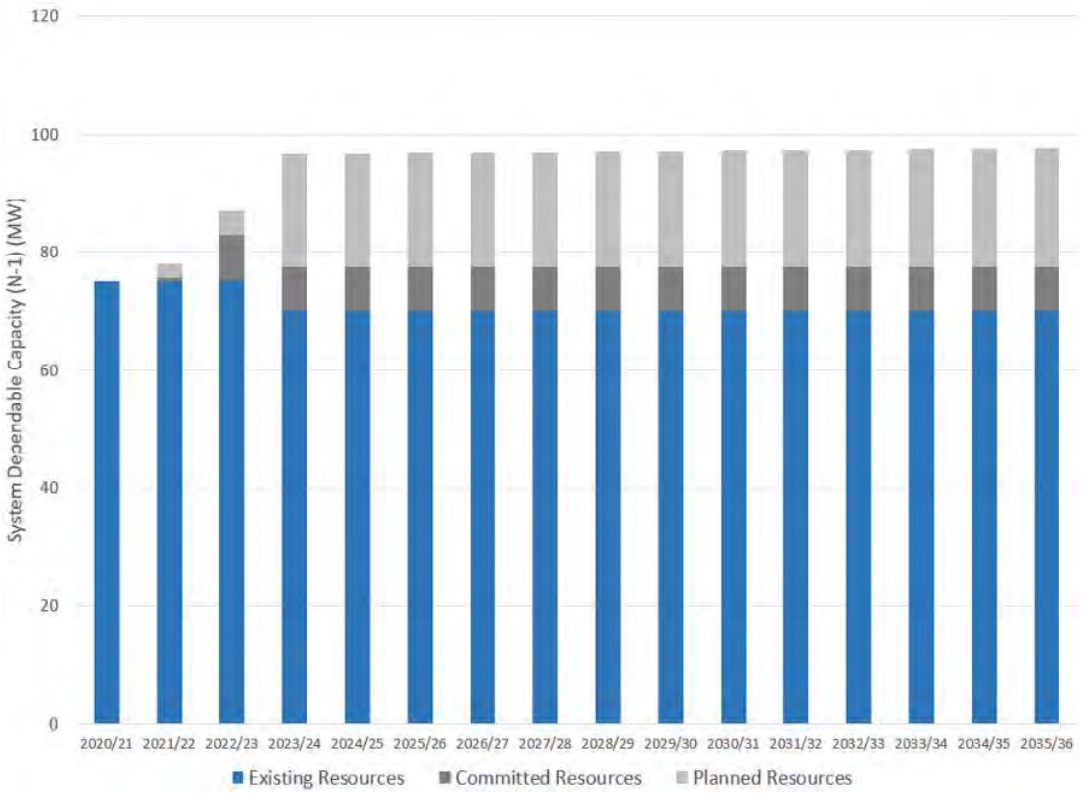


6 Supply & Demand Gap

6.1 Methodology

The goal of the resource planning process was to develop recommended actions for YEC to both meet YIS's electrical energy needs and satisfy the capacity gaps over the 10-year horizon. The difference between electrical demand and generation supply is the gap, or "Need", as shown in Figure 13.

Figure 13: Gap Analysis Overview

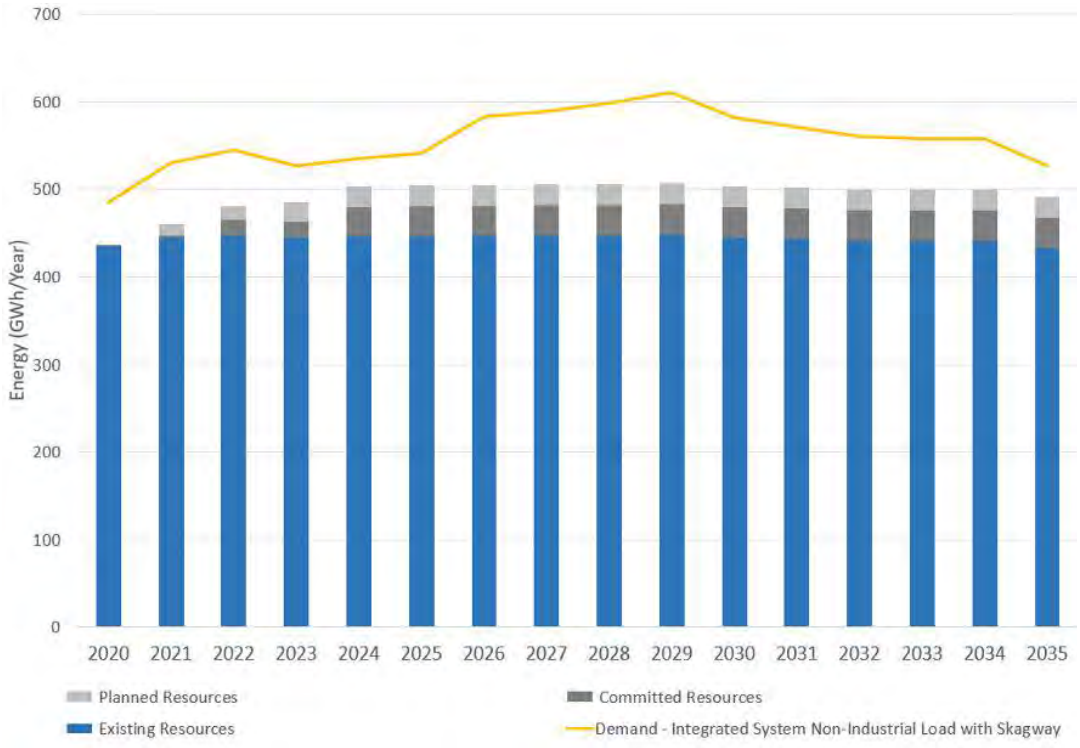
This gap analysis calculates the difference between the forecast energy and peak capacity demand and the expected future resource capability (including Existing, Committed and Planned Resources). The analysis is for the expected Base Case for the 10-Year Renewable Electricity planning evaluations.

6.2 Energy Gap Analysis

6.2.1 Annual Energy Gap

Figure 14 shows the gap between forecast annual energy demand (from Figure 7 in Section 4) and forecast generation (from Figure 11 in Section 5). A detailed breakdown, including individual resources, is included in Appendix A. The annual energy gap increases from 49 GWh in 2020 to 100 GWh in 2029.

Figure 14: Annual Energy Gap Analysis (Base Case)



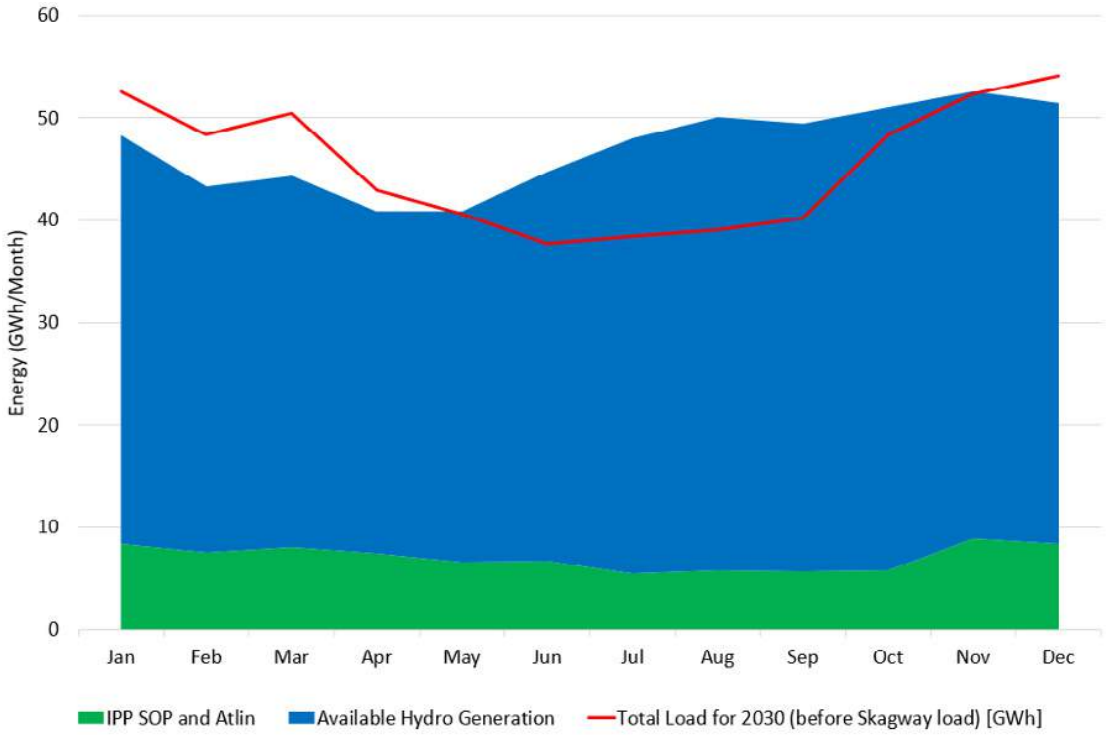
The energy gap between YEC's future expected resource capability and forecast load under average water conditions (as illustrated in Figure 14) implies that in some years YEC will need to utilize thermal resources if it does not develop any new renewable resources. In those years of average or below average water, YEC will need to run LNG, and potentially some diesel, to meet Yukon's energy needs.

This energy gap creates an opportunity for YEC to develop new renewable generation resources. These have the potential reduce reliance on thermal resources (LNG and diesel) to meet the forecast energy gap needs, particularly in low water years. It will be necessary to develop these new renewable energy resources if YEC is to meet the target specified in Yukon government's *Our Clean Future* strategy (a 93% rolling average in renewable energy).

6.2.2 Monthly Energy Gap & Summer Spilled Energy

Figure 15 shows the forecast monthly energy demand compared to the supply of hydroelectric and IPP SOP renewable energy supply for the year 2030.

Figure 15: Monthly Renewable Supply vs Demand (2030)



This figure illustrates that YEC will have surplus energy available during the summer but insufficient energy available during winter months to meet forecast energy demand. Additional data on the monthly and annual energy gap is provided in Appendix B.

Perhaps the most important conclusion to be drawn from Figure 15 is that Yukon is forecast to have surplus energy available in the summer months that will be permanently lost. Typically, this will be in the form of water spilled over the dam at the Whitehorse generating facility. Because other renewables such as solar and wind sourced from IPPs are not dispatchable, their energy must be accepted by YEC. YEC must then use its dispatchable hydroelectric assets (i.e. Whitehorse hydro during the summer) to balance supply and demand. Therefore, YEC will be forced to spill water over the Whitehorse dam whenever excess generation is supplied into the YIS. This seasonal mismatch between potential electricity production from hydro generation and the timing of maximum customer demand is a key planning constraint for YEC.

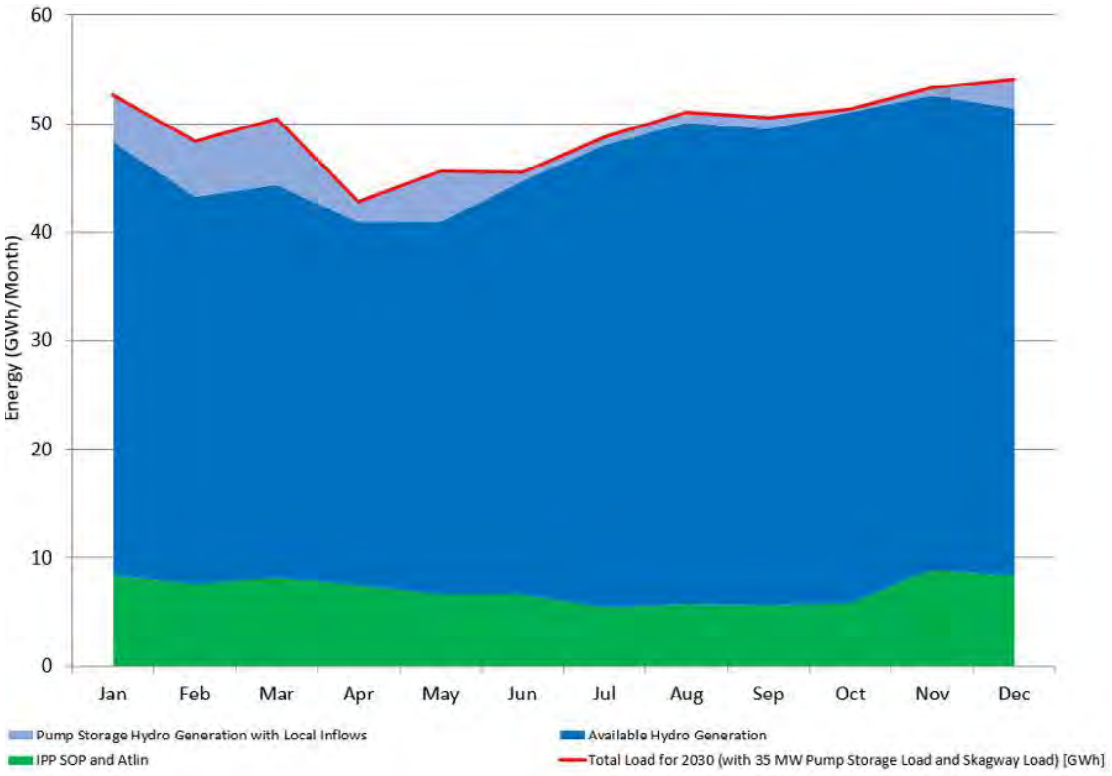
Two development options that would help address this issue are considered in this plan:

1. **Development of Seasonal Storage.** Since YEC has surplus energy available in the summer months and a deficit in winter months, there is a potential to use seasonal storage to store excess summer energy. That is, water spilled at YEC's existing hydro facilities could be stored and used for generation during the winter to meet winter loads. The only commercially available renewable technology for long term fuel storage in the quantities required by YEC (i.e. 40+ GWh) is pumped storage hydro.
2. **Securing New Customers for Summer Energy.** Another option to reduce summertime spilled water (i.e. wasted energy) is to secure new customers looking to purchase summer energy. By developing and investing in the Southern Lakes area as part of the 10-Year Renewable Electricity Plan, YEC has the potential opportunity to sell surplus summer energy to Skagway for the provision of clean shore-side power to cruise ships. The Skagway pier can interconnect up to four (4) cruise ships at once, which can amount to approximately 35 GWh/year of summer energy demand. Currently, cruise ships visiting Skagway in the summer burn diesel to generate shipboard electricity while at port. The electrification of shore-side power is one of the leading strategies that cruise ship operators employ to reduce their greenhouse gas (GHG) emissions while at port. This is an opportunity to utilize YEC's otherwise spilled water (i.e. wasted energy) to increase revenues to offset Yukon electricity costs, while also reducing GHG emissions in Skagway.

By capturing the surplus energy from otherwise spilled water through a combination of seasonal storage development and new summer energy customers, monthly energy supply and demand will be better matched.

This is illustrated in Figure 16 where the increased summer energy demand would reduce the excess amount of hydro generation in the summer months, as demonstrated previously in Figure 8. Additionally, summer demand would be further increased by the pumped storage facility utilizing energy to pump water from the lower reservoir into the upper reservoir. The excess hydro generation would then be available for use in the winter months due to this seasonal storage. The additional energy highlighted in light blue in Figure 16 is the energy provided by the pumped storage facility, which would also help close the energy gap in the winter months. The forecast in this Figure is based on the Tutshi-Moon pumped storage project, which has hydrologic inflows that make it a net energy producer rather than a net energy consumer, as detailed in Section 7.

Figure 16: Monthly Renewable Supply vs Demand – Modified (2030)

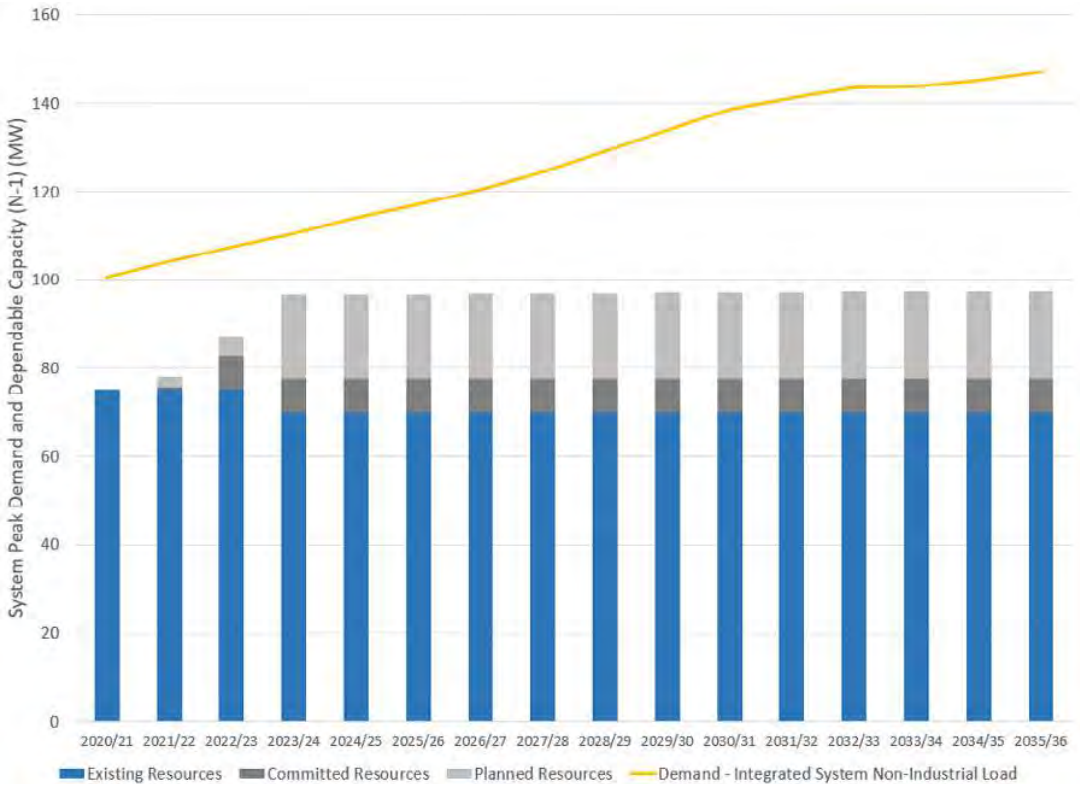


The benefits associated with the productive use of forecast summer surplus energy were the main drivers for incorporating a seasonal pumped storage hydroelectric project and the electrification of Skagway cruise ships as key elements of the 10-Year Renewable Electricity Plan.

6.3 Capacity Gap Analysis

Figure 17 shows the annual gap between the forecasted peak (non-industrial) capacity demand (from Figure 9 in Section 4) and the dependable peak capacity (from Figure 12 in Section 4) under N-1 conditions. The forecast peak capacity gap is significant, growing to approximately 40% of YEC's existing, committed and planned capacity resources. YEC can fill the forecast gap on an interim basis by temporarily renting diesel generators. However, temporary diesel generators have lower reliability and have a higher future availability risk than other resource options. Therefore, finding renewable resource options to fill this peak capacity gap is a priority of the 10-Year Renewable Electricity Plan.

Figure 17: Annual Capacity Gap Analysis under N-1 Conditions (Base Case)



7 Future Potential Resource Options

7.1 Future Potential Resource Options Update Process

The next step in the resource planning process was identifying a list of Future Potential Resource Options to be included in a portfolio that would address the energy and peak capacity gaps identified in Section 6. In order to develop a list of Future Potential Resource Options, the resource options from YEC's 2016 Integrated Resource Plan were updated in three (3) stages:

» **Stage 1:** Refined List of Resources;

» **Stage 2:** Updated Technical Attributes; and

» **Stage 3:** Updated Financial Attributes.

It is important to acknowledge that a comprehensive evaluation of environmental and socio-economic attributes of each resource option was included in the 2016 IRP. Since no showstoppers prohibiting the resource options under consideration in this report were identified during that analysis, these environmental and socio-economic attributes were not re-evaluated as part of the 10-Year Renewable Electricity Plan. If the projects identified in the Plan move forward, detailed environmental and socio-economic analyses and assessments will be carried out as part each project's planning.

7.1.1 Stage 1: Refined List of Resources

In Stage 1, all resource options considered in the 2016 IRP were refined into a subset of preferred resource options. Resource options that were deemed to be fundamentally uneconomic, located too far from existing or proposed transmission infrastructure, too large for the need, or that have been superseded by other options were eliminated from the list. The Committed and Planned Resources described in Sections 5.1.2 and 5.1.3 were also removed from the list because they are assumed to be in operation as per previous plans. The refinement process reduced the 92 resource options evaluated in the 2016 IRP down to 19 resource options (excluding DSM and transmission options).

7.1.2 Stage 2: Technical Attribute Update

In Stage 2, the technical attributes of the refined resource options identified in Stage 1 were updated to reflect current available information. Updates were made to the technical attributes considered in the 2016 IRP such as annual energy, firm energy, installed capacity, dependable capacity, project life, lead time, and resource dispatchability.

The technical attributes from the 2016 IRP were used for the refined list of resource options from Stage 1, except for options which have been studied further since that time. The updated resource options included:

- **Small Hydro.** Knight Piésold Ltd. (KP) was engaged by YEC to update and further develop a desktop review of the potential hydroelectric projects in Yukon and northern BC, provided in Appendix E. This study resulted in a refined and updated list of five (5) small hydroelectric projects of interest, with capacities ranging from 8 MW to 13 MW.
- **Pumped Storage Hydro.** KP was engaged by YEC to update and further develop the Tutshi-Moon pumped storage project. As part of this study, four separate development options with varying levels of installed capacity and winter generating capability were evaluated. The study is provided in Appendix F.
- **Wind.** Although the wind resources have not been studied further since the 2016 IRP, indicative wind sites with varying installed capacities are included in the refined list of resource options. Future wind resources could be implemented either by YEC or by IPPs via a Call for Power.
- **Geothermal.** EAVOR was approached to provide technical and financial details regarding a new geothermal technology being developed in Alberta called the Eavor-Loop technology. The technology was assessed as not being sufficiently mature and commercially proven for consideration as a potential utility resource option. Therefore, an assumption was made that early implementations of the technology would be made via the IPP SOP program. As a result, the technology was excluded from the refined list of resource options.
- **Thermal-Diesel.** Generic permanent and temporary diesel options are included as part of the refined list of resources. They are flexible, scalable, and can be used to help bridge dependable capacity gaps (but not long-term energy gaps). The updated technical attributes associated with these projects were extracted from a series of thermal generation project assessments completed by Midgard Consulting Inc. (Midgard).

7.1.3 Stage 3: Financial Attribute Update

In Stage 3, the financial attributes of the refined list of resource options identified in Stage 1 were updated. The financial attributes considered in the 2016 IRP included the Levelized Cost of Energy (LCOE) and the Levelized Cost of Capacity (LCOC). These were calculated utilizing inputs that include the annualized estimated capital (CAPEX) and operating & maintenance (O&M) costs for each project.

The process for updating these attributes is summarized below:

» **CAPEX Update**. For mature technologies such as hydro and thermal, the CAPEX from the 2016 IRP were inflated to 2019 dollars assuming a 2% inflation rate. The CAPEX for the Small Hydro and Pumped Storage Hydro projects were estimated separately by KP. For maturing technologies including solar and wind, a desktop study was completed to evaluate recent trends in total installed costs. It should be noted that:

- The capital costs of the Atlin Hydro Expansion and the Tutshi-Moon Pumped Storage Hydro Projects were considered with and without Federal funding. Since the completion of this analysis, further work has indicated that additional costs for the Atlin-Jakes Corner transmission must be considered as art of the Atlin Hydro Expansion Project, adding approximately $50 million in capital costs. This will increase the required Federal funding for the project.

- A new 138 kV transmission line from Whitehorse to Skagway (AK) via Carcross (YT), which would be required to connect projects in the Southern Lakes area, was assumed to be supported with up to 75% Federal funding. The transmission cost assumptions associated with projects located near the new transmission line assume an interconnection to this proposed line.

» **O&M Update.** The annualized O&M for the Small Hydro and Pumped Storage Hydro projects in the KP studies were updated. The O&M cost assumptions for all other options were taken from the 2016 Resource Plan, inflated to 2019 dollars assuming a 2% inflation rate.

» **Financial Modelling Update.** Based on the updated set of technical and financial attributes, YEC completed financial modelling to determine the updated LCOE and LCOC associated with the refined list of resource options.

7.2 Future Potential Resource Options

Table 3: Refined List of Future Potential Resource Options

IRP Resource	Options	Installed Capacity (MW)	Dependable Capacity (MW)	Lead Time (Years)	
Hydro Uprate	Aishihik Hydro 1 & Hydro 2 Uprate	1.3 MW	1.3 MW	3 Years	
Small hydro	Primrose (Storage)	13.0 MW	13.0 MW	6 Years	
	Drury (Storage)	10.0 MW	10.0 MW	6 Years	
	Tutshi Windy Arm (Storage)	10.0 MW	10.0 MW	6 Years	
	Wolf River (ROR)	11.0 MW	4.0 MW	6 Years	
	Atlin Hydro Expansion (Storage)	6.0 MW	6.0 MW	5 Years	
	Atlin Hydro Expansion (Storage) with Federal funding	6.0 MW	6.0 MW	5 Years	
Wind	Wind Resource 1	6.0 MW	0.0 MW	5 Years	
	Wind Resource 2	10.0 MW	0.0 MW	5 Years	
	Wind Resource 3	20.0 MW	0.0 MW	5 Years	
Solar	Whitehorse Solar 1	1.0 MW	0.0 MW	2 Years	
	Whitehorse Solar 2	5.0 MW	0.0 MW	2 Years	
	Whitehorse Solar 3	10.0 MW	0.0 MW	2 Years	
Diesel (Comparator)	Generic Greenfield Permanent @ Takhini	10.0 MW	10.0 MW	4 Years	
	Generic Rental @ Whitehorse Substation S150	2.0 MW	2.0 MW	0 Years	
Pumped Storage	Tutshi-Moon (15MW-25GWh)	15.0 MW	15.0 MW	6 Years	
	Tutshi-Moon (15MW-45GWh)	15.0 MW	15.0 MW	6 Years	
	Tutshi-Moon (25MW-50GWh)	25.0 MW	25.0 MW	6 Years	
	Tutshi-Moon (35MW-50GWh)	35.0 MW	35.0 MW	6 Years	
	Tutshi-Moon (15MW-25GWh with Federal Funding	15.0 MW	15.0 MW	6 Years	
	Tutshi-Moon (15MW-45GWh with Federal Funding	15.0 MW	15.0 MW	6 Years	
	Tutshi-Moon (25MW-50GWh with Federal Funding	25.0 MW	25.0 MW	6 Years	
	Tutshi-Moon (35MW-50GWh) with Federal Funding	35.0 MW	35.0 MW	6 Years	
Energy Storage	Lithium-ion	8.0 MW	8.0 MW	2 Years	

Table 3 is a summary of the 19 Future Potential Resources considered in the 10-Year Renewable Electricity Plan along with their associated technical and financial attributes.

	Annual Energy (MWh/Yr)	CAPEX ($2019)	O&M		LCOC ($/kW-Yr)	LCOE ($/kWh-Yr)
			Fixed ($2019/Yr)	Variable ($2019/MWh)		
	2,700 MWh	$5,300,000	$0	$5.31	$185	$0.09
	74,100 MWh	$177,500,000	$3,900,000	$5.00	$797	$0.14
	30,600 MWh	$110,500,000	$2,400,000	$5.00	$635	$0.21
	49,300 MWh	$135,600,000	$3,700,000	$5.00	$860	$0.17
	79,700 MWh	$165,100,000	$3,600,000	$5.00	$2,417	$0.12
	44,700 MWh	$131,000,000	$2,900,000	$5.00	$1,270	$0.17
	44,700 MWh	$32,750,000	$2,900,000	$5.00	$708	$0.10
	18,100 MWh	$39,500,000	$280,000	$27.26	Not supplied	$0.17
	29,500 MWh	$49,200,000	$290,000	$21.81	Not supplied	$0.13
	57,300 MWh	$73,500,000	$340,000	$21.40	Not supplied	$0.10
	1,100 MWh	$2,300,000	$30,000	$0.00	Not supplied	$0.13
	5,600 MWh	$8,100,000	$150,000	$0.00	Not supplied	$0.10
	11,500 MWh	$16,100,000	$340,000	$0.00	Not supplied	$0.10
	2,500 MWh	$25,600,000	$170,000	$22.00	$131	$0.53
	2,500 MWh	$0.00	$280,000	$0.00	$243	Not Supplied
	19,900 MWh	$182,500,000	$2,020,000	$0.00	$552	$0.42
	14,000 MWh	$194,200,000	$2,050,000	$0.00	$581	$0.62
	12,000 MWh	$245,000,000	$2,100,000	$0.00	$421	$0.88
	10,000 MWh	$280,000,000	$2,150,000	$0.00	$336	$1.18
	19,900 MWh	$45,625,000	$2,020,000	$0.00	$239	$0.18
	14,000 MWh	$48,550,000	$2,050,000	$0.00	$248	$0.27
	12,000 MWh	$61,250,000	$2,100,000	$0.00	$168	$0.35
	10,000 MWh	$70,000,000	$2,150,000	$0.00	$130	$0.46
	2,800 MWh	$29,500,000	$280,000	$0.00	$280	Not Supplied

7.3 Future Potential Resource Observations

1. **Intermittent renewables do not contribute capacity.** Resources such as wind and solar offer relatively low levelized costs for energy (LCOE), but do not provide dependable capacity to the Yukon system. This is because they can only generate electricity while their energy source is available (e.g. the sun is shining and/or the wind is blowing). As a result, these resources cannot address YEC's key challenge of closing the existing and forecast peak capacity gap. In addition, since solar resources are summer peaking generation resources, integrating more solar resources increases the quantity of surplus summer energy.

2. **Small Hydro.** In general, this is an attractive resource because it offers reasonably priced energy and capacity in a single project. The Atlin Hydro Expansion project is preferred based on its shorter project development timeline when compared to the other small hydro options.

3. **Tutshi-Moon Pumped Storage Hydro Inflows & Seasonal Shifting.** This project would be used for seasonal energy storage, storing excess summer energy (in the form of water held in the upper reservoir) for generation during the winter. This means that pumping water into the reservoir for storage will occur during the summer months when there is surplus energy available, and generation will occur during the winter months when electricity demand increases. In addition, the Tutshi-Moon pumped storage project is expected to have hydrologic inflows that make it a net energy producer. Typical pumped storage hydro projects are net energy consumers due to the energy losses associated with the water pumping process. Since the pumped storage hydro options evaluated are not cost competitive on a LCOC basis compared to greenfield diesel generation or diesel generator rentals without grant funding, Federal funding is required to bring the LCOC of pumped storage hydro in line with that of diesel. Finally, there are economies of scale with regards to the LCOC for the Tutshi-Moon pumped storage project, such that upscaling the project to reduce the project LCOC is justifiable.

4. **Federal Funding**. Securing Federal funding to help finance the Atlin Hydro Expansion and Tutshi-Moon pumped storage hydro projects is required to bring the cost of energy and capacity from these projects down, thereby reducing the impacts of these projects on electricity rates in Yukon. Without Federal funding, these projects are not considered cost-competitive and would most likely not be approved by the Yukon Utilities Board.

5. **Aishihik Uprate Capacity.** The 1.3 MW dependable capacity associated with the Aishihik Hydro 1 and Hydro 2 uprate projects is only considered available if the loss of Aishihik is no longer the largest single contingency event (N-1 Event) on the YIS.

7.4 Southern Lakes Transmission Project

Given the limitations of existing transmission in the Southern Lakes area and the requirement to connect new projects, upgrading and expanding the transmission infrastructure in the Southern Lakes area is a necessary element of this plan.

This plan assumes that a new transmission line from Skagway (AK) to Whitehorse through Carcross (YT) will be built in a phased manner to support the development of the Southern Lakes area as illustrated in Figure 18. This is a 138 kV transmission line with sufficient transmission capacity to accommodate the full portfolio of future planned projects. In order to minimize intrusion into the natural environment, the proposed line will follow existing rights of way where possible (e.g. highway, transmission or rail).

Figure 18: Southern Lakes Transmission Network

The proposed development of this line follows a phased approach:

» **Phase 1.** This phase includes the construction of the Whitehorse -> Carcross -> Jakes Corner section of the line transmitting power from the Atlin Hydro Expansion project to the load centre at Whitehorse. It should be noted that the viability of connecting the Atlin Hydro Expansion project to the existing ATCO distribution system at Jakes Corner is currently being assessed as an interim measure. By decoupling the timing of the Atlin Hydro Expansion project from that of the Southern Lakes Transmission Project, the Atlin Hydro Expansion project can move forward as soon as possible

» **Phase 2.** This would extend the line from Carcross (YT) to Moon Lake (BC) to interconnect the proposed Tutshi-Moon Pumped Storage Hydro project. The execution of this phase is contingent on the timing and implementation of the proposed Tutshi-Moon Pumped Storage Hydro project.

» **Phase 3.** The final phase of the project would involve an extension of the line from Moon Lake (BC) to Skagway (AK) to complete the 138 kV interconnection from Whitehorse (YT) to Skagway (AK). This final phase will only proceed if and when YEC secures summer energy sales to Skagway for the purposes of providing shore-side power to cruise ships.

Some flexibility is assumed in the sequencing of the transmission construction phases outlined above. For example, it is conceivable that the Whitehorse-Carcross-Skagway line could be constructed in a single step if Yukon Energy is able to advance the business opportunity to sell power to cruise ships in Skagway.

8 Preferred Resource Portfolios

8.1 Portfolio Analysis Methodology

The goal of portfolio analysis is to develop an optimal set of projects capable of addressing both the energy and peak capacity shortfalls over the 10-year planning horizon. YEC's methodology was to follow a directed portfolio development that focused on projects clustered in the Southern Lakes area, facilitated by a Federally supported build-out of transmission infrastructure in that area.

The following assumptions were made in the development of the project portfolio:

1. **Federal Funding.** An assumption was made that Federal funding would be available to protect ratepayers from the impacts of developing significant new infrastructure projects. In order to achieve or exceed the 93% renewable portfolio standard policy objective, Federal funding is also necessary to improve the economics of certain renewable resource options (e.g. pumped storage hydro) relative to the lowest cost fossil fuel-based options.

2. **Committed and Planned Resources Will Happen.** The portfolios assume that the Committed and Planned Resources (previously described in Sections 5.1.2 and 5.1.3), including demand side management programs, are developed and implemented in their respectively planned years.

3. **Atlin Hydro Expansion.** This project is included in the portfolio because of its ability to supply both dependable capacity and firm energy, and because of its significantly shorter project development timeline when compared to other greenfield hydro options.

4. **Tutshi-Moon Pumped Storage Hydro.** This project will provide a significant increase in renewable dependable capacity to address Yukon's existing and forecast capacity shortfall. At the same time, it presents an opportunity to utilize surplus summer energy to meet the forecast winter energy shortfall.

5. **Southern Lakes Transmission build-out.** A new transmission line is required to connect identified projects in the plan (Tutshi-Moon Pumped Storage Hydro; Atlin Hydro Expansion) to the Yukon grid. The development of a new transmission line also facilitates the connection of renewable energy projects developed under the IPP SOP in the Southern Lakes Area, and enables the potential for future sales of surplus summer energy to Skagway for the provision of shore-side power to summertime cruise ships.

6. **Intermittent Renewables (Wind).** These are included as required to meet any residual energy gaps not filled by Tutshi-Moon Pumped Storage Hydro and Atlin Hydro Expansion projects (e.g. in the high load scenario).

7. **Bridging Residual Energy Gaps.** Existing thermal LNG generation is assumed to be available to bridge any small outstanding gaps between average energy and forecast energy demand over the planning period.

8. **Bridging Residual Capacity Gaps.** Temporary rental diesel units are assumed to be available to bridge any outstanding gap between the forecast dependable capacity generation and peak capacity demand over the planning period.

9. **Portfolio Economics Check.** Once the portfolios were built, the Net Present Value of each portfolio was compared to find the lowest cost portfolios which are presented in this report.

The output of the portfolio analysis was an optimum set of resource options that meets the energy and capacity planning criteria under each scenario. The preferred portfolios for the expected Base Case scenario as well as the High Case are presented in the following section. Preferred portfolio analysis results for the Low Case and the Base Case (without Skagway) are provided in Appendix C:

8.2 Preferred Portfolios

The portfolios for the Base Case and High Case scenarios, are presented in the following format:

» **Planning Horizon.** Although the planning horizon for the 10-Year Renewable Electricity Plan is from 2020 to 2030, the annual energy and peak demand forecasts are shown over a longer timeframe (i.e. 2020 to 2035) to show the phased development of certain resource options included in the portfolio (e.g. Tutshi-Moon Pumped Storage Hydro).

» **Annual Energy.** These forecasts show the annual energy demand and average energy generation for Existing, Committed, Planned, and Future Potential Resources over the planning horizon.

» **Peak Capacity Demand.** These forecasts show the peak capacity demand requirement under the N-1 planning criterion, and the dependable capacity for Existing, Committed, Planned, and Future Potential Resources over the planning horizon.

» **Portfolio Summary**. This table lists Future Potential Resources with their respective in-service dates and installed capacities.

» **Portfolio Capital Cost.** This table shows the simple (undiscounted) value of the capital expenditures for Future Potential Resources and the Southern Lakes Transmission Project over the 10-year planning period, both with and without Federal funding (assumed to be the typical maximum 75% of capital cost). For the Base Case and High Case, all three phases of the Southern Lakes Transmission Project are included (e.g. the line extends from Whitehorse, YT to Skagway, AK). These costs include future projects that may be developed by both YEC and/or independent power producers. This does not include the costs of the Committed and Planned Resources in each plan. The Portfolio Capital Cost was presented for illustrative purposes to show the magnitude of undiscounted capital investment over the planning period.

8.2.1 Base Case Portfolio

Figure 19: Base Case Portfolio, Energy

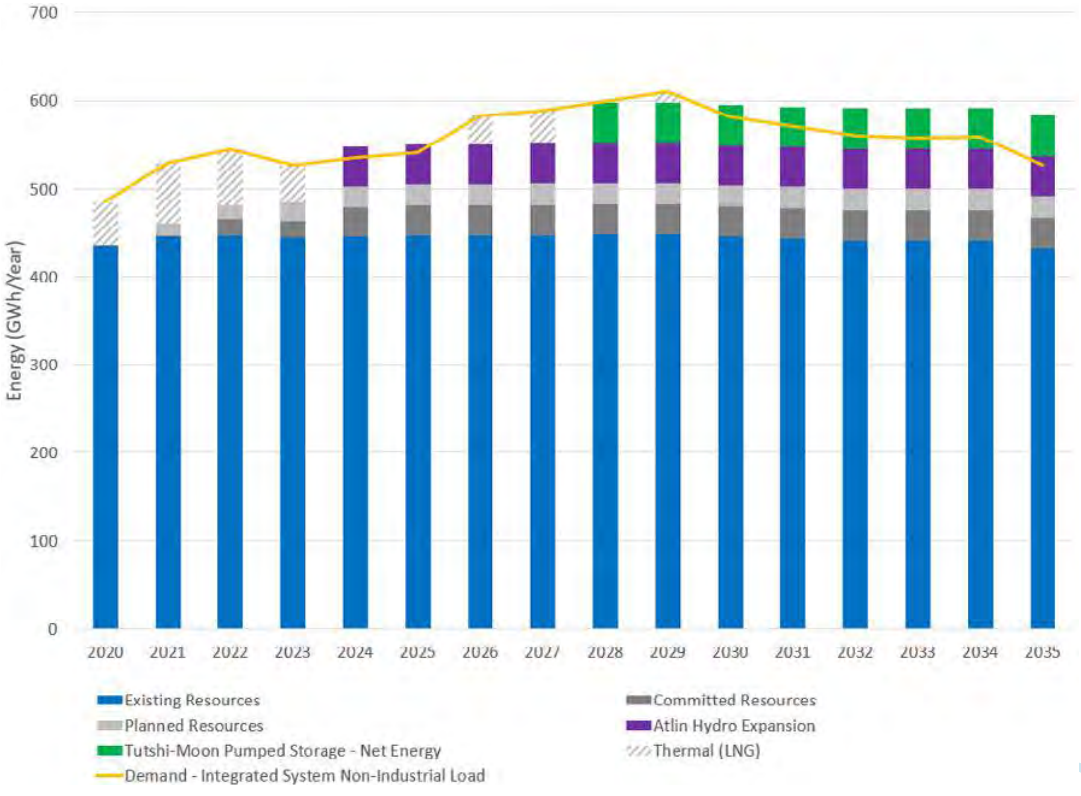


Figure 20: Base Case Portfolio, Capacity

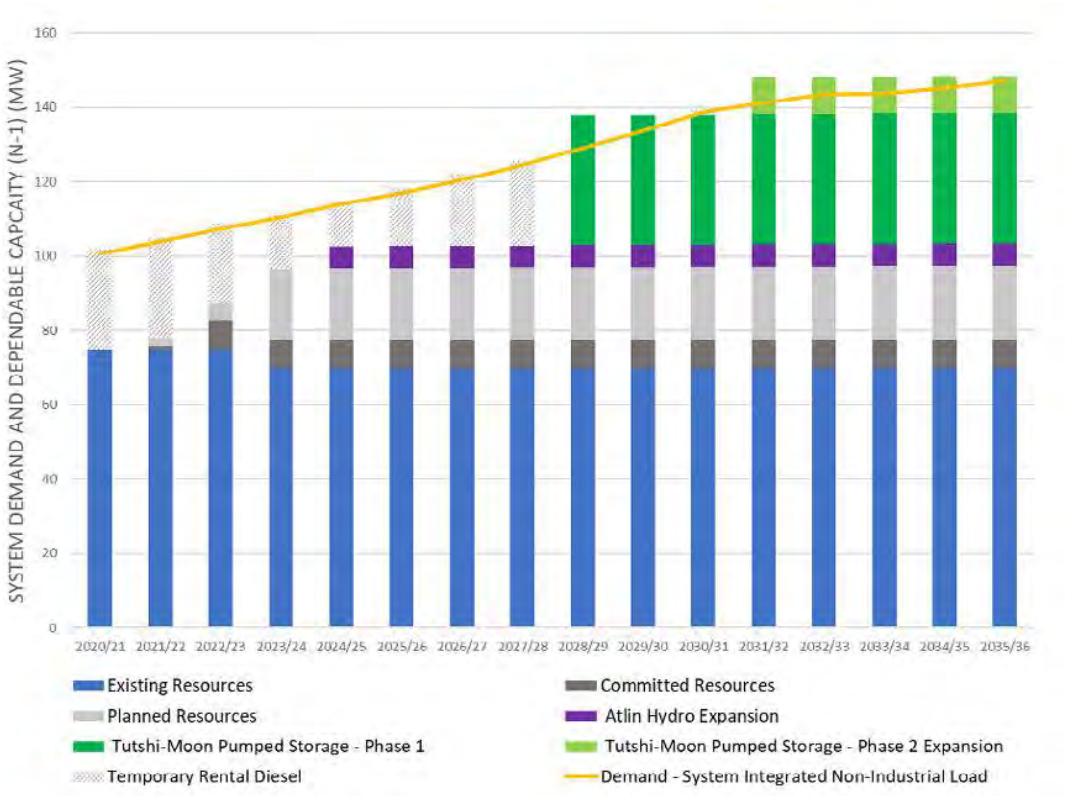

Table 4: Base Case Portfolio Summary (2020 - 2030)

	INSTALLED CAPACITY [MW]	DEPENDABLE CAPACITY [MW]
Committed Resources	8.6	7.6
Planned Resources	20.3	19.5
Sub-total (Committed & Planned)	**28.9**	**27.1**
FUTURE RESOURCES:		
2024/25 Atlin Hydro Expansion Project	6	6
2028/29 Tutshi-Moon Pumped Storage Project – Phase 1	35	35
Sub-total (Future Projects):	**41**	**41**
GRAND TOTAL:	**69.9**	**68.1**

Table 5: Base Case Portfolio Cost Summary (2020 – 2030)

COST COMPONENT	COST [2019$ MILLIONS]
Portfolio Capital Cost without Federal Funding:	$ 577 million
Portfolio Capital Cost with Federal Funding:	$ 144 million

Appendix D: provides a more detailed breakdown of the cost and capacity components for the Base Case.

8.2.2 High Case Portfolio

Figure 21: High Case Portfolio, Energy

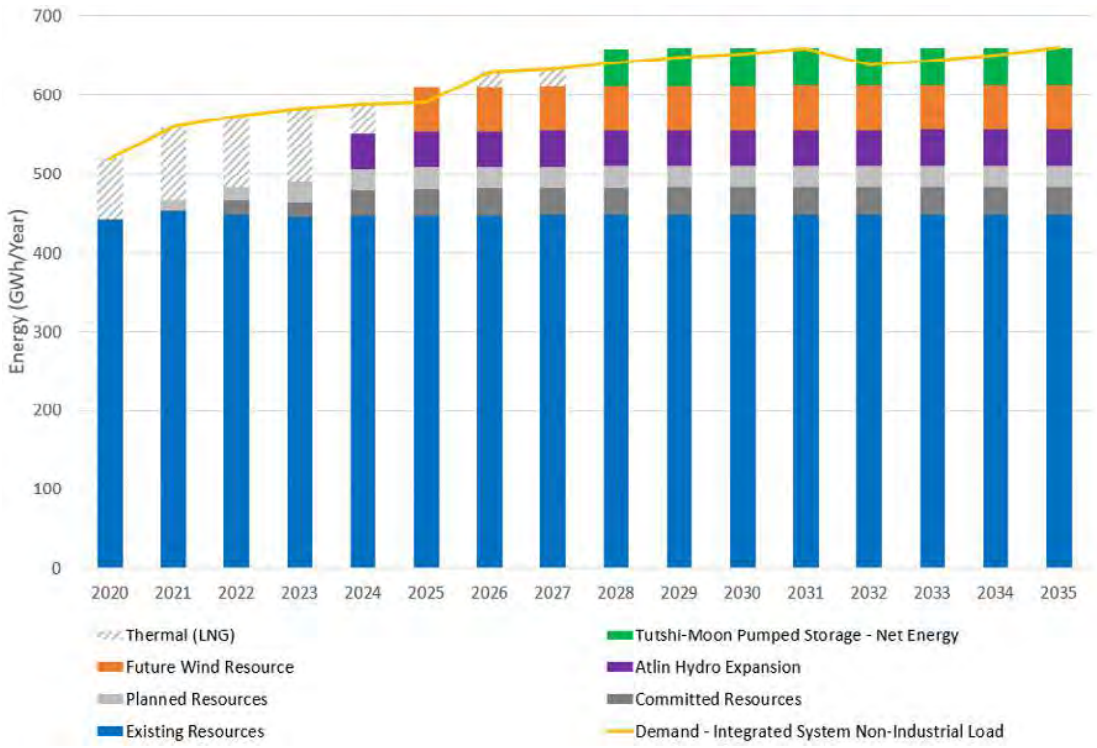

Figure 22: High Case Portfolio, Capacity

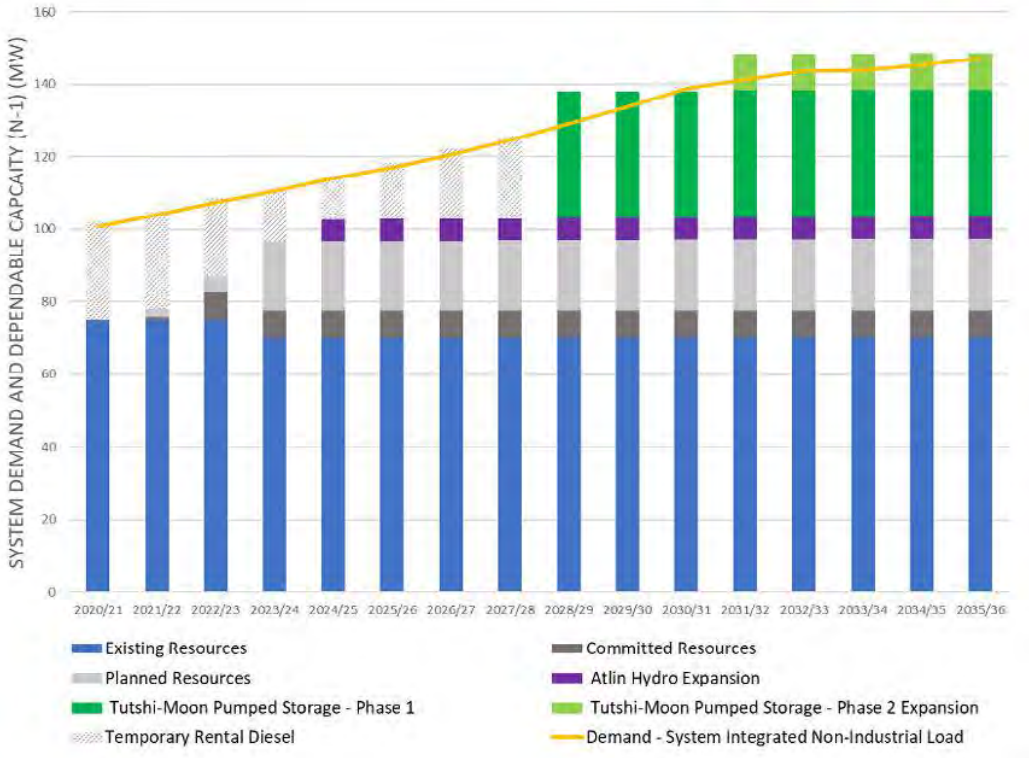

Table 6: High Case Portfolio Summary (2020 – 2030)

	INSTALLED CAPACITY [MW]	DEPENDABLE CAPACITY [MW]
Committed Resources	8.6	7.6
Planned Resources	20.3	19.5
Sub-total (Committed & Planned)	**28.9**	**27.1**
FUTURE RESOURCES:		
2024/25 Atlin Hydro Expansion Project	6	6
2025/26 Wind Resource Project	20	0
2028/29 Tutshi-Moon Pumped Storage Project – Phase 1	35	35
Sub-total (Future Projects):	**41**	**41**
GRAND TOTAL:	**89.9**	**68.1**

Table 7: High Case Portfolio Cost Summary (2020 – 2030)

COST COMPONENT	COST [2019$ MILLIONS]
Portfolio Capital Cost without Federal Funding:	$ 651 million
Portfolio Capital Cost with Federal Funding:	$ 163 million

Appendix D: provides a more detailed breakdown of the cost and capacity components for the Base Case.

8.3 Portfolio Summary

As a consequence of the long lead times associated with developing generation and transmission, the portfolios show an energy and dependable capacity shortfall over the planning period, especially in the early years. As a result, residual energy and capacity gaps are assumed to be met with LNG generation and temporary diesel generator rentals over the planning period. Conversely, the Base Case scenario shows an energy surplus after 2030 based on the forecast decrease in industrial load, which indicates that the net energy production from the pumped storage facility would be in surplus. Federal funding will be critical in order to protect ratepayers from the financial cost of this potential surplus.

A summary of the resource options comprising the Base Case and the High Case scenario portfolios is presented in Table 8. Implementation of both the Atlin Hydro Expansion project in year 2024/25 and phase 1 of the Tutshi-Moon Lake Pumped Storage Project in year 2028/29 is required for both portfolios. Finally, the High Case scenario also requires a new 20 MW wind resource in 2025/26 to meet the higher energy requirements over the planning period.

Table 8: Future Resources Selected for Key Scenarios

	BASE CASE	HIGH CASE
2024/25	Atlin Hydro Expansion (6 MW)	Atlin Hydro Expansion (6 MW)
2025/26		Wind Resource (20 MW)
2028/29	Tutshi-Moon Pumped Storage Project – Phase 1 (35 MW)	Tutshi-Moon Pumped Storage Project – Phase 1 (35 MW)
Total Portfolio Capital Cost without Federal Funding ($M)	**$577 Million**	**$651 Million**
Total Portfolio Capital Cost with Federal Funding ($M)	**$144 Million**	**$163 Million**

8.3.1 Southern Lakes Geographic Focus

The 10-Year Renewable Electricity Plan's underlying focus on clean energy and capacity resources led to the development of multiple solutions in the Southern Lakes area, the geographical area shown in Figure 23.

Figure 23: Southern Lakes Transmission Network

With its abundance of lakes and proximity to Whitehorse (Yukon's main population and electrical load centre), the Southern Lakes area is well suited for developing hydroelectric resources. Hydroelectric and pumped storage hydro screening studies were completed as part of the 2016 Integrated Resource Plan. These studies identified several potential project sites in the Southern Lakes area, including the Tutshi-Windy Arm and Surprise Lake hydroelectric project sites, as well as the Moon-Tutshi, Racine-Moon, Lindeman-Fraser, Racine-Mount Brown and Atlin-Black Mountain pumped storage hydro sites. These general findings were confirmed in the study updates discussed in Section 7.1. Prospective Independent Power Producer (IPP) projects have also been identified in the Southern Lakes area, including the Atlin Hydro Expansion project and the Montana Mountain Wind and Solar Projects.

Given the limited existing transmission assets in the Southern Lakes area and the requirement to interconnect new projects, upgrading and expanding the transmission infrastructure is a requirement for enabling the projects in the Southern Lakes area. It may also be possible for YEC to take advantage of a potentially attractive business opportunity to supply electricity to cruise ships docking in Skagway during the summer tourist season. Currently, the Skagway pier has the capability to interconnect up to four (4) cruise ships, which can amount to approximately 35 GWh/year of summer energy demand. Cruise ships visiting Skagway today burn diesel fuel to generate shipboard electricity while at the dock. Electrifying cruise ships using surplus energy available during the summer months could lead to increased revenues for Yukoners to offset Yukon electricity costs, and a reduction in GHG emissions in Skagway. As noted in Section 4.2, this analysis was conducted prior to the COVID-19 pandemic; YEC will assess the timing and extent of the recovery of the cruise ship industry as part of its evaluation of the Skagway business opportunity.

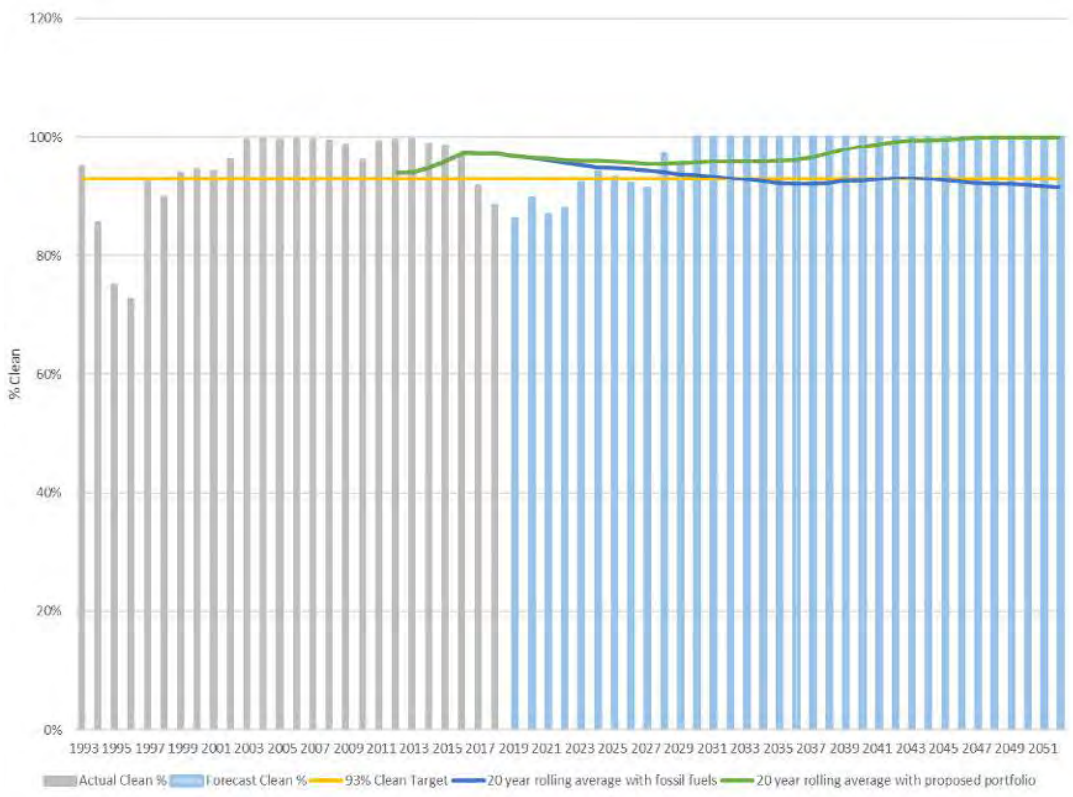
The majority of the new generation in the Plan is located in British Columbia; however, Yukoners will be receiving the benefits of the greenhouse gas emissions reductions and renewable electricity provision. YEC will strive to maximize other benefits to Yukoners via contracting and procurement opportunities and Yukon First Nations benefits agreements. YEC will also continue to work with both the Yukon and BC governments to ensure key stakeholders are engaged appropriately.

8.4 Renewable Portfolio Target

Under the Yukon government's draft Climate Change, Energy and Green Economy strategy, YEC is mandated to meet a renewable portfolio target of 93% on a long-term average basis. This means that at least 93% of the electricity generated on the YIS has to come from renewable sources.

Figure 24 illustrates the forecast percentage renewable generation profile of the electricity mix assuming that the 10-Year Renewable Electricity Plan portfolio is successfully executed. For comparison, the figure also includes a forecast percentage renewable generation profile for an alternate portfolio with a heavy reliance on fossil fuels to meet forecast energy needs (i.e., the portfolio that would be required if the 10-Year Renewable Electricity Plan is not implemented).

Figure 24: Long Term Energy Generation Profile



The bars shown in Figure 24 represent the actual percentage of renewable energy being generated by the system. The gap between the bars and the 100% threshold represents the percentage of energy generated by non-renewable resources (e.g. thermal). The lower percentage of renewable generation observed in recent years (i.e. 2017-2020) was a result of increased thermal generation at the margin given load growth and low hydroelectric resources (drought conditions) in these years.

As new renewable supply projects are developed over the planning period, there is an observed increase in percentage renewables in the energy generation mix. As observed in Figure 24, the 10-Year Renewable Electricity Plan portfolio exceeds the 93% renewable target over the planning period and beyond. The portfolio of projects recommended in the 10-Year Renewable Electricity Plan delivers on Yukon government's commitment for GHG reductions by 2030. It positions YEC favourably to contribute towards achieving the Federal government's "net zero by 2050" target.

9 10-Year Renewable Energy Action Plan

This section presents the key considerations in developing the 10-Year Renewable Electricity Action Plan (Action Plan), and the proposed steps to be undertaken to implement it.

9.1 Project Development Plan

The recommended Action Plan is based on developing the resource portfolio generated for the Base Case scenario, with add-on resources identified for other scenarios. Figure 25 summarizes the Action Plan recommendations.

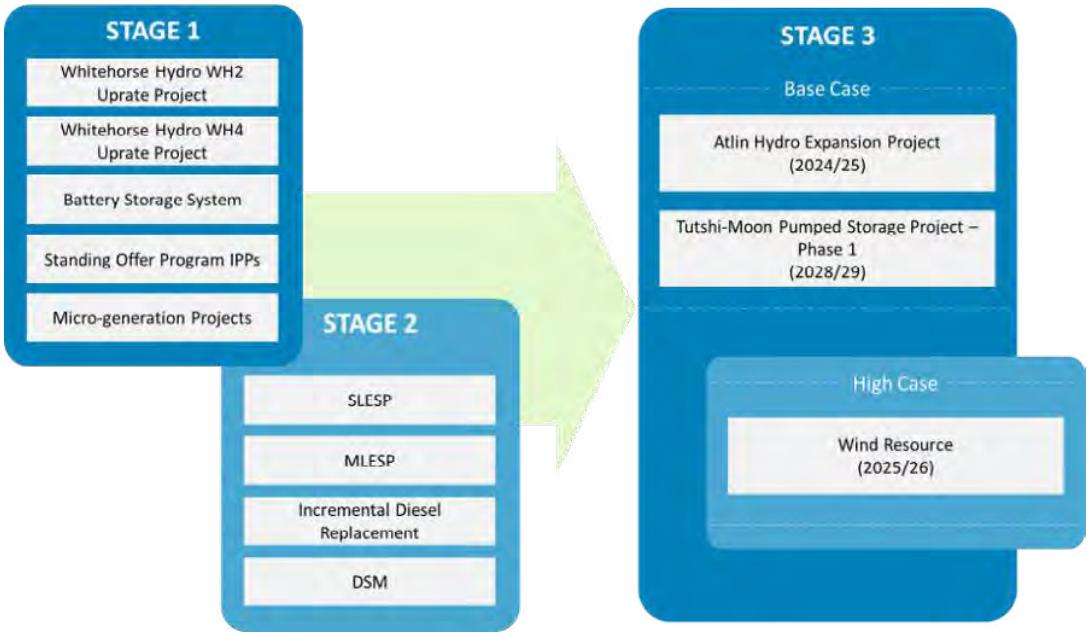
The Action Plan is divided into three stages:

» **Stage 1 – Implementation of the Committed Resources.** These resources are essential in all the portfolios over the planning period. These common resources include the Whitehorse Hydro #2 and #4 (WH2 and WH4) Uprate Projects, Battery Storage System, SOP IPP, and Micro-generation projects.

» **Stage 2 – Completion of Planning Work & Final Decisions to Proceed with Planned Resources.** These common resources include the SLESP, MLESP, the Incremental Diesel Replacement, and DSM.

» **Stage 3 – Development and implementation of the Future Potential Resources.** The options recommended for the expected Base Case scenario are the Atlin Hydro Expansion Project and Phase 1 of the Tutshi-Moon Lake Pumped Storage Project. The additional Future Potential Resource option included in the High Case portfolio (i.e. the Wind Resource) is considered as potential add-on resource to the Action Plan but is ultimately contingent on future growth.

Figure 25: 10-Year Renewable Electricity Action Plan



As with all long-term resource plans, there is the potential for future changes to trigger changes to the path forward. YEC will continue to monitor the key elements that influence the Plan, including the load forecast, progress or obstacles in executing the projects, and developments in emerging or uncertain technologies, and will update the path forward in future long-term resource planning exercises accordingly.

9.2 Key Risks & Uncertainties

The key risks and uncertainties with regard to the 10-year Renewable Electricity Plan are described below. If YEC is unable to move forward with the projects in the Plan, a new plan will be required to address Yukon's load growth and renewable electricity requirements.

- **Federal Funding Uncertainty.** The Action Plan assumes that Federal funding will be secured for the development of the identified generation projects and the supporting Southern Lakes transmission infrastructure. As such, Federal funding is an essential part of the recommended Action Plan as it will help minimize the rate impacts of the plan for Yukoners, and protect ratepayers from contingent risks such as the premature loss of industrial load. However, securing federal funding is not a certainty. To mitigate this risk, options to phase the Federal funding requests, such as focusing on securing funding for project planning first, and only proceeding with project construction once construction funding has been secured, will be explored with Federal funding agencies in order to mitigate risks. YEC will also coordinate closely with Yukon government and potential First Nations project developers and partners in pursuit of this Federal funding. If YEC is unable to secure Federal funding, a new long-term resource plan will need to be developed, as it is a critical requirement for the execution of the 10-Year Renewable Electricity Plan.
- **General Development Risks.** There is always some potential for technical or financial problems during project planning or construction, which could result in abandoning specific lower cost resources in favor of more expensive resources and/or delays. The resulting impacts include higher rates driven by increased portfolio costs and/or insufficient energy and/or capacity supply.
- **Residual Ratepayer Risk (exposure to surplus energy/mismatch).** If the future load projections used to justify capital plans do not materialize, over-building and/or over-production of electricity from the IPP SOP or micro-generation programs could lead to additional surplus energy and a seasonal mismatch between available generation and demand. This poses a financial risk to ratepayers in the form of higher rates.
- **SOP IPP Uncertainty.** The possibility of bankruptcy or failure of contracted generation assets, or the failure of contracted IPPs to reach commercial operation (multiple causes) could result in some IPP projects being delayed or not completed. The resulting risks include the inability to achieve renewable energy targets, increased thermal energy requirements, and/or insufficient energy supply.

» **Regulatory Uncertainties.** These uncertainties could lead to proposed electricity supply projects being disallowed by the regulator or to protracted legal and regulatory processes delaying project approvals or relicensing. If these projects are delayed or canceled, it will result in increased reliance on thermal generation for energy, and ongoing rental of temporary diesel engines for capacity. The resulting risks include the inability to achieve renewable energy targets, and potential rate increases caused by increased portfolio costs due to burning higher cost fossil fuels and introducing more expensive replacement projects.

9.3 First Nations Engagement, Support and Participation

Active First Nations participation in and support for the plan will be vital to the successful execution of the plan. YEC will be actively engaging with those First Nations on whose Traditional Territory the proposed projects are located.

Opportunities exist for First Nations to participate in multiple components of the plan, including the IPP SOP, and by taking an active role as project proponents and/or partners in the 10-Year Renewable Electricity Plan. In addition, First Nations will have contracting and other business opportunities during project planning and construction. These opportunities will be explored in detail during all phases of the project development.

Specific First Nations engagement plans for the two highest priority Future Potential Resources is outlined below:

» **Atlin Hydro Expansion project:** this project is being developed as an Independent Power Producer project by Tlingit Homeland Energy LP (THELP), a corporation owned by the development corporation of the Taku River Tlingit First Nation (TRTFN). As such, THELP will be responsible for all aspects of the project development, including environmental assessment and permitting, engineering design, construction and community and First Nations consultation. Yukon Energy has engaged in negotiations with THELP on a potential Electricity Purchase Agreement (EPA), which will outline the key commercial and operations terms under which YEC would purchase electricity from the Atlin Hydro Expansion project, should the project be approved to proceed. YEC and THELP are actively collaborating on securing government grant funding for the project, which will be critical to supporting the project economics while keeping the price of energy and capacity procured under the EPA affordable to Yukon customers.

» **Moon Lake Pump Storage Project:** this project is located on overlapping Traditional Territory of the Carcross/Tagish First Nation (C/TFN) and the Taku River Tlingit First Nation. As such, YEC plans to actively engage with both First Nations on the development of the Moon Lake Pump Storage project. As of Q4 2020, the project remains in a very early stage of development, and work completed to date has been limited to desk-top engineering and technical studies. YEC plans to engage with both C/TFN and TRTFN to establish a framework agreement covering the initial stages of project assessment and development, with the intent to undertake all field work, environmental assessment and monitoring, engineering design and community engagement in a collaborative, transparent manner. Options for the ultimate ownership structure of the project, including options for either partial of full ownership by First Nations, will also be assessed and negotiated over the initial phase of project planning. YEC will also actively collaborate with C/TFN and TRTFN on securing government grant funding for the project, which will be critical to supporting the project economics while keeping the project affordable for Yukon customers.

					Wind	N/A	0	0
					Total	**0.0**	**73,600**	**76,663**

Notes:

- *Single Contingency (N-1) scenario dependable capacity excludes the dependable capacity for Aishihik (37 MW) and ATCO's Haines junction diesel generator (1.5 MW) as the community would be isolated by the loss of the transmission line between the Aishihik Generating Station and the Takhini substation.*
- *No dependable capcity assumed for Minto Mine diesel generators and YEC wind turbines and mobile generators with the exception of unit YM1.*
- *Excludes ATCO Fish Lake Hydro. The contribution of the ATCO Fish Lake Hydro plant was not included in the inventory of the existing resources as its contribution was deducted from the load forecast modelling.*

SMALL HYDROELECTRIC PROJECTS
SCREENING ASSESSMENT (10 MW – 30 MW)

Rev	Description	Date
0	Issued in Final	November 25, 2019

Knight Piésold CONSULTING

EXECUTIVE SUMMARY

Yukon Energy Corporation (YEC) engaged Knight Piésold Ltd. (KP) to update and further develop a desktop review of the potential hydroelectric projects in the Yukon and northern British Columbia. This study builds upon KP's 2016 *Small Hydroelectric Projects Screening Assessment,* the Midgard Consulting Inc.'s 2015 *Yukon Next Generation Hydro and Transmission Viability Study - Site Screening Inventory*, and other historic studies. The objectives of the study were to compile a regional assessment of hydropower development sites with installed capacities between 10 MW and 30 MW.

Part I: Screening Assessment

KP completed a screening assessment to progressively eliminate less attractive sites and focus in on the best potential hydroelectric development options. The steps taken in the screening process were:

1. Compilation of a list of 147 sites and alternatives previously considered by Midgard and KP. A handful of additional sites were added for consideration based on proximity to transmission lines and perceived generating potential; however, the review of additional sites should not be considered exhaustive.
2. Screen 1 – Coarse Screening: Projects were grouped by which transmission branch they could be connected to. This included all existing transmission lines in the Yukon as well as a number of proposed lines. With the sites organized, a four-part high-level screen was initiated to eliminate sites that were:
   - Below a 10 MW threshold, or projects not believed to be practical at a 10 MW installed capacity
   - Too distant from transmission (in excess of 50 km from a proposed or existing line)
   - Located in parks (except for Primrose and Tutshi Windy Arm)
   - Affecting the Yukon River or known to flood communities

Sites passing all four of the above criteria, and those sites that were indeterminate on a cursory review, were advanced to Screen 2. A total of 56 sites were advanced.

1. Screen 2 – Quantitative Assessment: KP completed a number of high-level analyses to develop a better understanding of the sites and their hydropower potential. The activities completed in Screen 2 were:
   - Locating sites to best utilize available topographic relief and determining catchment areas
   - Developing conceptual layouts, including intake and powerhouse locations, dam and water conveyance alignments, etc.
   - Reviewing regional hydrological data to establish site-specific estimates for Mean Annual Discharge (MAD) and the seasonal distribution of flow
   - Estimating installed capacity and energy generation profiles
   - Developing indicative capital cost estimates
   - Developing estimates for Levelized Cost of Capacity (LCOC) and Levelized Cost of Energy (LCOE)

Certain sites appeared to have two or more configuration options. KP reviewed these alternatives at a high-level and selected the best option for presentation in this study. In some instances, a run of river and storage option have both been presented.

1. Screen 3 – Final Screening and Selection of Preferred Sites: the results of Screen 2 were presented to YEC for final consideration and selection of the preferred sites. The final screening criteria were applied as follows:
   - Elimination of those sites associated with the proposed Beaver Creek-Hanes Junction and Faro-Watson Lake transmission lines

- Elimination of sites with dams on major rivers due to social risk and high temporary works construction costs
- Elimination of sites with LCOE values exceeding $0.35/kWh

The preferred sites were determined to be Primrose (storage), Drury (storage), Tutshi-Windy Arm (storage), Wolf (as run of river and storage), and Atlin (storage).

Part II: Concept Development for Preferred Sites

KP completed a closer evaluation of the preferred sites to build upon the quantitative results of the screening process and to provide YEC with the basis for planning future studies for these sites. The table below summarizes the key financial and technical attributes for the five preferred sites.

Further evaluations of the preferred sites are recommended to improve the understanding of engineering, economic, environmental, and social factors impacting project development. The first steps would involve discussions with affected First Nations, acquisition of accurate topography to validate elevations, and the initiation of hydrology studies. Should such evaluations indicate that there are no critical barriers to project development, further evaluation of the sites through pre-feasibility and feasibility studies should be pursued to prove economic viability.

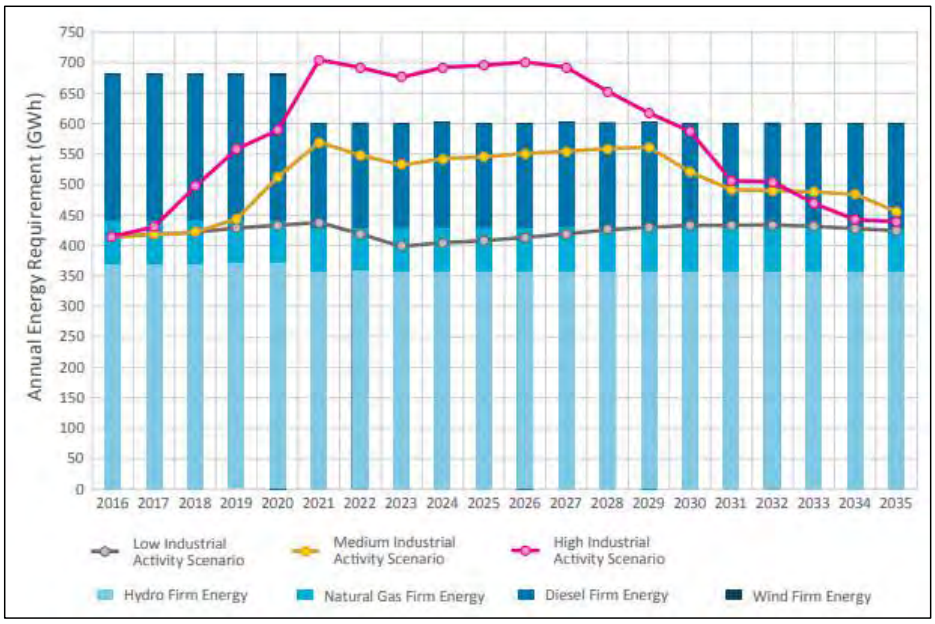
1.0 BACKGROUND

1.1 RESOURCE PLANNING

Yukon Energy Corporation (YEC) and the Yukon government work to ensure that the Yukon's electrical energy needs are met now and in the future, and that future generations can enjoy an energy legacy similar to that provided by the current hydro generation of Whitehorse, Aishihik, Mayo and Fish Lake.

In 2013, the Yukon government issued the Yukon Hydroelectric Power Planning Directive to Yukon Development Corporation (YDC). The directive tasked YDC to plan one or more hydroelectric projects to ensure an adequate and affordable supply of reliable and sustainable electrical power was available in the Yukon.

The 2016 Yukon Energy Resource Plan outlined the energy options that YEC would like to discuss further with the Yukon government, First Nations, stakeholders and the Yukon public. The energy options include small hydro as potential sources of energy to meet future growth. YEC included an investigation of small hydro in its work plan while they monitor how the Yukon load grows over time. Figure 1.1 presents the forecasted energy needs in the Yukon.



NOTES:
1. SOURCE: YUKON ENERGY'S 2016 RESOURCE PLAN (JUNE 2017).

Figure 1.1 Yukon Projected Annual Energy Requirement

The Yukon 2016 Resource Plan states that legally barred and unviable resource options include:

- Generation or transmission options that are located in protected areas or interim protected areas, such as inside a National Park, or projects that would inundate land within a National Park.
- Hydroelectric projects that inundate titled property or a private residence, except for the hydro storage enhancement of existing YEC facilities.
- Projects in remote locations, far from the Yukon transmission grid. The servicing of remote communities is not the focus of the Resource Plan and is covered in specific community planning processes.
- Generation options exceeding 50 MW of installed capacity. Given the YEC demand requirements of the reasonably foreseeable future, and the isolated nature of the Yukon grid, a project beyond this size would exceed domestic requirements, with no ability to sell the surplus.

1.2 ENGAGEMENT

YEC commissioned Knight Piésold Ltd. (KP) in 2019 to update and further develop a desktop review of potential small hydroelectric projects in the Yukon and northern British Columbia. The objectives of the study were to compare technical and economic development criteria and to systematically screen and shortlist development options to provide YEC with the basis to plan future studies on the most attractive sites.

This study is a regional assessment of hydropower development options with capacities between 10 MW and 30 MW, and with estimated transmission line interconnection distances not exceeding 50 km. It builds on KP's 2016 *Small Hydroelectric Projects Screening Assessment*, Midgard Consulting Inc.'s 2015 *Yukon Next Generation Hydro and Transmission Viability Study – Site Screening Inventory*, and other historic studies. It includes a review of all sites previously presented in the 2016 KP study, 2015 Midgard study, and a number of additional sites identified by KP with perceived hydroelectric development potential.

1.3 STUDY LIMITATIONS

The current study is high-level and is based on relatively coarse mapping and hydrology datasets. As such, all results are indicative only and subject to change when better data become available. For example, the publicly available GIS mapping for the Yukon has a contour interval of 20 to 30 metres, and this is restrictive in terms of the identification and evaluation of low-head development sites and low head dams.

The scope of this study is limited to those sites previously identified in the 2016 KP study, the 2015 Midgard study, and a handful of additional sites identified by KP during the current study. There may be other viable sites that have not been considered during previous studies or identified as additional sites in the current study.

The high-level scope and the large number of sites only allowed for limited consideration of alternative configurations at each site. The optimal hydro site will depend on several factors, including capital costs, desired capacity, transmission constraints, environmental impacts, and social conditions.

Finally, the indicative cost estimating performed relies on very generic procedures for estimating quantities (earthworks, concrete, etc.), power equipment types and costs, and transmission line and access road lengths and costs. The values should only be considered as comparative metrics which are used to focus in on the preferred sites. This simplicity is necessary to conduct this type of high-level study, but it may also

lead to oversights in terrain hazards, foundation conditions, or other technical challenges that may affect project costs/viability.

2.0 BACKGROUND INFORMATION

2.1 YUKON POWER GRID

YEC provides the power needs for more than 15,000 customers across the Yukon Territory. The Yukon electricity network is an isolated grid, with no connection to other jurisdictions (i.e. BC, Alaska or Northwest Territory). The Yukon grid currently services all Yukon communities except for Watson Lake, Burwash Landing/Destruction Bay, Beaver Creek, and Old Crow.

2.1.1 CURRENT CAPACITY

YEC currently owns and operates approximately 131 MW of installed capacity, consisting of 92 MW of hydro, 0.8 MW of wind, and 37.8 MW of thermal (diesel and natural gas). Yukon Electrical Company Ltd. (YECL), owned by ATCO, supplies approximately 1.3 MW of hydroelectricity and 6.8 MW of diesel power.

YEC's hydroelectric generating capacity is comprised of:

- 37 MW Aishihik Generating Station, 150 km west of Whitehorse
- 15 MW Mayo Generating Station, 450 km north of Whitehorse
- 40 MW Whitehorse Generating Station, located on the Yukon River at Whitehorse
- 1.3 MW Fish Lake Generating Station (YECL)

2.1.2 EXISTING TRANSMISSION LINES

The Yukon power grid is shown on Figure 2.1 and comprises the following major components:

- 138 kV Whitehorse / Aishihik / Faro (WAF) grid
- 69 kV Mayo / Dawson transmission line
- 138 kV Carmacks / Stewart transmission line, connecting the WAF grid and the Mayo / Dawson transmission line

2.1.3 PROPOSED TRANSMISSION LINES

The following major transmission line extensions have also been considered by YEC:

- Skagway (AK) to Whitehorse through Carcross (YK) and British Columbia
- Atlin (BC) to Whitehorse
- Beaver Creek to Hanes Junction (alternatively Destruction Bay to Hanes Junction)
- Faro to Watson Lake, to connect Watson Lake to the Yukon grid

2.2 OVERVIEW OF HYDROELECTRIC POWER GENERATION

Hydropower is a renewable source of energy with a low carbon footprint. It is a long standing, proven technology that is prevalent worldwide and particularly in regions with high annual precipitation and mountainous terrain.

Conventional hydroelectric power stations can be generally categorized into two types: run of river (RoR) and storage hydro. Storage hydro utilizes water stored behind a dam to generate energy on demand, whereas RoR hydro utilizes the available flows in a river/stream and does not significantly alter natural hydrologic conditions. RoR and Storage hydro are further defined in the sections to follow.

2.2.1 RUN OF RIVER HYDRO

RoR hydroelectric plants utilize the available flow in a river at any given time, with minimal upstream headpond / reservoir live storage. Water is typically diverted at a weir into a water conveyance system (canal, tunnel, and/or penstock), to a powerhouse, and then back into the natural river channel. Very little alteration is made to the natural hydrograph downstream of a run of river project. A conceptual layout of a run of river hydro scheme is provided in Figure 2.2 below.

Electric output is a function of short term (hourly or daily) river discharge, varying daily and seasonally in parallel with the river discharge hydrograph. In the Yukon, run of river generating potential occurs predominantly from May until August, during spring freshet and summer glacial melt.

For the Purpose of this study the run of river projects have been broken down into two categories:

- *"High Head Run of River"* where the projects will divert water away from the main river course, reducing the flow in a portion of the river (i.e. the diversion reach), and then returning the flow to the natural watercourse downstream of the rapids/waterfalls. The project head is generally generated by the natural topographical drop in elevation in the stream over the diversion reach.
- "*Low Head Run of River*" where the project head will principally be generated by the height of the dam/weir in the mainstem of the river. These projects will typically need to handle large flows to generate the required power (i.e. greater than10 MW for the current study). The reservoirs created for these types of dams are not utilized to store the water for electrical generation at select times, but to create the head for power generation. They still operate as run of river facilities utilizing the naturally available flow in the river at any given time.

2.2.2 STORAGE HYDRO

Storage hydroelectric plants utilize an upstream lake or reservoir to store water and to control the outflow and energy output on a daily, monthly, or seasonal basis. This allows for load shaping and winter generation, a times when a run of river hydroelectric facility might not be able to generate a significant amount of energy. A conceptual layout of a storage hydro scheme is provided in Figure 2.2 below.

Storage hydropower configurations vary, from lake/reservoir-controlled High Head RoR style projects, to large dams with built-in generating units where all elevation head is derived from the dam itself, to a combination of both.

3.0 SITES AND SCREENING METHODOLOGY

3.1 SITE LIST

KP compiled a list of 147 sites for preliminary review, comprised of the amalgamated set of sites previously considered in the 2016 KP study and 2015 Midgard study, and a number of additional sites which were identified with perceived hydroelectric development potential in close proximity to transmission lines.

Figure 3.1 shows a map of the Yukon with all sites identified. Table 3.1 provides an alphabetical list of sites.

FIGURE 3.1

3.2 SCREENING METHODOLOGY

The screening assessment involved several steps to identify, evaluate, and focus in on the preferred hydropower development sites. This process was iterative and included YEC reviews and adjustments to the screening logic throughout the study period. The process was comparable to that used in the 2016 KP study but involved some modifications to the general approach to handle the larger number of sites, modified installed capacity range (between 10 MW and 30 MW), and modified transmission line length restrictions (extended to 50 km).

The process was developed to eliminate sites that are indeterminate, fundamentally flawed, and comparatively expensive or technically unviable, with the overriding objective of providing a focus for future studies on the best development options.

The screening process is described in terms of four main stages:

- Screen 1: Coarse Screening
  - KP applied a coarse screen with four parameters to quickly eliminate many of the less attractive sites which did not warrant an in-depth review. Section 4 describes the coarse screening process.
- Screen 2: Quantitative Assessment
  - KP evaluated a number of quantitative metrics for those sites passing Screen 1 in order to further reduce the site list. Section 5 describes the Screen 2 screening process.
- Screen 3: Final Screening Parameters
  - Those sites passing Screen 2 were presented to YEC for review and feedback, and some final screening criteria were requested by YEC. Section 6 describes the Screen 3 process.
- Assessment of Preferred Options (Top 5 Sites)
  - Screen 3 reduced the site list to the final 5 preferred sites warranting a more detailed assessment. Section 7 describes the final 5 sites.

3.3 DATA COMPILATION

Appendix A summarizes all the previously listed sites and project alternatives in relation to a select number of available reports in which these project sites have been mentioned.

A review of YEC data and a search of publicly available mapping data through the Geomatics Yukon web portal was performed (http://www.geomaticsyukon.ca) to confirm that the data used in the study was as current and comprehensive as possible. In comparison to the 2016 KP study:

- No additional topographical information was available
- Transmission line information was unchanged
- First Nation Settlement Lands were included in the mapping

4.0 SCREEN 1: COARSE SCREENING

4.1 PROJECT GROUPINGS

Projects were first grouped according to the likely transmission line segment (either existing or proposed) that would be used for interconnection. This regional approach helped to streamline the data compilation and review process. The transmission line groupings are:

- Cluster 1: Aishihik-Whitehorse 138 kV (Existing)
- Cluster 2: Carmacks-Whitehorse 138 kV (Existing)
- Cluster 3: Carmacks-Faro 138 kV (Existing)
- Cluster 4: Stewart Crossing-Carmacks 138 kV (Existing)
- Cluster 5: Dawson City-Stewart Crossing 69 kV (Existing)
- Cluster 6: Stewart Crossing-Mayo 69 KV (Existing)
- Cluster 7: Mayo Expansion (Proposed)
- Cluster 8: Faro-Watson Lake (Proposed)
- Cluster 9: Beaver Creek-Hanes Junction (Proposed)
- Cluster 10: Whitehorse-Carcross-Jake's Corner-Johnson's Crossing-Teslin 34 kV (Existing)
- Cluster 11: Carcross-Skagway (Proposed)
- Cluster 12: Jake's Corner-Atlin (Proposed)

4.2 SCREENING ASSESSMENT

With the project sites grouped as discussed above, a coarse screening assessment was undertaken to eliminate undesirable sites and allow the more rigorous Screens 2 and 3 to focus on fewer sites. The coarse screen was implemented with four criteria that could be determined on a cursory review:

- 10 MW minimum installed capacity: sites that were unlikely to meet a minimum installed capacity threshold of 10 MW were eliminated.
- 50 km maximum transmission line length: sites more than 50 km from existing or proposed transmission lines were eliminated.
- Parks and protected areas: sites located in parks or restricted areas were eliminated, except for the Primrose and Tutshi Windy Arm sites (on request by YEC).
- Yukon River and communities: sites affecting the Yukon River or known to flood communities were eliminated.

Table 4.1 presents the full list of sites, grouped according to likely interconnection transmission line. Sites which were not eliminated by any of the four coarse screening parameters are shaded in green and represent the 56 sites that advanced to Screen 2. Figure 4.1 shows a map of the Yukon with the sites that advanced to Screen 2.

5.0 SCREEN 2: QUANTITATIVE ASSESSMENT

5.1 OVERVIEW

Screen 1 reduced the site list from 147 to 56 sites. Those sites passing Screen 1 were subjected to the Screen 2 process, referred to as the 'Quantitative Assessment'. Screen 2 involved a number of analyses:

- Review of existing information and development of a high-level conceptualization of the projects, including intake and powerhouse location, project head, and potential for reservoir storage.
- Regional hydrological review to develop estimates for Mean Annual Discharge (MAD) and the seasonal distribution of flows.
- Estimation of installed capacity and energy generation profiles.
- Indicative cost estimating.
- Levelized financial comparison, including Levelized Cost of Capacity (LCOC) and Levelized Cost of Energy (LCOE).

The subsequent sections of this report detail the components of the Screen 2 process. A summary of the results can be found in Table 5.2, and details of the review and concept development are presented in Appendix B.

5.2 HYDROLOGY AND DESIGN FLOW ESTIMATES

5.2.1 PREVIOUS ESTIMATES

During the 2016 KP study, flow records were compiled and reviewed from a total of 46 Water Survey of Canada (WSC) gauges with catchment areas between 10 km^2 and 7,000 km^2. This analysis was undertaken to develop an understanding of regional trends in measured runoff for catchments of varying sizes and regions. Monthly average data was used to develop estimates of Mean Annual Discharge (MAD) and Mean Annual Unit Discharge (MAUD) at each stream gauge location. The data were then used to produce generic monthly hydrographs which were scaled and applied to each project site.

1. GAUGES IN YUKON.

Figure 5.1 illustrates the "generic" Yukon hydrographs that were developed. Figure 5.2 illustrates the location of Yukon stream gauges along with indicative unit runoffs.

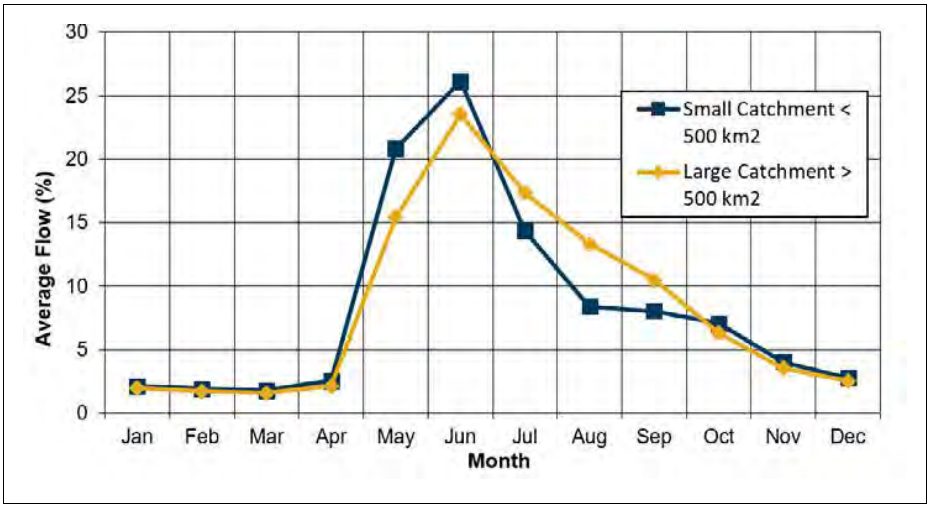
Where no previous hydrology information could be obtained, KP developed estimates based on the MAUD values from the WSC gauges in the region and scaled according to catchment area. These gauges are dispersed across most of the Yukon and provide a reasonable means of assessing hydrologic patterns throughout the region. Some of the basic trends evident in the data are as follows:

- MAUD appears to decrease in a south-westerly direction along the border between the Yukon and the Northwest Territories, with lower unit discharge values evident in the dry, lower relief interior zones versus the mountainous terrain along the eastern provincial border.
- In the south-western corner of the Yukon, MAUD appears to be relatively high due to the onshore movement of moist maritime air from the Pacific Coast. The effects of this moisture influx extend slightly beyond the Coastal Mountain Range, and then drops off markedly due to a 'precipitation shadow' effect that results in a progressive reduction in MAUD moving east.

MAUD values were selected for the project sites based on proximity and similarity of catchment size to the WSC stations. Commonly, there are two to three local gauge stations that provide a basis for estimating unit discharge. Where applicable, consideration was also given to the MAUD values reported for various project sites.

Additional regional considerations when determining a site's MAUD included:

- Glaciers in a watershed, which generally increase MAUD due to melt during the warm summer months
- Lakes in a watershed, which generally decrease MAUD due to greater evaporation
- The local relief, with higher elevation watersheds generally having higher precipitation and correspondingly higher MAUD



NOTES:

2. BASED ON AN EVALUATION OF MONTHLY AVERAGE FLOWS AT 46 WATER SURVEY OF CANADA (WSC) GAUGES IN YUKON.

5.2.2 RUN OF RIVER PROJECTS DESIGN FLOW FACTORS AND DESIGN FLOWS

RoR hydroelectric plants utilize the available flow in a river at any given time, with unusable headpond/reservoir storage, and electric output is a function of short-term yield (often evaluated on a daily basis). The optimal installed capacity depends on numerous factors, including constructability, environmental requirements, and the need for and ability to sell seasonal power.

In the previous KP evaluation most of the run-of-river projects evaluated were of the “high-head type”. Based on experience evaluating these types of projects KP made the assumption that the optimal design flow for a run of river plant tends to be in the order of 1.5 to 2 times the MAD value. In contrast KP targeted a design factor 0.5 times MAD for “low-head” storage type projects on large river systems.

In the current evaluation the study aims to target a specific range of capacity and needed the ability to evaluate run-of-river projects located on large river systems. To accomplish this, curves were developed based on a set of assumptions that showed the exchange of capacity factor as a function of the design flow factor. The design flow for the plant is equal to the design factor times the average annual flow. To develop these curves, daily stream flow data for various streams were downloaded from the WSC, with years having incomplete daily records removed. An energy model was then built for a single unit meter of head based on the following assumptions:

- In-stream Flow Requirements (IFR) equal to 5 percent of MAD
- A minimum turbinable flow of 5% of the design flow
- 10 percent head losses through intake and conveyance to the turbine, at maximum design flow, and an exponential decrease in head loss with decreasing flow
- Average efficiency of 90 percent from turbine to the point of sale, to account for turbine – generator losses, transformer losses, transmission losses, station usage, and outages

For a given design flow factor and project head, the resulting design flow, power and energy can be calculated (see Figure 5.3).

To further assess the winter capacity a similar set of curves was developed, combining the energy generated in the months of December, January, February, and March (see Figure 5.4).

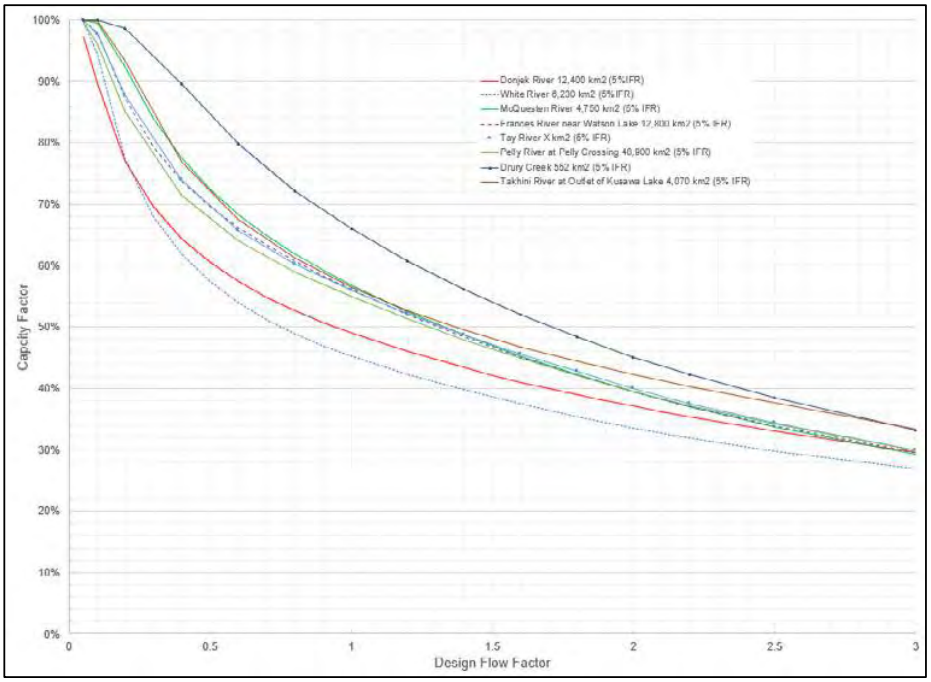

Figure 5.3 **Run of River Based Capacity Factors resulting from Design Flow Factors**

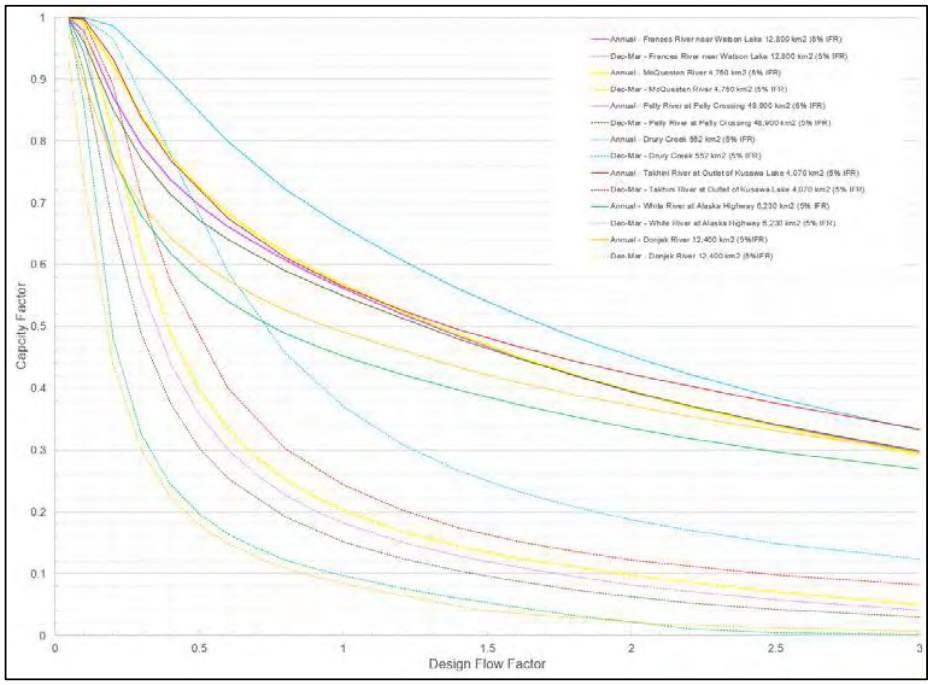

Figure 5.4 **Run of River Based Winter Capacity Factors resulting from Design Flow Factors**

5.2.3 STORAGE PROJECTS DESIGN FLOW FACTORS AND DESIGN FLOWS

Estimating the design flow factor to be applied in energy modeling for a storage hydroelectric project is inherently more complex than for run-of-river analyses. These complexities lie in the regulation of flows due to the ability to store some volume of water for generation. Individual daily storage regulation models were developed for storage sites making the following assumptions:

- Daily inflows were typically prorated from the nearest stream to the proper unit runoff and drainage area (See Table 5.1).
- Depth capacity curves were assumed to be linear between available topographic contours. This was deemed to be acceptable as, in most instances, the reservoir elevation variations were relatively small.
- Release rules assumed a full day release if water was available in the reservoir during the months of December, January, February or March or if the reservoir volume exceeded 90 percent of its capacity.

All other assumptions were identical to the run-of-river model.

Table 5.1 WSC Gauges for Storage Models

Sites	Surrogate Gauge	Complete Record Period
Drury, Big Kalzas, Finlayson, Glenlyon, Reid Lake (Lake Creek)	Drury Creek (09AH005)	1995-2009 and 2016-2017
Fortin	Pelly River at Pelly Crossing (09BC001)	1960-2017
Wolf River	Nisutlin River (09AD001)	1979-1995
Tushi Windy Arm, Primrose	Takhini River (09AC004)	1954,1959-60, 1965-67, 1969-86

5.2.4 DEPENDABLE CAPACITY

YEC requested that all projects shortlisted during this screening process be assessed for Dependable Capacity. Dependable Capacity, expressed in MW, is the maximum generation output that a resource can reliably provide in a specific timeframe, typically during the period of greatest demand. YEC defines dependable capacity as the maximum output that a resource can reliably provide over two consecutive weeks during the four winter months (November to February) based on the inflows in the five driest inflow years in history. Dependable Capacity was only evaluated for the five preferred sites which are discussed in Section 7.

5.3 INDICATIVE COSTS

Basic indicative cost estimates in $2019 were developed for each project using KP's in-house experience and cost estimating database for projects with comparable characteristics. Where the level of detail in the existing design was insufficient to permit an accurate assessment of site-specific conditions, facility layouts and sizes, costs were scaled according to head, flow, installed capacity, and other key project costing metrics. Cost estimates included the following major components:

- Mobilization, Demobilization, Insurance, Bonds, Overheads, and Contractor's Profits
- Access and Site Preparation
- Dam(s) and Reservoir(s) (if any)

- Intake, Forebay, and Headrace
- Water Conveyance System
- Powerhouse and Tailrace and Ancillary Services
- Power Generation Equipment (Water to Wire)
- Switchyard, Transmission, and Interconnection
- Engineering, Procurement, and Construction Management (EPCM): 8 %
- Contingency: 30 %

5.4 COST TO BENEFIT ANALYSIS

The fair evaluation of alternative hydropower development options requires an assessment of project costs and benefits. The cost to benefit assessment was based on the comparative values for the following financial metrics:

- Unit Cost of Capacity (UCC)
- Unit Cost of Energy (UCE)
- Levelized Cost of Capacity (LCOC)
- Levelized Cost of Energy (LCOE)
- Levelized Cost of Winter Energy (LCOWE)

5.4.1 UNIT COST OF CAPACITY

Unit Cost of Capacity = Capital Cost ($) / Installed Capacity (MW)

This unit of measurement can be useful for gauging project costs in relation to other proposed or existing power projects in a simplistic manner. For instance, YEC's Mayo B Hydroelectric Project was constructed for a cost of roughly $120 million and added 10 MW of power to the Yukon's energy system (YEC, 2016), equating to a UCC of $12 million/MW. The LCOC of the better options in this study are in this order of magnitude, providing some confidence in the underlying quantities and unit rates that have been assumed.

While UCC does have its usefulness, it is not a good measure of the overall project value since capacity is not directly correlated to energy production and revenues.

5.4.2 UNIT COST OF ENERGY

Unit Cost of Energy = Capital Cost ($) / Average Annual Energy Production (GWh/yr).

UCE is a simple and useful financial metric for the determination of a project's value and relative ranking of sites with different installed capacities and hydrology characteristics. Provided that all energy can be sold, UCE is directly correlated with revenue.

UCE in the order of $2.5 million/GWh/yr or less are considered to have development potential.

5.4.3 LEVELIZED COST OF CAPACITY

The loaded capital cost, or net present cost at Commercial Operation Date (COD) is accounts interest accrued during construction, using the following formula:

$$LCOC = \frac{levelized\ cost\ of\ capital + annual\ expenditure}{installed\ capacity}$$

The levelized capital cost per year is calculated using the capital recovery factor formula:

$$LC = \frac{rC(1+r)^n}{(1+r)^n - 1}$$

Where:

LC	levelized capital cost per year
C	Capital Cost
O	Operating and maintenance cost (estimated at 2.2% of Capital Costs + $0.005/kWh)
r	discount rate (assumed 4.82%)
n	expected lifetime of plan + construction period (assuming 3 years of construction and a 65-year design life.)

5.4.4 LEVELIZED COST OF ENERGY

In the energy sector, LCOE is often used as a metric for evaluating energy projects because it allows for an “apples-to-apples” comparison of the costs associated with the generation of energy between different energy sources. For instance, there is a desire to be able to fairly compare hydropower projects with high upfront capital costs, and comparably low operations and maintenance costs (i.e. no fuel cost) with, for instance, thermal generation projects with lower upfront capital costs but relatively high operating costs that include fuel consumption.

The hydroelectric LCOE can be compared against the LCOE of a Yukon based thermal generation asset. If the hydroelectric project’s LCOE is higher than the thermal generation LCOE, it is deemed uneconomic.

YEC provided the following information to assist in the hydropower screening evaluation:

- Discount rate for net present valuation: 4.82%
- Yukon grid power: $0.19/kWh
- Diesel generation: $0.33/kWh
- Liquified natural gas (LNG): $0.15/kWh

In order to calculate the LCOE an estimate of the capital and operations and maintenance costs is required. The calculation for LCOE is presented below.

$$LCOE = \frac{sum\ of\ costs\ over\ lifetime}{sum\ of\ energy\ produced\ over\ lifetime}$$

$$LCOE = \frac{\sum_{t=0}^{n} \frac{C^t + O^t}{(1+r)^t}}{\sum_{t=0}^{n} \frac{E_t}{(1+r)^t}}$$

Where:

Ct	Capital Cost in year t

Ot	Operating and maintenance cost in year t (estimated at 2.2% of Capital Costs + $0.005/kWh)
Et	Energy Generated in year t (estimated to be the mean annual energy)
r	discount rate (assumed 4.82%)
n	expected lifetime of plan + construction period (assuming 3 years of construction and a 65-year design life.)

5.4.5 LEVELIZED COST OF WINTER ENERGY (LCOWE)

For the purpose of this study the Levelized Cost of Winter Energy (LCOWE) was calculated as follows to compare the winter generation portfolios:

$$LCOWE = \frac{\sum_{t=0}^{n} \frac{C^t + O^t - R^t}{(1+r)^t}}{\sum_{t=0}^{n} \frac{WE_t}{(1+r)^t}}$$

Where:

Ct	Capital Cost in year t
Ot	Operating and maintenance cost in year t (estimated at 2.2% of Capital Costs + $0.005kWh)
Rt	Revenue from non winter energy at the Yukon grid power rate of $0.19/kWh
WEt	Energy Generated in December, January, February and March of year t
r	discount rate (assumed 4.82%)
n	expected lifetime of plan + construction period (assuming 3 years of construction and a 65-year design life.)

5.5 SCREEN 2 RESULTS

The results of the Screen 2 assessment are presented in Table 5.2. Additional information regarding the background review and development of concepts is presented in Appendix B.

6.0 SCREEN 3: FINAL SCREENING

6.1 ADDITIONAL SCREENING CRITERIA

The Screen 2 results were presented to YEC for review and guidance for the final screening and shortlisting of sites. During this phase, YEC requested the removal of the sites associated with two proposed transmission line segments:

- Cluster 8: Faro-Watson Lake
- Cluster 9: Beaver Creek-Hanes Junction

The removal of the sites associated with these transmission lines was based on low probability of these transmission line segments being developed in the foreseeable future.

Additional final screening criteria were implemented as follows:

- Sites below 10 MW except for Atlin;
- Sites consisting of dams on large river systems were removed due to perceived social risk and high temporary works construction costs
- Sites with a LCOE exceeding $0.35/kWh were removed

Table 6.1 presents the sites remaining for the final selection of the top five preferred sites.

Table 6.1 Sites for Final Selection

6.2 SELECTION OF TOP 5 SITES

The selection of the top five sites was made on a combination of comparative LCOE results for the sites presented in Table 6.1, and discussions with YEC for site-specific screening criteria. Four of the shortlisted sites were easily selected for their performance on an LCOE basis and their ability to provide winter energy:

- Primrose
- Drury
- Tutshi-Windy Arm
- Wolf

The fifth site for the shortlist was determined to be Atlin following a detailed conversation with YEC. While Atlin did not offer 10MW of capacity, the following additional considerations ultimately led to the decision:

- Lapie is a RoR project which would not offer any reliable winter generation capacity. Winter capacity is of primary importance to YEC, therefore this site was not selected.
- Reid Lakes and Lake Creek: involves two separate generating stations, with a RoR diversion project feeding a lake storage project. Each on its own is uneconomic, and the combined project is complex and requires an inter-basin transfer of water which is anticipated to pose a significant challenge for development.
- Atlin: while this site offers a lower installed capacity (8 MW), it is optimal for its winter generation potential. It is also considered lower risk than many other sites in terms of the available information supporting its design.

7.0 SHORTLIST CONCEPT DEVELOPMENT

7.1 PRIMROSE

The Primrose River and its tributaries form a hanging valley above Kusawa Lake, which make it a potentially very attractive site. Its presence within the boundaries of Kusawa Territorial Park means it was screened out of the 2016 KP study. The neighbouring drainage of Takhini Lake was also considered as part of proposed schemes in the past.

The Primrose site has been investigated on numerous occasions since 1952. The Demers 1989 Report forms the basis for the project configurations listed in the existing project inventories but were assumed to be using large dams. KP evaluated the project as both a RoR project and a storage project with a 10 m high dam and it is attractive in both instances.

A basic arrangement for the proposed project layout is shown on Figure 7.1. Key project parameters for this layout are as follows:

- Design Flow: 11.6 m^3/s.
- Gross Head: 138 m.
- Installed Capacity: 12.7 MW.
- Dependable Capacity: 12.7 MW (during the driest winter of synthetic record 1973-74 the project could generate for 97 continuous days during the winter at 12.7 MW).
- The current access assumes that the project site will require barge access and 20 km of new access roads to reach the proposed dam site from Kusawa Lake. 20 km of additional access road through the Kusawa Territorial Park would be required if the project site is not accessed/accessible by barge.
- A Rose Lake outlet control dam to provide 10 m of lake storage (operating storage of 100 million cubic metres (Mm^3)), equipped with IFR release system and spillway for flood water management.
- A 4,700 m long penstock.
- A Powerhouse (el. 740 masl).
- Substation and a 40 km long transmission line, with a t-tap interconnection to the existing 138 kV line between Aishihik and Whitehorse along Alaska Highway #1.

The project site is attractive but its presence in the Kusawa Territorial Park may be a major obstacle. Only one alternative to lower the powerhouse site to increase the project head at the expense of the increased penstock cost was considered. There could be a more optimal project layout once detailed topography for the site is obtained. Physical considerations at the proposed dam site are also unknown.

Table 7.1 presents the estimated average monthly energy output for the Primrose project. The project layout is shown on Figure 7.1.

7.2 DRURY

The Drury Lake Project is located on Drury Creek between Drury Lake and Little Salmon Lake, in the Yukon River watershed. The site is approximately 170 km north of Whitehorse and is situated within 1 km of the Robert Campbell Highway and the existing transmission line.

The Drury site was evaluated as both a run of river project and a storage project. The available stream gauge information for Drury seems to indicate some natural flow attenuation from Drury lake offering some winter generation even on a RoR basis.

This project was short listed as it has a relatively low LCOE and offers the opportunity to generate winter energy. It was carried forward as a storage project but may also be valuable as a RoR project.

A variety of studies have previously been commissioned for the Drury site, including high level reconnaissance, geotechnical investigations, and design studies, and these have resulted in several alternative design concepts. The most recent study, apart from the 2016 KP study, was completed by KGS in 2008 and provides basic site layouts, design and geotechnical considerations, and cost estimates for different options.

While earlier studies considered a low gradient canal and a short penstock, geotechnical risk and the presence of permafrost were noted by KGS. At this desktop level, the conveyance alignment and specific constructability concerns cannot be addressed in any detail beyond that reported by KGS, and so the selection of a buried low-pressure penstock instead of a canal has been adopted by KP.

A preliminary general arrangement of the project layout is shown on Figure 7.2. Key project parameters and characteristics for this layout are as follows:

- Design Flow: 12.7 m^3/s.
- Gross Head: 100 m.
- Installed Capacity: 10 MW.
- Dependable Capacity: 10 MW (during the driest winter of synthetic record 1998-99 the project could generate for 63 continuous days during the winter at 10 MW).
- 5.3 km of access roads from the Robert Campbell Highway to the powerhouse, along the water conveyance, and upstream to the outlet of Drury Lake.
- Concrete Faced Rockfill Dam (CFRD) at the outlet of Drury Lake to provide 5 m of storage (operating storage of 130 Mm^3). The dam would be constructed with an IFR discharge system and a spillway to Drury Creek for flood water management.
- An intake structure.
- 4.9 km penstock located on the south side of Drury Creek (alignment as previously indicated by KGS).
- Powerhouse (El. 620 masl) and substation at the edge of Drury Creek, upstream of the Robert Campbell Highway and the river mouth at Little Salmon Lake.
- 0.5 km transmission line, with t-tap interconnection to the existing transmission line.

Note: The lack of detailed topography makes siting the location and configuration of the projects point of diversion difficult. The existing topography shows 5 km of very flat terrain and stream gradient at the outlet of Drury Lake, as such the current option assumes a single structure would be enough to provide impoundment and a penstock offtake.

Table 7.2 presents the average estimated energy output for the Drury project.

7.3 TUTSHI WINDY ARM

The Tutshi – Windy Arm Project is a proposed storage hydropower development located between Tutshi Lake and Windy Arm of Tagish Lake in northern British Columbia. Tutshi and Tagish Lakes are tributaries to the Yukon River. The project site is approximately 45 km to the south of Carcross, Yukon, and the proposed powerhouse location is within 1 km to the east of the Klondike Highway.

Several studies have previously been completed for this site, including geotechnical investigations, design, and cost estimates, resulting in a number of alternative design concepts. This desktop study is based on the most current concepts, presented in the 2008 KGS report.

The Tutshi Lake/T'ooch' Áayi Conservancy was established in 2012 as a result of the Wóoshtin Wudidaa Atlin Taku Land Use Plan and Taku River Tlingit First Nation Strategic Engagement Agreement. The conservancy, located approximately 65 kilometres northwest of Atlin, encompasses the eastern half of Tutshi Lake. Tutshi Lake is culturally significant to the Carcross/Tagish and Taku River Tlingit First Nations. The lake also has high value lake trout habitat. The Tlingit name (T'ooch' Áayi) means "charcoal lake", after the dark colour of the lake water.

A basic arrangement for the proposed project layout is shown on 3. Key project parameters for this layout are as follows:

- Design Flow: 25 m3/s.
- Gross Head: 51 m.
- Installed Capacity: 10 MW.
- Dependable Capacity: 10 MW (during the driest winter of synthetic record 1973-74 the project could generate for 108 continuous days during the winter at 10 MW).
- 23.5 km of access roads, to reach the powerhouse, surface conveyance, tunnel intake, and outlet control dam on Tutshi Lake.
- Tutshi Lake outlet control dam to provide 5 m of lake storage (operating storage of 267 Mm3), equipped with IFR release system and spillway for flood water management.
- Tunnel intake and 1.7 km tunnel through the hill separating the north end of Tutshi Lake from Windy Arm of Tagish Lake (Intake El. 707 masl).
- 2.7 km long penstock.
- Powerhouse on the south shore of Windy Arm, Tagish Lake (El. 656 masl).
- Substation and a 1 km long transmission line, with t-tap interconnection to a proposed transmission line along the Klondike Highway between Carcross and Skagway (AK).

The Taku River Tlingit First Nation and Carcross Tagish First Nation would need to be approached prior to any serious consideration of the project site. Site investigations and a more detailed review of site-specific data would be required to confirm project viability and the optimal project size.

Table 7.3 presents the average monthly energy output for the Tutshi-Windy Arm project. The project arrangement is shown on Figure 7.3.

7.4 ATLIN HYDRO

Atlin is an isolated community located approximately 50 km south of the Yukon-British Columbia border. Atlin is only road accessible from the Yukon Territory. On April 1, 2009 the 2.1 MW Atlin Hydro Project began commercial power production (Illustrated in Figure 7.4). The hydropower facility is owned by Xeitl Limited Partnership which is 100% owned by Taku River Tlingit First Nation. The project is located on Pine Creek and is approximately 4 km east of the community of Atlin, BC. The facility overlaps with previously conceived layouts of a Surprise Lake hydroelectric project.

NOTES:
1. PHOTO SOURCE: WWW.WATERPOWERMAGAZINE.COM.

Figure 7.4 Atlin Hydro Project Photos

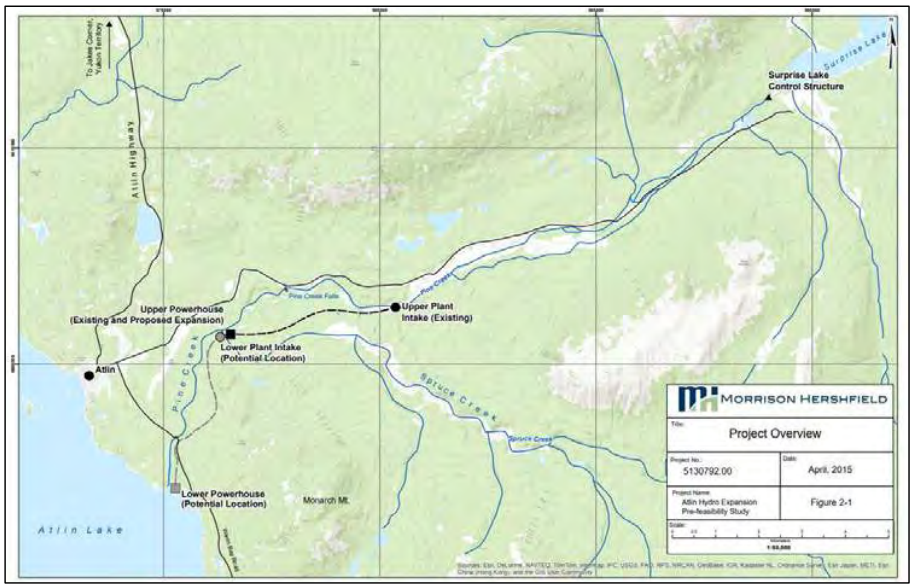
On June 23, 2016 Morrison Hershfield provided YEC with a detailed report on the Atlin Hydro Expansion Project. The report includes a transmission line options assessment for connection to the Yukon electrical system. The detail provided in this report (good quality topography, complete hydrological assessment, detailed drawings and estimates) means this project has less unknowns and risks than the other projects in this short list.

For the purpose of conciseness, the Morrison Hershfield information will only be repeated here in brief summary. They have completed an alternatives assessment, a hydrological assessment and a Pre-Feasibility Assessment. The proposed general arrangement is shown in Figure 7.5. A summary of the estimated energy is shown in Table 7.4 The conclusion is quoted below.

“It is proposed to develop a total of 7.8 MW at Pine Creek, consisting of expanding the existing (upper) 2.1 MW powerhouse with an additional two turbines to bring the total installed capacity to 5 MW plus the addition of a second, or lower, powerhouse near Atlin Lake with an installed capacity of 2.8 MW. The upper power plant operates under a gross head of approximately 107 m and the lower plant has a gross head of approximately 56 m.”

“For the expansion of the upper power plant, a second 4 km long HDPE penstock will be required to convey a maximum flow of 3.55 m³/s from the existing head pond to the powerhouse. The penstock will require the excavation of a trench, mainly through overburden materials except some limited bedrock excavations near the intake structure. The lower power plant requires 4 km of twin HDPE penstocks to convey a maximum

flow of 7 m³/s. A new excavated head pond just downstream of the existing (upper) powerhouse is required to supply the lower penstocks. Spruce Creek would be diverted into the lower head pond such that flows from Spruce Creek can be used to increase electrical generation at the lower power plant.



NOTES:
1. SOURCE: ATLIN HYDRO EXPANSION STUDY.

Figure 7.5 Atlin Hydro Project and Surprise Lake

Increased storage in Surprise Lake to maximize winter electrical generation will be developed by modifying the existing control structure at the lake outlet. It is proposed to increase the storage range from 1.1 m to 2.5 m by increasing both top and bottom storage by approximately 0.7 m. This operating scheme would not require modification of the project's existing Permit Over Crown Land which allows storage of water up to elevation 913.85 masl. The storage of water allows the project to generate approximately 70% of its annual average energy production during winter months (November through April). Winter energy is of highest value to the Yukon's electrical grid.

In consideration of the existing hydropower infrastructure the Atlin Hydro Expansion Project has the potential to produce on average 44.7 GWh/yr of energy, of which at 36 GWh/yr is available for export to the Yukon after the community of Atlin's needs are met. Cost for the hydroelectric development only (without transmission) are estimated at $79.7 million. A total project cost of $120.7 million is estimated, including a 69 kV transmission line to connect with the Yukon's electrical grid at Jakes Corner."

7.5 WOLF RIVER

The Wolf River is a tributary of the Nisutlin River upstream of Teslin Lake, in the headwaters of the Yukon River. The Wolf River Project site is located near the river mouth and approximately 22 km to the northeast of the community of Teslin and the Alaska Highway. First Nation Heritage Routes and First Nation Settlement Lands associated with the Teslin Tlingit Council are visible in the GeoYukon database covering the area adjacent to the north bank of the Wolf River.

The previous KP report and the 1990 and 1991 Hydro Investigations by S. Demers looked at the project site. Little is known of site-specific geotechnical conditions and cannot be confirmed at the desktop level. There are several project configurations possible and the main limitation on the project installed capacity is associated with the capacity of the existing 34 kV transmission line from Teslin. In the current layout the main intake has been placed below the confluence of Caribou Creek and Wolf River (previously the intake was considered a bit higher in the basin missing out on the Caribou Creek catchment.) The 1991 study also noted the potential opportunity for storage in Wolf Lake, which could improve winter generation and the plant capacity factor.

Two project configurations were considered in the first a run-of-river project limited by the existing transmission and capped at 11 MW of installed capacity. A second utilizing the potential of the site at 30 MW with the addition of storage at Wolf Lake to allow for firm winter generation but requiring an additional higher capacity of transmission line to Whitehorse.

A basic general arrangement for the proposed project layout is shown on Figure 7.6.

Key project parameters for this layout are shown below.

Table 7.5 Wolf River Alternatives

Sites	Wolf River	Wolf River and Wolf Lake
Design Flow	18.8	37.6
Gross Head (m)	75	100
Installed Capacity (MW)	11.2	30.0
Dependable Capacity (MW)	4.0	30.0
Canal Length (m)	6,900	11,500
Penstock Length (m)	1,300	900
Transmission Line (km)	20	20+150

Project access should be able to circumvent the Nisutlin River Delta National Wildlife Area. Access to the project site can be done through either or both of the following:

- Upgrades to an existing 34 km trail identified as leaving the Alaska Highway (#1) 20 km east of Teslin.
- A new 23 km access road departing from Teslin, running west of the Nisutlin River Delta National Wildlife Area. This option would require a bridge across the Nisutlin River.
- 73 km of trail upgrades are required to access Wolf Lake from the proposed intake site.

Both project configurations would require a canal diversion and a forebay to the penstock and a powerhouse and a short tailrace channel back to Wolf River.

Both configurations would include a substation and 23 km transmission line to Teslin. Development of a large generating capacity at Wolf River would need a more careful consideration of the transmission line capabilities and energy demand. For the current assessment valuation, it was presumed that 150 km of new line would be needed to connect Teslin to Whitehorse through Jake's Corner to support a 30 MW project site.

Table 7.6 presents the average monthly energy output for the Wolf River project. The project arrangement is shown on Figure 7.6.

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 CONCLUSIONS

The objectives of the study were to compile a regional assessment of hydropower development sites with installed capacities between 10 MW and 30 MW and within 50 km of existing or proposed transmission lines. KP developed a list of 147 sites and completed a hydropower screening assessment to progressively eliminate the less attractive sites and focus in on the best potential hydroelectric development options. Following a coarse screening of these 147 sites, 56 Sites were selected for a further quantitative assessment. KP performed a quantitative assessment to determine potential layouts, capacity, average annual and winter energy yield and indicative development costs. During a final screening and selection process, the sites were presented to YEC for final consideration and implementation of additional screening criteria. The final screening was based on capacity, location, expected development costs and perceived social acceptability. This narrowed the 56 sites to nine sites, including:

- Primrose (as both ROR and lake storage projects)
- Wolf River (with and without Wolf Lake)
- Tutshi Windy Arm
- Atlin
- Drury Creek (as both ROR and lake storage projects)
- Lake Creek and Reid Lakes
- Lapie
- McQuestin River
- Anvil Creek

These 9 sites were assessed in more detail, and the final 5 preferred sites were selected as:

- Primrose (as a lake storage project)
- Drury (as a lake storage project)
- Tutshi Windy Arm
- Atlin
- Wolf River (with and without Wolf Lake)

A summary of the Financial and Technical attributes of the preferred sites is presented in Table 8.1.

8.2 RECOMMENDATIONS

8.2.1 FIRST NATIONS

All 5 of the sites (Primrose, Drury, Tutshi, Atlin, and Wolf River) short listed for concept development will require the involvement of First Nations and other stakeholders to make them a success. In British Columbia, renewable energy has become an important industry for First Nations and it has been an industry First Nations have embraced because projects can be developed with minimal impacts to their rights, environment, and within their values. It is possible the Yukon may experience a similar situation.

Judith Sayers for the BC First Nations Clean Energy Working Group indicates that First Nations with clear Economic Development Plans, Land Use Plans and Community Energy Policies in place before they start involvement with renewable energy projects have an easier time finding an acceptable community direction regarding such projects. Ensuring that renewable energy development is considered in those plans is of key importance. (Source: https://www.cleanenergybc.org/wp-content/uploads/2016/04/BC-FN-Toolkit.pdf).

8.2.2 TECHNICAL EVALUATION

Further evaluation of the preferred sites is recommended, to improve the design basis, project configurations, and understanding of hydrological and geotechnical conditions. The following activities are recommended:

- Set the projects energy objectives, including the required installed capacity and winter energy generation potential to meet the forecasted energy and power demands in the Yukon
- Undertake a screening assessment of social and environmental permitting constraints at each of the five preferred sites
- Obtain accurate mapping (such as satellite topography) for the proposed project areas to confirm project configurations and details including dam sizes, water conveyance routings, available generation head, powerhouse locations, access roads, and transmission lines
- Implement hydrological data collection programs at the preferred sites or reinforce existing programs
- Conduct preliminary site visits to the preferred sites to further evaluate technical viability
- Update energy estimates based on hydrology data and accurate depth-area-capacity curves for reservoirs
- Update quantity and cost estimates

Should the above assessment indicate that there are no critical technical or environmental barriers to development, detailed evaluation of the sites through pre-feasibility and feasibility studies should be pursued to prove economic viability.

Yukon Energy Corporation
Small Hydroelectric Projects
Screening Assessment (10 MW – 30 MW)

APPENDIX B

Site Descriptions

(Pages B-1 to B-9)

APPENDIX B
SITE DESCRIPTIONS

The projects passing the coarse screen have been reviewed below and numeric details about each site can be found in **Error! Reference source not found.** of the main report. On occasion sites previously lacking information have been added to the Table for completeness or a further site-specific review revealed the site should be dismissed from consideration or added for consideration.

1.0 CLUSTER 1 – AISHIHIK-WHITEHORSE 138 KV

1.1 PRIMROSE

This site was short listed. See Section 7.1.

2.0 CLUSTER 2 – CARMACKS-WHITEHORSE 138 KV

2.1 IBEX RIVER

A concept for a 3.5 MW run-of-river on the Ibex River was investigated and dismissed based on size and cost. The site is a bit too far removed from transmission and access to be viable. It does benefit from a nearby stream gauge that could help in refining the energy generation assessment.

3.0 CLUSTER 3 – CARMACKS-FARO 138 KV

3.1 ANVIL

A few run-of-river configurations were considered up and down Anvil Creek. The project location has been previously been associated with Anvil Lake, a site that does not offer the same generating opportunities. The most attractive options for Anvil Creek assume long tunnels, resulting in average to higher LCOE returns, as such the project was not shortlisted. It was only possible to fully regulate the river for winter generation with a very tall dam structure, which proved to be cost prohibitive (i.e. $1 billion for 30 MW of firm winter generation).

3.2 DRURY

This site was short listed. See Section 7.2.

3.3 GLENLYON

Glenlyon offers the opportunity for a lake storage project or a run-of-river project but falls short of the desired installed capacity and is a bit too isolated and costly.

3.4 LITTLE SALMON

The Little Salmon Lake outlet offers little in the way of elevation differential given the current available topography. It is also not believed that it would be an environmentally acceptable site given its use for recreational angling and the name of the lake. It was elected not to consider the site for a high dam.

3.5 TAY RIVER

The Tay River forms a large watershed but it's existing WSC stream gauge indicates (perhaps inaccurately) a very low unit runoff (2.4 l/s/km^2). The gauge information also reveals the site offers a poor winter generation profile even at a low design factor. The site is also a bit too distant from transmission and access increasing its cost.

4.0 CLUSTER 4 - STEWART CROSSING - CARMACKS 138 KV

4.1 LAKE CREEK AND REID LAKES

Lake Creek offered the opportunity for an average run of river project. A Reid Lakes storage project could only be built with a diversion from Lake Creek (through the run of river project). Reid Lakes is a flat system of lakes that appear difficult to keep contained based on the available topographical observations; as a result, it is not able to provide full impoundment for winter generation limiting the concepts value.

Reid Lake was nevertheless a relatively interesting winter energy option, but when averaged with the inclusion of the Lake Creek cost and energy it fell off the project short list, particularly given the requirement for an interbasin transfer.

4.2 GRANITE CANYON

The Granite Canyon project site is located on the Pelly River, approximately 20 km east of Pelly Crossing. It is considered as a small run-over river project on a very large system, the total drainage area is estimated to be 46,200 km^2. The site proved one of the more difficult to evaluate at a very high level as the temporary works costs could outweigh the costs of the permanent works, but this is difficult to evaluate without a detailed assessment.

The Granite Canyon site was previously designed as a potential 254 MW hydroelectric project. The project first appeared in T. Ingledow & Associates Limited's report entitled "Hydroelectric Resources Survey of the Central Yukon Territory" in 1968 and subsequently revisited in Sigma Resource Consultants Limited's 1975 "The Development of Power in the Yukon" report.

KP has not had the opportunity to review the Acres Consulting Services Limited's (Acres) 1982 "Granite Canyon Development Prefeasibility Study" or the AECOM Canada Limited's 2010 "Large Hydro Stage 1" report. The Acres 1982 preliminary project layout included a large facility with a 100 m high concrete arch dam and a smaller 50 m high arch dam configuration with a crest gate spillway structure built into the dam. The water intake, conveyance, powerhouse, and tailrace structures were located on the west abutment of the river. Diversion tunnels were located under the east abutment of the river to facilitate de-watering of the dam site during construction.

KP's rapid assessment assumes a 25 m, concrete faced rockfill dam and a low design flow factor (0.25 x MAD). The initial cost estimate indicates that the project site had a low LCOE and a decent winter energy profile but was not short listed due to perceived social acceptability and permitting risks.

4.3 MICA CREEK

Taltmain Lake offers the ability to regulate the Mica Creek flows however we assume a low unit runoff for the area and there appears to be insufficient drop in elevation to justify a 10 MW project size.

5.0 CLUSTER 5: DAWSON CITY - STEWART CROSSING 69 KV

5.1 ALDER CREEK, BONANZA CREEK, FIFTEEN MILE DIVERSION, FORTY MILE RIVER AND INDIAN RIVER, SWEDE CREEK, AND THANE CREEK

These projects were evaluated on a run-of-river basis as they offered decent drainages or elevation drops but their assumed poor unit runoffs and a lack of winter generating potential make them unsuitable based on current assumptions.

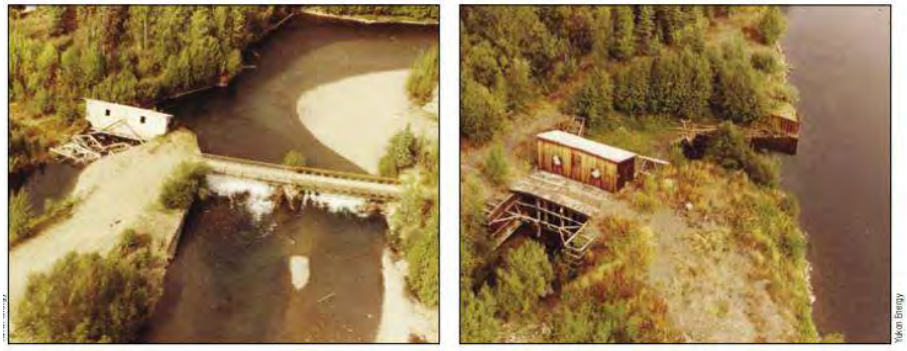
5.2 MCQUESTIN

McQuestin is a sizable river basin (3,769 km^2) and offered some promise as a small section of the river appears on the mapping to show a 60 m drop over a 9 km distance. The existing stream gauge on the river offered some certainty around the unit runoff. The cost estimate puts the project in a high but viable range for further consideration.

5.3 NORTH FORK KLONDIKE RIVER

A plant used to exist on the Klondike River at North Fork. YEC information reveals:

“The North Fork plant operated until 1966, when the last Yukon Consolidated Gold Company dredge shut down. A number of studies have been undertaken over the years to explore the feasibility of re-activating the North Fork plant. All have recommended against it, largely because of the difficulty of maintaining power production through the winter months when demand is the highest.”



NOTE:
1. SOURCE: HTTP:/ /WWW.ENERGY.GOV.YK.CA/PDF/POWER_OF_WATER.PDF

Figure 5.1 North Fork Plant (Photos)

Yukon Energy Corporation
Small Hydroelectric Projects
Screening Assessment (10 MW – 30 MW)

Powerhouse at North Fork, (left) 1922 and (right) interior, 1913. In 1935, the building was extended to house a third unit.

NOTE:
2. SOURCE: HTTP:/ /WWW.ENERGY.GOV.YK.CA/PDF/POWER_OF_WATER.PDF

Figure 5.2 North Fork Plant (Photos)

For this review KP considered a 10 MW project with a 10 m dam on the Klondike River at North Fork, elevation was limited due to the presence of bridges and the Klondike Highway.

6.0 CLUSTER 6 - STEWART CROSSING - MAYO 69 KV

No sites investigated.

7.0 CLUSTER 7: PROPOSED MAYO TRANSMISSION EXPANSIONS

7.1 BIG KALZAS LAKE

Big Kalsas Lake offers the opportunity of a 10 MW project with storage and regulation on the lake for winter generation. The cost estimate reveals it is on the higher end of the LCOE.

7.2 FRASER FALLS

A project at Fraser Falls would likely backwater the Horseshoe Slough Habitat Protection Area.

The available topography does not currently allow the identification of any specific drop in elevation at the fall's location. As a result, the project configuration assumed a dam would be the only means of providing any elevation drop. Fraser Falls drain an area in excess of 30,000 km^2. The assumed project costs end up being very high due to the very large temporary work costs.

7.3 PLEASANT CREEK WITH ROGUE DIVERSION

A further look into the access and transmission distances gave reason to remove this site from consideration due to the very high access and temporary works costs.

7.4 SEVEN MILE CANYON

Seven Mile Canyon offer the opportunity for a low head run of river project with a 20 m high structure, but the remoteness and configuration of the project resulted in a higher LCOE.

8.0 CLUSTER 8: PROPOSED FARO TO WATSON LAKE

During the second stage of screening, it was elected not to short list projects along the proposed Faro to Watson route. Lapie and Ross Canyon were still considered due to there proximity to the existing YEC transmission line at Faro.

8.1 BIG CAMPBELL CREEK

The Campbell Creek site was listed in the 2010 AECOM report as “no defined scheme” with a report reference from a 1980 Moneco report. Midgard reviewed the two 1980 Moneco reports available, but neither mentioned the site. The Campbell Creek site was listed in the 1983 Moneco summary report with the statement “not yet studied”. Due to the lack of available site information, it was previously discarded by Midgard. KP had also considered Campbell Creek but Big Campbell Creek is the name of the actual location considered. The site offers the possibility of a 10 MW run of river, but with a high LCOE.

8.2 BLIND CREEK

Small sub 10 MW run of river project that benefits from Anvil Lake.

8.3 CAMPBELL CREEK

In adequate site, possibly confused with Big Campbell Creek in previous studies.

8.4 FALSE CANYON OR FRANCES RIVER (LOWER CANYON)

The site may have been referred to previously as Frances River (Lower Canyon).

False Canyon on the Frances River offers the opportunity for a low head run of river project in a relatively restrained canyon, near the Robert Campbell Highway and the proposed transmission. A 15 m structure would allow for a 15 MW facility.

8.5 FINLAYSON

The Finlayson River is a major tributary to Frances Lake and the Frances River, in the Liard River watershed. The Finlayson River Project is located adjacent to the Robert Campbell Highway and just upstream of Frances Lake, approximately 300 km to the northeast of Whitehorse. The project site was previously short listed by KP.

The current design concept involves a run of river diversion on Finlayson River downstream of the Wolverine River confluence with possible lake storage and flow regulation on Finlayson Lake and Wolverine Lake. The Finlayson site could function as a run of river project on its own merits due to the relatively large drop in elevation. The project could easily be staged as the added controls at Finlayson Lake and Wolverine Lake are distinct sites that simply add value to the run-of-river project.

The site was relatively attractive but was removed from consideration with the removal of the Faro to Watson Lake proposed line.

8.6 FORTIN LAKE DAM

The Fortin Lake site was evaluated as a 6 MW and 10 MW storage site. Its value lies in regulating the Pelly River Flows for the benefit of downstream generation sites. Based on available topography a 25 m structure should offer a large amount of storage without needing to construct multiple saddle dams.

8.7 FRANCIS RIVER (MIDDLE)

On the Frances River, near the Frances River bridge on HWY 4 a narrow portion of the river offers the opportunity for a low head run of river project. A 20 m structure would allow for a 15 MW facility.

8.8 HOOLE CANYON

Hoole Canyon on the Pelly River offers the opportunity for a low head run of river project in a relatively restrained canyon, near the Robert Campbell Highway and the proposed transmission. A 25 m structure would allow for a 12 MW facility.

8.9 HOOLE CANYON + FORTIN LAKE DAM

If the two projects are combined, they offer a firmer winter generation profile for smaller individual installed capacities.

8.10 HOOLE RIVER

The Hoole River site was listed in the 2010 AECOM report but was cut due to having “no defined scheme”. Midgard’s review of all available previous studies revealed no other mention of the Hoole River Project. Due to the lack of available information on the site, it was previously discarded. For the purpose of this study a 12 MW project resulting from a low head 20 m structure is proposed.

8.11 HYLAND RIVER

Hyland River at the Hyland Canyon offer the opportunity for a dam and some drop river elevation. The project site is a bit removed from other infrastructure increasing the potential project cost.

8.12 LAPIE

Lapie is an attractive run of river site and is located close to exiting transmission at Ross River. This study did not evaluate the large number of design permutations that are possible to optimize this site, as the drainage area varies greatly as the potential intake is pushed upstream for greater project head.

8.13 LIARD CANYON

The proper evaluation of Liard Canyon suffers from some topographical and mapping uncertainty at the border between British Columbia and the Yukon. A more detailed look at the site revealed that it is likely that a dam structure would impact the community of Watson Lake, as such the project was removed from further consideration.

8.14 LITTLE RANCHERIA RIVER

The 2010 AECOM report references the 1990 Demers report as a source for the Little Rancheria River site. The Little Rancheria site was listed in the 2010 AECOM report (with no stated capacity or energy) but was cut due to being a "very distant site". Midgard's review reveals the Little Rancheria River site was subject to reconnaissance study only in 1990, and no sites were identified. Due to the lack of available site information, it was previously discarded.

The current evaluation assumes a run-of-river project could be developed at the site with a long penstock, but the project is rather distant from the proposed transmission.

8.15 ROSS CANYON

Ross Canyon on the Ross River offers the opportunity for a low head run of river project in a relatively restrained canyon, near the community of Ross River. A 40 m structure would allow for a 15 MW facility. The site was looked at with a long conveyance system in lieu of a large dam but the capital cost would have increased. The site was removed from further consideration to a perceived lack of social licence. The project would also affect Canol Road #6.

8.16 SLATE RAPIDS

Slate Rapids as previously designed, is a potential 42 MW hydroelectric project on the Pelly River, located in the Pelly River Basin approximately 75 km east of the community of Ross River. The project first appeared in Moneco Consultants Pacific Limited's report entitled "Slate Rapids Hydropower Development" in 1983. It was subsequently revisited in A.S. Demers' 1989 "Yukon Energy Corporation: 1989 Hydro Investigations", and in AECOM Canada Limited's 2010 "Large Hydro Stage 1" report.

Given the range of projects considered 10-30 MW and the fact the Slate Rapids site was difficult to contain requiring multiple saddle dams, the use of Fortin Lake with a smaller structure seemed to be a better option for consideration.

8.17 TYERS RIVER

Tyers River is large drainage tributary of Frances Lake and offers the opportunity for a run of river project, but it is a bit removed from major infrastructure.

9.0 CLUSTER 9 - PROPOSED BEAVER CREEK TO HANES JUNCTION

9.1 LOWER CANYON ON WHITE RIVER

The Lower Canyon on White River is located immediately upstream of the Alaska Highway #1 White River Bridge. The area offers a narrowing of the glacier fed river, creating the potential for a 25 m structure and a 15 MW project.

9.2 DONJEK RIVER

KP Considered a low head run of river project on the Donjek River, it has very similar characteristics to the White River project but with the added costs of being more distant from the proposed transmission line and existing roads. It does drain a slightly larger area.

9.3 KOIDERN

The Koidern Project is a proposed glacier fed run-of-river hydropower development located between Haines Junction and Beaver Creek in southwestern Yukon. The Koidern River is a tributary of the Kluane River. The proposed powerhouse location is within 5 km of the Alaska Highway. It was selected as it is indicative of a more compact and cost-effective type of run-of-river project. It offers lower LCOE despite not offering any dependable capacity.

The project location is outside the bounds of the Asi Keyi Territorial Park, but the intake structure is proposed within the bounds of the Kluane Wildlife Sanctuary. The powerhouse is located outside the area bounds. It is not believed that this particular type of run-of-river development would be in conflict with the objectives of these protected areas, chiefly:

- To provide economic opportunities for Kluane and White River First Nation people.
- To recognize and protect the traditional and current use of the area by Kluane and White River First Nation people.
- To encourage public awareness, appreciation and enjoyment of the natural, historical and cultural resources of the park in a manner that will ensure it is protected for the benefit of future generations.
- To protect, for all time, a natural area of territorial significance, which includes a portion of the Kluane Wildlife Sanctuary, containing physical and biological features of international significance as well as sites of archaeological, historical and cultural value.

It is understood that the management planning for these areas began in April 2015 and is ongoing and that the Government of Yukon and the two affected First Nations will jointly review the plan before it is approved by Yukon's Minister of Environment.

A basic arrangement for the proposed project layout is shown on **Error! Reference source not found.**. Key project parameters for this layout are as follows:

- Design Flow: 16.4 m^3/s
- Gross Head: 140 m
- Installed Capacity: 16 MW
- Dependable Capacity: 0 MW (This project is a glacier fed run-of-river project and does not offer much in the way of winter generation)
- 10 km of access roads, to reach the powerhouse, penstock, and intake
- A run-of-river intake with a small headpond (El. 930 masl.)
- A 7 km long penstock.
- A Powerhouse and tailrace (El. 790 masl)
- A Substation and 20 km long transmission line to a potential transmission line along the Alaskan Highway

9.4 LYNX AND WOLVERINE

Like Koidern, the site offers the opportunity for a high head freshet driven run of river project.

9.5 BURWASH

Like Koidern, the site offers the opportunity for a high head freshet driven run of river project.

9.6 DUKE

Like Koidern, the site offers the opportunity for a high head freshet driven run of river project.

10.0 CLUSTER 10: WHITEHORSE-CARCROSS-JAKE'S CORNER-JOHNSON'S CROSSING-TESLIN 34KV

10.1 SQUANGA CREEK

A development at Squanga Creek would not meet the 10 MW criteria threshold.

10.2 WOLF RIVER

This site was short listed. See Section 7.5.

11.0 CLUSTER 11: PROPOSED EXTENSION FROM CARCROSS TO SKAGWAY

11.1 MOON LAKE

Moon Lake is located roughly 100 km south-southeast from Whitehorse, and 18 km south of the BC Yukon border, and it drains into Tutshi Lake from the south and is ultimately a tributary to the Yukon River, above Whitehorse. While the site was attractive site that had been previously reported in some detail and offered storage capability but was below 10 MW in capacity at a design flow of 2.2 x MAD. The project would also be too small to support a transmission line to Carcross on its own merit.

11.2 TUTSHI LAKE

This site was short listed. See Section 7.3.

12.0 CLUSTER 12 - PROPOSED EXTENSION FROM JAKE'S CORNER TO ATLIN

12.1 SURPRISE LAKE AND THE ATLIN HYDRO PROJECT

This site was short listed. See Section 7.4.

Appendix F:
Knight Piesold Pumped Storage Report

Knight Piésold CONSULTING

November 27, 2019

Mr. Hector Campbell
Chair, NNDDC Board
Campbell's North Consulting

E vancouver@knightpiesold.com
www.knightpiesold.com

Dear Hector,

RE: Moon–Tutshi Pumped Storage Options

1.0 INTRODUCTION

1.1 REQUEST FOR INFORMATION

YEC (Yukon Energy Corporation) has requested Knight Piésold (KP) to add the Moon-Tutshi pumped storage project to the short-listed sites for its report "Hydropower Potential Assessment (10 MW – 30 MW)". This letter report has been prepared to provide the relevant information for the Moon-Tutshi pumped storage project separately, as the assessment parameters and characteristics of the proposed pumped storage development are not easily comparable to a traditional hydropower project and are best presented in a separate report.

As requested, KP modeled the proposed Moon-Tutshi Pumped Storage Project, assuming the following development options:

- 15 MW installed capacity and 25 GWh/yr of continuous winter generating capability
- 15 MW installed capacity and 50 GWh/yr of continuous winter generating capability
- 25 MW installed capacity and 50 GWh/yr of continuous winter generating capability
- 35 MW installed capacity and 50 GWh/yr of continuous winter generating capability

1.2 PURPOSE

The proposed purpose of the Moon-Tutshi Pumped Storage Project would be as follows: a pump storage project between Tutshi Lake and Moon Lake designed to seasonally store freshet energy from other Yukon hydropower assets and provide additional winter generation potential to YEC. A pumped storage project would also provide greater flexibility within the YEC grid to allow for easier integration of solar and wind renewables.

1.3 PROJECT SITE AND BASIC CONCEPT

Moon Lake is located in British Columbia (BC) approximately 100km south of Whitehorse, and 20 km south of the BC-Yukon border. Moon Lake drains into Tutshi Lake through Moon Creek at a steep gradient. Existing mapping shows an approximate 390 m drop in elevation between the two lakes. Tutsh Lake drains into Tagish Lake and onwards to the Yukon River.

The Klondike Highway linking Carcross Yukon and Skagway Alaska runs along the western shore of Tutshi Lake. Accessing the Moon Lake site will require either a barge or a new road. If a barge is used, new barge

Knight Piésold CONSULTING

landings will need to be constructed at a point along the Klondike Highway and at the foot of Moon Creek. If a new access road is constructed, the shortest and most practical route would be along the southern shoreline of Tutshi Lake.

The 2015 study by Midgard of a proposed pumped storage project at Moon-Tutshi Lakes assumes that flows from Tutshi Lake are pumped into the Moon Lake storage reservoir during high flow - low energy demand periods. The Midgard study had not accounted for a new structure at the outlet of Tutshi Lake, which has now been included. Access to the outlet of Tutshi Lake would require either a new 20 km access road from the Klondike Highway or a new barge landing and access road from Tagish Lake. (See Figure 1.1.)

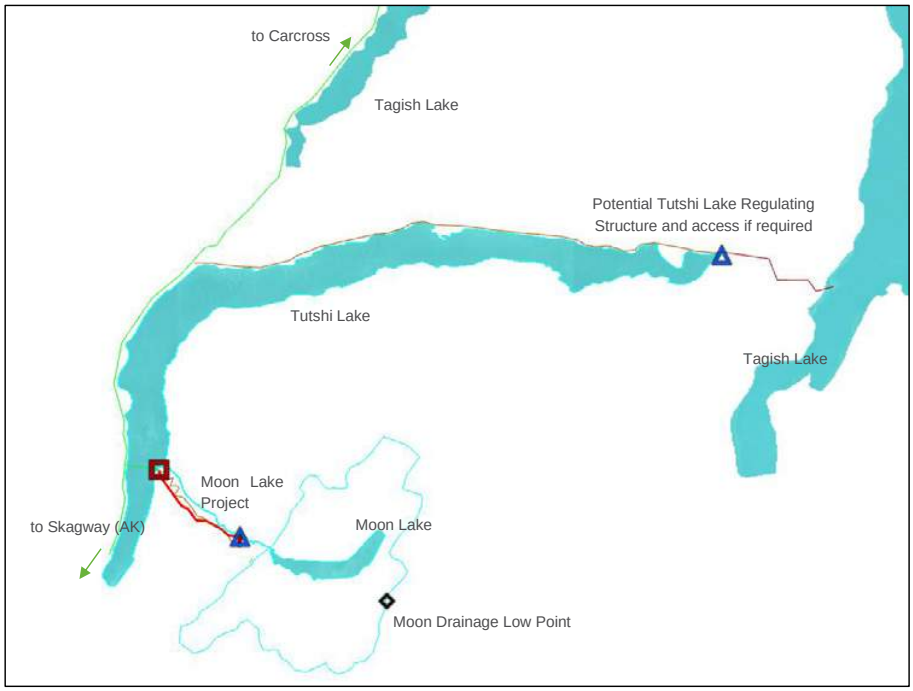

Figure 1.1 Tutshi-Moon Project

The proposed pumped storage project will create a large reservoir for storage on the existing Moon Lake and draw flows as need for generation from this new Moon Lake Reservoir. Water stored in the Moon Lake reservoir will come for two sources, including:

- Natural inflows into the reservoir from the Moon Creek catchment
- Pumped water from the lower Tutshi Lake

The Tutshi Lake/T'ooch' Áayi Conservancy was established in 2012 as a result of the Wóoshtin Wudidaa Atlin Taku Land Use Plan and Taku River Tlingit First Nation Strategic Engagement Agreement. The

conservancy, located approximately 65 kilometres northwest of Atlin, encompasses the eastern half of Tutshi Lake. Tutshi Lake is culturally significant to the Carcross/Tagish and Taku River Tlingit First Nations. The lake also has high value lake trout habitat. The Tlingit name (T'ooch' Áayi) means "charcoal lake", after the dark colour of the lake water. Moon Lake is not located within the conservancy, but the outlet of Tushi Lake is.

2.0 CONFIGURATIONS

2.1 PREVIOUS

The 2015 Midgard report proposed a project arrangement comprising the following key components:

- a 31 m high, 700 m long earthfill dam on Moon Lake with a spillway on the south abutment of the dam.
- a low level outlet/intake in both Moon Lake and Tutshi Lake.
- a 5.24 km long, 1.6 m diameter buried steel penstock.
- a powerhouse, with concrete substructure and steel superstructure, containing a 20.2 MW vertical axis Pelton turbine and synchronous generator as well as two 9.4 MW peak power, variable speed drive vertical axis pumps. Flows would be discharged to or drawn from a 7 m deep sump connected to Tutshi Lake.

2.2 PROPOSED

For the purpose of this assessment the layout of the proposed Moon-Tutshi Project has been assumed to be comparable to the Midgard layout, but with differing storage capacities and generation capacities. The Moon Lake dam location and powerhouse location were assumed to be identical; the penstock was assumed to be run on the left bank. The penstock alignment was changed slightly for a more manageable access gradient shortening it by 250m for a total 5km length. These concepts should be further refined if the project is advanced.

The project characteristics for the different development options are presented in Table 2.2 below. The pumping durations presented below were determined based on preliminary modeling of the hydrological system and could be increased in size if desired (i.e. to provide additional flexibility for YEC's Grid for the addition of more renewables such as wind and solar).

Knight Piésold CONSULTING

Table 2.1 Moon-Tutshi Project Attributes

	Moon-Tutshi Pumped Storage			
	15 MW	15MW	25MW	35MW
	25 GWh	50 GWh	50 GWh	50 GWh
Moon Lake Minimum Operating Level (masl)	1,114	1,114	1,114	1,114
Moon Full Supply Level (masl)	1,121.5	1,124	1,124	1,124
Tutshi Lake Tail Water Level (masl)	714	714	714	714
Active Storage Variation (m)	7.5	10	10	10
Total Dam Height (m) (assuming 3 m of overburden and 4 m of dead storage and 1 m freeboard)	15.5	18	18	18
Active Storage Volume ($x10^6$ m^3)	40	59	59	59
Design Flow - Generation (m^3/s)	4.4	4.4	7.35	10.25
Design Flow - Pumping (m^3/s)	1.0	3.0	3.0	3.5
Installed Capacity (MW)	15	15	25	35
Full to Empty Energy Storage (GWh)	38	56	56	56
Generation Duration to Empty Reservoir (Days)	106	156	93	67
Pumping Duration to Fill Reservoir (Days)	460	228	228	196
Average Annual Generating Energy (GWh)	33.4	51.8	54.7	59.1
Minimum Annual Generating Energy (GWh)	25.2	47.6	46.2	51.2
Average Annual Pumping Energy (GWh)	14.8	39.5	44.6	51.2
Average Annual Net Energy (GWh)	18.5	12.2	10.1	7.9
Average Whitehorse Hydro Plant Bonus Winter Yield (GWh) based on 140 kW per m3/s	1.4	1.8	1.9	2.1
Average Total Net Energy (GWh)	19.9	14.0	12.0	9.0

3.0 HYDROLOGY AND ENERGY ASSESSMENT

KP assessed the hydrology of both the Moon Lake and Tutshi Lake catchment areas and then developed a daily energy model using the parameters presented in the sections below (Sections 3.1. through 3.6).

3.1 HYDROLOGY

For the purpose of this study, more effort was placed on the assessment of the Moon Lake catchment area, as it is small when compared to the Tutshi Lake catchment area and would therefore be the more critical water resource in terms of the pumped storage hydro assessment. The natural inflows into Moon Lake would also contribute to the energy generation potential of the project, and therefore have a direct impact on the financial viability of the project.

Moon Creek has a drainage area of 57.4 km^2 at the proposed dam on Moon Lake. The existing WSC data shown in Table 3.1 was utilised to determine long-term daily inflows into Moon Lake averaging out to 0.8 m^3/s.

Table 3.1 Stream Gauges

Gauge	WSC	Period	Drainage Area (km^2)	Unit Runoff (l/s/km^2)	Complete Years
Moon Creek near the outlet of Moon Lake	09AA018	2012-2017	53	13.5	4
Tutshi River at outlet of Tutshi Lake	09AA013	1956-2017	989	16.2	50

3.2 TUTSHI LAKE STAGE DISCHARGE RELATIONSHIP

For the purpose of this evaluation is was assumed that the Tutshi Lake elevation is naturally maintained at 1,114 masl. This is not an unreasonable assumption given the relative size of Tutshi Lake compared to Moon Lake.

If this project is advanced to the next stage, it is recommended that existing WSC data be utilized to develop a Tutshi Lake stage discharge curve to simulate the natural control of the lake outlet and then perform the appropriate water balance to determine if there is any significant fluctuation in the Tutshi Lake levels that might impact the energy and power generation potential of the proposed project.

3.3 CYCLE EFFICIENCY

A traditional pumped storage hydroelectric project has a roundtrip efficiency of about 70% (i.e. consumes 30% more energy than it generates). As per the previous studies by KP and Midgard, the same 30% losses have been assumed for the Moon-Tutshi Project. This equates to a combined hydraulic, electrical and mechanical efficiency of 87% while generating and 81 % while pumping for the 15 MW, 25 GWh option.

3.4 YEC SYSTEM BENEFIT

YEC has advised KP that the average winter water to kW conversion at the Whitehorse Hydro Plant is 140 kW per m^3/s. The expected additional annual winter energy yield is shown in Table 2.2.

3.5 STORAGE

For the purpose of this assessment the depth area capacity relationship (DAC) provided by the Midgard has been used in the assessment. The corresponding active storage volumes are shown in Table 2.2.

3.6 OPERATING RULES

The Moon Lake Reservoir is operated on a continual generation basis to the extent possible during the months of November-February or if the reservoir is over 95% full. Pumping is triggered in the months of June-September until the reservoir is 95% full. An instream flow release (IFR or ecological flow) of 5% of the Mean Annual Discharge (MAD) is continually released from the Moon Lake Reservoir to sustain the aquatic habitat in Moon Creek.

Knight Piésold CONSULTING

3.7 ENERGY ASSESSMENT

A daily flow energy model was developed for the system that accounted for both the pumped flow into Moon Lake plus the natural inflow into Moon Lake. This makes the Moon-Tutshi Pumped Storage Project somewhat unique, as for all four options for the project are net energy generators (i.e. not consumers like traditional closed loop pumped storage hydro facilities). Table 2.2 presents the results of the study, including:

- Energy required for pumping
- Energy generated from a combination of the pumped flows and natural inflows
- Energy generated through benefits to the YEC grid
- Total Net Energy (GWh/year)

4.0 COST ESTIMATE

The capital cost estimates shown in Table 4.1 are based on the project configurations described in Table 2.2 above. These basic project characteristics were used to establish the sizes of the project components and associated quantities. These technical attributes were used to estimate approximate material volumes for excavation, backfill, embankment material and reinforced concrete. Electrical and mechanical equipment requirements were estimated based on empirical data from KP's prior projects and published reports. The capital cost estimate includes an allowance for the Contractor's preliminary and general costs (overheads, insurance, bonus and profit etc.), an allowance for EPCM costs, and a variable contingency.

Unit rates for material production, equipment procurement and installation costs relied on KP's internal costing database including recent, relevant experience with similar sized hydroelectric projects in Western Canada and the Yukon Territory. KP's hydro project cost database also offered an "order of magnitude check of total estimated costs for individual facility components and complete facilities, based on projects with comparable characteristics such as, design flow, penstock pipe characteristics (length, diameter, etc.), gross head, generating capacity, powerhouse area, excavation quantities, reinforced concrete volumes, backfill quantities, switchyard capacity and transmission line capacity and length. Generating equipment costs are based on installed capacity, head and flow, while switchyard costs are interpolated based on installed capacity.

Knight Piésold CONSULTING

Table 4.1 Cost Estimate

	Tutshi-Moon			
	15 MW	**15MW**	**25MW**	**35MW**
	25 GWh	**50 GWh**	**50 GWh**	**50 GWh**
Mod, Demob, Insurance, Bonds, Overheads, Contractor's Profit	$30,500,000	$32,500,000	$41,000,000	$46,800,000
Access and Site Preparation	$6,000,000	$6,000,000	$6,000,000	$6,000,000
Intake, Forebay, and Headrace	$3,200,000	$3,200,000	$4,500,000	$5,700,000
Water Conveyance System	$25,000,000	$25,000,000	$37,500,000	$43,400,000
Powerhouse and Ancillary Services	$11,000,000	$11,000,000	$15,500,000	$18,000,000
Power Generation Equipment (Water to Wire)	$15,000,000	$15,000,000	$25,000,000	$35,000,000
Switchyard, Transmission and Interconnection	$4,000,000	$4,000,000	$4,000,000	$4,000,000
Dams and Reservoirs	$22,500,000	$29,000,000	$29,000,000	$29,000,000
Access and Dam on Tutshi	$15,000,000	$15,000,000	$15,000,000	$15,000,000
Sub-Total	$132,200,000	$140,700,000	$177,500,000	$202,900,000
EPCM	$10,600,000	$11,300,000	$14,200,000	$16,200,000
Contingency	$39,700,000	$42,200,000	$53,300,000	$60,900,000
Total Estimated Capital Cost	**$182,500,000**	**$194,200,000**	**$245,000,000**	**$280,000,000**

NOTES:

1. 2019 CANADIAN DOLLARS (CAD)
2. DOES NOT INCLUDE UPFRONT ENVIRONMENTAL, PERMITTING AND OWNERS COSTS.
3. DOES NOT INCLUDE APPLICABLE SALES TAXES.
4. EPCM COSTS INCLUDE DETAILED ENGINEERING, TENDERING OF CIVIL AND WATER-TO-WIRE CONTRACTS, SITE SUPERVISION, OVERALL PROJECT MANAGEMENT AND ENVIRONMENTAL MONITORING.
5. COSTS ARE PRELIMINARY AND ARE CONSIDERED EQUIVALENT TO AN AACE CLASS 5 ESTIMATE.

5.0 RECOMMENDATIONS

It is recommended that the Taku River Tlingit First Nation and Carcross Tagish First Nation be consulted prior to any serious consideration of the project development. There may be traditional use and cultural values associated with the site that this study does not take into consideration. A more detailed review of site-specific data would be required to confirm project viability and the optimal project size.

Further evaluation of the site is recommended, to improve the design basis, the project configuration, and the understanding of hydrological, topographical and geotechnical conditions. The following activities are recommended:

- Set the project's energy objectives, including the required installed capacity and winter energy generation requirement with a clear purpose for how the plant is envisaged to be utilised.
- Perform a more detailed review of the existing hydrological information.

Knight Piésold CONSULTING

- Obtain accurate topographical mapping for the proposed project area to confirm project configurations and details including dam sizes, water conveyance routings, available generation head, powerhouse locations, access roads, and transmission lines. For this project site a LIDAR survey is highly recommended. KP can aide in solicitating contractors to this effect.
- Several existing rights have been previously been identified at the project site and its vicinity. These should be investigated further in order to make sure all potential development barriers have been mitigated.
- Submit a water licence application to Front Counter BC so as to secure the first-in-line water rights to the project ahead of other potential claimants. British Columbia recognizes the rights to water on a first come, first serve basis.
- Complete a feasibility level assessment of the project, including environmental screening.

6.0 CLOSING

Should you require any additional information or clarification on the content of this report, please do not hesitate to contact either of the undersigned.

Yours truly,
Knight Piésold Ltd.

TOPIC: **Diesel Retirement Replacement**

REFERENCE: **2021 General Rate Application, Appendix 5-3, Section 5.3-1**

PREAMBLE: On page 5.3-3 (PDF page 181), YEC discusses diesel replacement.

QUESTION:

a) Please provide the business case that identifies all the options or alternatives considered and a detailed analysis of the costs of replacement compared to each of the options considered. In the response, please provide the costs of each unit included in the proposal, and the total cost or the project.

b) Please fully discuss how YEC considers total life cycle cost of the alternatives in its business case.

c) Please provide the expected life of each unit.

ANSWER:

(a)

The project is currently in the planning phase, and will remain in WIP in 2021 and therefore not affect the 2021 GRA forecast revenue requirement. Please see response to YUB - YEC-1-92(c) for an update on planning assessments to date.

(b)

When assessing thermal generation capacity development options focused on addressing the N-1 dependable capacity shortfall, business case assessments examine the levelized cost of capacity (LCOC) for each option over the expected life of the facility.

(c)

The expected life of the planed diesel retirements are:

- Faro Diesel 1 (FD1) is March 2022;

- Dawson Diesel 2 (DD2) is March 2023; and

- Dawson Diesel 5 (DD5) is March 2023.

The remaining diesel plant retirements are beyond the 10 year period.

TOPIC: **Southern Lakes Enhanced Storage**

REFERENCE: **2021 General Rate Application, Appendix 5-3, Section 5.3-1**

PREAMBLE: On page 5.3-4 (PDF page 182), YEC discusses Southern Lakes Enhanced Storage.

QUESTION:

a) Please provide a detailed analysis that clearly demonstrates how the Southern Lakes Enhanced Storage project was considered in determining the need for each capital project that results in increased capacity of the asset or system.

ANSWER:

(a)

The Southern Lakes Enhanced Storage Project was selected in all scenarios of YEC's 2016 Resource Plan, and was also included in YEC's 10-Year Renewable Electricity Plan. Accordingly, the project has been inherently included in the analysis of all YEC projects needed for the future.

TOPIC: **EV Infrastructure Project**

REFERENCE: **2021 General Rate Application, Appendix 5-5**

PREAMBLE: On PDF page 194, YEC discusses an EV Infrastructure Project.

QUESTION:

a) Please fully discuss and explain who (shareholder or customer) would bear the risk if there is not sufficient EV usage to warrant EV stations.

b) Please fully explain YEC's position as to whether EV stations should be owned and operated by independent competitive entities or by regulated utilities.

ANSWER:

(a) and **(b)**

Please see response to YUB-YEC-1-101. Subsequent to the submission of the Application, YEC has chosen to defer this project to a future year, as it is expected to take several years for the rollout of electric vehicles to take place at a larger scale in Yukon. This change has no impact on the forecast revenue requirement for the 2021 test year, i.e., Appendix 5.5 includes only projects forecast to remain in WIP.

The potential impact of electric vehicles on the Yukon electrical system will need to be assessed along with any requirements for YEC to meet these challenges. As noted in the Application, not addressing this could result in unforeseen costs and reactionary programs.

TOPIC: **Board Directions**

REFERENCE: **2021 General Rate Application, Tab 6.0**

PREAMBLE: On PDF page 198, YEC discusses Cost of Service (COS) studies and rate design. On lines 15-19, YEC states:

> The latest Order in Council (OIC) direction provided in December 2018 (OIC 2018/220) provides that material rate design changes that would result in rebalancing of rates between different customer classes cannot be undertaken at this time. The remaining outstanding directives in Order 2010-13 will be addressed in the next joint cost of service and rate design application. This includes directives #1 to #12 and #19 (as summarized in Tab 6 of the 2012/13 GRA filing).

QUESTION:

a) Please fully discuss and explain all conversations, communications, and correspondence YEC has had with its Shareholder, about why a COS proceeding and rate rebalancing may in fact be appropriate.

ANSWER:

(a)

This question is outside the scope of the current proceeding.

TOPIC: **Directive #463 – Battery Project**

REFERENCE: **2021 General Rate Application, Tab 6.1.5**

PREAMBLE: On PDF page 207, YEC notes that the Board did not approve a battery project, yet YEC proceeded with a project, based on receiving grants for the project.

QUESTION:

a) Please fully explain YEC's position on who bears the risk if the project does not produce benefits or proves to be unviable. Would that be written off to the shareholder or included in future rates?

ANSWER:

(a)

It is noted that the Battery Energy Storage System project has been designated by OIC 2020/180 as a "regulated project" under Part 3 of *the Public Utilities Act*. Based on this requirement, on January 20, 2021 Yukon Energy filed an application for an energy project certificate and an energy operation certificate with the Minister of Justice of Yukon; and the need and justification for the project will be subject to a review by the YUB prior to the issuance of a project energy certification and operation certification by the Yukon Government. This process will include a review of the project business case and risks.

The project will also be subject to a prudence review by the YUB prior to it being included in rates. Costs determined to be prudently incurred by the YUB would be included in rates.

TOPIC: **Depreciation Study**

REFERENCE: **2021 General Rate Application, Tab 9 Depreciation Study**

PREAMBLE: On PDF page 246, The Alliance Consulting Group states:

> At the request of Yukon Energy, this study continues to use the ALG depreciation procedure to group the assets within each account. In its last depreciation study, Yukon Energy was authorized to use the average life group, whole life ("ALG-WL") depreciation procedure. This study continues to use the ALG depreciation procedure to group the assets within each account.

QUESTION:

a) Please fully explain all methods that are accepted by depreciation experts, including the ELG method. In the response, please provide the advantages and disadvantages of each.

b) Please fully explain the impact on depreciation rates if the ELG were used. Would lives tend to lengthen or shorten?

c) Please provide a full discussion of The Alliance Consulting Group's experience as to which depreciation method is most commonly used.

d) Does The Alliance Consulting Group support the ALG method or would it prefer some other method like the ELG method?

e) Please fully explain whether The Alliance Consulting Group recommended a different method to YEC. Please fully explain the process for the selection of the ALG.

f) Please provide the retainer letter or other engagement documents that govern the relationship between YEC and The Alliance Consulting Group.

g) Please fully explain any ways that The Alliance Consulting Group could support that would lengthen lives and reduce customer rates.

ANSWER:

(a)

ALG or ELG are depreciation procedures. See Attachment 1 to this response which is an extract from Depreciation Systems, an authoritative treatise on the subject. ALG and ELG are defined by how assets are grouped.

As stated in the attachment:

> "Both procedures are "systematic and rational" as required by the definition of depreciation accounting. Use of the average life procedure matches the depreciation charges to the service provided by the average lived unit. That is, the shorter-lived units contribute fewer units of service than the longer-lived units, and therefore, the total accrual associated with a short-lived unit is less than that associated with a long-lived unit. The ALG procedure treats each unit as though its life is equal to the average life of the group. The ELG procedure treats each unit in the group as though its life was known. This is the basis for the argument that the equal life group procedure better matches depreciation charges with the life of the units in the group."

(b)

Alliance Consulting Group has not made the computation to quantify impact of using ELG to determine depreciation rates. In general, with growing plant (such as the case with YEC), ELG will produce higher depreciation accrual rates than ALG. The life choices would remain the same, but the deprecation accrual rates would change and increase if ELG was adopted. If lives are lengthened, both ALG and ELG depreciation rates decrease. If lives are shortened, both ALG and ELG depreciation rates increase.

(c)

Alliance Consulting Group supports the uses of the ALG method, which has been used in the majority of our cases. We have also recommended ELG in certain jurisdictions where ELG is the precedent accepted by the regulatory body.

(d)

Yes, although ELG will provide a more precise pattern for recovering the cost of varying-live assets within a group, both ALG and ELG are accepted in various jurisdictions. YEC's existing depreciation rates are derived using the ALG procedure. Therefore, Alliance Consulting Group supports the uses of the ALG method for YEC.

(e)

Alliance Consulting Group did not recommend any other method to YEC. ALG is the procedure used in YEC's currently approved depreciation rates and ALG is used by many companies across the utility industry.

(f)

See Attachment 1 to this response.

(g)

Alliance Consulting Group does not agree with the concept propounded in the question. Depreciation provides cost recovery of the investment in capital equipment. Regulatory principles incorporate the matching principle where customers utilizing assets should be charged for the recovery of those costs over the assets' lives, rather than shift the burden to ratepayers who do not have use of the assets. The proposed depreciation rates by Alliance Consulting Group achieve that objective.

5 Depreciation Systems

THE recovery of capital through depreciation accruals may be thought of as a dynamic system. A system is an arrangement of things that are connected to form a complete organization of integrated parts. The state of the system at any time is defined by current values of the characteristics that define the system. A dynamic system is one where the state of the system depends on the history of the input variables. To define and study a system is to better understand the system so that more efficient methods of control can be designed to accomplish the desired ends.

There are two methods of controlling a system. One is to select an input and wait for the result or final output. If a different output is desired, the input is changed and the new output is obtained. The other method of control is to select an initial input, monitor the process, and when necessary, alter the input to achieve the desired goal. The first method is called an open control loop and the second a closed control loop. A necessary feature of the closed control loop is the feedback resulting from the monitoring of the system. A home heating system is a common and simple example of a dynamic system with a closed feedback loop. The parts of the system are a furnace and a thermostat. The thermostat monitors the room temperature and creates feedback, in the form of electrical signals, when the room temperature rises above or falls below the desired temperature. The electrical signals turn the furnace off or on to achieve the desired goal, a constant, predetermined room temperature.

Think of a depreciation accounting system as a dynamic system controlled with a closed feedback loop. Estimates of life and salvage and the

amount of plant in service are inputs to the system, and the accumulated provision for depreciation is a measure of the state of the system at any time. The process of calculating the accumulated provision for depreciation is determined by the factors needed to define the system. The initial input to the system is estimates of the life and salvage, which are combined in an accrual rate. Dynamic forces affect the life and salvage, and revision of the original life and salvage estimates are the result of the monitoring process. These revisions to the initial input initiate feedback in the form of adjustments to the accumulated provision for depreciation. The goal of the system is recovery of capital in a timely manner.

One consideration that complicates this discussion is that many options can be combined to form many different depreciation systems. Whether the depreciation is for book, tax, valuation, or other purposes, each of these factors must be considered when discussing and defining a depreciation system.

DEFINING A DEPRECIATION SYSTEM

Below is a list of the factors needed to define a depreciation system. Each factor contains two or three options, and the complete definition of a system requires the selection of one option from each factor. The order of the list is arbitrary, but the last four factors are those whose options are varied when discussing depreciation systems commonly used to calculate book depreciation.

1. The depreciation concept, including (a) physical condition, (b) decrease in value, or (c) cost of operation
2. Depreciation over (a) time or (b) units of production
3. Depreciation of (a) a unit of property or (b) a group of property
4. Methods of allocation, including (a) the straight line method, (b) an accelerated method, or (c) a decelerated method
5. Procedures for applying the method of allocation including (a) the average life procedure, (b) the equal life group procedure, or (c) the probable life procedure
6. Adjustment using (a) the amortization method or (b) the remaining life method
7. Use of (a) the broad group model or (b) the vintage group model

The mathematically astute reader who multiplies the number of options in each factor will find that there are 432 combinations of options, each of which is a potential depreciation system. However, not all of these combinations are feasible, and some are unimportant. Only a few of these

combinations are of major interest when considering systems of book depreciation currently being used.

Concepts of Depreciation

Three options are available when defining the concept of depreciation. These include (a) physical condition, (b) decrease in value, or (c) cost of operation. Though all have been used by utilities to determine book value, the cost of operation is, with few exceptions, the concept in current use.

Physical condition is, perhaps, the first option a lay person would think of if asked to define depreciation. An early reference to the relationship between depreciation and physical condition is from the 1588 textbook by John Mellis who referred to a debit to the profit and loss account because "implements of householde I doe find at this day to be consumed and worn." A later reference is in the 1833 annual report of the Baltimore and Ohio Railroad, which reported that an annuity was established "to provide for the replacement of oak sills and sleepers and yellow pine stringpieces."

Two problems arise when using the concept of physical condition as a measure of depreciation. First, wear and tear do not account for all retirements; in fact, they are often a minor reason for the retirement of property. Second, physical condition can be difficult to measure. Though it is possible to measure directly the wear of railroad track and the corrosion of cast iron pipe, easily measurable wear is not characteristic of most industrial property.

The concept of loss of value is also a common depreciation concept, and the lay person often uses it to explain the difference between the purchase price and the current market value of an automobile or major household appliance. The definition from the Supreme Court case *Lindheimer v. Illinois Bell Telephone* (1934) is often quoted: "Broadly speaking, depreciation is the loss, not restored by current maintenance, which is due to all the factors causing the ultimate retirement of the property. These factors embrace wear and tear, decay, inadequacy, and obsolescence."

In contrast to the concept of physical depreciation, the Lindheimer definition recognizes that factors other than wear and tear cause or contribute to the retirement of property. The definition refers to the "loss" but does not clearly state what is "lost" or how the "loss" should be measured. A 1935 definition by the Federal Communications Commission was similar to the Lindheimer definition but referred to "loss in service value," where service value is equated to the original cost less salvage.

Use of the concept of loss of value to determine annual depreciation charges might imply the need for an annual valuation of the property owned by the organization, particularly if the rate of loss in value was not

uniform or readily defined. The process of determining a value is complex, depending on the purpose of the valuation and type of property. Thus, an annual valuation of a utility could be such an expensive and time-consuming process that it would not be a practical approach to use in determining annual depreciation.

Many types of property provide a constant level of service until they are retired. The intrinsic physical value of this type of property is only that it functions. A gas meter is a common example of a type of property that may provide a constant level of service throughout its life. If value is measured by the level of service provided, the meter would retain full value until retirement because its value to the utility would depend on its function rather than its age. This concept ignores the consumption of future service and would result in an annual depreciation charge that would be zero until the final year of service. Then the charge would equal the full value and would result in deferring all depreciation charges until the final year of service. A concept that better matches depreciation to service rendered and weighs it in relation to the total service potential might be preferable for purposes of both book and valuation depreciation. That is, a quantitative measure of value, such as service-years, is generally preferable to a functional measure.

The third concept is that depreciation represents an allocated cost of capital to operation. This concept recognizes that depreciation is a cost of providing service and that an organization should recover the capital invested in equipment and other property needed to provide the required service. In fact, the term *capital recovery* is often used in connection with depreciation. An early reference to depreciation is by the Roman Marcus Vitrurius Pollio, who in 27 B.C. wrote of "walls which are built of soft and smooth-looking stone, that will not last long." He calculated that the walls would not last more than eighty years and suggested that, for purposes of valuation, one-eightieth part of their original cost be deducted each year. Pollio not only raised several issues concerning depreciation but seemed to be equating depreciation to a cost of operation.

The definition of *depreciation accounting* by the American Institute of Certified Public Accountants (1961, par. 56) reflects the concept of depreciation as a cost: "Depreciation accounting is a system of accounting that aims to distribute cost or other basic value of tangible capital assets, less salvage (if any), over the estimated useful life of the unit (which may be a group of assets) in a systematic and rational manner. It is a process of allocation, not of valuation." This definition does not use the term *loss of service value* because it is defining depreciation accounting rather than depreciation itself. The definition emphasizes that the purpose of depreciation accounting is a means of distributing cost in a rational manner during the service life, in turn providing for the systematic recovery of capital. By use of the term *useful life,* the definition encompasses all causes of retirement. By referring to the distribution of cost less salvage, this definition recognizes that salvage should be considered when developing depreciation charges.

Historically, all three concepts of depreciation have been used by utilities to determine the book value of industrial property. Of these, the concept of depreciation as the allocation of cost has proven to be the most useful and most widely used concept.

Time versus Unit of Production

Useful life can be measured in units of time or units of production (also called units of service). Measurement of life in years is a common and familiar concept. Measurement of life in units of production can be applied to some types of property such as a truck, whose life can be measured in miles (e.g., a useful life of 100,000 miles). A feeder pipeline connecting an oil field to a transmission line will be in service until the field is no longer productive. If the only function of the feeder line is to transport oil from the field to the transmission line, the life of the feeder line is determined by the reserves of the oil field that must eventually pass through the pipeline. Annual depreciation could be measured in units of production, such as barrels of oil. A railroad might depreciate rail as a function of the accumulated weight that the rail has carried.

Suppose a truck is to be depreciated over its life as measured in miles. First, the life must be estimated, say 100,000 miles. Second, the number of miles the truck will be driven during the next year, say 27,000 miles, must be forecast to have sufficient information to budget the annual depreciation charge. Third, at the end of the year when the budgeted annual depreciation becomes an accounting entry, the amount would be calculated to reflect the actual miles driven.

The most common measure of life is in units of time rather than units of production. Most types of property (e.g., poles, buildings, wire) do not have a measure of production associated with them. If the life can be measured in some unit of production and the rate of production is constant from year to year, measurement of life in either units of time or production will result in the same annual accruals. The unit of production has strong appeal in situations where use varies significantly over time and the life can be measured in units of production. But these two conditions are not often met, and usually life is measured over time.

Depreciation of an Individual Unit versus a Group

Accounting records of transactions relating to depreciable property can be kept on either a unit or a group basis. An individual unit of property has a single life, while the units in a group of property display a range, or

dispersion, of lives. Grouping many units of property into a single account simplifies the accounting system but also creates a complexity not encountered in the depreciation of an individual unit. The resulting complications provide a major challenge to the depreciation analyst.

A vintage group refers to a group of property placed in service during the same year. The plant in service decreases until all units are retired from service. The individual unit and the vintage group are similar because each has well-defined life characteristics. The life of an individual unit is described by a single number and the life of a vintage group is described by a survivor curve, which is a statistical description of the lives of the units of property in the group.

Methods of Allocation

To fully recover capital invested in plant and equipment, the total depreciation charge must equal the depreciation base. When using the allocation of cost concept, the depreciation base is the initial, or original, cost less net salvage. The annual depreciation accrual rate for a unit of property can be (a) constant over life (straight line), (b) high during early years and low in later years (accelerated), or (c) low in early years and high in later years (decelerated). Most methods of allocation fall into one of these three classifications, although it would be possible to develop a method that is a combination of them. The straight line method of allocation is the method of allocation most often used when calculating book depreciation. Accelerated methods of allocation are commonly used for tax purposes. Decelerated methods of allocation are not in common use for book or tax purposes, but they are of historical interest and are used in valuation problems.

Average Life, Equal Life Group, or Probable Life Procedures

The average life and equal life group procedures are two ways of applying a method of allocation to determine the annual accrual. The probable life procedure is similar to the average life procedure, but is not appropriate for depreciation accounting.

A group of property displays a wide range of lives, and the life characteristics of the group must be described statistically. This is in contrast to a unit of property, whose life can be described as a single number. When depreciating a group of property, rather than a unit of property, a major decision must be made whether to base the depreciation accrual rate on the average life of the group (the average life procedure) or whether to divide the group into subgroups of equal life (the equal life group procedure).

In the average life procedure, a constant annual accrual rate based on the average life of all property in the group is applied to the surviving

property. Most retirements occur either before or after, rather than at, the average life, but both short- and long-lived property are depreciated at the same rate. Property having a shorter life than the average will not be fully depreciated by the time of its retirement. Because the accrual rate is based on the average life of the group, the difference between accruals for early retirements and the full cost of the early retirements will be balanced during the life of the property having lives longer than the average. The result is that the group will be fully depreciated by the time of the final retirement.

In the equal life group procedure the property is divided into subgroups that each have a common life. Each subgroup is then depreciated as a unit using an accrual rate based on the common life of the group. Each unit is fully depreciated by the time it is retired. Application of the equal life group procedure is generally considered to better match the consumption of capital with service provided than does application of the average life procedure.

Any of the three methods of allocation (i.e., straight line, accelerated, or decelerated) can be applied to an individual unit or to group property. When the average life procedure is applied, the straight line method of allocation is easily used; application of either an accelerated or a decelerated method becomes more complicated. When the equal life group procedure is used, any of the three methods of allocation can be easily used.

The probable life procedure is a variation of the average life procedure. It is not valid for depreciation accounting or capital recovery because it does not fully depreciate the group. The depreciation charges are allocated over the average life of the property remaining in service (i.e., over the probable life), so that the continually decreasing rate is inadequate to fully recover the depreciable base. Use of this procedure should be restricted to those special situations where it is applicable; for example, it may used in the valuation process.

Methods of Adjustment

Depreciation accrual rates are calculated using estimates of the service life and salvage. Over time, new events that provide additional information occur, and the existing estimates are revised. A revision of the estimates of life and salvage results in the recognition that the accumulated provision for depreciation may now be either higher or lower than necessary, depending upon the magnitude and direction of the revised estimates. This recognition may justify an adjustment to the accumulated provision for depreciation, an adjustment to the annual depreciation rate, or both.

Adjustments to the accumulated provision for depreciation[1] can be made using either a fixed amortization period or the remaining life basis. The term *amortization method of adjustment* is used to describe a general

approach in which the first step is the estimation of the required adjustment to the accumulated provision for depreciation and the second step is the determination of the timing and amount of the adjustment. In the remaining life method of adjustment, adjustments to the accumulated provision for depreciation are amortized over the remaining life of the property and are automatically included in the annual accrual.

The amortization method of adjustment uses the revised estimates of life and salvage characteristics to compute the calculated accumulated depreciation (CAD) to serve as a guide when determining the appropriate adjustment. The CAD is compared to the accumulated provision for depreciation; a significant difference between the two shows that an adjustment to the accumulated provision for depreciation may be advisable. The adjustment can be allocated in several ways, which might include (1) a lump sum equal to the adjustment made immediately, (2) amortization of the adjustment over a fixed period (e.g., over 5 years), or (3) amortization of the adjustment over the remaining life of the property. A lump sum adjustment is not an amortization but will be considered an option in the amortization method of adjustment (i.e., the amortization method could be more accurately called the amortization or lump sum method of adjustment). The difference between the CAD and the accumulated provision for depreciation is only an estimate of the required adjustment. The need for, the magnitude of, and the timing of the actual adjustment should be based upon the recommendation of the depreciation professional. This recommendation requires professional judgment and should consider several factors: the characteristics of the account; the cause of the difference; estimates of future events that will affect the property; the year-to-year volatility of the accumulated provision for depreciation; and the depreciation policies of the organization. A revised forecast of life or salvage normally leads to a revised depreciation rate even when an adjustment to the accumulated provision for depreciation is not considered necessary.

When using the remaining life method of adjustment, emphasis is placed upon forecasting the remaining life of the property in service. A change in the estimate of either life or salvage characteristics automatically triggers an adjustment to the accumulated provision for depreciation, and the adjustment will be spread over the remaining life of the property.

Broad Group or Vintage Group Model

Typically, property depreciated as a group provides a service to the organization over a long period of time. Each year property in the group is retired from service, but new property is added to the group to replace that retired or to increase the capacity of the group. Thus, over time vintage groups are continually being retired from and added to the group. A group

such as this is called a *continuous property group,* though the term *open-ended group* is also used. The life and salvage characteristics of the vintages in the continuous property group must be specified in some systematic manner. The broad group model views each vintage in the continuous group as having identical life and salvage characteristics. The vintage group model views each vintage as having different life and salvage characteristics.

UNIT DEPRECIATION

Depreciation of a unit of property is a concept more readily understood than depreciation of a group of property. This section will present a brief discussion of the three methods of allocating the depreciable cost of a unit of property among accounting periods. An understanding of unit depreciation, particularly the straight line method of allocation, is necessary when considering depreciation for a group of property. In all examples, the cost of operation depreciation concept will be used, and depreciation will be over time (i.e., years). The depreciation base will equal the original cost less net salvage. This base represents the amount of capital to be consumed and, therefore, the amount of capital to be recovered through depreciation accruals.

Methods of Allocation

The three general methods of allocation are straight line, accelerated, and decelerated. An example of each will be applied to a unit of property that has an initial cost of $4000, a life of 4 years, and a net salvage value of $800 at retirement. The net salvage is commonly expressed in terms of the *salvage ratio* (SR), $800/$4000 or 0.20 or 20%.

Straight Line Method of Allocation

The straight line method of allocation is used almost exclusively by regulated, capital-intensive companies when calculating depreciation accruals for book accounting purposes. The straight line method applies a constant annual accrual rate to the cost of the unit, thus yielding a constant annual depreciation charge. The net book value (i.e., the original cost less the accumulated provision for depreciation) plotted versus time is a straight line.

The straight line rate is (1 – SR)/life. The factor (1 – SR) = (1 – 0.20) = 0.80, or 80%, represents the fraction of the original investment consumed during the life of the property, or the depreciable base. In this example that amount is 0.80 × $4000, or $3200. The accrual rate is 0.80/4

or 20%. The equal annual accruals are obtained by multiplying the original cost by the accrual rate. The figures in Table 5.1 (see end of chapter) are based on the assumption that this property was installed on January 1, 1974, and show the resulting accumulated provision for depreciation by year for this system. In the final year, the credit to the accumulated provision for depreciation equals the annual depreciation charge of $800 plus the net salvage of $800 for a total credit of $1600.

A major reason for the popularity of the straight line method is its simplicity. In addition, it occupies a middle ground between the accelerated and decelerated methods. Implicit in the use of the straight line method is the suggestion that the level of service provided by industrial property is independent of its age, and therefore the annual depreciation rate also should be independent of age (i.e., constant). Examples can be given where property such as poles, pipelines, cable, and meters provides a constant level of service throughout its life, but examples where the service provided by these types of property varies with age also can be given.

Accelerated Methods of Allocation

Any method that results in annual accruals that are higher early in life than late in life is called an accelerated method of allocation. Accelerated methods are allowed for calculating depreciation for tax purposes and are often used because of the rapid recovery of capital that they provide. Sometimes industrial property provides more service during early years than later years. An electrical generating unit begins its life as a base load generator operating continuously except for scheduled maintenance. As more efficient generators are installed, the base load generator becomes a peak load generator and operates only several hours each day. Eventually the generator is not used regularly but is used on a standby basis. Thus the service it provides changes significantly with age.

One accelerated method is the sum-of-years–digits method. Applying it to the $4000, 4 years, 20% salvage ratio example leaves the depreciable base unaffected at $3200, but the annual accruals vary with age rather than staying constant. To calculate the annual rate during year i, first sum the digits from 1 through the maximum life. In the example the sum is $1 + 2 + 3 + 4 = 10$. (A useful equation is that the sum of digits from 1 to n is $[(n)(n + 1)/2]$ or in the example $[(4) \times (5)/2] = 10$.) The rate during year i is $(1 - SR)(\text{life} - i + 1)/(\text{sum-of-years–digits})$. Applied to the example, the annual accrual rates are calculated as follows:

			Annual Rate	
Year	Sum	Life − Year + 1	No Salvage	With Salvage
1	10	4 − 1 + 1 = 4	40%	32%
2	10	4 − 2 + 1 = 3	30%	24%
3	10	4 − 3 + 1 = 2	20%	16%
4	10	4 − 4 + 1 = 1	10%	8%
			100%	80%

Note that with no salvage the accrual rates sum to 100% and that with salvage the accrual rates sum to 100%(1 − SR) or 80%, so that the depreciable base is recovered. Table 5.2 (see end of chapter) shows the application of the sum-of-years–digits method to the example.

The annual accruals of $1280 and $960 during the first two years are larger than the $800 annual accrual when using the straight line method of allocation, but the $640 and $320 for the final two years are less. When matching depreciation to service, an accelerated method of allocation would be appropriate if the property yields significantly more service early in life than it does later in life.

The declining balance method is another example of an accelerated method of allocation and it is widely used for tax depreciation. This method applies a constant rate to the declining balance of the book value, so that the annual accruals decrease even though the rate is constant. The rate is equal to a constant/life; if the constant is two, the rate is double the straight line rate and results in the double declining balance method. Rather than double declining balance, we will use 1.5 declining balance, so that the rate is 1.5/4 or 37.5%. Table 5.3 (see end of chapter) shows the calculations using the 1.5 declining balance method and illustrates a complexity inherent in the method. Because salvage was not included in the rate, it is necessary to switch to a straight line rate late in life so that the final value of the accumulated provision for depreciation is zero. In this example, the book value is $976 at the beginning of the fourth year; continuation of the 37.5% rate will result in a fourth-year accrual of $366 and total accruals of $3390, which is $190 more than the $3200 capital that has been consumed. We will switch to a straight line rate that will yield a final accrual of $976 − $800 or $176 during the final year as shown in Table 5.3. Details on switching rules should be obtained from the IRS if using this method for tax depreciation.

The equation $1 - (SR)^{1/N}$ calculates the declining balance rate that will yield a final book value equal to a nonzero salvage. In our example that rate is $1 - 0.2^{1/4}$ or 1 − 0.67 or 33%. Applying that rate to the book balance yields total annual accruals of $3200 without resorting to switching rules at the end of the life.

Decelerated Methods of Allocation

Any method that results in annual accruals that are lower early in life than later in life is called a decelerated method of allocation. The sinking fund method is an example of a decelerated method. To apply it to our example, the sinking fund factor (also called the A/F factor) must be calculated; the sinking fund factor is $\{r/[(1 + r)^n - 1]\}$, where r is an interest rate and n is the life. Tables of this factor as a function of r and n are included in most books on business finance and engineering economics. If r = 10% and n = 4, the sinking fund factor is $\{0.10/[(1.10)^4 - 1]\}$ or 0.2155. This means that if \$100 × 0.2155 or \$21.55 is invested at the end of each year for four years and returns an annual effective return of 10% compounded annually, the value of the sinking fund at the end of the fourth year will be \$100. But in order for the four annual payments of \$21.55 to total \$100, each payment must be compounded by (1 + r), or 1.10 in the example, each year. The accrual rate without salvage is 21.55% the first year, 1.1 × 21.55% or 23.70% the second year, 1.1 × 23.70% or 26.07% the third year, and 1.1 × 26.07% or 28.68% the fourth year. The annual accrual rates without and with 20% salvage are summarized as follows:

	Annual Rate	
Year	No Salvage	With Salvage
1	21.55%	17.24%
2	23.70%	18.96%
3	26.07%	20.85%
4	28.68%	22.95%
	100.00%	80.00%

The accrual rates with salvage are used in Table 5.4 (see end of chapter).

The annual accruals of \$690 and \$758 during the first two years are less than the \$800 annual accrual resulting from the straight line method of allocation, and the \$834 and \$918 during the final two years are more. A larger rate of interest results in a larger difference between annual accruals. A negative interest rate will result in accelerated depreciation. A zero interest rate results in a straight line rate.

Another decelerated method of allocation is the present worth method. It results in annual accruals that are identical with the sinking fund method, although the rationale leading to the calculation of the annual accruals is different. The present worth method is often used in the economic valuation and comparison of capital investments.

GROUP DEPRECIATION SYSTEMS WITH NO SALVAGE

The remainder of this chapter is devoted to the depreciation of a vintage group of property. First, the systems described and examples presented will assume zero salvage. Then the modifications to these systems when salvage is not zero will be introduced and discussed.

Four of the seven factors of depreciation listed at the beginning of the chapter will be limited to one option during the following discussion. Only the cost of operation concept of depreciation will be considered. Depreciation will be over time. Depreciation will be of a group, not a unit. Only the straight line method of allocation will be used. Both the average life and equal life group procedures, and the amortization and remaining life methods of adjustments will be examined. A discussion of the broad group and vintage group models will be deferred to a following chapter.

The Average Life Procedure Applied to a Vintage Group

Calculation of the Annual Accrual

One system of calculating the annual accrual incorporates the straight line method of allocation (SL) and applies the average life procedure (AL) to a vintage group. It is denoted by the initials SL-AL. As defined, this system lacks a feedback loop to control the system. A method of adjustment must be added to design a controlled, closed loop depreciation system.

The average life procedure applies the constant rate of 1/AL to the average plant in service during the year. Note that because the balance is averaged over a year, the AL must be measured in years. If the estimate of the average life is accurate, the vintage will be fully depreciated (i.e., the accumulated provision for depreciation will equal zero) after the final retirement.

It may not be immediately clear that this system will work (i.e., that the sum of the accruals will equal the original cost of the initial installations). The left side of the equation below equals the sum of the annual accruals when a rate of 1/AL is used and is set equal to the amount to be recovered (i.e., the original cost or initial balance).

$$\Sigma \text{ (average plant in service during age interval j)/AL} = \text{original cost}$$
$$\text{summed for j} = 0, 1, 2, \ldots, \text{ML (the maximum life)}$$

The average plant in service during the age interval times the one-year width of the age interval equals the dollar-years service provided during the year. The sum of the values (average plant in service during age interval j) is

equal to the area under the survivor curve and may be written (area under the survivor curve)/AL = original cost, or by rearranging this equation, AL = (the area under the survivor curve)/(original cost). The average life has been shown to equal the area under the survivor curve divided by the original cost (true whether the survivor curve is measured in dollars or units), so the original equality is true. We can conclude that this system will fully recover the initial investment regardless of the shape of the survivor curve.

This equation also shows that if the AL used in the accrual rate is not equal to the actual average life, the sum of the accruals will not equal the original cost. Suppose that the actual life was 8 years, but a life of 6 years was forecast and used in the depreciation rate. The total accruals would equal 8/6 or 133% of the original cost, and the accumulated provision for depreciation would show an overaccrual equal to 133% − 100% or 33% of the original cost at the time of the final retirement. Similarly, a forecast of a life of 10 years would result in total accruals of 8/10 or 80% of the original cost. At the time of the final retirement the accumulated provision for depreciation would show an underaccrual equal to 100% − 80% or 20% of the original cost.

Consider a property group having the survivor curve shown in Figure 5.1. This curve could result from the grouping of two units, one with a cost of $4000 and a 4-year life and the second with a cost of $6000 and an 8-year life. The average life (AL) is the area under the survivor curve divided by the original cost or the AL = [(4000 × 4) + (6000 × 8)]/10000 or 6.4 years. The straight line, average life annual accrual rate is 1/6.4 or 15.625%.

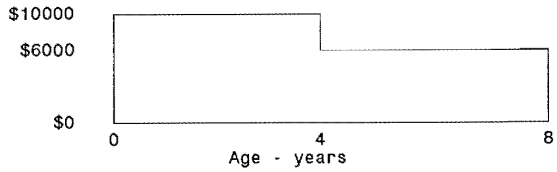

Figure 5.1. A survivor curve with an average life of 6.4 years.

NOTE: To simplify calculations in this section, age intervals will be 0–1, 1–2, 2–3, etc., installations will be assumed to occur at the start of the age interval, and retirements will be assumed to occur at the end of the age interval. The average plant in service during the age interval will then equal the balance at the start of the interval, so that applying the annual accrual rate to the plant in service at the start of the interval is equivalent to applying it to the average balance. In all tables in this section, the balance, accumulated provision for depreciation, and calculated accumulated depreciation are calculated at the beginning of the year. Note that the accumulated provision for depreciation is zero at the beginning of the initial year. Examples using the half-year convention will be shown later.

Table 5.5 (see end of chapter) shows the annual accruals and accumulated provision for depreciation that result from the SL-AL system. Column (b) shows beginning of year balances of $10,000 for the four years 1974 to 1977, and balances of $6000 for the next four years, 1978 to 1981. This follows the survivor curve shown in Figure 5.1. Column (c) shows a $4000 retirement at the end of 1977 and a $6000 retirement at the end of 1981. The annual accrual, column (e), is the product of the rate, column (d), and the plant balance at the start of the year, column (b). As described in the preceding note, retirements are assumed to take place at the end of the year, so that the plant balance at the start of the year is also the average balance during the year. The accumulated provision for depreciation, column (f), is zero at the start of the first year and is then increased by the annual accruals and reduced by the annual retirements. At the time of the final retirement, the accumulated provision for depreciation is zero, showing that the sum of the annual accruals and the annual retirements equals zero and that the property is fully depreciated.

Suppose that at the time of the initial installation of the property, the estimate of the average life was 7.4 years. If the rate 1/7.4 is used throughout the life of the property but the actual life is 6.4 years, then only (6.4/7.4)($10000) or $8649 will be depreciated and $10000 − $8649 or $1351 of invested capital will not be recovered. This is verified by the calculations shown in Table 5.6 (see end of chapter).

An Adjustment Problem—AL Procedure

Now suppose that in January 1977, because of events and activities occurring since 1974, the original forecast of 7.4 years average life is revised to 6.4 years. Table 5.7 (see end of chapter) shows the accumulated provision for depreciation at the start of 1977 is $4054. Unless some corrective action is taken, the annual accruals will not equal the $10,000 original cost, and at the time of the final retirement a total of $1351 will remain unrecovered. The SL-AL system of calculating the annual accruals must be augmented to include a method of adjustment to define a depreciation system that will adapt to the almost certain circumstance that forecasts are revised from time to time.

When there is a revision of the original forecast of service life, it

becomes necessary to consider a method of augmenting the SL-AL system of calculating annual accruals. Either of two methods of adjustment, the amortization method (AM) or the remaining life method (RL), can be added to the system of calculating annual accruals to construct a depreciation system with a closed feedback loop.

Amortization Method of Adjustment (SL-AL-AM)

Use of the amortization method of adjustment does not result in the prescription of an adjustment, but places the responsibility of recommending the magnitude and timing of the adjustment in the hands of the depreciation professional. Control focuses on the calculated accumulated depreciation (CAD). The CAD is normally a reasonable and valid estimate of an adequate level of the accumulated provision for depreciation. The depreciation professional will examine the variation between the CAD and the accumulated provision for depreciation to determine if adjustments to the annual accrual are necessary.

DEVELOPMENT OF THE CALCULATED ACCUMULATED DEPRECIATION. Two approaches can be used to develop the calculated accumulated depreciation. One, a retrospective approach, is to reconstruct the past accruals and retirements to determine what the accumulated provision for depreciation would have been given the current estimate of the life characteristics. The other, a prospective approach, is to estimate the sum of the future additions to and subtractions from the accumulated provision for depreciation. The sum of these additions and subtractions also is an estimate of the accumulated provision for depreciation that would be desirable to have on the books.

The retrospective approach appears to be straightforward. In fact, Table 5.5 shows that if property had the service life characteristics shown in Figure 5.1, the accumulated provision for depreciation at the start of the fourth year would be $4688. Comparison of this figure to the accumulated provision for depreciation of $4054 shown in Table 5.7 shows that an adjustment of $634 is necessary. In practice, however, the retrospective approach has a major shortcoming. The history of the account may go back many years and include accounting transactions, such as transfers, sales, acquisitions, and adjustments, which have been recorded in the accumulated provision for depreciation account. Use of the retrospective approach requires complete knowledge of these transactions as they must be considered for inclusion in the construction of the CAD. Because of the difficulties likely to be encountered in reconstructing the accumulated provision for depreciation, the retrospective approach is usually discarded in favor of the prospective approach.

The prospective approach to the CAD is based on estimates of the

future accruals and retirements. Estimates of future accruals and retirements can be made if the survivor characteristics of the property have been estimated. The following relationship states that the calculated accumulated depreciation plus all future accruals, less all future retirements, equals zero. If this relationship holds, the cost of the property will be fully allocated at the time of the final retirement.

$$\text{CAD(i)} + \text{future accruals} - \text{future retirements} = 0$$

or

$$\text{CAD(i)} = \text{future retirements} - \text{future accruals}$$

The future retirements equal the current balance of the plant in service, because all property currently in service must eventually be retired. The future accruals is the sum of the annual future accruals when the SL-AL system of calculating the annual accruals is used. Thus, CAD(i) = current balance $-$ Σ (average balance during year j)(1/AL) = current balance $-$ (1/AL)Σ (average balance during year j) summed for j from year i to year of final retirement, where CAD(i) = calculated accumulated depreciation at the start of year i.

The average balance during each year is determined by the survivor curve used to describe the life characteristics of the vintage. The sum of the average balances during the year, starting with the current year and continuing through all years until the year of the final retirement, is equal to the area under the survivor curve and to the right of the current age. This area represents the remaining service and is measured, in this case, in dollar-years. The remaining service divided by the plant in service is defined as the average remaining life (also called the expectancy). Dividing both sides of the equation above by the current balance yields the following definition and equation for the calculated accumulated depreciation ratio, which will be abbreviated as CADR[2]:

CAD(i)/current balance = current balance/current balance $-$ (area under the survivor curve/current balance)/AL

CAD(i)/current balance = CADR(i) = 1 $-$ RL(i)/AL, where CADR(i) = calculated accumulated depreciation ratio at age i and RL(i) = remaining life at age i

Tables of the Iowa survivor curves contain values of the calculated accumulated depreciation ratios.

Table 5.8 (see end of chapter) shows the calculation of the RL, the

CADR, and the CAD for the survivor curve shown in Figure 5.1. The 64,000 dollar-years of remaining service at age zero, column (d), is equal to the sum of the annual balances shown in column (c) and also equal to the area under the survivor curve. (Remember that the width of each interval is one year, so that the balance at the start of the year multiplied by the width of the interval, one year, is the area under the survivor curve attributable to that year.) The amount in column (d) represents the remaining service contained in the existing plant. Each year the amount in column (d) is reduced by the average plant balance during that year times the one-year period (i.e., the service provided during the year) to calculate the service, measured in dollar-years, remaining at the beginning of the next year. The remaining life, column (e), is the remaining service divided by the balance or column (d)/column (c). The CADR, column (f), is 1 – remaining life/average life. The CAD, column (g), equals the CADR multiplied by the plant in service. This calculation shows that the CADR is sensitive to both the average life *and* the shape of the survivor curve.

AN AMORTIZATION SOLUTION TO THE AL ADJUSTMENT PROBLEM. Now return to the problem raised in the scenario shown in Table 5.7. Table 5.8 shows that if the estimate of a 6.4-year average life is accurate, the current value of the accumulated provision for depreciation would be $4688 rather than the recorded $4054, and this results in an apparent deficit of $634. If the depreciation professional believes this variation is significant, then an adjustment to the accumulated provision for depreciation should be made.

The adjustment to the accumulated provision for depreciation can be made in several ways, ranging from a lump sum adjustment of $634 to amortizing the $634 over a period less than the remaining life, equal the remaining life, or longer than the remaining life. For example, suppose it is decided to amortize the $634 over two years; then the accumulated provision for depreciation would be credited an additional $317 in 1978 and 1979. In addition, the annual rate would be changed to 1/6.4 to reflect the revised forecast. Table 5.9 (see end of chapter) shows that these adjustments will result in a recovery of the $10,000 initial investment as reflected by the final zero balance of the accumulated provision for depreciation.

The CAD is not a precise measurement. It is based on a model that only approximates the complex chain of events that occur in an actual property group and depends upon forecasts of future life and salvage. Thus, it serves as a guide to, not a prescription for, adjustments to the accumulated provision for depreciation.

Remaining Life Method of Adjustment (SL-AL-RL)

In 1953 the California Public Utilities Commission issued *Determination of Straight-line Remaining Life Depreciation Accruals,* also called *Standard Practice U-4.* This document, which was revised in 1961, presents the steps required in determining the annual accrual when using the straight line method of allocation, the average life procedure, and the remaining life method of adjustment.

Though the term *remaining life* is often thought of as a basis for calculating the annual accrual, it is more appropriately considered a method of adjustment used with a system of calculating annual accruals. As discussed in the preceding paragraphs, a revision of the forecast of average life may lead to an adjustment to the accumulated provision for depreciation. When the remaining life method of adjustment is used, the variation between the CAD and the accumulated provision for depreciation is amortized over the remaining life of the plant in service. This adjustment is automatic in the sense that it is built into the remaining life calculations.

Table 5.5 shows the calculation of annual accruals using the SL-AL system applied to property described by the survivor curve of Figure 5.1. Remember that the annual accrual is the average balance during the year times the straight line rate 1/AL. Use of the remaining life method of adjustment requires different calculations even though the same annual accruals will result. Before calculating the accruals, the remaining life rates for the survivor curve used to estimate the life characteristics must be determined, and these calculations are shown in Table 5.10 (see end of chapter).

The remaining life calculations can be viewed in two ways. One is that the rate 1/RL is applied to the future accrual, which is the current plant in service less the accumulated provision for depreciation. The future accrual (i.e., the amount remaining to be accrued) is allocated over the remaining life of the vintage group using the straight line method. The procedure used to apply the straight line method assumes each unit in service has a remaining life equal to the average remaining life. Thus the AL procedure is used. Table 5.11 (see end of chapter) shows the remaining life calculations using the survivor curve in Figure 5.1. Column (d), the future accruals, is the balance less the accumulated provision for depreciation, column (b) – column (g). The remaining life rates, taken from Table 5.10, are shown in column (e). The annual accruals, the product of columns (d) and column (e), are in column (f). Note that the annual accruals resulting from the remaining life calculations are identical with those obtained by applying the rate 1/AL to the average plant in service and shown in Table 5.5.

A second way of viewing the remaining life calculation is to consider the annual accrual as the SL-AL accrual plus an adjustment to reduce the variation between the CAD and the accumulated provision for depreciation. The following calculations show that the amortization method, SL-AL-AM, and the remaining life method, SL-AL-RL, yield identical annual accruals when the variation between the CAD and the accumulated provi-

sion for depreciation is either (a) zero or (b) amortized over the remaining life.[3]

Let:[4] B = plant balance
AL = average life
RL = remaining life
APD = the accumulated provision for depreciation
APDR = the ratio APD/B
CAD = the calculated accumulated depreciation
CADR = the ratio CAD/B
AARL = the annual accrual using the RL method of adjustment
AAAM = the annual accrual using the AM method of adjustment

The annual accrual will be calculated for both methods of adjustment, and the two annual accruals will then be compared. First, the annual accrual using the remaining life method of adjustment (the AARL) is the total amount remaining to be depreciated (i.e., the future accrual) divided by the remaining life or AARL = (B − APD)/RL = B[(1 − APDR)/RL].

Next, the annual accrual using the amortization method of adjustment (the AAAM) will be written as the sum of the straight line, average life accrual plus the annual adjustment of the variation between the CAD and the accumulated provision for depreciation. The following calculations assume the variation is amortized over the remaining life and make use of the fact that the CADR = 1 − RL/AL.

$$\begin{aligned} \text{AAAM} &= \text{annual accrual} + \text{adjustment} \\ &= \text{annual accrual} + \text{variation/remaining life} \\ &= B/AL + (CAD - APD)/RL \\ &= B/AL + [B(CADR) - B(APDR)]/RL \\ &= B[1/AL + CADR/RL - APDR/RL] \\ &= B[1/AL + (1 - RL/AL)/RL - APDR/RL] \\ &= B[1/AL + 1/RL - 1/AL - APDR/RL] \\ \text{AAAM} &= B[(1 - APDR)/RL] \end{aligned}$$

but this is the same as the annual accrual using the RL method of adjustment so AARL = B[(1 − APDR)/RL] = AAAM.

If the variation is zero, then the accumulated provision for depreciation (APDR) equals the CAD. Because the CAD equals 1 − RL/AL, the annual accruals using the remaining life method of adjustment can be written

$$\begin{aligned} \text{AARL} &= B[(1 - APDR)/RL] \\ &= B[(1 - CADR)/RL] \\ &= B[(1 - 1 + RL/AL)/RL] \\ &= B[1/AL] \\ &= \text{AAAM} \end{aligned}$$

Thus, when the variation is zero, the remaining life accrual can be expressed as the balance divided by the AL.

EFFECTS OF USING AN IMPROPER REMAINING LIFE. Calculation of the remaining life requires knowledge of the survivor curve; survivor curves with the same average life but different shapes will have different remaining lives. This raises the question of the result of applying the remaining life method of adjustment when the average life is correct but the shape of the survivor curve used to calculate the remaining lives differs from the actual retirement pattern. To examine this question, suppose the survivor curve shown in Table 5.12 (see end of chapter) is used to estimate the life characteristics of the property to be depreciated. Though the average life of this curve is 6.4 years, the same as the survivor curve shown in Figure 5.1, its retirement pattern is significantly different from the pattern shown in Figure 5.1.

Note that, as shown during 1981 in Table 5.12, calculation of the remaining life can be puzzling. Confusion arises because the final retirement takes place not at the end of the year, but 1/3 of the way through the year. At the start of the year, the remaining life is 2000/6000 or 1/3 year. However, a remaining life of 1 is needed to obtain a final rate of 100%. An explanation is the choice of one-year intervals to calculate accruals. Suppose that accruals were calculated every 1/3 year, so that a unit of time is 1/3 year rather than 1 year. The average life would then be 6.4 × 3 or 19.2 units (i.e., 19.2 one/third years). These calculations would show the sum of the three 1/3-year accruals equal the annual accruals shown in Table 5.12. However, at the start of 1981, the remaining life is 1 unit, and the corresponding rate is 100%.

Table 5.13 (see end of chapter) shows the result of applying the accrual rates from Table 5.12 to property whose survivor curve is described in Figure 5.1. That is, we will use the correct average life but the incorrect remaining lives. Though the total accruals equal the $10,000 original cost, the annual accruals are not identical with those of Table 5.11. In this example, the maximum life of the survivor curve used to calculate the remaining life rates (7.33 years) is less than the maximum life of the property (8 years), so the final, 100% accrual rate of Table 5.12 assures the accruals will total $10,000.

Now suppose that the survivor curve used to describe the life characteristics of the property being depreciated still has an average life of 6.4 years but the maximum life is greater than 8 years, as shown in Table 5.14

(see end of chapter). When the accrual rates shown in Table 5.14 are applied to property whose life characteristics are shown in Figure 5.1, an underaccrual of $1875 results, because the final retirement was forecast to occur in 1983 but actually occurred in 1981. This emphasizes the fact that when using the remaining life method of adjustment, estimates of the shape of the survivor curve may need to be revised, even though estimates of the average life are unchanged. See Table 5.15 at the end of this chapter.

How does the remaining life adjustment behave when life estimates are revised? Again, the scenario shown in Table 5.7 can be used to observe the results of applying the remaining life method of adjustment. Let the initial forecast of service life be the survivor curve shown in Table 5.16 (see end of chapter); it has an average life of 7.4 years, the same life used to generate the accrual rate shown in Table 5.6.

The remaining life rates of Table 5.16 are used to calculate annual accruals and the accumulated provision for depreciation shown in Table 5.17 (see end of chapter). Because the actual average life is 6.4 years but the forecast life is 7.4 years, the total accruals are $1351 less than the required $10,000.

A REMAINING LIFE SOLUTION TO THE AL ADJUSTMENT PROBLEM. Table 5.7 presented a scenario where accrual rates based on a forecast life of 7.4 years were used for the years 1974, 1975, and 1976. Then in January 1977, the forecast was revised to an average life of 6.4 years. From our discussion of the amortization method of adjustment, we know that in 1977 the accumulated provision for depreciation is $634 less than it would be had the revised forecast been used during 1974, 1975, and 1976. Unless some adjustment is made, that difference will grow to $1351.

The remaining life method of adjustment shown in Table 5.18 (see end of chapter) will amortize the $634 in the following manner. At the start of 1977 the remaining life is 3.4 years, so the adjustment during that year is $634/3.4 or $186. This amount is the difference between the $1749 accrual shown in Table 5.18 and the $1563 accrual (i.e., the average life accrual $10000/6.4) shown in Table 5.5. It reduces the adjustment to $643 − $186 or $448 at the start of 1978. Then the remaining life is 4 years, so the adjustment during 1978 is $448/4 or $112, which is again the difference between the accruals for 1978 as shown in Tables 5.17 and 5.5. In this manner the adjustments for 1979, 1980, and 1981 can be shown to be $112, $112, and $112. Thus, the $1634 variation is amortized over the remaining life. The adjustments are "automatic"; that is, they result automatically when the remaining life calculations are used to determine the annual accruals.

Summary

When comparing the amortization and remaining life methods of adjustment, remember that the magnitude and timing of the annual accruals depend upon the method of allocation and the procedure for applying the method of allocation. The difference between the two methods of adjustment only becomes apparent when the forecast is revised. The remaining life method amortizes the variation between the CAD and the accumulated provision for depreciation over the remaining life and the adjustment is included in the annual accrual. The amortization method allows the variation to be amortized over any period, but requires that the annual amount to be amortized be calculated separately and then added to the calculated accrual. If the depreciation professional chooses to amortize the variation over the remaining life, the two methods result in equal annual accruals.

Neither method of adjustment will properly recover the depreciable base unless accurate forecasts are made. It could be argued that the remaining life method requires only an estimate of the remaining life, while the amortization method requires an estimate of the average life. Remember that at age zero the remaining life is also the average life, and that at any time, the average life can be partitioned into the realized life and the remaining life. The realized life can be obtained from historical records while the remaining life must be forecast. From that point of view, there is no difference between the difficulty of forecasting the remaining life and the average life, because the average life depends on the realized life (which is known) and the remaining life (which must be forecast).

Both methods of adjustment require a forecast of the survivor curve describing the property. The amortization method requires only the average life when calculating the annual accruals, but requires the shape of the survivor curve to calculate the CAD. The remaining life method requires the average life and the shape of the curve to calculate the remaining life and the annual accruals.

The Equal Life Group Procedure Applied to a Vintage Group

The next system of calculating the annual accrual uses the straight line method of allocation and applies the equal life group procedure to a vintage group (SL-ELG). Both the AM and RL methods of adjustment are combined with the ELG procedure.

History of the Equal Life Group Procedure

Allocation using the equal life group procedure was discussed as early as March, 1928, during an ICC hearing (*Telephone Engineer and Management,* 1967, p. 55). Robley Winfrey studied it during the 1930s and in 1942

published a detailed discussion of the procedure in *Depreciation of Group Properties, Bulletin 155.* Winfrey considered it "the only mathematically correct procedure" (p. 71) and called it the unit summation procedure. The procedure was primarily of academic interest until the 1970s.

The major objection to the everyday use of the equal life group procedure was the large number of computations necessary to calculate the annual depreciation. When done manually, these calculations consumed enough time to make the equal life group procedure impractical. As computers became more common and computer time less expensive, this objection gradually disappeared. Another objection focused on the fact that in a growing account, the change from the average life to the equal life group procedure typically was accompanied by a significant increase in annual accruals. Though this increase was coupled with a similar decrease as the account matured, the increase created a bias against the procedure. In the early 1970s, the Bell System began to espouse the equal life group procedure in both the United States and Canada. Bell's informational campaign speeded acceptance first by regulators in Canada and then in the United States. The major argument for equal life group procedure is that it more closely matches depreciation charges with the service rendered during the life of the property than does the average life procedure.

The ELG Procedure

To find the accrual rate when using the equal life group procedure, the life characteristics (the average service life and the shape of the survivor curve) must be estimated. Then the original cost is subdivided into equal life groups. Typically, the equal life groups are formed by specifying the life of each group in one-year increments, and the survivor curve is used to find the proportion of the original cost assigned to each equal life group. Though it is not possible to physically identify the individual units in each ELG, it is possible to statistically identify the fraction of the plant in service in each ELG. Each equal life group is treated as a unit of property and is depreciated using the straight line method of allocation. Note that any method of allocation that can be applied to an individual unit can be applied in the same manner to an equal life group. The total annual accrual for the vintage is found by summing the annual accruals for each equal life group remaining in service. The ELG accrual rate is the total annual accrual divided by the average plant in service during the year.

The $10,000 original cost of the survivor curve shown in Figure 5.1 can be divided into two groups. The first group has a life of 4 years and contains $4000 of the original cost. The second group has a life of 8 years and contains $6000 of the original cost. These will be identified as group A and group B respectively. Note that each dollar in group A has a life of 4 years, therefore the name *equal life group.* Each group will be depreciated using the straight line method of allocation, so that the first group will be depreciated at a rate of 1/4 for 4 years and the second group at a rate of 1/8 for 8 years. Table 5.19 (see end of chapter) shows the calculation of the annual accruals for each equal life group and then sums them to obtain the total accruals and accrual rates. For the year 1974, the annual accruals of $1000 and $750 total $1750, which results in a composite annual rate of $1750/$10000 or 17.50%. For this survivor curve, the ELG rates are constant during the first 4 years (17.50%) and during the last 4 years (12.50%).

The annual accrual rates developed in Table 5.19 are used in Table 5.20 (see end of chapter), which shows the SL-ELG method of calculating the annual accruals and accumulated provision for depreciation for property described by the survivor curve shown in Figure 5.1.

Comparison of the AL and ELG Procedure

Compare the annual accruals and the accumulated provision for depreciation resulting from the use of the SL-ELG system, which are shown in Table 5.20, with the annual accruals and accumulated provision for depreciation resulting from the use of the SL-AL system, which are shown in Table 5.5. When contrasted with the average life procedure, the equal life group procedure results in annual accruals that are higher during the early years and lower in the later years. After the first retirement, which reduces the 1977 balance by $4000, the accumulated provision for depreciation using the average life procedure is $2250 as contrasted with $3000 using the equal life group procedure. With the equal life group procedure, the first unit has been fully depreciated and retired, and $3000 has been accumulated against the eventual (in 4 years) retirement of the $6000 life group, which has a life of 8 years. The $6000 life group is halfway through its life and is half depreciated. The accumulated provision for depreciation with the average life procedure is only $2250, so the $4000 unit was not fully depreciated at the time of its retirement. The $750 difference in the accumulated provision for depreciation between the two procedures will be made up over the life of the longer-lived unit. This is not to imply that the average life procedure is incorrect, only that it is different.

Both procedures are "systematic and rational" as required by the definition of depreciation accounting. Use of the average life procedure matches the depreciation charges to the service provided by the average-lived unit. That is, the shorter-lived units contribute fewer units of service than the longer-lived units, and therefore, the total accrual associated with a short-lived unit is less than that associated with a long-lived unit.

The AL procedure treats each unit as though its life is equal to the average life of the group. The ELG procedure treats each unit in the group as though its life was known. This is the basis for the argument that the equal life group procedure better matches depreciation charges with the life of the units in the group.

Effect of Improper Forecast of Curve Shape

What happens if the shape of the curve used to calculate the equal life group rates differs from the shape of the curve describing the property, even though the estimate of the average service life is correct? Table 5.14 shows a survivor curve with an average life of 6.4 years and with units of $4000 and $6000 but with a different shape than the survivor curve shown in Figure 5.1. Table 5.21 (see end of chapter) shows the application of the ELG rates (see Table 5.19) for the survivor curve shown in Figure 5.1 to property whose survivor curve is shown in Table 5.14. The accruals total only $9400, leaving $600 of the original cost unrecovered. This shows that the shape of the survivor curve affects the capital recovery when using the ELG procedure.

Effect of Improper Average Life Forecast

Now recall the survivor curve with an average life of 7.4 years that was used to show the result of overestimating the service life when using the SL-AL system. The annual accrual rates for this curve when using the SL-ELG system are shown in Table 5.22 and these accrual rates are applied to property with an average life of 6.4 years to obtain the annual accruals shown in Table 5.23. (See end of chapter for both tables.) The results are similar to those shown in Table 5.6. The property lacks $1034 of being fully recovered; this is a smaller deficit than if the average life procedure had been used because of the higher early accrual rates resulting from the use of the equal life group procedure.

An Adjustment Problem—The ELG Procedure

As before, suppose that during 1974, 1975, and 1976 annual accruals were obtained from rates based on a 7.4 year life and shown in Table 5.22. In January 1977, the original forecast is revised to the survivor curve shown in Figure 5.1. Table 5.24 (see end of chapter) shows the accumulated depreciation at the time of the revised forecast to be $4863. The SL-ELG system must be augmented to include a method of adjusting the accumulated provision for depreciation to correct for the accruals made during 1974, 1975, and 1976.

Either the amortization or the remaining life method of adjustment can be used to add a feedback loop to the SL-ELG system of calculating annual accruals. Much of the previous discussion of adjustments to the SL-AL system is applicable to the SL-ELG system, and this section will address only the additional information needed when the equal life group procedure is substituted for the average life procedure.

Amortization Method of Adjustment (SL-ELG-AM)

The discussion of the purpose of, approach to, and estimation of the accumulated provision for depreciation in a preceding section is germane to the CAD calculation when using the SL-ELG-AM system. The calculation of the calculated accumulated depreciation ratio at age i using the equation CADR(i) = 1 − RL(i)/AL is still correct, but the terms RL(i) and the AL now apply to each equal life group rather than the total vintage group. As such, the RL and the AL are no longer averages but are simply the remaining life and the life of a single ELG. The CADR is calculated for each equal life group and is then multiplied by the number of dollars in that equal life group to find the CAD for that equal life group. The CAD for the vintage group is then obtained by summing the CAD for each equal life group remaining in service.

Calculation of the CADR(i) is simplified because the remaining life of an equal life group is the life of the equal life group minus its age. This is true because the survivor curve of a unit is the square survivor curve. If the life of an equal life group is 8 years and its age is 3 years, the remaining life is 5 years, and the calculated accumulated depreciation ratio is CADR(3) = 1 − 5/8 or 3/8, which simplifies to the age/AL.

Table 5.25 (see end of chapter) shows the CAD calculations for the survivor curve shown in Figure 5.1. At the end of the third year, both equal life groups remain in service and their age is 3 years. The $4000 equal life group has an age of 3 years, a CADR of 3/4 or 0.75, and the CAD for this unit is $4000 × 0.75, or $3000. The $6000 equal life group has an age of 3 years, a calculated accumulated depreciation ratio of 3/8 or 0.375, and the CAD for this unit is $6000 × 0.375 or $2250. The CAD of the vintage is $3000 + $2250 or $5250. Because the balance at that time is $10,000, the calculated accumulated depreciation ratio for the vintage is 0.525.

AN AMORTIZATION SOLUTION TO THE ELG ADJUSTMENT PROBLEM. Now return to the scenario summarized in Table 5.24. The accumulated provision for depreciation is $4863 and it is now the start of 1977; the original forecast has been revised and the CAD, based on the revised forecast, calculated. Had the revised forecast been used starting in 1974, the current amount of the accumulated provision for depreciation would be $5250. An adjustment of $5250 − $4863 or $387 is needed to fully recover the initial $10,000 investment.

The amortization method of adjustment allows the $387 to be amortized over a period recommended by the depreciation professional. Suppose that it is decided to make the entire adjustment as a lump sum during 1977. An argument for an immediate adjustment of $387 is that this timing places the increase in the cost of service nearest to the customers who benefitted

by the under-accruals during 1974, 1975, and 1976. Deferral of this adjustment until later in the life of the property may be more likely to assess customers who had not benefitted by the service provided by the property during 1974, 1975, and 1976.

Table 5.26 (see end of chapter) shows the resulting accruals if an immediate, lump sum adjustment is made and the revised rates adopted. As anticipated, the accumulated provision for depreciation is zero at the time of the final retirement.

Remaining Life Method of Adjustment (SL-ELG-RL)

The remaining life method of adjustment can be used with the ELG procedure to form the SL-ELG-RL system of depreciation. The general comments concerning the SL-AL-RL system of depreciation apply when using the ELG procedure, rather than the AL procedure. This section will discuss the differences between the two systems and will focus on the equal life groups formed from the vintage group.

When using the SL-ELG-RL system of depreciation, the annual accruals, as shown in Table 5.20, are determined by the SL-ELG system. But the remaining life method of adjustment requires that the annual accruals be calculated by dividing the future accrual by the remaining life. Application of the remaining life method of adjustment to the ELG procedure requires calculations be made for each ELG. The accruals for each ELG are obtained by dividing the future accrual of the ELG by the remaining life of the ELG and summing over all ELGs to obtain the annual accrual for the vintage. These calculations are shown in Table 5.27 (see end of chapter), where the first section of the table shows the calculations for the $4000 and the $6000 units, and the second portion of the table totals the accruals from each ELG to obtain the vintage accrual. As expected, the annual accruals and the accumulated provision for depreciation are equal to those shown in Table 5.20.

Note that column (e) of the final section of Table 5.27, labeled 1/RL and equaling the composite rate, was calculated by dividing the annual accruals by the future accrual (i.e., the vintage accrual rate was calculated after the annual accrual was calculated).

These accrual rates also can be viewed as a weighted average, where the remaining life for an ELG is weighted by the balance/life of the ELG. In 1976 both unit A and B are in service and their remaining lives are 2 and 6 years respectively. The weight for A is $4000/4 (the balance/life of the ELG) or $1000; for B it is $6000/8 or $750. The remaining life using the average service life weighting is then [$1000(2) + $750(6)]/$1750 or 3.71 years. Note that the numerator ($6500) equals the future accrual and the denominator equals the annual accrual, so that these calculations are equivalent to those shown in Table 5.27.

ALLOCATION OF THE ACCUMULATED PROVISION FOR DEPRECIATION. The calculation of the annual accruals when there is a variation between the CAD and the accumulated provision for depreciation raises the question of how the accumulated provision for depreciation should be allocated among the equal life groups. Any accrual rate used to calculate the annual accrual either explicitly or implicitly allocates the accumulated provision for depreciation (and the variation) among the ELGs. Suppose that at the start of 1976 the accumulated provision for depreciation is $2500, resulting in a variation between the CAD and the accumulated provision for depreciation of $3500 − $2500 or $1000, so that future accrual must include adjustments that will total $1000.

Any method that allocates the accumulated provision for depreciation to each ELG could be used (e.g., the accumulated provision for depreciation could be spread equally among the ELGs, or $1250 to unit A and $1250 to unit B). Logically, the method used should be based on a rational scheme that is consistent with the goals of the depreciation system.

Two methods of allocation will be considered: (a) allocation proportional to the CAD and (b) allocation proportional to the balance less the CAD, which will be called the calculated future accrual (CFA). In either case, we must divide the $2500 accumulated provision for depreciation into two parts and assign one part to unit A and the other to unit B.

The first method considered will be an allocation proportional to the CAD. The calculations are shown below, with columns (b) and (c) taken from Table 5.27. Column (d) shows that ratio of the CAD associated with unit A to the total CAD is 2000/3500 or 57.14%, so that portion of the accumulated provision for depreciation will be allocated to unit A and the remaining 1500/3500 or 42.86% to unit B. Column (e) shows the results of using these percentages to allocate the $2500 accumulated provision for depreciation to the two units. Column (f) is obtained by subtracting the accumulated provision for depreciation allocated to the unit, column (e), from the balance, column (b), and is divided by the remaining life to obtain the annual accrual, column (h), for the ELG. These calculations are equivalent to allocating the $1000 variation proportionally to the CAD; note that 57.14% of $1000 is $571 and that the CAD for unit A, $2000 less $571 is $1429. The total annual accrual is $2107, the resulting composite rate is 2107/7500 or 28.09%, and the composite remaining life is 1/0.2809 or 3.56 years.

Unit (a)	Bal (b)	CAD (c)	% CAD (d)	Accum depr (e)	Future accrual (f)	RL (g)	Accrual (h)
A	4000	2000	57.14	1429	2571	2	1286
B	6000	1500	42.86	1071	4929	6	821
		3500		2500	7500		2107

The preceding example assumed a variation of +$1000. Now suppose the accumulated provision for depreciation is $4500 as shown below. The resulting variation is $3500 − $4500 or −$1000; the future accrual will be reduced by $1000. The calculations below show allocation of this variation proportional to the CAD. The annual accrual is now only $1393, the composite rate is 25.32%, and the composite remaining life is 1/0.2532 or 3.95 years. Note that when using this method of allocation, the composite rate varies with the variation. The larger the variation the larger the rate (and the smaller the composite remaining life), while the smaller the variation the smaller the rate (and the larger the composite remaining life).

Unit (a)	Bal (b)	CAD (c)	% CAD (d)	Accum depr (e)	Future accrual (f)	RL (g)	Accrual (h)
A	4000	2000	57.14	2571	1429	2	714
B	6000	1500	42.86	1929	4071	6	679
		3500		4500	5500		1393

The second method allocates the variation proportional to the CFA. The calculations are shown below. Column (d) shows the balance less the CAD and column (e) shows these figures as a percentage of the total. The $7500 actual future accrual is then allocated to each unit using these percentages and the results are shown in column (f). This is equivalent to allocating the $1000 variation by assigning 30.77% to unit A and 69.23% to unit B. The total accrual is $2019, the composite rate is 2019/7500 or 26.92%, and the composite remaining life is 3.71 years. Note that the composite rate is the same as that used when there was a zero variation and is shown in Table 5.27. If this example was carried out assuming an accumulated provision for depreciation of $4500 resulting in a variation of −$1000, the composite rate would remain at 26.92% and the composite remaining life would remain at 3.71 years.

Unit (a)	Bal (b)	CAD (c)	CFA (d)	% CFA (e)	Future Accrual (f)	RL (g)	Accrual (h)
A	4000	2000	2000	30.77	2308	2	1154
B	6000	1500	4500	69.23	5192	6	865
			6500		7500		2019

An important insight into the difference between the two methods is gained by observing the contribution of each ELG to the total annual accrual. The variation can be expressed as $1000/6500 or 15.38% of the CFA; the future accrual is 15.38% more than it should be if the most recent forecast is correct. Had the accumulated provision for depreciation been $6500, the annual accrual would have been $1750. If the accumulated provision for depreciation is allocated proportionally to the CAD (i.e., the first method), the total annual accrual is increased by (2107 − 1750)/1750 or 20.40%; also, the accrual due to unit A is increased by (1286 − 1000)/1000 or 28.60%, and the accrual due to unit B is increased by (821 − 750)/750 or 9.5%. In contrast, allocation proportional to the CFA (i.e., the second method) yields an increase in the annual accrual of (2019 − 1750)/1750 or 15.38%; also, the accrual due to unit A and unit B are both increased by 15.38%. Allocation proportional to the CAD results in accruals associated with units with a smaller remaining life receiving a proportionally larger share of the variation. Allocation proportional to the CFA yields accruals that are uniformly proportional to the variation.

Use of the method of allocation in which the variance is proportional to the CAD is supported by these arguments.

1. Each ELG will be fully depreciated by the end of its service life.
2. Adjustments (either positive or negative) to past accruals are more rapid, thus placing the added costs or savings on the rate payers closest to the past.
3. The composite rate will increase or decrease as the size of the variation increases or decreases. The larger the variation, the more rapid the rate of adjustment.
4. Typically the allocation of the accumulated provision for depreciation among accounts is proportional to the CAD, and this method extends that concept to the vintage group.

Arguments for allocation proportional to the CFA are listed below:

1. The accrual for each ELG is increased (or decreased) by the same proportion.
2. Adjustments to past accruals are spread over a longer period, thus the magnitude of change in the annual accrual is minimized.
3. The composite rate remains constant despite the size of the variation, thus simplifying both the concept and the calculations.
4. This method is currently widely used when allocating the accumulated provision for depreciation among ELGs within a vintage group.

Strong arguments exist for both methods of allocation. In all future examples, the variation within a vintage group will be allocated proportionally to the CFA, thus allowing use of a constant composite rate despite the

magnitude of the variation. This does not imply that this method is better, only that in this case it is more convenient because the composite rate can be calculated without knowledge of the variation.

Again, return to the problem raised in the scenario shown in Table 5.24. First, duplicate the results of Table 5.23 using the remaining life calculations. This requires calculation of the composite remaining life of the survivor curve shown in Table 5.16, which had an average life of 7.4 years; these calculations are shown in Table 5.28 (see end of chapter).

A REMAINING LIFE SOLUTION TO THE ELG ADJUSTMENT PROBLEM. Next, apply these accrual rates to the example problem, as shown in Table 5.29 (see end of chapter). Note that the annual accruals and accumulated provision for depreciation are the same as in Table 5.23 because both use the same forecast. If the forecast is not revised, $1034 of the initial investment will not be recovered.

Now apply the remaining life method of adjustment to the problem presented in Table 5.24. Starting in 1977, use the accrual rates shown in Table 5.27. The results, shown in Table 5.30 (see end of chapter), are that the −$387 difference between the accumulated provision for depreciation and the CAD at the start of 1977 is amortized over the remaining life of the property, and the accumulated provision for depreciation, after the final retirement, is $0.

How does the remaining life method of adjustment allocate the $387 deficit? Table 5.27 shows that the CFA, at the start of 1977, is $1000 for unit A and $3750 for unit B, for a total of $4750, and that the remaining lives are 1 and 5 years respectively. Unit A accounts for 1000/4750 or 21% of the total while unit B accounts for 3750/4750 or 79%. The method of calculating the composite rate shown in Table 5.27 prorates the $387 deficit so that 21% or 0.21 × $387 or $82 is added to the future accrual of unit A and 79% or 0.79 × $387 or $305 is added to the future accrual of unit B. The $82 is amortized over the remaining life of 1 year, so that the 1977 accrual includes ($1000 + $82)/1 or $1082 for unit A. The $305 is amortized over the remaining life of 5 years, so that the 1977 accrual includes 750 + $305/5 or $811 for unit B. The total 1977 accrual is then $1082 + $811 or $1893. The annual accruals from 1978 through 1981 include the $750 and a $305/5 or $61 adjustment.

GROUP DEPRECIATION SYSTEMS WITH SALVAGE

The preceding discussion of systems of depreciation of a vintage group of property assumed there was no salvage (i.e., the net salvage was zero). These systems can be modified to include salvage so that the annual accruals are a function of the estimates of both life and salvage. In this section the term *salvage* will always refer to salvage used in the accrual rate, which is the net salvage (i.e., the gross salvage less the cost of retiring). An important concept is that a depreciation system should consider the change in salvage as the property ages.

Aged Salvage

Examine the salvage schedule shown in Table 5.31 (see end of chapter) as it will be used in the examples that follow. The salvage ratios of units A and B are 30% and 10% respectively so the salvage is 0.30 × $4000 or $1200 for unit A and 0.10 × $6000 or $600 for unit B. The average salvage ratio (ASR) is (1200 + 600)/10000 or 18%. Column (b) shows the age at the start of the year and reminds us that the salvage ratio changes with age. The term *aged salvage* is used to express this concept. Column (c) is the survivor curve and column (e) shows the salvage ratio for each year in which the plant is retired. Column (f) is the salvage ratio times the retirement frequency. The salvage ratio during the fourth year is 30% and the retirement frequency is 4000/10000 or 0.40, yielding a weighted ratio of 30% × 0.40 or 12% to show that salvage during that year equals 12% of the original investment. The sum of column (f), 18%, is the total salvage expressed as a percentage of the initial cost and is called the average salvage ratio (ASR). The product of the average salvage ratio and the original cost equals the total salvage dollars for the vintage group. Column (g) is the total salvage to that time divided by the total retirements to that time and equals the (average) realized salvage ratio[5] at that age. At age 4, the total salvage realized thus far is $1200 and retirements have totaled $4000; the ratio 1200/4000 yields the realized salvage ratio of 30%. Column (h) is the total salvage remaining to be collected divided by plant remaining to be retired and equals the (average) future salvage ratio. At age 4, the remaining salvage is $600 and the plant remaining to be retired is the $6000 plant in service; the ratio 600/6000 yields the future salvage ratio of 10%. Column (i) is the average salvage ratio. It is the sum of the product of the realized salvage ratio, column (g), times the percent of the plant that has been retired, plus the product of the future salvage ratio, column (h), times the percent of the plant in service. At age 5, 40% of the plant has been retired with a realized salvage ratio of 30%, while 60% remains in service with a future salvage ratio of 10%; the average salvage ratio is 30% × 0.4 + 10% × 0.6 or 18%. Though the realized and future salvage ratios vary with time, the average salvage ratio for the salvage schedule is constant.

It is important to remember that the future salvage ratio changes with the age of the plant. At the time of the initial installation, the future salvage ratio and the average salvage ratio are both 18%. But after unit A is retired,

the future salvage depends only on the remaining plant in service, unit B, and that salvage ratio is 10%. A positive salvage was used in the example, but negative salvage could have been selected just as easily. This schedule also reflects salvage that decreases with age, but an example where salvage increases with age could have been used.

The Average Life Procedure Applied to a Vintage Group

Calculation of the Annual Accrual

When applying the SL-AL system of calculating annual accruals, the rate 1/AL is applied to the plant in service to recover the initial investment. Only the original cost less salvage, or 1 − ASR, may be recovered through annual accruals. In our example the original cost is $10,000 and the ASR is 18%, so $10000 × 1.00 − 0.18 or $8200 is recovered through annual accruals and the remaining 18% or $1800 is recovered as salvage at the time of the retirement.

In the section that assumed no salvage, it was shown that original cost = Σ (average plant in service during age interval j)/AL, when summed over j = 0,1,2, . . ., ML. The equation below shows both sides multiplied by the fraction of the original cost to be recovered, (1 − ASR), so that the rate, on the righthand side, will now be (1 − ASR)/AL. The total accruals, the lefthand side, will be the original cost times (1 − ASR), which equals the capital consumed. This shows that application of the rate (1 − ASR)/AL will fully recover the original cost less the salvage.

(original cost)(1 − ASR) = Σ (average plant in service during age interval j)(1 − ASR)/AL when summed over j = 0,1,2, . . ., ML

Table 5.32 (see end of chapter) shows the result of applying this rate to the example used in the previous section to obtain the annual accruals.

The accumulated provision for depreciation is $2325 after the first retirement. The accumulated provision for depreciation at the start of the previous year, $3844, is increased by the annual accrual of $1281, decreased by the $4000 original cost, and increased by the $1200 salvage to yield the accumulated provision for depreciation of $2325 at the start of 1978.

Note that any other salvage schedule with an average salvage ratio of 18% will yield the same annual rate and result in the same annual accruals shown in Table 5.32. However, the accumulated provision for depreciation will vary from Table 5.32 because the timing of the salvage between the two schedules will differ. If, for example, the salvage ratio is 18% for *both* units (so that the average salvage remains at 18%), the annual accruals will remain at $1281 for the first 4 years and $769 for the last 4 years. But, the accumulated provision for depreciation at the start of 1978 will equal $3844 + $1281 − $4000 × (1.00 − 0.18) or $1845 rather than $2325. This difference would continue until the final retirement, when the accumulated provision for depreciation becomes zero.

Modifying the annual accrual rate (1/AL) by the factor (1 − ASR) is an extension of the average life procedure to include salvage. The factor (1 − ASR) in the accrual rate is a constant used throughout the life of the property regardless of the actual salvage ratio at each age. All units are treated as though their salvage ratio was equal to the average salvage ratio even though the actual salvage for that year is, depending on the salvage schedule, above or below the average.

Effect of Error in the Estimate of Average Salvage

If the estimate of average salvage is wrong, then the total accruals will not equal the capital consumed. Suppose the estimate of average salvage is $0; then $10,000 rather than $8200 is recovered and the accumulated provision for depreciation will equal $1800 after the final retirement. Or suppose the original estimate is a salvage ratio of 40% for unit A and 15% for unit B, resulting in an average salvage ratio of [(40% × 4000) + (15% × 6000)]/10000 or 25%, as shown in Table 5.33 (see end of chapter).

If a correct life estimate of 6.4 years is assumed, the resulting rate using this schedule is (100% − 25%)/6.4 or 11.719%. Table 5.34 (see end of chapter) shows that the total accruals will equal only $7500, leaving $7500 − $8200 or −$700 in the accumulated provision for depreciation after the final retirement because an ASR of 25% rather than 18% was used.

An Adjustment Problem—The AL Procedure

Assume that our initial estimate of the salvage schedule is that shown in Table 5.33 and that the annual accruals for 1974 through 1977 were based on the 11.719% rate. Now suppose that in January 1978, because of events and activities occurring since 1974, the original salvage forecast of 25% average salvage is revised to 18% as shown in the salvage schedule in Table 5.31, which will turn out to be a correct estimate. Table 5.35 (see end of chapter) shows the accumulated provision for depreciation at the start of 1978 is $1888 and presents the problem of adjusting the future accruals in light of the revised forecast.

When you use either the amortization (AM) or remaining life (RL) method of adjustment, the distinction between the average salvage and future salvage plays an important role in the calculation of the adjustment to the accumulated provision for depreciation. Since both the CAD and remaining life calculations are based on future events, they require estimates of future, rather than average, salvage. Though at age zero the average and future salvage ratios are equal, the difference between these two

averages typically increases as the property ages.

Amortization Method of Adjustment **(SL-AL-AM)**

The underlying relationship used to develop the CAD when there was no salvage was CAD = future retirements − future accruals. Future salvage will affect the future value of the accumulated provision for depreciation. The relationship should be modified to read CAD = future retirements − future gross salvage + future cost of retiring − future accrual, or CAD = future retirements − future net salvage − future accrual. This shows that positive future salvage reduces the required accumulated provision for depreciation, because a portion of the original cost is recovered through salvage. Future retirements equal the current balance, the future salvage can be expressed as the future salvage ratio times the current balance, and the straight line rate (1 − ASR)/AL is used to calculate future accruals so that

CAD(i) = B(i) − B(i)[(FSR(i)] − [(1 − ASR)/AL] Σ (average balance during year j) when summed over j from year i to final year of retirement

where B(i) = balance at age i (i.e., the current balance)
CAD(i) = calculated accumulated depreciation at age i
CADR(i) = calculated accumulated depreciation ratio at age i, CAD(i)/B(i)
FSR(i) = future salvage ratio at age i
RL(i) = remaining life at age i
AL = average life

The term Σ (average balance during year j)/B(i) has been shown to equal the remaining life, RL(i), so RL(i) × B(i) = Σ (average balance during year i). Making this substitution and dividing both sides of the equation by B(i) yields the equation CADR(i) = [1 − FSR(i)] − (1 − ASR)[RL(i)/AL]. The first term is the fraction of the plant in service to be recovered and the second is the future accruals expressed as a fraction of the plant in service. Another form of this equation is CADR(i) = (1 − ASR)[1 − RL(i)/AL] + ASR − FSR(i). This form emphasizes the sensitivity of the CADR(i) to the difference between the average and future salvage. If the average and future salvages are equal, or if they are assumed to be equal, the above equation reduces to CADR(i) = (1 − ASR) − (1 − ASR)[RL(i)/AL] = (1 − ASR)[1 − RL(i)/AL].

Table 5.36 (see end of chapter) shows the CAD for the example problem when the salvage schedule shown in Table 5.31 is used. Column (e) is 1 − FSR(i), which represents the percentage of the current plant in service that must be recovered through annual accruals. Initially this is 82%, but

after the first retirement it changes to reflect the fact that 90% of plant now in service must be recovered via depreciation. Column (f) is the straight line rate (100% − 18%)/6.4 or 12.81%. Column (g) is the remaining life, which was obtained from Table 5.8. These factors are combined using the equation [1 − FSR(i)] − (1 − ASR)[RL(i)/AL] to compute the calculated accumulated depreciation ratios shown in column (h). At the end of 1978, the remaining life is 4 years and the future salvage ratio is 10%. If the first form of the equation for the CADR(4)—note that at this time both the age and the remaining life happen to be 4 years—is used, the calculation is (1 − 0.10) − (1 − 0.18)(4/6.4) or 38.75%. If the second form is used, the calculation is (1 − 0.18)(1 − 4/6.4) + (0.18 − 0.10), which also equals 38.75%. Finally, the CADR(4) is multiplied by the current balance, B(4), to obtain the CAD(4), which is shown in column (i).

AN AMORTIZATION SOLUTION TO THE AL ADJUSTMENT PROBLEM. A comparison of the CAD shown in Table 5.36 with the accumulated provision for depreciation shown in Table 5.35 shows that at the start of 1978 the plant is underaccrued by $2325 − $1888 or $437. With the amortization method of adjustment, this deficit is amortized over a period recommended by the depreciation professional. Suppose it was decided to amortize the deficit over the remaining 4 years of life, or $437/4 or $109 each year. The results are shown in Table 5.37 (see end of chapter).

Remaining Life Method of Adjustment **(SL-AL-RL)**

The remaining life method of adjustment requires an estimate of future salvage to calculate the future accrual. When the salvage is not zero, the future accrual (i.e., the total amount remaining to be recovered) equals the current balance less the *future* salvage less the accumulated provision for depreciation. As before, the annual accrual is the future accrual divided by the remaining life or

AARL(i) = [B(i) − FS(i) − APD(i)]/RL(i)
= B(i)[1 − FSR(i) − APDR(i)]/RL(i)

where: B(i) = balance at age i
FS(i) = future salvage at age i
FSR(i) = future salvage ratio at age i
APD(i) = the accumulated provision for depreciation at age i
APDR(i) = the ratio APD(i)/B(i)
RL(i) = remaining life at age i
AARL(i) = the annual accrual at age i using the RL method of adjustment

When there is no salvage, the annual accrual resulting from use of the RL method of adjustment equals the annual accrual resulting from use of the AM method of adjustment if the variation between the CAD and the accumulated provision for depreciation is zero or if the variation is amortized over the remaining life. This is also true when the salvage is not zero and can be proven using the arguments presented in the preceding section. Remember both methods of adjustment require use of the future salvage; the RL method requires it to calculate the future accrual and the amortization method requires it to calculate the CAD.

Table 5.38 (see end of chapter) shows the remaining life calculations for the example problem; the future accrual, column (d), is calculated by subtracting the future salvage and the accumulated provision for depreciation from the balance. At the start of 1978 this calculation is \$6000 − \$600 − \$2325 or \$3075. Because the variation between the CAD and the accumulated provision for depreciation is zero, the annual accruals equal those calculated using the SL-AL method and shown in Table 5.32.

Table 5.39 (see end of chapter) shows the remaining life calculations when the salvage schedule shown in Table 5.33 is used as a forecast. Because the salvage forecast is incorrect, the original cost is not fully recovered. When using the remaining life method of adjustment, the actual salvage for unit A, \$1200, was reflected in the accumulated provision for depreciation at the start of 1978. The difference between the actual and forecast salvage for unit A, (0.40 − 0.30) × \$4000 or \$400, was amortized over the remaining four years, accounting for the \$100 a year difference between annual accruals shown in Table 5.34 and those shown in Table 5.39 during the years 1978 to 1981. Because the final salvage is misestimated by \$300, total accruals in Table 5.39 are \$300 less than the required \$8200.

A REMAINING LIFE SOLUTION TO THE AL ADJUSTMENT PROBLEM. Now return to the problem presented in Table 5.35 and use the revised forecast of future salvage to calculate annual accruals starting in 1978. The remaining life calculations will amortize the \$437 deficit over the remaining 4 years. The 1978 annual accrual of \$878 shown in Table 5.40 (see end of chapter) is composed of a \$769 accrual and a \$437/4 or \$109 adjustment. The annual adjustment for the next year is the variation, which is now \$437 − \$109, divided by the remaining life of 3 years, which again yields an adjustment of (\$437 − \$109)/3 or \$109. In the same manner the adjustments for the next 2 years can each be shown to be \$109. Table 5.37 shows the results of using the amortization method of adjustment to distribute the \$437 variation over 4 years. The annual accruals for both methods of adjustment are the same (see Tables 5.37 and 5.40) because the 4-year amortization period chosen for the AM method of adjustment equals the remaining life (4 years).

The Equal Life Group Procedure Applied to a Vintage Group

Calculation of the Annual Accrual

A previous section illustrated the division of the survivor curve shown in Figure 5.1 into ELGs, each of which had zero salvage and were depreciated as a unit using the annual rate of 1/AL. When salvage is not zero, the annual rate (1 − ASR)/AL is applied to each ELG. The average salvage ratio (ASR) and the average life (AL) both refer to a specific ELG rather than to the average of the vintage group. Table 5.41 (see end of chapter) shows the calculation of annual accrual rates using the SL-ELG system of calculating annual accruals. The rate of (100% − 30%)/4 or 17.5% is applied to unit A and results in annual accruals of \$700 for 4 years; the rate of (100% − 10%)/8 or 11.25% applied to unit B results in annual accruals of \$625 for 8 years. The ELG rate for the vintage group is 13.75% for the first 4 years and 11.25% for the final 4 years.

Table 5.42 (see end of chapter) shows the application of the rates developed in Table 5.41 to obtain the annual accruals and the accumulated provision for depreciation.

Now compare the accruals using the ELG procedure with those obtained using the AL procedure and shown in Table 5.32. The ELG procedure again results in higher annual accruals early in life and lower accruals later in life. The ELG procedure with zero salvage was shown to yield the same accruals that would result if each equal life group was depreciated as an individual unit, so that each unit is fully depreciated at the time of its retirement. The same principle applies with nonzero salvage; each equal life group is assigned the salvage ratio associated with that particular group, thus assuring that the dollars in each ELG will be fully depreciated at retirement. In contrast, the AL procedure uses the average salvage ratio in the accrual rate. The salvage ratio during any year may be above or below the average ratio used in the accrual rate. Retirements with a large salvage ratio are averaged with those with a small ratio so that the depreciation for a particular retirement is averaged over the life of the vintage group.

Table 5.33 is a schedule with an average salvage ratio of 25% and was used to show the results of misestimating salvage when using the AL procedure. Table 5.43 (see end of chapter) shows the ELG rates that result from using that same salvage schedule.

The higher average salvage ratio yields lower accrual rates. When these rates are applied, as shown in Table 5.44, the original cost is not fully recovered. After the final retirement the accumulated provision for depreciation is −\$700, which is the difference between the actual salvage of \$1600 and forecast salvage of \$2500. This is the same deficit that resulted when using the AL procedure (see Table 5.34). In both procedures, the depreciable base was underestimated by \$700, so the total annual accruals were \$700

less than required to fully recover the original cost.

An Adjustment Problem—ELG Procedure

Again suppose that the rates shown in Table 5.43 are used from 1974 through 1977. Then in January 1978, the original salvage ratio estimate of 40% for unit A and 15% for unit B is revised to 30% for unit A and 10% for unit B. Table 5.45 (see end of chapter) shows the current accumulated provision for depreciation at the start of 1978 is $2150. The future accrual must be adjusted to ensure recovery of the $8200 of capital used to provide service during the years 1974 to 1982.

Both the amortization (AM) and remaining life (RL) methods of adjustment used with the ELG procedure and with no salvage were discussed in a previous section. That discussion will now be extended to include salvage.

Amortization Method of Adjustment (SL-ELG-AM)

The first step when using the amortization method of adjustment is to calculate the current value of the CAD as shown in Table 5.46 (see end of chapter). Unit A has a life of 4 years and a salvage of 30% so that (1.00 − 0.30) × $4000 or $2800 must be recovered through the annual accruals. The first row shows the accumulated provision for depreciation for unit A at the start of years 1, 2, 3, and 4. At the start of year 5, the sum of the previous accruals equals the original cost less salvage ($2800), so the retirement of unit A reduces the CAD to zero. In a similar manner, the (1.00 − 0.10) × $6000 or $5400 depreciable cost associated with unit B is recovered over 8 years as shown in the second row. The annual CAD is the sum of the CAD over all ELGs, 2 in this case, and the calculated accumulated depreciation ratio is, by definition, the CAD/plant in service.

The CAD at age 4 is $2700, but the accumulated provision for depreciation at the start of 1977 and shown in Table 5.45 is $2150, which results in a variation of $550. The depreciation professional must decide if this is a significant variation and, if so, how an adjustment should be made.

Note that at the start of 1978 unit A has been retired and is no longer an element in the calculation of the CAD. Any estimates relating to the age or salvage of unit A do not affect the calculation of the CAD from 1978 on. In general, equal life groups that have been retired do not affect the CAD. When calculating the CAD for a system using the ELG procedure, future, rather than past or average, estimates of life and salvage are needed.

AN AMORTIZATION SOLUTION TO THE ELG ADJUSTMENT PROBLEM. At the start of 1978 only unit B remains in service and the estimate of its life remains at 8 years, while its salvage ratio is now estimated to be 10% rather than 15%. Even if the annual accrual rate is immediately revised to 11.25% (see Table 5.41) to reflect this change in the salvage forecast, the existing deficit of $550 will remain in the accumulated provision for depreciation. By amortizing this variation over 3 years, $550/3 or $183 per year will be added to the annual accruals during the next 3 years, as shown in Table 5.47 (see end of chapter).

Remaining Life Method of Adjustment (SL-ELG-RL)

The remaining life method of adjustment requires the future salvage and the life of each ELG to calculate the annual accrual. Each ELG has a single life and a single salvage, so the average and future salvage for each ELG are the same. Table 5.48 (see end of chapter) shows the calculation of the annual accruals for each ELG using the salvage schedule shown in Table 5.31. The future accrual equals the plant in service less the future salvage less the accumulated provision for depreciation and must be calculated for each ELG remaining in service. The initial value of the future accrual for unit A is (1.00 − 0.30) × $4000 or $2800, the remaining life is 4 years, and the annual accrual is $700. For unit B the future accrual is (1.00 − 0.10) × $6000 or $5400, the remaining life is 8 years, and the annual accrual is $675.

The future accrual and the annual accrual for each ELG are combined in the bottom portion of the table to obtain the totals shown in columns (d) and (f). The annual accrual rate shown in column (e) of Table 5.48 was obtained by dividing the annual accrual shown in column (f) by the future accrual shown in column (d) (i.e., the annual accruals were calculated first and then divided by the future accrual to find the annual rate). As mentioned previously, the reciprocal of the rate is called the composite remaining life.

The annual rate also can be calculated using the weighted average referred to in the discussion of depreciation systems with no salvage. Calculation of this average when there is salvage requires calculating the weighted average of the remaining life times (1 − ASR). In 1976, both units A and B are in service and their remaining lives are 2 and 6 years respectively, while their salvage ratios are 30% and 10% respectively. The numerator of the weight for A is the balance over the average life, $4000/4 years, and this weight is independent of salvage. The numerator of the weight for B is $6000/8. The composite remaining life is {[$4000 × (1 − 0.30)/4] × 2 + [$6000 × (1 − 0.10)/8] × 6} divided by the sum of the weights, [$4000 × (1 − 0.30)/4 + $6000 × (1 − 0.10)/8] or [($700 × 2) + ($675 × 6)]/$1375 or 3.964 or 25.229%, which agrees with the rate shown in Table 5.48.

ALLOCATION OF THE VARIATION. In the section on depreciation systems with no salvage, we discussed the calculation of annual accruals when there is a variation between the CAD and the accumulated provision for

depreciation. That discussion will now be expanded to include salvage.

In the section with no salvage we assumed a $1000 variation and then calculated the 1976 accrual. We will now repeat that calculation with salvage. Assume the accumulated provision for depreciation at start of 1976 is $1750 (i.e., from Table 5.46 we see the CAD at the start of 1976 is $2750, the variation is $2750 − $1750 or $1000). First allocate the variation in proportion to the CAD as shown below. Column (e) uses the percentages in column (d) to allocate the $1750 accumulated provision for depreciation to units A and B. The future accrual, column (f), is obtained by subtracting the accumulated provision for depreciation and the salvage ($1200 and $600 for units A and B respectively) from the balance, column (b). Dividing the future accrual by the remaining life yields the annual accrual for each ELG, column (h). The accruals total $1712. This results in a composite rate of $1712/$6450 or 26.54% and a composite remaining life of 3.77 years.

Unit (a)	Bal (b)	CAD (c)	% CAD (d)	Accum depr (e)	Future accrual (f)	RL (g)	Accrual (h)
A	4000	1400	50.91	891	1909	2	955
B	6000	1350	49.09	859	4541	6	757
		2750		1750	6450		1712

Now consider the same circumstances but make the allocation in proportion to the calculated future accrual, as shown in the following calculations. For unit A the calculated future accrual (CFA), column (d), is the balance less the CAD less the salvage or $4000 − $1400 − $1200 or $1400. Column (f) is obtained by first calculating the total future accrual, which is $10000 − ($1200 + $600) − $1750 or $6450; this amount is then prorated to units A and B using the percentages shown in column (e). Totaling the accruals for each ELG yields $1627 and a composite rate of $1627/$6450 or 25.229% and a composite remaining life of 3.96 years. This is the same as the composite rate when the variation is zero (see Table 5.48).

Unit (a)	Bal (b)	CAD (c)	CFA (d)	% CFA (e)	Future accrual (f)	RL (g)	Accrual (h)
A	4000	1400	1400	25.69	1657	2	829
B	6000	1350	4050	74.31	4793	6	798
			5450		6450		1627

Now the composite rates shown in Table 5.48 are applied to the example problem and the results are shown in Table 5.49 (see end of chapter). At

the start of 1979, the estimated future salvage is $600, so the future accrual is $6000 − $600 − $3375 or $2025, and applying the composite annual remaining life rate of 33.33% results in an annual accrual of $675. Because the life and salvage estimates used in Table 5.48 were correct, no adjustments are required and the remaining life accruals are equal those obtained using the SL-ELG system of calculating annual accruals and shown in Table 5.42.

Table 5.50 (see end of chapter) shows the calculation of the composite annual rates when the estimated salvage ratios are 40% and 15% for units A and B respectively. The balance to be depreciated for unit A is (1.00 − 0.40) × $4000 or $2400; the balance for unit B is (1.00 − 0.15) × $6000 or $5100. Composite rates are shown in the bottom portion of the table. Note that the rates during ages 5 through 8 are identical with those in Table 5.48 although the salvage ratios differ. To explain this, remember that the composite rate is the sum of the balance less salvage divided by the annual accrual. During the final 4 years of the example problem, only one ELG survives. The numerator and the denominator of the composite rate both contain the factor (1 − ASR); these cancel, so in this example the composite rates for the final 4 years are independent of the salvage ratios.

Table 5.51 (see end of chapter) shows application of these rates to the example problem. Future salvage ratio estimates of 25% from 1974 to 1977 and 15% from 1978 to 1981 are used to calculate the future accrual. As with the SL-AL-RL system (see Table 5.39), the misestimation of future salvage results in an under-accrual of $300.

A REMAINING LIFE SOLUTION TO THE ADJUSTMENT PROBLEM. Return to the ELG adjustment problem presented in Table 5.45. When the 1978 forecast of future salvage is changed from 15% to 10% and the depreciation process is carried forward, the entire $8200 is, as shown in Table 5.52 (see end of chapter), fully recovered.

A COMMENT. Hypothetical examples of survivor curves and salvage schedules have been used to show basic concepts of depreciation. Be careful when making generalizations based on these examples. The only generalization that can be drawn from the preceding examples is that incorrect forecasts can result in improper capital recovery. The magnitude and direction of the error depends on the particular example. Estimates of life can be too short or too long and the shape of the curve can vary while keeping the average life constant. The shape of the curve determines the remaining life and therefore affects the CAD calculations and the remaining life rates. The salvage ratio can be positive or negative, though only positive salvage was used in the preceding examples. When considering aged salvage, the ratios can increase or decrease with age, and the consequences of using average

rather than aged salvage depend on the pattern of the salvage. Any generalizations concerning the variation between the calculated accumulated depreciation and the accumulated provision for depreciation because of errors in estimation of parameters should carefully state the assumptions made.

Use of Average, Rather than Aged, Salvage

Salvage is sometimes viewed as though it remains constant as the property ages, as opposed to the more realistic view that the salvage varies with age. The former view equates average and future salvage, while the latter view recognizes that the salvage ratio may change each year and that it is necessary to estimate the salvage schedule. This section will examine the results of not recognizing that salvage varies with age by illustrating the use of the average salvage ratio rather than a salvage schedule.

The Average Life Procedure

The average life procedure requires estimates of future salvage to assure proper adjustments. When using the amortization method of adjustment, the future salvage enters the CAD calculation; when using the remaining life method of adjustment, the future salvage is needed to calculate the future accrual.

First consider the amortization method of adjustment. The CAD equation CADR(i) = (1 − ASR)[1 − RL(i)/AL] + ASR − FSR(i) reduces to CADR(i) = (1 − ASR)[1 − RL(i)/AL] when the future salvage ratio, FSR(i), is set equal to the average salvage ratio, ASR. The annual values of the CAD using the second equation are shown in Table 5.53 (see end of chapter), and these values should be compared to those in Table 5.36, which were calculated using the correct future salvage. Though the CAD starts and ends at zero in both tables, there is a significant difference between the two after the first retirement. In Table 5.53 the calculations for the CAD at the start of year 5 anticipate a salvage ratio of 18%, which is \$4000 × 0.18 or \$720 for unit A, rather than the actual salvage of \$1200. This difference of \$1200 − \$720 or \$480 equals the difference between the CAD at the start of year 5 in the two tables.

If the CAD shown in Table 5.53 is used as a guide in analyzing the problem posed in Table 5.35, the variation between the calculated accumulated depreciation and the accumulated provision for depreciation is \$1845 − \$1888 or −\$43. This suggests that the future accrual should be *reduced* by a total of \$43. The potential \$437 deficit is concealed by the failure of the depreciation professional to forecast the salvage schedule. The salvage of the final retirement is estimated to be \$6000 × 0.18 or \$1080 rather than the actual \$600, and this difference of \$480 is the difference between the CAD calculated using the salvage schedule and the CAD calculated using

the average salvage during the final 4 years.

The net impact of not distinguishing between average and future salvage depends on the amount of the change in salvage ratios as the account matures. Forecasters may tend to associate realized salvage with average salvage, thus presupposing that future salvage ratios will be close to those observed early in the life of the vintage. The result may be a poor forecast of the average salvage ratio used in the accrual rate.

Results of using the average salvage rather than the future salvage with the remaining life method of adjustment are shown in Table 5.54 (see end of chapter). The annual accruals during the first 4 years are the same as in Table 5.38 (which uses the correct value of future salvage), because the future and average salvage are equal until the time of the first retirement. During the remaining 4 years, the system assumes that only 82% of the plant in service must be recovered. Actually 90% is needed, so a deficit of (82% − 90%) × \$6000 or −\$480 results.

When using the AL procedure and either method of adjustment, accurate estimates of the salvage schedule are needed to fully recover invested capital in a timely manner. Use of the average, rather than aged salvage, will result in incorrect estimates of the CAD and may result in accruals that do not equal the capital consumed.

The Equal Life Group Procedure

The equal life group procedure requires the salvage ratio for each life group in order to calculate the annual accrual. The future salvage is the weighted average of all ELGs remaining in service. Table 5.55 (see end of chapter) shows the calculation of annual accrual rates using the 18% average salvage ratio for both ELGs. Unit A is assigned a rate of (100% − 18%)/4 or 20.5% and unit B a rate of (100% − 18%)/8 or 10.25%.

Table 5.56 (see end of chapter) shows the application of these rates. Note that the accruals total \$8200, as they should, but the timing of the accruals differs from those shown in Table 5.42, which use the correct aged salvage. Because the first retirement had a higher than average salvage ratio, the total annual accruals generated by unit A, 4 × \$820 or \$3280, are \$480 greater than the \$4000 − \$1200 or \$2800 to be depreciated, while the total annual accruals for unit B, 8 × \$615 or \$4920, are \$480 less than the \$6000 − \$600 or \$5400 to be depreciated. The fact that the two differences cancel each other is not coincidence, but the result of using the average salvage ratio.

In this example, use of the average salvage resulted in higher early rates than would have resulted if the salvage schedule had been used. If the salvage schedule had reflected salvage ratios that increased with age, the early rates would have been lower than those resulting from using the average.

Use of the average salvage rather than the aged salvage associated with

each ELG results in the use of the AL procedure for the salvage portion of the annual accrual rate. This combination of the ELG procedure for life and the AL procedure for salvage fully recovers the initial investment less salvage, but it partially negates the major attribute of the ELG procedure. Use of the average salvage in the ELG accrual rate will not match the annual depreciation charges with the consumption of capital. When the ELG procedure is used with a salvage schedule, the units comprising the ELG are fully accrued at the time of their retirement. This is not true if the average salvage is used. The magnitude of the difference in timing resulting from using the average salvage rather than the salvage schedule depends on two factors. First, if the salvage ratio is zero or near zero, then the difference is also zero or near zero. Second, if the salvage ratio is constant, or nearly constant, the annual retirement ratios will be close to the average salvage ratio and the difference will be small. These two factors interact to determine the magnitude of the difference.

Suppose the average salvage ratio of 18%, rather than the aged salvage, had been applied to each ELG when calculating the CAD. The resulting CADs and CADRs are shown in Table 5.57 (see end of chapter).

The CAD at the start of 1978 calculated using the average salvage is $2460 as compared to the CAD of $2700 obtained using the salvage schedule. If the average salvage is used, the variation between the CAD and the accumulated provision for depreciation of $2150 shown in Table 5.45 would be $310 rather than the correct value of $550. If the adjustment was based on the CAD calculated using the average salvage, a deficit of $240 would result. This shows that when the salvage varies with age, use of the average salvage with the ELG procedure will affect the accuracy of the CAD.

Now examine the effects of using the average salvage rather than the aged salvage when the remaining life method of adjustment is used. Table 5.58 at the end of the chapter (which is constructed in the same manner as Table 5.48) shows the calculation of the composite rates using average salvage. The balances for both units A and B are calculated by multiplying the initial cost by (100% − 18%) or 82%, yielding balances of $3280 and $4920 respectively.

Table 5.59 (see end of chapter) shows the results of using average rather than aged salvage with the remaining life method of adjustment. Note that the total accruals were $480 less than necessary to recover the $8200 of capital consumed. After the first retirement, the system expected a future salvage of 0.18 × $6000 or $1080 and accruals were based on that assumption. When only $600 was received, a deficit in accumulated provision for depreciation of $480 resulted.

SUMMARY

The two preceding sections discussed depreciation systems for group property. All the systems discussed applied the straight line method of allocation to a vintage group. First it was assumed that there was no salvage, and then the consideration of salvage was added.

Two procedures for applying the straight line method of depreciation were used. The average life procedure treats each member of the group as though it will have a life and salvage equal to the group average. Though we know that each member of the group will not behave as the average member, our assumption works because the variation between members brings us back to the average. The equal life group procedure statistically divides the vintage group into smaller, equal life groups so that each member of the equal life group will have the same life and salvage. Each equal life group is then depreciated as a unit using the life and salvage associated with the ELG. This yields two systems of calculating annual accruals, the SL-AL system and the SL-ELG system.

These systems are incomplete until a method of control is included in the system. There are two methods of creating a closed loop feedback system. One method is labeled the amortization (AM) method of adjustment. This term describes a system in which the calculated accumulated depreciation (CAD) is used as a measure against which the (book) accumulated provision for depreciation is compared. The depreciation analyst uses this feedback as a guide in determining the necessary adjustment to the annual accruals or, if necessary, to the accumulated provision for depreciation. The remaining life (RL) method of adjustment automatically amortizes the variation between the CAD and the accumulated provision for depreciation over the remaining life of the property.

Combining both methods of allocation with both methods of adjustment yields four depreciation systems. Two use the average life procedure, SL-AL-AM and SL-AL-RL, and two use the equal life group procedure, SL-ELG-AM and SL-ELG-RL. Because the methods of allocation for purpose of book depreciation are almost exclusively limited to the straight line method, these four choices represent the systems available for the depreciation of a vintage group.

Table 5.1. Calculation of the annual accruals and the accumulated provision for depreciation for a unit of property using the straight line method of allocation. The unit has a life of 4 years and a 20% salvage ratio.

Year	Balance Jan 1	Retired	Rate%	Annual accrual	* Accumulated depreciation * Net Jan 1	Debit	Credit
1974	$4000		20.0	$800	$0	$0	$800
1975	4000		20.0	800	800	0	800
1976	4000		20.0	800	1600	0	800
1977	4000	$4000	20.0	800	2400	4000	1600
1978	0				0		
				$3200		$4000	$4000

Table 5.2. Calculation of the annual accruals and the accumulated provision for depreciation for a unit of property using the sum-of-years-digits (accelerated) method of allocation. The unit has a life of 4 years and a 20% salvage ratio.

Year	Balance Jan 1	Retired	Rate%	Annual accrual	* Accumulated depreciation * Net Jan 1	Debit	Credit
1974	$4000		32.0	$1280	$0	$0	$1280
1975	4000		24.0	960	1280	0	960
1976	4000		16.0	640	2240	0	640
1977	4000	$4000	8.0	320	2880	$4000	1120
1978	0				0		
				$3200		$4000	$4000

Table 5.3. Calculation of the annual accruals and the accumulated provision for depreciation for a unit of property using the declining balanbe (accelerated) method of allocation. The unit has a life of 4 years and a 20% salvage ratio. The rate is 1.5/4 or 37.5%.

Year	Declining balance Jan 1	Retired	Rate%	Annual accrual	* Accumulated depreciation * Net Jan 1	Debit	Credit
1974	$4000		37.5	$1500	$0	$0	$1500
1975	2500		37.5	938	1500	0	938
1976	1562		37.5	586	2438	0	586
1977	976	$4000	*	176	3024	4000	976
1978	0				0		
				$3200		4000	$4000

* Switch to straight line rate. This yields a final accrual of $176.

Table 5.4. Calculation of the annual accruals and the accumulated provision for depreciation for a unit of property using the sinking fund (decelerated) method of allocation with i=10%. The unit has a life of 4 years and a 20% salvage ratio.

Year	Balance Jan 1	Retired	Rate%	Annual accrual	* Accumulated depreciation * Net Jan 1	Debit	Credit
1974	$4000		17.24	$690	$0	$0	$690
1975	4000		18.96	758	690	0	758
1976	4000		20.86	834	1448	0	834
1977	4000	$4000	22.95	918	2282	4000	1718
1978	0				0		
				$3200		4000	$4000

* Salvage for these units is $1200 and $600 respectively.

NOTES

1. Gas (FERC), electric (FERC), and water companies (NARUC) use the title Accumulated Provision for Depreciation, while telecommunications (FCC) and railroads (ICC) use the title Accumulated Depreciation. Telecommunications used the title Depreciation Reserve until 1986. We will use the term *Accumulated Provision for Depreciation*. It refers to the net balance of either of these accounts.

2. The CADR is also called reserve ratio or the accrued ratio.

3. The balance, usually shown in column (b) of the tables at the end of this chapter, can be defined as the balance at the start of the year or the average balance during the year. The convention used in this chapter results in the start-of-year balance equaling the average balance. When other conventions are used, a small difference between the two annual accruals may result because the remaining life calculation typically applies the rate to the beginning-year balance while the amortization calculation typically applies the rate to the average balance during the year.

4. All of these variables except AL are a function of the age of the property, and a complete notation would include an index for the age. For example, rather than RL, use RL(i) = the remaining life at age i. The following calculations all refer to the same year so the index i is dropped.

5. Remember that both the realized and future salvage ratios are averages. Both the survivor curve and the salvage ratio at each age from zero to the maximum life are required to calculate these average ratios. For convenience, we will use the terms realized or future salvage ratio rather than *average* realized or *average* future salvage ratio.

6 Continuous Property Groups

CHAPTER 5 used elementary survivor curves, a single vintage group, and a simplified format to illustrate the calculation of the annual accrual for depreciation for several systems of depreciation. This chapter will use Iowa survivor curves and formats characteristic of those found in industrial practice to illustrate the application of these systems of depreciation to continuous property groups. The illustrations will include the use of both average salvage and salvage that varies with age.

A continuous property group[1] is created when vintage groups are combined to form a common group. Each year property is removed from service for many reasons and, at the same time, property may be added either to replace property that was retired or to increase service capacity. Over time the operating and physical characteristics of the property change, but the continuous property group continues as long as the service it provides is needed. If new vintages are no longer added, the continuous property group becomes closed, or bounded, and over time becomes smaller and finally vanishes. The continuous property group, which is usually recorded as a plant account or subaccount, is of interest because it represents the most common method of grouping assets for depreciation.

The method of allocation, the procedure for applying the method of allocation, and the method of adjustment (e.g., SL-AL-AM) specify the factors that define a depreciation system for a vintage group. The terms broad group and vintage group describe two ways of viewing the life and salvage characteristics of the vintage groups that have been combined to form a continuous property group for purposes of depreciation. One approach is to view the continuous property group as a collection of vintage

CONSULTING CONTRACT NO. 19013

This Consulting Contract (the **"Contract"**) is made effective as of **March 5, 2019** (the "**Effective Date**") and is entered into

BETWEEN

YUKON ENERGY CORPORATION, having its place of business at 2 Miles Canyon Road, P.O. Box 5920, Whitehorse YT Y1A 6S7 (hereinafter referred to as the **"Corporation"**)

AND

ALLIANCE CONSULTING GROUP a company duly incorporated under the laws of the United States of America and Texas, having an office at Suite 220, 101 E. Park Blvd, in the city of Plano, State of Texas 75074 (hereinafter referred to as the **"Consultant"**)

WHEREAS:

The Corporation wishes to engage the Services of the Consultant on the terms and conditions and understandings hereinafter set forth.

NOW THEREFORE THIS CONTRACT WITNESSES THAT in consideration of the terms set out in this Contract and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the Corporation and Consultant hereto agree as follows:

1. TERMS OF ENGAGEMENT

1.1 The Term of this Contract shall begin on the Effective Date and terminate on **June 30, 2019** unless terminated earlier in accordance with this Contract.

1.2 The Corporation and the Consultant may elect to extend the term of this Contract by mutual consent by the parties.

1.3 In consideration for the remuneration hereinafter set out, the Consultant agrees to make available Services as described in Schedule B, Scope of Work, "**Depreciation Study"** (the "Services") to the Corporation, provide advice with respect to the provision of Services as required, and other Services as may be requested by the Corporation.

1.4 This Contract represents the entire Contract between the Corporation and the Consultant.

1.5 The Services provided by the Consultant under the terms of this Contract will be authorized by the Corporation. The Consultant will not, without the prior written authorization from the Corporation, cause the Corporation to commit any funds or to incur any liability.

1.6 The Consultant agrees to act in the best interest of the Corporation and will devote time, effort, skill, attention and energies to carrying out the duties and responsibilities. As part of those responsibilities, the Consultant will provide any and all information requested in a timely fashion and the Consultant will conduct its business in a professional and reputable manner. Failure to comply with these requirements may be cause for termination of this Contract as provided for herein.

1.7 References herein to this "Contract" means the main text of this Contract and the schedules, being:

Schedule A - FEES AND DISBURSEMENTS

Schedule B - RFP SCOPE OF WORK

Schedule C - TESTIMONY LIST AS OF JANUARY 24, 2019

Schedule D - RESUMES

2. STATUS OF THE CONSULTANT

The Consultant is an independent Consultant and is not the servant, employee or agent of the Corporation. The Consultant agrees to indemnify and hold harmless the Corporation from any and all claims or demands for taxes, premiums or other statutory payments or assessments that may be made against the Corporation on behalf of the Consultant.

2.1 The Consultant may provide the Services at the Consultant's place of business or at the Corporation's place of business in Whitehorse, Yukon or at such other place or places as may be required from time to time by the Corporation.

3. SUBCONTRACTORS/SUBCONSULTANTS

3.1 The Consultant may hire or engage one or more subcontractor(s)/subconsultant(s) to perform any or all of its obligations under this Contract; provided, that:

3.1.1 that the Consultant shall use the same degree of care in selecting any such subcontractor(s)/subconsultant(s) as it would if such subcontractor(s)/subconsultant(s) was being retained to provide similar services to the Consultant; and

3.1.2 that the Consultant shall in all cases remain responsible for all of its obligations under this Contract with respect to the scope of the Services.

3.2 The Consultant shall require each subcontractor/subconsultant, to the extent of the Work to be performed by the subcontractor/subconsultant, to be bound to the Consultant by the terms of any Contract, and to assume toward the Consultant all the obligations and responsibilities which the Consultant, by this Contract, assumes toward the Corporation. Said Contract shall preserve and protect the rights of the Corporation under the Contract with respect to the Work to be performed by the subcontractor/subconsultant so that the subcontracting thereof will not prejudice such rights.

4. GENERAL PROVISIONS

4.1 Unless otherwise specified, this Contract shall be governed by the laws of the Yukon and the Consultant will hereby attorn to the jurisdiction of the Yukon Courts.

4.2 The Corporation and the Consultant respectively bind themselves, their partners, successors, assigns and legal representatives to the other party to this Contract to the partners, successors, assigns and legal representatives of all such other parties with respect to all terms and conditions of this Contract.

4.3 Neither party to this Contract may assign any of its rights or obligations under this Contract without the prior written consent of the other party, which consent may be unreasonably withheld, except that either party may assign this Contract or any of its rights or obligations to any of its subsidiaries and/or affiliated companies without consent of the other party.

4.4 This Contract and any Schedules hereto, constitute the entire Contract between the Corporation and the Consultant and no other representations or Contracts, oral or otherwise, exist between the parties with respect to the subject matter of this Contract unless referred to in the Contract.

4.5 This Contract may be amended only by written instrument signed by both the Corporation and the Consultant.

4.6 The Consultant has no authority to make any statements, representations or commitments of any kind or take any action that will bind the Corporation.

4.7 No condoning, excusing or waiver by any party of any default, breach of non-observance by any other party at any time or times in respect of any covenant or condition contained in this Contract will operate as a waiver of that party's rights in respect of any continuing or subsequent default, breach of non-observance, or so as to defeat or affect in any way the rights of that party in respect of any such continuing or subsequent defaults, breach of non-observance, and no waiver will be inferred from or implied by anything done or omitted to be done by the party having those rights.

4.8 If any provision of this Contract or the application thereof to any person or circumstance to any extent is invalid or unenforceable, the remainder of this Contract or the application of that provision to any other person or circumstance other than those in respect of which it is held invalid or unenforceable will not be affected thereby and each provision of this Contract is separately valid and enforceable to the fullest extent permitted by law.

5. FEES AND REIMBURSABLE EXPENSES

5.1 The Corporation agrees to pay the Consultant for Services performed in accordance with the terms of this Contract, and in accordance with the rates set out in Schedule "A" attached to this Contract. The Consultant will accept such payment as full payment and full reimbursement for the Services performed under this Contract.

5.2 The Consultant agrees that any and all engineering changes that are deemed minor by both parties and necessary in the completion of the Services covered under the Contract will be included within the price and rates quoted in the Contract, unless otherwise mutually agreed by the Change Order.

5.3 If the Corporation considers it appropriate, the Consultant may be required to submit monthly progress/milestone reports with payment invoices.

5.4 The Corporation may require that invoices are allocated into multiple cost codes, which will be provided to the Consultant.

5.5 Changes to the Services shall only be made on receipt of written instructions from the Corporation. Any resulting adjustment to the agreed price shall be agreed upon by the Corporation and the Consultant and will represent the reasonable and proper costs incurred by or savings accruing to the Consultant using the rates submitted in the proposal.

5. TERMINATION, SUSPENSION OR ABANDONMENT

5.1 The Corporation, at its sole discretion, may by providing written notice to the Consultant suspend the Services in whole or part or suspend this Contract. Upon receipt of such notice, the Consultant shall immediately discontinue its work on the suspended Services and continue to perform all other Services that have not been suspended. The Corporation may, by written notice, require the Consultant to resume some or all of the suspended Services in accordance with the notice.

5.2 The Corporation, at its sole discretion, may by providing a minimum of thirty (30) days written notice to the Consultant terminate all or any part of this Contract or the Service. Such notice may specify the scope of the termination and will specify the effective date of such termination. Upon receipt of such notice, the Consultant shall immediately discontinue the Services in accordance with the notice.

5.3 If the Services or this Contract are suspended or terminated in whole or in part pursuant to this section, the Consultant shall take all steps necessary to minimize the costs associated with such termination or suspension.

5.4 In the event of termination of this Contract, the Consultant shall be compensated within thirty (30) days of the date that an invoice is rendered for all Services performed to the date of termination, together with reimbursable expenses then due to the Consultant provided such Services and expenses have been properly documented and justified to the Corporation's satisfaction.

6. INDEMNIFICATION

6.1 The Consultant will indemnify and save harmless the Corporation, its successors, assigns, directors, officers, agents, employees, and authorized representatives and each of them from and against any and all claims, demands, losses, costs, damages, actions, suits, or proceedings whether directly or indirectly caused or incurred, related to or occasioned by, arising or resulting from and to the extent of any negligent error omission or act of the Consultant, any sub-consultant and their respective servants, agents and employees in the performance of the Contract, excepting liability arising out of any error, omission or negligent act of the Corporation, its successors, assigns, agents, employees and authorized representatives. Notwithstanding and superseding anything to the contrary on this Contract.

6.1.1 The aggregate liability of the Consultant arising out of the performance or non-performance of the Services or otherwise in connection with this Contract is limited to the sum of the amount of the professional fees paid to the Consultant pursuant to this Agreement up to [redacted] USD and 10% of such fees paid in excess of [redacted] USD;

6.1.2 Provided that in no event will the Consultant's aggregate liability exceed $1,000,000; Consultants liability for claims or losses covered by the insurance policies referred to in Clause 7. (a) (b) and (c) shall not be subject to Clause 6.1 and shall instead be limited to the proceeds of insurance up to the amounts specified in Clause 7. (a) (b) and (c).

6.2 The Corporation shall indemnify and save harmless the Consultant, its successors, assigns, agents, employees and authorized representatives and each of them from and against any and all claims, demands, losses, costs, damages, actions, suits or proceedings whether directly or indirectly caused or incurred, related to or occasioned by, arising or resulting from any error, omission or negligent act of the Corporation or its servants, agents and employees in the performance of this Contract, excepting liability arising out of any negligent error, omission or negligent act of the Consultant, its successors, assigns, agents, employees and authorized representatives.

6.3 The indemnity provided by the Consultant in this Section 6 will survive the expiration or termination of this Contract for a period of one year.

6.4 The Consultant shall perform the Services (a) with due care and skill in accordance with the standard of care and skill normally exercised by professional engineers providing similar services on projects of similar scope and complexity and in comparable locations, and (b) re-perform any Services that fail to comply with this standard of care if the Corporation gives the Consultant notice of such failure within twelve months of performance of such Services.

6.5 The Corporation or any person authorized by the Corporation will have the right, at all reasonable times, to inspect or otherwise review the Services performed, or being performed, and the premises and locations where the Services are being performed. No review or approval by or on behalf of the Corporation will have the effect of relieving the Consultant of its responsibilities and obligations under this Contract. No review or approval by the Corporation will be deemed to be a waiver or release of any rights that the Corporation may have against the Consultant; save to the extent that the Corporation expressly waives such rights or releases the Consultant in writing.

7. INSURANCE

7.1 Before commencing the Work, Consultant shall obtain and maintain the following insurance policies during the term of the Contract:

7.1.1 A commercial general liability policy, in an amount for each and every occurrence of $2 million for each and every occurrence and in the aggregate, with a standard form cross liability clause and a broad form property damage endorsement, the latter in an amount equal to the full policy limit. The policy will name Yukon Energy Corporation as an additional insured with respect to liabilities that arise out of Consultant's operations, and shall contain cross liability and severability of interest clauses or equivalent wording;

7.1.2 Automobile insurance covering liability for bodily injury, including death, or property damage to third parties arising out of ownership, use or operation of Consultant owned or leased licensed motor vehicles of $2 million inclusive;

7.1.3 Property insurance covering loss or damage to tools, property and equipment of Consultant or for which Consultant is legally liable or responsible of an amount equal to the full replacement value of such tools, property and equipment with a waiver of the insurer's rights of subrogation against the Corporation.

7.1.4 A Professional Liability Insurance policy in an amount of $1 million per claim and in the aggregate, to cover damages because of any error, omission or negligent act in professional services rendered by the Consultant. Coverage will be maintained for at least twenty four (24) months after completion of the Work or earlier termination of the Contract.

7.2 Consultant shall within fourteen (14) days following a request by Corporation's Designate, provide a completed Certificate of Insurance evidencing Consultant's compliance with this clause, except that no evidence of automobile insurance is required unless evidence of such insurance is specifically requested.

7.3 Consultant shall be solely responsible for determining the appropriate type and amount of insurance that Consultant should have in place from time to time, but must maintain during the term of the Contract at least the amount and type of insurance it is required to maintain under this clause.

7.4 Consultant shall be responsible for the full amount of all deductibles of all insurance policies required. Failure to furnish proof of insurance shall be considered a breach of the Contract, allowing the Corporation to obtain such insurance and charge the cost to the Consultant, or to terminate the Contract at the Corporation's absolution discretion.

8. WORKER'S COMPENSATION

8.1 Requirements for Consultants Registered Outside the Yukon

If the Consultant is to perform any work on the Corporation's site including but not limited to delivery, assembly, installation and/or unloading of deliverables, Consultant shall within ten (10) days of the award of a Contract and before commencing work on site, provide a Letter of Compliance issued by the Yukon Workers' Compensation Health and Safety Board ("YWCHSB"), including but not limited to:

- an account number and/or Letter of Compliance from YWCHSB to confirm registration in Yukon;
- a statement from WCB that the Consultant and any sub-contractors are registered and in good standing in their home province;
- confirmation that all persons performing the Work who are not covered by the Workers Compensation Act are covered under personal optional protection coverage available through WCB.

8.2 Requirements for Consultants Performing Work in the Yukon

If the Consultant is to perform any work on the Corporation's site including but not limited to delivery, assembly, installation and/or unloading of deliverables, Consultant shall within ten (10) days of the award of a Contract and before commencing work on site, and at any time on the request of the Corporation, provide evidence of certification by the Yukon Workers' Compensation Health and Safety Board ("YWCHSB"), including but not limited to:

- if the Consultant will be performing work on the Corporation's site that does not exceed ten (10) days per year, a statement from the YWCHSB that the Consultant is registered with the YWCHSB;
- if the Consultant will be performing work on the Corporation's site that exceeds ten (10) days per year, a statement and/or certificate from the YWCHSB that the Consultant and all sub-contractors are registered and in good standing, and that all workers performing the Work are covered by the Consultant's or sub-'s workers compensation through the YWCHSB;
- confirmation that all persons performing the Work who are not covered by the YWCHSB are covered under personal optional protection coverage available through YWCHSB.

8.3 **Responsibility**

The Consultant shall be responsible for the safe performance of all the Work and the safety of all persons engaged in the Work and shall comply with all applicable safety provisions of the applicable Workers' Compensation Board(s) and safety regulations issued by the Corporation for the Work site.

8.4 **On-Line Safety Orientation**

Consultant is required to complete the Corporation on-line safety orientation prior to commencing any work on the Corporation's premises. The orientation may be found at the following link. YEC On-Line Safety Orientation

9. COMPLIANCE WITH THE OCCUPATIONAL HEALTH AND SAFETY ACT

9.1 The Consultant shall confirm it will comply with all the provisions of the Yukon Occupational Health and Safety Act, regulations and codes, and all amendments thereto, now or hereafter, made there under the said act and shall confirm it will indemnify the Corporation in respect to all matters arising out of or in connection with failure of the Consultant to comply in all respects with applicable provisions of the said act, regulations and codes.

9.2 If the Consultant is to perform any work on the Corporation's site, the Consultant shall comply with all applicable safety regulations issued by the Corporation. For the purpose of this general condition, the term "safety regulations" includes any and all operating order, work protection practices, lockout procedures, and any other safety requirements that may be required or regulated whether municipally, provincially, federally, or otherwise. The Consultant shall be solely responsible for the safe performance of all the work and the safety of all persons engaged in the work and shall ensure all safety laws, regulations and requirements are implemented and adhered to through the performance of the Contract.

9.3 Prior to commencing any work on the Corporation's site, the Consultant shall ensure that all on-site personnel and sub-consultant personnel shall participate in the Corporation's contractor safety orientation (available on-line or in person), or have previously participated in a Corporation contractor safety orientation within the past three years. The contractor safety orientation is specific to the Corporation's properties, sites, equipment, hazards, precautionary measures, emergency protocols, job safety analysis requirements, tailboard requirements and security requirements and can be accessed the Corporation Project Manager.

9.4 The Consultant shall immediately notify the Corporation in writing of any incidents or circumstances described herein, and about any claims made, and the Consultant shall obtain a release in the names of the Corporation and the Consultant.

10. CONFIDENTIALITY

10.1 In the course of this Contract, the Consultant may acquire confidential information with respect to the work or the Corporation's business operations, including without restriction, costing information, strategic plans and product services. Any information given to or reviewed by the Consultant for the purposes of this Contract shall be considered as confidential and privileged by the Consultant and Sub-consultant(s) and shall include all information relating to the work and any process, technology or system relating thereto, the design, construction, operation, maintenance or any other aspect of the Services or the work or relating to the nature of the Corporation's business and affairs that the Consultant, either directly or indirectly, receives or acquires from the Corporation or from anyone on behalf of the Corporation either in writing or verbally or through observation of the Corporation facilities or rights of way, except information falling into any one of the following categories:

10.1.1 Information that the Consultant demonstrates was in its possession on a non-confidential basis prior to receipt or acquisition of such information from the Corporation;

10.1.2 Information that is lawfully in the public domain at the time of receipt by the Consultant of such information from the Corporation;

10.1.3 Information that upon the Consultant's receipt or acquisition from the Corporation, becomes part of the public domain through no act of the Consultant or of any third party under an obligation or confidence with respect to such information, but only after such information becomes part of the public domain;

10.1.4 Information that upon the Consultant's receipt or acquisition from the Corporation, is lawfully obtained by the Consultant from a third party, provided that such third party is under no obligation of confidence with respect to such information;

10.1.5 Information that the Corporation is required to disclose pursuant to the Personal *Information Protection and Electronic Documents Act* ("PIPEDA") *or* other legislation.

10.2 The Consultant shall keep all confidential information in confidence and shall not disclose it to others without the prior written consent of the Corporation and the Consultant shall not use the confidential information except in the performance of the Services.

10.3 The Consultant may disclose the confidential information to those of its employees, Sub-consultant(s) or suppliers and their respective employees to whom disclosure is required for the Consultant to perform the Services provided that the Consultant shall ensure that its employees, Sub-consultant(s) and suppliers keep confidential information in confidence and shall not disclose it to others without prior written consent of the Corporation.

10.4 The Consultant shall not use the Corporation's name, registered or unregistered trademarks or any of the Corporation's slogans or logos in any advertising or promotional

materials or publicity releases, and shall not take, permit to be taken or use any photographs of the Corporation facilities without the prior written approval of the Corporation.

10.5 Any documentation relating to the work that is in the custody or under the control of the Corporation is subject to the *Access to Information and Protection of Privacy Act* ("ATIPP"). Except as stated above in this section, all information submitted by the Consultant to the Corporation will be considered confidential during the term of this Contract.

11. AUTHORSHIP AND USE OF DOCUMENTS

11.1 Reports, plans, sketches, drawings, graphic representations and specifications as instruments of Service prepared by the Consultant pursuant to this Contract (the "Documents") are and shall belong to the Corporation. The copyright in such Documents shall belong to the Corporation and such copyright shall continue for fifty (50) years from the date of their first publication. The Consultant may retain one copy of such Documents for its records.

11.2 The Corporation may use the Documents for any other purposes and the Corporation and Consultant shall agree on the fees for any Services necessary to properly revise the Documents for such use. If the Corporation and Consultant are unable to reach such an agreement, the Corporation may retain another Consultant for the purpose of revising the Documents for such alteration, addition or deletion, as it deems fit.

11.3 The Documents referred to above include Documents prepared by Sub-consultant(s) as well.

11.4 The Corporation shall indemnify and save harmless the Consultant and Sub-consultant(s) from and against any costs, damages, actions, suits or proceedings arising out of any modification or revision of the plans, sketches, drawings, graphic representations and specifications made pursuant to this section made by the Corporation other than by the Consultant or the Sub-consultant(s).

11.5 Submission or distribution of the Documents to meet official regulatory requirements or for other purposes in connection with the Corporation's requirements in accordance with this Contract will not be construed as publication in disparagement of the Corporation's rights.

12. INTELLECTUAL PROPERTY

12.1 All information and data, in any form, prepared by the Consultant pursuant to this Contract, together with all designs or materials capable of intellectual property protection, prepared, developed or created by the Consultant, its employees or agents during the performance of and/or pursuant to this Contract shall automatically become the property of the Corporation unless specifically noted otherwise in this Contract.

13. DISPUTES

13.1 **Amicable Negotiation**. Each party will make bona fide efforts to resolve any disputes arising among them by amicable negotiations and provide frank, candid and timely disclosure of all relevant facts, information and documents to facilitate those negotiations.

The parties will use their best efforts to conduct any dispute resolution procedures under this Contract as efficiently and cost effectively as possible. If there is a dispute among the parties under this Contract, a party will provide written notice (the "Dispute Notice") to the other party to the dispute of the nature of the dispute.

13.2 **Reference to Senior Officials**. If a dispute cannot be resolved between the parties within 5 working days after the date of receipt of the Dispute Notice, the parties will attempt to resolve the dispute with the assistance of one senior official from each party to the dispute. The place of discussion will be Whitehorse, Yukon, unless the senior officials otherwise agree. Each party will bear its own costs of the discussion. The results of the discussion will be non-binding and will be reported to the parties forthwith.

13.3 **Mediation**. If a dispute cannot be resolved under above section within 10 working days of receipt of the Dispute Notice, either party may give notice to the other party of a desire to commence mediation and the parties will jointly appoint a mutually acceptable mediator within 5 working days after such notice is given.

13.4 **Arbitration**. If a dispute cannot be resolved under above section within 20 working days of a mediation under above section, either party may, by written notice to the other party, commence arbitration. Arbitration will be administered under the Arbitration Act (Yukon). The place of arbitration will be Whitehorse, Yukon. Each party will bear its own costs of the arbitration and any additional costs of the arbitrator(s) will be borne equally by each of the parties. Arbitration will be final and binding on the parties. Notwithstanding the foregoing, either party may at any time, prior to the first face to face meeting of the Parties and the arbitrator, under this section 13 refer the dispute being arbitrated to the courts for resolution.

13.5 **Confidentiality**. All negotiations and/or matters relating to the arbitration under this Contract will be kept confidential and will not be disclosed to any other persons except those persons authorized in writing by the parties.

13.6 **Continued Performance**. For greater certainty the parties will continue to perform their respective obligations under this Contract while a dispute under this Contract is being resolved.

14. FORCE MAJEURE

14.1 Neither party shall be responsible for any delay or failure to perform its obligations under this Contract where such delay is due to fire, flood, explosion, war, embargo, government action, act of public authority, act of god, or to any other cause beyond its control, except labour disruption.

14.2 In the event Force Majeure occurs, the party who is delayed or fails to perform shall give prompt notice to the other party and shall take all reasonable steps to eliminate the cause.

14.3 Should the Force Majeure event last longer than thirty (30) days, the Corporation may terminate this Contract by notice to the Consultant without further liability, expense or cost of any kind except for the fees and expenses incurred to the date of termination and demobilization costs.

15. NOTICE

15.1 For the purpose of this Contract, any notices required to be given to the Corporation may be sent by email to Project Authority who for this Contract is Jason Epp, Controller, with an email address of jason.epp@yec.yk.ca, along with a copy to procurement@yec.yk.ca or personally delivered, sent by prepaid registered post addressed to the Corporation at the address indicated on Page 1 of this Contract.

16. GOVERNING LAW

16.1 This Agreement shall be governed by, subject to and interpreted in accordance with the laws of the Yukon and the federal laws of Canada applicable therein.

17. COUNTERPARTS

17.1 This Contract may be executed in multiple copies, each of which will be deemed an original, and all of which taken together will constitute one single agreement.

SCHEDULE "B"

SCOPE OF WORK

Assess and recommend appropriate depreciation rates for Yukon Energy property plant and equipment at a level appropriate for review by the regulator, Yukon Utilities Board.

Specific activities to include:

- Review of historical data including review of previous depreciation study results and corporate accounting records sufficient to understand the nature of the assets, historical acquisition/construction timing, current rates and planned usage;
- a review of the average service lives of a peer group of Canadian electric utilities;
- operation and management interviews to confirm nature and use of assets;
- assessment and recommendation of appropriateness of current method and procedure of depreciation rate calculation;
- determination of the adequacy of the current accumulated depreciation accounts to reflect the consumption of the consumed service value of the assets under review;
- interviews with management and internal subject matter experts to the extent necessary;
- Prepare report that makes recommendations on:
    - Expected service life of assets;
    - Depreciation requirements by asset
    - Adequacy of the accumulated depreciation by class
    - Average remaining life of assets by class.
- support for study findings with Yukon Utilities Board as appropriate (support may include drafting of application sections, response to interrogatories and/or appearance before the Board]; and
- Completion and delivery of the final Depreciation Studies report.

Note asset classifications are based on OEB/FERC definitions.

REBECCA RICHARDS

SENIOR CONSULTANT, ALLIANCE CONSULTING GROUP

Profile

- 13 years of experience in utility property accounting, depreciation, and corporate finance.
- Coordinated several depreciation studies for all types of utilities including electric, gas, water, and steam heating

Professional Experience

- 2015-present
    - Senior Consultant - Alliance Consulting Group, Plano, TX

      Senior Consultant involved in all aspects of depreciation studies. Perform depreciation studies for electric, gas, communication, water and wastewater utility clients. Provide support during rate case litigation including drafting study narratives and responding to interrogatories.

- 2006-2015
    - Team Lead Property Accounting - We Energies, Milwaukee, WI

      Managed all fixed asset internal and external reporting and property accounting functions in compliance with state and federal regulatory requirements. Established and maintained the Company's capitalization and depreciation policies. Initiated and oversaw all process improvement initiatives related to fixed asset finance systems and processes. Coordinated depreciation studies and supported rate case and regulatory proceedings. Vast working knowledge of fixed asset and finance systems including SAP, UI, and PowerPlant.

- 1995-2006
    - Operations Manager - Courtyard by Marriott, Brookfield, WI

      Hired, trained, and developed all front desk associates and maintained Marriott's high quality customer service standards.

Education

- Bachelor of Science in Accounting, Marquette University, Milwaukee, WI
- Associates Degree in Accounting, Milwaukee Area Technical College, Milwaukee, WI

Memberships

- EEI/AGA Property Accounting and Valuation Committee
- Society of Depreciation Professionals

DANE A. WATSON, PE, MBA, CDP

MANAGING PARTNER, ALLIANCE CONSULTING GROUP

Profile

- 34 years of experience in utility depreciation, valuation and property accounting.
- Industry wide reputation with significant experience as Expert Witness, in depreciation, valuation, and rate base areas.
- Proven experience in effectively managing property systems and reengineering processes/ systems to achieve significant cost savings.
- Goal-Oriented, "outside the box" thinker with demonstrated strong leadership and communication capabilities.
- Organized, highly-motivated, and focused problem solver.

Relevant Experience and Accomplishments

- Depreciation and Asset Accounting
  - Conducted over 200 depreciation studies for electric (generation, transmission, and distribution), gas (transmission, distribution, LNG and storage), water/wastewater, telecom and mining companies (regulated and non-regulated) and supported over 35 state regulatory bodies and FERC.
  - Ongoing teaching of depreciation (basic and advanced) in many industry venues (EEI/AGA, SDP, Michigan State, State Commissions).
  - Lead or served in numerous national industry roles related to depreciation and property accounting including twice chairing the Plant Accounting and Valuation Committee of the Edison Electric Institute and twice chairing the Society of Depreciation Professionals.
  - Served as gas and electric industry Project Manager for the implementation of SFAS 143.
  - Served as general editor for "Introduction to Depreciation and Net Salvage".
  - Managed fixed asset accounting, depreciation accounting and analysis, lease accounting, inventory accounting, transportation accounting and records management for one of the largest electric and gas utilities in the US.
- System/Process Reengineering
  - Reengineered fixed asset process and managed redesign of a Fixed Asset system to create a $1.5-$2.0 million savings per year.
  - Designed and implemented a new leased asset tracking and payment system that enabled reduction of errors in lease payments by $3-$4 million per year.
  - Designed and implemented an internal shared asset tracking and allocation system to meet stringent affiliate transaction rules.
  - Championed, designed and implemented imaging system to replace paper and microfilm document storage system saving over $1 million per year.

Employment History:

- 2004-present
  - Partner Alliance Consulting Group, Plano, TX

- 1996-2004
  - Manager of Property Accounting Services TXU Business Services, Dallas, TX
    Testified in 15 rate or restructuring proceedings before various Commissions including the Texas Railroad Commission, the Texas Public Utilities Commission and the FERC. Lead Sarbanes-Oxley implementation for property processes. During tenure, increased scope to managing all fixed asset and construction accounting, inventory accounting, transportation accounting, and fixed asset accounting systems. Lead efforts to convert 14 companies to a new fixed asset system. Restructured valuation system to provide a 90% faster response time. Implemented new construction/fixed asset systems that facilitated a 12 FTE reduction in staff. Built state-of-the-art lease accounting system to handle reporting and payment of all TXU leases. Built highly automated imaging system to replace microfilm and paper document storage and retrieval system reducing costs and shortening response time.

- 1992-1996
  - Technical Support Manager Texas Utilities Generating Company, Dallas, TX
    Managed group responsible for depreciation and valuation analysis for TXU as well as special projects. Responsible for teaching and running engineering economics analysis for large capital projects. Managed nuclear plant decommissioning studies and electrical line loss allocation studies.

- 1985-1992
  - Associate Engineer to Senior Engineer Texas Utilities Generating Company, Dallas, TX
    Given increasing responsibility related to depreciation and valuation program creation, valuation analysis, depreciation analysis, training TXU employees in engineering economics, report preparation, writing and supporting depreciation testimony before the Texas Public Utilities Commission.

Education:

- M.B.A., General Business, Amberton University, Garland, TX
- B.S., Electrical Engineering, University of Arkansas

Honors and Awards

- Professional Engineer (TX)
- Certified Depreciation Professional (“CDP”)
- Senior Member of the Institute of Electronics and Electrical Engineers (“IEEE”)
- IEEE 3rd Millennium Medal
- IEEE Region 5 Treasurer, Audit Committee Chair, IEEE-USA Secretary Treasurer, IEEE MGA Treasurer, IEEE Finance Committee Member
- American Association of Engineering Societies (AESS) Treasurer
- Twice Chair of the Edison Electric Institute (“EEI”) Property Accounting and Valuation Committee
- Former Board member and twice President of the Society of Depreciation Professionals

KAREN HALLAMAN PONDER, PH.D.

SENIOR CONSULTANT, ALLIANCE CONSULTING GROUP

Profile

- Recognized expert in the field, particularly with regard to historical analyses of life and net salvage.
- More than 40 years of experience in utility property accounting, depreciation, and valuation.
- Involved in dozens of depreciation studies through all facets of the process including regulatory support through information discovery and rate proceedings.
- Prepared depreciation studies for all types of utilities including electric, gas water and wastewater.
- Taught courses on depreciation models and theory, actuarial analysis, and simulated plant record analysis for 30 plus years in nationally recognized training venues.

Professional Experience:

- 2004-present
    - Senior Consultant - Alliance Consulting Group, Plano, TX

      Involved in all aspects of conducting depreciation studies from data gathering to analysis and supporting recommendations through testimony. Participated in more than 200 depreciation studies. Subject matter expert on depreciation theory. Performed depreciation studies for various entities ranging from electric, gas, mining, water and wastewater.
- 1993-2004
    - Capital Recovery Specialist - Texas Utilities, Dallas, TX.

      Responsible for studies and analysis of asset data in a variety of assignments ranging from the engineering department to property accounting.
- 1985-1997
    - Faculty Member - Depreciation Programs of Kalamazoo, Michigan

      Taught classes on Depreciation Models, Simulated Plant Record Method Analysis, and Actuarial Analysis. Participants included company representatives, staff of various state commissions and consultants from the United States and Canada.
- 1978-1984
    - Senior Engineer - Texas Utilities, Dallas, TX.

      Held positions of increasing responsibility in various utility departments including general office engineering, economic research and budgets. Responsibilities included preparing depreciation studies and rate case support.

Education

- Ph.D., Industrial Engineering with specialty in Engineering Valuation, Iowa State University
- M.S., Statistics, Iowa State University
- B.S., Mathematical Statistics *summa cum laude*, McNeese State University, Lake Charles, LA

Memberships

- Society of Depreciation Professionals
- Society of Depreciation Professionals, Training Faculty, 2007 to present
- Society of Depreciation Professionals, Secretary, 2014 to 2015
- Society of Depreciation Professionals, Training Deputy Chair, 2018 to present

RHONDA WATTS

SENIOR CONSULTANT, ALLIANCE CONSULTING GROUP

Profile

- 29 years of experience in utility accounting, property accounting, depreciation, and regulatory processes. Participated in over 100 depreciation studies.
- Industry reputation with experience as Expert Witness in depreciation.
- Performed numerous depreciation studies through all facets of the process including regulatory support and testimony. Experience focus on historical analyses of life and net salvage.
- Prepares depreciation studies for all types of utilities including electric, gas, telecommunication, water and wastewater.

Professional Experience

- 2009-present
    - Senior Consultant - Alliance Consulting Group, Plano, TX

      Senior Consultant involved in all aspects of depreciation studies. Performs depreciation studies for electric, gas, communication, water and wastewater utility clients. Provides support during rate case litigation including drafting study narratives and testimony and responding to interrogatories. Provides testimony before state regulatory bodies.
- 1996-2009
    - Senior Manager - Deloitte & Touche LLP

      Senior Manager in the Energy and Resources Group with concentration in the areas of depreciation and fixed asset accounting systems. Areas of expertise include the principles and procedures of capital recovery, utility organization, accounting and information systems and regulatory practices.
- 1990-1996
    - Accountant - Nevada Power Company

      Accountant and analyst positions of increasing responsibility. Areas of responsibility include plant and receivables accounting, depreciation study updating, rate case schedule preparation and support, regulatory compliance reporting, financial report preparation, and budget variance analysis.
- 1986-1990
    - Primary Accountant - UNLV Foundation

      Primary Accountant responsible for the proper processing and accounting for donations to the UNLV Foundation in support of academic excellence. Also compiled financial reports for the Board of Directors and Trustees.

Major Projects

- Conducted numerous depreciation studies and assisted in regulatory support through testimony, information discovery and rate proceedings for various electric, gas, water and wastewater utility companies.
- Assisted various audit teams in the review of client's implementation of FASB 143 and Interpretation No. 47 (Asset Retirement Obligations). The review encompasses the Company's processes, assessments, calculations and supporting documentation.
- Managed teams in the conduct of Sarbanes Oxley Section 404 readiness testing for international advertising, marketing and communication services companies in 2004 and 2005.

Education

- Bachelor of Science in Business Administration, Accounting and Finance emphasis, University of Nevada, Las Vegas

Certifications and Memberships

- Member of EEI/AGA Property Accounting and Valuation Committee and Society of Depreciation Professionals
- Past President and other leadership positions for the Society of Depreciation Professionals

Other Professional Activities

- Review and content contributor for Hahne-Aliff "Accounting for Public Utilities", Chapter 6 Public Utility Depreciation during tenure at Deloitte
- Former Board member as well as Treasurer, Secretary, Vice President and President of the Society of Depreciation Professionals
- Presenter at AGA/EEI Accounting Committee Meetings
- Taught client requested Depreciation Basics

TOPIC: **Secondary Sales**

REFERENCE: **2021 General Rate Application, Table 2.1, 2.2 and Section 2.2.4 and Section 2.3.1**

PREAMBLE: In Tables 2.1 and 2.2, YEC forecasts 0 for secondary sales related to Generation for 2021. On page 2-8 (PDF page 33 of 441), lines 9-14, YEC states:

> Due to the lack of surplus hydro generation available resulting from below average water conditions and growth of firm load, secondary sales ceased in September 2018. Secondary sales were 258 MW.h in 2018 (compared with 2,059 MW.h forecast in the 2018 Compliance Filing) and 0 MW.h in 2019. Secondary sales were forecast at 0 MW.h sales in 2020 and 2021 when the 2021 GRA load forecast was prepared. YEC will update 2021 test year forecasts in the compliance filing if any secondary sales are expected to occur in 2021 as a result of surplus water availability.

On page 2-9 (PDF page 34 of 441) at line 19, YEC states "[a]ctual hydro generation is currently forecast to reflect water availability at about LTA in 2020, and water availability above LTA in 2021."

CW would like to understand the correlation between surplus water and secondary sales.

QUESTION:

a) Please provide an analysis that compares water levels and secondary sales for each of the last 10 years.

b) Please fully explain the relationship between water levels and secondary sales.

c) Please explain what YEC means by stating that 2021 water levels will be above LTA.

ANSWER:

(a)

Table 1 below provides a comparison of Whitehorse yearly inflows (percent of average) to secondary sales from 2011 to 2020.

Table 1: Summary of Secondary Sales vs Whitehorse Yearly Inflow

	Secondary Sales (KWh)	Whitehorse Yearly Inflow %
2011	552,300	93%
2012	1,992,620	103%
2013	3,959,400	114%
2014	5,414,580	110%
2015	7,030,020	110%
2016	4,835,100	105%
2017	8,385,030	99%
2018	257,955	97%
2019	480	94%
2020	173,841	97%

(b)

Secondary sales typically occur when Yukon Energy is spilling water at one of the hydro facilities and the facility is not operating at a 100% capacity factor. The relationship of secondary sales to water condition is that during higher water (inflows) periods there is a higher potential for spill, and therefore a higher potential for secondary sales. However, secondary sales also relate to the timing and volume of potential secondary sales loads – which tend to focus on winter heating time periods when the potential for spill is reduced.

(c)

Table 2.2 in the Application shows forecast ST 2021 hydro generation at 506.5 GWh, and shows LTA hydro generation for 2021 at the lower level of 452.4 GWh. The ST forecast reflects conditions in the fall of 2020, following high inflows to Aishihik and Mayo during the preceding summer that reversed the prior year's low water conditions.

As shown in prior years, water availability forecasts provided in the fall for the following year are subject to review in following spring and again during the following summer – and can display material changes as actual conditions unfold.

Nathaniel YEE
(NY)

REFERENCE: **Page 1-8, "Diesel rental unit costs of approximately $3.8 million are forecast for the diesel rental units expected to be required for the 2021 GRA test year,5 and [5] 15 units at 1.8 MW for each unit to total 27 MW for 2021 plus two spare units to total of 17 units."**

QUESTION:

a) Please provide a breakdown of all rental and installation infrastructure costs, also noting those attributable to the "spare units."

b) Please explain the decision to rent and install "spare units."

c) As they are rented to increase "reliable capacity," what is the reliability/failure history of rental diesels?

d) How is service and maintenance handled with the supplier?

e) What are the terms of the rental? Monthly, yearly or?

ANSWER:

(a)

Diesel rental unit costs of approximately $3.8 million are broken out in Table 1. Costs for spare units are included in the categories of Generators and Transformers. Each unit whether initially designated as spare or not has the same cost. See YUB-YEC-1-49 for a breakdown of capital costs for N-1 Capacity Shortage Faro Thermal Rental Site; and N-1 Capacity Shortage Whitehorse Thermal Rental Site. See also discussion in NY-YEC-1-3.

Table 1: Diesel Rental Cost Summary

Rental	**Cost ($millions)**
Generators	$ 2.1
Transformers	$ 0.7
Fuel Tanks	$ 0.2
Total Rental	$ 3.0
Other	
Delivery fees	$ 0.4
Stand-down fees	$ 0.2
Start-up and Commissioning	$ 0.2
Total	$ 3.8

(b)

Based on the 2019/2020 rental season, the availability of the units averaged 85.7%, effectively reducing the dependable capacity of the rental fleet from 16.2 MW to 13 MW. The rental fleet provides the N-1 scenario generation capacity. To ensure YEC has the capability to meet the N-1 capacity requirement YEC rented two additional units.

(c)

The following is noted regarding the units:

- 2019/2020 – Availability 82.4%; and
- 2020/2021 – YTD availability 86.6% (Whse), 78.6% (Faro).

(d)

Twice daily reports are issued to the vendor in a group email identifying unit unavailability for service. The vendor dispatches service technicians to the sites and reports back on resolutions or delays to equipment issues. YEC has a comprehensive report provided to the vendor upon request that provides current status and historical availability statistics (see below).

Report Date: 3/3/2021

(e)

The existing rental agreements have a term from December 1, 2020 to April 20, 2021.

REFERENCE: **Page 1-8, "Non-industrial peak load has increased from 86.4 MW in the approved 2018 GRA forecast to 100.7 MW (or 100.6 on page 2-4?) forecast for 2021 (14 MW increase), accounting for most of the 17 MW growth in the N-1 dependable capacity shortfall."**

and

Page 2-12 Item 2.4 "As indicated in Table 2.2, the peak demand for the integrated system is forecast to be 112.7 MW in 2021. The actual peak demand was 93.0 MW in 2018, 90.0 MW in 2019 and 103.8 MW in 2020."

and

QUESTION:

a) 103.8MW is indicated as "Forecast" in Table 2.2 and "Actual" on page 2-12. Which is correct? Is this forecast or actual?

b) Please explain the inputs and forecasting methodology that resulted in 100.7 MW (or 100.6 MW) non-industrial peak load, and 112.7 MW integrated system peak.

c) Please also provide peak loads by month (Non-industrial and integrated system separately), approved, actual and forecast for 2017 to 2021 inclusive.

ANSWER:

(a)

2020 columns in the 2021 GRA reflect preliminary actuals for January through June, and forecasts for July through December. Therefore, the 2020 columns are shown as forecasts. The peak demand of 103.8 MW shown in Table 2.2 was realized in January 2020. Therefore, on page 2-12 it is noted as actual peak.

(b)

As part of the development of YEC's 10-year Renewable Electricity Plan, the non-industrial peak forecast was updated using the Itron model (as described in the 2016 Resource Plan) and calibrated to consider the updated recorded actual 2019/20 peak. The integrated system peak includes the non-industrial and industrial peaks. The industrial peaks were added based on data provided by the industrial customers.

(c)

The YEC peak forecast model only models a winter peak (maximum load expected in coldest period) – this data is not forecast by month. Peak loads are recorded as the maximum load experienced in each winter. Please see response to CW-YEC-1-1 (a).

REFERENCE:

QUESTION:

a) What is the actual rental cost of the 17 diesels? The GRA has rental cost of 3.834 (or 3.8) million, while according to the Hansard, Andrew Hall cited 4.1 million on 15-Dec, 2020. Should the GRA reflect 4.1 million rather than 3.8 million for the rental diesels? Please provide documentation.

ANSWER:

(a)

The diesel rental costs of $3.834 million included in the operating and maintenance costs reflect forecast rental payments required for 17 rental units.

In addition to the rental costs, there are capital costs required to accommodate and connect rental diesel units to the Yukon Integrated System. As reviewed in section 5.2.1.2 of the Application the capital cost for N-1 Capacity Shortage Thermal Rental Site Infrastructures in Whitehorse and Faro at $3.335 million which has annual capital related costs of about $0.243 million [annual depreciation and return on rate base]. With the annual capital related costs, the total annual cost for 2021 for diesel rentals at about $4.1 million.

Please also see response to YUB-YEC-1 (a).

REFERENCE: **Page 5-7 "N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure[7] ($2.037 million forecast in 2020). The project involves the design and installation of temporary rental site electrical infrastructure at Faro (870S) to ensure Yukon Energy can continue to meet its N-1 capacity planning requirements."**

QUESTION:

a) As the project has been completed, is/was the $2.037 million accurate? Are actuals available?

b) Please provide a breakdown of all costs of this infrastructure.

ANSWER:

(a) and **(b)**

The actual cost was $2.446 million. Please see response to YUB-YEC-1-49 and CW-YEC-1-26 (a) and (b).

REFERENCE: **Page 2-14, "Installed YEC and AEY dependable grid capacity for the winter peak in 2021, based on existing capacity today and any planned additions/retirements and excluding Fish Lake hydro, is 139.1 MW in 2021 (70.5 MW of YEC hydro, 12.6 MW YEC LNG, 23.5 MW of YEC diesel, 5.6 MW of AEY diesel and plus 27 MW20 diesel from rented diesel units in order to meet the N-1 criterion assessment).21"**

and

"21 Yukon Energy's 2016 Resource Plan provides details on YEC's updated generation inventory and dependable winter capacity of 114,983 kW (see Chapter 4, Table 4.1). The updates since 2016 Resource Plan include reduced Mayo GS dependable capacity to 6.5 MW due to restricted winter outflows, increased WH GS dependable capacity to 27 MW, retired WH diesel #3, added LNG 3rd engine and other changes to the dependable capacity of the existing diesel units."

I believe that the note is actually referencing Table 4.2 of the 2016 Resource Plan, as Table 4.1 is comparisons with BC Hydro and Hydro-Québec – and not generation inventory.

QUESTION:

a) Please provide an updated Yukon Integrated System Generation Inventory, incorporating the changes in note 21. This would be an update of Table 4.2 from the 2016 resource plan.

b) While referencing the 2016 Resource Plan, noted discrepancies between Table 4.2 and Figure 4-7, Yukon's Transmission and Generation Facilities. Please also provide an update/correction of Figure 4-7 from the 2016 Resource Plan.

ANSWER:

(a) and **(b)**

Please see Appendix A to YEC's 10-Year Renewable Electricity Plan that provides updated version of Table 4.2 from the 2016 Resource Plan. Figure 1 of 10-Year Renewable Electricity Plan illustrates Yukon Electrical System in similar way as Figure 4-7 from 2016 Resource Plan, but without a list of generation capacities. As noted, the generation capacity list is provided in Appendix A of the 10-Year Renewable Electricity Plan.

The copy of the 10-Year Renewable Electricity Plan is provided in response to CW-YEC-1-36 (a).

It is also confirmed that the correct reference to the 2016 Resource Plan is Table 4.2, not Table 4.1.

REFERENCE:

QUESTION:

a) Please provide the stacking order for all thermal generation, YEC owned and rentals – for each site and for the integrated system.

ANSWER:

(a)

The stacking order for all thermal generation is as follows:

	Type/ Location	Units	Comment
1	YEC LNG	WG1, WG2 and WG3	
2	Whse rentals	YM-10, YM-11, YM-12, YM-13, YM-14, YM-15, YM-16, YM-17, YM-18, YM-19.	There is no particular stacking order for these units
3	Faro rentals	YM-20, YM-21, YM-22, YM-23, YM-24, YM-25 and YM26	There is no particular stacking order for these units
4	YEC Whse	WD4, WD5, WD6, WD7	
5	YEC Dawson	DD5, DD4, DD3, DD2, DD1	
6	YEC Faro	FD7, FD1	
7	YEC Mayo	MD1, MD2, MD3	

REFERENCE:

QUESTION:

a) What modifications have been made to the Faro diesel plant since the 2014 YESAB assessment? Please provide details and dates of any and all changes/modifications to the Faro plant.

ANSWER:

(a)

Please see the summary provided below – which provides the modification to the plant and the date of the modification since 2014.

S/N	Modification	Date
1	Moved FD5 Dawson	2014
2	FD0 plant RTU replacement	2017
3	Heating system UG leak replacement (FD7 to FD1)	2017
4	Faro plant repairs	2016

REFERENCE:

QUESTION:

Please provide all documents relating to permits for the addition of the rental generators. If any of these are not available or steps were not taken, please explain.

a) Any and all applications and correspondence with regulator(s) regarding rental diesels.

b) Community consultation and feedback results.

c) YESAB assessment documentation relating to the rental generators.

d) Compliance documents, decision documents and permits.

ANSWER:

(a)

Please see Attachment 1 and Attachment 2 to this response which provide correspondence related to rental diesels at the WRGS and FGS.

(b)

Yukon Energy has undertaken the following effort to inform governments, residents and Citizens in the Faro area of the Corporation's requirement to install temporary rentals diesels at the existing Faro diesel plant:

- **Ross River Dena Council:**

    - Between April 2020 and January 2020, Yukon Energy contacted representatives of the Dena Nezzidi Limited Partnership (DNLP) (designate for the Ross River Dena Council) at least nine times by email and phone to share information about the Faro rental diesel project and procurement opportunities, and to request a meeting with Ross River Dena Council to discuss the project.

- The Dena Nezzidi Limited Partnership representative attended Yukon Energy's December 2, 2020 public information meeting. Copies of the presentation and a summary of the discussion were provided following the meeting.

- As of February 9, 2021, representatives of the Dena Nezzidi Limited Partnership have not provided Yukon Energy with a date and time for the requested meeting with Ross River Dena Council to discuss the specific Faro rental diesel project and YESAA project proposal.

- **Town of Faro:**
  - On April 14, 2020, Yukon Energy emailed the Town of Faro advising of its plans to add rental diesels in Faro in 2020. The email included a request for a follow-up discussion.

  - On July 27, 2020, Yukon Energy met with the Town of Faro Council to discuss the 10-Year Renewable Electricity Plan. As part of this meeting, Yukon Energy shared information about the rental diesel project with Council and garnered feedback on the project.

  - Additional information about the project and public consultation efforts were shared with Town staff and Council members in follow-up emails and conversations.

- **Residents and Citizens:**
  - An information piece about the Faro rental project was mailed to all residents and citizens in Faro in September 2020. Information about the project, along with a copy of the mailer, was added to Yukon Energy's website at the same time. See Attachment 1 to this response.

  - Yukon Energy hosted a public information meeting about the project on December 2, 2020. The session was hosted online due to COVID-19 concerns. Six members of the public attended. The meeting was advertised with community posters, radio and print ads, and social media. A copy of the presentation was made available after the meeting on Yukon Energy's website. See Attachment 2 to this response.

- Yukon Energy responded to questions received by phone, email and social media about the project as received.

- Key themes of questions and comments raised by public members were:
  - Noise levels from rentals
  - Air quality
  - Consultation with local residents
  - Consultation with Ross River Dena Council
  - Faro Air Permits (allowances, changes and subsequent consultation)

(c)

The rental diesels at the Whitehorse Rapids Generating Station (WRGS) have been installed and operated under Air Emission Permit amendments that were made under existing YESAA Decision Documents. No YESAA assessments have been required to date for the use of rental diesels as the activities represented by their use are sufficiently similar to those generating activities that have been previously assessed under YESAA and the YG regulatory authority determined that the existing decision documents for previous assessments of these activities are sufficient for the purposes of amending YEC's air emissions permit.

The rental diesels at the Faro Generating Station (FGS) can be operated up to an operating cap of 10.6 MW and no YESAA assessment is required for that purpose as the previous YESAA assessments of the facility and the associated Decision Documents allow for this operational cap at the site under YEC's existing air emissions permit.

(d)

Per the response to NY-YEC-1-8 (c), the rentals have not required specific assessment under YESAA to be authorized for use under YEC's air emissions permit, therefore there are no compliance documents, decision documents, or permits issued pursuant to a specific YESAA assessment for the rentals, other than the existing air emissions permit, which authorizes the use of temporary diesel generators beyond those permanently installed at the facility within a generating capacity limit.

From: Elizabeth.Barker@gov.yk.ca
To: Travis Ritchie
Subject: RE: AEP 60-010 Amendment
Date: October 13, 2020 4:05:52 PM

Good Afternoon Travis,
We have determined that the information provided in YEC's previous Faro station YESAA assessments (2008-0230 and 2011-0246) is still valid for the proposed 2020 amendment of reinstalling capacity of approximately 5.65MW at the Faro generating station. YEC has authorization to reinstall previously relocated/de-rated capacity of up to 10.6MW, cumulative station capacity, without proceeding through the YESAA assessment process. As discussed, any additional capacity increase that will bring the Faro station's cumulative capacity above 10.6MW will need to proceed through the YESAA assessment process before being considered.
As this amendment doesn't change the content of your current Air Emissions Permit 60-010, we will not be issuing an amended permit and you may continue to use permit 60-010 as is .
Cheers,
Liz

Elizabeth Barker

pursuant to the 2008/2011 assessment findings and related decision documents.
If you need, I can resubmit the amendment application for reinstallation of only the previously assessed capacity, removing reference to the 3 additional units (YM23-YM25). YEC can then work on getting a YESAA assessment completed for the additional capacity, which could be permitted afterward.
Does that sound reasonable? If it's helpful to speak on the phone please let me know and I will call you at a convenient time.
Thanks again.
Regards,
Travis

From: Elizabeth.Barker@gov.yk.ca [mailto:Elizabeth.Barker@gov.yk.ca]
Sent: September 23, 2020 5:03 PM
To: Travis Ritchie <Travis.Ritchie@yec.yk.ca>
Subject: AEP 60-010 Amendment
Good Afternoon Travis,
According to the Assessable Activities Regulation under YESAA, Part 4, Item 2 (b) applies to your AEP 60-010 amendment application.

PART 4

Energy and Telecommunications

	Column 1	Column 2
Item	Activity	Specific Exception
1	Construction, installation, operation, modification, decommissioning or abandonment of, or other activity in relation to, a power line or a telecommunications line	
2	Construction, operation, modification, decommissioning or abandonment of, or other activity in relation to, • **(a)** a hydroelectric generating station; • **(b)** a fossil fuel-fired electrical generating station; • **(c)** a wind-powered electrical generating station; • **(d)** a wood-fired electrical generating station; or • **(e)** a wood-fuelled heating facility for the commercial sale of heat	Construction, operation, modification, decommissioning or abandonment of, or other activity in relation to, a wind-powered electrical generating station if its production capacity is, and in the case of a modification remains, 50 kW or less

Specifically, the Faro generating station underwent a YESAA assessment in 2014. In the assessment, FD1 and FD7 were assessed with production capacities of 5.15MW and 3MW for a total of 8.15MW.
Currently, FD1 and FD7 have been derated to 2.4MW and 2.8MW however, with the addition of YM20-22 (5.4MW) and the addition of the YM23-25(5.4MW) as emergency backup, this brings the station capacity to a total of 16MW. This is 7.85MW greater than the capacity that was previously assessed in 2014. As the modification of production capacity is greater than 50kW, this project will need to proceed through YESAB before we can issue any permit amendments.
Please let me know if you would like to discuss this further.
Have a great day,
Liz

(Via email)

Dear Ms. Barker,

RE: AIR EMISSIONS PERMIT NO. 60-010 – APPLICATION FOR APPROVAL TO INSTALL PREVIOUSLY REPLOCATED AND DERATED GENERATING CAPACITY - FARO GENERATING STATION

Please find an application and supporting documentation regarding the above referenced permit amendment request. Pursuant to permit Part 2, Item 5, we are seeking approval to reinstall site capacity that was relocated to other generating stations in recent years, as well derated site capacity with existing units.

Please contact me by telephone at 867.393.5350 or by email: travis.ritchie@yec.yk.ca if you have any questions, comments, or concerns with this submission.

Thank you for your time and consideration in this matter.

Yours Sincerely,

Travis Ritchie, P.Biol.

Manager – Environment, Assessment, & Licensing

APPLICATION FOR RENEWAL, AMENDMENT OR CANCELLATION OF *ENVIRONMENT ACT* PERMITS

Please complete the following and ensure that all information is legibly printed or typed:

Permittee: Yukon Energy Corporation
(Business or individual name)

Permit type: Air Emissions Permit
(e.g. pesticide, special waste, air emissions, solid waste, land treatment facility, relocation, ODS/OH)

Permit number: 60-010
(e.g. 4201-XX-XXX)

Please check (✓) appropriate box:

Renewal

☐ I have fully reviewed my permit and the information on my current permit is correct and complete and my business is operating as described therein.

Amendment

☑ I have fully reviewed my permit and the following changes or additions have occurred and should be taken into account when renewing my permit (attach additional information if necessary):

Ownership: Yukon Energy Corporation (no change)
Mailing Address: Box 5920
Whitehorse Yukon Y1A 6S7
Site Location(s): Faro Generating Station (XX, Faro, YT

Telephone #: 867.393.5350 Fax #:
Email: travis.ritchie@yec.yk.ca
Products/Activities: Reinstall previoulsy relocated/derated capacity (aprx. 5.65 MW)
Transport special wastes: yes: ☐ no: ☑
Other: See attached supporting documents.
Note: additional information may be required depending on the nature of the change.

Cancellation

☐ I am no longer undertaking the activities authorized by the above permit. I understand that I will be contacted by enforcement officials to confirm that a permit is no longer required, at the following coordinates:

Mailing Address:
Site Location(s):
Telephone #: Fax #:
Email:
Permitted Activities:

I, Travis Ritchie *[print name clearly]*, certify that I am an authorized representative of Yukon Energy Corporation *[business name]*, and hereby make application for the renewal, amendment or cancellation of the above-noted permit, as indicated, and certify that the information provided on this form is correct.

Signature of applicant	Date	# of attachments
	Sepetmber 28, 2020	3 (Attachments A-C)

This information is being collected under the authority of s.90 of the *Environment Act*. For further information contact the Environmental Programs Branch at (867) 667-5683.

50	400V	1440 (1800)	1310 (1638)

FEATURES

EPA TIER 2 and CARB certified for non-road mobile applications. Factory designed, certified prototype tested with torsional analysis. Production tested and delivered in a package that is ready to be connected to your fuel and power lines. Supported 100% by your Caterpillar® dealer with warranty on parts and labor. Extended warranty available in some areas. The generator set is designed and manufactured in an ISO 9001:2000 compliant facility. Generator set and components meet or exceed the following specifications: AS1359, AS2789, ABGSM TM3, BS4999, DIN6271, DIN6280, EGSA101P, JEM1359, IEC 34/1, ISO3046/1, ISO8528, NEMA MG1-22

CATERPILLAR SR4B GENERATOR

Single bearing, wye-connected, static regulated, brushless permanent magnet excited generator designed to match the performance and output characteristics of the Caterpillar diesel engine driving it.

RELIABLE, FUEL EFFICIENT DIESEL ENGINE

The compact, four-stroke-cycle diesel engine combines durability with minimum weight while providing dependability and economy. The fuel system operates on a variety of fuels.

CATERPILLAR COOLING SYSTEM

Sized compatible to rating with energy efficient fan and core.

CATERPILLAR SWITCHGEAR

Provides single unit and/or multi-unit/utility paralleling components. Standby, load sense/load demand, import, export, and base load modes. Comes standard with Basler Utility Multi-function Relay IPS-100.

EXCLUSIVE CATERPILLAR DIGITAL VOLTAGE REGULATOR (CDVR)

Three-phase sensing and adjustable Volts-per-Hertz regulation give precise control, excellent block loading, and constant voltage in the normal operating range.

ENVIRONMENTALLY FRIENDLY

110% spill containment of onboard engine fluids.

SOUND ATTENUATED CONTAINER

For ease of transportation and protection. Meets 75 dB(A) at 50 ft or below per SAE J1074 measurement procedure at 110% prime load.

RATING DEFINITIONS

Standby – Applicable for supplying continuous electrical power (at variable load) in the event of a utility power failure. No overload is permitted on these ratings. The generator on the generator set is peak prime rated (as defined in ISO8528-3) at 30° C (86° F).

Prime – Applicable for supplying continuous electrical power (at variable load) in lieu of commercially purchased power. There is no limitation to the annual hours of operation and the generator set can supply 10% overload power for 1 hour in 12 hours.

XQ2000 RENTAL

CATERPILLAR®

STANDARD FEATURES

GENERATOR SET EMCP 3.3 LOCAL CONTROL PANEL

- Generator mounted EMCP 3.3 provides power metering, protective relaying and engine and generator control and monitoring.
- Provides MODBUS datalink to paralleling control for monitoring of engine parameters.
- Convenient service access for Caterpillar service tools (not included).
- Integration with the CDVR provides enhanced system monitoring.
- Ability to view and reset diagnostics of all controls networked on J1939 datalink.
- Network modules via the control panel removes the need for a separate service tool for troubleshooting.
- Real-time clock allows for date and time stamping of diagnostics and events.

EMCP 3.3 ENGINE OPERATOR INTERFACE

- Graphical display with positive image, transflective LCD, adjustable white backlight/ contrast.
- Two LED status indicators (1 red, 1 amber).
- Three engine control keys and status indicators (Run/Auto/Stop).
- Lamp test key.
- Alarm acknowledgement key.
- Display navigation keys.
- Two shortcut keys: Engine Operating Parameters and Generator Operating Parameters.
- Fuel level monitoring and control.

CIRCUIT BREAKER

- 3000A fixed type, 3 poles, genset mounted, electrically operated, insulated case circuit breaker.
- Solid state trip unit for overload (time overcurrent) and fault (instantaneous) overcurrent protection.
- Includes DC shunt trip coil activated on any monitored engine or electrical fault, 100 KA-interrupting capacity at 480 VAC.

VOLTAGE REGULATION AND POWER FACTOR CONTROL CIRCUITRY

- Generator mounted automatic voltage regulator, microprocessor based.
- Manual raise/lower voltage adjust capability and VAR/power factor control circuitry for maintaining constant generator power factor while paralleled with the utility.
- Includes RFI suppression, exciter limiter and exciter diode monitoring.
- Voltage and power factor adjustments are performed on the setting screen of the HMI touch screen.

FUEL TANK

- UL Listed 1250 gallon double walled.
- Fuel transfer system

CURRENT TRANSFORMERS

- CT's rated 3000:5 with secondaries wired to shorting terminal strips.

POTENTIAL TRANSFORMERS

- 4:1 ratio with primary and secondary fuse protection.

BUS BARS

- Three phase, plus full rated neutral, bus bars are tin-plated copper with NEMA standard hole pattern for connection of customer load cables and generator cables.
- Bus bars are sized for full load capacity of the generator set at 0.8 power factor.
- Includes ground bus, tin-plated copper, for connection to the generator frame ground and field ground cable.

AC DISTRIBUTION

- Provides 240 VAC for all module accessories.
- Includes controls to de-energize jacket water heaters and generator space heater when the engine is running.

SHORE POWER TWO (2)

- One (1) shore power connection distribution block for jacket water heaters.
- One (1) for generator space, battery charger, and fuel pump.

INTERNAL LIGHTING

- Four (4) internal DC lights with one (1) timer and two switches installed at each side of the container door.
- Three (3) internal AC lights.
- One (1) single duplex service receptacle.

BATTERY CHARGER AND BATTERIES

- 24 VDC/20A battery charger with float/equalize modes and charging ammeter.
- Maintenance free batteries.

EMERGENCY STOP PUSHBUTTON

- Two external ESPs located near each access door.

MODES OF OPERATION

Caterpillar utility paralleling controls are intended for automatic or manual paralleling with a utility power source as a load management system, with provisions for standby operation feeding an isolated load network. Load management operation involves microprocessor-based automatic loading controls with soft loading, base load, Import/Export control and soft unloading. For Standby operation, the generator operates as an isochronous machine isolated from the utility supply. The controls allow for automatic operation, initiated locally or remotely by the customer's SCADA system. Detailed modes of operation are listed below:

SINGLE UNIT ISLAND AND MULTI-UNIT ISLAND OPERATION

1. Utility Standby Mode (Normal)
   a. The utility is providing power for the plant loads.
   b. The Power Module Generator breaker is open.
   c. The pm is in automatic standby mode to respond to a utility failure.
2. Emergency Mode (Emergency)
   a. Utility Failure
      1) The customer protective relaying senses a utility abnormal condition.
      2) A run request is sent to the Power Module Generator plant.
      3) The first Power Module Generator reach rated to voltage and frequency is closed to the bus.
      4) In Multi-Unit Island Mode, the remaining Power Module Generators are paralleled to the bus as they reach rated voltage and frequency. This function is performed via the ModBus Plus data link connected between the Power Modules.
      5) Plant load is transferred to the Power Modules, which share load equally via ModBus Plus data link.
      6) The system is now in Emergency Mode.

GENERATOR DEMAND PRIORITY CONTROL

The System Controls include a Generator Demand Priority Control function to automatically match the on-line Power Module Generator capacity to the loads in order to avoid unnecessary operation of all the Power Module Generators when the plant loads are low.

The following controls are provided for each Power Module Generator:

a. User-settable Generator Priority Selector
b. Status indicator for the Generator Priority selected
c. Status indicator for Power Module Generator on-line or off-line
d. Generator Demand Priority Control Switch (On/Off)
e. User-settable Generator Remove Level (% as a function of single generator capacity)
f. User-settable Generator Remove Time Delay
g. User-settable Generator Add Level (% as a function of single generator capacity)
h. User-settable Generator Add Time Delay

Upon entrance into Emergency Mode, all generators will be started and paralleled to the bus. After the Remove Time Delay, Power Module Generators will be removed from the bus as a function of the generator percentage loading. Generators will be removed from the bus in descending priority order.

Should the generator percentage loading increase to the user-selected Generator Add Level after the user-selected Generator Add Time Delay, the next priority generator will be started, synchronized and paralleled to the bus. Should the Power Module Generator plant ever reach 100% loading, the next priority generator will be started and added to the bus, bypassing the Generator Add Time Delay.

MODES OF OPERATION (continued)

SINGLE UNIT IMPORT, EXPORT OR BASE LOAD OPERATION

During periods of peak demand the system may be placed in operation using the operator interface panel on the front of the switchgear.

1. Entry – Local
   a. The operator places the System Control Switch into Load Management.
   b. The operator selects Import, Export or Base Load Operation.
   c. The Load Management Setpoint is the amount of power Imported, Exported or Base-Loaded. A 4-12-20mA signal is provided by the customer and is linearly proportional to the utility load, with 12mA equaling 0 kW. The 4-12-20mA utility load signal is wired to one and only one Power Module. If the Power Module selected for Load Management is not available, the 4-12-20mA signal will be routed to a different Power Module.
   d. The operator sets the Load Management Setpoint and Power Factor Setpoint.
   e. A Run request signal is received by the Single Unit Power Module.
   f. The Power Module Generator is started and will run for a predetermined warm-up time before it is synchronized and paralleled to the utility.
   g. When the generator is on the bus, it is soft-ramp-loaded until the generator output reaches the Load Management Setpoint.
   h. The generator output is dynamically adjusted to maintain the Load Management Setpoint.
   i. Should the utility fail during Load Management Operation, the Protective Relay will cause the Paralleling Circuit Breaker 52G to open and be locked out until the Lockout Relay is manually reset by an operator on site. The generator is allowed to run for the duration of the cooldown time.
2. Exit – Local
   a. The Run Request signal is removed from the power module.
   b. The generator is soft-ramp-unloaded until the plant load is fully supported by the utility.
   c. The Paralleling Circuit Breaker 52G is opened.
   d. The generator is allowed to run for the duration of the cooldown time.

STANDARD PARALLELING CONTROL

GENERATOR PARALLELING CONTROLS

The switchgear includes:

- Single unit island mode.
- Multiple unit island mode.
  - Includes Load Sense/Load Demand control.
  - Load sharing capability is provided via network communication.
- Single unit utility parallel mode.
  Selectable for Import/Export control.
  If import or export control is selected a 4-12-20mA signal is required (provided by others) scalable to the utility contribution.
- 6 inch black and white HMI touch screen.
- Reverse compatibility module provided for interface to legacy designed Power Module Switchgear. Includes PLC, load share and voltage droop.

Incoming Utility Breaker Status Circuit – Circuit to accept customers contact from remote utility disconnect device. Customer to provide a normally open form 'a' contact to indicate when the local load network is connected to the utility grid.

Utility Transfer Trip Circuit – Circuit accepts input (normally open dry contact) from customer's system protective relay(s) or other controlling device. Operation of contacts causes tripping of the generator circuit breaker via the generator (software) 86 lock-out function and places the engine in cooldown mode. Circuit is disabled when operating in single unit or multiple unit island.

GENERATOR PARALLELING CONTROLS OPERATOR INTERFACE

Graphical mimic one line diagram that shows generator with its respective circuit breaker in a one-line representation of the system. The graphics utilize black and white indicators and bar graphs while actively displaying the following information:

- Utility CB Open/Closed. Input contacts provided by others.
- Utility kW 4-12-20mA signal required and provided by customer that is scalable to the utility contribution.
- Generator CB Open/Closed/Tripped.
- Generator Volts/Amps/kW/Frequency.
- Engine Stopped/Running/Cooldown/Pre-Alarm/Shutdown.
- Engine ECS Position Stop/Auto/Run.
- Utility Output kW.
- System Summary Alarm.

Event logging is also included with up to 500 stored events.

GENERATOR METERING AND PROTECTION

Generator metering that will graphically display 3Ø Voltage, 3Ø Current, Frequency, Power Factor, kW, kVAR and a Synchroscope Display of EMCP 3.3 faults, CDVR or ADEM 3 will be provided via Modbus RTU interface to EMCP 3.3.

Generator/Intertie Protective Relaying including:

- Device 27/59 – Under/Over Voltage.
- Device 81O/U – Under/Over Frequency.
- Device 40 – Loss of Excitation.
- Device 32 – Reverse Power.
- Device 25 – Synchronizing Check.
- Device 15 – Auto Synchronizer.
- Device 65 – Governor Load Sharing, Soft Loading Control.
- Device 90 – VAR/PF and Cross Current Compensation Controller.

PROGRAMMING AND DIAGNOSTICS

Includes field programmable set points for engine control and monitoring variables and self-diagnosis of the EMCP 3.3 system component and wiring failures.

ENGINE CONTROL SWITCH

Keypad selectable, four (4) positions – Off, Auto, Man, Cool:

- Off for engine shutdown and resetting faults.
- Auto for local or remote automatic operation when initiated by switch operation or contact closure.
- Man for local starting and manual paralleling.
- Cool for normal engine shutdown with timed cool-down cycle.

CIRCUIT BREAKER CONTROL SWITCH

Heavy duty, three- (3) position spring return to center with momentary trip and close position and slip contacts for automatic closing. Includes circuit breaker position indicating lamps.

EMERGENCY STOP PUSHBUTTON

- Mushroom head, twist to reset, causes engine shutdown and tripping of the generator circuit breaker. Prevents engine starting when depressed.

XQ2000 RENTAL

CATERPILLAR®

STANDARD PARALLELING CONTROL (continued)

ELECTRONIC LOAD SHARING GOVERNOR

- Includes speed adjustment, and auto load share capability when in parallel with legacy power modules.

ALARM MODULE

- Dedicates annunciator screens for warning and shutdown faults. Includes external mounted horn and acknowledge push-button.

AUTOMATIC/MANUAL PARALLELING

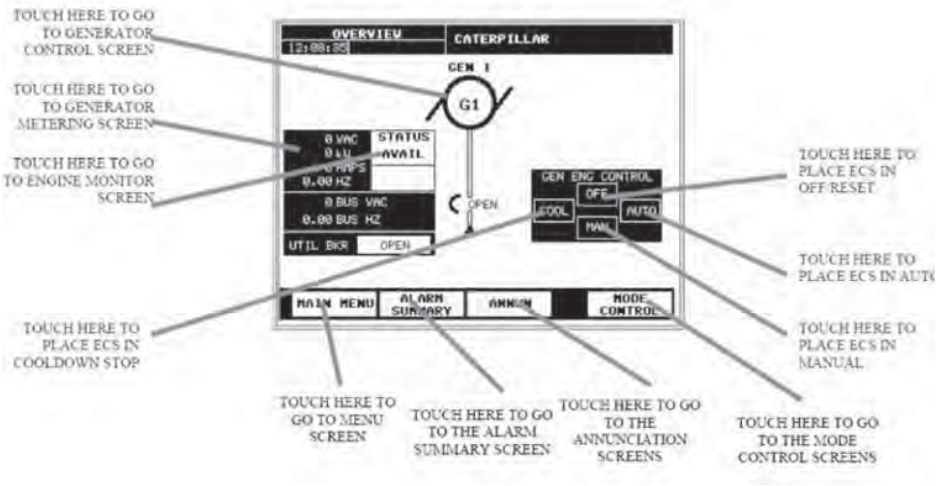
- Automatically synchronizes and parallels the generator with another power source.
- Includes provisions for manual permissive paralleling.

HUMAN MACHINE INTERFACE (HMI) HIGHLIGHTS

- Engine/Generator function is performed thru the 6" HMI touch screen interface.

Overview Screen (Typical)

Shows the generator status, generator metering data, bus metering data, ECS position, and generator/utility breaker status.

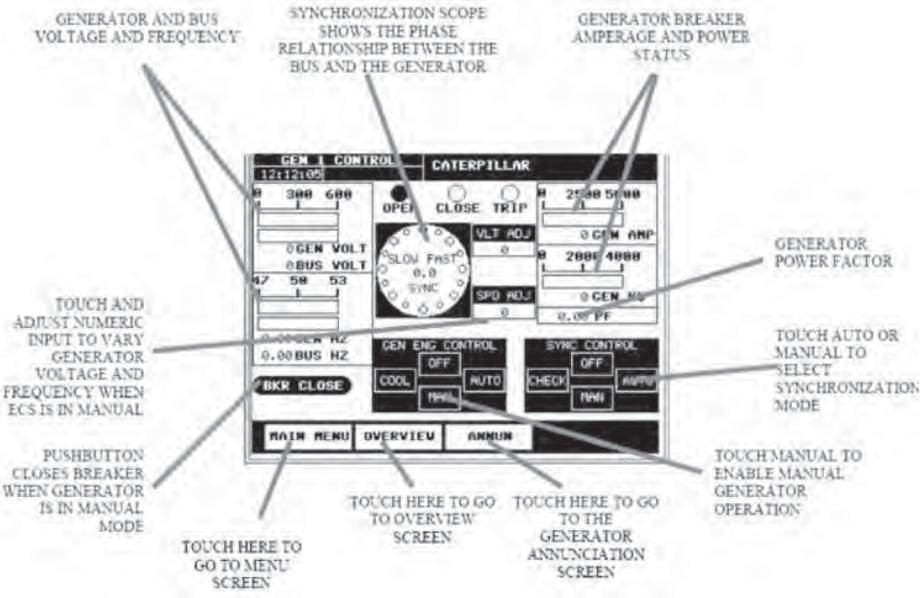


XQ2000 RENTAL

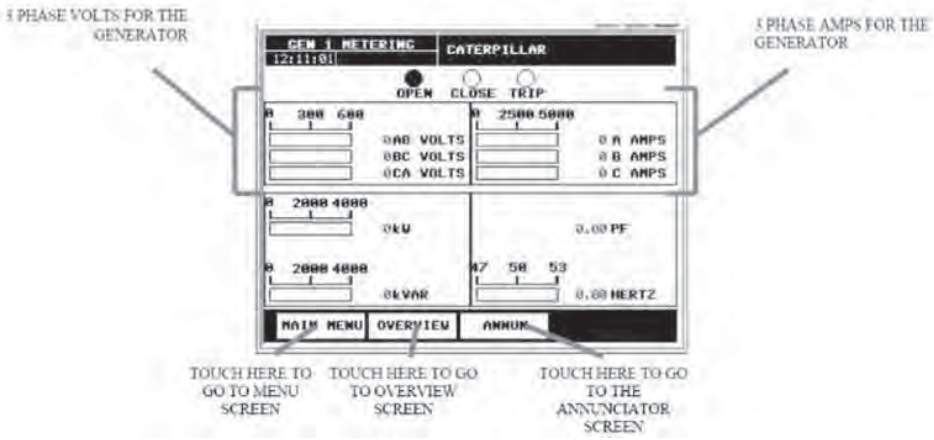
CATERPILLAR®

STANDARD PARALLELING CONTROL (continued)

Generator Control Screen (Typical)
It allows the operator to observe the automatic synchronization and transfer of the load to and from the generator. Engine control allows the operator to run the engine in manual, or switch to automatic modes. Voltage and frequency offset adjustment allows the operator to control generator frequency and voltage.



Generator Metering Screen (Typical)
Allows the operator to view three phases of voltage and amperage for the bus and the generator.



XQ2000 RENTAL

CATERPILLAR®

STANDARD PARALLELING CONTROL (continued)

Engine Monitoring Screen (Typical)
Engine status is obtained directly from the EMCP 3. Engine starts and total hours can be used by the operator to determine when regular preventive maintenance is required. Other metering includes engine battery and oil filter health.

ENVIRONMENTAL WORK PRACTICES

September 2020

ENVIRONMENTAL WORK PRACTICE

An Environmental Work Practice is a set of positive guidelines or "Do's and Don'ts" on how to control an aspect of the services, activities, or products of Yukon Energy that may have a negative effect on the environment.

DIESEL GENERATOR EMISSIONS

EMS-EWP-002

1.0 Introduction

1.1 Purpose

Provide steps to use Yukon Energy Diesel generators efficiently and with the fewest air emissions and least pollution emitted into the environment, as well as to minimize the impact of such air emissions where they are unavoidable.

1.2 Requirements

- A copy of the Air Emissions Permit, from Environment Yukon, is kept at each site.

1.2.1 Operation and Maintenance

- Except for maintenance purposes (e.g., exercise, run after repair) SCC and Plant Operators must use the generators at each site **in order of highest efficiency** under the circumstances. In the rare event that is not possible the operator and SCC must keep a record of why this was done.
- Whenever possible schedule maintenance with surplus hydroelectricity availability so diesel generation is not needed to meet electrical demand.
- Follow manufacturers maintenance presciptions and conduct all necessasary maintenance for generators and environmental emissions controls so the units are as efficient as possible. Monthly run-ups are currently done as scheduled maintenance.
- All particulates collected by emissions control equipment shall be contained such that they are not released to the environment.
- All inspections carried out on the diesel generators shall be documented and retained and will include the name of inspector, date, observations, and actions taken and date of actionsand the date each action was taken.

2.0 Monitoring, Reporting and Record Keeping

1. Keep all records for a minimum of three years and make them available upon request for inspection by a Yukon GovernmentEnvironmental Protection Officer.
2. Records will be kept at Records Management
3. The unit operating authority (i.e., SCC, by way of YEC Environment Department) must obtain approval from an Environmental Protection Officer with YG prior to:
   a. any addition, modification, removal or replacement of any equipment or components related to the release, abatement, control or treatment of air emissions; or
   b. any change in the location of the source(s) (i.e., if there is a plan to move a generator).

3.0 Applicable Legislation and Other Requirments

4. *Yukon Environment Act Yukon Air Emissions Regulations*
5. *Yukon Air Emissions Permit No. 60-010*

4.0 Other Related Information

Yukon Energy Safe Work Practices
SWP's can be found on the Health and Safety Sharepoint site.

.

ENVIRONMENTAL WORK PRACTICE

An Environmental Work Practice is a set of positive guidelines or "Do's and Don'ts" on how to control an aspect of the services, activities, or products of Yukon Energy that may have a negative effect on the environment.

FUELS, LUBRICANTS AND COOLANTS

EMS-EWP-005

1.1 Purpose

The purpose of the **Environmental Work Practice** for **Fuels, Lubricants and Coolants** is to provide the steps required to purchase, store, use, products in compliance with applicable laws and otherwise in an environmentally responsible manner.

2.0 Fuels, Lubricants and Coolants

Spills and leaks of oils, coolants, liquids and fuels can harm soil and water and human health. Spills need to be documented, reported, and cleaned up immediately.

2.1 Requirements

- All fuel storage containers should have secondary containment and ideally include integral leak detection and recovery capabilities.
- In addition to absorbent material required to cleanup drips, leaks and minor spills, a fully stocked spill kit shall be available where substances are stored and/or where oil filled equipment will be working.
- Once a spill kit is used, any materials taken out shall be replaced as soon as possible.
- Replacement materials can be obtained through the supplier.
- Lead hands will be responsible for storing spill response equipment in their areas of responsibility.
- All service vehicles transporting hazardous materials and all heavy equipment, must maintain suitable spill response equipment with the vehicle/equipment at all times.
- Staff and contractors on site will be familiar with the contents of onsite spill kits and will be trained in the proper use of spill kits.
- Use external secondary containment for single-walled tanks, for double-walled tanks with capacities more than 4,000 litres, or when storing more than twenty-four 45-gallon drums in one group.
- For 45-gallon drums, use drip pans or similar containers.
- For single walled tanks or double walled tanks over 4,000L, use an approved liner or a curbed concrete pad surrounding the tank, and a spill containment device attached to the intake valve.

The liner or pad and spill containment device must be made of materials that are compatible with the stored materials.

Records Maintenance

- Spill Contingency Plans will be located at each facility. Project managers, lead hands and the site supervisors shall have a copy of the spill contingency plan available on site at a central location.
- Spill contingency plans will also be located in T&D service vehicles.
- Monthly summaries of fuel inventories must be maintained on site as well as records of anytime fuel is added to the system

Reporting

- If a fuel system fails a leak test, it must be reported to the Yukon Energy Department of Environment
- Reporting to the Yukon Spill Report line by the YEC Dept of Environment is necessary if;
    - There is a shortage of 1.0% on monthly tank capacity or tank thouroughput,
    - if there are 4 shortages of 50 litres or more;
    - or consecutive losses totaling 200 litres or more
    - Any loss to water

Fuelling

- Ensure personel is present during fuelling
- Do not refuel equipment within 30m of a watercourse or waterbody. Exceptions to this requirement include equipment refueled within secondary containment (e.g., water pump contained within spill tray).
- Ensure written standard operating procedures, work practices or guidleines (this EWP) are in place during fuelling activities.
- Keep adequate quantities of spill response equipment near fuelling areas
- Use secondary containment at all times when refueling.

Transportation

- All fuels, lubricants, coolants and other hazardous substances must be transported under applicable Transportation of Dangerous Goods Act and Regulation. When transporting any hazardous materials, refer to TDG regulations and the MSDS sheet for the product.
- Contractors hauling hazardous goods for YEC must have Transporation of Dangerous Goods training and certification as well as MSDS sheets for the product in the vehicle.

Waste Handling

WHITEHORSE PLANTS: PUT OILY WASTE INTO RED METAL CONTAINERS.

- Put all contaminated absorbent pads, spent oil filters and contaminated rags into the red oily waste bins in the Whitehorse Hydro and Diesel plants. Oily waste bins will get emptied into a larger dumpster for oily waste outside the WH Diesel plant.
- Do not line red bins with plastic bags as it could cause a fire.
- Waste oil/fuel/solvents/coolants must be stored in clearly labeled and sealed containers, located upright and out of the elements (i.e., not exposed to precipitation or excessive ultraviolet light), and ideally will be stored in outdoor shelters, or indoors on pallets, with integral leak containment
- Keep storage sites secure
- Keep containers at least 30m away from surface waters, catch basins (stormwater), private and public water supply wells.

Waste Records Collection & Retention

- Leadhands are responsible for storing this material and coordinating with waste collection contractor for regular pick-ups.
- Properly completed and signed records and waste manifests must be completed for all waste disposal events and must be retained and regularly provided to Yukon Energy Records Management for filing.

3.0 Applicable Legislation

- Yukon Environment Act, *Spills Regulations*, Yukon Territorial Government
- The storage of hazardous substances is regulated under the *Yukon's Storage Tank Regulations*
- Oil and Gas Act, *Gas Processing Plant Regulations*, Yukon Territorial Government

4.0 Additional Information

YEC Spill Contingency Plans
Can be found on the EMS SharePoint site under Environmental Documents.

ENVIRONMENTAL WORK PRACTICE

An Environmental Work Practice is a set of positive guidelines or "Do's and Don'ts" on how to control an aspect of the services, activities, or products of Yukon Energy that may have a negative effect on the environment.

SPECIAL WASTES

EMS-EWP-008

1.0 Introduction

*1.1 **Purpose***

The purpose of this **Work Practice** for **Special Wastes** (commonly known as hazardous wastes) is to provide the steps required to purchase, store, use and dispose of hazardous wastes in an environmentally responsible manner and according to the YEC Special Waste Permit **41-120.**

2.0 Special Wastes

Yukon Energy is permitted to generate and store the following:

- Waste oil
- Waste solvent
- Waste anti-freeze
- Waste lead based paint chips

Other examples of special wastes include waste batteries, SF6 and asbestos. In addition, any waste dangerous goods are considered special wastes.

2.1 Requirements

If the contractor or employee works with special waste in any way, they need to understand the YEC Special Waste Permit. The following are requirements under the permit:

Documentation

- Keep the Special Waste Permit posted at each site
- Keep a waste manifest everytime you transport or get rid of special wastes, send to YEC Environment Department
- Maintain records of the types of special wastes in and out of your storage areas, volume, origin and storage location. File with YEC Records Management on a yearly basis.

- Submit inspection reports of weekly, monthly and annual inspections (see below requirements) to YEC Environment Department

Storage

- Prevent contamination and leaks by ensuring containers are:
    - properly labelled,
    - sealed, covered and
    - stored within secondary containment.
- Never mix or dilute special wastes.
- Routinely remove special wastes from site to an approved facility

Inspection

- Weekly - inspect for leaks of special waste storage weekly
- Monthly - Inspect storage containers for change in volume
- Annually – check container integrity, check for cracks or other issues

The Yukon *Special Waste Regulations* and the *Gas Processing Plant Regulations* state that a person who possesses or controls a special waste at the time of a release (spill), or who causes a release, **must report the incident** to the Yukon Spill Report Line (667-7244) and the Chief Operating Officer of the Oil and Gas Branch (334-3112, if LNG). The Manager of Environment or Environmental Analyst will make this report.

Containment and clean-up action should begin as soon as possible to protect human health and the environment.

Note that for all but very small quantities of special waste, most placarding, shipping documentation, and transporter certification requirements consistent with the *Transportation of Dangerous Goods Regulations* apply to the transport of special waste.

3.0 Other Special Wastes not included in the Special Waste Permit 41-120

3.1 Pest Control Products

3.1.1 Requirements

Pest control products include herbicides (e.g., weeds, other undesirable vegetation) and pesticides (e.g., insects, rodents). One must ensure that the certified applicator or his/her assistant performs the work as specified in the permit.

The applicator must have a **Pesticide Service Permit** (see separate Fact Sheet) to apply commercial or restricted pesticides. A **Pesticide Applicator Certificate** is required to purchase any commercial or restricted pesticides.

3.2 Mercaptan

Mercaptan is used to add smell to natural gas and has the ability to leach through soil or the sediment at a moderate rate. Accumulates very little in the bodies of living organisms. Highly volatile from water.

3.2.1 Requirements

- Store and handle in accordance with federal and territorial regulations. Grounding and bonding required. Keep separated from incompatible substances.

3.3 Used Batteries and Aerosol Cans

- Batteries contain sulfuric acid and lead. Both of these materials can damage the environment and pose a safety hazard if handled improperly.
- Under the *Yukon Special Waste Regulations*, you must have a Special Waste Permit if you handle more than five kilograms of lead-acid batteries per month.
- Keep used batteries in a bin and call KBL environmental when the bin is full for disposal.

3.3.1 Requirements

When storing batteries, or preparing them for shipment, follow the steps outlined below to help prevent leaks and spills and to avoid contamination of the storage site:

- Batteries and aerosol cans should be collected and stored in a leak-proof container out of direct sunlight and exposure to precipitation (rain/snow).
- Leadhands shall ensure the proper storage and disposal of such materials. They are also responsible for coordinating the collection and disposal of the material in cooperation with the Environmental Coordinator on an annual or more frequent basis, as required.
- Larger batteries can be placed on wooden pallets. Do not make stacks of batteries more than **three layers thick**. Separate each layer with a sheet of plywood or other suitable material.
- **Layers of pallets** should not be stacked more than **two** high.
- Enclose batteries on the pallet with thick plastic to prevent leaks. All sides must be wrapped to protect the batteries from the weather and to prevent any acid from being discharged into the environment.
- After wrapping the batteries in plastic, strap the stack of batteries to the pallet to prevent the batteries from shifting.

4.0 Disposal methods

- **Collection by a Permitted Facility**
  There are several facilities in Yukon that have permits in place for treating and/or disposing of special waste.

- Liquid natural gas, natural gas
  In the event of a spill, allow to vapourize and disperse to the atmosphere

- Mercaptan: Contain in leak proof container and dispose at permited special waste handling facility.

5.0 Applicable Legislation

- Environment Act, *Pesticides Regulation,* Yukon Territorial Government
- Environment Act , *Spills Regulations*, Yukon Territorial Government
- Environment Act, *Solid Waste Regulations*, Yukon Territorial Government
- Environment Act, *Special Waste Regulations*, Yukon Territorial Government
- Canadian Environmental Protection Act. *Ozone Depleting Substances Regulations*, Environment Canada
- Oil and Gas Act, *Gas Processing Plant Regulations*, Yukon Territorial Government
- Transportation of Dangerous Goods Act, Government of Canada

6.0 Additional Information

YEC Safe Work Practices (SWP)
SWP's can be found on the Health and Safety Departments SharePoint site.

YEC Spill Contingency Plans
Can be found on the Environmental Management System (EMS) Sharepoint site under the Environment Department.

Manager, Environment, Assessment & Licensing
Yukon Energy Corporation
Email: Travis.Ritchie@yec.yk.ca

Dear Mr. Ritchie:

Re: Requirement for Assessment under the *Yukon Environmental and Socio-economic Assessment Act* for Renewal of Permit #60-010

As you are aware, s.49.1(1) of the *Yukon Environmental and Socio-economic Assessment Act* (*YESAA*) as amended in 2015 placed the responsibility for determining whether an assessment is required prior to renewal or amendment of an authorization on the Decision Body for the project. Assessment of an existing project is required when an authorization is renewed or amended, if, in the opinion of a Decision Body for the project, there is a significant change to the original project that would otherwise be subject to an assessment.

As the Decision Body on *YESAA* project 2011-0241 (YEC AEP renewal – Whitehorse Rapids Generating Station), and a regulator on project 2013-0115 (YEC Whitehorse Natural Gas Conversion), the Department of Environment has determined that there have been no significant changes to the air emissions components of the projects since these two previous assessments. Therefore, the amendment of Air Emissions Permit #60-010 does not require a *YESAA* assessment at this time.

We are in receipt of your amendment form and will proceed in issuing the permit to complete the renewal process.

Your project may require a new *YESAA* assessment in the future if there are significant changes to the site or activities. You are required to notify an environmental protection analyst if there are any changes to the air emissions components of your project as compared to the scope of the most recent *YESAA* assessment, so that the significance of the change can be determined. Inspections and/or enforcement officials may also conduct permit inspections to assess whether any changes have occurred.

.../2

Please do not hesitate to contact either myself (867-667-8177; Todd.Powell@gov.yk.ca) or Janine Kostelnik (667-5456; Janine.Kostelnik@gov.yk.ca) if you have any questions about this determination.

Sincerely,

Todd Powell
A/Director, Environmental Programs

RECORD OF DETERMINATION OF SIGNIFICANT CHANGE

DATE: December 11, 2017

NAME OF DECISION BODY: Department of Environment

PROJECT NAME: Yukon Energy Corporation

YESAB File #: 2011-0241, 2013-0115

PROPONENT NAME: Yukon Energy Corporation

REGULATORY AUTHORIZATION(S), LEGISLATION AND PERMIT #:

1. **Air Emissions Permit**
   Air Emissions Regulations, Permit #60-010

YESAA subsection 49.1(1) states: "A new assessment of a project or existing project is not required when an authorization is renewed or amended unless, in the opinion of a decision body for the project, there is a significant change to the original project that would otherwise be subject to an assessment."

Following are the criteria, factors and analysis that have been taken into consideration by the Decision Body:

Criteria/Factors Considered	Analysis
1. Is the activity listed in the Assessable Activities, Exceptions and Executive Committee Regulations? Identify the section of the regulations and how the exemptions do not apply.	**Schedule 1, Part 4.2** Activity: Construction, operation, modification, decommissioning or abandonment of, or other activity in relation to a fossil fuel-fired electrical generating station. Specific Exemption: Construction, operation, modification, decommissioning or abandonment of, or other activity in relation to, a wind-powered electrical generating station if its production capacity is, and in the case of a modification remains, 50 kW or less. The exemption does not apply because the modification is specific to fossil fuel-fired electrical generation.

Criteria/Factors Considered	Analysis
2. How has the project changed since the previous assessment?	Yukon Energy Corporation (YEC) have requested an amendment to their Air Emissions permit to include the use of four (with a potential 5th unit in 2018/2019) Tier 2 diesel engines to the Whitehorse facility for N-1 emergency use only, to address potential capacity gaps over the winter months on an interim basis.
3. Were the subject, scale and scope of the changes to the project identified in #2 above discussed in the previous Evaluation Report or Decision Document? If the changes were discussed in the Evaluation Report or Decision Document, did YESAB provide any comment on how these changes would affect the environment?	The installed thermal capacity that was assessed in 2011-0241 was 25.2 MW of diesel. In 2013-0115 two of the diesel engines identified in 2011-0241 were taken out and replaced by LNG units. The two diesel generators decommissioned were rated at 3.92 MW and 5.15 MW (9.1 MW total). They were replaced by 2 modern natural gas units rated at 4.4 MW each (8.8 MW total). The proposed additional temporary engines were not directly discussed in either of the past two assessments, however the overall capacity of the facility remains within the 25MW. The air quality impact assessments conducted for each WRGS plant configuration (25MW diesel in 2008 and 2011 and 16.1 MW diesel + 8.8 MW natural gas in 2013) indicated that no significant adverse human health effects would result even under the worst case operating scenario for either facility configuration (all units operating under the most adverse meteorological conditions). The potential for temporary use of up to five units with 10 MW of diesel generation, using more modern and cleaner operating EPA Tier 2 rated engines, is not anticipated to result in significant changes to the overall facility emissions and the conclusions of previous air quality impact assessments for the station.
4. Do any of the changes identified in #2 conflict with any of the terms and conditions of the Decision Document in the previous	N/A

Criteria/Factors Considered	Analysis
assessment?	
5. During the previous assessment, did First Nations, organizations, other stakeholders, or the public indicate concerns about the project that could be intensified as a result of the proposed changes?	2011-0241: residents of Riverdale raised some concerns about the cumulative short and long term health impact of diesel emissions on the already poor air quality in their neighbourhood. Concerns were also raised about a potential increase to noise levels, and about industrial customers being required to supply their own power. These concerns were raised by residents, Riverdale Community Association, and Yukon Conservation Society. 2013- 0115: Many concerns were raised about the use and transportation of LNG to Whitehorse. These comments were specific to impacts about use of LNG, rather than the removal of the two diesel engines and therefore falls outside of the scope of this determination of significant change.
6. Do you consider the changes to the project to be "significant"? Why?	Yukon Environment has deemed that there are no significant changes to the project proposed.

RATIONALE FOR DETERMINATION

Two previous YESAA assessments are relevant to this determination:

1. 2011-0241: renewal of Air Emissions Permit in order to maintain the ability to operate its diesel generating facilities.
2. 2013-0115: construction and operation of natural gas powered, reciprocating engine driven generation station and associated liquefied natural gas transfer, storage and vapourization facilities on the site adjacent to YECs hydroelectric facility. The two LNG generators replaced two existing diesel generators which were at the end of their life cycle with a total capacity of 8MW (9.1 MW nameplate rating).

An N-1 emergency event is a very unlikely incident where an extended winter power outage occurs due to loss of their largest source of electricity (Aishihik hydro plant or Aishihik to Whitehorse transmission line). YEC's 2016 Resource Plan identified that should they find themselves in an N-1 event situation, they may not be able to produce enough electricity to meet demand at peak times. Without emergency

back-up, rolling black-outs would be initiated, which is not a preferable solution.

YEC will be renting four diesel engines as back up this winter (2017/18), which if all ran at the same time, would generate less emissions than the two which were taken out of service in 2013, due to higher efficiency. The units are Tier 2 engines that meet current US Environmental Protection Agency guidelines for diesel generators, and would be the cleanest in their diesel fleet at the Whitehorse facility. The applicant is requesting this emergency use be approved during the winter seasons until 2021, which is when they plan on having a more permanent solution to addressing the longer term capacity gap.

The potential need for a 5th unit is based on a load forecast and the consideration of historic winter temperatures. Should ongoing load monitoring and any updating of the load forecast suggest that an additional 2 MW is needed to protect against an N-1 event, then an additional unit would be temporarily installed during the winter period in 2018/2019 and in future winters until such time as a permanent solution can be brought into service to address the current capacity gap.

The potential significance of this change may be considered both in light of the capacity but also of the air emissions resulting from the activity. Notwithstanding the contribution of the natural gas generators, the temporary use of up to 10 MW of Tier 2 diesel engines, the air quality impact assessment from previous assessments that indicated that there would be no significant adverse human health effects would result even under the worst case operating scenario for either facility configuration (all units operating under the most adverse meteorological conditions.

The amended air emissions permit will include appropriate operational, reporting and record keeping requirements.

The Decision Body has:

Consulted with other decision bodies on the determination (if there are multiple decision bodies).	☒ N/A-there are no other decision bodies for this project.
Discussed determination with other regulator(s) on the determination (if applicable)	☒ The Department of Environment provided Yukon departments of EMR (O&G) and EMO, and the City of Whitehorse, with an opportunity to provide comments. No comments were received.
Ensured that First Nation consultation obligations are being met for this renewal or amendment	☒ The Department of Environment initiated written consultation with Ta'an Kwächän Council and Kwanlin Dün First Nations on November 28, 2017. No comments were received from either of these First Nations.

In the opinion of the Decision Body for this project, as noted in the reasons mentioned above, it has been determined that the renewal or amendment to the regulatory authorization:

☐ **Requires a *YESAA* assessment**
☒ **Does not require a *YESAA* assessment**

THERMAL ENERGY PART OF OUR
Future-Focused Portfolio

yukon energy

planning for cold weather, emergencies and increased demand

THE INSTALLATION OF RENTAL DIESEL GENERATORS AT THE EXISTING FARO DIESEL PLANT

next steps

Over the next few months, we'll be working to get our Faro diesel plant site ready for the arrival of the rental generators. During that time you can expect to see the following.

Yukon Energy crews and contractors at the Faro diesel plant doing groundwork and installing additional electrical equipment in the yard

The arrival of the seven generators

The delivery of additional shipments of fuel now and throughout the winter

staying safe during COVID-19

Yukon is our home too. Like you, we are committed to the health and safety of our employees, families and customers. We have developed a strict COVID-19 safety plan that makes the Faro diesel generator project COVID-safe. We will:

Maintain two metres of separation between workers

Use Personal Protective Equipment at all times

Disinfect equipment regularly

Stagger work breaks to help enforce social distancing

For more information, visit **yukonenergy.ca** or contact **communications@yec.yk.ca.**

yukon energy

At Yukon Energy, it's our job to supply the electricity Yukoners need when and where they need it. Our ability to keep the lights on is especially important during Yukon's cold and dark winters when demand for electricity is the highest.

This means we're always planning for cold weather, emergencies and increased demands for electricity. That's why we rent diesel generators each year as our insurance policy against prolonged power outages until we can build more dependable renewable resources.

This winter, we're renting 17 portable diesel generators; seven more than last year. If the cold snap in January 2020 reinforced anything for us, it's that, collectively, Yukoners are using more electricity than ever before, and that more sources of dependable electricity are needed at the flip of a switch during the winter.

Ten of the rental diesel generators will be installed in our Whitehorse parking lot like last year. The other seven will be installed at our diesel power plant in Faro.

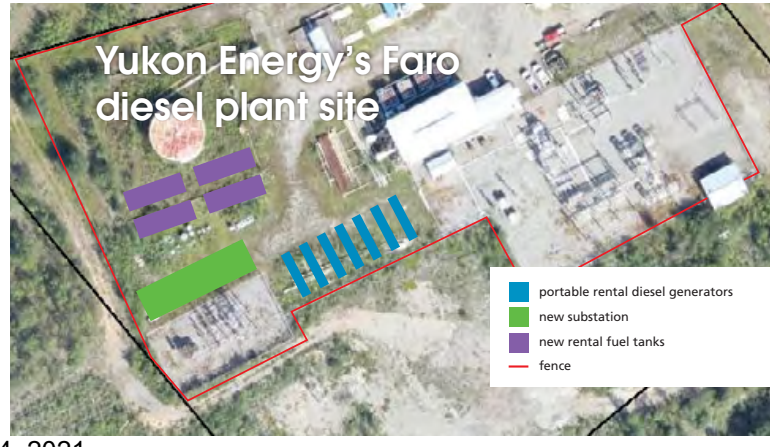
why Faro?

Our diesel plant in Faro is the ideal second location for these portable rental diesel generators because:

- There's enough room to install the generators within our property's fenceline.
- There's room in our yard to build the new substation we need to connect the generators to the Yukon grid.
- There's an existing fuel storage tank on site and room to add the extra temporary fuel tanks we'll need.

When researching this project, we also looked at the option of adding rental generators at our existing diesel plants in Dawson and Mayo. We ruled out those options because:

1. There isn't enough room at the Dawson and Mayo plants to add the extra rental units, fuel and electrical equipment we would need.
2. Our studies showed that by having all seven of the extra rentals located in Faro, they could more efficiently meet peak demands for electricity across the entire Yukon grid.
3. Setting up the seven extra rentals in Faro is less expensive than having to set them up in three separate locations.



how often will they be used?

We rent portable diesel generators each winter to protect Yukoners from prolonged power outages during emergencies and periods of high demand.

The rental diesel generators in Faro won't run all of the time. They'll be used:

- On extremely cold winter days when Yukoners need more electricity (usually around breakfast and dinner time).
- In case of a breakdown at one of our major hydro power plants.
- Each month, for a few hours, to test the engines.

how loud will they be?

We know that diesel generators can be loud.

This winter, we will monitor noise levels emitted by the rental diesel units at the Faro plant. If sound levels are found to be higher than permissible levels, we'll look at ways to help muffle the noise in future years.

Rental Diesels in Faro

December 2, 2020

With thanks and gratitude

Yukon Energy recognizes that we live and work on the Traditional Territories of Yukon First Nations.

We give thanks to the Ross River Dena Council for allowing our facilities and this project to take place on their Traditional Territory.

2

Today's discussion

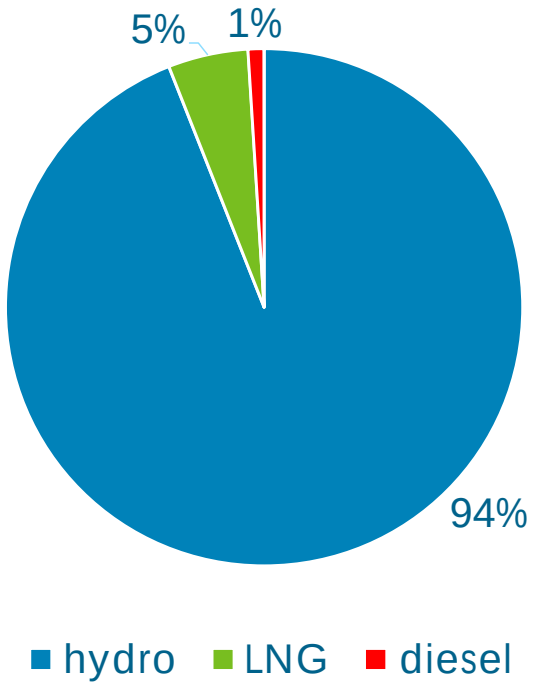
- Why diesel?
- Why more now?
- Why Faro?
- When will they be used?
- What does it mean?
- What does the future hold?
- Discussion

3

Why diesel?

It’s a key part of our electricity mix

Generation Sources, 2015-2019 average

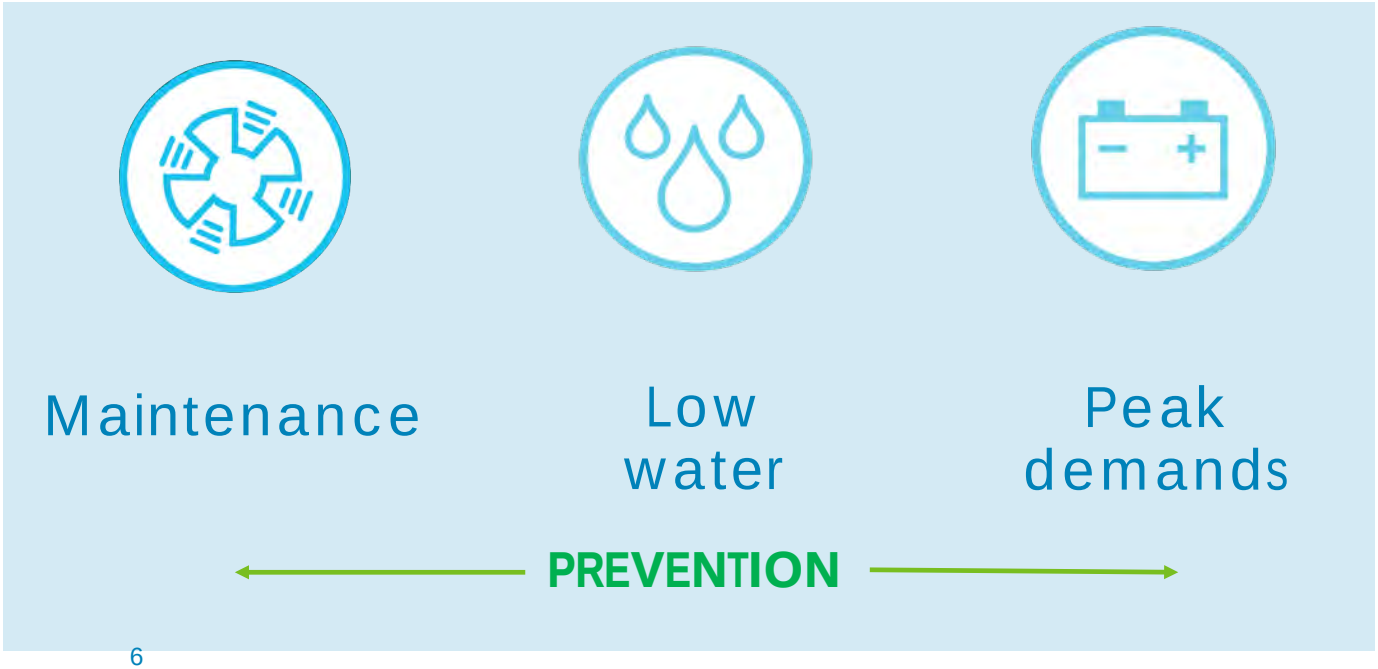


5

Yukon's electricity system is one of the greenest in Canada, using mostly hydro.

We're an isolated grid, not connected to any other province or territory. We need to be self-sufficient.

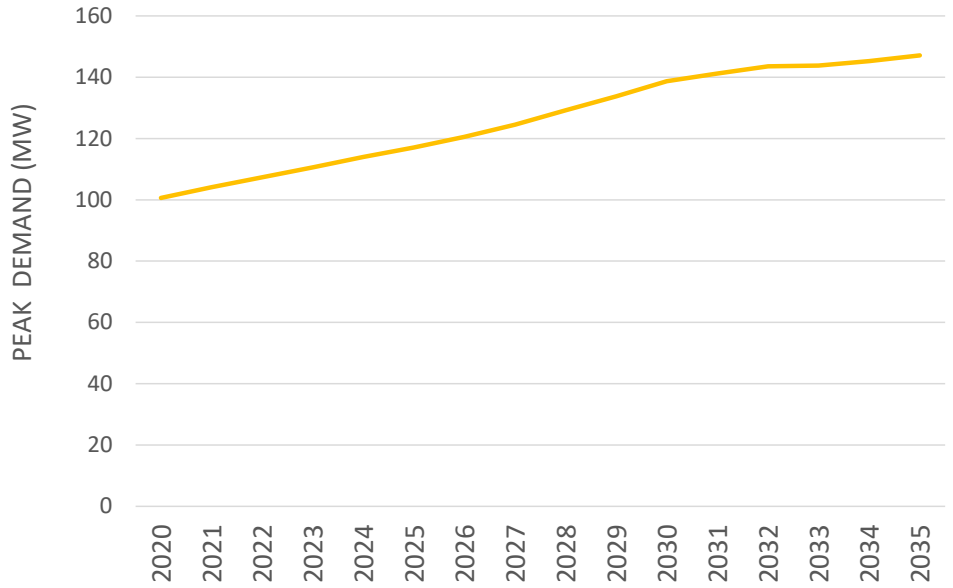
Diesel is used during:



Why more now?

Peak demand for electricity is growing

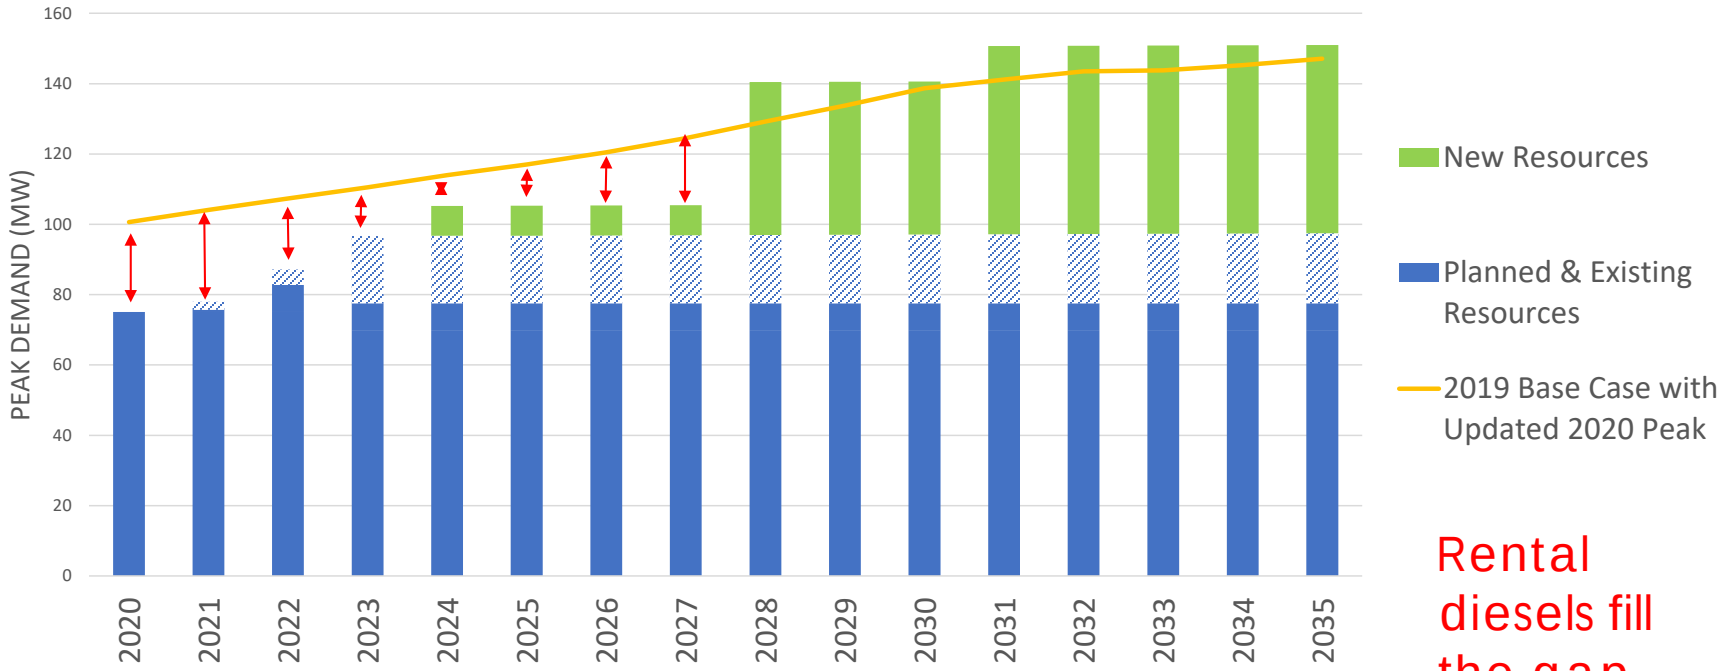
We expect peak demand for electricity to grow by 40% in the next 10 years



- Continued growth in population & electricity use
- Policy actions to address the climate change emergency

8

Rental diesels are needed to fill the gap until new projects are built



Rental diesels fill the gap

9

Why Faro?

The ideal second site for rentals

Whitehorse is full

11

Project location considerations

Site specific:

- Existing diesel sites only
- Allowances in existing air permit
- Space for units, fuel and substation

General:

- Whitehorse is maxed out
- Operating efficiencies (output and resources)
- Cost efficiencies

12

Faro as the preferred site

Site layout

14

Space in our yard

Equipment and fuel tanks

New substation

Rental units

18

Commissioning

19

When will they be used?

To keep the lights on

Running the rentals

During cold weather for peaking

In case of an emergency

21

What does it mean?

Environment, sound and air assessments

Environmental & socio-economic assessments

Sound assessment

Existing Site	With Rentals
58 dB	<1 dB change

Note: nearest point of reception is barracks bldg. on Ketza Ave.

Rental units are more efficient and have lower emissions than the existing permanent units.

Annual facility emissions are well under those permitted by the Yukon Ambient Air Quality Standards.

An irritant (NOx) may be present under extreme conditions, very infrequently and for short periods of time.

What does the future hold?

Upgrades and improvements on site

Immediate: Diesel will be used to keep the lights on.

Next year: A proposal to YESAB for an expanded air permit.

2-3 years: Replacing an old diesel unit with newer model.

8-10 years: Rentals used each winter until renewables built.

Long-term: Diesel used to prevent & restore outages and during emergencies.

27

Discussion

Thank you for your time

REFERENCE:

QUESTION:

a) As the Faro diesel site is on RRDC Traditional Territory, does YEC have have [sic] the support of Ross River Dena Council for the modifications to the plant? Please provide documentation of any consultation and interaction with RRDC concerning the Faro plant.

ANSWER:

(a)

Between April 2020 and January 2020, Yukon Energy has contacted representatives of the Dena Nezzidi Limited Partnership (designate for the Ross River Dena Council) at least nine times by email and phone to share information about the Faro rental diesel project and procurement opportunities, and to request a meeting with Ross River Dena Council to discuss the project.

The Dena Nezzidi Limited Partnership representative attended Yukon Energy's December 2, 2020 public information meeting. Copies of the presentation and a summary of the discussion was provided to them following the meeting.

As of February 9, 2021, representatives of the Dena Nezzidi Limited Partnership have not provided Yukon Energy with a date and time for the requested meeting with Ross River Dena Council to discuss the specific Faro rental diesel project and YESAA project proposal.

REFERENCE:

QUESTION:

At the (virtual) meeting that YEC held with the community about the rental diesels on 2-Dec, 2020, one slide had the text: “Next Year: A proposal to YESAB for an expanded air permit.”

a) Please explain what is covered by the current 2014-2024 air permit.

b) Please explain what YEC is seeking with the “expanded air permit,” and why it is needed.

c) Please provide the “Project Description” that will be used for the upcoming YESAB assessment for the Faro site.

d) Please explain the business case for applying for the air permit after the installation of infrastructure and the renting of generators.

e) Please discuss the risks and potential financial impacts of building a project before applying for a required YESAB assessment.

f) Please discuss how this approach relates to social license for stakeholders (RRDC and Faro residents)

ANSWER:

(a)

The current air emissions permit authorizes the use of diesel fuel to operate compression ignition engines to generate electricity at the Whitehorse Rapids Generating Station (WRGS), Mayo Generation Station (MGS), Dawson City Generating Station (DCGS), and Faro Generating Station (FGS) generating stations, with WRGS also having authorization to operate three (3) natural gas fired generators.

(b)

Yukon Energy is seeking authorization to operate up to an additional 4.9 MW of diesel generation at the FGS, in addition to its existing generation limit of 10.6 MW (for a total of 15.5 MW).

(c)

The Yukon Energy Corporation (Yukon Energy) is applying under Parts 6 and 9 of the *Environment Act* and Part V of the *Air Emissions Regulations* for an amendment of Air Emissions Permit No. 60-010 authorizing Yukon Energy to modify the thermal generating component (the Project) of its Faro Diesel Facility (the Site).

Yukon Energy is seeking an amendment of the Permit to allow for the addition of up to 4.9 MW of additional (to a maximum total of 15.5 MW) operational capacity for the diesel electricity generators. The Site is currently permitted to operate at a capacity of 10.6 MW. These generators will act as insurance against the very unlikely event that Yukon Energy experiences an extended winter power outage with loss of generation or transmission from the Aishihik Generating Station,[1] if hydroelectricity cannot meet energy demands and for maintenance purposes. An extended power outage has a very low probability, but the likely consequences require Yukon Energy to be prepared to immediately restore supply to customers on the grid to avoid rolling blackouts. Having access to portable diesel generators ensures that Yukon Energy can continue to provide reliable service during the winter in an emergency.

The need for this contingency measure came as a result of analysis of information prepared as part of Yukon Energy's 2016 Resource Plan (2017). The 2016 plan and the 2017-18 GRA identified that there was a capacity gap in 2017-18 of approximately 8 MW between maximum probable (winter) load and the installed capacity of the system under an N-1 event. Yukon Energy's updated 10-Year Renewable Electricity Plan, updated in December 2020, identifies an even greater gap (> 20 MW) between existing resources

[1] **Emergency (or "N-1") Whitehorse-Aishihik-Faro (WAF) and Mayo-Dawson (MD) system capacity planning criteria:** Each grid system (WAF and MD) will be planned to be able to carry the forecast peak winter loads (excluding major industrial loads) under the largest single contingency (known as "N-1"). The N-1 criterion determines system capacity assuming the loss of the system's single largest generating or transmission-related generation source. In the case of WAF, this is presently the Aishihik transmission line, without which the WAF grid loses ability to access approximately 37 MW of generation.

and forecasted peak energy demand (Yukon Energy 2020). This Project is expected to be required until more permanent solutions to address the current N-1 capacity gap are implemented. Yukon Government's document Our Clean Future: A Yukon strategy for climate change, energy and a green economy (Government of Yukon 2020) identifies a renewable energy target of 97% by 2030. Yukon Energy's 10-Year Renewable Electricity Plan outlines key projects and partnerships that will help to address the energy and peak capacity shortfalls over the 10-year planning horizon. A number of projects have been identified in the Future-Focused Portfolio (such as Whitehorse Hydro uprates, the battery energy storage system, the Southern and Mayo Lakes Enhanced Storage Projects) but these projects will take time to plan, design, permit, and construct, and Yukon Energy requires a temporary solution be put in place until new capacity can be added to the system. These back-up units would be at the bottom of stacking order and would only be operated in the case of an emergency, when hydroelectricity cannot meet demands, and for short durations for monthly exercise to confirm operational readiness.

The permit amendment request to modify the existing thermal is subject to a Designated Office level environmental and socio-economic effects assessment by the Yukon Environmental and Socio-economic Assessment Board (YESAB) under the *Yukon Environmental and Socio-economic Assessment Act* (YESAA).

Pursuant to that assessment, Yukon Energy requests a recommendation from the Designated Office to allow the Permit amendment to proceed, on the basis that the Project (i.e., the modifications to Yukon Energy's diesel generating facilities described in this proposal and operated in accordance with the terms and conditions of an air emissions Permit and the applicable provisions of the *Environment Act* and *Air Emissions Regulations*) will not have a significant adverse environmental or socio-economic effect within the meaning of section 56(1)(a) of YESAA.

In contrast to the diesel generation facilities operated by ATCO in communities such as Watson Lake and Old Crow, which are isolated from the transmission grid and must therefore operate continuously (24 hours per day, 365 days per year), Yukon Energy only uses its fossil fuel-fired generators:

- As back up during renewable energy system outages (planned and unplanned);

- To supplement energy demand during colder periods of the year; and

- To exercise the units for very short durations on a monthly basis to ensure operational readiness.

This is because most of the needs of customers on the system are satisfied by Yukon Energy's three hydro generating stations. For the vast majority of the time, the thermal generators do not operate. However, Yukon Energy's thermal generation facilities are essential to its ability to provide a reliable supply of electricity to customers whenever demand exceeds hydro supply (e.g., as a result of planned maintenance, emergency repair, or peaking demand during cold temperatures).[2]

Yukon Energy is regulated principally under the Yukon *Business Corporations Act*, *Public Utilities Act*, and *Waters Act*, and the federal *Fisheries Act.* In particular, under the *Public Utilities Act*, Yukon Energy has an obligation to supply electricity service to its customers, and its rates and operations are subject to regulation by the Yukon Utilities Board. Yukon Energy's thermal generation facilities are also subject to regulation under the Yukon *Environment Act* and *Air Emissions Regulations*, as well as *YESAA*.

Yukon Energy's diesel (thermal) electric generating plants are installed and operated to ensure the ongoing operation of the integrated power system and so all customers on these systems can receive reliable power consistent with Yukon Energy's corporate and regulatory obligations.

Given the current generation mix (hydro, wind, and thermal) and system design, Yukon Energy's ability to operate the installed thermal plants, particularly during conditions where demand for electricity cannot be adequately met by hydro (e.g., planned maintenance, emergency repair, demand during cold winter temperatures), is essential to avoid scenarios where there would be a requirement to impose blackout conditions to various customers. This is particularly relevant during times where the lack of such ability would at best be very inconvenient, and at worst dangerous to infrastructure and human health and safety, such as would be the case during cold winter temperatures.

[2] For example, Yukon Energy's reliance on the thermal generation facilities was essential when a major power outage occurred on the WAF grid in January 2006 due to a failure on the connection to the Aishihik hydro generating facility. If Yukon Energy had not had the ability to operate its diesel units in those circumstances, customers would have been left without power in the middle of the winter.

The current need for thermal generation is related to several factors including:

1. The need to meet demand for electricity during those times when hydro-electric facilities are offline as a result of an emergency condition;

2. The need to meet demand for electricity during those times when hydro-electric facilities are taken offline for routine maintenance;

3. The need to meet demand for electricity during those times when there is a grid separation (i.e., transmission outage) and electricity from hydro-electric facilities is not available;

4. The need to exercise a particular diesel unit as a part of routine maintenance; and

5. The need to meet demand for electricity during those times when hydro-electric facilities are otherwise unable to meet current demand for energy.

This Project includes an amendment to the existing Air Emissions Permit (Permit No. 60-010) to operate additional temporary rental diesel units up to a total site operational capacity of 15.5 MW, as required. The reason these units have been added to the Faro Diesel Facility is add additional capacity to reduce the gap in dependable energy required versus available.

Yukon Energy requires an amendment of its existing Air Emissions Permit No. 60-010 to have the ability to operate additional thermal generation resources and ensure the continuity of a reliable supply of power to Yukoners as described earlier in this proposal. A Permit can be issued by the Minister responsible for the Department of the Environment pursuant to Section 12 of the *Air Emissions Regulations* under the *Environment Act*. It is expected that the existing permit would be amended to allow the requested modification to the Faro Diesel Facility.

To amend the Permit, the Yukon Government regulatory authorities may require a decision document based on the environmental and socio-economic assessment of the amendment application under *YESAA*. An environmental and socio-economic assessment is understood to be required under Schedule 1, Part 4, Item 2(b) of the *Assessable Activities, Exceptions and Executive Committee Projects Regulations* under

YESAA, because the Permit is for the "operation … of … a fossil fuel-fired electrical generating station".

While the amendment request will be to authorize changes to the Faro Diesel Facility to have up to 15.5 MW of standby/back-up diesel generating capacity, the activity is a modification to an existing facility and does not involve the construction, decommissioning, or abandonment of a fossil-fuel fired electrical generating station, as such the proposed activity is not immediately assessable at the Executive Committee level.

Yukon Energy is requesting a recommendation by the Designated Office to allow the Permit amendment to proceed, on the basis that the Project (i.e., the continuing operation of the Yukon Energy's Faro Diesel Facility with the addition of 4.9 MW of additional diesel generating capacity (total of 15.5 MW of generating capacity) in accordance with the terms and conditions of the amended Permit and the applicable provisions of the *Environment Act* and *Air Emissions Regulations*) will not have a significant adverse environmental or socio-economic effect within the meaning of section 56(1)(a) of *YESAA*.

(d)

The Corporation deemed it prudent to advance the project activities in order to ensure it was positioned to meet the grid demand for energy as soon as the assessment and permitting could be completed for the additional capacity beyond the existing facility generating capacity limit. The prudency of sequencing activities in this manner was based on several factors that balanced the very real risks of not being ready to meet demand under an emergency condition with the risks of being denied a recommendation to proceed with the expanded generation capabilities as a consequence of the YESAA assessment and/or the permitting process that would follow under the *Environment Act*, *Air Emission Regulations*. The risk of proceeding with installation of the additional generators was mitigated by the following factors:

- Previous standardized modelling, stack testing, and assessments (including 3 assessments under YESAA) of air emissions at the Whitehorse Rapids Generating Station up to a maximum of 22 MW, with the nearest human receptor being within 250 m of the facility, have repeatedly demonstrated that there is a low likelihood of significant adverse effects arising from the operation of the facility.

- With the nearest receptor in the case of the FGS being more than 300 m from the facility, and the fact that operations would be capped at 15.5 MW, it was concluded that the potential for significant adverse effects associated with the increased generating complement proposed for the FGS was low.

- The FGS has previously been assessed under YESAA and authorized under the Environment Act, Air Emission Regulation for a total generating capacity of 10.6 MW. Through changing operational requirements the installed capacity at the facility has changed periodically, with installed units being moved to other generating stations that required such relocation to optimize operations. The FGS currently has generators with rated capacity lower than the permitted site limit or cap and as such the installation of at least some of the rental diesels could be used at the facility up to the existing permitted cap without further YESAA assessment. The availability capacity room within the permitted cap is another factor in proceeding with making provisions for additional unit installation at site before undertaking the assessment for the additional capacity which is only proposed for use beyond the existing air permit capacity limits once the required assessment and permitting is successfully completed.

(e)

Given the risk assessment and conclusions made under the circumstances described in the response to NY-YEC-1-10(d), the potential financial implications of proceeding with the project installation before applying for YESAA assessment required to add to the site capacity were deemed to be minimal and tolerable when compared to the very serious health, safety, and numerous other relevant implications of not being able to meet customer demand for electricity in the case of an emergency in the cold and darkness of winter in the Yukon.

(f)

Yukon Energy takes its responsibility to provide safe, reliable, affordable, and environmentally responsible electricity very seriously. In the context of the operational requirements driving the emerging need for the Project and the consequences of not being in a position to meet that need in an emergency it was determined that interested and potentially affected governments, organizations, and communities would best served by YEC advancing project planning. This would ensure timely ability to avoid the potential

need for service disruptions up to the current generating capacity limits it was lawfully permitted to operate, and has been for decades, while undertaking the appropriate activities to assess and permit the additional capacity it was proposing only to operate once an amended permit could be issued. On balance, it was assessed that reasonable societal expectations of the Corporation would be met by such an approach given the circumstances and the low likelihood of potentially significant adverse effects of such actions.

REFERENCE:

QUESTION:

Diesel Timeline: Please provide a timeline documenting the decisions and implementations of rental diesel in Faro. Please include the following points:

a) When was the decision made to add more rental diesel?

b) When was the decision made to put the additional rentals in Faro?

c) When did YEC inform Faro residents of the installation of the new diesels?

d) When did work begin on the installation of the rental diesels and related infrastructure?

e) When did YEC seek regulatory approval for the additional rentals?

f) When did YEC receive compliance documentation from the Department of Environment?

g) When was it realized that a YESAB assessment will be required to use the installed capacity?

h) When will the YESAB process for the additional diesels begin?

i) What is the projected date of YESAB completion?

j) How long are rental diesels expected to be part of the system?

k) When will other projects be completed or brought on-line to retire rental diesels? (Faro and Whitehorse) Please include specific projects and estimated completion dates and corresponding reduction in rental diesel.

ANSWER:

(a)

The decision to add more temporary diesel was made in January 2020 following an update of the peak forecast based on the record 2020 peak event recorded January 16, 2020.

(b)

The decision to add additional rental diesels at Faro was made in February 2020.

(c)

An information piece about the Faro rental project was mailed to all residents and citizens in Faro in September 2020. Information about the project, along with a copy of the mailer, was added to Yukon Energy's website at the same time. See response to NY-YEC-1-8 (a) Attachment 1 for referenced materials.

Yukon Energy hosted a public information meeting about the project on December 2, 2020. The session was hosted online due to COVID-19 concerns. Six members of the public attended. The meeting was advertised with community posters, radio and print ads, and social media. A copy of the presentation was made available after the meeting on Yukon Energy's website. See response to NY-YEC-1-8 (b) Attachment 2 for referenced materials.

Yukon Energy responded to questions received by phone, email and social media about the project as received.

(d)

Work began on February 26, 2020.

(e)

Yukon Energy has not yet sought regulatory approval for the additional capacity beyond the capacity limits of the existing air emissions permit. Only once an assessment is completed under YESAA and a Decision Document is issued will Yukon Energy make

application for the additional capacity beyond its existing permit capacity limits for the FGS. Regarding the installation of new units at the site to bring the operating complement of generators on site up the existing permitted capacity limit of 10.6 MW, that formal approval, which is provided for under the permit, was sought in August 2020.

(f)

As outlined in NY-YEC-1-10, “compliance documentation” has not been required for the activities Yukon Energy has undertaken to date.

(g)

It was understood that an assessment under YESAA would be required as soon as it was determined that the project proposed to install operating capacity beyond the existing permit limits of 10.6 MW. That conclusion was reached in summer 2020.

(h)

The YESAB process is tentatively planned for Q1 2021, following additional planned engagement with the RRDC.

(i)

While beyond Yukon Energy’s control, an assessment under YESAA for a project of this nature has historically taken 3-6 months.

(j)

Rental diesels are expected to be required on the system for the next 8 to 10 years.

(k)

The expected annual capacity additions, and forecast rental diesel requirements, are shown in the Table 1 below.

Table 1: Expected Capacity Additions: 2020/21 to 2028/29

	2020/ 2021	2021/ 2022	2022/ 2023	2023/ 2024	2024/ 2025	2025/ 2026	2026/ 2027	2027/ 2028	2028/ 2029
Rental Requirements (# of Units)									
Whitehorse	9	9	9	8	6	8	9	9	0
Faro	6	6	3	0	0	0	1	3	0
New Capacity Resources (MW)									
DSM Programs	-	2.2	4.4	6.6	6.7	6.7	6.8	6.8	7.0
Battery Energy Storage System	-	-	7	7	7	7	7	7	7
Whitehorse #2 Uprate	-	0.6	0.6	0.6	0.6	0.6	0.6	0.6	0.6
Diesel Replacement[1]	-	-	-	7.3	7.3	7.3	7.3	7.3	7.3
Atlin Hydro Expansion	-	-	-	-	8.5	8.5	8.5	8.5	8.5
Moon Lake Pumped Storage	-	-	-	-	-	-	-	-	35

[1] While the diesel replacement project replaces retired capacity with like-for-like nameplate capacity, some older units currently have de-rated dependable capacity, and the Whitehorse units being replaced have already been retired from the system. Replacement of these units with like-for-like nameplate capacity results in an increase in 7.3 MW of dependable capacity for the system.

REFERENCE:

QUESTION:

Rental diesel alternatives

a) What alternatives to rental diesel were considered?

b) Please provide cost/benefit analysis on alternatives to rental diesel.

c) What sites/locations were considered?

d) What criteria was used in selection / elimination of sites?

ANSWER:

(a) and **(b)**

YEC experienced a record peak in January 2020, which informed the forecast of required N-1 dependable capacity. This capacity was required for the winter of 2020/2021. No alternative to rental diesels would be available in this timeline. YEC's 10-Year Renewable Electricity Plan (see CW-YEC-1-36(a) Attachment 1) outlines several alternatives which will replace the rental diesels as they are brought online over the next ten years.

(c)

The following sites/locations were considered:

1. New site in Whitehorse
2. Faro
3. Mayo
4. Dawson

(d)

Given the tight timeline for deployment, the main criteria for site section was the existing permitting at each site, in order to maximize how much additional capacity of thermal could

be added under YEC's current air emissions permits. Consideration was also given to whether a YESAB Designated Office review and amended permit would be required (timeline of several months) versus a full YESAB Executive Committee Assessment, as that process would take more than a year to complete.

REFERENCE: **Impacts of rental generators on Faro which may affect future YESAB**

QUESTION:

a) Please provide a copy of the sound modeling study for the Faro generators.

(This study was cited by Travis Ritchie of YEC in a (virtual) meeting that YEC held with the community about the rental diesels on 2-Dec, 2020 – from the YEC meeting summary: "Travis noted that the findings of Yukon Energy's sound modelling study showed that if all rentals were to be running that predicted sound levels from the site at the nearest point of reception (occupied building) would be less than 1 dB more than what is emitted by the permanent generators.")

b) Please provide an updated spill plan and map of the site.

c) Please provide the most recent air quality assessment and dispersion study for the Faro site, and explain how this will be affected by the addition of the rentals.

ANSWER:

(a)

Please see Attachment 1 to this response.

(b)

Please see Attachment 1 to this response for the Faro Spill Contingency Plan. The site plan can be found on page 18 of the Spill Contingency Plan.

(c)

Please see Attachment 1 to this response.

1.0	February 12, 2021	Noise Impact Assessment – Generator Additions	Upgrade facility from approved 10.6 MW to 15.5 MW.	WSP Canada Inc

EXECUTIVE SUMMARY

WSP Canada Inc., (WSP) was retained by Yukon Energy Corporation (YEC) to prepare a Noise Impact Assessment (NIA) report for its diesel-fuelled electricity generating facility in Faro, Yukon. The Facility is located in south-central Yukon, within the asserted traditional territory of the Kaska Nation and upstream from the territory of the Selkirk First Nation. The Facility is located just northwest of the Town of Faro, Yukon and approximately 15 km south of Faro Mine.

The Facility has an existing Air Emissions Permit which allows the Facility to operate up to a capacity of 10.6 MW. The Facility has been, and is currently operating much below the permitted facility capacity of 10.6 MW with only two existing diesel generators on-site. WSP conducted a NIA to evaluate the potential noise impacts of increasing the Facility's capacity from the existing permitted capacity at 10.6 MW to 15.5 MW in the future. As a conservative approach the assessment of noise impact is based on 16.0 MW capacity. However, it is understood that the YEC will only be applying for a permit amendment with the Yukon Environmental and Socio-economic Assessment Board (YESAB), to allow up to 15.5 MW of capacity at the Faro Facility.

Compliance was established using the manufacturer's sound level data for the existing and proposed generators as noted below:

1. The existing generator, Model: Mirrlees KV16 with rated capacity of 5.15 MW, located within FD1 building shall be operated at or below the capacity of 2.4 MW
2. The existing generator, Model: Caterpillar (CAT) 3612 with rated capacity of 3.3 MW, located within FD7 building shall be operated at or below the capacity of 2.8 MW
3. Seven new generators are proposed (6 will be used for regular operation and 1 standby generator); each generator will be with rated capacity of 1.8 MW. Each of these generators will be with enclosures, silencers or mufflers providing an overall maximum sound level of 78 dBA at 7 metres (23 feet);

The assessment presented in this report are based on the guidelines provided British Columbia Oil and Gas Commission's (BC OGC) "British Columbia Noise Control Best Practices Guideline" (2009) and the principles provided in the Health Canada's (HC) "Guidance for Evaluating Human Health Impacts in Environmental Assessments: Noise" (2017). The assessment indicated that the changes in sound level due to the upgrade is minimal (less than 1 dB). Therefore, it is concluded that the operation of Facility with the proposed expansion complies with the PSL.

1 INTRODUCTION

WSP Canada Inc. (WSP) was retained by Yukon Energy Corporation (YEC) to prepare a Noise Impact Assessment (NIA) report for its facility located in Faro, Yukon (the Facility). The Facility currently includes diesel generators with a permitted generating capacity of 10.6 MW. YEC is planning to expand the Facility's generation capacity to 15.5 MW. This report is required in support of a permit amendment pursuit with the Yukon Environmental and Socio-economic Assessment Board (YESAB) to increase capacity at the diesel-fuelled electric generating facility from the permitted capacity of 10.6 MW to 15.5 MW. Although the application of the Faro Facility is for 15.5 MW capacity, as a conservative approach, the NIA considered a capacity of 16 MW. However, it is understood that the YEC will only be applying for a permit amendment to allow up to 15.5 MW of capacity at the Faro Facility.

The purpose of this assessment is to evaluate the overall changes in noise impact due to the proposed changes at the nearby sensitive receptors. The analysis is based on manufacturer's sound level data and conservative estimates of the source sound levels. The findings of the assessment are discussed further within this report.

1.1 STUDY AREA

The study area surrounding the Facility can be classified as a rural area. The existing acoustic environment in the study area is expected to be dominated by natural environmental sounds during the day and night time.

The Facility is located in south-central Yukon, within the asserted traditional territory of the Kaska Nation and upstream from the territory of the Selkirk First Nation. The Facility is located just northwest of the Town of Faro, Yukon and approximately 15 km south of Faro Mine. The 25-sq. km Faro Mine was once the largest open pit lead-zinc mine in the world. The mine has been closed since 1998 and in the process of reclamation. The town is home to approximately 348 residences (Statistics Canada, 2016).

The Facility is in an area classified as 'Industrial/Commercial' surrounded by 'Industrial/Commercial' to the north; 'Parks & Open Space' to the west, and south; and 'Unsurvey Interim Protected First Nation Lands' to the east. The 'residential' lands located to the south and southeast is known as the Town of Faro. A scaled area map showing the Facility and its surrounding area is shown in **Figure 1** and a zoning map is included in **Figure 2**.

1.2 FACILITY DESCRIPTION

The Facility provides reliable energy supply to supplement renewable energy sources. The Facility provides electricity during loss of hydro generation, peak hours of consumption, low water periods, extreme low temperatures and emergencies. The Facility has the potential to operate 24 hours a day.

The Facility is comprised of the following existing buildings; a site plan showing the Facility buildings is provided in **Figure 3**:

- Generator Building (ID: FD1);
- Generator Building (ID: FD7)
- Office Building;
- Control Building;
- Storage Building and
- Diesel Storage Tanks.

The expansion includes operation of 7 rental units at the Facility; the make and mode of these units are Caterpillar (CAT) model 3516C. During the period of this permit the make and model of these units will remain the same.

1.2.1 *OPERATING CAPACITY*

The following generator operations makes up the proposed operating capacity (**Table 1.1**):

Table 1.1 Generator Capacities

GENSET ID	DESCRIPTION	RATED CAPACITY	OPERATING CAPACITY	REMARKS
FD1 (within building)	Mirrlees KV16 Model	5.15 MW	2.4 MW	Existing Operation
FD7 (within building)	Caterpillar (CAT) 3612	3.3 MW	2.8 MW	Existing Operation
YM20 to YM26[1]	Caterpillar (CAT) 3516C	1.8 MW each	6 units to provide 10.3 MW	New Turbines
Total Operating Capacity			15.5 MW	Total future capacity

[1] One of the rental units (i.e. YM26) will be a standby generator and will be used in case of power failure of another generator.

Other than the generator building, other buildings do not have a source with significant noise generation. The noise sources associated with generator building includes, air intake louvres and dampers, exhaust fans, noise breakout through the façade and combustion exhaust. In addition, there are remote radiators for the existing generators located outside the buildings on the north and southwest side at ground level, respectively. The 1.8 MW units (YM20 to YM26) comes with enclosures, silencers and mufflers designed to control noise emissions.

1.3 STUDY OBJECTIVES

The Facility has an existing Air Emissions Permit which allows the Facility to operate up to a capacity of 10.6 MW. The Facility has been, and is currently operating much below the permitted facility capacity of 10.6 MW with only two existing diesel generators on-site. These generators are housed in separate buildings on-site (FD1 and FD7). The study investigates if the future operation with 15.5 MW capacity has the potential to change the existing conditions.

2 NOISE SOURCE SUMMARY

WSP used drawings and site photographs to identify and establish the source of sound for the existing Facility operation and future Facility upgrade. Drawings from the site are included in **Appendix A**. The sources of noise are primarily air intakes and exhausts, radiators and the generators.

2.1 NOISE SOURCES

A total of thirty-four (34) non-negligible noise sources were identified and included in the assessments. These noise sources considered in the assessment are summarized in **Table 2.1;** the sound power of these sources were estimated based on the manufacturer's data. A detailed summary of the sources is provided in **Appendix B.** Manufacturer specification sheets are provided in **Appendix C**.

A site layout plan showing the source locations within the Facility is provided in **Figure 3**.

Notes:
[1] Source Location: O = outside of a building, I = inside of a building
[2] Noise Control Measures: S = Silencer/Muffler, A = Acoustic Lining, E = Acoustic Enclosure, U = Uncontrolled.

2.2 SOURCES WITH NEGIGIBLE EFFECTS

Some sources are expected to produce sound levels that are not significant compared to other loud sources. These noise sources are considered negligible and are not included in the assessment as these sources are not expected to contribute to the overall noise effect of the Facility at the nearby noise sensitive receptors. The sources with a negligible contribution (or source with insignificant contribution) at the receptors are listed below.

- Small exhaust fans and HVAC units;
- Small compressor or pumps;
- Indoor equipment with small or no motors;
- Breakout noise through façade of building that do not house generators;
- Small transformers (if any); and
- Worker vehicles (moving and idling).

3 NOISE RECEPTOR SUMMARY

Noise receptors are those locations where sound from noise sources at a facility is received and assessed against applicable limits. Sound may be assessed at the plane of a window (PoW) of a noise receptor such as a dwelling. For the purpose of this assessment, the selected PoWs represent the predictable worst-case noise impacts; it represents the closest PoW to the Facility (i.e., the window of the receptor facing the Facility). Receptors are summarized in **Table 3.1** and locations are shown in **Figure 1**.

Table 3.1 Point of Reception Summary

POR ID	DESCRIPTION	RECEPTOR HEIGHT[1] (M)	DISTANCE FROM FACILITY (M)[2]
R1	One Storey Residence on Dawson Drive	1.5	359
R2	Two Storey Residence on Dawson Drive	4.5	406
R3	Three Storey Residence on Dawson Drive	7.5	415
R4	One Storey Army Barracks on Kitza Avenue	1.5	359
R5	One Storey Del Van Gorder School on 100 Bell Avenue	4.5	792
R6	One Storey Faro Health Centre on 447 Campbell Street	1.5	915

Notes:
[1] The height represents the upper story window, which is most exposed to the site.
[2] Distance are provided from the Facility's closest noise source to the receptor.

4 ASSESSMENT CRITERIA

This section reviews the available criteria and establishes acceptable criteria for the Facility upgrade.

In the absence of any specific regulatory noise guidance or criteria in the Yukon, this assessment takes into account best practices and the following guidelines:

- British Columbia Oil and Gas Commission's (BC OGC) "British Columbia Noise Control Best Practices Guideline" (2009); and
- Health Canada's (HC) "Guidance for Evaluating Human Health Impacts in Environmental Assessments: Noise" (2017).

4.1 BRITISH COLUMBIA NOISE CONTROL BEST PRACTICES GUIDELINE

The BC OCG guidelines (BC Guide) are widely accepted in western Canada and commonly used in the Yukon. The guideline provides guidance regarding noise management from noise emission from energy-industry activities. The guideline requires a noise impact assessment for modifications to existing facilities, if there is a reasonable expectation of changes in noise source or sound level, and if there is a receptor located within 1.5 km distance. There is reasonable expectation of source sound levels as well, as there are receptors nearby for the Yukon Energy Facility. Therefore, a noise assessment is required.

The BC Guide is a receptor-based guideline (not property line-based guideline); it defines Permissible Sound Levels (PSLs) at the receptor locations. A PSL at the nearest residence or nearby receptors can be determined based on the methods discussed in the BC Guide. The BC Guide provides methods to estimate daytime (07:00 to 22:00) PSL and nighttime (22:00 to 07:00) PSL.

In accordance with the BC Guide, facilities constructed in and in operation prior to October 1998 are considered "deferred facilities". Such facilities, without outstanding noise complaints are considered to meet the community noise tolerance levels. It is understood that the Faro Facility was constructed prior to 1998 and does not have outstanding noise complaints. Therefore, the sound level from the existing operation is considered to be the PSL for this assessment.

Accordingly, a baseline model with existing operation was completed and the sound levels at the receptors were estimated. The estimated sound level from existing operation at receptors R1 to R6 are shown in **Table 4.1**.

Table 4.1 Permissible Sound Level Limits from BC OCG

POR ID	EXISTING NOISE LEVEL DAYTIME/NIGHTIME PSL (dBA)[1]
R1	58
R2	59
R3	59
R4	59
R5	48
R6	46

Notes:
[1] Refer Section 5 for modelling and results.

4.2 ACCEPTABLE SOUND LEVEL

As discussed previously, the sound levels in this assessment are expressed in terms of energy equivalent sound level over a one-hour period (Leq (1 hour)). Since the generator upgrade is proposed to an existing facility, the assessment considers changes to the acoustical environment before and after the upgrade.

Table 4.2 below, from published literatures, outlines the noise impact rating in relation to the change in sound levels from the baseline condition (or condition prior to the proposed upgrades). When a "significant" or greater impact is predicted (5 dB or greater), noise mitigation measures and their feasibility should be investigated.

Table 4.2 Noise Impact Rating

CHANGES IN SOUND LEVEL	IMPACT RATING
0 to 2.99 dB	Insignificant
3 to 4.99 dB	Noticeable
5 to 9.99 dB	Significant
Over 10 dB	Very Significant

Therefore, a change of up to 3 dB is considered insignificant and was used to assess the impact.

5 IMPACT ASSESSMENT

The objective of this acoustic assessment is to determine the changes in sound level due to proposed changes at Yukon Energy's Faro generator station upgrades during a predictable worst-case operation. A predictable worst-case operation is considered as an hour of operation during which the facility operates at its capacity (i.e. operates at 16 MW capacity).

Since the generator upgrade is being designed, this assessment is completed using an acoustic modelling approach for Faro Facility's current and future operations. This section discusses the assessment methodology, modelling scenarios, the results of the assessment as well as discusses the compliance of the Faro Facility.

5.1 ASSESSMENT METHODS

The predictive analysis of the Faro Facility's noise impact at the POR was completed using commercially available software package CADNA/A (Ver. 2020), a computerized implementation of the algorithms contained in the ISO 9613 "Acoustics – Attenuation of Sound during Propagation Outdoors". CadnaA modelling takes into account the following:

- Source sound power levels;
- Distance attenuation;
- Source-receptor geometry;
- Ground and air (atmospheric) attenuation; and
- Temperature and humidity effects on noise propagation.

The lands between the Facility and receptors are a mixture of sound abortive (e.g. grass) with some reflective (e.g. paved road) and modelled accordingly. Road pavements were modelled with a ground absorption of 0.4 and remaining surfaces were modelled with a ground absorption of one (1). Typical Yukon meteorological values were used to initialize several parameters in the model. These included a temperature of 10 degrees Centigrade and a relative humidity of 80%.

5.2 OPERATING SCENARIOS

The assessment was done assuming a predictable worst-case operation. Since the Facility has the potential to operate at full capacity 24 hours per day to meet power demands, no differences between daytime, evening, or nighttime operations were considered. Two scenarios were evaluated to determine the changes in sound level as previously discussed:

- Existing/Current Operation; and
- Future Expanded Capacity

5.3 MODELLING RESULTS

Table 5.1 shows the predicted sound level results between existing and future scenarios and compares the change in sound levels. Equivalent sound level contours (isopleths of equal sound level) are presented in **Figure 4** and **Figure 5** at heights of 1.5 m above the ground for existing and future scenarios, respectively.

Table 5.1 Summary of Changes in Sound Levels between Existing and Future Scenarios

POR ID	PREDICTED SOUND PRESSURE LEVELS (SPL), dBA			
	EXISTING SPL /PSL [dBA]	FUTURE SPL [dBA]	CHANGE in SPL[1] [dBA]	IMPACT RATING
R1	58	58	< 1	Insignificant
R2	59	60	< 1	Insignificant
R3	59	59	< 1	Insignificant
R4	59	60	< 1	Insignificant
R5	48	48	< 1	Insignificant
R6	46	46	< 1	Insignificant

Notes:
[1] No changes are also considered less than 1 decibel change for simplicity.

As indicated in **Table 5.1**, the changes in the sound levels produced by addition of generators to reach a capacity of 15.5 MW are predicted to be less than 1 dBA. The change in sound level caused by the proposed changes to the Yukon Energy Facility are therefore not considered a significant change. **Figure 6** shows the equivalent sound level contours for the existing and future operation side by side for comparison purposes; these figures show minimal change in sound level contours near the receptor area.

Since the change in sound level due to proposed modification (i.e. capacity increase) is predicted to be less than 1 dB, no additional mitigation other than those included with the proposed 1.8 MW rental units as identified are required.

6 RECOMMENDATIONS AND CLOSURE

6.1 RECOMMENDATIONS

Compliance was established using the manufacturer's sound level data; therefore, when selecting the new generators to reach operational capacity of 15.5 MW the following shall be implemented:

1. The existing generator, Model: Mirrlees KV16 with rated capacity of 5.15 MW, located within FD1 building shall be operated at or below the capacity of 2.4 MW
2. The existing generator, Model: Caterpillar (CAT) 3612 with rated capacity of 3.3 MW, located within FD7 building shall be operated at or below the capacity of 2.8 MW
3. The proposed new generators (YM20 to YM26) shall be 6 regulars plus 1 standby generator each with rated capacity of 1.8 MW and each with enclosures providing an overall maximum sound level of 78 dBA at 7 metres (23 feet);
4. Prior to installation, a shop drawing can be requested from supplier confirming the sound data to be less than 78 dBA at 7 metres (23 feet);
5. If a complaint is received after installation, an acoustic audit shall be performed consisting of onsite measurements.

6.2 CLOSURE

WSP Canada Inc., was retained by Yukon Energy Corporation (YEC) to conduct a Noise Impact Noise Impact Assessment (NIA) report in support of a permit amendment pursuit with the Yukon Environmental and Socio-economic Assessment Board (YESAB) to increase capacity at the diesel-fuelled electric generating facility in Faro, Yukon (the Facility) from the existing permitted capacity of 10.6 MW to 15.5 MW in the future.

Based on WSP's assessment and available information at the time of this report, the assessment indicated that the changes in sound level due to the upgrade is minimal. Therefore, it is concluded that the operation of Facility with the proposed expansion complies with the PSL.

FEATURES

EPA TIER 2 and CARB certified for non-road mobile applications. Factory designed, certified prototype tested with torsional analysis. Production tested and delivered in a package that is ready to be connected to your fuel and power lines. Supported 100% by your Caterpillar® dealer with warranty on parts and labor. Extended warranty available in some areas. The generator set is designed and manufactured in an ISO 9001:2000 compliant facility. Generator set and components meet or exceed the following specifications: AS1359, AS2789, ABGSM TM3, BS4999, DIN6271, DIN6280, EGSA101P, JEM1359, IEC 34/1, ISO3046/1, ISO8528, NEMA MG1-22

CATERPILLAR SR4B GENERATOR

Single bearing, wye-connected, static regulated, brushless permanent magnet excited generator designed to match the performance and output characteristics of the Caterpillar diesel engine driving it.

RELIABLE, FUEL EFFICIENT DIESEL ENGINE

The compact, four-stroke-cycle diesel engine combines durability with minimum weight while providing dependability and economy. The fuel system operates on a variety of fuels.

CATERPILLAR COOLING SYSTEM

Sized compatible to rating with energy efficient fan and core.

CATERPILLAR SWITCHGEAR

Provides single unit and/or multi-unit/utility paralleling components. Standby, load sense/load demand, import, export, and base load modes. Comes standard with Basler Utility Multi-function Relay IPS-100.

EXCLUSIVE CATERPILLAR DIGITAL VOLTAGE REGULATOR (CDVR)

Three-phase sensing and adjustable Volts-per-Hertz regulation give precise control, excellent block loading, and constant voltage in the normal operating range.

ENVIRONMENTALLY FRIENDLY

110% spill containment of onboard engine fluids.

SOUND ATTENUATED CONTAINER

For ease of transportation and protection. Meets 75 dB(A) at 50 ft or below per SAE J1074 measurement procedure at 110% prime load.

FACTORY INSTALLED STANDARD EQUIPMENT

SYSTEM	STANDARD EQUIPMENT
Engine	EPA approved Tier 2 3516C Caterpillar engine Heavy duty air cleaner with service indicator 60-Amp charging alternator Fuel filters – primary and duplex secondary with integral water separator and change-over valve Lubricating oil system with spin-on, full flow oil filters and water cooled oil cooler Oil drain lines routed to engine rail Jacket water heater Fuel cooler and priming pump Electronic ADEM™ A3 controls 24V electric starting motors with battery rack and cables
Generator	SR-4B brushless, permanent magnet excited, three-phase with Caterpillar digital voltage regulator (CDVR), space heater, 6-lead design, Class H insulation operating at Class F temperature for extended life, winding temperature detectors and anti-condensation space heaters (120/240V 1.2 kW)
Containerized Module	40' ISO high cube container, CSC certified 3-axle, 40' ISO container chassis Seven (7) sound attenuated air intake louvers and 4 lockable personnel doors with panic release Side bus bar access door, external access load connection bus bars Shore power connection via distribution block connections for jacket water heater, battery charger, space heaters, and generator condensate heaters Standard lighting 3 AC/4 DC, one (1) single duplex service receptacle, 2 external break-glass emergency stop push buttons 1,250 gal fuel tank, UL listed, double wall, 9 hr runtime @ prime rating Sound attenuated 75 dB(A) @ 50 ft Spill containment 110% of all engine fluids Four (4) oversized maintenance-free batteries, battery rack and 20-Amp battery charger Hospital grade, internally insulated, rectangular exhaust silencer with vertical discharge Vibration isolators, corrosion resistant hardware and hinges External drain access to standard fluids Fire extinguishers (Qty 2) Standard Cat rental decals and painted standard Cat power module white Interior walls and ceilings insulated with 100 mm of acoustic paneling Floor of container insulated with acoustic glass and covered with galvanized steel
Cooling	Standard cooling provides 43° C ambient capability (60 Hz) at prime +10% rating Vertically mounted, separate ATAAC and JW cores with vertical air discharge
Generator Paralleling Control	Custom switchgear control with EMCP 3.3 genset mounted controller and wall mounted paralleling controls Automatic start/stop with cool down timer Protections: 25, 27/59, 40, 32, 81 O/U Utility multi-function relay protections: 25,27/59, 32, 47, 50/51, 62, 67, 81 O/U UMR is IEEE1547-2003 compliant in most applications Reverse compatibility module provided for interface to legacy power modules Touch screen controls with event log Multi-mode operation (island, multi-island and utility parallel), load sharing (multi-unit only) Import & export control (utility parallel only), manual and automatic paralleling capability Touch screen display (status and alarms) Metering display: voltage, current, frequency, power factor, kW, WHM, kVAR, and synchroscope
Quality	Standard genset and package factory tested UL, NEMA, ISO and IEEE standards O&M manuals

RATING DEFINITIONS

Standby – Applicable for supplying continuous electrical power (at variable load) in the event of a utility power failure. No overload is permitted on these ratings. The generator on the generator set is peak prime rated (as defined in ISO8528-3) at 30° C (86° F).

Prime – Applicable for supplying continuous electrical power (at variable load) in lieu of commercially purchased power. There is no limitation to the annual hours of operation and the generator set can supply 10% overload power for 1 hour in 12 hours.

STANDARD FEATURES

GENERATOR SET EMCP 3.3 LOCAL CONTROL PANEL

- Generator mounted EMCP 3.3 provides power metering, protective relaying and engine and generator control and monitoring.
- Provides MODBUS datalink to paralleling control for monitoring of engine parameters.
- Convenient service access for Caterpillar service tools (not included).
- Integration with the CDVR provides enhanced system monitoring.
- Ability to view and reset diagnostics of all controls networked on J1939 datalink.
- Network modules via the control panel removes the need for a separate service tool for troubleshooting.
- Real-time clock allows for date and time stamping of diagnostics and events.

EMCP 3.3 ENGINE OPERATOR INTERFACE

- Graphical display with positive image, transflective LCD, adjustable white backlight/ contrast.
- Two LED status indicators (1 red, 1 amber).
- Three engine control keys and status indicators (Run/Auto/Stop).
- Lamp test key.
- Alarm acknowledgement key.
- Display navigation keys.
- Two shortcut keys: Engine Operating Parameters and Generator Operating Parameters.
- Fuel level monitoring and control.

CIRCUIT BREAKER

- 3000A fixed type, 3 poles, genset mounted, electrically operated, insulated case circuit breaker.
- Solid state trip unit for overload (time overcurrent) and fault (instantaneous) overcurrent protection.
- Includes DC shunt trip coil activated on any monitored engine or electrical fault, 100 KA-interrupting capacity at 480 VAC.

VOLTAGE REGULATION AND POWER FACTOR CONTROL CIRCUITRY

- Generator mounted automatic voltage regulator, microprocessor based.
- Manual raise/lower voltage adjust capability and VAR/power factor control circuitry for maintaining constant generator power factor while paralleled with the utility.
- Includes RFI suppression, exciter limiter and exciter diode monitoring.
- Voltage and power factor adjustments are performed on the setting screen of the HMI touch screen.

FUEL TANK

- UL Listed 1250 gallon double walled.
- Fuel transfer system

CURRENT TRANSFORMERS

- CT's rated 3000:5 with secondaries wired to shorting terminal strips.

POTENTIAL TRANSFORMERS

- 4:1 ratio with primary and secondary fuse protection.

BUS BARS

- Three phase, plus full rated neutral, bus bars are tin-plated copper with NEMA standard hole pattern for connection of customer load cables and generator cables.
- Bus bars are sized for full load capacity of the generator set at 0.8 power factor.
- Includes ground bus, tin-plated copper, for connection to the generator frame ground and field ground cable.

AC DISTRIBUTION

- Provides 240 VAC for all module accessories.
- Includes controls to de-energize jacket water heaters and generator space heater when the engine is running.

SHORE POWER TWO (2)

- One (1) shore power connection distribution block for jacket water heaters.
- One (1) for generator space, battery charger, and fuel pump.

INTERNAL LIGHTING

- Four (4) internal DC lights with one (1) timer and two switches installed at each side of the container door.
- Three (3) internal AC lights.
- One (1) single duplex service receptacle.

BATTERY CHARGER AND BATTERIES

- 24 VDC/20A battery charger with float/equalize modes and charging ammeter.
- Maintenance free batteries.

EMERGENCY STOP PUSHBUTTON

- Two external ESPs located near each access door.

MODES OF OPERATION

Caterpillar utility paralleling controls are intended for automatic or manual paralleling with a utility power source as a load management system, with provisions for standby operation feeding an isolated load network. Load management operation involves microprocessor-based automatic loading controls with soft loading, base load, Import/Export control and soft unloading. For Standby operation, the generator operates as an isochronous machine isolated from the utility supply. The controls allow for automatic operation, initiated locally or remotely by the customer's SCADA system. Detailed modes of operation are listed below:

SINGLE UNIT ISLAND AND MULTI-UNIT ISLAND OPERATION

1. Utility Standby Mode (Normal)
   a. The utility is providing power for the plant loads.
   b. The Power Module Generator breaker is open.
   c. The pm is in automatic standby mode to respond to a utility failure.
2. Emergency Mode (Emergency)
   a. Utility Failure
      1) The customer protective relaying senses a utility abnormal condition.
      2) A run request is sent to the Power Module Generator plant.
      3) The first Power Module Generator reach rated to voltage and frequency is closed to the bus.
      4) In Multi-Unit Island Mode, the remaining Power Module Generators are paralleled to the bus as they reach rated voltage and frequency. This function is performed via the ModBus Plus data link connected between the Power Modules.
      5) Plant load is transferred to the Power Modules, which share load equally via ModBus Plus data link.
      6) The system is now in Emergency Mode.

GENERATOR DEMAND PRIORITY CONTROL

The System Controls include a Generator Demand Priority Control function to automatically match the on-line Power Module Generator capacity to the loads in order to avoid unnecessary operation of all the Power Module Generators when the plant loads are low.

The following controls are provided for each Power Module Generator:

a. User-settable Generator Priority Selector
b. Status indicator for the Generator Priority selected
c. Status indicator for Power Module Generator on-line or off-line
d. Generator Demand Priority Control Switch (On/Off)
e. User-settable Generator Remove Level (% as a function of single generator capacity)
f. User-settable Generator Remove Time Delay
g. User-settable Generator Add Level (% as a function of single generator capacity)
h. User-settable Generator Add Time Delay

Upon entrance into Emergency Mode, all generators will be started and paralleled to the bus. After the Remove Time Delay, Power Module Generators will be removed from the bus as a function of the generator percentage loading. Generators will be removed from the bus in descending priority order.

Should the generator percentage loading increase to the user-selected Generator Add Level after the user-selected Generator Add Time Delay, the next priority generator will be started, synchronized and paralleled to the bus. Should the Power Module Generator plant ever reach 100% loading, the next priority generator will be started and added to the bus, bypassing the Generator Add Time Delay.

MODES OF OPERATION (continued)

SINGLE UNIT IMPORT, EXPORT OR BASE LOAD OPERATION

During periods of peak demand the system may be placed in operation using the operator interface panel on the front of the switchgear.

1. Entry – Local
   a. The operator places the System Control Switch into Load Management.
   b. The operator selects Import, Export or Base Load Operation.
   c. The Load Management Setpoint is the amount of power Imported, Exported or Base-Loaded. A 4-12-20mA signal is provided by the customer and is linearly proportional to the utility load, with 12mA equaling 0 kW. The 4-12-20mA utility load signal is wired to one and only one Power Module. If the Power Module selected for Load Management is not available, the 4-12-20mA signal will be routed to a different Power Module.
   d. The operator sets the Load Management Setpoint and Power Factor Setpoint.
   e. A Run request signal is received by the Single Unit Power Module.
   f. The Power Module Generator is started and will run for a predetermined warm-up time before it is synchronized and paralleled to the utility.
   g. When the generator is on the bus, it is soft-ramp-loaded until the generator output reaches the Load Management Setpoint.
   h. The generator output is dynamically adjusted to maintain the Load Management Setpoint.
   i. Should the utility fail during Load Management Operation, the Protective Relay will cause the Paralleling Circuit Breaker 52G to open and be locked out until the Lockout Relay is manually reset by an operator on site. The generator is allowed to run for the duration of the cooldown time.
2. Exit – Local
   a. The Run Request signal is removed from the power module.
   b. The generator is soft-ramp-unloaded until the plant load is fully supported by the utility.
   c. The Paralleling Circuit Breaker 52G is opened.
   d. The generator is allowed to run for the duration of the cooldown time.

STANDARD PARALLELING CONTROL

GENERATOR PARALLELING CONTROLS

The switchgear includes:

- Single unit island mode.
- Multiple unit island mode.
  - Includes Load Sense/Load Demand control.
  - Load sharing capability is provided via network communication.
- Single unit utility parallel mode.
  Selectable for Import/Export control.
  If import or export control is selected a 4-12-20mA signal is required (provided by others) scalable to the utility contribution.
- 6 inch black and white HMI touch screen.
- Reverse compatibility module provided for interface to legacy designed Power Module Switchgear. Includes PLC, load share and voltage droop.

Incoming Utility Breaker Status Circuit – Circuit to accept customers contact from remote utility disconnect device. Customer to provide a normally open form 'a' contact to indicate when the local load network is connected to the utility grid.

Utility Transfer Trip Circuit – Circuit accepts input (normally open dry contact) from customer's system protective relay(s) or other controlling device. Operation of contacts causes tripping of the generator circuit breaker via the generator (software) 86 lock-out function and places the engine in cooldown mode. Circuit is disabled when operating in single unit or multiple unit island.

GENERATOR PARALLELING CONTROLS OPERATOR INTERFACE

Graphical mimic one line diagram that shows generator with its respective circuit breaker in a one-line representation of the system. The graphics utilize black and white indicators and bar graphs while actively displaying the following information:

- Utility CB Open/Closed. Input contacts provided by others.
- Utility kW 4-12-20mA signal required and provided by customer that is scalable to the utility contribution.
- Generator CB Open/Closed/Tripped.
- Generator Volts/Amps/kW/Frequency.
- Engine Stopped/Running/Cooldown/Pre-Alarm/Shutdown.
- Engine ECS Position Stop/Auto/Run.
- Utility Output kW.
- System Summary Alarm.

Event logging is also included with up to 500 stored events.

GENERATOR METERING AND PROTECTION

Generator metering that will graphically display 3Ø Voltage, 3Ø Current, Frequency, Power Factor, kW, kVAR and a Synchroscope Display of EMCP 3.3 faults, CDVR or ADEM 3 will be provided via Modbus RTU interface to EMCP 3.3.

Generator/Intertie Protective Relaying including:

- Device 27/59 – Under/Over Voltage.
- Device 81O/U – Under/Over Frequency.
- Device 40 – Loss of Excitation.
- Device 32 – Reverse Power.
- Device 25 – Synchronizing Check.
- Device 15 – Auto Synchronizer.
- Device 65 – Governor Load Sharing, Soft Loading Control.
- Device 90 – VAR/PF and Cross Current Compensation Controller.

PROGRAMMING AND DIAGNOSTICS

Includes field programmable set points for engine control and monitoring variables and self-diagnosis of the EMCP 3.3 system component and wiring failures.

ENGINE CONTROL SWITCH

Keypad selectable, four (4) positions – Off, Auto, Man, Cool:

- Off for engine shutdown and resetting faults.
- Auto for local or remote automatic operation when initiated by switch operation or contact closure.
- Man for local starting and manual paralleling.
- Cool for normal engine shutdown with timed cool-down cycle.

CIRCUIT BREAKER CONTROL SWITCH

Heavy duty, three- (3) position spring return to center with momentary trip and close position and slip contacts for automatic closing. Includes circuit breaker position indicating lamps.

EMERGENCY STOP PUSHBUTTON

- Mushroom head, twist to reset, causes engine shutdown and tripping of the generator circuit breaker. Prevents engine starting when depressed.

STANDARD PARALLELING CONTROL (continued)

ELECTRONIC LOAD SHARING GOVERNOR

- Includes speed adjustment, and auto load share capability when in parallel with legacy power modules.

ALARM MODULE

- Dedicates annunciator screens for warning and shutdown faults. Includes external mounted horn and acknowledge push-button.

AUTOMATIC/MANUAL PARALLELING

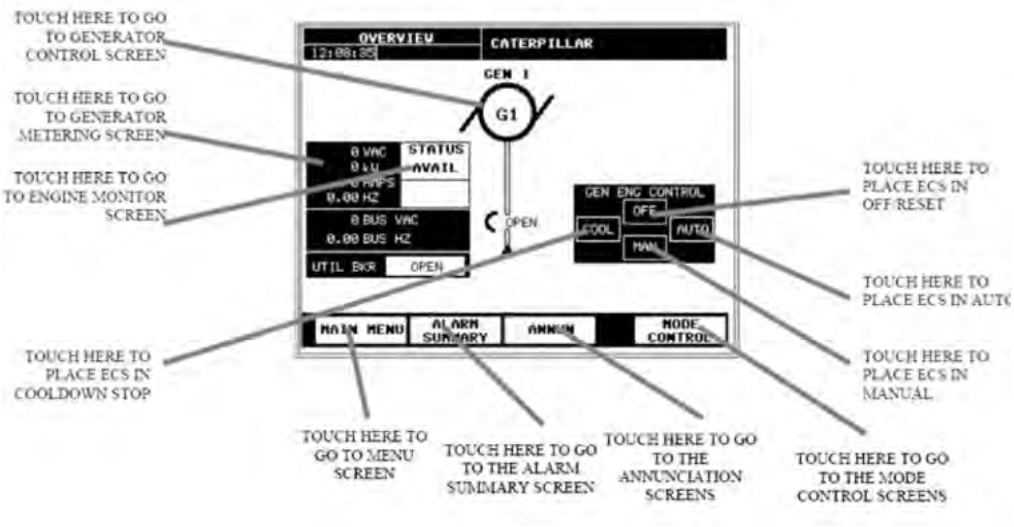
- Automatically synchronizes and parallels the generator with another power source.
- Includes provisions for manual permissive paralleling.

HUMAN MACHINE INTERFACE (HMI) HIGHLIGHTS

- Engine/Generator function is performed thru the 6" HMI touch screen interface.

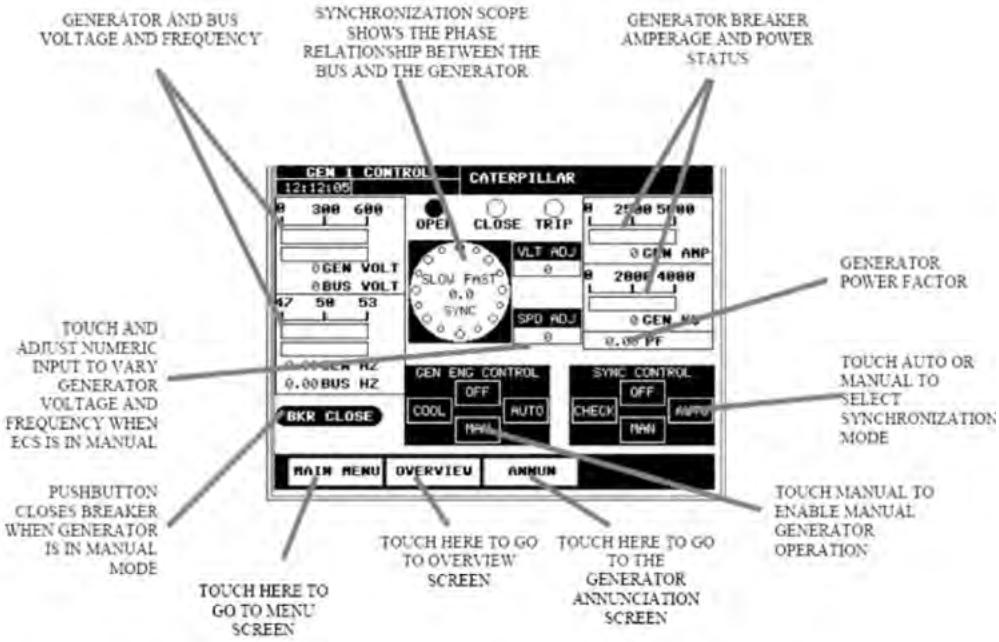
Overview Screen (Typical)

Shows the generator status, generator metering data, bus metering data, ECS position, and generator/utility breaker status.

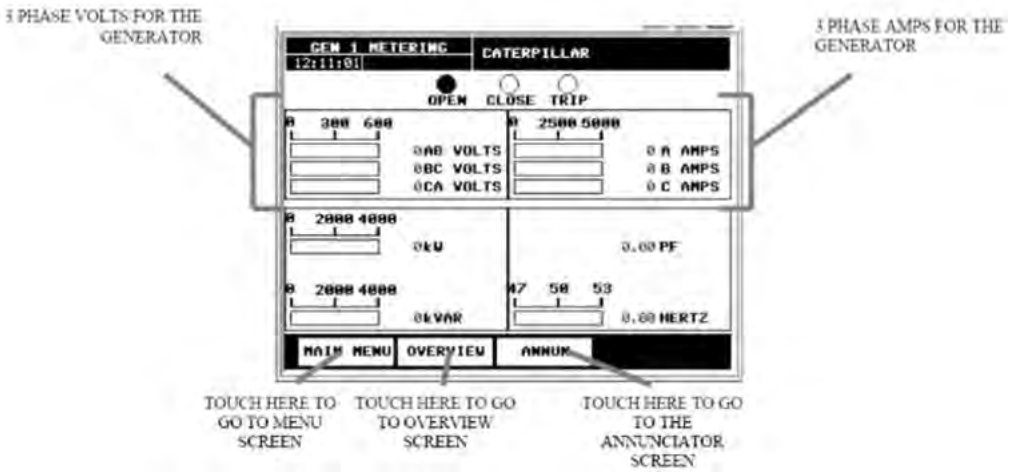


STANDARD PARALLELING CONTROL (continued)

Generator Control Screen (Typical)
It allows the operator to observe the automatic synchronization and transfer of the load to and from the generator. Engine control allows the operator to run the engine in manual, or switch to automatic modes. Voltage and frequency offset adjustment allows the operator to control generator frequency and voltage.



Generator Metering Screen (Typical)
Allows the operator to view three phases of voltage and amperage for the bus and the generator.



STANDARD PARALLELING CONTROL (continued)

Engine Monitoring Screen (Typical)

Engine status is obtained directly from the EMCP 3. Engine starts and total hours can be used by the operator to determine when regular preventive maintenance is required. Other metering includes engine battery and oil filter health.

1.0 EMERGENCY CONTACT INFORMATION

SCC **(Available 24/7)**

Phone: **867-393-5324, 867-393-5355**

YEC Radio:

1. Ensure your radio is on the correct channel for your area.
2. Press and hold the "push to talk (PTT)" button (large button on left hand side of the mic)
3. While pressing the PTT button dial 1111 on the mic.
4. Voicecall your party.

If you are in the Faro Area, use channel 13

YEC Radio Notes:

- The link can be enabled/disabled from the northern or the southern radio network.
- The link will automatically be disabled after five minutes of inactivity.
- When in the Carmacks area you will hear a beep-beep after enabling the link and a beep-beep-beep after disabling the link. Unfortunately these acknowledgment tones are not transmitted in other areas of the radio network.
- The radio link between the southern and northern networks is very long and heavy snow or ice fog between Carmacks and Stewart Crossing may render the link inoperable at times.

2.0 INITIAL ACTION/SAFE APPROACH GUIDELINES

The following are intended as guidelines. Consider the circumstances of each event and act accordingly.

NOTIFY SSC and SUPERVISOR IF AVAILABLE **SCC Phone# 867-393-5324, 867-393-5355**

- Arrange Call-Back time, if appropriate.

ALERT OTHER EMPLOYEES/PERSONS IN AREA

- Approach spill site from up-wind or, if indoors, ensure you have a clear escape route
- Establish Perimeter Security
- Evacuate, if necessary
- Eliminate Ignition Sources
- Commence documentation

USE THE BUDDY SYSTEM

IDENTIFY MATERIAL, SPILL SOURCE, ESTIMATE QUANTITY SPILLED AND POTENTIAL FATE

- Block Potential Escape Routes, if appropriate

IF SPILL CONTINUING, CONTROL SOURCE, IF SAFE TO DO SO

- **SUBSTATION SPILLS. DO NOT ENTER UNLESS AUTHORIZED. HIGH VOLTAGE: CONTACT SCC then LEADHAND ELECTRICAL MAINTENANCE 334-5868**
- Develop Spill Site Safety Plan located on page 9 and 10 of this document.

Refer to product MSDS. Wear appropriate PPE.

- (See "Fast Fact Sheets" at the back pages of this plan for spills of specific products.)

SUMMON RESPONSE RESOURCES, AS APPROPRIATE

UPDATE SCC and SUPERVISOR ON PROGRESS

Note: In some instances, initial on-scene personnel will only be able to monitor and/or contain the spill with resources at hand until assistance arrives.

DO NOT PUT YOURSELF at RISK

3.0 PURPOSE AND SCOPE

At this time this Spill Contingency Plan covers situations related to a spill or other unintended release of a liquid, solid and/or gas that may present a threat to those in a YEC facility or to the environment.
This spill contingency plan applies to all spills that occur at Yukon Energy's diesel facilities located in Faro, Yukon. The VP of Operations will approve the plan yearly and the Environment and Resource Analyst with Leadhands of Mechanical and Electrical Maintenance will review the plan yearly to ensure the information is current.

Purpose

The purpose of Yukon Energy's Spill Contingency Plan is to provide a plan of action for every foreseeable hazardous material spill event at the Faro Generating Facility. It defines the responsibilities of key response personnel and outlines the procedures for responding to spills in a way that will minimize potential health and safety hazards, environmental damage, and clean-up costs. The plan has been prepared to provide easy access to all the information needed in dealing with a spill.

It is the policy of Yukon Energy to initiate clean up activity when, in the opinion of its management, Yukon Energy is clearly associated, or likely to be associated with the spilled material. As well it is our company policy:

- To meet or surpass regulatory requirements;
- To provide protection of the environment using all of YEC's resources; when practicable
- To cooperate with other groups working on protection of the environment;
- To minimize the adverse effects of our activities on the natural and social environment;
- To keep employees, government officials and the public informed.

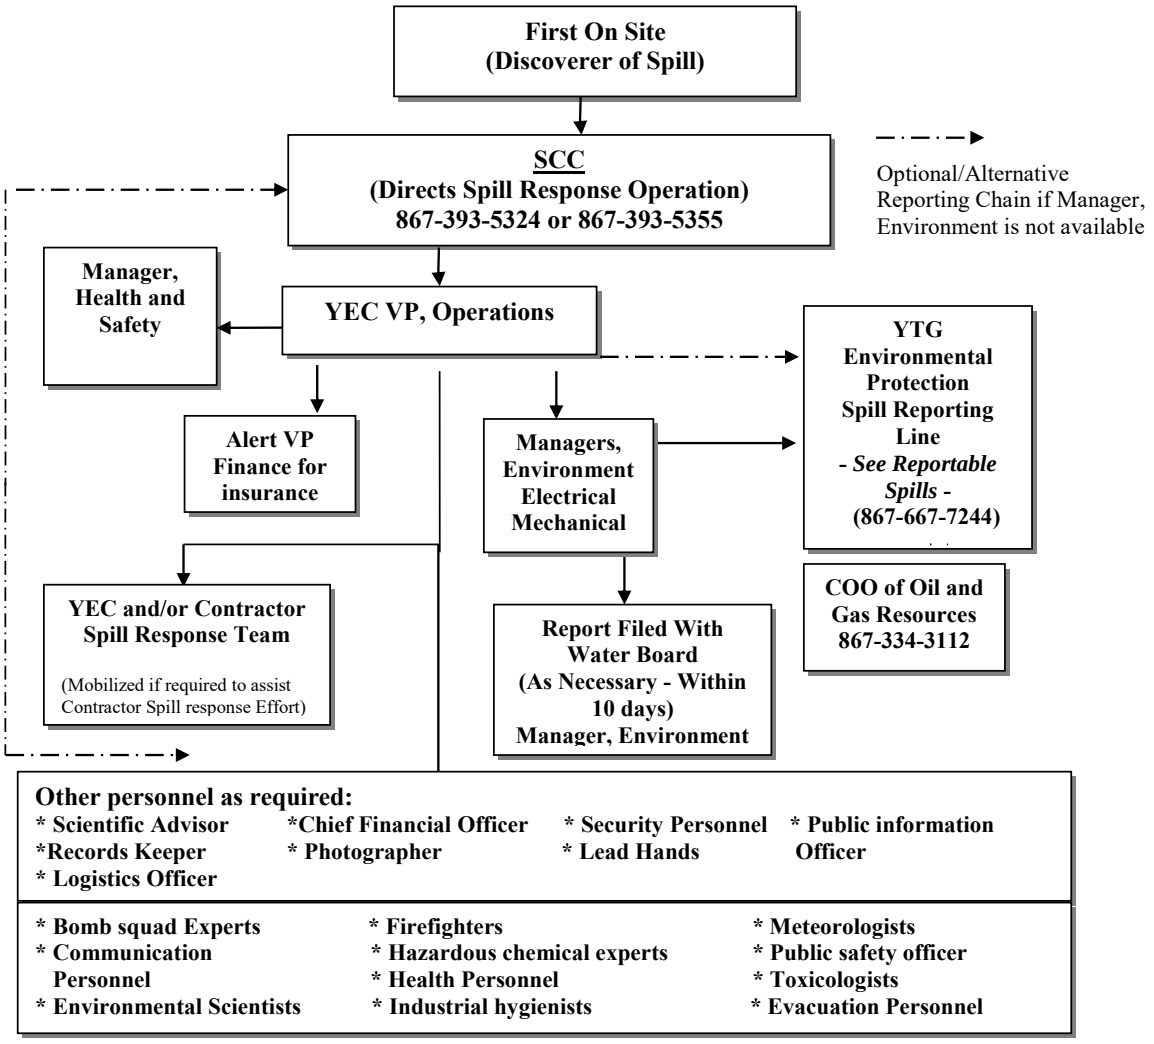
Scope

The Faro Diesel/Substation Spill Contingency Plan, Reporting Procedures and Hazardous Materials Locations document covers all hazardous materials stored and used at the Faro Diesel Generating Station and Substation sites. This document covers both spills on land as well as in adjacent watercourses (e.g., Rose Creek). The plan is approved yearly by the VP of Operations following a yearly review by and the Leadhands of Electrical and Mechanical Maintenance will review the plan yearly to ensure the information is current and accurate.

4.0 NOTIFICATIONS

Figure 1. Contact/Reporting Flow Chart
Contact flow chart in the event of a fuel, oil or other hazardous material spill. Qualified alternates will be contacted in the event someone is unavailable.

All spills of petroleum products of **5 litres** or more of fresh, or **0.5 L** of used waste oil or other hazardous materials to permeable surface and any amount to water must be reported to the 24 Hour Spill Report Line by the Manager, Environment to insure that an investigation may be undertaken by the appropriate government authority. In the event of a LNG or natural gas release, the Chief Operating Officer of the Oil and Gas Branch must be informed.



The specific information requested when a spill is reported to government is outlined in Yukon Energy's Incident Reporting Safe Work Practice SWP-006 and Environmental Work Practice EWP-006 found on the Health and Safety and Environment EMS Sharepoint Site

5.0 RESPONSE ORGANIZATION

Response organization Structure (s) by Classification Level of Response

MINOR: Level 1 INCIDENT COMMANDER: **RESPONDER/SUPERVISOR**

Is a spill of a minor nature that presents no significant threat to employees, property or the environment and absolutely no risk to the public. It can be cleaned up and remediated using workers and equipment available at the facility or site.

Example: A litre of varsol was spilled on the impermeable shop floor. The spiller alerts those around him of the occurrence, that the incident has occurred and cleans the product up using a small spill kit. Waste is disposed of in an appropriately labelled hazardous material waste container manner. No need to report externally or internally unless an equipment deficiency is raised. In this example if the solvent had been in use (i.e., was not fresh) and/or had been spilled to a dirt floor, or other permeable surface, internal and external reporting would be required.

MODERATE: Level 2 INCIDENT COMMANDER: **LEAD HAND** or delegate

A medium spill event where there is potential risk to employees, property or the environment but no risk to the public. This level may require external assistance to contain, recover or remediate.

Example: A vehicle entering the Whitehorse facility has impacted and punctured several barrels of waste oil stored directly on the ground with no spill tray to catch any release.

MAJOR: Level 3 INCIDENT COMMANDER: **VP, OPERATIONS** or delegate

A major spill event where there is a significant risk to employees, property, the environment and/or the public. Considerable internal and possibly external resources may be required to effectively respond.

Example: The 160,000L fuel tank in the yard of the Whitehorse facility has leaked and the product is escaping through a previously unidentified crack low on the secondary containment wall. The spill is spreading around the yard and entering the unpaved area adjacent to the property fence.

Responsibility to summon/manage external resources:

First Responders: SCC or personnel at the scene

External Emergency Responders/Regulators: Manager, Environment or Delegate. VP of Operations
Spill Response Contractors: SCC, Manager of Environment, VP of Operations, Lead hands

6.0 SPILL SITE SAFETY PLAN

Incident Name _____ ***Operational Period*** From _____ To _____

1. DESCRIBE THE INCIDENT AND SPECIFY THE SITE ENTRY OBJECTIVES

Description _____

Location _____

Incident Type

- ☐ Spill
- ☐ Gas release
- ☐ Explosion
- ☐ Fire
- ☐ Other _____
- ☐ Unknown

Site Entry Objectives under this Site Safety Plan

- ☐ Initial assessment or reconnaissance
- ☐ Account for personnel and/or rescue victims
- ☐ Source control
- ☐ Fire suppression
- ☐ Spill containment
- ☐ Spill recovery and/or cleanup

2. IDENTIFY PRODUCT HAZARDS

Consult MSDS; if no MSDS call CANUTEC at 613-996-6666 or "*666" (in Canada only)

Product Properties

Name _____
Estimated Amount _____
MSDS on Hand? _____
Gas / Liquid / Solid (circle)
Water soluble? _____
Specific gravity or vapor density _____

Product Hazards *(check all that apply)*

- ☐ Flammable (flash point _____ °C)
- ☐ Explosive (LEL range _____ to _____ %)
- ☐ Corrosive (corrodes _____)
- ☐ Reactive (reacts with _____)
- ☐ Toxic (IDLH _____; TLV _____)
- ☐ Carcinogenic

Potential Routes of Exposure to the Product *(check all that apply)*

☐ Inhalation ☐ Ingestion ☐ Eye contact ☐ Skin contact

3. IDENTIFY PHYSICAL SITE HAZARDS AND CONDITIONS

Physical Site Hazards

- ☐ Confined space
- ☐ Elevated area
- ☐ Pit or trench
- ☐ On or near water
- ☐ Unstable structure
- ☐ Electrocution
- ☐ Wildlife encounter
- ☐ Noise/vibration
- ☐ Extreme temperatures
- ☐ Low visibility
- ☐ Slip or trip hazards

Site Conditions *(as applicable)*

Air temperature _____
Wind chill temperature _____
Water temperature _____
Wind speed & direction _____
Precipitation _____
Humidity _____
Visiblity _____
Wave ht. (avg & max) _____
Speed of current _____
Direction of current _____
High/low tide times _____
High/low tide heights _____
Forecast _____
_____
_____
_____

Wind Chill Temperature Chart

Wind Speed (km/hr)

Effective temperature (°C)	0	10	15	20	25	30	35	40	45	50	55	60

x	x	x	x	Cold weather gear*

5. SPECIFY MONITORING REQUIREMENTS

Site Safety Officer or designee is responsible for monitoring the following parameters (indicated by checked boxes) at the appropriate frequency and for immediately communicating levels requiring action to the On-Scene Commander. Action levels based on TLVs published by ACGIH.

Parameter	*Frequency*	*Action Level*	*Required Action*
☐ Oxygen		<19.5%	Wear SCBA
		>23.5%	Fire potential; stop monitoring, leave area
☐ Flammable gas		≥10% LEL	Explosion hazard; leave area
☐ Benzene		>25 ppm	Wear SCBA
		0.5 - 25 ppm	Use full-face air purifying respirator with organic vapor cartridges
☐ Carbon dioxide		>50,000 ppm	Wear SCBA
		5,000 - 50,000 ppm	Use half-face air purifying respirator with appropriate cartridge
☐ Hydrocarbons		50 to 500 ppm	Use half-face air purifying respirator with appropriate cartridge
		>500 - 2,500 ppm	Use full-face air purifying respirator with appropriate cartridge

6. BRIEF ALL PERSONNEL

Site Diagram attached? ☐ Yes ☐ No

Reviewed with all team members *(check all applicable items)*

- ☐ Buddy system
- ☐ Hazards / conditions on site
- ☐ Emergency hand signals
- ☐ Evacuation alarm
- ☐ Evacuation / escape route
- ☐ Criteria for immediate evacuation
- ☐ Radio communications
- ☐ Location of first aid/rescue gear
- ☐ Required PPE
- ☐ Safe access route to site

10.0 SITE SPECIFIC INFORMATION: FARO

The Facility

The Faro Diesel/Substation site is located in the town of Faro. The Faro Diesel/Substation facility includes the following structures:

- Diesel generating plant buildings (2) and mobile diesel gensets (6)
- Diesel fuel storage tanks (4)
- Substation

The map on the following page shows the existing layout of the Yukon Energy's area at the Faro Generating Facility.

- YEC and its contractors shall maintain reports of all spill or unauthorized discharge occurrences, including spills that are less than the reportable quantities under the Yukon *Spills Regulations.* The log book shall be made available at the request of the inspector. The reports shall include, but not necessarily be limited to:

    - Date and time of the spill;
    - Substance spilt or discharged;
    - Approximate amount spilled or discharged;
    - Distance between the spill or discharge and the nearest watercourse; and
    - Remedial measures taken to contain and clean-up the spill area or to cease the discharge

These are written in the reports by the first responder, Lead Hand or VP of Operations depending on the severity of the spill. See page 6 for response organization structure.

11.0 RESOURCES AT RISK

Table 3. Site Description

A.	**Site Locations**	Running of Diesels to produce Electricity.
B.	**The site location and boundaries:**	Faro, Yukon, Canada. Yukon Energy Diesel Generating site
C.	**The drainage pathways from the site:**	Rose Creek, Pelly River
D.	**Nearby waterways and sensitive areas:**	Rose Creek, Pelly River, Town of Faro Residents

Table 4. Nearby Waterways[1] and Sensitive Areas[2]

Waterway[1] or Sensitive Area[2]	Distance from Project Site	Direction of Flow from Project Site
Rose Creek	70m from waterway	South, into the Pelly River

It is very unlikely that Yukon Energy would affect any water resources as diesel fuel tanks are located inside berms and the facility is not located adjacent to a waterway. As well sumps are located under the plant floors to intercept oils from going to ground.

12.0 SITE SPECIFIC SCENARIOS

SCENARIO 1

During a short break, employees were in the parking lot at the Faro Diesel Generating Station.
They observed a tank truck enter the main gate, hit what they took to be a patch of ice and hit the main diesel storage tank and create a crack in the wall of the main diesel tank.
The students saw the driver stumble from the tank truck cab and collapse against the perimeter fence adjacent to the tank.
The PLT onsite took command of the incident.

1. **NOTIFY SUPERVISOR OR SSC**

    - Call SCC and VP of Operations
    - Arrange Call-Back time, if appropriate.
    - Incident commander will call all emergency response teams

2. **ALERT OTHER EMPLOYEES/PERSONS IN AREA**

    - Approach spill site from up-wind or, if indoors, ensure you have a clear escape route
        - Check to see if tanker truck is intact and not spilling onto ground
        - Check on the person that stumbled from the truck and remove him from the scene
        - Check cab of truck for any other passengers
        - Call YEC advanced first aiders to tend to the driver
        - Check inside berm for any YEC employees

    - Establish Perimeter Security. Stop people from going in and out of the YEC gate. Call police to do this or other YEC group. Use danger tape around the area, restricting access. Keep everyone inside buildings until clean-up is complete

    - Evacuate main corporate building and diesel plants, if necessary

    - Eliminate Ignition Sources. Shut off power going to tank fed from inside. SCC will call contractor with a vacuum truck to pump the diesel out of the tanker truck. Pads and absorbents are thrown down where liquid has spilled.

    - Commence documentation

USE BUDDY SYSTEM

3. **IDENTIFY MATERIAL, SPILL SOURCE, ESTIMATE QUANTITY SPILLED AND POTENTIAL FATE**

    - Block Potential Escape Routes, if appropriate

4. **IF SPILL CONTINUING, CONTROL SOURCE, IF SAFE TO DO SO**

    - Develop Initial Incident Response Plans (Defensive, Offensive or Non-Intervention)

    - Refer to product SDS. Wear appropriate PPE.

(See "Fast Fact Sheets" in this Plan for spills of specific products.)

5. **SUMMON RESPONSE RESOURCES, AS APPROPRIATE**

6. **UPDATE SUPERVISOR AND/OR SCC ON PROGRESS**

7. **COMPLETE DETAILED INCIDENT REPORT**

Table 5. Other Possible Scenarios

Hazardous Materials and Location	Spill Response Task			
	Assess the Spill	**Secure the Area**	**Contain and Eliminate the Spill Source**	**Clean Up Spilled Material Decontaminate Equipment Dispose of Spilled & Contaminated Material[1]**
Diesel Plant Storage – Mobilgard 312, Delvac 1340, Diesel, Varasol, Anti-Freeze	• Any considerable losses in the dip readings from one check to the next • Any fuel/lubricants smells or any pools on the floor	Inside the diesel plant	• Cover drains with the drain covers from the spill kit. • Use leak filler if leak is accessible and if it is safe to do so	• Use granular sorbents and sorbent sheets to mop up the spill • Hydrocarbon soiled materials will be disposed of in barrels and sealed. Barrels are located in the spill trailer. • Special waste is picked up is once a year by Environment Yukon
Waste oil	• Oil smells or any pools outside the waste oil containment	Outside the diesel plant in waste oil containment	• Use the spill kit located next to WD3 • Use oilwik boom around the spill site	• Use granular sorbents and sorbent sheets • Dig up the area to assess the extent of the spill • Place the contaminated soil in a poly lined temporary containment or a metal bin. • Attain a contaminated soil removal permit and transport to a land treatment facility
Any hazardous material	• See material flowing in the Whitehorse YEC yard	Cover the man holes immediately and contain the spill	• Use the Spill response trailer. Use man hole covers and a sorbent boom	• Clean up material with sorbents and discard appropriately

13.0 APPENDIX A: FORMS

ICS 201 –BREIFING DOCUMENT
ICS 214A – INDIVIDUAL LOG
Safe action/Initial Action Checklists by Substance

- **Diesel Fuel**
- **Delvac 1340**
- **Coolant- CAT EC-1 (238-8650)**
- **Mobilgard 312**
- **Teresso 46**
- **Varsol**
- **Waste Oil**
- **Voltesso 35**
- **SF6**

Appendix A1: **ICS 201-BRIEFING DOCUMENT**

Purpose. The Incident Briefing form provides the Incident Commander (YEC Site Supervisor) with basic information regarding the incident situation and the resources allocated to the incident. It also serves as a permanent record of the initial response to the incident.

Preparation. The briefing form is prepared by the Incident Commander (YEC Site Supervisor) for presentation to the incoming Incident Commander along with a more detailed oral briefing. Proper symbology should be used when preparing a map of the incident.

Distribution. After the initial briefing of the Incident Commander (YEC Site Supervisor) and General Staff members, the Incident Briefing is duplicated and distributed to the Command Staff, Section Chiefs, Branch Directors, Division/Group Supervisors, and appropriate Planning and Logistics Section Unit Leaders. The sketch map and summary of current action portions of the briefing form are given to the Situation Unit while the Current Organization and Resources Summary portion are given to the Resources Unit.

1. Incident Name:	2. Prepared by: Date: Time:	INCIDENT BRIEFING ICS 201-OS (pg 1 of 4)

3. Map/Sketch (include maps drawn here or attached, showing the total area of operations, the incident site/area, overflight results, trajectories, impacted shorelines, or other graphics depicting situational and response status)

INCIDENT BRIEFING	June 2000	ICS 201-OS (pg 1 of 4)

1. Incident Name:	2. Prepared by: Date: Time:	INCIDENT BRIEFING ICS 201-OS (pg 2 of 4)

4. Initial Incident Objectives

5. Summary of Current Actions

INCIDENT BRIEFING
June 2000
ICS 201-OS (pg 3 of 4)

1. Incident Name:	2. Prepared by: Date: Time:	INCIDENT BRIEFING ICS 201-OS (pg 4 of 4)

7. Resources Summary

Resources Needed	Time Ordered	Resources Identifier	ETA	On-Scene?	NOTES: (Location/Assignment/Status)

Appendix A2-: **ICS 214A – INDIVIDUAL LOG**

Purpose. The Unit Log is used to record details of unit activity including strike team activity. The file of these logs provides a basic reference from which to extract information for inclusion in any after-action report.

Initiation of Log. A Unit Log is initiated and maintained by head of the spill response effort.

1. Incident Name	2. Operational Period (Date / Time) From: To:	INDIVIDUAL LOG ICS 214a-OS
3. Individual Name	4. ICS Section	5. Assignment / Location

6. Activity Log		Page of
Time	Major Events	

7. Prepared by:	Date / Time

INDIVIDUAL LOG	June 2000	ICS 214a-OS

Record all personal activity --> Supervisor at end of shift --> Documentation Unit

Appendix A3-9: **SAFE ACTION/INITIAL ACTION CHECKLISTS BY SUBSTANCE**

Purpose. The purpose of the Safe Action/Initial Action Checklists by substance are to provide safety measures, PPE to be worn, first aid, emergency response, physical and chemical properties of a particular substance.

Use: These checklists are to be used as initial first action by the first responder.

Appendix A3: **DIESEL FUEL -SAFETY MEASURES**

- May cause eye, respiratory and skin irritation, headache, nausea, mental confusion, unconsciousness and death
  - Wear appropriate PPE
- Combustible liquid, may form explosive vapours
  - Eliminate ignition sources and monitor for combustible gases
- May accumulate static electricity
  - Ground and bond during transfers
- Vapours heavier than air
  - Stay out of low areas and confined spaces

Personal Protection

- If there is a high level of fumes during a spill, ventilate area before entering
- Wear required PPE, as appropriate

First Aid

- **Eyes**
  - Flush eyes immediately with fresh warm water (40C-45C) for at least 15 minutes holding lids open. DO NOT USE excessively hot or cold water
  - Get medical attention
- **Skin**
  - Remove contaminated clothing
  - Wash contaminated skin thoroughly with soap and warm water
  - Obtain medical attention if irritation or redness develops
- **Inhalation**
  - Move person to fresh air
  - Administer oxygen therapy, as necessary
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
  - If swallowed, DO NOT INDUCE VOMITING and obtain immediate medical attention
  - Small amounts of materials that enter the mouth should be rinsed out until taste of substance is eliminated. Remove dentures and rinse well, if applicable

For Further Information Consult Product SDS

Appendix A3: **DIESEL FUEL –EMERGENCY RESPONSE**

Spill

- Isolate area, restrict access and evacuate if necessary
- Eliminate ignition sources
- Advise SCC and/or Supervisor (867) 393 5324/ 393 5355
- Request assistance
- Attempt to limit escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO2, foam and/or H20 fog. DO NOT use a direct stream of water as it may spread the fire

Physical & Chemical Properties

Appearance:	Clear white to pale/bright yellow liquid
Odour:	Petroleum
Flashpoint:	Approximately > + 37.8C
Solubility in water:	Insoluble
Specific Gravity:	0.78 – 0.85
Vapour Density:	> than 1 (Air = 1)

For Further Information Consult Product SDS

Appendix A6: **DELVAC 1340- SAFETY MEASURES**

- Excessive exposure may result in eye, skin, or respiratory irritation. Wear appropriate PPE
- Material will not burn unless preheated. Avoid excessive heat as it may cause formation of vapours or mists in which case SCBA must be worn
  - Eliminate ignition sources
- Spilled material may create a slipping hazard

Personal Protection

- Wear required PPE, as appropriate

First Aid

- **Eyes**
  - Flush eyes immediately with fresh warm water (40C-45C) for 15 minutes holding lids open
  - Get medical attention if irritation occurs and persists
- **Skin**
  - Wash contaminated skin with mild soap and warm water. Remove contaminated clothing
  - Get medical attention if irritation occurs and persists
- **Inhalation**
  - Remove from further exposure.
  - For those providing assistance, avoid exposure to yourself or others. Use adequate respiratory protection.
  - If respiratory irritation, dizziness, nausea, or unconsciousness occurs, seek immediate medical assistance
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
  - Not normally a factor.
  - If swallowed, DO NOT INDUCE VOMITING and get immediate medical attention
  - If vomiting occurs, keep the head low to prevent product entering the lungs

For Further Information Consult Product SDS

Appendix A6: **DELVAC 1340- EMERGENCY RESPONSE**

Spill

- ISOLATE AREA, restrict access and evacuate if necessary
- Eliminate ignition sources
- Spill may create slipping hazard
- Advise Supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Attempt to limit product escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using sorbent materials and/or vacuum truck

Fire

- Evacuate and isolate area, restrict access
- Advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO_2, foam and/or H_20 fog. DO NOT use direct stream of water as it may spread fire

Physical & Chemical Properties

Appearance:	Liquid. Brown
Odour:	Hydrocarbon odour
Flashpoint:	+ 230 C (446ºF)
Solubility in water:	Negligible
Specific Gravity:	< 1 (Water = 1)
Vapour Density:	Not available

For Further Information Consult Product SDS

Appendix A7: **COOLANT- CAT EC-1 (238-8650) - SAFETY MEASURES**

- DO NOT taste or swallow antifreeze. DO NOT breathe vapours or fumes
  - Wear appropriate PPE
- Material is unlikely to burn unless preheated
- It may possibly accumulate static electricity
  - Ground and bond containers during transfer

Personal Protection

- If high level of fumes are present during a spill, ventilate area before entering
- Wear other required PPE, as appropriate

First Aid

- **Eyes**
  - Flush eyes immediately with fresh warm water (40C-45C) for 15 minutes holding lids open
  - Obtain medical attention if irritation persists
- **Skin**
  - Wash contaminated area with plenty of mild soap and water. Remove contaminated clothing
  - If irritation occurs and persists, obtain medical attention
- **Inhalation**
  - Move exposed person to fresh air
  - Administer oxygen therapy, as necessary and only if trained
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
  - If symptoms occur, obtain medical attention
- **Ingestion**
  - Remove dentures, if any, and rinse. Rinse out mouth until taste of product dissipates
  - If swallowed, DO NOT INDUCE VOMITING. Get immediate medical attention
  - If vomiting occurs, keep the head low to prevent product entering the lungs.

For Further Information Consult Product SDS

Appendix A7: **COOLANT- CAT EC-1 (238-8650) - EMERGENCY RESPONSE**

Spill

- ISOLATE area, restrict access and evacuate if necessary
- Eliminate ignition sources though substance unlikely to ignite
- Advise Supervisor and/or SCC # (867) 393 5324/SCC Cell. (867) 393 5355
- Request assistance
- Attempt to limit product escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using appropriate sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO_2, foam and/or H_20 fog
  DO NOT use a direct stream of water as it may spread fire

Physical & Chemical Properties

Appearance:	Liquid. Yellow Colour
Odour:	Faint or mild
Flashpoint:	+ 127 C
Solubility in water:	Soluble
Lower/Upper Explosive Limits:	Lower 3.2% Upper: Not stated
Vapour Density:	2.1 (Air = 1)

For Further Information Consult Product SDS

Appendix A8: **MOBILGARD 312 – SAFETY MEASURES**

- Excessive exposure may result in eye, skin, or respiratory irritation.
- Exposure most likely to occur through skin contact or from inhalation of mechanically or thermally generated oil mists. Normally, product has a low level of toxicity
    - Wear appropriate PPE
- Material will not burn unless preheated. Avoid excessive heat as it may cause formation of vapours or mists
    - Eliminate ignition sources
- Spilled material may create a slipping hazard

Personal Protection

- If high level of fumes are present during a spill, ventilate area before entering
- Wear other required PPE, as appropriate
- If contact is likely with eyes, then safety glasses should be worn.

First Aid

- **Eyes**
    - Flush eyes immediately with fresh warm water (40C-45C) for 15 minutes holding lids open
    - Get medical attention if irritation occurs and persists
- **Skin**
    - Wash contaminated skin with mild soap and water. Remove contaminated clothing
    - Get medical attention if symptoms occur and persist
- **Inhalation**
    - Move exposed person to fresh air
    - Administer oxygen therapy, as necessary and only if trained
    - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
    - Remove dentures, if any. Wash out mouth with water. Substance has low oral toxicity
    - First Aid is normally not required. Seek medical attention if discomfort occurs

For Further Information Consult Product SDS

Appendix A8: **MOBILGARD 312 – EMERGENCY RESPONSE**

Spill

- Isolate area, restrict access and evacuate if necessary
- Eliminate ignition sources
- Spill may create slipping hazard
- Advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Request assistance
- Attempt to limit product escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO_2, foam and/or H_20 fog. DO NOT use direct stream of water as it may spread the fire

Physical & Chemical Properties

Appearance:	Liquid. Brown colour
Odour:	Hydrocarbon odour
Flashpoint:	> + 225 C (437 F)
Solubility in water:	Insoluble
Specific Gravity:	< 1 (Water = 1)
Vapour Density:	Not available

For Further Information Consult Product SDS

Appendix A9: **TERESSO 46 – SAFETY MEASURES**

- Low order of toxicity. Excessive exposure may result in eye, skin or respiratory inhalation
  - Wear appropriate PPE
- Material will not burn unless preheated. Avoid excessive heat as it may cause formation of vapors or mists
  - Eliminate ignition sources
- Spilled material may create a slipping hazard

Personal Protection

- If high levels of fumes are present during the event of a spill, ventilate area before entering
- Wear other required PPE, as appropriate

First Aid

- **Eyes**
  - Flush eyes immediately with fresh water (40C-45C) for 15 minutes holding lids open. DO NOT USE excessively hot or cold water
  - Get medical attention if irritation occurs
- **Skin**
  - Wash contaminated skin with mild soap and water. Remove contaminated clothing
  - Get medical attention if symptoms occurs or the substances comes in contact with an open wound
- **Inhalation**
  - Move exposed person to fresh air
  - Administer oxygen therapy, as necessary and only if trained
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
  - First aid is not normally required. Seek medical attention if discomfort occurs
  - Remove dentures, if any, and rinse before replacing. Rinse out mouth with water until taste of product dissipates. Substance has low oral toxicity

For Further Information Consult Product SDS

Appendix A9: **TERESSO 46 – EMERGENCY RESPONSE**

Spill

- Isolate area, restrict access and evacuate if necessary
- Eliminate ignition sources
- Spill may create slipping hazard
- Advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Attempt to limit product escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO_2, foam and/or H_20 fog. DO NOT use direct stream of water as it may spread fire

Physical & Chemical Properties

Appearance:	Liquid. Amber in colour
Odour:	Lubricating oil odour
Flashpoint:	+ 200 C
Solubility in water:	Negligible
Specific Gravity:	< 1 (Water = 1)
Vapour Density:	> 2 (Air = 1)

For Further Information Consult Product SDS

Appendix A10: **VARSOL – SAFETY MEASURES**

- May cause mild irritation to eyes and skin upon contact, drowsiness, lack of coordination, headache and nausea.
  - Wear appropriate PPE
- Combustible liquid. May form explosive vapours. Use in adequately ventilated area
  - Eliminate ignition sources
- Vapours heavier than air
  - Stay out of low areas and confined spaces
- May accumulate static electricity
  - Ground and bond containers during transfer

Personal Protection

- If high level of fumes are present during a spill, ventilate area before entering
- Wear other required PPE, as appropriate

First Aid

- **Eyes**
  - Flush eyes immediately with fresh warm water (40C-45C) for 15 minutes holding lids open
  - Get medical attention if irritation occurs
- **Skin**
  - Flush contaminated skin with plenty of water. Remove contaminated clothing
  - Get medical attention if symptoms occur
- **Inhalation**
  - Move exposed person to fresh air
  - Administer oxygen therapy, as necessary and only if trained
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
  - Get medical attention if adverse health effects persist or are severe
- **Ingestion**
  - Remove dentures, if any, and rinse with water. Rinse out mouth with water
  - Obtain medical attention if symptoms occur
  - If swallowed, DO NOT INDUCE VOMITING. Give small quantities of water or milk to drink and get immediate medical attention
  - If vomiting occurs, keep the head low to prevent product entering the lungs

For Further Information Consult Product SDS

Appendix A10: **VARSOL – EMERGENCY RESPONSE**

Spill

- Isolate area, restrict access and evacuate if necessary
- Eliminate ignition sources
- Advise Supervisor and/or SCC # (867) 393 5324/. (867393 5355
- Request assistance
- Attempt to limit product escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO_2, foam and/or H_20 fog. DO NOT use direct stream of water as it may spread fire

Physical & Chemical Properties

Appearance:	Clear liquid
Odour:	Petroleum distillate
Flashpoint:	> + 37.8 C (Combustible liquid)
Solubility in water:	Insoluble
Lower/Upper Flammability Limits:	1% - 13%
Vapour Density:	5 (Air = 1)

For Further Information Consult Product SDS

Appendix A11: **VOLTESSO 35 - SAFETY MEASURES**

- May cause eye, respiratory and skin irritation. Frequent or prolonged contact may de-fat and dry the skin
  - Wear appropriate PPE
- Combustible liquid, may form explosive vapours
  - Eliminate ignition sources and monitor for combustible gases
- May accumulate static electricity
  - Ground and bond during transfers
- Vapours heavier than air
  - Stay out of low areas and confined spaces

Personal Protection

- If high level of fumes are present during a spill, ventilate area before entering
- Wear other required PPE, as appropriate

First Aid

- **Eyes**
  - Flush eyes immediately with fresh warm water (40C-45C) for at least 15 minutes holding lids open. DO NOT USE excessively hot or cold water
  - Get medical attention
- **Skin**
  - Remove contaminated clothing
  - Wash contaminated skin thoroughly with soap and warm water
  - Obtain medical attention if irritation or redness develops
  - Launder contaminated clothing before reuse
- **Inhalation**
  - Move person to fresh air
  - Administer oxygen therapy, as necessary and only if trained
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
  - If swallowed, DO NOT INDUCE VOMITING and obtain immediate medical attention
  - Small amounts of materials that enter the mouth should be rinsed out until taste of substance is eliminated. Remove dentures and rinse well, if applicable

For Further Information Consult Product SDS

Appendix A11: **VOLTESSO 35–EMERGENCY RESPONSE**

Spill

- Isolate area, restrict access and evacuate if necessary
- Eliminate ignition sources
- Advise Supervisor and/or SCC (867) 393 5324/ 867 393 5355 to request assistance
- Attempt to limit escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO2, foam and/or H20 fog. DO NOT use a direct stream of water as it may spread the fire

Physical & Chemical Properties

Appearance:	Pale Yellow, liquid
Odour:	N/D
Flashpoint:	Approximately > 145C
Solubility in water:	Negligible
Specific Gravity:	-
Vapour Density:	> N/D (Air = 1)

For Further Information Consult Product SDS

Appendix A12: **SF6 GAS- SAFETY MEASURES**

- May cause eye, respiratory and skin irritation. Frequent or prolonged contact may de-fat and dry the skin
- Escaping gas may cause frostbite injury
  - Wear appropriate PPE
  - Eliminate ignition sources and monitor for combustible gases
- May accumulate static electricity
  - Ground and bond during transfers
- Vapours heavier than air
  - Stay out of low areas and confined spaces

Personal Protection

- General mechanical ventilation must be worn
- Ribber gloves
- ANSI approved Chemical Workers Goggles
- Coveralls

First Aid

- **Eyes**
  - Flush eyes immediately with fresh warm water (40C-45C) for at least 15 minutes holding lids open. DO NOT USE excessively hot or cold water
  - Get medical attention if pain or sensitivity to light persists
- **Skin**
  - Wash exposed area extremely thouroughly, but gently in cases of frostbite –like injury, with soap and water
- **Inhalation**
  - Move person to fresh air
  - Administer oxygen therapy, as necessary and only if trained
  - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
  - If swallowed, DO NOT INDUCE VOMITING and obtain immediate medical attention
  - Contact MD immediately

For Further Information Consult Product SDS

Appendix A12: **SF6 GAS –EMERGENCY RESPONSE**

Spill

- Evacuate personnel to safe areas. Wear PPE and self-contained breathing apparatus when entering area unless atmosphere is proved to be safe. Ventilate the area. Monitor oxygen level
- Stay upwind
- If possible, stop the flow of product
- Advise Supervisor and/or SCC (867) 393 5324/ 867 393 5355 Request assistance

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO2, foam and/or H20 fog. DO NOT use a direct stream of water as it may spread the fire

For Further Information Consult Product SDS

Appendix A13: **WASTE OIL – SAFETY MEASURES**

- Mixture of water, oil and lubricant additives. Concentrations of components will vary. The product is not expected to be irritating and has a low level of toxicity under normal use. Exposure most likely to occur through skin or eye contact
    - Wear appropriate PPE
    - Spill may create slipping hazard
- Material is unlikely to burn unless preheated. Spilled material may produce a slipping hazard
    - Vapour pressure will vary dependent on the composition
- It may possibly accumulate static electricity
    - Ground and bond containers during transfer

Personal Protection

- If high level of fumes are present during a spill, ventilate area before entering
- Wear other required PPE, as appropriate

First Aid

- **Eyes**
    - Flush eyes immediately with fresh warm water (40C-45C) for 15 minutes holding lids open
    - Get medical attention if irritation persists
- **Skin**
    - Wash contaminated area with plenty of mild soap and water for 15 minutes. Remove contaminated clothing
    - If irritation occurs and persists, obtain medical attention
- **Inhalation**
    - Move exposed person to fresh air. Additional First Aid treatment is not usually required
    - Administer oxygen therapy, if necessary and/or obtain medical assistance
    - WHEN OXYGEN IS IN USE, ENSURE NO SMOKING
- **Ingestion**
    - Remove dentures, if any, and rinse with water. Rinse out mouth with water
    - If swallowed, DO NOT INDUCE VOMITING. Get immediate medical attention
    - If vomiting occurs, keep the head low to prevent product entering the lungs. Obtain medical attention

For Further Information Consult Product SDS

Appendix A13: **WASTE OIL – EMERGENCY RESPONSE**

Spill

- Isolate area, restrict access and evacuate if necessary
- Eliminate ignition sources though substance unlikely to ignite
- Spilled material make create a slipping hazard
- Advise Supervisor and/or SCC # (867) 393 5324/ (867) 393 5355
- Request assistance
- Attempt to limit product escape routes and shut off source – IF SAFE TO DO SO
- Contain and recover using appropriate sorbent materials and/or vacuum truck

Fire

- Isolate area, restrict access and evacuate if necessary
- Call Fire Department, advise supervisor and/or SCC # (867) 393 5324/ 393 5355 to request assistance
- Shut off fuel to fire, IF SAFE TO DO SO
- If qualified, extinguish with dry chemical extinguisher, CO_2, foam and/or H_20 fog. DO NOT use a direct stream of water as it may spread fire

Physical & Chemical Properties

Appearance:	Liquid. Colour will vary depending on composition
Odour:	Hydrocarbon
Flashpoint:	Will vary depending on composition. Unlikely to burn
Solubility in water:	Insoluble
Lower/Upper Explosive Limits:	Will vary
Vapour Density:	Will vary

For Further Information Consult Product SDS

14.0 WASTE MANAGEMENT

All equipment and/or material used in clean-up (e.g. used sorbents, oil containment materials etc.) must be disposed of in accordance with Environment Yukon requirements.

Accidental spills may produce special wastes (e.g., material with > 3% used oil) and contaminated soil. All waste disposal must comply with the *Yukon Special Waste Regulations* of the *Yukon Environment Act.*

Compliance with these regulations generally requires:

- Classification of the waste
- Packaging requirements (proper labeling and suitable storage containers)
- Transportation documentation
- All transporters must be properly trained
- Disposal in accordance with the regulations at an appropriate facility
- Spill reporting requirements must also be followed
- Waste sorbent material may not be disposed of in a landfill without prior approval from YTG Environment and the landfill operator.
- Contaminated soil must be treated and dealt with as required on a site specific basis and must comply with the requirements of the Yukon Contaminated Sites and Special Waste Regulations. At a minimum, the contractor must consider soil relocation agreement standards and obtain soil relocation permit as required.

Specific clean up requirements

Fuels and lubricants/Waste oil

After clean up, soiled sorbent materials will be placed inside an over pack or sealed metal drums and contained securely until organized special waste disposal can be coordinated.

Liquid wastes will be contained in a separate over pack or sealed metal drum.

Contaminated soils will be removed by an authorized contaminated soil receptor and transported to a land treatment facility.

All other products

All other products are to be contained in over packs or sealed metal drums separately from other products. Do not mix soiled materials. These materials are also to be picked up by Environment Yukon special wastes pick up, which occurs annually or another organized special waste disposal program at Yukon Energy. Contact the Manager of Environment for further information.

15.0 PLAN ADMINISTRATION

The following table must be filled out when changes are made to the plan.
YEC shall review the spill contingency plan annually and provide a summary of that review, including any revisions to the plan, as a component of the annual report.

Document Release and Revision History

Revision #	Revised Section/Page #	Purpose of Release: Details of Revisions/Amendments	Approved By:	Effective Date
00		New document	Director, Operations	May 2000
01	New cover page #1, #2	New cover page #1, added revision history page #2, updated contact info as required	Director, Operations	March 2004
02	Page #7, #10, #11, #12	Updated contact info as required & updated fuel day tank amounts	Director, Operations	May 2007
03	Pages 5,7, 8, and 11	Updated contact info and reporting chain as required	Manager, Environment	December 2009
04	All	Added site specific spill response procedures, updates contact information, added list of contractors for external resources, added resources at risk, updated on site spill response resources inventory. Added spill classification and clean-up plan. Added Spill Plan acknowledgement form, added sample incident report form. Added CFO to YEC reporting chain	Environmental Coordinator	June 20, 2012
05	Page #'s 6, 10-21, 24, 27, 31	Updated notifications, spill equipment inventory, contacts, site information and forms.	Environmental Coordinator	March 6, 2014
06	Page 3,5, 8,20,27, 35	Referenced Spill Safety Plan instead of Initial Incident Response Plan, Some general changes in wording to improve readability, added details about reporting, added spill response equipment located a Whitehorse Gas facility, added Aishihik Water License details, used the title Site Specific Hypothetical Scenarios. In Hypothetical scenarios changed sequence of response to correspond to proper action	Environmental Coordinator	August 13, 2015
07	Page 3, 4, 7, 11-22, 36	Removed mobile radio information, added map of radio coverage, updated contact flow chart, updated spill kit inventory lists, removed superfluous map of LNG plant	Environmental Coordinator	July 21, 2017
08	Pages, 4,6,7,11-13,16,18,21,22,24	Updated Radio map, purpose and scope, materials and equipment, equipment and services, contact directory, site plan, hazardous materials amounts	Env.and Resource Analyst	Sept 24, 2020

Name:	Signature:	Review Date:
VP, Operations		Nov 17/20
EMS Manager		Nov. 18/20

Distribution List- Via YEC EMS SharePoint

This document is a Yukon Energy Environmental Management System (EMS) Environmental Work Plan (EWP), A hard copy of this document must be maintained in the operational area to which it refers (e.g., hydro plant) and replaced after the annual document review or whenever a revision is made to the plan.

EXECUTIVE SUMMARY

WSP Canada Inc. conducted an air quality dispersion modelling and impact assessment for Yukon Energy Corporation's diesel-fuelled electricity generating facility in Faro, Yukon to evaluate the potential air quality impacts of increasing the facility capacity from the existing permitted capacity at 10.6 MW to 16 MW in the future. WSP understands that while the air quality assessment contained within in this report is based on an expanded facility capacity of 16 MW, Yukon Energy Corporation will only be applying for a permit amendment to allow up to 15.5 MW of capacity on site.

A total of five (5) criteria air contaminants were evaluated based on the emission characteristics of the facility genset engine and diesel fuel use - $PM_{2.5}$ PM_{10}, NO_2, SO_2, and CO. Three years (2016-2018) were modelled using the refined CALPUFF dispersion modelling system in accordance with the requirements of a comprehensive air quality dispersion modelling assessment as stipulated in the British Columbia Air Dispersion Modelling Guideline. To evaluate the facility compliance with the Yukon Ambient Air Quality Standards (YAAQS) and show the change in potential air quality impacts between the current and future operating conditions, two (2) modelling scenarios were considered in this air assessment:

1. Existing Permitted Emission Capacity Scenario (10.6 MW); and,
2. Future Expanded Emission Capacity Scenario (16 MW).

Both the existing and future permit scenarios were evaluated assuming maximum emissions from the facility's generators based upon maximum operating conditions and name-plate capacities. The modelling also conservatively assumed that all generators are emitting simultaneously and continuously at the name-plate capacity year-round.

Despite these conservative assumptions, the ambient air quality dispersion modelling results showed that, with the exception of short-term (1-hour) NO_2 results, the maximum cumulative predicted concentrations for all air contaminants ($PM_{2.5}$ PM_{10}, SO_2, and CO) were well below their respective ambient air quality criteria. The maximum points of impingement (worst-case receptors) were all found either near the Facility or outside the Town of Faro, in both scenarios. Overall, the cumulative predicted air contaminant concentrations from the Future Scenario were higher than those of the Existing Scenario given the increased power generation of the facility expansion.

While the dispersion modelling results predicted short-term NO_2 exceedances for both scenarios, the primary objective of the air quality assessment was to evaluate the potential risks on the human population residing near the facility (in the Town of Faro). The modelling results for the Existing Scenario at the maximally impacted receptor within the Faro Town showed that the cumulative predicted concentrations for all pollutants evaluated were in compliance with the YAAQS.

While the dispersion modelling predicted short-term (1-hour) NO_2 exceedances in the Future Scenario, the predicted air quality impacts for all the other air pollutants – including both fine and coarse particulate matter ($PM_{2.5}$ and PM_{10}), SO_2, and CO – were well below the YAAQS. With regards to the NO_2 predicted short-term (1-hour) NO2 exceedances, it is important to note that the YAAQS for NO_2 were reduced drastically in late 2019 from 401 µg/m^3 previously to 113 µg/m^3 presently. The maximum cumulative predicted 1-hour NO_2 concentrations from both existing and future permit scenarios would be well below the previous NO_2 criteria. When compared to the newly revised NO_2 YAAQS, the maximum cumulative predicted 1-hour NO_2 concentration was 129% of the Yukon Ambient Air Quality Standards for NO_2 at the maximally impacted Faro Town receptor in the Future Scenario. Moreover, the predicted 1-hour NO_2 exceedances were found spatially limited to a confined area surrounding the Facility areas on the outskirts of Faro, with a low frequency of occurrence of 0.21% of the time (56 hours out of 26,304 modelled hours) at the maximally impacted Faro Town receptor.

These short-term (1-hour) NO_2 exceedances were found entirely under calm stable meteorological conditions which typically hinder atmospheric dispersion; primarily during nighttime and in the colder months of the year; and, exclusively under west-northwest winds. Outdoor human activity would be limited during cold nighttime hours and this lowers the probability of human to be exposed to the short-term NO_2 impacts. Combined with the low frequency of model predictions exceeding the NO_2 YAAQS (56

hours out of 26,304 modelled hours),there is an even lower probability of exposure to levels above the YAAQS.

Finally, it is important to note that the modelling results represent the worst-case potential air quality impacts based upon the facility's maximum operating conditions. As such, the model predicted air contaminant concentrations are likely conservative. Furthermore, the conditions giving rise to predicted short-term NO_2 exceedances would be very unlikely to happen because the emission sources at the facility are highly unlikely to operate continuously year-round at the maximum possible emission rates, nor would it be likely that these maximum emissions coincide exactly with the particular meteorological conditions that give rise to the event as they occur, on average, for less than 20 hours per year modelled. The typical facility emissions are expected to be much lower and would not be anticipated to result in adverse air quality impacts given the low risk of predicted exceedance under even conservative assumptions. With model predictions indicating an extremely low risk of predicted short-term NO_2 impacts and low potential impacts from the other air pollutants, the overall air quality impacts from the future expanded facility are not anticipated to pose a significant risk to the Town of Faro and air quality would be anticipated to remain in compliance with YAAQS.

1 INTRODUCTION

WSP Canada Inc. (WSP) was retained by Yukon Energy Corporation (YEC) to perform an air dispersion modelling and impact assessment in support of its permit amendment pursuit with the Yukon Environmental and Socio-economic Assessment Board (YESAB) to increase capacity at the diesel-fuelled electricity generating facility in Faro, Yukon (the "Project" or the "Facility") from the existing permitted capacity of 10.6 MW to 16 MW in the future. WSP understands that while the air quality assessment contained within in this report is based on an expanded facility capacity of 16 MW, Yukon Energy Corporation will only be applying for a permit amendment to allow up to 15.5 MW of capacity on site.

While the existing permit allows the Facility to operate up to a capacity of 10.6 MW, the Facility has been and is currently operating much below the permitted facility capacity of 10.6 MW with only two existing diesel generators on-site – specifically Mirrlees KV16 (Genset ID: FD1) and Caterpillar (CAT) 3612 (Genset ID: FD7). The existing FD1 and FD7 gensets have also been de-rated from their original nameplate capacity of 5.15 MW and 3.3 MW to 2.4 MW and 2.8 MW, respectively. Once expanded, the Facility will continue to operate the existing FD1 and FD7 at the de-rated 2.4 MW and 2.8 MW levels and the proposed facility capacity expansion of 16 MW would see the installation of additional six (6) CAT 3516C 1.8 MW diesel generators (Genset ID: YM20, YM21, YM22, YM23, YM24, and YM25).

Since there is no air dispersion modelling guideline in Yukon, the air dispersion modelling and impact assessment for the Project (the "Air Assessment") followed recommendations of the British Columbia Air Quality Dispersion Modelling Guideline (BC AQDMG, 2015)[1]. The dispersion modelling was completed following the requirements of a Level 3 Comprehensive Assessment as defined by the BC AQDMG and was conducted using the refined dispersion model called CALPUFF.

The following sections describe the assessment methodology and inputs employed in the dispersion modelling, as well as the model prediction results and findings evaluated for two modelling scenarios - representing the existing permitted and future expanded facility capacities.

2 AIR QUALITY CRITERIA

Based on the emission characteristics of the Facility's diesel generators, a total of five (5) key criteria air contaminants (CACs) were evaluated in the Air Assessment (Table 2-1). The current Yukon Ambient Air Quality Standards (YAAQS) used as the air quality criteria against which modelling results are assessed. Since there are no YAAQS established for Carbon Monoxide (CO), the ambient air quality objectives from the nearest jurisdiction – British Columbia, are chosen as the air quality criteria for CO in this Air Assessment.

It should be noted that the YAAQS were revised by the Yukon Government Department of Environment recently on October 23, 2019[i], to follow the new and more stringent Canadian Ambient Air Quality Standards (CAAQS) adopted by the Canadian Council of Ministers of the Environment (CCME) to drive air quality improvements across the country. In particular, both CAAQS and YAAQS reduced the 1-hour NO_2 Standard drastically from 401 µg/m^3 previously to 113 µg/m^3 presently.

Table 2-1 Air Quality Standards for Air Contaminants Evaluated

Air Contaminant	Jurisdiction	Ambient Air Quality Standard (µg/m^3)		Statistical Form of Standard
Particulate Matter Fine ($PM_{2.5}$)	Yukon	24-Hour	27	The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations.
	Yukon	Annual	8.8	The 3-year average of the annual average of all 1-hour concentrations.
Particulate Matter Coarse (PM_{10})	Yukon	24-Hour	50	The maximum 24-hour block average concentration.
Nitrogen Dioxide (NO_2)	Yukon	1-Hour	113	The 3-year average of the annual 98th percentile of the daily maximum 1-hour average concentrations.
		Annual	32	The average over a single calendar year of all 1-hour average concentrations.
Sulphur Dioxide (SO_2)	Yukon	1-Hour	183	The 3-year average of the annual 99th percentile of the daily maximum 1-hour average concentrations.
		Annual	13	The average over a single calendar year of all 1-hour average concentrations.
Carbon Monoxide (CO)	British Columbia	1-Hour	14,300	The maximum 1-hour block average concentration.
		8-Hour	5,500	The maximum 8-hour block average concentration.

3 BASELINE AIR QUALITY

Baseline air contaminant concentrations are determined in dispersion modelling assessments in order to provide a complete indication of cumulative impacts to air quality. In this context, the BC AQDMG states that "baseline" is meant to be the concentrations due to emissions from both natural and anthropogenic sources. In other words, it is intended to be the result of the contribution from all sources except the source(s) being modelled. To evaluate compliance against the YAAQS, selected baseline air quality concentrations for the Town of Faro are added to the dispersion model predictions resulting in a predicted cumulative air contaminant concentration.

It is common practice to determine the baseline from historical air quality monitoring data within the modelled airshed. Continuous ambient air quality monitoring data is only available from one station in Yukon located in Downtown Whitehorse (the "Whitehorse AQ Station") and operated by Yukon's Department of Environment as part of Canada's National Air Pollution Surveillance (NAPS) program (NAPS ID: 119004). This station continuously monitors NO_2, NOx and $PM_{2.5}$. To determine the baseline air contaminant concentrations, the most recent available three (3) years of NO_2, NOx and $PM_{2.5}$ monitoring data from the Whitehorse AQ Station were gathered and analyzed in accordance to the BC AQDMG. Due to the lack of SO_2 and CO monitoring in Yukon, the baseline concentrations for SO_2 and CO were not applied in this Air Assessment. The 24-hour PM_{10} baseline concentration were estimated by pro-rating the 24-hour $PM_{2.5}$ baseline concentrations with the ratio of PM_{10} to $PM_{2.5}$ YAAQS values for the 24-hour averaging period (1.85 based on 50 µg/m^3 to 27 µg/m^3).

Directly applying baseline air contaminant concentrations from the Whitehorse AQ Station would not appropriately represent the expected concentrations in the small Town of Faro since there are significantly greater anthropogenic activities and emission sources in Whitehorse. To better estimate baseline concentrations in Faro, the baseline concentrations calculated from the Whitehorse AQ Station were scaled based on the emissions inventories developed for each community in the previous YEC air assessment (SENES, 2011), as shown in Table 3-1. Specifically, the 2007 annual NO_2 emission in Faro was estimated to be 9.66 tonnes, as compared to 540.12 tonnes in Whitehorse, resulting in 1.8% as the Faro to Whitehorse percentage; for $PM_{2.5}$, 1.5% was computed as the percentage of Faro over Whitehorse using 7.3 tonnes of annual $PM_{2.5}$ emissions in Faro and 503.29 tonnes in Whitehorse.

As a way to substantiate the application of the emission estimates from 2007 in scaling baseline air contaminant concentrations for the current Air Assessment, the most recent available population figures from the Yukon Bureau of Statistics[2] were used to compare the community populations between and growth trends in Faro and Whitehorse. Table 3-2 below demonstrates the small population of Faro when compared to Whitehorse and the incremental change from the historical population counts in each community. This supports our assumption that anthropogenic emissions levels in Faro are a fraction of those in Whitehorse and would not have materially change from the 2007 inventory levels.

Table 3-1 Estimated Annual Community Emissions in 2007

Air Contaminant	Annual Emissions (tonnes/year)		Proportion (%) of Faro to Whitehorse Community Annual Emissions
	Whitehorse	Faro	
NOx (as NO_2)	540.12	9.66	1.8%
$PM_{2.5}$	503.29	7.30	1.5%

[2] *Yukon Bureau of Statistics. Yukon Census Historical Population 1901 to 2016. Retrieved from Government of Yukon website:* https://yukon.ca/sites/yukon.ca/files/ybs/fin-yukon-census-historical-population-1901-2016.pdf

Table 3-2 Comparison of Population Counts Between Faro and Whitehorse

Census Year	Population Counts		Proportion (%) of Faro to Whitehorse Population Counts
	Whitehorse	Faro	
2006	20,461	341	1.7%
2011	23,276	344	1.5%
2016	25,085	348	1.4%

Table 3-3 presents the summary of 2016-2018 baseline concentrations calculated from the Whitehorse AQ Station as well those estimated for Faro using the scaling methods described above. The estimated baseline concentrations for Faro were added to the dispersion modelling results to predict the cumulative air contaminant concentrations for the Air Assessment.

Table 3-3 Summary of Baseline Air Quality Concentrations

Air Contaminant	Averaging Time	Ambient Air Quality Standard ($\mu g/m^3$)	Statistical Form for Baseline Concentrations	Baseline Concentrations (2016-2018)			
				Whitehorse		Faro	
				$\mu g/m^3$	% of Criteria	$\mu g/m^3$	% of Criteria
NO_2	1-hour	113	The 3-year average of the annual 98th percentile of the daily maximum 1-hour average concentrations.	37.5	33%	**0.67**	**0.6%**
	Annual	32	The 3-year average of the annual average of all 1-hour concentrations.	6.0	19%	**0.11**	**0.3%**
PM_{10}	24-hour	50	The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations.	31.5	63%	**0.46**	**0.9%**
$PM_{2.5}$	24-hour	27	The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations.	17.0	63%	**0.25**	**0.9%**
	Annual	8.8	The 3-year average of the annual average of all 1-hour concentrations.	3.3	38%	**0.05**	**0.5%**

4 MODELLED EMISSIONS

4.1 MODELLING SCENARIOS

To evaluate the potential air quality impacts from the Facility's proposed expansion, two (2) modelling scenarios were compared in this Air Assessment:

1. Existing Permitted Emission Capacity Scenario (10.6 MW); and,
2. Future Expanded Emission Capacity Scenario (16 MW).

Both emission scenarios assumed that the generators are operating continuously at the maximum rated capacity. To reflect the worst-case air quality impacts from the Facility, the estimated model emission rates established for each emission scenario were applied to all hours during 2016-2018 modelling years. This conservative approach is common in air dispersion modelling assessments. It allows for emission sources to be assessed at maximum pollutant emission rates under all meteorological condition combinations to predict the potential worst-case air contaminant concentrations. However, it should be noted that this conservative assessment of potential air quality impacts did not account for seasonal load variations whereby the generators operate at or near full capacity for only a small portion of the year, during peak consumption periods, but most of the time operate well below their nameplate or total Facility capacity. The typical Facility emissions are expected to be much lower than the maximum possible emission rates modelled in this Air Assessment.

Table 4-1 summarizes the Facility capacity and genset configurations for the "Existing Scenario" and "Future Scenario". While the Facility has historically operated below the existing permit capacity of 10.6 MW using only two existing gensets (FD1 and FD7) that have been de-rated to 2.4 MW and 2.8 MW respectively, three (3) of the new CAT 3516C 1.8 MW diesel generators (Genset ID: YM20, YM21, YM22) were assumed to be added to the Existing Scenario to model emissions levels at the current permitted capacity. The Future Scenario evaluated a Facility capacity of 16 MW using the existing FD1 and FD7 combined with the six (6) new CAT 3516C 1.8 MW diesel generators (Genset ID: YM20, YM21, YM22, YM23, YM24, and YM25).

Table 4-1 Summary of Modelling Scenarios Evaluated for the Project

Modelling Scenario	Genset Configuration	Genset Unit Output and Facility Capacity
Existing Permitted Emission Capacity (Existing)	FD1 + FD7 + YM20 + YM21 + YM22	2.4 MW + 2.8 MW + 3 x 1.8 MW = **10.6 MW**
Future Expanded Emission Capacity (Future)	FD1 + FD7 + YM20 + YM21 + YM22 + YM23 + YM24 + YM25	2.4 MW + 2.8 MW + 6 x 1.8 MW = **16.0 MW**

4.2 SOURCE PARAMETERS AND MODELLED EMISSION RATES

The genset engine exhaust vents were simulated as vertically-oriented point or stack sources in the CALPUFF model. Table 4-2 below summarized the genset types and source characteristics modelled for the Project. The stack parameters were compiled from a combination of data sources, including manufacturer's specification sheets and drawings, as well as the previous YEC air assessment (SENES, 2011). Building downwash effects on these point sources was analyzed according to the genset configurations specified in Table 4-1 for each modelling scenarios using the Building Profile Input Program (BPIP-PRIME) as recommended by the BC AQDMG (2015). The buildings and structures digitized for the Facility are based on the facility layout drawings provided by YEC and genset enclosure drawings from the manufacturers.

To evaluate the potential worst-case air quality impacts resulting from the maximum possible emissions levels from both existing and future permit scenarios, all of the gensets considered in each scenario are conservatively assumed to be releasing simultaneously in a continuously emitting fashion. The new genset (CAT 3516C) emission rates were estimated using the greater of the maximum or name-plate operating capacity from the gensets manufacturer's specifications (such as full-load sustained output and emission performance data), or the applicable stationary combustion source emission factors from published reference documents (such as the United States Environmental Protection Agency's Compilation of Air Emissions Factors referred to as the AP-42). Emission estimates with respect to the existing gensets FD1 and FD7 were provided by YEC using stack sampling data from the previous YEC air assessment (SENES, 2011). The estimated pollutant emission rates and source characteristics modelled for each genset unit in this assessment are detailed in Table 4-2 below.

5 MODELLING METHODOLOGY

Air dispersion modelling was conducted following the methods recommended in the BC AQDMG (2015), which is referenced by *YESAB Proponent's Guide: Model Documentation Report* (2016) as an exemplary guideline for air dispersion modelling. The CALPUFF air dispersion modelling suite was used for assessing potential air quality impacts. CALPUFF is a suite of numerical models (CALMET, CALPUFF, and CALPOST) that are used in series to determine the potential impact of emissions in the vicinity of a source or group of sources.

Detailed three-dimensional meteorological fields were produced by the diagnostic computer model CALMET Version 6.5.0 (Level 150223), based on digital land use data and terrain data, as well as observed surface and upper air data that are available for the Project domain. In accordance with the BC AQDMG (2015), the most recent three years (2016-2018) of meteorological data were modelled in CALMET. The three-dimensional meteorological fields produced by CALMET were used by CALPUFF Version 7.2.1 (Level 150618), a three-dimensional, multi-species, non-steady-state Gaussian puff dispersion model that can simulate the effects of time and space varying meteorological conditions on air contaminant transport. Finally, post-processing utilities were used to post-process and summarize the modelling output from CALPUFF.

5.1 CALMET – METEOROLOGICAL MODELLING

CALMET Version 6.5.0 (Level 150223), associated with the latest CALPUFF System Version 7, was used to generate the meteorological fields for the time period from January 1, 2016 through December 31, 2018. The CALMET model was run in Observation-only mode. Surface weather observations were extracted from the nearest observational weather station situated at the international airport in Faro – "Faro (AUT)" station operated by Environment and Climate Change Canada (ECCC) (WMO ID: 71949). In addition, upper air soundings were retrieved from the only upper air station located in Yukon, namely the Whitehorse international airport station (WMO ID: 71964) – operated by NAV Canada – for meteorology in the vertical layers above the surface in order to resolve the three-dimensional meteorology in the CALMET modelling.

The meteorological data input and CALMET output for the modelling period was assessed following the Quality Assurance and Quality Control (QA/QC) procedures outlined in Section 9 of the AQDMG. A description of the CALMET modelling methodology and data sets follows.

The Universal Transverse Mercator (UTM, NAD 83) coordinate system was used for this model application. The CALMET domain for the Project was a 12 km by 12 km domain as presented in Figure 5-1. The CALMET model was run with a 200 m horizontal grid resolution. The modelling domain and grid resolution were chosen such that the main topographical features expected to influence the three-dimensional diagnostic meteorological fields around the Project are adequately captured.

5.1.1 OBSERVED METEOROLOGICAL DATA

Surface weather stations that record hourly meteorological data within the Project's CALMET domain include one station – "Faro (AUT)" – operated by ECCC (WMO ID: 71949). The available meteorological data collected from January 1, 2016 through December 31, 2018 at this surface station was used as input to the CALMET model executed in Observation-only mode. Upper air data from the Whitehorse international airport station (WMO ID: 71964) was retrieved for the aforementioned modelling period and used as secondary meteorological input to resolve three-dimensional meteorology in the CALMET modelling. The locations of these meteorological stations are displayed as part of Figure 5-1 below.

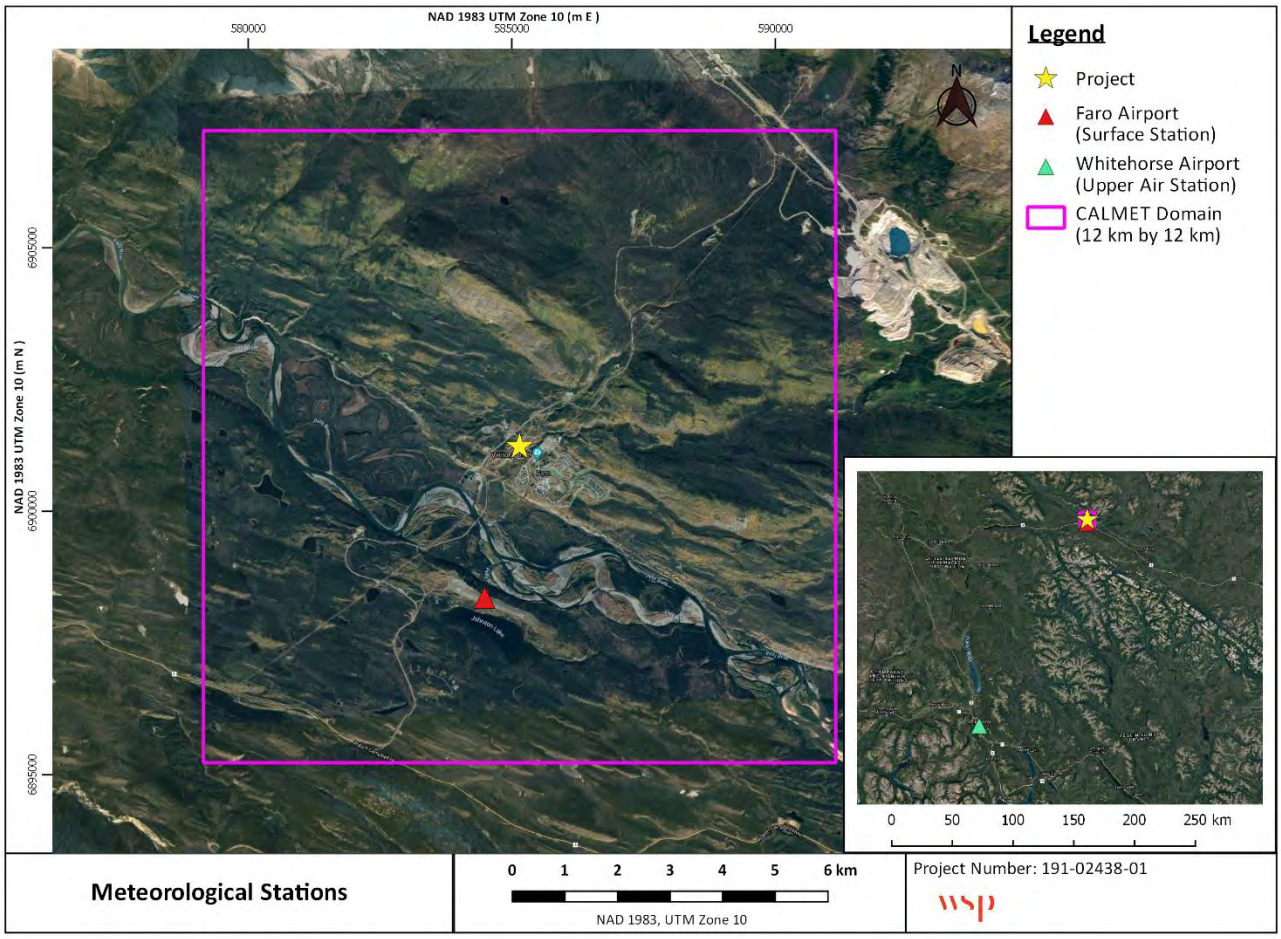

Figure 5-1 Meteorological Stations within CALMET Domain

CALMET requires a measured data value for every hour from at least one meteorological station in order to simulate the three-dimensional fields. Missing data procedures were implemented, when required, according to the AQDMG. The basic meteorological parameters required by the CALMET model were gathered from the surface station and prepared into a CALMET-ready surface data file (SURF.DAT) which includes the following meteorological parameters: wind speed, wind direction, temperature, relative humidity, and station pressure.

Figure 5-2 below illustrates the windrose compiled from the surface wind data observed at the airport in Faro from 2016 to 2018, which shows the prevailing wind patterns.

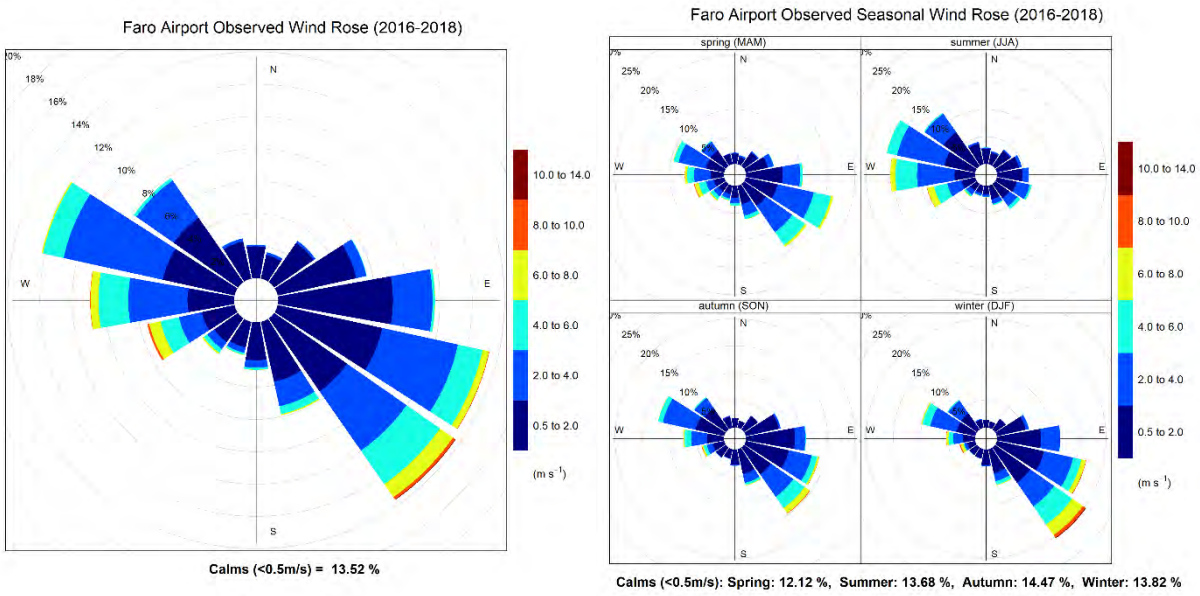

Figure 5-2 Windroses for the Surface Weather Station at Faro International Airport (2016-2018)

5.1.2 GEOPHYSICAL DATA – TERRAIN ELEVATION AND LAND USE

Digital terrain elevation and landuse data covering the CALMET model domain was used to simulate effects of the topography and landscape on the meteorological conditions in the model. In accordance with the AQDMG, the Canadian Digital Elevation Data (CDED) provided by Natural Resources Canada in a 1:50,000 scale was used to generate the terrain elevation inputs for each CALMET grid point, as well as the base elevations of the model emission sources and receptors. Land use characteristics for each grid cell were gathered from 2015 Canada Land Use dataset provided by Natural Resources Canada. Figure 5-3 and Figure 5-4 below show the terrain elevation and land use data used in the CALMET modelling.

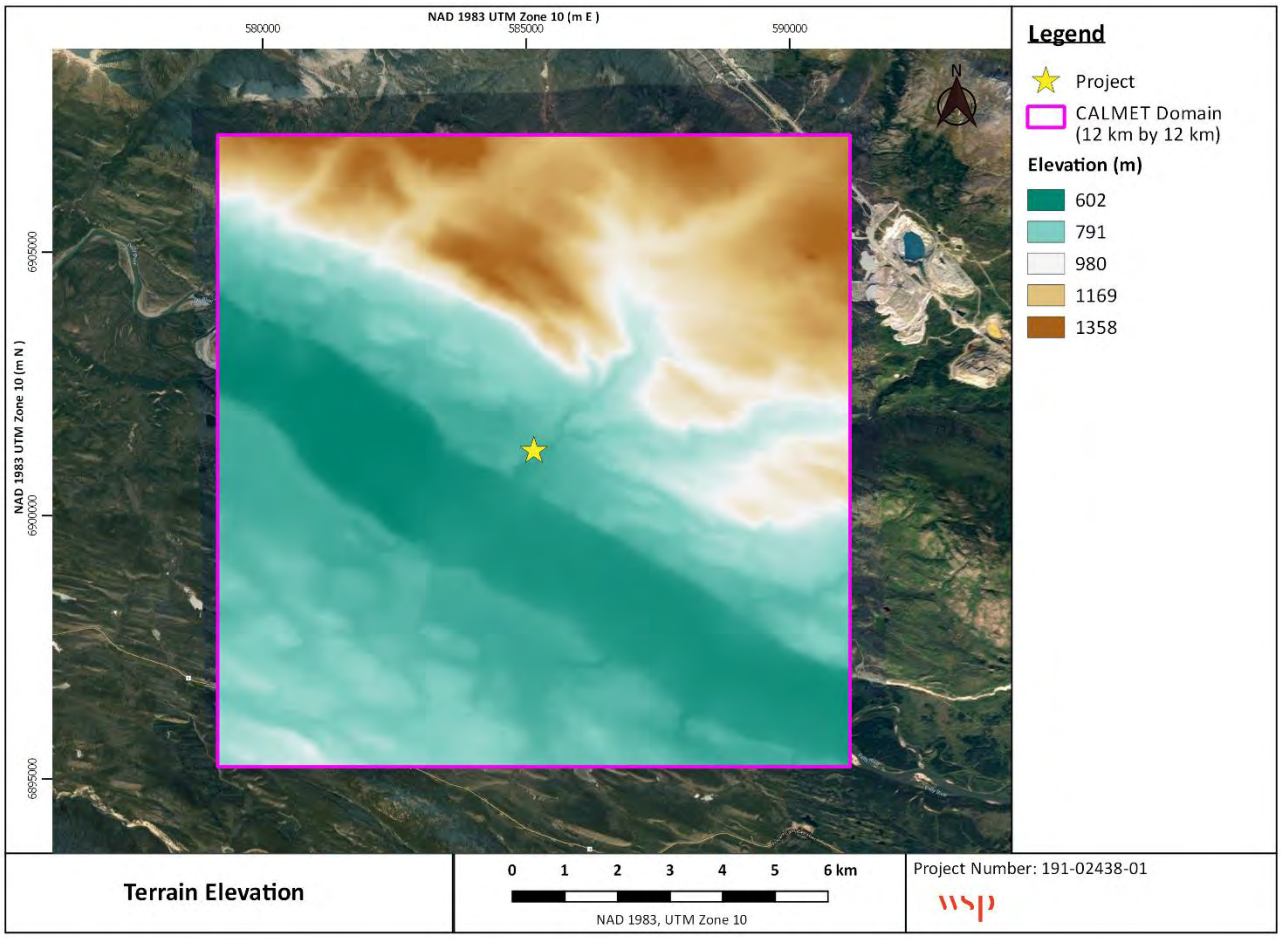

Figure 5-3 Terrain Elevation Data used in CALMET

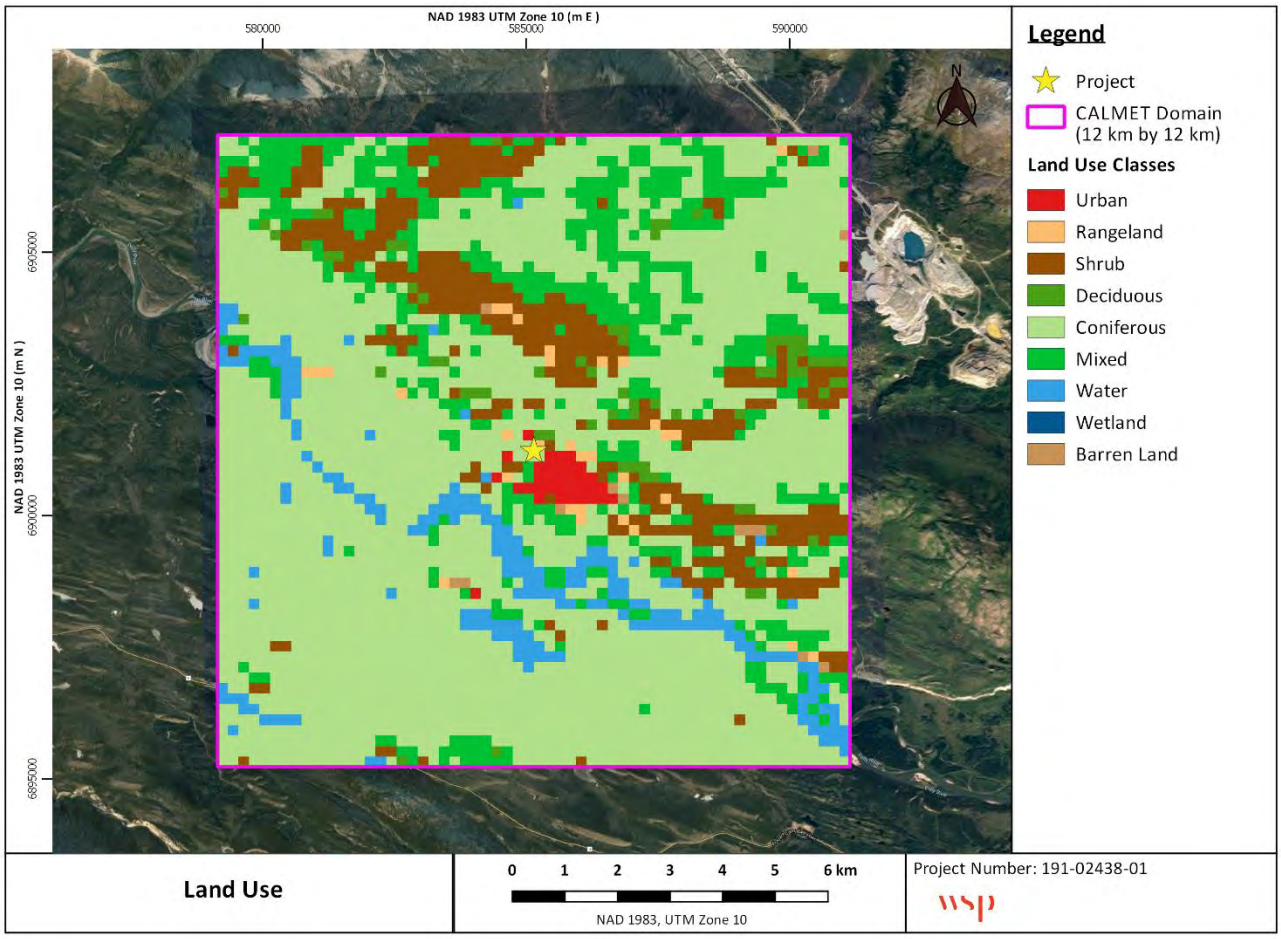

Figure 5-4 Land Use Data used in CALMET

Seasonal parameters were specified for each month based on the seasonal categories outlined in Table 5-1. According to the AQDMG, the seasonal categories are defined as follows:

- Season 1: Midsummer with lush vegetation
- Season 2: Autumn with cropland that has not been harvested
- Season 3: Winter 1, late autumn after frost, no snow on the ground
- Season 4: Winter 2, snow on the ground and subfreezing
- Season 5: Transitional spring with partially green short annuals

Table 5-1 Seasonal Categories for GEO.DAT used in CALMET

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Seasonal Category	4	4	4	4	4	5	1	2	2	3	4	4

5.1.3 CALMET MODEL SWITCHES

The CALMET model has a number of user-specified input switches that determine how the model handles terrain effects, interpolation of observational input data, and so forth. The differences in the modelled and measured meteorological fields were examined as part of QA/QC, and this analysis was utilized to refine and adjust the model options as appropriate. Table 5-2 outlines the options selected in CALMET modelling. The AQDMG default parameters were used wherever applicable.

Table 5-2 Selected CALMET Model Options

CALMET Model Switch	Parameter	Option Selected	BC AQDMG Default
Determines whether observation data are used, or in combination with NWP model output, or NWP data only	NOOBS	0 (Observation Only mode)	No default
Cloud Data Option: 1,2,3,4	MCLOUD	1 (Clouds data generated from surface observations)	No default
Wind field model selection variable	IWFCOD	1 (Yes)	✓
Compute Froude number adjustment effects?	IFRADJ	1 (Yes)	✓
Compute kinematic effects?	IKINE	0 (No)	✓
Use O'Brien procedure for adjustment of the vertical velocity?	IOBR	0 (No)	✓
Compute slope flows?	ISLOPE	1 (Yes)	✓
Extrapolate surface wind observations to upper layers?	IEXTRP	-4 (Extrapolate surface observations using similarity theory)	✓
Extrapolate calm winds aloft?	ICALM	1 (Yes)	No default
Layer-dependent biases	BIAS	-1, -1, -1, -1, -1, -1, -1, -1, -0.5, 0, 0, 0	No default
Minimum distance between upper air station and surface station for which extrapolation of surface winds will be allowed	RMIN2	-1	✓
Gridded prognostic wind field model output fields	IPROG	0 (No, do not use wind fields from MM5/3D.dat file as initial guess field)	✓
Time step (hrs) of the NWP output used as input data	ISTEPPGS	3600	✓
Use coarse CALMET fields as initial guess fields?	IGFMET	0 (Off)	✓
Use varying radius of influence?	LVARY	F (No, stations outside of RMAX1 are excluded)	✓
Maximum radius of influence over land of the surface layer	RMAX1	4.5 km	No default
Maximum radius of influence over land aloft	RMAX2	4.5 km (Set equal to RMAX1)	No default
Maximum radius of influence over water	RMAX3	Not used	No default
Minimum radius of influence used in the wind field interpolation	RMIN	0.1	✓
Radius of influence of terrain features	TERRAD	5 km	No default
Distance from a surface station at which the station observations and 1st guess field are equally weighted	R1	4 km	No default
Distance from an upper air station at which the observations and 1st guess field are equally weighted	R2	4 km (Set equal to R1)	No default
Relative weighting of the prognostic wind field data	RPROG	0	No default
Maximum acceptable divergence in the divergence minimum procedure.	DIVLIM	$5*10^{-6}$	✓

CALMET Model Switch	Parameter	Option Selected	BC AQDMG Default
Maximum number of iterations in the divergence minimum procedure.	NITER	50	✓
Number of passes in the smoothing procedure	NSMTH	2, 4, 4, 4, 4, 4, 4, 4, 4, 0, 0	✓
Maximum number of stations used in each layer for the interpolation of data to a grid point	NINTR2	99	✓
Critical Froude number	CRITFN	1	✓
Empirical factor controlling the influence of kinematic effects	ALPHA	0.1	✓
Multiplicative scaling factor for extrapolation of surface observations to upper layers	FEXTR2	Not used	✓
Number of barriers to interpolation of the wind fields	NBAR	0	✓
Level (1 to NZ) up to which barriers apply.	KBAR	10	✓
X and Y coordinates of barriers	XBBAR, YBBAR, XEBAR, YEBAR	Not used	✓
Diagnostic module surface temperature option	IDIOPT1	0 (Compute internally from hourly surface observations or prognostic fields)	✓
Diag module sfc station to use for the sfc temp (stn ID).	ISURFT	-1 (2-D spatially varying surface temperatures)	✓
Diagnostic module domain-averaged lapse rate option	IDIOPT2	0 (Compute internally from prognostic fields)	✓
Diagnostic module upper air station to use for lapse rate to use	IUPT	-1 (2-D spatially varying potential temperature lapse rate)	✓
Depth through which the domain-scale lapse rate is computed	ZUPT	200	✓
Initial guess field wind components	IDIOPT3	0 (Computed internally from observations or NWP output wind fields)	✓
Upper air station to use for domain-scale winds	IUPWND	-1 (Use 3-D initial guess fields)	✓
Bottom and top of layer through which the initial guess winds are computed	ZUPWND	1,1000	✓
Observed surface wind components for wind field module.	IDIOPT4	0 (Read wind speed and wind direction from SURF.DAT. DIAG.DAT not used.)	✓
Observed upper air wind components	IDIOPT5	0 (Read wind speed and wind direction from upper air data file UP.DAT. DIAG.DAT not used.)	✓
Use Lake Breeze Module?	LLBREZE	F (No, do not use Lake Breeze Module)	✓
# of boxes defining region	NBOX	Not used	✓
X Grid line 1 and line 2 defining the region of interest	XG1, XG2	Not used	✓
Y Grid line 1 and line 2 defining the region of interest	YG1, YG2	Not used	✓
X Point defining the coastline	XBCST	Not used	✓
Y Point defining the coastline	YBCST	Not used	✓

5.2 CALMET QA/QC

Section 9 of the AQDMG with respect to the CALMET/CALPUFF modelling QA/QC process were considered. Key results of the quality tests that were applied to the CALMET modelling are documented and presented in the sections below. The CALMET model outputs at the nearest CALMET grid point to the Project's emission sources were extracted and used to represent the Project and is referred to as the "Facility". In addition, the nearest surface meteorological station ("Faro Airport") was selected for this CALMET QA/QC analysis. Specifically, the observed meteorological data at Faro Airport was used to compare with the CALMET modelled meteorological data extracted at the nearest CALMET grid point to Faro Airport.

5.2.1 TEMPERATURE

Figure 5-5 shows the average monthly surface temperatures at observed and CALMET extracted points. Figure 5-6 shows the average hourly temperatures binned into hour intervals of a day. Both temporal plots show good agreement between the predicted and observed temperature values.

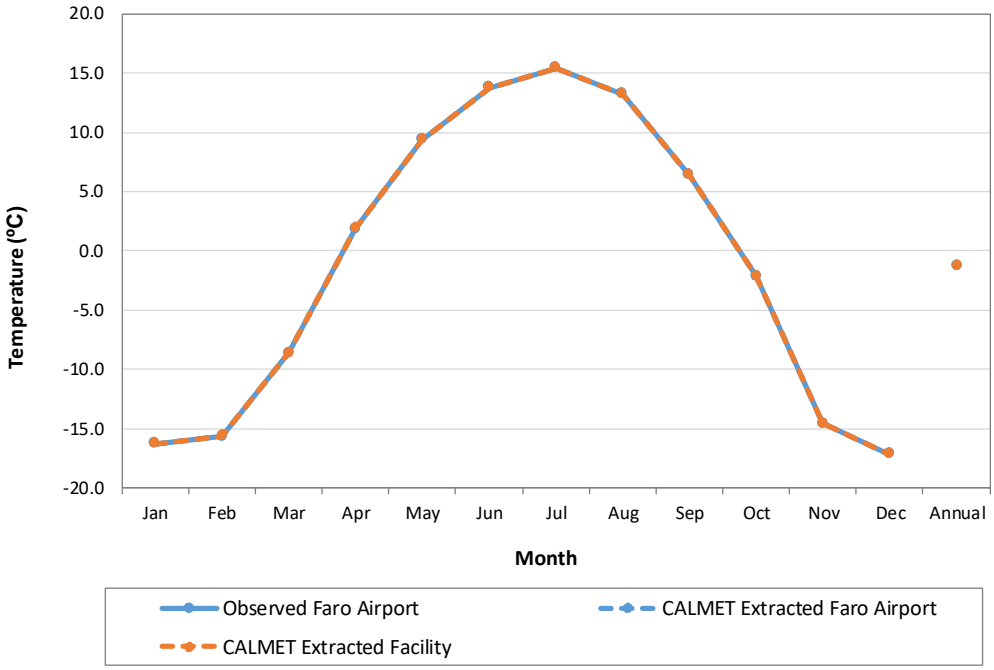

Figure 5-5 Monthly Temperature Variation

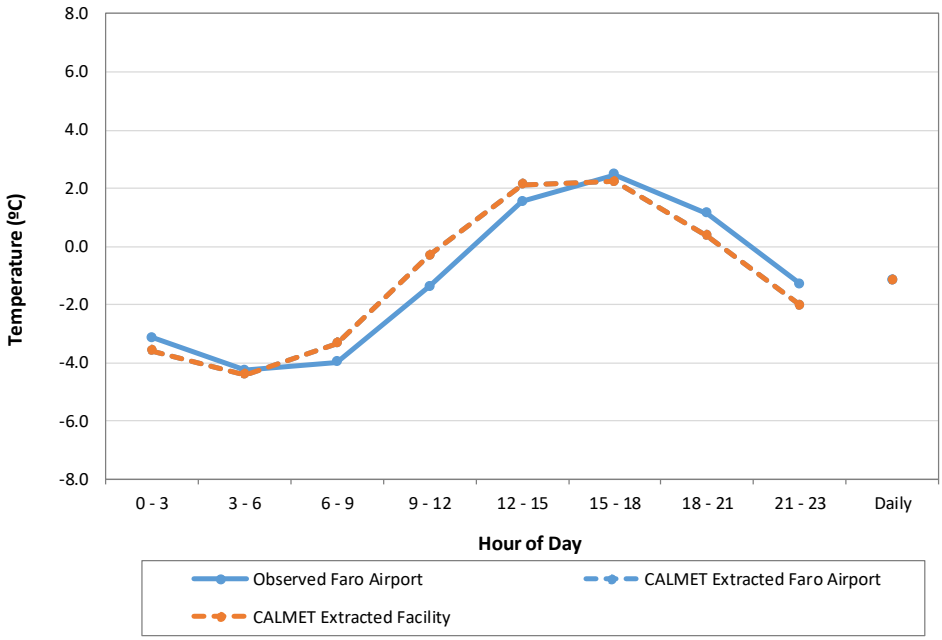

Figure 5-6 Diurnal Temperature Variation

5.2.2 WIND SPEED

The frequency distribution of wind speed at the observed and CALMET extracted points are shown below in Figure 5-7. The modelled wind speeds show good agreement with the observed wind speed data.

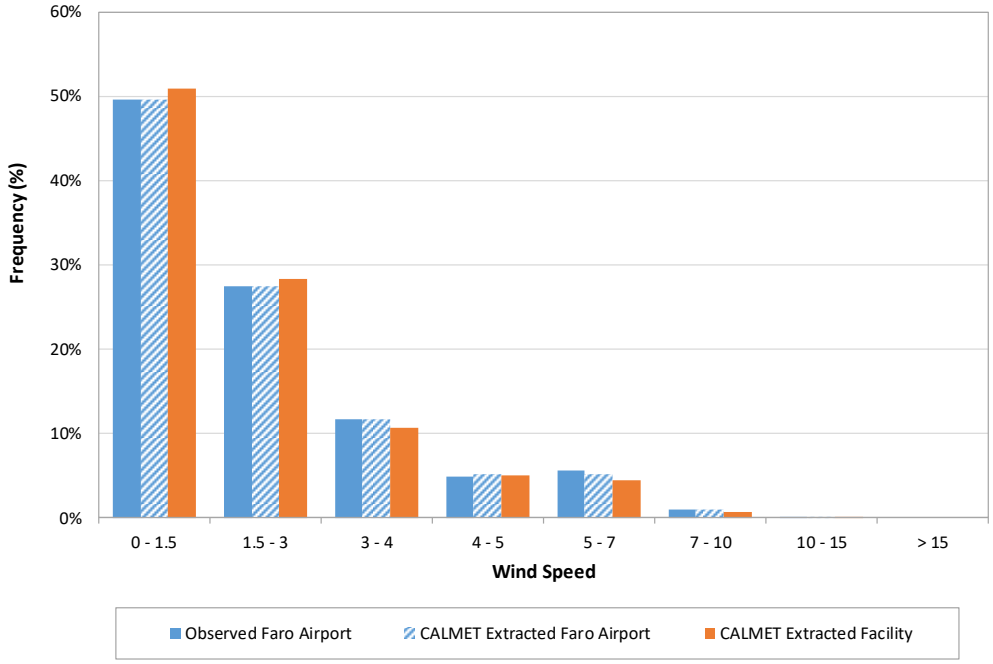

Figure 5-7 Wind Speed Frequency

5.2.3 WIND ROSE

The following figures show full-period and seasonal wind roses for the observed wind data at the selected surface meteorological station (Faro Airport), modelled CALMET wind data extracted at the nearest grid point to Faro Airport, and modelled CALMET wind data extracted at the nearest point to the Facility. The observed and modelled CALMET wind roses show good agreement at Faro Airport station. The wind roses indicate that the predominant winds are from the west-northwest, southeast, and east-southeast directions at Faro Airport station, and east and east-southeast directions at the Facility, which are expected considering the surrounding valley orientation shaped by the Pelly River.

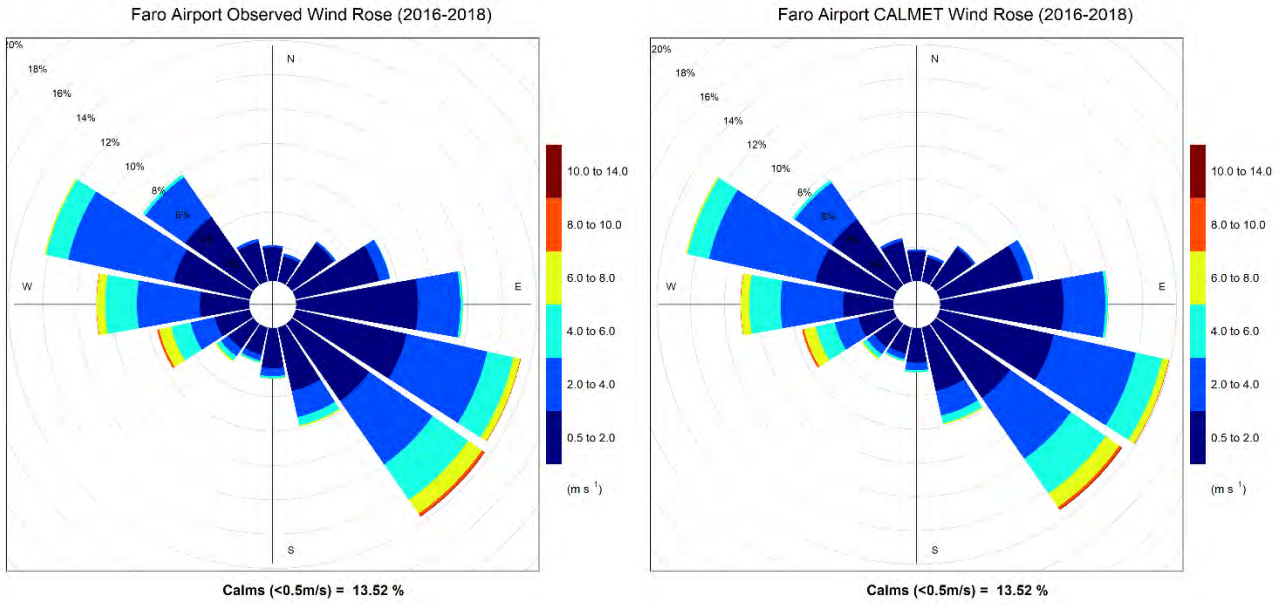

Figure 5-8 Wind Roses at Faro Airport Station

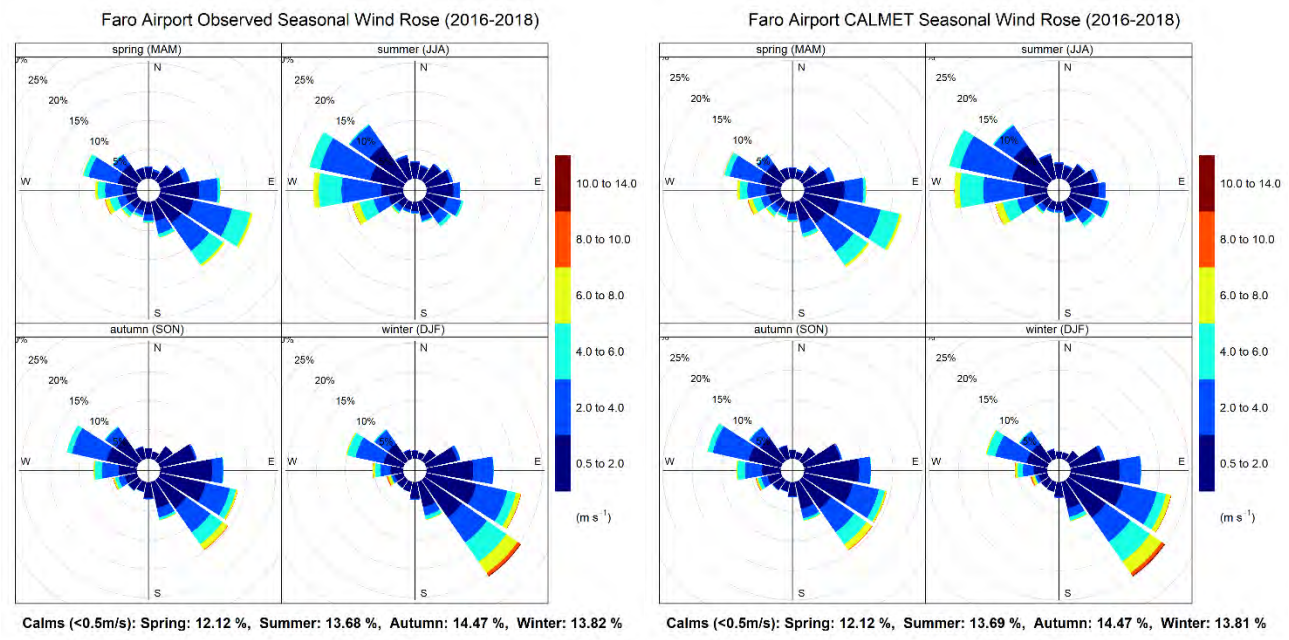

Figure 5-9 Seasonal Wind Roses at Faro Airport Station

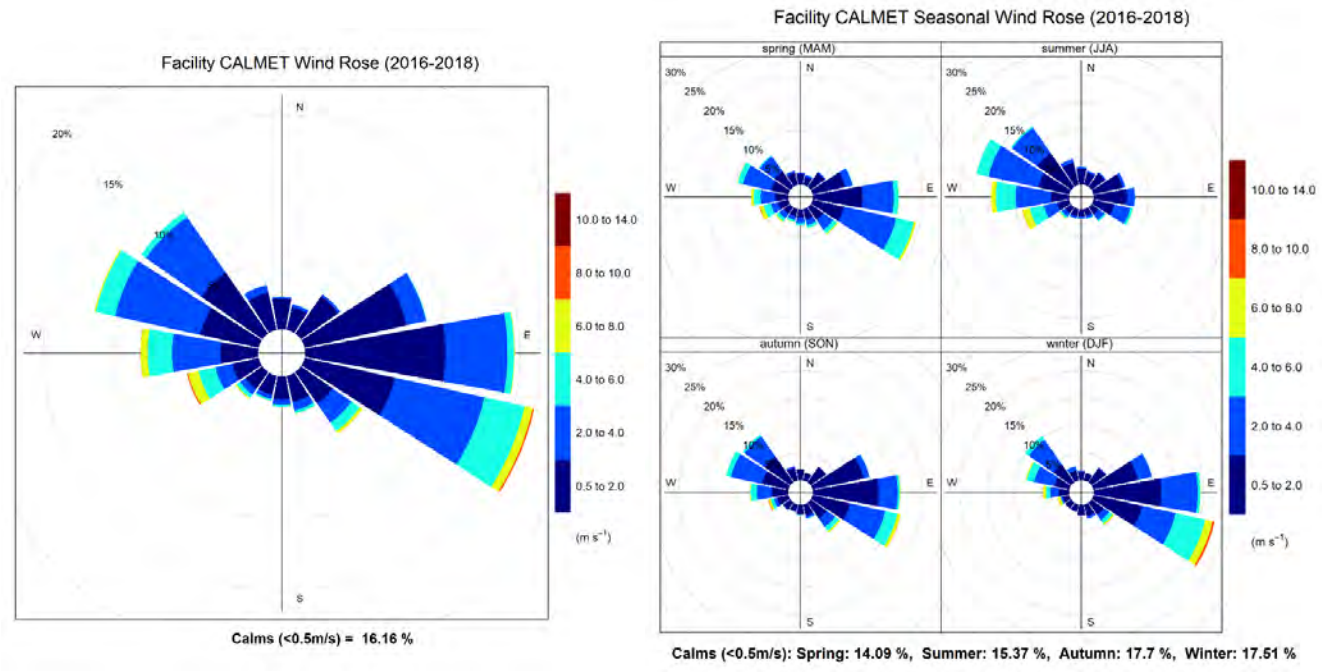

Figure 5-10 Annual and Seasonal Wind Rose at the Facility Location

5.2.4 ATMOSPHERIC STABILITY

Model predicted stability classes are provided in Figure 5-11. The distribution shows higher occurrences of neutral (stability class 4) and stable (stability class 6) conditions near to the Facility and Faro Airport station. There are no observations of atmospheric stability for comparison.

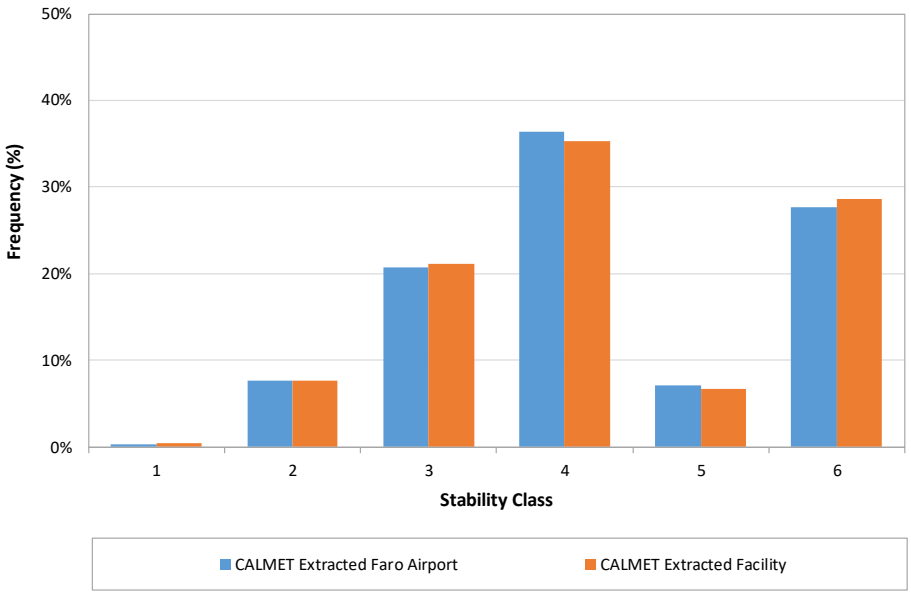

Figure 5-11 Frequency Distribution of Stability Classes

5.2.5 MIXING HEIGHT

Predicted mixing height statistics from CALMET meteorological outputs are below for selected CALMET extracted points. The monthly mixing height variation is shown in Figure 5-12. Figure 5-13 shows the diurnal mixing height variation, illustrating the expected pattern of increasing mixing heights during the daytime and decreasing mixing heights into the nighttime. Figure 5-14 shows the frequency distribution of all the mixing heights predicted by the CALMET model at the selected CALMET extract points. There are no observations of mixing height for comparison.

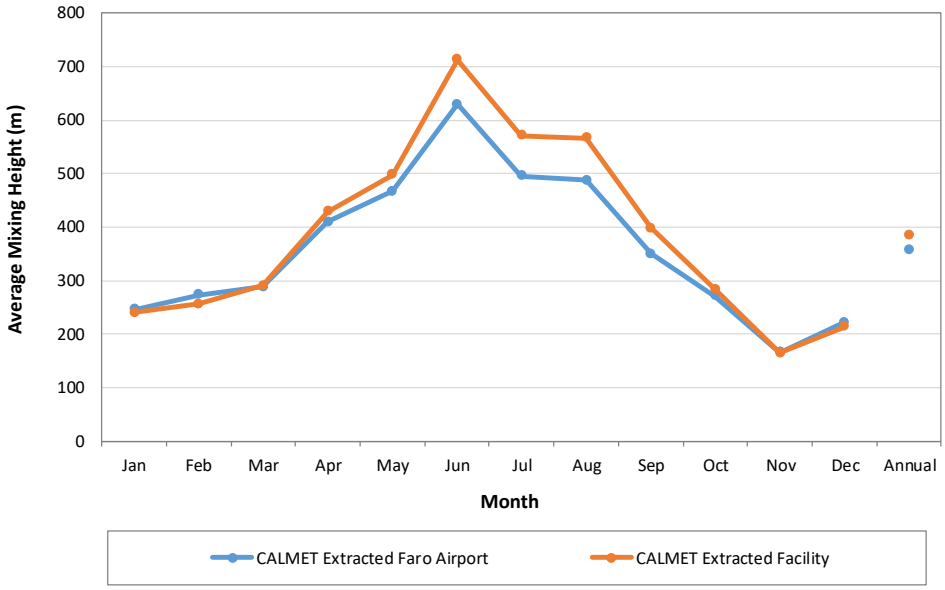

Figure 5-12 Monthly Mixing Height Variation

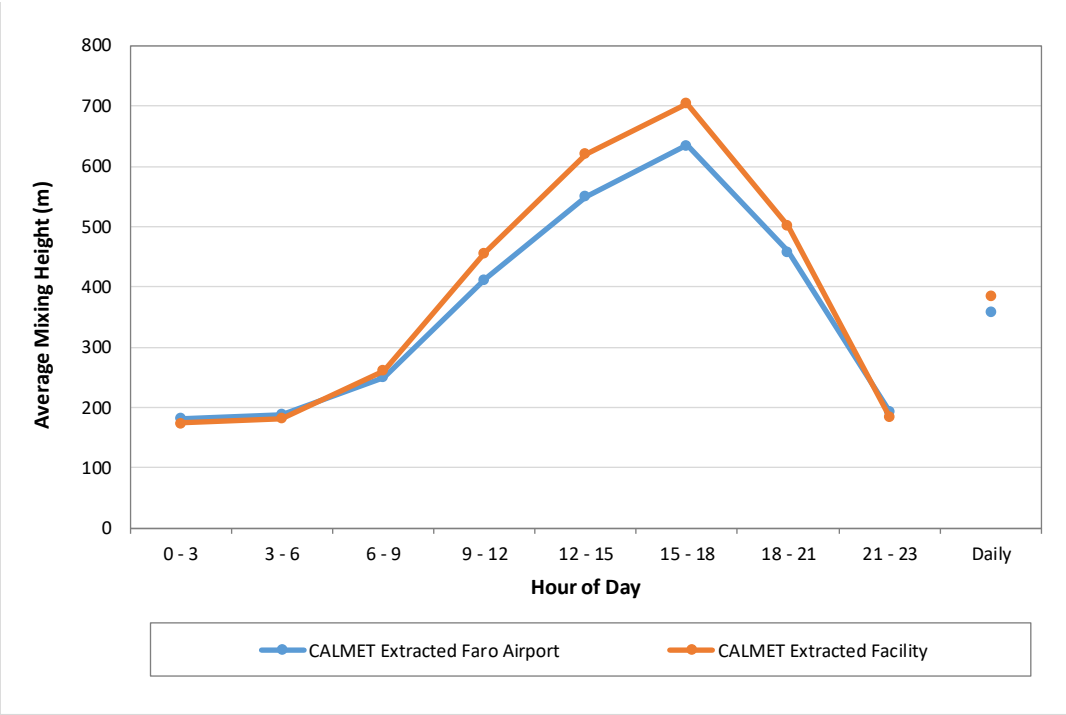

Figure 5-13 Diurnal Mixing Height Variation

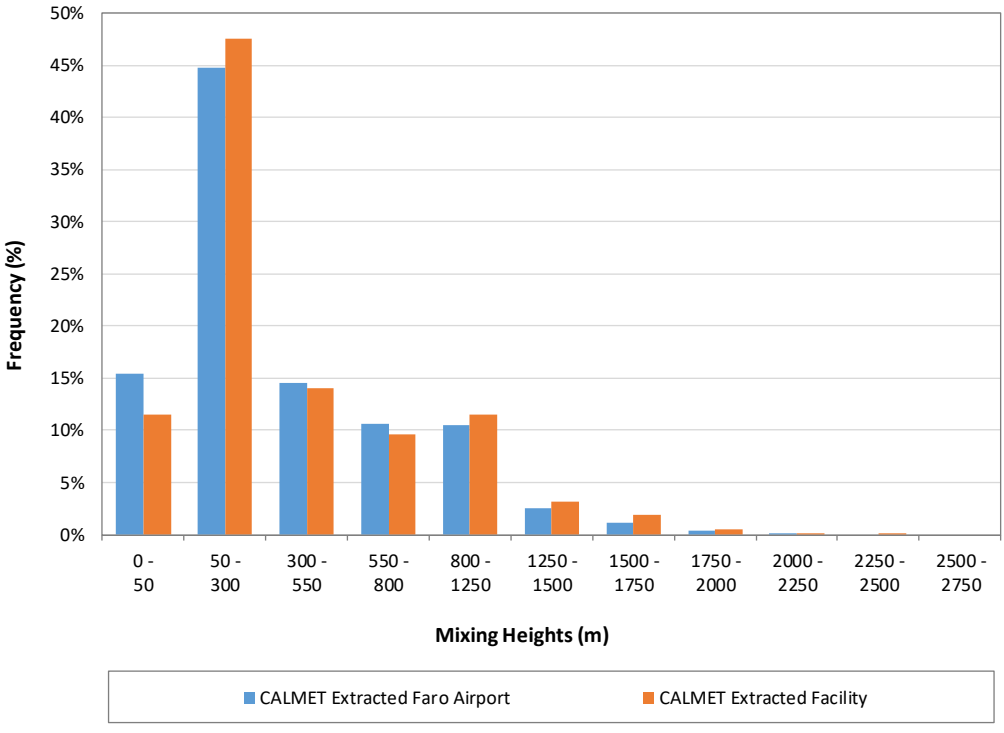

Figure 5-14 Mixing Height Frequency Distribution

5.3 CALPUFF – DISPERSION MODELLING

CALPUFF Version 7.2.1 (Level 150618) was executed for the three-year time period from January 1, 2016 through December 31, 2018. The CALPUFF model uses the meteorological fields generated from CALMET and simulates the dispersion of air emissions from the Project's point sources described in Section 4.

5.3.1 CALPUFF MODEL SWITCHES

Table 5-3 outlines the selected CALPUFF model options. Unless otherwise stated in Table 5-3, the AQDMG default parameters are used wherever applicable.

Table 5-3 Selected CALPUFF Model Options

CALPUFF Model Switch	Parameter	Option Selected	AQDMG Default
Vertical distribution used in the near field	MGAUSS	1 (Gaussian)	✓
Terrain adjustment method	MCTADJ	3 (Partial plume path adjustment)	✓
Subgrid-Scale complex terrain flag	MCTSG	0 (Not used)	✓
Near-field puffs modelled as elongated?	MSLUG	0 (No)	✓
Transitional Plume Rise modelled?	MTRANS	1 (Yes)	✓
Stack-tip downwash?	MTIP	1 (Yes)	✓
Method selected to compute plume rise for point sources not subject to downwash.	MRISE	1 (Briggs plume rise)	✓
Method used to simulate building downwash?	MBDW	2 (PRIME)	✓
Vertical wind shear modelled above stack top?	MSHEAR	0 (No)	✓
Puff splitting allowed?	MSPLIT	0 (No)	✓
Chemical Transformation Scheme?	MCHEM	0 (Not modelled)	✓
Aqueous phase transformation flag (only used in MCHEM =1 or 3)	MAQCHEM	Not used	✓
Wet removal modelled?	MWET	0 (No)	✓
Dry deposition modelled?	MDRY	0 (No)	✓
Gravitational settling (plume tilt)?	MTILT	0 (Not used)	✓
Method used to compute dispersion coefficients	MDISP	2 (Internally calculated)	✓
Sigma measurements used?	MTURBVW	Not used	✓
Back-up method used to compute dispersion when measured turbulence data are missing	MDISP2	Not used	✓
Method used for Lagrangian time scale for σy	MTAULY	0 (Lagrangian time scale)	✓
Advective-Decay timescale for turbulence	MTAUADV	0 (No turbulence advection)	✓
Method used to compute turbulence σv and σw profiles	MCTURB	1 (CALPUFF defaults)	✓
PG sigma y,z adjusted for roughness	MROUGH	0 (Yes)	✓
Partial plume penetration of elevated inversion?	MPARTL	1 (Yes)	✓
Partial plume penetration from buoyant area sources	MPARTLBA	Not used	✓
Strength of temperature inversion provided in PROFILE.DAT extended records?	MTINV	0 (No)	✓
Probability Distribution Function used for dispersion under convective conditions?	MPDF	1 (Yes)	✓
Sub-grid TIBL module used for shore line?	MSGTIBL	Not used	✓
Boundary conditions (concentration) modelled?	MBCON	0 (No)	✓
Configure for FOG Model output?	MFOG	0 (No)	✓
Test options specified to see if they conform to regulatory values?	MREG	0 (No)	✓
Minimum turbulence velocities, sigma v and sigma w for each stability class over land and water	SVMIN, SWMIN	CALPUFF defaults	✓

5.3.2 CALPUFF MODEL DOMAIN AND RECEPTORS

A 12 km by 12 km CALMET model domain and a 10 km by 10 km CALPUFF model domain were defined (Figure 5-15). Receptor grids were then produced for the Project following the instructions established by BC AQDMG (2015). Sensitive receptors - including health care facility, school, child care facility, nearest business and nearest residential location - were also identified and incorporated into the receptor grid. The names and locations of these sensitive receptors are displayed in Figure 5-15.

Model receptors were established according to the receptor spacing and extent requirements as set out in BC AQDMG within the CALPUFF domain. The model receptors created for the Project not only met the minimum requirements outlined in the BC AQDMG, but also included additional dense receptors at 50 m spacing placed over the entire Town of Faro to allow for more model predictions within the community. Receptors representing the sensitive human populations found nearby the Facility were also included in the model receptor grid.

The complete receptor grid used in CALPUFF were generated as follows and also presented in Figure 5-15 below:

- 20 m spacing along the Facility boundary (or Fenceline);
- 50 m spacing within 1.75 km of the Project stack locations, including those encapsulating the entire Faro Town area;
- 250 m spacing within 2 km of the Project stack locations;
- 500 m within 5 km of the Project stack locations;
- Nearest residence (situated approximately 380 m southeast of the Project);
- Nearest business (situated approximately 360 m east-southeast of the Project);
- Nearest child care facility (Bubble's Faro Daycare, situated approximately 785 m southeast of the Project);
- Nearest school (Del Van Gorder School, situated approximately 825 m southeast of the Project), and,
- Nearest health care facility (Faro Health Centre, situated approximately 860 m southeast of the Project).

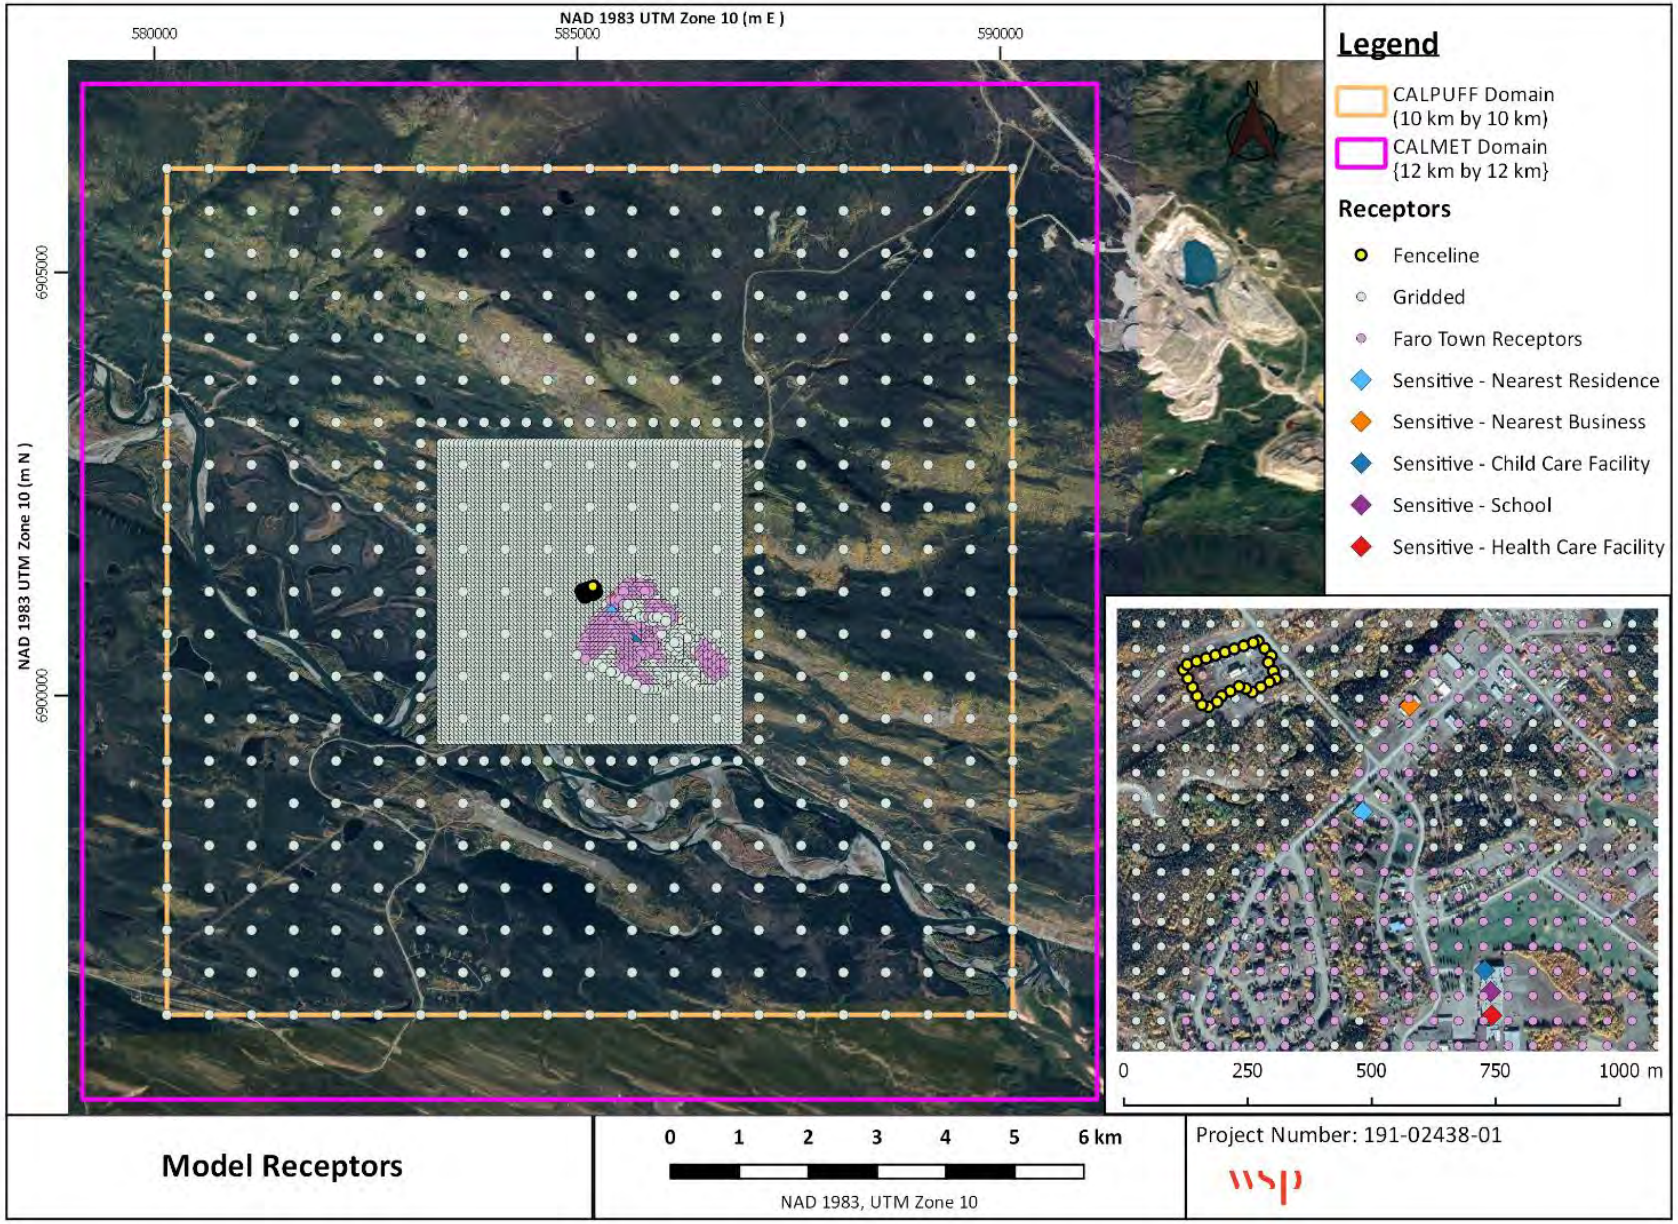

Figure 5-15 Modelled Receptors and Domains

5.3.3 BUILDING DOWNWASH

Buildings or other solid structures may impact air flows in the vicinity of a stack or point source due to the formation of turbulent eddies on the downwind side of the building. On the downwind side of a structure, a recirculating cavity of air forms and it does not mix with other air efficiently. This cavity has the potential to reduce plume rise and impact dispersion. The flow that is affected by the obstruction is known as the "wake".

The CALPUFF model accounts for building downwash with enhanced plume dispersion coefficients due to the turbulent wake and reduced plume rise caused by a combination of the descending streamlines in the lee of the building and the increased entrainment on the wake. Building downwash was considered in this Air Assessment using the US EPA Building Profile Input Program (BPIP-PRIME).

The buildings or structures and their corresponding heights included in the building downwash analysis using BPIP-PRIME are shown in Figure 5-16 and Table 5-4, respectively.

Table 5-4 Building and Structure Heights used in BPIP-PRIME

Building or Structure Name	Building ID	Building Height (m)
Diesel Fuel Tank #1	0	7.4
Diesel Fuel Tank #2	1	4.6
Building #1	2	2.6
FD7 Building	3	9.8
Building #2	6	3.0
FD1 Plant	7	8.9
Office	8	4.9
Control Building	9	4.3
Storage Building	10	5.3
YM20 Enclosure	11	4.0
YM21 Enclosure	12	4.0
YM22 Enclosure	13	4.0
YM23 Enclosure	14	4.0
YM24 Enclosure	15	4.0
YM25 Enclosure	16	4.0

Figure 5-16 Buildings and Structures included in BPIP-PRIME

5.4 NO_X TO NO_2 CONVERSION

As dispersion models only compute and output Nitrogen Oxides (NOx) concentrations, model predicted NOx concentrations need to be converted to NO_2 concentrations using estimation methods in order to compare and demonstrate compliance with the established NO_2 criteria. The regulatory NO_2 conversion methods outlined in BC AQDMG (2015) are conservative and were neither updated nor tested as appropriate for determination of compliance with the new CAAQS. It is generally accepted that with the more stringent NO_2 objectives recently adopted by CCME, that current AQDMG approaches to NOx to NO_2 conversion in dispersion modelling assessments will need to be further refined for most dispersion modelling assessments. Given the overly conservative nature of regulatory NO_2 conversion methods found in any Canadian jurisdictions at the current time, WSP applied the Janssen conversion method for the Project to allow for consistency with past YEC air assessments (SENES, 2011)[3].

[3] *SENES Consultants Limited (2011, October 20). Air Quality Assessment Update in Support of Permit Renewal for Diesel Generator Operations Prepared for Yukon Energy Corporation. Vancouver, British Columbia, Canada.*

The Janssen method is based on an empirically-derived relationship between the source-to-receptor distance and the resulting NO_2-to-NO_x conversion ratios which increases with distance from the source. These NO_2/NO_x conversion ratios are provided in Table 5-5 and applied to the modelled NO_x concentrations in order to estimate the NO_2 concentrations for both modelling scenarios as presented in the air dispersion modelling result tables under Section 6 of this report.

Table 5-5 NO_2/NO_x Conversion Ratios from the Janssen Method

Distance from Source (km)	NO_2/NO_x Conversion Ratios
0 – 1	0.05
1 – 2	0.14
2 – 3	0.19
3 – 4	0.25
4 – 5	0.29
5 – 6	0.33
6 – 7	0.37

6 POST-PROCESSING AND RESULTS

The CALPOST utility from the CALPUFF System Version 7 was used to post-process the CALPUFF dispersion modelling outputs for all air contaminants (NO_2, PM_{10}, $PM_{2.5}$, SO_2, and CO) according to the required statistical forms and averaging periods of the applicable ambient air quality criteria chosen for the Air Assessment (Section 2). The following sections outline the maximum predicted air contaminant concentrations resulting from the two modelling scenarios ("Existing Scenario" and "Future Scenario") defined under Section 4.1. Maximum predicted concentrations are presented in summary tables (Table 6-1 through Table 6-3), summarized by averaging periods (1-hour, 8-hour, 24-hour, and annual) and receptor types. The receptor types are categorized as follows:

- Maximum Point of Impingement (MPOI) – the receptor with the highest predicted ambient concentration across all modelled receptors;
- Faro Town – the receptor with the highest predicted ambient concentration within the Town of Faro;
- Nearest residence (situated approximately 380 m southeast of the Project);
- Nearest business (situated approximately 360 m east-southeast of the Project);
- Nearest child care facility (Bubble's Faro Daycare, situated approximately 785 m southeast of the Project);
- Nearest school (Del Van Gorder School, situated approximately 825 m southeast of the Project), and,
- Nearest health care facility (Faro Health Centre, situated approximately 860 m southeast of the Project).

The maximum predicted air contaminant concentrations from the Existing Scenario and the Future Scenario are outlined in Section 6.1 and Section 6.2, respectively. Tabular summarises of the model predictions at the MPOI for both modelling scenarios are provided in Table 6-1, while Table 6-2 and Table 6-3 present predictions at the sensitive receptors for the Existing and Future Scenarios, respectively. The tables present the total (cumulative) Project concentrations derived by summing the model predicted concentrations with baseline concentrations, where available, and are organized by modelling scenario (as per Table 4-1). Values highlighted in yellow indicate the occurrence of cumulative model predictions exceeding ambient air quality criteria.

In order to illustrate the magnitude compared to the ambient air quality standards considered, percentages of predicted concentrations relative to the applicable standard are also provided in the modelling results summary tables (Table 6-1 through Table 6-3). The spatial distribution and pattern of the dispersion modelling results are depicted by contour plots (isopleths) of maximum predicted concentrations for each air contaminant and averaging period in Figures Figure 6-1 to Figure 6-19. Where appropriate, frequency of exceedances of the applicable ambient air quality criteria are presented. A more in-depth analysis and discussion by each air contaminant are presented in the subsections below.

Table 6-1 Summary of Maximum Cumulative Modelling Results at the MPOI from both Emission Scenarios

AIR CONTAMINANT	AVERAGING PERIOD	AMBIENT AIR QUALITY STANDARD ($\mu g/m^3$)	JURSIDICTION	BASELINE CONCENTRATION		MAXIMUM CUMULATIVE MODEL PREDICTED CONCENTRATION AT THE MPOI			
						Existing Scenario		Future Scenario	
				Value ($\mu g/m^3$)	% of Criteria	Value ($\mu g/m^3$)	% of Criteria	Value ($\mu g/m^3$)	% of Criteria

6.1 RESULTS FOR EXISTING SCENARIO

The first modelling scenario considered the ambient air quality impact of the two existing gensets (FD1 and FD7) that have been de-rated to 2.4 MW and 2.8 MW respectively, and three (3) of the new CAT 3516C 1.8 MW diesel generators (Genset ID: YM20, YM21, YM22). The air dispersion modelling results for each air contaminant and averaging period are discussed below, along with the associated contour plots.

6.1.1 GASEOUS POLLUTANTS (SO_2, CO, AND NO_2)

Predicted concentrations of SO_2 and CO for both short-term and long-term averaging periods are very low compared to the ambient air quality criteria. As there was no ambient SO_2 nor CO data available near the Project location, baseline values were not calculated for these 2 air contaminants. As such, baseline air quality was not considered, and the predicted concentrations were found to be well below the ambient air quality criteria. In particular, the maximum predicted concentrations for each receptor category are as follows:

- SO_2
  - MPOI
    - 3.3 µg/m^3, or 2% of the 1-hour SO_2 YAAQS;
    - 0.2 µg/m^3, or 2% of the annual SO_2 YAAQS;
  - Faro Town
    - 1.84 µg/m^3, or 1% of the 1-hour SO_2 YAAQS;
    - 0.06 µg/m^3, or 0.4% of the annual SO_2 YAAQS;
  - Nearest Sensitive Receptors
    - range from 0.70 µg/m^3 to 1.00 µg/m^3 (0.4% to 0.5%) of the 1-hour SO_2 YAAQS; and,
    - range from 0.02 µg/m^3 to 0.04 µg/m^3 (0.2% to 0.3%) of the annual SO_2 YAAQS.
- CO
  - MPOI
    - 480.3 µg/m^3, or 3% of the 1-hour CO ambient air quality criteria;
    - 248.8 µg/m^3, or 5% of the 8-hour CO ambient air quality criteria;
  - Faro Town
    - 192.2 µg/m^3, or 1.3% of the 1-hour CO ambient air quality criteria;
    - 68.1 µg/m^3, or 1.2% of the 8-hour CO ambient air quality criteria;
  - Nearest Sensitive Receptors
    - range from 84.9 µg/m^3 to 115.5 µg/m^3 (0.6% to 0.8%) of the 1-hour CO ambient air quality criteria; and,
    - range from 35.7 µg/m^3 to 62.5 µg/m^3 (0.6% to 1.1%) of the 8-hour CO ambient air quality criteria.

These results indicate that the contribution of the emissions from the Existing Scenario to ambient SO_2 and CO is low. The contour plots (Figure 6-1 through Figure 6-4) show that the predicted concentrations decrease significantly with increased distance from the Facility.

As discussed in Section 5.4, the Janssen Method was used to convert model predictions from NO_x to NO_2 values. The resulting maximum predicted NO_2 concentrations exceed the YAAQS for the short-term averaging period (1-hour) and are well below the YAAQS for the long-term averaging period (annual) at the MPOI. Within the Town of Faro and at the sensitive receptors, the predicted NO_2 concentrations are predicted to be in compliance with the YAAQS. When baseline NO_2 concentration is considered, the cumulative NO_2 predicted concentrations at the various receptor types are as follows:

- MPOI
    - 160.3 µg/m^3, or 142% of the 1-hour NO_2 YAAQS;
    - 11.0 µg/m^3, or 34% of the annual NO_2 YAAQS;
- Faro Town
    - 98.1 µg/m^3, or 87% of the 1-hour NO_2 YAAQS;
    - 3.9 µg/m^3, or 12% of the annual NO_2 YAAQS;
- Nearest Sensitive Receptors
    - range from 29.8 µg/m^3 to 43.0 µg/m^3 (26% to 38%) of the 1-hour NO_2 YAAQS; and,
    - range from 1.1 µg/m^3 to 2.2 µg/m^3 (4% to 7%) of the annual NO_2 YAAQS.

Based on the spatial distribution as shown by the contour plots below (Figure 6-5 and Figure 6-6), exceedances were only predicted for the short-term averaging period (1-hour) and occur away from the receptors that have potential to impact the human population near the Project (i.e. Faro Town receptors). It is important to note that the observed pattern of predicted 1-hour NO_2 concentration distribution with “pockets” of higher concentrations further away from the facility is due to the discrete distance-based conversion methodology of the Janssen Method.

Oftentimes, predicted exceedances are found to occur infrequently, especially given the fact that there would be limited (if any) hours that the Facility is operating at the maximum capacity level. As such, a frequency of exceedance analysis was conducted to determine the number of modelling hours that are predicted to exceed the 1-hour NO_2 YAAQS at the MPOI (situated approximately 1 km east of the Facility center). The resulting percentage of frequency of exceedance, using the 98th percentile 1-hour NO_2 predictions, was determined to be 0.27% (71 hours) at the MPOI. Since the primary concern of air quality assessment is to evaluate the potential risks of the emissions resulting from the Future Scenario on the human population residing near the Project (i.e. at the Faro Town receptors), rather than at the point of maximum impingement, further investigation into determining patterns of the exceedances was not performed for this modelling scenario.

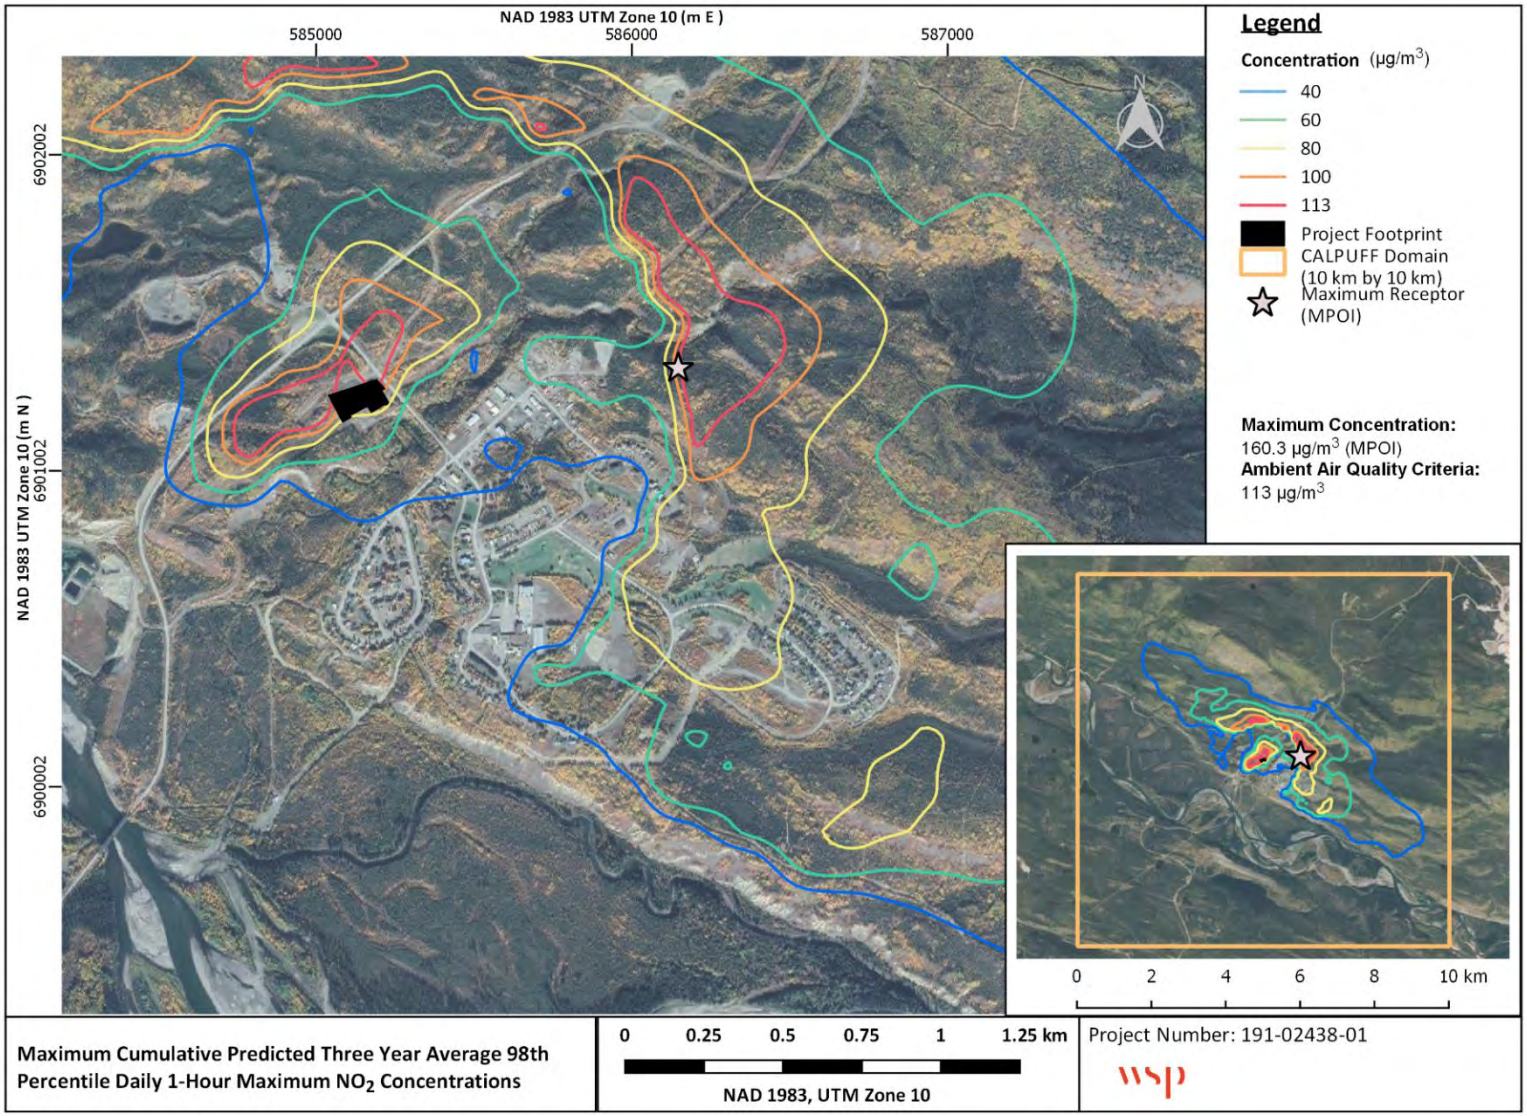

Figure 6-5 Contour Plot of Predicted 1-Hour NO_2 Concentrations for the Existing Scenario

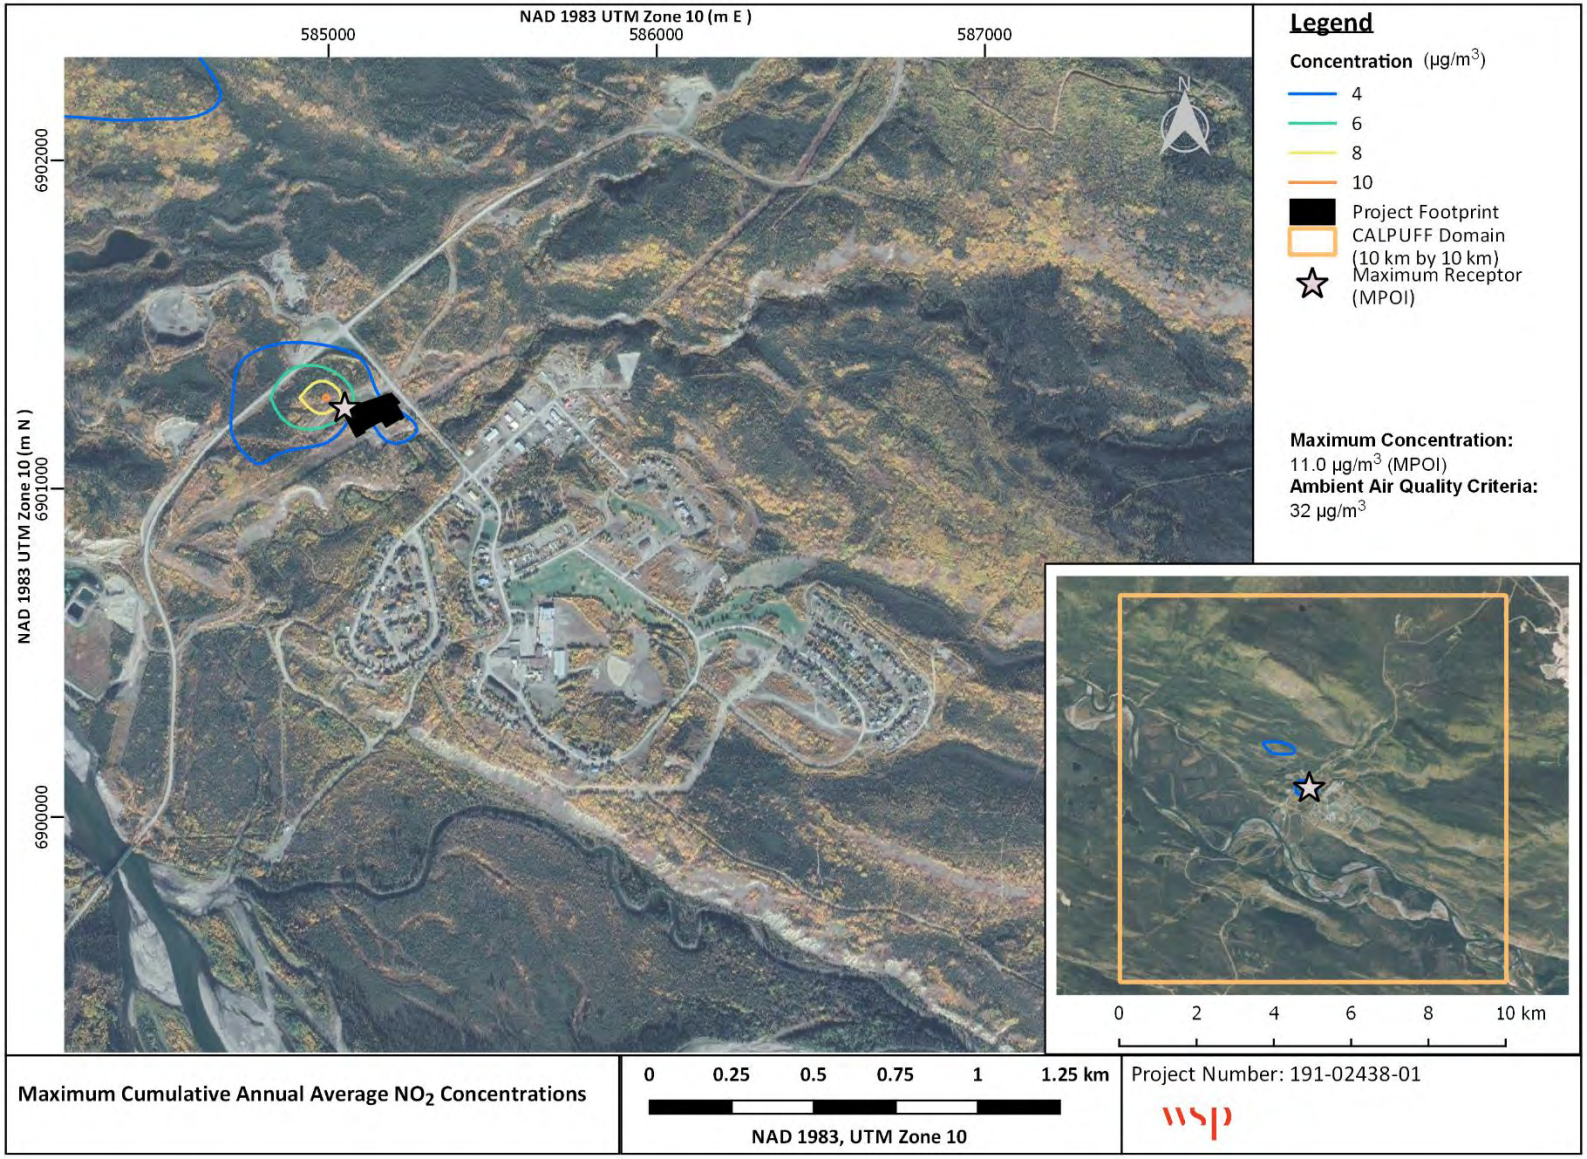

Figure 6-6 Contour Plot of Predicted Annual NO_2 Concentrations for the Existing Scenario

6.1.2 PARTICULATE MATTER ($PM_{2.5}$ AND PM_{10})

With regards to $PM_{2.5}$ and PM_{10}, the predicted concentrations for both short-term and long-term periods showed no exceedances of the associated air quality criteria. When baseline air quality is considered, the cumulative $PM_{2.5}$ and PM_{10} predicted concentrations remain well below the air quality criteria:

- PM_{10}
  - MPOI
    - 19.7 µg/m^3, or 39% of the 24-hour PM_{10} YAAQS;
  - Faro Town
    - 5.8 µg/m^3, or 12% of the 24-hour PM_{10} YAAQS; and,
  - Nearest Sensitive Receptors
    - range from 3.1 µg/m^3 to 4.9 µg/m^3 (6% to 10%) of the 24-hour PM_{10} YAAQS.
- $PM_{2.5}$
  - MPOI
    - 9.3 µg/m^3, or 34% of the 24-hour $PM_{2.5}$ YAAQS;
    - 1.6 µg/m^3, or 18% of the annual $PM_{2.5}$ YAAQS;
  - Faro Town
    - 2.5 µg/m^3, or 9% of the 24-hour $PM_{2.5}$ YAAQS;
    - 0.5 µg/m^3, or 6% of the annual $PM_{2.5}$ YAAQS;
  - Nearest Sensitive Receptors
    - range from 1.1 µg/m^3 to 1.7 µg/m^3 (4% to 6%) of the 24-hour $PM_{2.5}$ YAAQS; and,
    - range from 0.2 µg/m^3 to 0.4 µg/m^3 (2% to 4%) of the annual $PM_{2.5}$ YAAQS.

These results indicate that the contribution of the emissions from the Existing Scenario to ambient concentrations of particulate matter is low relative to YAAQS. In addition, the contour plots (Figure 6-7 through Figure 6-9) show the limited spatial distribution of predicted particulate matter concentrations, where the predicted concentrations decrease significantly with increased distance from the Facility

6.2 RESULTS FOR FUTURE SCENARIO

The second modelling scenario considered the ambient air quality impact of the two existing gensets (FD1 and FD7) that had been de-rated to 2.4 MW and 2.8 MW respectively, and six (6) new CAT 3516C 1.8 MW diesel generators (Genset ID: YM20, YM21, YM22, YM23, YM24, and YM25). The air dispersion modelling results for each air contaminant and averaging period are discussed below, along with the associated contour plots.

6.2.1 GASEOUS POLLUTANTS (SO_2, CO, AND NO_2)

Similar to the results of the Existing Scenario, the predicted concentrations of SO_2 and CO for both short-term and long-term averaging periods are very low compared to the ambient air quality criteria. As mentioned in Section 3, baseline values were not available for these two air contaminants, so the predicted values alone are presented below. The predicted concentrations were found to be well below the ambient air quality criteria, where the maximum predicted concentrations for each receptor category are as follows:

- SO_2
  - MPOI
    - 4.3 µg/m^3, or 2% of the 1-hour SO_2 YAAQS;
    - 0.3 µg/m^3, or 3% of the annual SO_2 YAAQS;
  - Faro Town
    - 2.40 µg/m^3, or 1.3% of the 1-hour SO_2 YAAQS;
    - 0.08 µg/m^3, or 0.6% of the annual SO_2 YAAQS;
  - Nearest Sensitive Receptors
    - range from 1.00 µg/m^3 to 1.33 µg/m^3 (0.5% to 0.7%) of the 1-hour SO_2 YAAQS; and,
    - range from 0.03 µg/m^3 to 0.06 µg/m^3 (0.2% to 0.5%) of the annual SO_2 YAAQS.
- CO
  - MPOI
    - 489.0 µg/m^3, or 3% of the 1-hour CO ambient air quality criteria;
    - 310.4 µg/m^3, or 6% of the 8-hour CO ambient air quality criteria;
  - Faro Town
    - 252.2 µg/m^3, or 1.8% of the 1-hour CO ambient air quality criteria;
    - 80.7 µg/m^3, or 1.5% of the 8-hour CO ambient air quality criteria;
  - Nearest Sensitive Receptors
    - range from 104.5 µg/m^3 to 144.8 µg/m^3 (0.7% to 1.0%) of the 1-hour CO ambient air quality criteria; and,
    - range from 45.6 µg/m^3 to 75.8 µg/m^3 (0.8% to 1.4%) of the 8-hour CO ambient air quality criteria.

These results indicate that the contribution of the emissions from the Future Scenario to ambient SO_2 and CO is low. The contour plots (Figure 6-10 through Figure 6-13) show that the predicted concentrations significantly decrease with increased distance from the Facility.

As discussed in Section 5.4, the Janssen Method was used to convert model predictions from NO_x to NO_2 values. The resulting maximum predicted NO_2 concentrations exceed the YAAQS for the short-term averaging period (1-hour) and are well below the YAAQS for the long-term averaging period (annual) at the MPOI. Within the Town of Faro, ambient NO_2 concentrations are predicted to exceed the YAAQS for the short-term averaging period (1-hour) but are well below the YAAQS for the long-term averaging period (annual). The predicted NO_2 concentrations are predicted to be in compliance with the YAAQS at all of the sensitive receptors. When baseline NO_2 concentrations (as defined in Section 3) is considered, the cumulative NO_2 predicted concentrations at the various receptor types are as follows:

- MPOI
    - 243.2 µg/m^3, or 215% of the 1-hour NO_2 YAAQS;
    - 18.3 µg/m^3, or 57% of the annual NO_2 YAAQS;
- Faro Town
    - 145.3 µg/m^3, or 129% of the 1-hour NO_2 YAAQS;
    - 5.7 µg/m^3, or 18% of the annual NO_2 YAAQS;
- Nearest Sensitive Receptors
    - range from 43.0 µg/m^3 to 62.3 µg/m^3 (38% to 55%) of the 1-hour NO_2 YAAQS; and,
    - range from 1.7 µg/m^3 to 3.4 µg/m^3 (5% to 11%) of the annual NO_2 YAAQS.

Based on the spatial distribution as shown by the contour plots below (Figure 6-14 and Figure 6-15), exceedances were predicted for the short-term averaging period (1-hour) only and were found scattered in a confined area surrounding the Facility and also on the outskirts of the Town of Faro. It is important to note that the observed pattern of predicted 1-hour NO_2 concentration distribution with “pockets” of higher concentrations further away from the Facility is due to the discrete distance-based conversion methodology of the Janssen Method.

To characterize the risk associated with the predicted 1-hour NO_2 exceedances, further analysis to evaluate and illustrate the magnitude and extent of these exceedances was performed to determine patterns and provide useful context to the predicted air quality impacts from the Facility’s maximum permitted levels. Since the primary concern of air quality assessment is to evaluate the potential risks on the human population residing near the Project (i.e. at the Faro Town receptors), rather than at the point of maximum impingement, further data analysis of the predicted short-term NO_2 exceedances were analyzed for the maximally impacted receptor within the Faro Town (shown by “Maximum Receptor (Faro Town)” in Figure 6-14)

Specifically, the predicted 1-hour NO_2 exceedances were analyzed for frequency of occurrence, temporal pattern, and meteorological conditions that were attributable to the elevated NO_2 predictions. The frequency of exceedance, using the 98th percentile of 1-hour NO_2 predictions, was determined to be 0.96% (253 hours) at the MPOI and 0.21% (56 hours) at the maximally impacted Faro Town receptor. Moreover, the predicted 1-hour NO_2 exceedances occur entirely under particular wind conditions (light winds predominantly from the west-northwest direction as depicted by Figure 6-16), which primarily follow the prevailing winds at the Facility (as extracted from the CALMET model, shown in Figure 5-10). In fact, based on Table 6-4, all of the predicted exceedances are found from wind directions between 290° and 310°, and low wind speeds (1-3 m/s). Furthermore, according to Table 6-5, the majority of the predicted exceedances (51 out of 56 exceeding hours) occur during the cooler months of the year (January through April and September through December) within the night-time hours (18:00 to 07:00), during which poor dispersion patterns such as temperature inversions and stagnant conditions are more likely to be observed.

6.2.2 PARTICULATE MATTER ($PM_{2.5}$ AND PM_{10})

With regards to $PM_{2.5}$ and PM_{10}, the predicted concentrations for both short-term and long-term periods showed no exceedances of the associated air quality criteria. When baseline air quality is considered, the cumulative $PM_{2.5}$ and PM_{10} predicted concentrations remain well below the air quality criteria:

- PM_{10}
  - MPOI
    - 24.1 µg/m^3, or 48% of the 24-hour PM_{10} YAAQS;
  - Faro Town
    - 6.9 µg/m^3, or 14% of the 24-hour PM_{10} YAAQS; and
  - Nearest Sensitive Receptors
    - range from 3.8 µg/m^3 to 5.6 µg/m^3 (8% to 11%) of the 24-hour PM_{10} YAAQS.
- $PM_{2.5}$
  - MPOI
    - 12.7 µg/m^3, or 47% of the 24-hour $PM_{2.5}$ YAAQS;
    - 2.2 µg/m^3, or 25% of the annual $PM_{2.5}$ YAAQS;
  - Faro Town
    - 3.1 µg/m^3, or 11% of the 24-hour $PM_{2.5}$ YAAQS;
    - 0.6 µg/m^3, or 7% of the annual $PM_{2.5}$ YAAQS
  - Nearest Sensitive Receptors
    - range from 1.4 µg/m^3 to 2.2 µg/m^3 (5% to 8%) of the 24-hour $PM_{2.5}$ YAAQS; and
    - range from 0.3 µg/m^3 to 0.5 µg/m^3 (3% to 6%) of the annual $PM_{2.5}$ YAAQS.

These results indicate that the contribution of the emissions from the Future Scenario to ambient concentrations of particulate matter is low relative to the YAAQS. In addition, the contour plots (Figure 6-17 through Figure 6-19) show that the predicted concentrations significantly decrease with increased distance from the Facility.

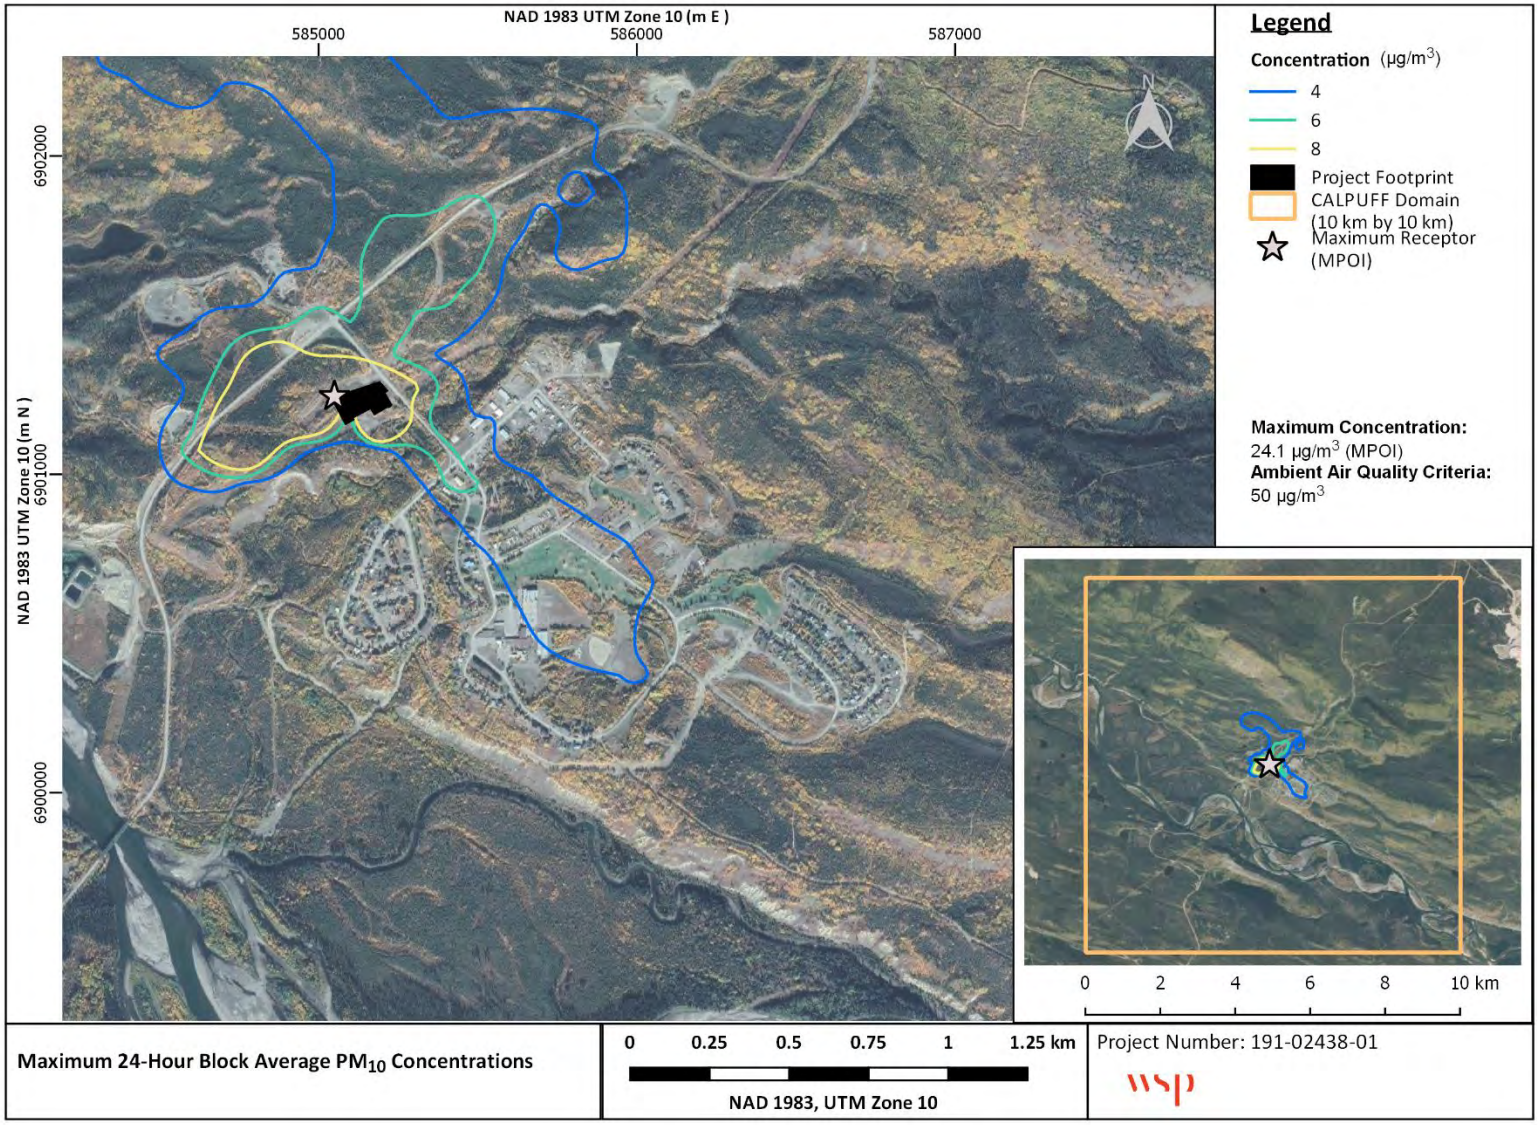

Figure 6-17 Contour Plot of Predicted 24-Hour PM_{10} Concentrations for the Future Scenario

Figure 6-18 Contour Plot of Predicted 24-Hour $PM_{2.5}$ Concentrations for the Future Scenario

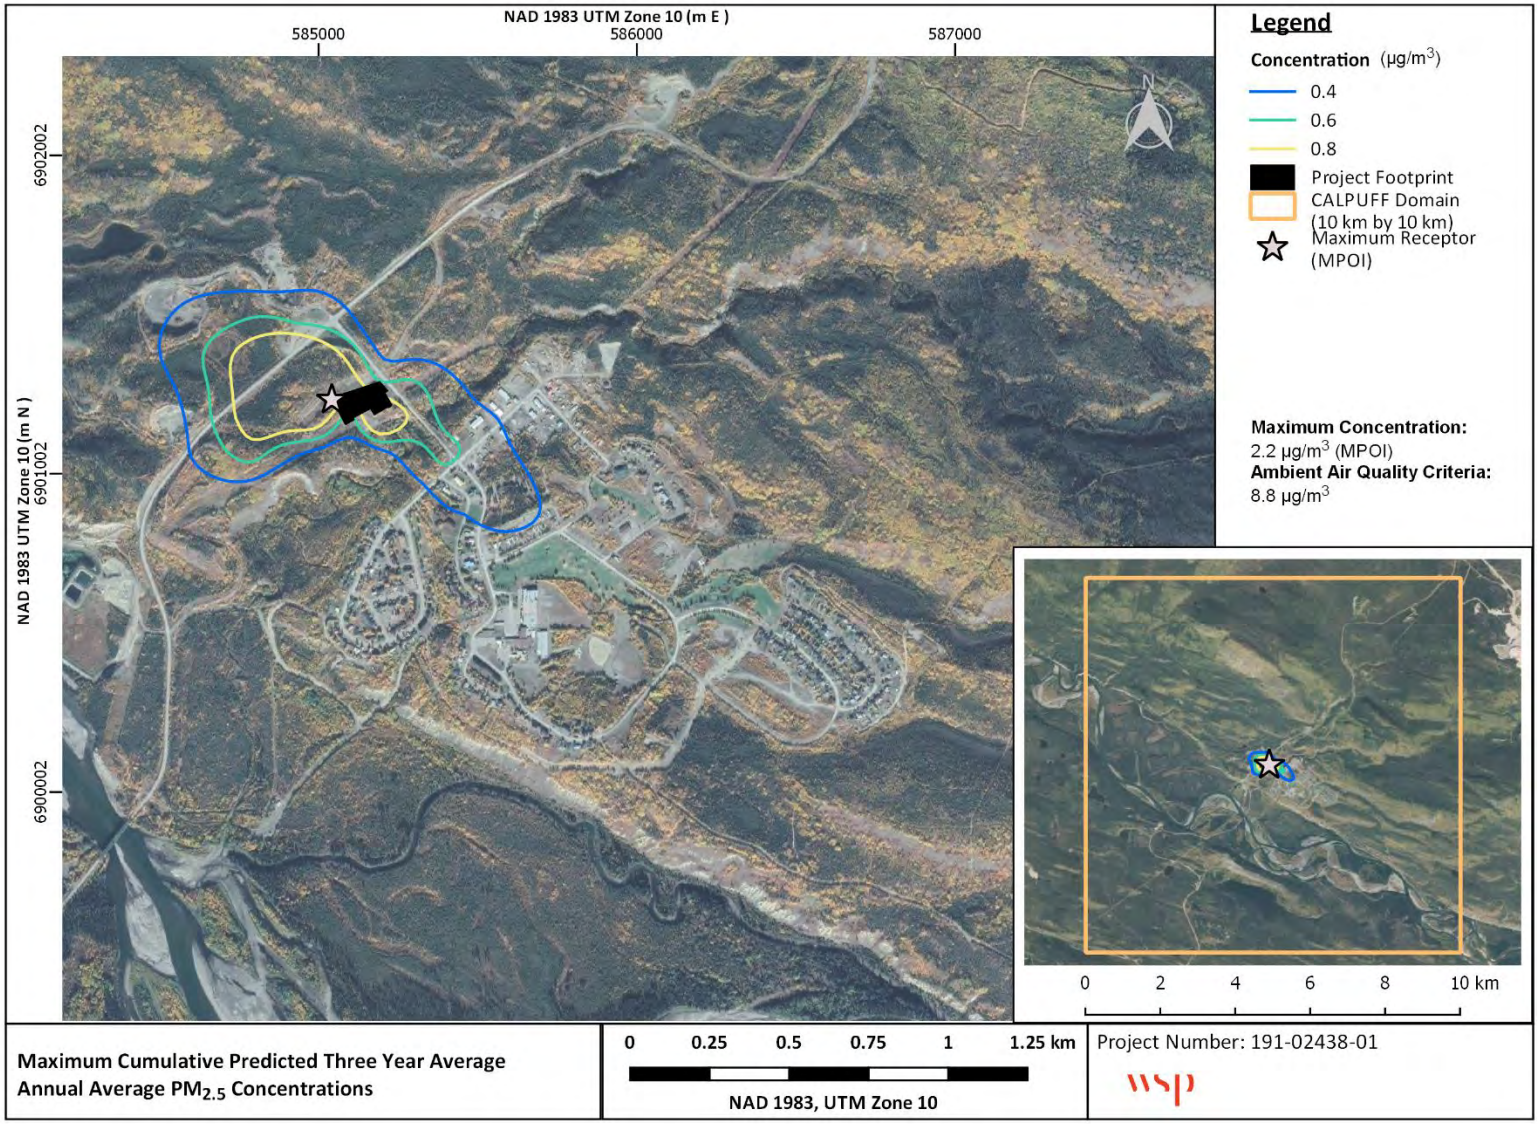

Figure 6-19 Contour Plot of Predicted Annual $PM_{2.5}$ Concentrations for the Future Scenario

7 CONCLUSION

The ambient air quality dispersion modelling results showed that, with the exception of short-term (1-hour) NO_2 results, the maximum total or cumulative predicted concentrations for all air contaminants ($PM_{2.5}$ PM_{10}, SO_2, and CO) were well below their respective ambient air quality standards. The maximum points of impingement (worst-case receptors) were all found either near the Facility or outside the Town of Faro, in both the existing and future permit scenarios. Overall, the cumulative predicted air contaminant concentrations from the Future Scenario were higher than those of the Existing Scenario given the increased power generation of the facility expansion.

While the dispersion modelling results predicted short-term NO_2 exceedances for both scenarios, the primary objective of the air quality assessment was to evaluate the potential risks on the human population residing near the facility in the Town of Faro. The modelling results for the Existing Scenario at the maximally impacted receptor within the Town of Faro showed that the cumulative predicted concentrations for all pollutants evaluated were in compliance with the YAAQS.

For the Future Scenario, the predicted air quality impacts for all the other air pollutants – including both fine and coarse particulate matter ($PM_{2.5}$ and PM_{10}), SO_2, and CO – were well below the YAAQS. With regards to the NO_2 predicted short-term (1-hour) NO_2 exceedances, it is important to note that the YAAQS for NO_2 were reduced drastically in late 2019 from 401 µg/m^3 previously to 113 µg/m^3 presently. The maximum cumulative predicted 1-hour NO_2 concentrations from both existing and future permit scenarios would be well below the previous NO_2 criteria. When compared to the newly revised NO_2 YAAQS, the maximum cumulative predicted 1-hour NO_2 concentration was 129% of the Yukon Ambient Air Quality Standards for NO_2 at the maximally impacted Faro Town receptor in the Future Scenario. Moreover, the predicted 1-hour NO_2 exceedances were spatially limited to a confined area surrounding the Facility and also on the outskirts of Faro, with a low frequency of occurrence of 0.21% of the time (56 hours out of 26,304 modelled hours) at the maximally impacted Faro Town receptor.

These short-term (1-hour) NO_2 exceedances were found entirely under calm stable meteorological conditions which typically hinder atmospheric dispersion; primarily during nighttime and in the colder months of the year; and, exclusively under west-northwest winds. Outdoor human activity would be limited during cold nighttime hours and this lowers the probability of human to be exposed to the short-term NO_2 impacts. Combined with the low frequency of model predictions exceeding the NO_2 YAAQS (56 hours out of 26,304 modelled hours),there is an even lower probability of exposure to levels above the YAAQS.

Finally, it is important to note that the modelling results represent the worst-case potential air quality impacts based upon the facility's maximum operating conditions. As such, the model predicted air contaminant concentrations are likely conservative. Furthermore, the conditions giving rise to predicted short-term NO_2 exceedances would be very unlikely to happen because the emission sources at the facility are highly unlikely to operate continuously year-round at the maximum possible emission rates, nor would it be likely that these maximum emissions coincide exactly with the particular meteorological conditions that give rise to the event as they occur, on average, for less than 20 hours per year modelled. The typical facility emissions are expected to be much lower and would not be anticipated to result in adverse air quality impacts given the low risk of predicted exceedance under even conservative assumptions. With model predictions indicating an extremely low risk of predicted short-term NO_2 impacts and low potential impacts from the other air pollutants, the overall air quality impacts from the future expanded facility are not anticipated to pose a significant risk to the Town of Faro and air quality would be anticipated to remain in compliance with YAAQS.

REFERENCE: **Page 4-10 and others** ***"assuming that rider F approximates zero effective July 1, 2021..."***

QUESTION:

a) Under what conditions would Rider F now not go to zero?

b) Under what conditions will Rider F be non-zero in the future?

c) Please provide a history of the changes to Rider F and corresponding fuel prices for the last 10 years.

ANSWER:

(a) and **(b)**

Rider F is non-zero when there is a requirement to recover added fuel price costs, or to refund fuel price savings, related to the Fuel Price Variance Account.

The Rider F rate is tied to the Fuel Price Variance Account (FPVA) balance that reflects thermal fuel price variances for YEC and AEY (Companies). The FPVA has a threshold of +/-$200,000. When the balance in the FPVA approaches or reaches the +/-$200,000 threshold, the Companies must inform the Board and interested parties of the Companies' intentions to implement a Rider F rate change to address the outstanding balance.

As indicated in response to CW-YEC-1-23 (a), (b) and (d), although, the actual balance of the Fuel Price Variance Account will depend on volume of actual thermal generation and fuel prices for YEC and AEY, the advisory filed by the companies on September 23, 2020 was the best information available for the companies at the time of filing which aimed to get Fuel Price Variance Account balance to zero by July 1, 2021. Rider F would now not go to zero on July 1, 2021 if the balance in the FPVA as forecast at that time is outside the +/- $200,000 threshold.

(c)

Please see table below that shows Rider F rate changes for the last 10 years. The Rider F change is not tied to the specific fuel price change, but it is tied to the balance of FPVA

as noted in response to (a) and (b). The fuel prices variance calculations for both companies are available in FPVA continuity tables provided to the Yukon Utilities Board in quarterly report which are available on YUB's website.

REFERENCE: **From the YEC website – page announcing the 2021 GRA: *"Our Board of Directors and staff also understand that paying more for power can be hard for some Yukoners, especially during the COVID pandemic. That's why our 2021 rate application outlines a way for our proposed rate increase to have a nearly zero impact on electricity bills."***

$204.72 Dec 2021 Monthly Bill with 2021 GRA (Residential 1000kWh/month consumption – from Page 4-11 Table 4.3)

$178.50 Dec 2021 Monthly Bill without 2021 GRA ($204.72 minus Rider F ($13.64) and 2017/18 GRA true-up ($12.58) from Page 1-2 Figure 1-1).

QUESTION:

a) For a December 2021 bill as outlined above, what is the percentage increase attributable to the 2021 GRA?

b) What is the decrease absent the 2021 GRA?

c) Please explain how this is promoted as "nearly zero impact on electricity bills?"

d) Why is the "No GRA Scenario" from Figure 1-1 not included in any of the tables or figures of Appendix 4.2?

e) While comparisons with NWT, Toronto, and Yukon (Nov-2020), etc. are interesting, none of these are impacted by the 2021 GRA and only serve to obscure the actual impact of the GRA on future bills. The GRA only impacts bills that are subject to the GRA, meaning Jul-21, Dec-21 and beyond. Please provide new versions of all tables and figures from Appendix 4.2 with the addition of "Yukon, No-GRA (July 2021)" and "Yukon, No-GRA (Dec 2021)" for comparison with the already included Yukon - pre-GRA (Nov-2020), Yukon, Interim (July 2021) and Yukon, Proposed (Dec 2021).

f) Please also provide and update of Table 4.3 (Page 4-11) with the addition of No-GRA calculations/columns for Jul-21 and Dec-21.

ANSWER:

(a)

As illustrated in Table 4.2A-3 in Appendix 4.2 of the Application, the increase in Rider J for residential 1,000 kW.h monthly usage is $20.42, increase from $30.37 to $50.78. This is about 10.0% increase (compared with the November 2020 bill of $204.00) which is attributable to the 2021 GRA. However, the overall bill increase from November 2020 to December 2021 is constrained to $0.72 or 0.4% due to offsetting reductions to Rider F and Rider J1 (total reduction of $19.70).

(b)

Absent the 2021 GRA the residential bill for 1,000 kW.h monthly usage would decrease by $13.71/month on July 1, 2021 when Rider F is reduced to approximate 0, and be further reduced by $12.58/month on December 1, 2021 when Rider J1 expires (total reduction of 12.9% compared with November 2020 bill).

(c)

The proposed approach is described as “nearly zero impact on electricity bills” because that is exactly what results from the Application.

As outlined in section 1.1 of the Application, the proposed rate implementation dated for the 2021 GRA is aimed to avoid any material bill change for customers. Delay in rate adjustments or delay of GRA would lead to bill instability (a sharp decline followed by a sharp increase when new rates as required for this GRA are approved) and higher new true-up rate rider requirements.

Please see section 1.1 of the Application for more details of the proposed approach in the 2021 GRA to reduce customer bill volatility.

(d)

Yukon Energy is not proposing “No GRA Scenario” therefore this scenario was not included in Appendix 4.2 tables and figures. However, throughout the Application the tables show “Existing 2021” which shows the “No GRA Scenario” – and Appendix 4.2

provides the information indicating expected changes to existing rates without the GRA (with the exception of Rider F).

(e) and **(f)**

Please see NY-YEC-1-15 Attachment 1 for versions of Appendix 4.2 tables and figures that include "No 2021 GRA" scenario. Please note that for illustration purposes Rider F is estimated for "No 2021 GRA" scenario using the fuel price variance for the 2021 GRA [about $2.129 million as shown in Table 1-2 in Tab 1]. This is only an estimate, the actual Rider F will depend on actual fuel prices and thermal generations for both YEC and AEY.

The version of Table 4.3 with "No 2021 GRA" scenario is provided below.

		No 2021 GRA *		2021 GRA	
	Nov-20	Jul-21	Dec-21	Jul-21	Dec-21
Residential Non-Government, Whitehorse					
850 kWh/month consumption	$176.48	$172.16	$161.26	$176.70	$177.31
change from Nov 2020		*-$4.31*	*-$15.21*	*$0.22*	*$0.84*
1,000 kWh/month consumption	$204.00	$198.93	$186.35	$204.00	$204.72
change from Nov 2020		*-$5.07*	*-$17.66*	*-$0.00*	*$0.71*
Commercial Non-Government, Whitehorse					
2,000 kWh/month consumption [5 kW demand]	$358.84	$348.70	$326.78	$355.30	$356.54
change from Nov 2020		*-$10.15*	*-$32.06*	*-$3.54*	*-$2.30*
3,500 kWh/month consumption [15 kW demand]	$753.00	$735.24	$688.62	$755.81	$758.45
change from Nov 2020		*-$17.76*	*-$64.38*	*$2.81*	*$5.45*

Note:

1. For illustration purposes Rider F is estimated for "No 2021 GRA" scenario using the fuel price variance for the 2021 GRA [about $2.129 million as shown in Table 1-2 in Tab 1]. The actual Rider F will depend on actual fuel prices and thermal generations for both YEC and AEY.

Table 4.2A-1:
Residential Electricity Bills in Comparison to Yukon
(1000 kWh/month consumption, Residential Non-Government, $)

		Monthly Bills before rate relief and taxes
1	NWT Thermal zone	$710.70
2	Baker Lake, Nunavut	$698.00
3	Iqaluit, Nunavut	$591.10
4	Yellowknife	$323.67
5	Yukon - pre-GRA (Nov-2020)	$204.00
6	Yukon No 2021 GRA (July 2021)*	$198.93
7	Yukon No 2021 GRA (Dec 2021)*	$186.35
8	Yukon, 2021 GRA Interim (July 2021)	$204.00
9	Yukon, 2021 GRA Proposed (Dec 2021)	$204.72
10	Toronto, ON	$188.42
11	Ottawa, ON	$173.77
12	Halifax, NS	$168.88
13	Charlottetown, PEI	$168.27
14	Regina, SK	$165.07
15	Calgary, AB	$148.31
16	Edmonton, AB	$142.93
17	St. John's, NL	$135.99
18	Moncton, NB	$134.19
19	Vancouver, BC	$115.13
20	Winnipeg, MB	$96.02
21	Montreal, QB	$72.99

Notes:

1. Monthly Bills are before taxes and rate relief [Hydro Quebec does not specify if the rate comparison includes rate relief].
2. Yukon existing bills include YEC Rider J [22.32%] and Rider J1 [9.25%], AEY Rider R [8.30%] and Rider F.
3. For illustration purposes Rider F is estimated for "No 2021 GRA" scenario using the fuel price variance for the 2021 GRA [about $2.129 million as shown in Table 1-2 in Tab 1]. The actual Rider F will depend on actual fuel prices and thermal generations for both YEC and AEY.
4. Yukon proposed bills assume interim Rider J increase of 10.08% effective July 1, 2021 and 4.93% Rider J increase effective December 1, 2021.
5. The monthly bills for Yellowknife are calculated using the rates in place in June 2019. Available at https://www.northlandutilities.com/en-ca/customer-billing-rates/bill-calculator/northland-utilities-limited-yellowknife.html [accessed on September 25, 2020].
6. The monthly bills for NWT Thermal Zone are calculated using the rates in place effective September 1, 2020. Available at https://www.ntpc.com/customer-service/residential-service/what-is-my-power-rate [accessed on September 25, 2020].
7. The monthly bills for Iqaluit and Baker Lake are calculated using the rates approved effective April 1, 2019, but also includes fuel rider refund effective October 1, 2020. Available at https://www.qec.nu.ca/customer-care/accounts-and-billing/customer-rates [accessed on September 25, 2020].
8. Bills for Toronto and Ottawa are based on Ontario Energy Board Bill Calculator. Toronto average monthly bill for 1,000 kW.h at $188.42 before taxes and rebates - calculation for Toronto Hydro-Electric System Limited tiered rate that include 12.6 c/kW.h energy rate, $58.15/month delivery charge and $4.27/month Regulatory charges; Ontario Electricity Rebate at $62.56/month is not included. Ottawa average monthly bill for 1,000 kW.h at $173.77 before taxes and rebates - calculation for Ottawa River Power Corporation tiered rate that include 12.6 c/kW.h energy rate, $43.44/month delivery charge and $4.33/month Regulatory charges; Ontario Electricity Rebate at $57.59/month is not included. https://www.oeb.ca/rates-and-your-bill/bill-calculator [accessed on October 21, 2020].
9. The monthly bills for the other cities are from Hydro Quebec's Comparison of Electricity Prices in Major North American Cities, Rates in effect April 1, 2020. Available at http://www.hydroquebec.com/data/documents-donnees/pdf/comparison-electricity-prices.pdf [accessed on October 21, 2020].

Table 4.2A-2:
Small Commercial Electricity Bills in Comparison to Yukon
(2000 kWh/month consumption, Commercial Non-Government, $)

		Monthly Bills before rate relief and taxes
1	Yukon - pre-GRA (Nov-2020)	$358.84
2	Yukon No 2021 GRA (July 2021)*	$348.70
3	Yukon No 2021 GRA (Dec 2021)*	$326.78
4	Yukon, 2021 GRA Interim (July 2021)	$355.30
5	Yukon, 2021 GRA Proposed (Dec 2021)	$356.54
6	Yellowknife	$532.26
7	Iqaluit, Nunavut	$981.20
8	NWT Thermal zone	$1,212.00
9	Baker Lake, Nunavut	$1,310.00

Notes:

1. Monthly Bills are before Rate Relief and taxes.
2. Yukon existing bills include YEC Rider J [22.32%] and Rider J1 [9.25%], AEY Rider R [8.30%] and Rider F.
3. For illustration purposes Rider F is estimated for "No 2021 GRA" scenario using the fuel price variance for the 2021 GRA [about $2.129 million as shown in Table 1-2 in Tab 1]. The actual Rider F will depend on actual fuel prices and thermal generations for both YEC and AEY.
4. Yukon proposed bills assume interim Rider J increase of 10.08% effective July 1, 2021 and 4.93% Rider J increase effective December 1, 2021.
5. The monthly bills for Yellowknife are calculated using the rates in place in June 2019. Available at https://www.northlandutilities.com/en-ca/customer-billing-rates/bill-calculator/northland-utilities-limited-yellowknife.html [accessed on September 25, 2020].
6. The monthly bills for NWT Thermal Zone are calculated using the rates in place effective April 1, 2019. Available at https://www.ntpc.com/customer-service/business-service/business-rates [accessed on September 25, 2020].
7. The monthly bills for Iqaluit and Baker Lake are calculated using the rates approved effective April 1, 2019, but also includes fuel rider refund effective October 1, 2020. Available at https://www.qec.nu.ca/customer-care/accounts-and-billing/customer-rates [accessed on September 25, 2020].

REFERENCE: **Page 10-28 "We expect COVID-19 impacts to have both positive and negative effects on Yukon Energy's financial position, net income and cash flows."**

PREAMBLE:

QUESTION:

a) What are the expected positive effects of COVID-19 on financial position, net income and cash flows?

b) What are the expected negative effects?

ANSWER:

(a)

The expected positive effects of COVID-19 include increases to Residential revenue (which includes YEC's Residential category as well as residential customers for AEY that are included in YEC's Wholesales category) as well as an expected decrease in YEC travel costs.

(b)

The expected negative effects of COVID-19 include decreases to Commercial revenue (which includes YEC's Commercial category as well as commercial customers for AEY that are included in YEC's Wholesales category) as well as increased contractor costs where required work requires workers to travel to Yukon and self-isolate before performing work.

Utilities Consumers' Group
(UCG)

TOPIC: **General Requests**

QUESTION:

a) Identify all persons (in-house and consultants) who have worked on this application to date and cost for each person.

b) Explain what measures Yukon Energy took to simplify this rate application to lower the costs of regulation and lessen the reliance for outside lawyers and consultants to deliberate our future.

c) Give the updated estimated costs for this 2021 GRA.

ANSWER:

(a), **(b)** and **(c)**

A very wide range of YEC staff and management, along with InterGroup Consultants, have worked to date on the Application, including responding to IRs. Updated estimated costs and costs by person are not readily available and will be provided to the extent required when the proceeding is concluded and the Board reviews cost submissions.

To the extent GRA preparation cost information is readily available it is provided in the response to UCG-YEC-1-104.

In an effort to simplify this rate application and lower costs of regulation, YEC in this Application separated clearly capital projects that remain in WIP and therefore are not relevant to the 2021 test year revenue requirement in order to help the Board and intervenors reduce IR and other related costs on matters not of priority at this time.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **YUB Rules of Practice October 17, 2012**

Response to information requests
14. (1) Subject to subsection (3) where an information request has been directed to a party and served on that party in accordance with the Board's directions, the party shall prepare a response that:
a) repeats each question in the information request,
b) provides full and adequate response to each question, and
c) identifies the individual or individuals who were responsible for preparing the response

QUESTION:

a) Please be certain to identify each response with the individual/s who prepared it.

ANSWER:

(a)

The requested information cannot be practically or reasonably provided at an individual level.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **Yukon Energy 2021 Rate Application**

QUESTION:

a) Please provide details of all customer and stakeholder consultations conducted by Yukon Energy Corporation during development of this application prior to submitting it to the YUB.

b) Please provide specific details on how YEC's customers were informed of proposals being considered for inclusion in the application and how input from customers was used to develop details of the application.

c) Please provide all documentation related to issues discussed during these consultations and a list of all parties involved in the consultations.

d) Please identify how and when the leadership / Board of YEC approved the General Rate Application as provided to the YUB. Please identify the dates on which these approvals were provided.

ANSWER:

(a) to **(c)**

YEC did not conduct customer or stakeholder consultations during development of the application prior to the filing.

(d)

The Board of Directors of YEC approved filing of the application by normal resolution at a meeting in October 2020.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application page 1**

YEC states "Pursuant to the Order in Council (OIC) 1995/90 (as amended by 2018/220) direction, the Board must ensure until the end of 2018 that rate adjustments for retail customers and major industrial customers apply equally, when measured as percentages, to all classes of retail customers and to the class of major industrial customers. Consequently, for both 2017 and 2018, all proposed rate adjustments for retail customers and industrial customers apply equally, as percentages".

REFERENCE: **Board Order 2010-13, Appendix A – Reasons for Decision**

"Therefore, the Board directs the Companies to file a joint COS study within six months of the expiry of OIC 2008/149. The Board further directs the Companies to incorporate all findings and directions of this Decision into the next COS study."

QUESTION:

a) Since the OIC 2008/149 expired at the end of 2018, please confirm the above Board direction was accomplished. If not, why not?

b) Please explain what Yukon Energy plans to do about following Board directions and orders?

ANSWER:

The reference provided to November 2020 Application page 1 does not appear to be correct. Page 1 of the Application notes:

> Pursuant to the Order in Council (OIC) 1995/90 direction (as amended by OIC 2018/220), the Board must ensure that rate adjustments for retail customers and major industrial customers apply equally, when measured as percentages, to all classes of retail customers and to the class of major industrial customers. Consequently, all proposed 2021 rate adjustments for retail customers and industrial customers apply equally, as percentages.

As detailed below the relevant provisions of OIC 2008/149 remain in effect.

The direction outlined in OIC 2008/149 was extended by OIC 2012/68. Insofar as it affects all classes of retail customers, this direction in effect extended the earlier Section 2.1(1) direction in OIC 2008/149 until December 31, 2013; and ensured that the same percentage rate adjustments will also apply to the class of major industrial customers.[1] This direction was extended by OIC 2014/23, and OIC 2018/220 removed subsection 2.1(3) which established an expiry date for Section 2.1. With this change, the provisions of Section 2.1(1) currently remain in effect without any expiry date.

See Tab 4, page 4-7 and 4-8 and Tab 6, page 6-1.

(b)

In Order 2013-01 the Board provided a series of directives related to the Cost of Service Study as filed by the Companies noting that it "[did] not accept the COS study as filed by the Companies", "an updated COS study approved by the Board is essential to establishing a future rate restructuring process" and directed the Companies to "file a joint COS study within six months of the expiry of OIC 2008/149" that "incorporate[s] all findings and directions of the decision."

The provisions of Section 2.1(1) currently remain in effect without any expiry date, and provide that material rate design changes that would result in rebalancing of rates between different customer classes cannot be undertaken at this time. The remaining outstanding directives in Order 2010-13 will be addressed in the next joint cost of service and rate design application.

[1] Subject to certain provisions noted in Tab 4, Section 4.4 of the 2021 GRA.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application page 2**

YEC states: “This GRA addresses a difficult situation, Yukon Energy's actual ROE has continued to fall well short of the 2018 approved ROE, and a new GRA is required to address ongoing revenue shortfalls.”

QUESTION:

a) Please provide details of any measures since the last 2017/18 GRA that have been taken to manage Yukon Energy's ongoing welfare.

b) Did Yukon Energy attempt any debt re-negotiation with Yukon Development Corporation (YDC) or any Promissory Note's flexible debt re-financing provisions to help alleviate some pressure. If not, why not?

c) Did YDC make any contributions that reduced project costs to be recovered from ratepayers? If yes, explain what for and how much.

d) Are there any secondary sales revenues or other related revenues forecast for 2021? If not, what will YEC do with any revenues if these circumstances change?

e) Were there any adjusted thermal fuel costs recouped from the Diesel Contingency Fund operation or the implementation of the Whitehorse Diesel-Natural Gas Conversion Project (LNG Project or LNG Plant project).

f) Please provide specific details YEC realized to:
   i. reduce ongoing costs?
   ii. reduce waste?
   iii. improve performance?

g) Please provide steps YEC has taken to date to study and consider a performance-based regulation mechanism, including earnings sharing.

ANSWER:

(a)

The Application describes measures and actions being undertaken by YEC to ensure its ongoing viability and fiscal health.

(b)

No. Refinancing of YDC debt is undertaken when options exist to reduce existing interest rates, in order to reduce debt costs. No such options were available in 2020 when the GRA was being prepared.

(c)

No.

(d)

Per Tab 2, Table 2.1 there are no secondary sales revenues forecast for 2021. As noted in Tab 2, page 2.2 of the Application, YEC will update 2021 test year forecasts in the compliance filing if any secondary sales are expected to occur in 2021 as a result of surplus water availability.

(e)

It is not clear what this question is addressing. The DCF no longer exists. The Application details operation of the LNG facilities.

(f)

Please see the Application, Tab 3 for details on YEC operations.

(g)

In UCG-YEC-1-19(c) from the 2008/09 GRA, Yukon Energy addressed this UCG concept as follows:

As noted in response UCG-YEC-1-32 provided during the 2005 Required Revenues and Related Matters proceeding, a multi-year performance based regulatory framework is not currently in place in Yukon. Implementing this form of regulation would likely require significant changes to the regulatory framework in the Yukon that have not yet been assessed. Yukon Energy has not assessed measures that the Yukon Government might adopt to bring in legislation or policy related to performance-based regulation.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application page 2**

YEC states: "Yukon Energy has developed an approach to enable a rate adjustment for the 2021 test year to address YEC's financial requirements without any material change in customer bills."

REFERENCE: **November 2020 Application, page 4**

YEC states: "In accordance with OIC 1995/90 direction, the Application proposes that Yukon Energy revenue shortfall for the test year be recovered through a Rider J increase of 15.01 percentage points in 2021 applicable to all YEC and AEY retail firm customers and all major industrial firm rates. This Rider J increase results in an overall increase in existing rates (excluding existing Rider J1 true-up and Rider F) of 11.54% for 2021.

QUESTION:

a) Please explain this second reference in simple laymans language as it is massively confusing. How can YEC exclude/deduct true-up and rider F from your requested revenue requirement increase? Why would they not simply come off our bills when paid off?

b) Please confirm the YEC is requesting a 15.01 per cent increase for the 2021 test year. Explain.

c) As YEC proclaims in the first reference that there will not be any material change in the customer bills, please explain how the expected reduction of the fuel Rider F will offset the requested increase for the proposed interim request, i.e. give the amount of Rider F reduction (as a percentage) expected and how this matches with the proposed interim rider of 10.08% increase requested?

d) Please give the amount of the true-up Rider as a percentage that YEC claims will offset the 15.01% increase slated for December 1, 2021 final rates.

e) Does YEC plan to reintroduce a Rider F charge after the first quarter of January, 2022 or when/if the price of diesel fluctuates from the rate hearing decision price? If yes how does the YEC propose this will keep bills from material changes?

f) Please provide detailed calculations of the total bill impacts for non-government residential customers (including customer charges, energy charges, all rate riders), similar to format as Table 4.2A-3 (1000kWh.) for 500, 750, and 15000 kWh. per month comparing bills from Jan /2018 to Dec/2021.

g) Please provide detailed calculations of the total bill for non-government general service customers (including demand charges, energy charges, all rate riders) similar to Table 4.2A-4 (2000kWh.) for 1500, 2500 and 3000 kWh. per month comparing bills from Jan 2018 to Dec/2021.

ANSWER:

(a)

The referenced paragraph meant to clarify that the required rate increase for the 2021 GRA at 11.54% results in an increase of 15.01% to Rider J as this rider only applies to the existing base rates [i.e., does not apply to riders].

Rider F and Rider J1 are not part of YEC's revenue requirement as they do not relate to the 2021 test year costs.

- YEC's Rider J1 is related to YEC's 2017-18 GRA shortfall true-up which is in effect until the earlier of November 30, 2021, or at such earlier month end when the $12.557 million shortfall has been recovered.

- Rider F relates to Fuel Price Variance Account that reflects fuel price variances for both YEC and AEY.

(b)

Not confirmed. Please see response to (a).

The rate increase is 11.54%, while 15.01% is an increase to Rider J.

(c)

Effective July 1, 2021, the Rider F rider is expected to be set to approximate zero which reduces the average residential monthly bill for 1,000 kW.h energy consumption by $13.71 [6.7% of monthly bill].

The proposed interim increase in Rider J by 10.08% would increase the monthly bill by the same amount [$13.71 or 6.7% of monthly bill]. The increase in bills for interim rates will be offset by reduction in Rider F resulting in no change in customer bills for that usage level.

(d)

Effective December 1, 2021, Rider J1 expires which reduces the average residential monthly bill for 1,000 kW.h energy consumption by $12.58 [6.2% of monthly bill].

The expected increase in Rider J by 4.93% [15.01% total increase less 10.08% interim increase] would increase the monthly bill by $6.71. However, a new true-up rider is required to collect 2021 GRA shortfalls which is estimated to be about $6.59/month for 1,000 kW.h consumption for residential customers. This leads to a total bill increase at $13.30/month or 6.5% of monthly bill.

The increase in bills from the 2021 GRA is almost fully offset by the referenced reductions in bills, therefore, the expected bill impact by December 1, 2021 is 0.4%.

The increase in bills for interim rates will be offset by a reduction in Rider F resulting in no change in customer bills for that usage level.

(e)

YEC does not “plan” Rider F adjustments; adjustments are driven by changes in the market value of fuel. Additionally, Rider F for the first quarter of 2022 will depend on the balance in the Fuel Price Variance Account that reflects fuel price variances not only for YEC but also of AEY. Therefore, YEC cannot provide what Rider F would be in 2022.

(f) and **(g)**

Please see UCG-YEC-1-6 Attachment 1.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application, page 2**

YEC states: “The 2021 GRA approach will also work to prevent rate and bill instability beyond 2021, and reduce rate increase requirements for subsequent GRA.”

QUESTION:

a) Please explain exactly how the YEC proposes to accomplish this broad statement.

b) Please explain how the YEC will guarantee its' trust to ratepayers that YEC will follow through with this statement. Or does this mean that instead of 20% increase next application, you will only need 15 per cent yet again? Or is this just another statement like 'other rates will go down when we connect the mines'?

ANSWER:

(a)

See discussion provided in Tab 1, Page 1-3 and 1-4, as well as Tab 4, pages 4-9 to 4-11.

(b)

As noted in Tab 1, a new GRA is overdue to enable Yukon Energy to address serious ongoing revenue shortfalls, and further delay in adjusting rates will have material implications for the financial integrity of the corporation. Further delay in implementing rate changes beyond 2021 would result in a material decrease in customer bills in 2021 when Rider F is reduced and the 2017-18 YEC GRA true-up comes off, followed by a later and more material increase in customer bills in 2022 or thereafter (at the time of the next GRA).

Yukon Energy has in its application outlined an approach to resolve outstanding revenue shortfall issues in 2021 without materially disrupting customer bills. Success will depend on completing the regulatory process on a timely basis, and implementing interim and final rates as outlined in the Application.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application, page 4. Summary of Requests #1**

YEC states it requests "approval of a forecast revenue requirement of $75.135 million for 2021.

QUESTION:

a) Please confirm that the YUB approved revenue requirements were $48.544 million for 2017 and $49.864 million for 2018.

b) Please explain, in layman's language, why an increase of $25 million or 50% since the last GRA (in three years) should be acceptable to your ratepayers.

c) Please provide a chart showing approved revenue requirement amounts for all GRA years since YEC took control of Management in 1998.

ANSWER:

(a)

Not confirmed. The numbers noted were the revenue requirements in the 2017-2018 GRA filing. The approved revenue requirement was $49.202 million for 2017 and $49.794 million for 2018 (see Order 2019-08 approving Yukon Energy's second compliance filing).

(b)

Most of the forecast $25 million increase in revenue requirement as referenced is increased sales funded fully at existing rates. The forecast 2021 revenue shortfall to be recovered through increased rates is $10.971 million (see Table 4-1).

The forecast 2021 revenue requirements primarily reflect proposed adjustments to thermal generation requirements (due to increased loads) and fuel prices (beyond YEC's control), changes to labour and non-labour costs, changes to depreciation resulting from a depreciation study provided as directed, and the impact of increases in rate base relative to 2018 approved numbers, the last test year reviewed by the Board during Yukon

Energy's 2017/2018 GRA application. Details on the basis for each area of cost increase are specified in Tab 3 of the Application. These are costs required to be incurred for ongoing operation of the utility.

(c)

The request is unreasonably broad and not directly relevant to the current proceeding. YEC has therefore not provided the requested chart.

TOPIC: Revenue Requirement Requests

REFERENCE: November 2020 Application Tab.1-7

1.3 CHANGES IN FORECAST LOADS
The 2021 load forecast is about 28% higher than the 2018 approved forecast.3 As noted in Table 1-2, revenues from higher loads are largely offset by increases in fuel costs. Higher non-industrial loads also result in capacity shortfalls that must be addressed and that are driving both capital and O&M cost increases.
Test year forecasts for 2021 reflect the following:
Wholesale Load – Actual 2018 (332.3 GWh) 17.6 GWh higher than approved forecast (314.7 GWh); firm wholesales for 2021 are forecast at 343.5 GW.h.
Industrial Load – Actual 2018 industrial load exceeded approved forecast (36.9 GWh vs 32.2 GWh). Forecast firm Yukon Energy sales to industrial customers for the 2021 test year is 102.911 GW.h.

REFERENCE: November 2020 Application Tab1-7/8

Thermal Generation requirements are growing due to higher firm grid loads – The 2018 Compliance Filings approved a forecast of 16.4 GW.h for long-term average (LTA) thermal generation requirements to supply the 2018 forecast grid load of 420 GWh. The 2021 LTA Forecast total firm generation load for the 2021 test year is 538.7 GW.h, compared to the 2018 approved load of 420.3 GWh.
thermal generation forecast is 84.3 GW.h for a forecast grid load 538.7 GW.h. The increased LTA thermal generation accounts for $10.8 million of the 2021 GRA cost increases from the approved 2018 GRA (based on 2018 GRA approved fuel prices). These added LTA thermal generation costs due to load growth are more than fully recovered by the increased revenues ($14.4 million) from the load growth.

QUESTION:

a) If increase revenues from higher loads are largely offset by increases in fuel costs, the reverse holds true in that fuel costs are largely offset by revenues from higher loads, why is Yukon Energy claiming a revenue shortfall of $2.1 million in this application for fuel costs?[1]

b) Please confirm Yukon Energy's policy approach through this application is to apply for forecast costs in fuel and purchased power; set the fuel rider in August to zero which basically offsets the requested interim rider (if the proposed fuel increase is accepted; and then rekindle Rider F at a latter [sic] date in 2022.

[1] Application November 2020, Page 3, Fuel Price Changes (19.4% of revenues shortfall).

c) Please confirm that the wholesale load is forecast to increase by 3.34% in 2021 from the 2018 Actual load.

d) Please confirm that industrial load is forecast to increase by 179% in 2021 from the 2018 Actual load.

e) If this is indeed the case, why does Yukon Energy insist "that higher non-industrial loads result in capacity shortfalls that must be addressed and that are driving both capital and O&M cost increases"? Is it not the industrial loads that are mostly driving these proposed increases?

f) What does Yukon Energy propose to do in this application to offset this blatant discrimination demonstrated for firm wholesale ratepayers?

ANSWER:

(a)

As noted on page 3 of the Application, higher fuel prices account for $2.1 million of the 2021 GRA revenue shortfall. See Tab 3, Section 3.2 of the Application.

(b)

Not confirmed.

As outlined in Tab 4, Section 4.5, the application is proposing that Rider J for 2021 of 32.40% for all firm non-industrial, and 28.75% for all firm industrial, be applied initially as of July 1, 2021 as an interim refundable rate rider, equal to a 10.08 percentage point increase in the existing Rider J rates for non-industrial and industrial rates [reflects about 67% of the total Rider J rate increase for 2021 in the current GRA].

July 1, 2021 is proposed as the effective date for the interim rates to reduce customer bill volatility. The current Rider F rider is forecast to be reduced effective July 1, 2021, and the Rider J 10.08% is set only to offset the Rider F reduction based on estimate for a 1,000 kW.h/month residential customer consumption with Rider F assumed to approximate zero as at July 1, 2021.

The GRA will re-set forecast fuel prices (driven in particular by higher natural gas price) such that Rider F going forward will now be based off updated fuel prices. YEC does not control actual diesel or natural gas prices, and therefore does not control future Rider F changes after mid 2021. Rider F will continue to apply, providing rate adjustments (down or up) depending on changes to fuel prices relative to the 2021 GRA updated forecast prices.

(c)

Per Tab 2, Table 2.1, the 2021 wholesale load is forecast to increase by 3.39% over the 2018 Actual load.

(d)

Confirmed.

(e) and **(f)**

See response to UCG-YEC-1-10 (a), (b) and (d). Industrial loads are not driving the capacity shortfalls noted in the question, as industrial loads are excluded from the determination of the N-1 dependable capacity shortfall.

Industrial loads are contributing to other cost requirements – however, many of the non-fuel O&M and capacity cost requirements are not linked clearly to grid load requirements, e.g., sustaining capital requirements, increased labour requirements, etc.

There is no basis for any suggestion of discrimination in favour of any group of customers.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **Application November 2020, Page 3**

Energy & Peak Load Changes (8.4% of revenue shortfall): Dependable capacity requirements caused by peak load growth for non-industrial sales drives diesel rental costs that account for $3.8 million (34.9%) of the 2021 GRA revenue shortfall. Higher overall loads provide increased revenues at existing rates ($14.4 million) that reduce the 2021 revenue shortfall by $2.9 million after considering load-related cost impacts of $10.8 million for increased long-term average thermal generation fuel cost requirements at 2018 GRA fuel prices (to address added energy generation) and $0.7 million for increased Mayo B Promissory Note interest due to higher loads.

QUESTION:

a) Does this above statement mean that if dependable capacity for peak load growth for non-industrial sales is needed (i.e. running of diesels or LNG) that the industrial loads will be temporarily discontinued during peak time frames? In other words are the mines on SCADA disconnect during peak loads requiring the usage of our rental diesels?

b) If not, why does Yukon Energy state that it is “dependable capacity requirements caused by peak load growth for non- industrial sales” which drives this cost?

c) Please confirm the Mayo B Promissory Note is to Yukon Development Corporation.

d) Should it not be the government/YEC (through edicts and OICs and PPAs) that takes fiscal responsibility for increased mine loads driving such rate increases rather than recouping this from the firm ratepayers through this rate application?

ANSWER:

(a), **(b)** and **(d)**

The diesel rental units are required to meet the N-1 dependable capacity criterion. The N-1 criterion does not include consideration of major industrial customer loads as these loads typically maintain sufficient on-site diesel for their own emergency purposes.

Industrial loads are not discontinued during peak periods – the referenced quote is focused on the requirements to ensure sufficient capacity to meet the N-1 criterion.

As reviewed in various past YUB proceedings, including PPA proceedings for new industrial loads, there is no basis for asserting that industrial loads are driving rate increases.

(c)

See response to UCG-YEC-1-22.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **Application November 2020**

Section 6.1 of OIC 1995/90 requires the Board to ensure that rates charged to major industrial customers are sufficient to recover the cost of service to that customer class.

REFERENCE: **YEC 2003-04 Rate Hearing Transcripts p.649**

Mr. Morrison: "Customers are customers, load is load. And we don't attribute specific diesel costs to different customers.

QUESTION:

a) Please reconcile the above underlined statements, if YEC cannot differentiate what the specific diesel costs are to serve each individual mine, how can YEC guarantee your regulator that you are adhering to the above OIC.

ANSWER:

(a)

The referenced OIC direction addresses "cost of service" which includes all relevant costs (including all historic costs in rate base) allocated to customer classes based on specific rules and procedures. The OIC quote has nothing to do with whether YEC is capable of attributing specific diesel costs to different customer classes, let alone specific customers.

All cost of service studies provided to date to the Board have confirmed that rates charged to major industrial customers as a class continue to recover the cost of service to that customer class, calculated on a Yukon-wide basis as required under OIC 1995/90.

The costs to serve added major industrial customers have also been reviewed by the Yukon Utilities Board (YUB) during the review of Power Purchase Agreements (PPA) with industrial customers. Board reports from these proceedings have not shown any basis for asserting that these customers are driving rate increases.

New industrial customers cover the costs to negotiate and conclude the PPA and incremental costs for connection and also make contributions towards existing and new transmission.

Specifically, YUB in Appendix A to the Order 2018-04 paragraph 26 stated the following:

> Generally, in terms of customer contributions for capital costs, the Board has previously stated the following:
>
> > The incremental costs (spur costs) for connections to existing or new transmission facilities should be completely borne by the industrial customer.
> >
> > Further, the Board agrees with the principle that industrial customers should make a contribution towards an appropriate share of new or to existing bulk transmission.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **Application November 2020, Tab 1-9**

Defined Benefit Pension Deferral Account: In this Application Yukon Energy is requesting approval of defined benefit pension plan deferral account that captures variances in contributions to the defined benefit pension plan from the cost included in the test year revenue requirements as a result of the required annual actuarial evaluations. A similar deferral account was approved for AEY by Board Order 2014-06.

QUESTION:

a) Please explain how this affects the revenue requirement for this application and if it does by how much in dollars and percentage?

ANSWER:

(a)

The proposed Defined Benefit Pension Plan Deferral Account does not impact 2021 GRA revenue requirements, but captures variances in contributions to the defined benefit pension plan between the test years. For example, if the actual contributions for 2021 or after vary from the amount included in the 2021 test year [or future test year forecasts] then the variance is included in the deferral account. The deferral account balance then will be dissolved based on YUB Order in the future GRAs.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **Application November 2020, Tab 1-8/9**

VGC Group and Alexco Fixed Charge: Rate Schedule 39 as currently approved includes a Fixed Charge for VGC Group and for Alexco of $8,402/ month, subject to amendment from time to time, including provision for allocation of the Fixed Charge between VGC Group and Alexco in years when both customers are Major Industrial Customers of YEC.6 As reviewed in Appendix 4.3 of this Application, YEC expects to file with the Board in late November/ early December 2020 for approval of an amended Transmission Facilities Fixed Cost effective January 1, 2021 of $428,812, resulting in an interim Fixed Charge (85% of the Transmission Facilities Fixed Cost) effective January 1, 2021 of $35,734 per month, with allocation of the interim Fixed Charge between VCG Group and Alexco [Table 4.3-2, Appendix 4.3 of this Application]. Aside from changes related to the 2021 GRA, a final Fixed Charge for 2021 would occur after 2021 year end as required to reflect final actual Transmission Facilities Fixed Cost and the actual MWh energy sales in 2021 that occurred to VGC Group and Alexco.

QUESTION:

a) Since Alexco came on line again in November 2020, and it is obvious that Yukon Energy had this amendment to the agreement already to go, why did YEC not include this Filing with this application to reduce the revenue requirement as well as regulatory costs for another process?

b) Will the firm ratepayer benefit from this Alexco agreement amendment in this 2021 rate application?

c) If yes, please show where and how in the application this adjustment is included.

d) If no, please explain why not?

e) Will Alexco be responsible for any of the transmission line and sub-station contribution costs to lower the rate base cost?

f) If not, why not.

ANSWER:

(a) through **(f)**

The Fixed Charge provision referenced in the quote is set to recover the defined Transmission Facilities Fixed Cost, which amount is allocated as directed between major industrial customers using the defined Transmission Facilities. The applicable Transmission Facilities Fixed Cost amount did not change when Alexco once again became a major industrial customer – only the allocation of this amount between VGC Group and Alexco changed. Accordingly, Alexco will be responsible for its share of the Transmission Facilities Fixed Cost as approved by the Board from time to time.

The above quote also references YEC's planned filing for an amendment to the Transmission Facilities Fixed Cost as required within 60 days after the Transmission Facilities Development Operation Date. This amendment cannot be filed until the Transmission Facilities Development Operation Date has occurred, which is now expected to be in March 2021. This amendment will increase the Fixed Charge to be recovered from VGC Group and Alexco. This application requirement exists separate from the 2021 GRA application, and was therefore assumed not to be part of the 2021 GRA application.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **Application November 2020 Tab Table 3.3**

Forecast

Non-labour costs are forecast to increase by $5.928 million in 2021 over 2018 approved costs. The average annual compound increase in non-labour expenses is approximately 16.51% (2021 expenses over 2018 approved) primarily due to $3.834 million costs for diesel rentals required to meet the N-1 single contingency capacity planning criteria (no diesel rental costs were included in the 2018 approved costs).

An increase in labour expense makes up $1.378 million, or 19%, of the total $7.306 million increase in operating and maintenance expense forecast for 2021 over 2018 approved costs. The average annual compound increase in labour expenses is approximately 3.71% (2021 expenses over 2018 approved).

3.3.1 Labour

Total labour expenditure is made up of labour expense for maintenance and administration and capitalized labour. Capitalized labour is charged to capital projects and becomes part of revenue requirement through annual depreciation charges incurred after in service. Maintenance and administration labour expense is charged directly to revenue requirement. Total maintenance and administration labour expense is forecast to be $13.310 million in 2021 as compared to 2018 approved costs of $11.932 million, reflecting an increase of $1.378 million.

QUESTION:

a) Please breakdown expenditure amounts and reason for all non-labour forecast costs of $5.928 minus the $3.834 million diesel rentals; i.e $2.094 million amount.

b) According to Table 3.3 and line 10 above, Labour costs are forecast to increase by $1.378 million or 11.5% since last GRA approval. Please breakdown all labour expenditures for maintenance and explain the need for each increase.

c) Please breakdown all labour expenses for administration and explain the need for each increase.

d) According to Table 3.3 above, Administration costs are forecast to increase by (Administration 3,001 3,016 3,365 3,491 3,858 3,858) $0.857 million or 28.6% since last GRA approval. Please give breakdown of all Administration costs and reason for increase in each partitioning.

e) According to Table 3.3 above, According to Table 3.3 above, (Insurance and Reserve for Injuries/Damages 1,510 1,525 1,596 1,778 1,902 2,259) costs are forecast to increase by $0.749 million or 50% since last GRA approval. Please give details on why this reserve has increased this great amount since the last GRA approval.

ANSWER:

(a)

Breakdowns of expenditures and reasons for all non-labour forecast costs are provided in the Application, starting at section 3.3.2 (page 3-13) through 3.3.8 (page 3-20).

(b) and **(c)**

Breakdowns of expenditures for all labour forecast costs are provided in the Application, starting at section 3.3.2 (page 3-13) through 3.3.8 (page 3-20). Reasons for the increase are provided in the Application at section 3.3.1.

(d)

Breakdowns of expenditures for all Administration costs and reasons for the more significant increases are provided in the Application, starting at section 3.3.6 (page 3-17).

(e)

Breakdowns of expenditures for all Insurance and Reserve for Injuries and Damages costs and reasons for the increases are provided in the Application, starting at section 3.3.7 (page 3-18 to page 3-20).

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab2-3**

21 Actual hydro generation in 2020 is forecast at 86.0% of grid generation, reflecting annual water
22 availability at about LTA. Current forecast hydro generation for 2021 is 94.0% of grid generation,
23 reflecting forecast water availability above LTA.

QUESTION:

a) What does this exactly mean, i.e. do you have the actual hydro generation for 2020 or is it forecast?

b) If not, please rephrase this to make it understandable.

ANSWER:

(a) and **(b)**

The “actual” hydro generation in the preamble refers to the hydro generation forecast to occur based on expected water availability in 2020. This differs from the long-term average generation which was used as the basis for thermal cost calculations.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab2-12**

18 As indicated in Table 2.2, the peak demand for the integrated system is forecast to be 112.7 MW in 2021.
19 The actual peak demand was 93.0 MW in 2018, 90.0 MW in 2019 and 103.8 MW in 2020.

QUESTION:

a) Does this 112.7MW forecast peak demand for 2021 include the three mines now on line? If not, please provide this mining peak load.

b) If this does include the mines, please breakdown the peak demand for firm ratepayers and for industrial ratepayers.

ANSWER:

(a) and **(b)**

The peak forecast of 112.7 MW includes both non-industrial and industrial peak. The forecast non-industrial peak for 2021 is 100.6 MW as noted on page 2-4 of the Application. The remaining 12.1 MW is forecast industrial peak.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab 2-13**

11 To address the severity of a potential
12 outage, Yukon Energy incorporated a second test – the N-1 standard which determines system
13 capacity assuming the loss of the system's single largest generating or transmission-related
14 generation resource. This standard does not include industrial loads as part of the assessment. It
15 ensures there is sufficient grid generation installed to meet firm residential and commercial
16 customers' loads when a failure occurs to the single largest system component

QUESTION:

a) Does this mean that the industrial loads are temporarily taken off the system until the reason for a potential outage is fixed and normal hydro power is restored, i.e. only firm customers are accommodated with the N-1 back-up supply?

b) If not, why not?

ANSWER:

(a) and **(b)**

The N-1 criteria does not include consideration of major industrial customer loads as these loads typically maintain sufficient on-site diesel for their own emergency purposes and therefore can be temporarily taken off the system during an emergency.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab2-15**

5 In summary, under N-1, there is surplus of dependable capacity of approximately 1.25
6 MW in 2021. Without rented diesel units, the N-1 capacity shortfall would be 25.75 MW 567 in 2021.

QUESTION:

a) How much above the standard rental costs for the diesels, when they are being used (i.e. is there a usage fee added to the stand-by rental? And how much?).

b) Please chart the operating-owned YEC diesels with capacity for each in Whitehorse, Faro, Mayo, Dawson. Ross River, Teslin, Carmacks, Carcross, Haines Junction, and any others.

c) Please chart the operating ATCO diesels in all their operating area on the grid with each capacity.

d) Would we today require diesels on the integrated grid if the mines were not operating (answer without peak load and with peak load)?

ANSWER:

(a)

Please see response to CW-YEC-1-17 (a) through (e).

(b)

Please see page 11 of 10-Year Renewable Electricity Plan provided in CW-YEC-1-36 (a) Attachment 1 for the map that shows generation facilities and Appendix A for the list of generation facilities with capacity information.

(c)

AEY would be in a better position to provide the requested information. This information as required for the N-1 capacity criteria is provided in Tab 2 of the Application.

(d)

Yes. When planning the system to the N-1 contingency criterion (used to determine the requirement of system capacity and consequent diesel rentals), the mines are not included in the analysis. Accordingly, the mines have no impact to the diesel requirements, as they have their own diesel backup.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab 2-17**

TAB 2 - SALES AND GENERATION Table 2.2:
Summary of Energy Balance, Losses, and Peak

Forecast Line No.	Description	2018 Approved	2018Actual	2019 Actual	2020 Forecast	2021
Sales and Losses						
1	Total Energy Sales	388,332	412,470	403,492	465,788	495,151
2	Losses - MWh	34,173	37,898	37,185	42,193	43,575
3	Losses - %	8.8%	9.2%	9.2%	9.1%	8.8%
4	Total Generation	422,506	450,368	440,676	507,980	538,726
5	Secondary Sales Related Generation	2,241	282	0	0	0
6	Firm Load Generation	420,265	450,086	440,676	507,980	538,726

QUESTION:

a) Give reason for the continual increase in loss of MWh on the grid through the four year period listed?

b) From above 118,461MWh increase of firm load generation from forecast 2021 to 2018 approved, or 28% (divided by 4 years equals a 7% increase per year) when you state earlier that the yearly firm load is increasing at 3.5% ????which is it?

ANSWER:

(a)

The MWh volume of grid losses increase as grid generation increases. YEC is proposing to maintain 8.8% line losses for the 2021 GRA which is the same as 2017/18 GRA.

(b)

On page 1-7 of the application YEC notes that the 2021 generation forecast for firm load is about 28% higher than the 2018 approved forecast. This is about 8.6% average annual increase.

YEC is unable to confirm the source for 3.5% referenced in the preamble.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab 2-17**
Peak – MW2 Integrated System 92.9 93.0 90.0 103.8 112.7

QUESTION:

a) Please explain the major difference of 19.8MW from 2018 approved to 2021 forecast for integrated peak.

ANSWER:

(a)

The question references "19.8 MW from 2018 approved" – Table 2.2 shows the 2018 approved forecast peak at 92.9 MW (vs actual at 93.0 MW).

The 2018 approved peak was based on the long-term peak forecast from the 2016 Resource Plan. The 2021 forecast peak at 112.7 MW is based on the updated peak forecast from YEC's 2020 10-Year Renewable Electricity Plan, consideration of the most recent peak of 103.8 MW in 2020, and forecast industrial peak load (12 MW). The major change driving an increase in the non-industrial peak since 2018 is the increased number of 100% electrically heated homes.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab 2.1-1**

APPENDIX 2.1: LONG-TERM AVERAGE THERMAL GENERATION CALCULATIONS

As per previous Board directives, Yukon Energy's GRA revenue requirement annual thermal generation costs for test years are based on long-term average (LTA) hydro generation (rather than forecasts of actual hydro generation resulting from actual water conditions). Accordingly, for the purpose of the 2021 GRA to test year, hydro and thermal generation forecasts are based on LTA water supply for hydro generation as updated with the latest information.

The determination of LTA annual hydro availability is adjusted as required in each GRA to address material changes in LTA hydro system capability due to changes in loads, installed capacity, licensing/permits or other factors.

The forecast 2021 LTA thermal generation for the Application is 84.3 GW.h, based on the Table 2.1-1 developed to determine annual expected YEC thermal generation based on long-term average YEC hydro generation at YEC 2021 forecast grid loads (net of expected IPPs and expected Fish Lake generation) ranging from 475 to 585 GW.h/year. The forecast for the test year is based on the following proposed updates to the determination of LTA annual hydro availability for the current GRA: a) Yukon Energy now has more water year records compared to 2017/18 GRA [38 water years, from 1981 to 2018, compared to 35 water years, 1981 to 2015, used in 2017/18 GRA]. This added information has tended to increase LTA hydro estimates.

QUESTION:

a) Does YEC have any management command/influence on the hydro system capability and usage? Explain.

b) Why is not the 2019 year included in your forecast model?

c) Do we now have more than average water conditions in our systems available for generation? Provide latest Update on Forecast Water Conditions for 2020 qualifying answer.

d) If yes, will this increased hydro use not result in a windfall for the utility if this particular forecasting model is accepted.

e) Please explain how the LWRF is functioning under these positive conditions.

ANSWER:

(a)

Yukon Energy optimizes the dispatch of the hydro system within the license requirements to maximize the hydro system capabilities. The main hydro management/influence that YEC conducts is managing the reservoir levels. Many external factors can influence the reservoirs outside of YEC's control, such as precipitation and the timing of freshet.

(b)

The model is updated every 2 to 3 years with hydrological data. 2019 data will be included in the next model update.

(c)

Based on initial calculations it appears the Aishihik and Mayo river system were higher than average and Whitehorse was slightly lower than average for the 2020 water year. All three hydro facilities refilled to at or near Full Supply Level in 2020.

(d) and **(e)**

Increased hydro use does not result in any windfall for the utility so long as LWRF deferral account procedures are in place to address water-related variances in hydro generation from GRA approved forecast that impact thermal generation fuel costs.

By way of example, Table 2.2 in the Application indicates a ST hydro forecast for 2021 that is 54 GWh higher than the LTA hydro forecast. If the ST forecast was to occur in 2021, and the 2021 GRA revenue requirement forecasts based on LTA hydro are approved, the actual thermal generation would be approximately 54 GWh lower than forecast in the GRA – and the full $9.9 million of fuel cost (at the forecast blend fuel price of $0.1838/kWh) would be paid into the LWRF by YEC as part of the 2021 LWRF Annual Report filing.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab 3-3**

12 The forecast Return on Rate Base increases by 20% ($2.832 million) from 2018 approved to 2021
13 forecast as proposed in the Application. The increase primarily reflects about 12% increase in mid-year
14 rate base in 2021 over 2018 approved. Yukon Energy's capital structure continues to be financed with
15 60% long-term debt and 40% equity. The forecast 2021 average cost of long-term debt at 2.81% is 58
16 basis points [or 26%] higher than the 2018 approved cost at 2.23%, primarily reflecting Mayo B related
17 debt's higher interest with higher loads. The forecast 2021 return on equity at 8.70% remains unchanged
18 from the 2018 approved cost.
Yukon Energy's forecast for new long-term debt interest rate for the 2021 test year is based on long-term
10 Canada bonds plus 120 basis points as directed by the Board. Please see Tab 3, Section 3.5.1. The
11 interest rate adopted for new debt forecast in the test year is 2.19%, determined using a formulaic
12 approach based on the long-term Canada Bonds rate plus 120 basis points (Government of Canada Long-
13 Term Bond Benchmark at 0.99% as of June 30, 2020).

QUESTION:

a) Why is long term debt rates proposed to increase by 26% since last approved GRA while the Bank of Canada rate trending downward, now at 0.25 per cent?

b) Is the add-on of 120 basis points non- negotiable for a new application? If not, why not?

c) Why are ratepayers paying, the holder of the Mayo B debt, prime rates when it is to our publicly-owned shareholder who owns the debt?

d) Does not this term note higher load reflect the mines of that area?

e) Does Yukon Energy make increased revenues from selling to the mines?

f) Why are firm ratepayers paying a premium for this term note when it is through a government decision via Yukon Energy to sell to the mines at a pre-determined contract price?

ANSWER:

(a)

The Application explains the impact from the Mayo B note increase relative to interest rate for new debt.

(b)

Directive 24 of Order 2018-10 notes as follows (as summarized in Tab 6):

> In Board Order 2013-01, the Board directed that a formulaic approach be used for forecasting future costs of debt. This direction was not followed. The Board reiterates the direction and expects this direction to be followed. In future GRAs, both Yukon utilities are to provide their cost-of-debt forecast based on the formulaic approach (long-term Canada bonds plus 120 basis points). If a utility chooses to employ a market-based approach, that utility must also provide a forecast based on the approved formulaic approach.

Yukon Energy's forecast for new long-term debt interest rate for the 2021 test year is based on long-term Canada bonds plus 120 basis points as directed by the Board.

(c), **(d)**, **(e)** and **(f)**

Tab 3, page 3-36 summarize the terms of the Mayo B Promissory Note. The terms of this debt have been reviewed in several previous GRAs. The debt interest rate is impacted by load levels on the grid. Higher loads from mines or other customers increase YEC revenues, and enable more effective use of Mayo B hydro generation such that payment of the full interest rate on the Mayo B Promissory Note is justified.

The Mayo B Promissory Note is a mitigation measure established at the time of that project's capitalization to protect ratepayers against low load risk impacts related to Mayo B rate base costs. The instrument contains a flexible interest provision that can reduce the annual interest rate expense to YEC when actual grid loads are lower than a prescribed minimum needed to justify the full interest rate; if the calculated interest expense is negative then YDC pays that amount to YEC in order to reduce the impact of Mayo B costs to ratepayers. The 2017/18 GRA noted that in each year since 2013, YEC's annual

interest expense on the Mayo B Promissory Note has been reduced by the flexible interest provisions. Lower loads in 2014 resulted in negative interest payments from YDC to YEC of $0.112 million.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application 3-6**

8 Purchased power costs also include forecast purchases in
9 2021 under the Yukon government Independent Power Production (IPP) Policy of 1.983 GW.h1 as
10 provided in Table 2.2. The purchase cost for the IPPs in 2021 is assumed at $0.1583/kW.h based on the
11 latest approved thermal fuel cost for YEC in its 2017/18 GRA.2 Total IPP purchase cost is forecast at
12 $0.314 million for 2021.

QUESTION:

a) What is the YEC protocol to purchase from IPP?

b) Please give a cost /benefit analysis of this 2021 forecast IPP purchase cost of $0.134 million?

c) Please provide purchase agreement with this IPP or any IPP?

ANSWER:

(a)

Please see YUB-YEC-1-95(c) for SOP IPP program material, including SOP Program Guide, SOP Program Rules, SOP Application Process, SOP Application Form, Interconnection Standards; and Electricity Purchase Agreement Template.

(b)

Per the quotation provided in the preamble – the Total IPP purchase cost is forecast at $0.314 million for 2021 (not $0.134 million). OIC 2019-25 provides direction regarding IPP costs that the Board must allow the utility to recover, based on paying the IPP the last approved blend fuel price per kWh for each kWh delivered. IPP costs will equal thermal fuel cost savings when all IPP generation can be used to displace thermal generation.

(c)

Please see Attachment 1 to this response.

Yukon Energy Corporation

STANDARD FORM ELECTRICITY PURCHASE AGREEMENT

STANDING OFFER PROGRAM

THIS ELECTRICITY PURCHASE AGREEMENT ("**EPA**") is made as of the 27th day of August, 2020

BETWEEN:

NOMAD CONTRACTING & ELECTRICAL SERVICES LTD., a corporation incorporated under the laws of the Yukon ("**Seller**")

- and -

YUKON ENERGY CORPORATION, a corporation incorporated under the laws of the Yukon ("**Buyer**")

WHEREAS:

A. The Government of Yukon issued the *Energy Strategy for Yukon* in January 2009 and in October 2015 issued the *Independent Power Production Policy* as reviewed and updated in October, 2018 (the "**IPP Policy**") as part of the strategy's priority action to "update and develop a policy framework for electricity that emphasizes efficiency, conservation and renewable energy". The IPP Policy created a framework for the development of the Standing Offer Program. In support of the objectives of the IPP Policy, the Government of Yukon issued the SOP OIC and, together with the Utilities, developed the SOP Rules;

B. Seller has proposed the development of the Project on the Electrical Grid pursuant to the Standing Offer Program and such Project has been reviewed and approved in accordance with the SOP Rules; and

C. This EPA is being entered into by the Parties in respect of the Project under the Standing Offer Program in accordance with the SOP Rules.

NOW THEREFORE Seller and Buyer agree as follows:

ARTICLE 1
DEFINITIONS, INTERPRETATION AND SCHEDULES

1.1 Definitions and Interpretation

The definitions and certain principles of interpretation that apply to this EPA are set out in Schedule "A".

1.2 Schedules

The following Schedules attached hereto are incorporated into and made a part of this EPA:

Schedule "A" - Definitions and Interpretation

Schedule "B"	-	Project Description
Schedule "C"	-	Form of Annual Operating Plan
Schedule "D"	-	System Interconnection Study Report
Schedule "E"	-	Monthly Energy Shortfall Payment
Schedule "F"	-	Termination Payment
Schedule "G"	-	System Interconnection Guidelines
Schedule "H"	-	Joint Operating Procedure
Schedule "I"	-	Delivery Time Adjustment Table

ARTICLE 2
CONDITIONS PRECEDENT AND TERM

2.1 Conditions Precedent

(a) Except as provided in this Section, this EPA has no legal force until the Conditions Precedent described in Schedule "B" are satisfied by Seller or waived by Buyer. The Conditions Precedent may only be waived by Buyer by notice in writing to Seller.

(b) Seller will:

(i) seek to satisfy each of the Conditions Precedent on or before the Condition Date;

(ii) keep Buyer informed of any circumstances which may result in any of those Conditions Precedent not being satisfied in accordance with their terms; and

(iii) promptly notify Buyer upon satisfaction of any of those Conditions Precedent and provide such supporting evidence as may be reasonably required by Buyer.

(c) If the Conditions Precedent are not satisfied or waived on or before the Condition Date, or it becomes apparent that the Conditions Precedent will not, in the reasonable opinion of Buyer, be satisfied by the Condition Date, the Conditions Precedent will be taken to have failed and Buyer shall be entitled to terminate this EPA, in which event each Party shall release the other from any and all claims, damages, costs, expenses or liabilities whatsoever incurred by it and its Affiliates in relation this EPA provided that (i) Seller shall remain liable for all costs incurred by Buyer in respect of the System Interconnection Study Report, System Upgrade Costs or New Interconnection Facilities Costs and (ii) otherwise each Party shall be responsible for its own costs incurred by it in connection with this EPA.

(d) Section 2.1(a) does not apply to this Article 2, Section 3.5 and Articles 10, 11, 12, 13 and 15 which shall be in full force and effect from the date of this EPA.

2.2 Term

Subject to Section 2.1, this EPA shall commence on the Effective Date and continues for the period specified in Schedule "B", unless it is terminated earlier in accordance with this EPA.

ARTICLE 3
CONSTRUCTION AND OPERATION

3.1 Construction and Operation Costs, Liabilities and Actions

Seller will be fully responsible for the permitting, design, engineering, construction, Interconnection, commissioning, operation, maintenance, reclamation and decommissioning of the Seller's Plant and shall be responsible for all costs, expenses, liabilities and other obligations associated with such activities.

3.2 Standard of Construction and Operation

Except as otherwise consented to in writing by Buyer, such consent not to be unreasonably withheld, conditioned or delayed, Seller will ensure that the location, design, engineering, construction, Interconnection, commissioning, operation and maintenance of the Seller's Plant, are and will be carried out at all times during the Term:

(a) in accordance with the description of the Seller's Plant in Schedule "B" and the information in the Application in all material respects;

(b) in compliance with the Project Standards; and

(c) by qualified and experienced individuals.

The Parties shall conduct their respective operations in accordance with the Joint Operating Procedure.

3.3 Project Changes

Without Buyer's prior written consent, not to be unreasonably withheld, conditioned or delayed Seller will not make any change to:

(a) the Seller's Plant as described in Schedule "B"; or

(b) any other aspects of the Seller's Plant or the information in any System Interconnection Study Report completed for Seller's Plant prior to the Effective Date which would require changes by Buyer to the System Upgrades where such change would increase Buyer's liability for any costs or otherwise increase the obligations or risks of Buyer with respect to the Seller's Plant or any other project.

Seller acknowledges that Buyer may require, as a condition of its consent to any change described in this Section, that Seller agree in writing to reimburse Buyer for any reasonable incremental liability for any losses, costs and damages incurred by Buyer or any third party, with respect to the Seller's Plant or any other project, as a result of any change described in this Section. Buyer may also require that Seller provide performance assurance or security to Buyer in order to ensure that Buyer has no financial exposure in respect of such reimbursement obligation.

3.4 Development Progress Reports

Seller will deliver a Development Progress Report to Buyer on each January 1, April 1, July 1 and October 1 after the Effective Date until Seller's COD. Buyer shall be entitled to request such

additional information as it may reasonably require from time to time in respect of Seller's development of Seller's Plant.

3.5 Responsibility for Upgrade Costs

Seller will be responsible for and shall pay Buyer for all System Upgrade Costs and New Interconnection Facilities Costs in accordance with the following:

(a) the System Interconnection Study Report sets out Buyer's estimate of System Upgrade Costs and the New Interconnection Facilities Costs. Seller shall (i) pay to Buyer in advance an amount equal to such estimate of System Upgrade Costs and New Interconnection Facilities Costs ("**Upgrade Costs Advance**") and/or (ii) provide such other security in form, substance and amount as may be acceptable to Buyer in its Discretion to secure the obligation of Seller to pay such costs ("**Upgrade Costs Security**"). Buyer shall not be required in any circumstances to accept Upgrade Costs Security except in its Discretion. Buyer shall not be required to perform any work or incur any System Upgrade Costs or New Interconnection Facilities Costs where Buyer determines in its Discretion that the amount of Upgrade Costs Advance it has received together with any Upgrade Costs Security is not sufficient to adequately secure the obligation of Seller to pay all System Upgrade Costs and New Interconnection Facilities Costs and Seller shall forthwith provide to Buyer such additional Upgrade Costs Advance and/or Upgrade Costs Security as may be reasonably required by Buyer;

(b) Buyer will exercise Good Industry Practice to perform, or cause to be performed, the work required in respect of the System Upgrades and the New Interconnection Facilities for the Project. Buyer shall be entitled to draw upon the Upgrade Costs Advance and Upgrade Costs Security from time to time in its Discretion to satisfy any System Upgrade Costs and New Interconnection Facilities Costs as and when incurred by Buyer; and

(c) notwithstanding the estimate of System Upgrade Costs and New Interconnection Facilities Costs provided by Buyer to Seller contemplated in Section 3.5(a) or the amount of any Upgrade Costs Advance and Upgrade Costs Security provided by Seller, Seller shall be responsible for and shall pay Buyer the actual System Upgrade Costs relating to the System Upgrades incurred by Buyer. Following the completion of the System Upgrades and the payment in full by Seller of all System Upgrade Costs incurred by Buyer for such work, Buyer shall release to Seller any undrawn portion of the Upgrade Costs Advance and Upgrade Costs Security**.**

3.6 Metering

As part of the System Upgrades and New Interconnection Facilities, Buyer will install and maintain an appropriate Meter installation at the POI, and ensure that such Meter is tested and sealed according to any Measurement Canada standards. Seller will allow Buyer to access the Seller's Plant as may be necessary from time to time to install and maintain the Meter at the POI. If there is any dispute regarding the accuracy of the Meter, either Party may give notice to the other Party of the dispute. In that case, the Parties will resolve the matter in accordance with the *Electricity and Gas Inspection Act* (Canada).

3.7 Insurance

Seller will, at its cost, obtain and maintain (a) policies of commercial general liability insurance with a per occurrence limit of liability not less than $5,000,000, and (b) property insurance, with limits of liability and deductibles consistent with those a prudent owner of a facility similar to the Seller's Plant would maintain and those the Facility Lender may require. All commercial general liability policies must include Buyer, its directors, officers, employees and agents as additional insureds and must contain a cross liability and severability of interest clause. All policies of insurance must include a waiver of subrogation in favour of Buyer. All policies of insurance must be placed with insurers that have a minimum rating of A- (or equivalent) by A.M. Best Company and are licensed to transact business in the Yukon and must be endorsed to provide to Buyer 30 days' prior written notice of cancellation, non-renewal or any material amendment that results in a reduction in coverage. Seller will give Buyer a copy of the insurance certificate(s) for the insurance required to be maintained by Seller under this Section not more than 30 days after the effective date of coverage and promptly upon renewal thereafter. Seller will be responsible for the full amount of all deductibles under all insurance policies required to be maintained by Seller under this Section.

3.8 Seller's COD

(a) Except with Buyer's prior written consent, Seller's COD may not occur earlier than 90 days prior to Target Seller's COD.

(b) Buyer will not be required to incur any incremental expense or other liability of any kind to enable Seller's COD to occur prior to Target Seller's COD.

3.9 Change in Target Seller's COD

If the estimated date for completing the System Upgrades or the New Interconnection Facilities as required to achieve Buyer's COD is later than 90 days prior to the Target Seller's COD, Buyer shall provide notice to Seller of such delay and, provided Seller is not responsible for any delay in completing the System Upgrades or the New Interconnection Facilities (including a failure to pay amounts contemplated in Section 3.5), upon Seller's written request that the Target Seller's COD be postponed, Buyer will postpone the Target Seller's COD to the estimated date for completing the System Upgrades and the New Interconnection Facilities plus 90 days.

3.10 No Liability For Delay

Buyer shall exercise reasonable commercial efforts to achieve Buyer's COD prior to Target Buyer's COD. Buyer will have no liability under this EPA for delays in completion of (a) any System Upgrades or the New Interconnection Facilities, or (b) other work undertaken by Buyer or any of Buyer's Affiliates on the Seller's Plant side of the POI, in each case howsoever arising.

3.11 Outages

(a) **Notice of Seller's Outage** - Seller will notify Buyer of any Outages in Seller's Plant, or changes in any such Outages, by delivering to Buyer an Outage Notice or revised Outage Notice:

(i) promptly in the case of a Forced Outage or a Maintenance Outage;

(ii) not less than 90 days in advance of any Planned Outage, or such shorter time period with Buyer's written consent, such consent not to be unreasonably withheld, delayed or conditioned; and

(iii) promptly in the case of any changes to the duration, start time or end time of any Outage.

(b) **Notice of Buyer's Outage** - In addition to Buyer's reporting requirements under Section 4.8(d), Buyer will notify Seller of any Planned Outages that will result in a Buyer's Distribution/Transmission Constraint or changes in any such Planned Outages, by delivering to Seller an Outage Notice or revised Outage Notice:

(i) not less than 90 days in advance of any such Planned Outage, or such shorter time period with Seller's written consent, such consent not to be unreasonably withheld, delayed or conditioned; and

(ii) promptly in the case of any changes to the duration, start time or end time of any Outage.

(c) **Coordination and Scheduling of Outages -** Seller will coordinate all Planned Outages or Maintenance Outages with Buyer's maintenance schedule or other requirements where such schedule or requirements are publicly available or otherwise notified to Seller.

3.12 Annual Operating Plan

On or before October 31 in each year during the Term, Seller will provide to Buyer its Annual Operating Plan, including any required update to the then current Annual Operating Plan, for the 12-month period commencing on January 1 of the next year. Seller will promptly provide Buyer with a revised Annual Operating Plan from time to time upon Seller becoming aware of any expected material change in the original Annual Operating Plan for that period. The Parties agree the Annual Operating Plan is provided for planning purposes and does not guarantee or limit the quantity or timing of Delivered Energy to the POI.

ARTICLE 4
PURCHASE AND SALE OBLIGATIONS

4.1 Energy prior to Buyer's COD

Subject to satisfaction of all obligations of Seller under this EPA, upon the occurrence of Seller's COD but prior to the occurrence of Buyer's COD, Buyer will not be obligated to purchase, or accept delivery from Seller of, any Energy, provided if Buyer does accept, in its sole discretion, delivery of Energy at the POI, Buyer will pay for such Energy accepted by Buyer prior to Buyer's COD in accordance with Section 5.1.

4.2 Energy after Buyer's COD

From and after Buyer's COD for the remainder of the Term, Seller will sell and deliver all Energy to Buyer at the POI and Buyer will, subject to Sections 4.3 and 4.4, purchase and accept delivery of all Delivered Energy. Buyer will pay for Delivered Energy from and after Buyer's COD in accordance with Section 5.1.

4.3 Limit on Delivered Energy and Capacity

Notwithstanding the foregoing provisions of this Article 4:

(a) in any hour, Buyer will not be obligated at any time to purchase or accept delivery from Seller at the POI of any Energy generated in excess of the Seller's Plant Capacity in such hour (as measured in KWh) and no amount will be payable by Buyer for Delivered Energy in excess of the Seller's Plant Capacity in such hour, whether prior to or after COD, and regardless of whether Buyer consented to and accepted delivery of such Energy at the POI;

(b) in any calendar year, Buyer will not be obligated to purchase or accept delivery from Seller at the POI of any Energy generated in excess of the Project Energy Volume and no amount will be payable by Buyer for Delivered Energy in any such calendar year in excess of the Project Energy Volume in such calendar year, whether prior to or after COD, and regardless of whether Buyer consented to and accepted delivery of such Energy at the POI; and

(c) in determining the total amount of Delivered Energy for a year, month, hour or any other time period under this EPA for any purpose, the amount of Delivered Energy in each hour of such time period will not exceed the Seller's Plant Capacity in such hour, even if Seller delivered to the POI Energy in excess of such amounts, or the Seller's Plant was capable of generating Energy in excess of such amounts.

4.4 Distribution/Transmission Constraints

Buyer will not be in breach or default of its obligations under Sections 4.1, 4.2 or 5.1 if Buyer is not able to accept delivery of Energy at the POI as a result of a Distribution/Transmission Constraint. Buyer will have no liability with respect to a Distribution/Transmission Constraint, except as set out in Section 4.8, if applicable.

4.5 Exclusivity

(a) Seller will not at any time during the Term commit, sell or deliver any Energy (or related Environmental Attributes) to any Person other than Buyer under this EPA. Seller will not use any Energy (or related Environmental Attributes) for any purpose whatsoever except for sale to Buyer under this EPA. These prohibitions do not apply if, and for so long as, Buyer is in breach of its obligations under Section 4.2.

(b) Seller shall not be entitled to interconnect a generating facility to the Seller's Plant and transmit electricity via the Seller's Plant to the POI.

4.6 Custody, Control, Risk of and Title To Energy

Custody, control, risk of, and title to, all Energy (including any Delivered Energy exceeding the limits set out in Section 4.3 even where Buyer has not paid for such excess Delivered Energy) shall pass from Seller to Buyer at the POI. Seller will ensure that all Energy delivered to Buyer under this EPA is free and clear of all liens, claims, charges and encumbrances.

4.7 Line Losses

Seller will be responsible for all Line Losses, costs and liabilities relating to the transmission of Energy and other electricity, if applicable, from the POI to the interconnection point between the New Interconnection Facilities and the Electrical Grid. Such Line Losses shall be determined in accordance with the Line Loss Methodology.

4.8 Distribution/Transmission Constraint

(a) If, in any month after Buyer's COD, Seller is unable to deliver Energy at the POI or Seller's ability to deliver Energy at the POI is reduced solely as a result of a continuous Distribution/Transmission Constraint which exceeds 30 minutes in duration and which:

(i) is not caused by a Planned Outage by Buyer of the Distribution System or Transmission System;

(ii) is not caused by an event beyond the reasonable control of Buyer; and

(iii) is not caused by Seller, the Seller's Plant or anything on Seller's side of the POI;

(a "**Non-Permitted Distribution/Transmission Constraint**") then, notwithstanding that Buyer is excused under Section 4.4 from its obligations under Section 4.2, Buyer shall pay Seller, for each calendar month in which the Non-Permitted Distribution/Transmission Constraint has occurred, the Monthly Energy Shortfall Payment calculated in accordance with Schedule "E" less any costs Seller avoided or, acting reasonably, could have avoided during the Non-Permitted Distribution/Transmission Constraint.

(b) Buyer will not be required to pay any Monthly Energy Shortfall Amount under this Section in any of the following circumstances:

(i) during any period specified as a Seller's Outage in any Outage Notice, revised Outage Notice or in the Annual Operating Plan or during any other period where the Seller's Plant would otherwise not have been operating;

(ii) during any period when either Party is or would be excused, in accordance with Section 14.1, from its obligation to deliver or to accept delivery of Energy as a result of Force Majeure; or

(iii) if Seller has not provided Buyer with an Annual Operating Plan in accordance with Section 3.12 for the year in which the Non-Permitted Distribution/Transmission Constraint occurs.

(c) Seller will maintain accurate and complete Records of all costs Seller avoided or, acting reasonably, could have avoided during the Non-Permitted Distribution/Transmission Constraint and will report all such costs to Buyer and provide Buyer with all information required to calculate such costs.

(d) Buyer will give Seller notice of all Distribution/Transmission Constraints in each month which individually exceed 30 minutes in duration when it provides its monthly statements in accordance with Section 5.3.

(e) In the event of a Dispute by the Parties in respect of the amount of any Monthly Energy Shortfall Amount, the matter shall be resolved in accordance with Article 12.

4.9 Buyer Dispatch/Turn-Down Right

(a) Buyer may at any time during the Term deliver notice to Seller requiring Seller to Dispatch/Turn-Down and Seller will promptly comply with any such direction except to the extent that any operational, technical or regulatory constraint prevents or limits Seller's ability to comply with such direction.

(b) For each hour of the applicable Dispatch/Turn-Down, Buyer will pay Seller an amount equal to:

(i) the price payable for post-COD Delivered Energy under Section 5.1 multiplied by (A) the aggregate of the duration of the applicable Dispatch/Turn-Down (measured as a fraction determined as the aggregate number of minutes in such Dispatch/Turn-Down period divided by 60) multiplied by (B) an amount equal to the positive difference, if any, of (1) the "Non-Permitted Distribution / Transmission Constraint Hourly Deemed Energy" set out in Table E-1 of Schedule "E" for the applicable calendar month less (2) the amount of Delivered Energy in such hour of Dispatch/Turn-Down (the positive difference being the "**Dispatch/Turn-Down Deemed Energy**"); less

(ii) any costs Seller avoided or, acting reasonably, could have avoided during the period of the Dispatch/Turn-Down.

(c) Buyer will not be required to pay any amount in respect of Dispatch/Turn-Down Deemed Energy under this Section in any of the following circumstances:

(i) during any period specified as a Seller's Outage in any Outage Notice, revised Outage Notice or in the Annual Operating Plan or during any other period where the Seller's Plant would otherwise not have been operating;

(ii) during any period when either Party is or would be excused, in accordance with Section 14.1, from its obligation to deliver or to accept delivery of Energy as a result of Force Majeure;

(iii) if Seller has not provided Buyer with an Annual Operating Plan in accordance with Section 3.12 for the year in which the Dispatch/Turn-Down occurs;

(iv) during any other hour when the Seller's Plant would otherwise not have been operating if there had been no Dispatch/Turn-Down notice; or

(v) where Buyer's requirement for Seller to Dispatch/Turn Down is the result of the operation of the Seller's Plant in a manner inconsistent with Section 3.2.

(d) Where Buyer requires the Dispatch/Turn-Down as result of a Non-Permitted Distribution/Transmission Constraint, Section 4.8 will apply.

4.10 Electric Service to Seller

If at any time Buyer delivers electrical energy to service Seller's Plant Load, then such electrical energy shall be accounted and paid for separately under the applicable agreement for such electricity energy services and will not be netted off of Delivered Energy for the purposes of determining amounts payable by Buyer in accordance with Section 5.1.

ARTICLE 5
PRICE AND PAYMENT TERMS

5.1 Energy Price

In each billing period, Buyer shall pay to Seller, for each KWh of Delivered Energy, the Energy Price calculated in accordance with Schedule "B".

5.2 No Further Payment

The amount payable by Buyer as specified in Section 5.1 is the full and complete payment and consideration payable by Buyer for Delivered Energy and for Environmental Attributes.

5.3 Statements and Payment

(a) **Statements**

(i) Buyer will, by the 15th day of each month after the Buyer's COD, deliver to Seller a statement for the preceding month. The statement must indicate, among other things:

(A) the amount of, and price payable for, Delivered Energy for that month;

(B) any amount owing by Buyer in respect of a Non-Permitted Distribution/Transmission Constraint pursuant to Section 4.8;

(C) any Final Amounts owing by either Party to the other Party.

Where there has been any Delivered Energy purchased by Buyer in the period prior to Buyer's COD, the first statement following Buyer's COD shall also account for all amounts payable by Buyer to Seller for such period prior to Buyer's COD. The statement must set out in reasonable detail the manner by which the statement and the amounts shown thereon were computed and be accompanied by sufficient data to enable Seller, acting reasonably, to satisfy itself as to the accuracy of the statement.

(ii) Either Party may give notice to the other Party of an error, omission or disputed amount on a statement within 36 months after the statement was first issued together with reasonable detail to support its claim. After expiry of that 36 month period, except in the case of willful misstatement, fraud or concealment, amounts on a previously issued statement will be considered accurate and amounts which were omitted will be considered to be nil, other than amounts disputed in accordance with this Section within the 36 month period, which will be resolved in accordance with this EPA.

(iii) If Seller gives notice to Buyer of an error, omission or disputed amount on a statement as described in Section 5.3(a)(ii), Seller may direct Buyer to promptly produce new statements for the relevant month(s). The new statements will show the undisputed amount and disputed amount each in a separate statement or will otherwise separate the amounts in a single statement in a manner acceptable to Seller, acting reasonably.

(b) **Payment**

(i) Within 30 days after receipt of a statement delivered under Section 5.3(a), and subject to Section 5.5, Buyer will pay to Seller or Seller will pay to Buyer the amount set out in the statement, except to the extent Seller in good faith disputes all or part of the statement by notice to Buyer as described in Section 5.3(a)(ii).

(ii) If Seller disputes any portion of a statement, the applicable Party must pay the undisputed net amount payable by it pursuant to the statement or, if applicable, the new statement of the undisputed amount described in Section 5.3(a)(iii).

(iii) The Parties will endeavor to resolve any error, omission or disputed amount on a statement amount within 30 days of the notice described in Section 5.3(a)(ii).

(iv) Any amount required to be paid in accordance with this EPA, but not paid by either Party when due, will accrue interest at an annual rate equal to the Prime Rate plus 2%, compounded monthly. Any disputed amount that is found to be payable will be deemed to have been due within 30 days after the date of receipt of the statement which included or should have included the disputed amount.

(c) **Payment Calculations**

(i) For the purpose of all payment calculations under this EPA:

(A) all payment calculations will be rounded to the nearest cent; and

(B) Energy will be expressed in KWh rounded to two decimal places.

(ii) For the purpose of all payment calculations under this EPA, where CPI is to apply, if Statistics Canada (or the then recognized statistical branch of the Canadian Government):

(A) computes, at any time after the Effective Date, the CPI on a basis different to that employed at the Effective Date, then the CPI will be converted using the appropriate formula recommended by Statistics Canada (or the then recognized statistical branch of the Canadian Government);

(B) at any time ceases to publish or provide the CPI, then the provisions of Section 2.7 of Schedule "A" will apply;

(C) has not published the CPI for a relevant period at the time Buyer is required to provide Seller with a statement, Seller will prepare the invoice based on the CPI in effect at the time the invoice is issued and

when the CPI for the relevant period is published, Buyer will recalculate the invoice amounts in the next succeeding invoice and will include a credit or debit, without interest, in the next succeeding invoice based on the results of the recalculation; or

(D) recalculates the CPI within 36 months after an invoice affected by that CPI calculation has been issued, then Buyer will recalculate the invoice amounts for the relevant period in the next succeeding invoice and will include a credit or debit, without interest, in the next succeeding invoice based on the results of the recalculation.

5.4 Taxes

All dollar amounts in this EPA do not include any value added, consumption, commodity or similar taxes, including GST and any successor thereto, which, if applicable, will be added to each statement and paid by Buyer.

5.5 Set-off

If Buyer and Seller each owe the other an amount under this EPA in the same month, then such amounts with respect to each Party will be aggregated and the Parties may discharge their obligations to pay through netting, in which case the Party, if any, owing the greater aggregate amount will pay to the other Party the difference between the amounts owed, provided that this Section applies only to any purchase price for Delivered Energy and any Final Amount owing by either Party to the other Party. Except as otherwise expressly provided herein, each Party reserves all rights, counterclaims and other remedies and defenses which such Party has, or may be entitled to, arising from or related to this EPA.

5.6 Change in Law and GRA Cost Recovery

(a) If at any time after the Effective Date:

(i) the costs to Buyer of complying with its obligations under this EPA are, as a result of one or more Changes in Law, increased or decreased (including, for greater certainty, any increase of the obligations or risks of Buyer with respect to the Seller's Plant, but excluding any increase of the obligations or risks of Buyer with respect to the System Upgrades or New Interconnection Facilities); or

(ii) the costs to Buyer of complying with its obligations under this EPA which were of a category or type previously recovered under a General Rate Application are determined under a General Rate Application to no longer be approved for recovery from Buyer's customers in such General Rate Application;

then, to the extent that Buyer would not have incurred such costs except for the Seller's Project and/or the entering into of this EPA, the amount payable by Buyer as specified in Section 5.1 shall be adjusted by the amount necessary to reflect those changed costs which Buyer is unable to recover from Buyer's customers in a General Rate Application.

(b) For each relevant event in Section 5.6(a)(i) or 5.6(a)(ii), Buyer shall provide Seller with a statement setting out such information as is reasonably necessary to demonstrate that such an event has occurred, the reasonableness and necessity of the measures taken by

Buyer in relation to the event, its efforts to mitigate the costs associated with such event including reasonable efforts of Buyer to recover such costs from its customers in a General Rate Application, the nature and extent of any increase or decrease in the amount payable by Seller as specified in Section 5.1, and any such other information as may be reasonably requested by Seller.

(c) If in Seller's view there has been a Change in Law that may decrease Buyer's costs, Seller may request Buyer to demonstrate how such Change in Law has affected its costs under this EPA by providing the applicable information contemplated in Section 5.6(b).

(d) The payments between the Parties shall thereafter be adjusted effective as of the date such event in Section 5.6(a)(i) or 5.6(a)(ii) affects the costs of Buyer hereunder.

(e) If there is any Dispute between the Parties with respect to this Section 5.6, including as to the appropriate increase or decrease in any payments between the Parties under this Agreement, the Dispute shall be resolved in accordance with Article 12.

ARTICLE 6
ENVIRONMENTAL ATTRIBUTES

6.1 Environmental Attributes

Seller hereby transfers, assigns and sets over to Buyer all right, title and interest in and to the Environmental Attributes. Seller will ensure that all Environmental Attributes transferred to Buyer under this EPA are free and clear of all liens, claims, charges and encumbrances. Seller shall use commercially reasonable efforts to (i) provide information reasonably requested by Buyer in relation to such Environmental Attributes, including as may be required to allow Buyer to verify or certify that such Environmental Attributes exist or have been created and (ii) assist in having Seller's Plant certified, licensed, qualified or approved under any rules, regulations, programs or applicable Laws of any Governmental Authority or independent certification agency in respect of Environmental Attributes, provided that Buyer shall pay Seller all costs reasonably incurred by Seller in respect of the same. Any failure by Seller to exercise such commercially reasonable efforts under this Section 6.1 is a "material default" for the purposes of this EPA, and Buyer may terminate this EPA under Section 9.1(j).

ARTICLE 7
EPA ADMINISTRATION, RECORDS AND AUDITS

7.1 Records

Each of Buyer and Seller will prepare and maintain all Records, or duplicates of such Records, at Buyer's head office or local Yukon office or the Seller's Plant, as applicable, or following the expiry of the Term or the earlier termination of this EPA, at such other location as may be agreed in writing between the Parties, for a period of not less than 7 years from the date on which each such Record is created. The Audit Parties may take copies of such Records for the purposes of an inspection or audit under Section 7.2.

7.2 Inspection and Audit Rights

For the sole purpose of verifying:

(a) compliance with this EPA;

(b) the accuracy of statements, supporting information and calculations delivered by a Party under this EPA;

(c) the qualification of the Seller's Plant and the Energy for the Environmental Certification; or

(d) the liability of Seller for System Upgrades Costs and New Interconnection Facilities Costs,

Buyer or Seller, as applicable, will, on reasonable prior written notice from either Party desiring to conduct an audit, provide the Audit Parties with prompt access during normal business hours to (i) in respect of Buyer, Buyer's records solely relating to this EPA, or (ii) in respect of Seller, Seller's Plant and all records relating to the Seller's Plant, including any Seller Confidential Information, as applicable, to enable the Audit Parties to conduct an inspection or audit thereof. The Audit Parties will exercise any access and audit rights under this Section in a manner that minimizes disruption to the operation of the Party subject to the audit. The audit rights contained in this Section 7.2 shall be subject to the limitations set forth in Section 5.3.

7.3 Seller Consents

Seller will promptly provide any consents required to enable any of the Audit Parties to make enquiries with any Governmental Authority or any Person administering the Environmental Certification concerning any or all of the following: (a) the qualification of the Seller's Plant and the Energy for Environmental Certification, the status of the Environmental Certification and copies of any audits, inspections or reports prepared in connection with the Environmental Certification; and (b) compliance by Seller with Laws and Permits applicable to the Seller's Plant.

ARTICLE 8
FIRST NATION CLAIMS

8.1 Notification of First Nation Claim

Given the ownership and location of the Project, Seller and Buyer do not expect any First Nation Claims. However, if Buyer or Seller receives or obtains evidence of a First Nations Claim, it will notify the other Party as soon as practicable.

8.2 Obligation to Consult

If Buyer receives, obtains evidence or becomes aware of a First Nations Claim, it may direct Seller, at Seller's cost, to:

(a) consult with the First Nations making the First Nation Claim, or, if requested by Buyer, assist Buyer in the consultation process;

(b) take any measures Seller deems necessary to address, prevent, mitigate, compensate or otherwise accommodate any Potential Impacts provided the measures are consented to in advance by Buyer and the First Nations making the First Nation Claim; and

(c) provide regular written reports to Buyer concerning Seller's compliance with this Section, as may be reasonably requested by Buyer.

8.3 Seller Termination for First Nation Claim

At any time prior to Buyer's COD, if:

(a) within 60 days of Buyer receiving, obtaining evidence or becoming aware of a First Nations Claim, Buyer does not make a direction to Seller as contemplated in Section 8.2;

(b) Buyer notifies Seller in writing that it will not make a direction to Seller as contemplated in Section 8.2; or

(c) after consultation with the First Nations making the First Nation Claim it becomes clear that the measure(s) necessary for Seller to resolve the First Nation Claim or to address, prevent, mitigate, compensate or otherwise accommodate any Potential Impacts would, in Seller's discretion, impose a commercially unreasonable cost on Seller, or would require the consent of Buyer under this EPA or agreement by Buyer to amend this EPA in order to address any Potential Impacts and such consent or agreement to amend is not provided within 60 days after Seller's request to Buyer,

then Seller may terminate this EPA on notice to Buyer. Such termination will be effective 30 days after the date of delivery of such notice of termination unless otherwise agreed by the Parties. A termination by Seller under this Section will, for all purposes of this EPA, be treated in the same manner as a termination by Seller under Section 9.3(c) of this EPA (including the obligations of Seller under Section 9.7). The termination of this EPA is the exclusive remedy to which Seller may be entitled to if Seller elects to terminate this EPA under this Section.

8.4 Buyer Termination for First Nation Claim

At any time prior to Buyer's COD, if Buyer receives, obtains evidence or becomes aware of a First Nations Claim, Buyer may, at its sole discretion, terminate this EPA on notice to Seller. Such termination will be effective 30 days after the date of delivery of such notice of termination unless otherwise agreed by the Parties. Upon a termination by Buyer under this Section 8.4, Seller shall reimburse Buyer for costs or liabilities described in Sections 9.7(a), (b) and (c). The reimbursement by Seller of such costs or liabilities, the indemnification by Seller contemplated in Section 8.5 and the termination of this EPA are the exclusive remedies to which Buyer may be entitled to if Buyer elects to terminate this EPA under this Section.

8.5 Seller Indemnity for First Nation Claim

Seller shall indemnify and hold Buyer and its Affiliates harmless from any and all claims, damages, costs, expenses, or liabilities whatsoever incurred by Buyer and its Affiliates in relation to such First Nation Claim and such indemnity shall survive termination of this EPA.

ARTICLE 9
TERMINATION

9.1 Termination by Buyer

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Buyer may have under this EPA or at law or in equity in respect of any of the following events, Buyer may terminate this EPA by notice to Seller if:

(a) Seller's COD does not occur within 730 days following Target Seller's COD for any reason whatsoever (including Force Majeure), provided that Buyer may terminate this EPA under this provision only if Buyer delivers a termination notice prior to Seller's COD; or

(b) at any time after Buyer's COD, Seller fails to deliver at least an average of 25% of the aggregate Projected Monthly Energy as set out in Schedule "E" to Buyer over all hours in a period of 730 continuous days for any reason whatsoever (including Force Majeure, a Distribution/Transmission Constraint), but excluding a Non-Permitted Distribution/ Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(c) at any time after Buyer's COD, Buyer is unable to accept delivery of Energy at the POI for a period of 730 continuous days due to Force Majeure invoked by Buyer or a Distribution/ Transmission Constraint other than a Non-Permitted Distribution/ Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(d) Seller breaches Section 4.5; or

(e) Seller fails to complete any application, payment, filing, study, document or other step in the process for interconnecting the Seller's Plant to the Distribution System, Transmission System or New Interconnection Facilities, as applicable, in accordance with the requirements of, and within the time limits, including any cure periods, specified by Buyer, and such failure could reasonably be expected to have an adverse impact on Buyer or any third party; or

(f) any System Interconnection Study Report completed after the Effective Date contains information that is inconsistent with the description of the Seller's Plant in Schedule "B" and Seller has not received Buyer's consent under Section 3.3 for the change to Schedule "B"; or

(g) Seller is Bankrupt or Insolvent; or

(h) Seller, as a result of an act or omission of Seller, ceases to be exempt from regulation as a "public utility" as defined in the *Public Utilities Act* with respect to the Seller's Plant and the sale of Energy to Buyer under this EPA, and the loss of such exemption could reasonably be expected to have an adverse effect on the benefit to Buyer of this EPA; or

(i) an amount due and payable by Seller to Buyer under this EPA remains unpaid for 30 days after its due date and such default has not been cured within 30 days after Buyer has given notice of the default to Seller; or

(j) Seller is in material default of any of its covenants, representations and warranties or other obligations under this EPA (other than as set out above), unless within 30 days after the date of notice by Buyer to Seller of the default Seller has cured the default or, if the default cannot be cured within that 30 day period, Seller demonstrates to the reasonable satisfaction of Buyer that Seller is working diligently and expeditiously to cure the default and the default is cured within a further reasonable period of time. A "material default" includes any purported Assignment of this EPA without the consent of Buyer.

Any termination pursuant to this Section will be effective immediately upon delivery of the notice of termination to Seller.

9.2 Notice of Termination Event

Seller will notify Buyer promptly if Seller is Bankrupt or Insolvent or if there is a material risk that Seller will become Bankrupt or Insolvent or if Seller has defaulted under any agreement with a Facility Lender or if any Permit or land tenure agreement for the Seller's Plant is terminated or expires.

9.3 Termination by Seller

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Seller may have under this EPA or at law or in equity in respect of any of the following events, Seller may terminate this EPA by notice to Buyer if:

(a) after Buyer's COD, Buyer has not accepted delivery of Energy for a period of 730 continuous days due to an event described in Section 4.4 or any event of Force Majeure and Seller is not entitled to receive any payment pursuant to Section 4.8 in respect of that period; or

(b) the Seller's Plant has suffered major damage where the cost to repair the damage exceeds the net present value (using the Present Value Rate) of the expected revenues under the EPA for the remainder of the Term less the net present value (using the Present Value Rate) of the estimated operating and maintenance costs for the Seller's Plant for the remainder of the Term; or

(c) Seller has been unable to achieve Seller's COD for a period of 730 days after Target Seller's COD or has been unable to deliver Energy to the POI for a period of 730 continuous days after Seller's COD in either case solely as a result of Force Majeure invoked by Seller or a Distribution/Transmission Constraint other than a Non-Permitted Distribution/Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(d) Buyer is Bankrupt or Insolvent; or

(e) except where an amount has been disputed in the manner specified in Section 5.3(a)(ii), an amount due and payable by Buyer to Seller under this EPA remains unpaid for 30 days

after its due date and such default has not been cured within 30 days after Seller has given notice of the default to Buyer; or

(f) Buyer is in material default of any of its covenants, representations and warranties or other obligations under this EPA (other than as set out above), unless within 30 days after the date of notice by Seller to Buyer of the default Buyer has cured the default or, if the default cannot be cured within that 30 day period, Buyer demonstrates to the reasonable satisfaction of Seller that Buyer is working diligently and expeditiously to cure the default and the default is cured within a further reasonable period of time.

Any termination pursuant to this Section will be effective immediately upon delivery of the notice of termination to Buyer.

9.4 Termination by Buyer for Convenience

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Buyer may have under this EPA or at law or in equity in respect of any of the following events, Buyer may terminate this EPA for convenience upon 90 days prior notice to Seller.

9.5 Effect of Termination

Upon expiry of the Term or earlier termination of this EPA in accordance with its terms:

(a) the Parties may pursue and enforce any rights and remedies permitted by law or equity in respect of any prior breach or breaches of this EPA and may enforce any liabilities and obligations that have accrued under this EPA prior to the expiry of the Term or the date of termination or that are stated to arise on termination of this EPA, subject to any express restrictions on remedies and limitations or exclusions of liability set out in this EPA;

(b) both Parties will remain bound by Section 3.5 with respect to the satisfaction of residual obligations for the period prior to termination or that are specified to arise on, or continue following, termination, and Sections 12.1 and 13.1 associated with Delivered Energy prior to termination of this EPA; and

(c) Seller will remain bound by Sections 7.1 and 7.2 for a period of 36 months following expiry or termination of this EPA;

and, in all such cases, both Parties will remain bound by any other provisions necessary for the interpretation and enforcement of the foregoing provisions.

9.6 Buyer Payment on Termination

If Seller terminates this EPA under any of Sections 9.3(d), 9.3(e) or 9.3(f) or Buyer terminates this EPA for convenience under Section 9.4, Buyer will pay to Seller an amount equal to the applicable Termination Payment due at the time of termination determined in accordance with Schedule "F".

9.7 Seller Payment on Termination

If Buyer terminates this EPA on or before 90 days after Seller's COD or Seller terminates this EPA on or before Buyer's COD under any of Sections 9.3(a), 9.3(b) or 9.3(c), Seller will, within 30 days after receipt of an invoice from Buyer, reimburse Buyer for:

(a) all System Upgrade Costs and New Interconnection Facilities Costs incurred by Buyer, or which Buyer has become contractually obligated to pay, prior to the termination of the EPA including System Upgrade Costs and New Interconnection Facilities Costs Seller would otherwise be responsible for under Section 3.5;

(b) any incremental liability for System Upgrade Costs and New Interconnection Facilities Costs which Buyer will incur as a result of the termination of this EPA; and

(c) any System Upgrade Costs and New Interconnection Facilities Costs which Seller is responsible for under any reimbursement agreement pursuant to Section 3.3.

9.8 Calculation and Payment

Buyer will pay any amount which it owes under Section 9.6 within 30 Business Days after the date of delivery of an invoice by Seller to Buyer. Any amounts owing by Seller to Buyer under this EPA will be netted against any amount owing by Buyer to Seller under Section 9.6.

9.9 Exclusive Remedies

Payment by Buyer of the amount determined under Section 9.6 is the exclusive remedy to which Seller is entitled, and Buyer's limit of liability, for termination of this EPA by Seller pursuant to any of Sections 9.3(d), 9.3(e) or 9.3(f). Subject to Section 9.4 and 9.7, termination of this EPA is the exclusive remedy to which Buyer or Seller, as the case may be, is entitled if Buyer or Seller elects to exercise its right to terminate this EPA under any of Section 9.1, 9.3(a), 9.3(b) or 9.3(c). For greater certainty, subject to Section 9.4 and 9.7, Seller will not be required to pay any termination payment on termination by Buyer of this EPA. Neither Party will have any right to terminate this EPA except as expressly set out herein.

ARTICLE 10
REPRESENTATIONS AND WARRANTIES

10.1 Seller's Representations

Seller represents and warrants to Buyer, and acknowledges that Buyer is relying on those representations and warranties in entering into this EPA, as follows:

(a) Seller is a corporation formed under the laws of the Yukon, is validly existing and is in good standing under the laws of the Yukon, is lawfully authorized to carry on business in the Yukon, and has full corporate power, capacity and authority to enter into and to perform its obligations under this EPA;

(b) this EPA constitutes a valid and binding obligation of Seller enforceable against Seller in accordance with its terms; and

(c) this EPA has been duly authorized, executed and delivered by Seller.

10.2 Buyer's Representations

Buyer represents and warrants to Seller, and acknowledges that Seller is relying on those representations and warranties in entering into this EPA, as follows:

(a) Buyer is a corporation formed under the laws of the Yukon, is validly existing and is in good standing under the laws of the Yukon, is lawfully authorized to carry on business in the Yukon, and has full corporate power, capacity and authority to enter into and to perform its obligations under this EPA;

(b) this EPA constitutes a valid and binding obligation of Buyer enforceable against Buyer in accordance with its terms; and

(c) this EPA has been duly authorized, executed and delivered by Buyer.

ARTICLE 11
LIABILITY LIMITATIONS

11.1 Limit of Liability

Buyer's liability for damages for any failure to take or pay for Delivered Energy under this EPA is limited to the amount payable by Buyer for that Delivered Energy under Article 5, amounts owing under Sections 4.8 and any interest thereon calculated under this EPA.

11.2 Consequential Damages

Neither Party will be liable to the other Party for any special, incidental, exemplary, punitive or consequential damages with respect to, arising out of, relating to or in any way connected with a Party's performance or non-performance under this EPA.

ARTICLE 12
DISPUTES

12.1 Dispute Resolution Procedure

Any dispute, controversy or claim arising out of or relating to this EPA ("**Dispute**") shall be exclusively and finally resolved in accordance with the dispute resolution procedure set forth in this Article 12 (the "**Dispute Resolution Procedure**").

12.2 Commencement of the Dispute Resolution Procedure

The Parties shall make reasonable efforts to first resolve any Dispute. If a Dispute cannot be resolved by the Parties, then either Party may initiate the Dispute Resolution Procedure by giving notice of the Dispute to the other Party (the "**Notice of Dispute**"). The Notice of Dispute shall contain a brief statement of the nature of the Dispute, set out the relief requested, and request that the Dispute Resolution Procedure be commenced.

12.3 Negotiations

Upon the submission of a Notice of Dispute pursuant to Section 12.2, each of the Parties shall refer the Dispute to a designated senior management executive with the authority to negotiate a

settlement of the Dispute for that Party (the "**Senior Management Executives**"). The Senior Management Executives of the Parties shall attempt to resolve the Dispute within 30 days from the date on which the Notice of Dispute was issued, or such longer period as the Senior Management Executives may otherwise unanimously agree. If the Senior Management Executives unanimously agree upon a resolution of the Dispute, such resolution shall be memorialized in a written settlement agreement mutually acceptable to the Parties and shall be binding on the Parties.

12.4 Arbitration

If a Dispute is not resolved by Senior Management Executives within 30 days from receipt of a Notice of Dispute (or such longer period as the Senior Management Executives may otherwise agree in writing), the Dispute shall, at the request of either Party, be resolved by binding arbitration under the Rules of Arbitration of the International Chamber of Commerce (the "**ICC Rules**"), except to the extent of conflicts between the ICC Rules and the provisions of this EPA, in which event the provisions of this EPA shall prevail. The following provisions shall apply to an arbitration commenced pursuant to this Section 12.4:

(a) the number of arbitrators shall be one;

(b) the place, or legal seat, of the arbitration shall be Whitehorse, Yukon;

(c) the language to be used in the arbitral proceedings shall be English;

(d) all awards issued by the arbitrator shall be final, non-appealable and binding on the Parties. Any award may be filed in any court of competent jurisdiction and may be enforced by a Party as a final judgment in such court. The Parties expressly waive, to the maximum extent permitted by law, any right of appeal of any award or reference of any matter to any court, other than as may be necessary to recognize or enforce an award;

(e) the arbitrator shall be guided by the International Bar Association's Rules on the Taking of Evidence in International Commercial Arbitration;

(f) the Parties shall request that the arbitrator render its final award within 12 months of the commencement of the arbitration, or as soon as possible thereafter, provided that no award shall be invalid if it is not rendered within the time period herein specified;

(g) any award for monetary damages shall be made and payable in Canadian Dollars and may include interest from the date of any breach or violation of this EPA until paid in full at the rate determined by the arbitrator;

(h) the Parties agree that any arbitration carried out hereunder shall be kept private and confidential, and that the existence of the proceedings and any element of it (including all awards, the identity of the Parties and all witnesses and experts, all materials created for the purposes of the arbitration, all testimony or other oral submissions, and all documents produced by a Party that were not already in the possession of the other Party) shall be kept confidential, except (i) with the consent of the Parties, (ii) to the extent disclosure may be lawfully required in bona fide judicial proceedings relating to the arbitration, (iii) where disclosure is lawfully required by a legal duty, and (iv) where such information is already in the public domain other than as a result of a breach of this clause. The Parties

also agree not to use any information disclosed to them during the arbitration for any purpose other than in connection with the arbitration;

(i) where a Dispute relates to the EPA, the Parties shall agree to consolidate the matters in Dispute under such agreements in a single arbitration;

(j) the Parties agree that during the resolution of a Dispute pursuant to this Article 12, the Parties shall continue to perform their obligations under this EPA, provided that such performance shall be without prejudice to the rights and remedies of the Parties and shall not be read or construed as a waiver of a Party's right to claim for recovery of any loss, costs, expenses or damages suffered as a result of the continued performance of this EPA; and

(k) each Party will be responsible for its own costs under this Article 12, subject to the award of an arbitrator.

ARTICLE 13
CONFIDENTIALITY

13.1 Confidentiality

(a) **Additional Confidentiality Obligation** - During the Term and for two years thereafter:

(i) Buyer will treat as confidential, and will not disclose to any third Person, Seller Confidential Information, and

(ii) Seller will treat as confidential, and will not disclose to any third Person, Buyer Confidential Information.

(b) **Disclosure of Confidential Information** - Notwithstanding Section 13.1(a) above:

(i) Seller may also disclose Buyer Confidential Information and Buyer may disclose Seller Confidential information in the following circumstances:

(A) disclosures expressly authorized under this EPA or otherwise set out in this EPA;

(B) disclosures to enable a Party to fulfill its obligations under the EPA;

(C) disclosure in any arbitration or legal proceedings for the enforcement of the EPA;

(D) disclosure to the Party's directors, officers, employees, Facility Lenders, consultants and advisors, and purchasers of the Environmental Attributes, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality;

(E) subject to Section 13.1(b)(ii)(D), disclosure required to be made by a Party by an order of a court, a regulatory agency or a tribunal or under any law, regulatory requirements or any requirement of any stock exchange that is binding upon a Party, provided that (i) to the extent

reasonably practicable, the Party intending to make such disclosure gives reasonable notice to the other Party before make the disclosure, and (ii) limits the disclosure to that required by the applicable order, Laws or regulatory or stock exchange requirement;

(F) disclosure to a third Person if such information was known by that third Person before disclosure by Buyer or Seller, as the case may be, provided the third Person did not know of the information as a result of a breach of the non-disclosure obligations in this EPA; or

(G) disclosure with the consent of Buyer, in the case of Buyer Confidential Information, or Seller, in the case of Seller Confidential Information.

(ii) Buyer may disclose Seller Confidential Information in the following circumstances:

(A) disclosure to Buyer's Affiliates or to a third Person, and their respective employees, consultants and advisors, for the purpose of reselling or marketing any Energy, including disclosure of Seller Confidential Information by such Affiliate or third Person to those who have purchased or may purchase the Energy;

(B) for purposes other than those described in Section 13.1(b)(i), to Buyer's Affiliates and to any directors, officers, employees, consultants and advisors of any Affiliates, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality;

(C) to any ministers, deputy ministers, servants or employees of the Yukon or the federal government, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality; or

(D) disclosure in any regulatory proceeding, whether related to this EPA or not, to the extent that Buyer considers disclosure is necessary or desirable to support its position in such proceeding.

ARTICLE 14
FORCE MAJEURE

14.1 Force Majeure

(a) If there is a Force Majeure affecting a Party's ability to perform an obligation under this EPA, and that Party wishes to declare a Force Majeure, that Party will promptly notify the other Party of the Force Majeure. The notice of Force Majeure must identify the nature of the Force Majeure, the date the Force Majeure commenced, the expected duration of the Force Majeure, and the particular obligations affected by the Force Majeure. If (i) a notice of Force Majeure is provided in accordance with this Section, (ii) the event in question is in fact an event of Force Majeure as defined in this EPA, and (iii) the event of Force Majeure commenced on the commencement date in the notice of Force

Majeure, then the Force Majeure will be deemed to have been invoked as of the commencement date stated in the notice.

(b) Neither Party will be in default of any obligation under this EPA if a Party is unable to perform that obligation due to an event or circumstance of Force Majeure, provided notice is delivered in accordance with this Section and the circumstances are, in fact, an event or circumstance of Force Majeure.

(c) Subject to any limitations expressly set out in this EPA, the time for performance of such obligation will be extended by the number of days that Party is unable to perform such obligation as a result of the event or circumstance of Force Majeure. The Party invoking Force Majeure will make commercially reasonable efforts to promptly remove the Force Majeure and will promptly respond to any inquiry from the other Party regarding the efforts being undertaken to remove the Force Majeure and will give prompt notice of the end of the Force Majeure.

ARTICLE 15
GENERAL PROVISIONS

15.1 Independence

The Parties are independent contractors, and nothing in this EPA or its performance creates a partnership, joint venture or agency relationship between the Parties.

15.2 Enurement

This EPA enures to the benefit of the Parties, their successors and their permitted assigns.

15.3 Assignment

(a) Seller may not assign this EPA except with the prior consent of Buyer, which consent may not be unreasonably withheld, conditioned or delayed provided such Assignment is to a Facility Lender. Any Assignment (other than an Assignment to a Facility Lender) is subject to the assignee entering into and becoming bound by this EPA, assuming all the obligations and liabilities of Seller under this EPA arising both before and after the Assignment, and providing the representations and warranties set out in Section 10.1 effective as at the time of Assignment, and Seller not being in default under this EPA. Unless agreed to in writing by Buyer, Seller shall remain jointly and severally liable with the assignee for all obligations of Seller under this EPA.

(b) Any request by Seller for Buyer's consent under Section 15.3(a) must be delivered to Buyer not less than 30 days before the date of the proposed Assignment. A request under this Section must be accompanied by such information as reasonably required by Buyer to assess the request for consent including the name, address and ownership structure of the assignee, details of any consultation with First Nations that may be impacted by the Seller's Plant or the Assignment with respect to the proposed Assignment, list of the directors and officers of the assignee and information concerning the assignee's operations, experience and financial status.

(c) If Seller seeks consent to Assign this EPA to a Facility Lender, Buyer may require, as a condition of its consent to the Assignment, that Seller and the Facility Lender enter into a

Lender Consent Agreement with Buyer containing customary provisions. If required by a Facility Lender, Buyer will enter into a Lender Consent Agreement with the Facility Lender and Seller containing customary provisions. Seller will reimburse Buyer for all costs reasonably incurred by Buyer in connection with any request by Seller for Buyer's consent pursuant to Section 15.3(a).

15.4 Entire Agreement

This EPA contains the entire agreement between the Parties with respect to the purchase and sale of Energy and supersedes all previous communications, understandings and agreements between the Parties with respect to the subject matter hereof. There are no representations, warranties, terms, conditions, undertakings or collateral agreements express, implied or statutory between the Parties other than as expressly set out in this EPA.

15.5 Amendment

This EPA may not be amended except by an agreement in writing signed by both Parties.

15.6 No Waiver

Other than in respect of the specific matter or circumstance for which a waiver is given, and except as otherwise specified in this EPA, no failure by a Party to enforce, or require a strict observance and performance of, any of the terms of this EPA will constitute a waiver of those terms or affect or impair those terms or the right of a Party at any time to enforce those terms or to take advantage of any remedy that Party may have in respect of any other matter or circumstance.

15.7 Notices

Any notice, consent, waiver, declaration, request for approval or other request, statement or bill that either Party may be required or may desire to give to the other Party under this EPA must be in writing addressed to the other Party at the address for that Party stated in Schedule "A" and:

(a) notices under Section 14.1, Article 8 and Article 9 must be delivered by hand or by a courier service during normal business hours on a Business Day and a notice so delivered will be deemed to have been delivered on that Business Day;

(b) all notices other than notices described in Section 15.7(a) may be delivered by email during normal business hours on a Business Day and a notice so delivered will be deemed to have been delivered on that Business Day; and

(c) either Party may change its address for notices under Section 3 of Schedule "A" to this EPA by notice to the other Party.

15.8 Interconnection Notices

Nothing in the System Interconnection Guidelines and no exercise of any right thereunder, restricts or otherwise affects any right, obligation or liability of either Party under this EPA, except to the extent set out expressly herein, and no notice, consent, approval or other communication or decision under or in relation to the System Interconnection Guidelines will

constitute or be relied upon as a notice, consent, approval or communication or decision under this EPA.

15.9 Commodity Contract/Forward Contract

The Parties agree and intend that this EPA constitutes an "eligible financial contract" under the *Bankruptcy and Insolvency Act* (Canada) and *Companies' Creditors Arrangement Act* (Canada).

15.10 Further Assurances

Each Party will, upon the reasonable request of the other Party, do, sign or cause to be done or signed all further acts, deeds, things, documents and assurances required for the performance of this EPA including, in the case of Seller, completing any registration process required in respect of Environmental Attributes as requested by Buyer.

15.11 Severability

Any provision of this EPA which is illegal or unenforceable will be ineffective to the extent of the illegality or unenforceability without invalidating the remaining provisions of this EPA.

15.12 Counterparts

This EPA may be executed in counterparts, each of which is deemed to be an original document and all of which are deemed one and the same document.

SCHEDULE "A"

DEFINITIONS AND INTERPRETATION

1. DEFINITIONS

References in a Schedule to a section or Section mean a section or Section of this EPA, and not a Schedule, unless otherwise stated. The following words and expressions wherever used in this EPA have the following meaning:

1.1 "**Affiliate**" means, with respect to any Party or any third Person, any Person directly or indirectly Controlled by, Controlling, or under common Control with, such Party or the third Person.

1.2 "**Annual Operating Plan**" means a 12-month operating plan for the Seller's Plant that includes for term of each operating plan, (a) a schedule of the expected total deliveries of Energy at the POI in each month and (b) a schedule of any Planned Outages of the Seller's Plant expected by Seller. The Annual Operating Plan will be consistent with Good Industry Practice and shall be substantially in the form attached hereto as Schedule "C", subject to such modifications thereto as may be reasonably required by Buyer.

1.3 "**Application**" means the application and all supporting documents and information with respect to the Seller's Plant filed by Seller with Buyer in the Standing Offer Program.

1.4 "**Assign**" or "**Assignment**" means to assign or dispose of this EPA or any direct or indirect interest in this EPA, in whole or in part, for all or part of the Term and, without limiting the foregoing, each of the following is deemed to be an Assignment of this EPA by Seller:

(a) any sale or other disposition of all or a substantial part of Seller's ownership interest in the Seller's Plant, or of all or any interest of Seller in this EPA or revenue derived from this EPA;

(b) any mortgage, pledge, charge or grant of a security interest in all or any part of the Seller's Plant or Seller's ownership interest therein; and

(c) any change of Control, merger, amalgamation or reorganization of Seller.

1.5 "**Audit Parties**" means the applicable Party conducting an audit under this EPA and its Affiliates, representatives, consultants, advisors and any other third Person retained in respect of the applicable audit.

1.6 "**Bankrupt or Insolvent**" means, with respect to a Person:

(a) the Person has started proceedings to be adjudicated a voluntary bankrupt or consented to the filing of a bankruptcy proceeding against it;

(b) the Person has filed a petition or similar proceeding seeking reorganization, arrangement or similar relief under any bankruptcy or insolvency law;

(c) a receiver, liquidator, trustee or assignee in bankruptcy has been appointed for the Person or the Person has consented to the appointment of a receiver, liquidator, trustee or assignee in bankruptcy;

(d) the Person has voluntarily suspended the transaction of its usual business; or

(e) a court of competent jurisdiction has issued an order declaring the Person bankrupt or insolvent.

1.7 "**Business Day**" means any calendar day which is not a Saturday, Sunday or Yukon statutory holiday.

1.8 "**Buyer**" means Yukon Energy Corporation and its successors and permitted assigns.

1.9 "**Buyer Confidential Information**" means technical or commercial information disclosed by Buyer to Seller that Buyer directs, and clearly marks, as confidential, including the System Interconnection Guidelines and this EPA but excluding information that (i) is or becomes in the public domain, other than as a result of a breach of this EPA by Seller, or (ii) is known to Seller before disclosure to it by Buyer, or becomes known to Seller, thereafter by way of disclosure to Seller by any other Person who is not under an obligation of confidentiality with respect thereto.

1.10 "**Buyer's COD**" shall occur when the System Upgrades have been completed and Buyer provides a notice of completion of the same to Seller.

1.11 "**Change in Law**" means (a) the enactment, adoption, promulgation, modification or repeal of any applicable Laws or any change in the interpretation or administration of any applicable Laws resulting from a decision of a Governmental Authority which occurs after the Effective Date; but in each case excluding a Change in Law relating to income tax, or (b) the requirement for a new Permit (including due to a change in the circumstances in which a Permit is required), a change in the terms of any Permit after the date such Permit is granted, or any change in the interpretation or administration of any Permits resulting from a decision of a Governmental Authority.

1.12 "**Condition Date**" means the date specified as such in Schedule "B".

1.13 "**Conditions Precedent**" means those conditions precedent set out in Schedule "B".

1.14 "**Control**" of any Person means:

(a) with respect to any corporation or other Person having voting shares or the equivalent, the ownership or power to vote, directly or indirectly, shares, or the equivalent, representing 50% or more of the power to vote in the election of directors, managers or Persons performing similar functions;

(b) ownership of 50% or more of the equity or beneficial interest in that Person; or

(c) the ability to direct the business and affairs of any Person by acting as a general partner, manager or otherwise.

1.15 "**CPI**" means the "Canada All Items (Not Seasonally Adjusted)" Consumer Price Index as published by Statistics Canada or any successor agency thereto.

1.16 "**Delivered Energy**" means in each month after Buyer's COD the amount of Energy delivered by Seller at the POI in that month as recorded by Buyer's Meter less the applicable Line Losses.

1.17 "**Development Progress Report**" means a report describing the progress of the financing, design, engineering, construction, Interconnection, and commissioning of the Seller's Plant, that is in form and content acceptable to Buyer, acting reasonably.

1.18 "**Discretion**" (whether or not capitalized) means sole, absolute and unfettered discretion unless this EPA expressly states otherwise.

1.19 "**Dispatch/Turn-Down**" means for Seller to turn down or shut off the Seller's Plant.

1.20 "**Dispatch/Turn-Down Deemed Energy**" has the meaning given to such term in Section 4.9(b)(i).

1.21 "**Distribution System**" means the distribution, protection, control and communication facilities in the Yukon that are or may be used in connection with, or that otherwise relate to, the transmission of electrical energy at 35 kilovolts or less, and includes all additions and modifications thereto and repairs or replacements thereof.

1.22 "**Distribution/Transmission Constraint**" means any disconnection of the Seller's Plant from the Distribution System or Transmission System, or any outage, suspension, constraint or curtailment in the operation of the Distribution System or Transmission System preventing or limiting deliveries of Energy at the POI or within the Distribution System or Transmission System or any direction from Buyer to reduce generation of the Seller's Plant as a result of any outage, suspension, constraint or curtailment in the operation of the Distribution System or Transmission System.

1.23 "**Effective Date**" shall mean the date on which all Conditions Precedent have been satisfied or waived in accordance with Section 2.1.

1.24 "**Electrical Grid**" means the electrical grid into which the Seller's Plant will be interconnected, as identified in Schedule "B"**.**

1.25 "**Eligible Clean Energy**" means wind, hydro, geothermal, biomass and solar energy sources permitted under the IPP Policy for the SOP generated by a Project located in Yukon which is directly connected into the YIS or the WLG through the New Interconnection Facilities.

1.26 "**Energy**" means all electrical energy expressed in KWh generated by the Seller's Plant, excluding electrical energy generated by the Seller's Plant which is required to service the Seller's Plant Load.

1.27 "**Energy Price**" has the meaning given to such term in Schedule "B".

1.28 "**Environmental Attributes**" means the following as attributable to Energy delivered to Buyer under this EPA:

(a) all attributes directly associated with, or that may be derived from, the Energy delivered to Buyer under this EPA having decreased environmental impacts relative to certain other generation facilities or technologies including any existing or future credit, allowance, "green" tag, ticket, certificate or other "green" marketing attribute or proprietary or contractual right, whether or not tradeable;

(b) any credit, reduction right, offset, allowance, allocated pollution right, certificate or other unit of any kind whatsoever, whether or not tradeable and any other proprietary or contractual right, whether or not tradeable, resulting from, or otherwise related to the actual or assumed reduction, displacement or offset of emissions at any location other than the Seller's Plant as a result of the generation, purchase or sale of the Energy delivered to Buyer under this EPA;

(c) any credit, reduction right, off-set, allowance, allocated pollution right, certificate or other unit of any kind whatsoever whether or not tradeable resulting from or otherwise related to the reduction, removal, or sequestration of emissions at or from the Seller's Plant; and

(d) all revenues, entitlements, benefits and other proceeds arising from or related to the foregoing, but for certainty not including:

i. benefits or proceeds from environmental incentive programs offered by Governmental Authorities that do not require a transfer of the attributes in (a) to (c) above; and

ii. benefits or proceeds from social programs, including programs relating to northern or rural development, employment or skills training, or First Nations, that do not require a transfer of the attributes in Sections (a) to (c) above.

1.29 "**Environmental Certification**" means any certification Buyer requires Seller to obtain under Section 6.1.

1.30 "**Facility Lender**" means any lender(s) providing any debt financing or debt hedging facilities for the design, engineering, construction and/or operation of the Seller's Plant and any successors or assigns thereto and any Person taking any mortgage, pledge, charge or grant of a security interest in all or any part of the Seller's Plant.

1.31 "**Final Amount**" means an amount owing by either Party to the other Party under this EPA, including as a result of a breach of this EPA, where such amount is: (a) undisputed by the Party owing such amount; or (b) has been finally determined by an arbitration award under Section 12.1 of this EPA or by a court order and all rights of appeal in respect of such award or order have been exhausted or have expired.

1.32 "**First Nation Claim**" means a legal claim or proceeding or written threat to commence a legal claim or proceeding from or on behalf of First Nations where such claim or threat alleges a breach or potential breach of, or an impact to: any First Nations' Treaty rights, rights under a Settlement Agreement (as that term is defined in the Yukon Umbrella Final Agreement), or rights under section 35 of the *Constitution Act*, 1982, by (a) this EPA, (b) the Seller's Plant, (c) the Interconnection or any works related to the Interconnection, or (d) any authorization granted by the Yukon or federal government relating to the Seller's Plant and its operations.

1.33 "**First Nations**" means any one of the 14 First Nations in the Yukon.

1.34 "**Force Majeure**" means any event or circumstance not within the control of the Party, or any of its Affiliates, claiming Force Majeure, but does not include:

(a) any economic hardship or lack of money, credit or markets;

(b) an event or circumstance that is the result of a breach by the Party seeking to invoke Force Majeure of a Permit or of any applicable Laws;

(c) a mechanical breakdown or control system hardware or software failure, unless the Party seeking to invoke Force Majeure can demonstrate by clear and convincing evidence that the breakdown or failure was caused by a latent defect in the design or manufacture of the equipment, hardware or software, which could not reasonably have been identified by normal inspection or testing of the equipment, hardware or software;

(d) an event or circumstance caused by a breach of, or default under, this EPA or a willful or negligent act or omission by the Party seeking to invoke Force Majeure;

(e) any Distribution/Transmission Constraint unless such event is caused by an event or circumstance not within the control of Buyer; or

(f) any acts or omissions of: (i) any Affiliate, employee, director, officer, agent or other representative of the Party invoking Force Majeure; (ii) any vendor, supplier, contractor, subcontractor, consultant or customer of or to the Party invoking Force Majeure; or (iii) any other Person for whom the Party invoking Force Majeure is responsible at law, unless the act or omission is caused by an event or circumstance that would constitute Force Majeure if the Person described above was a party to this EPA in place of a Party invoking Force Majeure.

1.35 "**Forced Outage**" means the immediate removal of one or more generating units of the Seller's Plant or transmission or distribution infrastructure of the Seller's Plant from service in response to equipment alarms or any damage identified during a Planned Outage or Maintenance Outage requiring extension of those Planned Outage or Maintenance Outage.

1.36 "**General Rate Application**" means any application, review, process, or procedure in which the YUB sets and approves rates to be charged by Buyer for the supply of the service for which it is franchised in accordance with the *Public Utilities Act*.

1.37 "**Good Industry Practice**" means:

(a) in respect of Buyer, any of the practices, methods and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition; provided such practices, methods and acts are not intended to be limited to the optimum practice, method or act to the exclusion of all others, but rather to be acceptable practices, methods or acts generally accepted in the Yukon; and provided that Buyer shall be in compliance with Good Industry Practice in respect of any equipment comprising the Distribution System or Transmission System, if it operates such equipment in accordance with all applicable original equipment manufacturer guidelines and requirements provided to Buyer by supplier of such equipment; and

(b) in respect of Seller, any of the practices, methods and acts engaged in or approved by a significant portion of the electric generation industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in

light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition; provided such practices, methods and acts are not intended to be limited to the optimum practice, method or act to the exclusion of all others, but rather to be acceptable practices, methods or acts generally accepted in Western Canada.

1.38 "**Governmental Authority**" means any federal, provincial, local or foreign government or any of their boards or agencies, or any regulatory authority other than Buyer and Seller and entities controlled by Buyer or Seller.

1.39 "**GST**" means the goods and services tax imposed under the *Excise Tax Act* (Canada) as that Act may be amended or replaced from time to time.

1.40 "**Interconnection"** means the POI.

1.41 "**IPP Policy**" has the meaning given to such term in the recitals to this EPA.

1.42 "**Joint Operating Procedure**" means the joint operating procedure attached as Schedule "H" as may be modified by Buyer from time to time.

1.43 "**KW**" means kilowatt.

1.44 "**KWh**" means kilowatt-hour.

1.45 "**Laws**" means any and all statutes, laws (including common law), ordinances, rules, regulations, codes, orders, bylaws, policies, directions, standards, guidelines, protocols and other lawful requirements of any Governmental Authority in effect from time to time.

1.46 "**Lender Consent Agreement**" means a lender consent agreement in the form and substance acceptable to Buyer, acting reasonably.

1.47 "**Line Losses**" means losses of electricity associated with the transmission and transformation of Energy and other electricity, if applicable, from the Seller's Plant to the POI that are recorded by the Meter or reasonably estimated by Buyer.

1.48 "**Line Loss Methodology**" means the Line Loss Methodology set forth in the System Interconnection Study Report for the purposes of this Project.

1.49 "**Maintenance Outage**" means any outage of Buyer's Distribution System or Transmission System or the Seller's Plant that is not a Planned Outage or a Forced Outage that typically has a flexible start and end time and of shorter duration than a Planned Outage.

1.50 "**Meter**" means a meter owned by Buyer that is: (a) capable of accurately measuring the quantity of Energy generated by the Seller's Plant and delivered to the POI independent of all other generation equipment or facilities, (b) capable of being remotely interrogated; and (b) calibrated to measure on an hourly basis the quantity of Energy delivered by Seller to the POI.

1.51 "**Monthly Energy Shortfall Payment**" has the meaning given to such term in Schedule "E".

1.52 "**New Interconnection Facilities**" means those additions, modifications and upgrades required to interconnect the Project to the Electrical Grid which are identified in the System Interconnection Study Report (and as further refined in subsequent interconnection studies, if required by Buyer) and approved by Buyer, but excluding any System Upgrades.

1.53 "**New Interconnection Facilities Costs**" means all costs incurred by Buyer for the design, engineering, procurement, construction, installation and commissioning of the New Interconnection Facilities, including applicable studies required by Buyer, an estimate of which is set out in the System Interconnection Study Report.

1.54 "**Non-Permitted Distribution/Transmission Constraint**" has the meaning given to such term in Section 4.8(a).

1.55 "**Outage**" means a Forced Outage, Maintenance Outage, or Planned Outage of Buyer's Distribution System or Transmission System or Seller's Plant.

1.56 "**Outage Notice**" means a notification of any Outage or revised notification of any Outage required to be delivered by Seller to Buyer or Buyer to Seller under this EPA that describes the timing, frequency, nature and duration of the Outage and that is in a format that may be prescribed by Buyer from time to time.

1.57 "**Party**" means Buyer or Seller, and "**Parties**" means both Buyer and Seller.

1.58 "**Permits**" means permits, certificates, licences, approvals and other authorizations issued by any Governmental Authorities as may be required for the design, construction, ownership, operation, maintenance and decommissioning of (i) the Seller's Plant and the delivery of Energy to the POI, and (ii) the System Upgrades and the New Interconnection Facilities.

1.59 "**Person**" means an individual, body corporate, firm, partnership, joint venture, trust, legal representative or other legal entity.

1.60 "**Planned Outage**" means an outage that is scheduled well in advance for purposes of inspections, maintenance, or repair of Buyer's Distribution System or Transmission System or Seller's Plant, that typically has a predetermined duration and scope of work, occurs only once or twice per year, and may last for several days.

1.61 "**POI**" or "**Point of Interconnection**" means the point at which the Seller's Plant interconnects with the Distribution System or Transmission System, as identified on the Single Line Diagram.

1.62 "**Potential Impacts**" means any adverse or potentially adverse impact on the established or potential aboriginal rights (including title) of First Nations as a result of:

(a) this EPA;

(b) the Project;

(c) the interconnection of the Seller's Plant to the Distribution System or Transmission System; or

(d) any activities directly related to the Seller's Plant that enable Seller to comply with its obligations under this EPA that are carried out by Seller, any Affiliate, consultant or contractor of Seller, or any other Person for whom Seller is responsible at law.

1.63 "**PPT**" means Pacific Prevailing Time, which means Pacific Daylight Time or Pacific Standard Time as applicable.

1.64 "**Present Value Rate**" means the annual yield on a Government of Canada bond having a term and maturity date that most closely matches the remaining Term (as at the date of the applicable calculation) and expiry date of this EPA, plus 3%.

1.65 "**Prime Rate**" means the floating prime interest rate announced from time to time by the main branch of Bank of Montreal in Whitehorse, Yukon, or any successor thereto, expressed as an annual rate, as the reference rate it will use to determine rates of interest payable on Canadian dollar commercial loans made in Canada.

1.66 "**Project**" means the financing, design, engineering, procurement, construction, commissioning, operation and maintenance of the Seller's Plant.

1.67 "**Project Cluster**" means two or more existing or proposed Projects under the SOP Rules that Buyer determines in its Discretion are so closely related to each other that they should be considered a project cluster for the purposes of the Standing Offer Program.

1.68 "**Project Energy Volume**" (in KWh) means the maximum annual Energy which Buyer may sell to Seller from the Project in any calendar year as set out in Schedule "B"; provided that where the Term does not commence on January 1, such amount shall be prorated for the first and last contract year which do not reflect a full calendar year.

1.69 "**Project Standards**" means:

(a) all applicable Laws;

(b) the terms and conditions of all Permits, including land tenure agreements, issued in connection with the Seller's Plant;

(c) Good Industry Practice;

(d) the description of the Seller's Plant in Schedule "B";

(e) the requirement that Energy must qualify as Eligible Clean Energy; and

(f) the terms and conditions of this EPA (including the System Interconnection Guidelines).

1.70 "**Public Utilities Act**" means the *Public Utilities Act* (Yukon) and any successor or replacement legislation.

1.71 "**Records**" means all records and logs required to properly administer this EPA, including:

(a) Energy generation records and operating logs;

(b) Meter readings;

(c) maintenance reports;

(d) invoice support records;

(e) documents concerning compliance with Project Standards, but excluding any such documents that are protected by solicitor-client privilege;

(f) records related to System Upgrade Costs and New Interconnection Facilities Costs;

(g) all information reasonably required to establish the amount of Energy Seller could have sold during a Distribution/Transmission Constraint including logs of all Outages of the Seller's Plant and other reductions in Energy output (specifying the date, time, duration and reasons for each such outage and each reduction in Energy output); and

(h) information relating to the Environmental Certification, information relating to the existence, nature and quality of Environmental Attributes, information required for the purposes of any Environmental Attributes or energy certification or tracking system, and any other information Buyer requires to enable it or any of its Affiliates to obtain and realize the benefit of the Environmental Attributes,

all consistent with Good Industry Practice.

1.72 "**Regulatory Agency Authorizations**" means the issuance of those Permits which are specified as required for the Project in the YESAB assessment report recommendation to proceed issued in respect of the Project.

1.73 "**Seller**" means the Party so identified on page one of this EPA, and its successors and permitted assigns.

1.74 "**Seller Confidential Information**" means any of Seller's confidential technical or financial information provided by Seller to Buyer in confidence with express written notice to Buyer of the confidential nature of the information, but excluding:

(a) this EPA; and

(b) information that (i) is or becomes in the public domain, other than as a result of a breach of this EPA by Buyer, or (ii) is known to Buyer before disclosure to it by Seller, or becomes known to Buyer thereafter by way of disclosure to Buyer by any other Person who is not under an obligation of confidentiality with respect thereto.

1.75 "**Seller's COD**" means the commercial operation date of Seller's Plant which is the date on which all of the following conditions have been satisfied in respect of the Seller's Plant:

(a) Seller has obtained all Permits required for the construction, commissioning, and operation of the Seller's Plant and all such Permits are in full force and effect;

(b) the Seller's Plant has been fully constructed in accordance with the Project Standards;

(c) Seller is not: (A) Bankrupt or Insolvent; (B) in default of any payment obligation or requirement to post security under this EPA; (C) in material default of any of its other covenants, representations, warranties or obligations under this EPA; or (D) in material

default under any Permit or Law applicable to the construction, commissioning or operation of the Seller's Plant or under any land tenure agreement for the site on which the Seller's Plant is located;

(d) a Meter has been installed at the POI in accordance with Section 3.6 of this EPA;

(e) Seller has delivered to Buyer a written notice together with certificate of Seller's professional registered engineer confirming that Seller's COD has been achieved; and

(f) Buyer has delivered a Commission Notice to Operate, or such other document(s) of similar effect as may be substituted therefor, which evidences no material deficiencies, in respect of the Seller's Plant Capacity and Seller's Plant operations;

and for purposes of this EPA, Seller's COD will be deemed to have occurred at 24:00 PPT on the later of the dates set out above.

1.76 "**Seller's Plant**" means Seller's plant described in Schedule "B" and all assets required to interconnect that plant to the Distribution System or Transmission System; all rights, property, facilities, assets, equipment, materials, Permits and contracts required to design, engineer, procure, construct, commission, operate and maintain the plant described in Schedule "B" and to interconnect that plant to the Distribution System or Transmission System, whether real or personal and whether tangible or intangible including all land tenure and all books, Records and accounts with respect to the Seller's Plant described in Schedule "B"; and shall include replacement parts or equipment which are of the same or similar nature as the parts or equipment being replaced and which do not materially increase the amount of Energy available from Seller's Plant.

1.77 "**Seller's Plant Capacity**" means the electrical generating capacity of the Seller's Plant set out in Schedule "B".

1.78 "**Seller's Plant Load**" means any electrical energy consumed by Seller's Plant.

1.79 "**Single Line Diagram**" means the simplified electrical representations of the Seller's Plant, the Interconnection, the Distribution System and Transmission System attached hereto in Schedule "B".

1.80 "**SOP OIC**" means that Order in Council issued by the Government of Yukon on January 24, 2019 regarding, among other things, the Standing Offer Program.

1.81 "**SOP Rules**" means the Standing Offer Program Rules developed by the Government of Yukon which governed this EPA as at the date of this EPA.

1.82 "**Standing Offer Program**" or "**SOP**" means the Standing Offer Program as described in the IPP Policy.

1.83 "**System Interconnection Guidelines**" means those system interconnection guidelines in the form attached as Schedule "G" hereto, as amended or replaced by Buyer from time to time.

1.84 "**System Interconnection Study Report**" means the detailed interconnection study issued to Seller by Buyer which, among other things, (i) evaluates the impact of the Project on the reliability of Buyer's system, (ii) provides a planning-level estimate of the required System

Upgrades and New Interconnection Facilities and associated costs, and (iii) establishes the Line Loss Methodology for this Project, a copy of which is attached as Schedule "D".

1.85 "**System Upgrades**" means additions, modifications and upgrades to the Distribution System, Transmission System or any portion of Buyer's generation system that are determined by Buyer to be required in order to facilitate the interconnection and to allow such Distribution System, Transmission System or any portion of Buyer's generation system to support the integration of the Energy produced by the Seller's Plant in accordance with this EPA and the System Interconnection Guidelines, which are identified in the System Interconnection Study Report (and as further refined in subsequent interconnection studies, if required by Buyer) and approved by Buyer, but excluding any New Interconnection Facilities.

1.86 "**System Upgrade Costs**" means all costs incurred by Buyer for the design, engineering, procurement, construction, installation and commissioning of the System Upgrades, including applicable studies required by Buyer, an estimate of which is set out in the System Interconnection Study Report.

1.87 "**Target Buyer's COD**" means the target date for achieving Buyer's COD, being the date specified for such term in Schedule "B", as may be extended pursuant to Section 3.9, if applicable.

1.88 "**Target Seller's COD**" means the target date for achieving Seller's COD, being the date specified for such term in Schedule "B", as may be extended pursuant to Section 3.9, if applicable.

1.89 "**Term**" has the meaning given to such term in Section 2.1.

1.90 "**Termination Payment**" has the meaning given to such term in Schedule "F".

1.91 "**Transmission System**" means the transmission, substation, protection, control and communication facilities owned and operated by Buyer, and includes all additions and modifications to those facilities and repairs or replacements of those facilities.

1.92 "**Upgrade Costs Advance**" has the meaning given to such term in Section 3.5(a).

1.93 "**Upgrade Costs Security**" has the meaning given to such term in Section 3.5(a).

1.94 "**Utilities**" means both Yukon Energy Corporation or Yukon Electrical Company, doing business as ATCO Electric Yukon, as applicable.

1.95 "**YESAA**" means the *Yukon Environmental and Socio-economic Assessment Act*, SC 2003, c 7.

1.96 "**YESAB**" means the Yukon Environmental and Socio-economic Assessment Board.

1.97 "**YUB**" means the Yukon Utilities Board and any successor thereto appointed from time to time under the *Public Utilities Act*.

2. INTERPRETATION

2.1 **Headings** - The division of this EPA into Articles, sections, Sections, paragraphs and Schedules and the insertion of headings are for convenience of reference only and do not affect the interpretation of this EPA.

2.2 **Plurality and Gender** - Words in the singular include the plural and vice versa. Words importing gender include the masculine, feminine and neuter genders.

2.3 **Governing Law** - This EPA is made under, and will be interpreted in accordance with, the Laws of the Yukon. Subject to Section 12.1, any suit, action or proceeding (a "**Proceeding**") arising out of or relating to this EPA may be brought in the courts of the Yukon at Whitehorse, and those courts have non-exclusive jurisdiction in respect of any Proceeding and the Parties hereby irrevocably attorn to the jurisdiction of such courts in respect of any Proceeding.

2.4 **Industry Terms** - Technical or industry specific phrases or words not otherwise defined in this EPA have the well-known meaning given to those terms as of the date of this EPA in the industry or trade in which they are applied or used.

2.5 **Statutory References** - Reference to a statute means, unless otherwise stated, the statute and regulations, if any, under that statute, in force from time to time, and any statute or regulation passed and in force which has the effect of supplementing or superseding that statute or those regulations.

2.6 **Currency** - References to dollars or $ means Canadian dollars, unless otherwise stated.

2.7 **Reference Indices -** If any index, tariff or price quotation referred to in this EPA ceases to be published, or if the basis therefor is changed materially, there will be substituted an available replacement index, tariff or price quotation that most nearly, of those then publicly available, approximates the intent and purpose of the index, tariff or quotation that has so ceased or changed. This EPA will be amended as necessary to accommodate such replacement index, tariff or price quotation, all as determined by written agreement between the Parties, or failing agreement, by arbitration under Section 12.1 of this EPA.

2.8 **Conversions** - If a value used in a calculation in this EPA must be converted to another unit of measurement for purposes of consistency or to achieve a meaningful answer, the value will be converted to that different unit for purposes of the calculation.

2.9 **Additional Interpretive Rules** - For the purposes of this EPA, except as otherwise expressly stated:

(a) "this EPA" means this EPA as it may from time to time be supplemented or amended and in effect, and includes the Schedules attached to this EPA;

(b) the words "herein", "hereof" and "hereunder" and other words of similar import refer to this EPA as a whole and not to any particular section, Section or other subdivision;

(c) the word "including" or "includes" is not limiting whether or not non-limiting language (such as "without limitation" or "but not limited to" or words of similar import) is used with reference thereto;

(d) the words "year" and "month" refer to a calendar year and a calendar month;

(e) any consent, approval or waiver contemplated by this EPA must be in writing and signed by the Party against whom its enforcement is sought, and may be given, withheld or conditioned in the unfettered discretion of the Party of whom it is requested, unless otherwise expressly stated;

(f) all rights and remedies of either Party under this EPA are cumulative and not exclusive of any other remedies to which either Party may be lawfully entitled, and either Party may pursue any and all of its remedies concurrently, consecutively and alternatively; and

(g) any notice required to be given, or other thing required to be done, under this EPA on or before a day that is not a Business Day, will be deemed to be given or done when required hereunder if given or done on or before the next following Business Day.

3. ADDRESSES FOR NOTICES

3.1 **Notices to Buyer** - Except as noted below, all notices addressed to Buyer will be delivered to the following address:

To: **YUKON ENERGY CORPORATION**
#2 Miles Canyon Road
Box 5920
Whitehorse, YT Y1A 6S7
Attention: IPP Manager
Email: ipp@yec.yk.ca

3.2 **Notices to Seller** - All notices addressed to Seller will be delivered to the following address:

To: **NOMAD CONTRACTING & ELECTRICAL SERVICES LTD.**
62 Mt Sima Rd
Whitehorse, YT Y1A 0A8
Attention: Sebastien Roy
Email: nomad_electric@outlook.com

SCHEDULE "B"

PROJECT DESCRIPTION

CONTRACT PARTICULARS:

1. **Condition Date:**

   Nil.

2. **Conditions Precedent:**

   Nil.

3. **Term:**

   The "**Term**" of this EPA commences on the Effective Date and continues for a period of 25 years following Buyer's COD.

4. **Energy Price and Seasonal Adjustment:**

   (a) In each billing period, Seller shall pay to Buyer, for each KWh of Delivered Energy the "**Energy Price**" calculated as follows:

   $\text{Energy Price}_n = (.5 * \$0.158/\text{KWh} * \text{CPI}_{\text{January 1, n}} / \text{CPI}_{\text{January 1, 2020}}) + (.5 * \$__/\text{KWh})$

   Where:

   n = the year for which the relevant calculation is being conducted

   $\text{CPI}_{\text{January 1, n}}$ = the CPI for December in the year immediately prior to the year for which the relevant calculation is being conducted;

   (b) For each hour, the Energy Price determined above for Delivered Energy during that hour will be adjusted to an amount (expressed in $/KWh) equal to the percentage of that Energy Price applicable for that hour as set out in the table in Schedule "I".

SELLER'S PLANT

1. **Location of Control Building:**

   60° 38’ 045” N and -135° 01’ 050” W

2. **Eligible Clean Energy Type:**

   Solar PV

3. **Seller's Plant Capacity:**

   150kW

4. **Project Energy Volume:**

Month	Energy Volume (KWh)
January	3,126.3
February	13,232.0
March	28,210.3
April	36,987.5
May	37,860.9
June	36,194.0
July	34,918.6
August	32,736.9
September	23,825.4
October	16,396.7
November	4,833.6
December	1,742.6

5. **Seller's Plant Description:**

Please refer to Seller's single line diagram in Exhibit B-1.

Total AC Power: 150 kW
Primary AC line voltage: 480 V
Total AC line current: 180.4 A
Total DC power: 246.4 kW
Open-circuit DC voltage: 1000V/String
Operating DC voltage: 700V/String
Total DC operating current: 352 A

6. **Target Seller's COD:**

June 1, 2021

7. **Electrical Grid:**

Yukon Integrated System.

BUYER'S SYSTEM UPGRADES

1. **System Upgrades:**

No upgrades are required other than a change to OCR5953 reclose interval to allow for the operation of the Nomad solar plant islanding detection

2. **New Interconnection Facilities:**

The proposed interconnection to the AEY SL649 distribution line will consist of:

- One slack-span tap from the mainline

- One OH to UG riser pore
- One switchable 300 kVA pad mount transformer and vault
- Estimated 25m of overhead 1/0 ACSR
- Estimated 15m of underground #1 cable
- 2 pole tap
- 150 kVA 14.4kV/25kV – 277/480V oilfield transformer

Please refer to Buyer's single line diagram in Exhibit B-2.

3. **Target Buyer's COD:**

June 1, 2021

BREAKERS/SWITCHES AND SYNCHRONIZATION

H365NR Safety switch, heavy duty, fusible, 400A, 3 poles, 250 hp, 600 VAC/DC, NEMA 3R, neutral factory installed and a CHU362RB 60A 3P Type3R 600VAC/DC Heavy Duty Non Fusible Safety Switch will be used. The specifications of such switches are attached.

After voltage is restored after an outage no reconnections will be attempted until the Seller has permission to reconnect from the System Control Center (as identified in Schedule "H"). After permission is given, the Seller must check that voltage and frequency are stable and within 10% of nominal values before closing in to reconnect:

- A plus or minus 10% voltage range is acceptable; and
- A plus or minus 10% frequency range is acceptable.

Product data sheet
Characteristics

CHU362RB
60A 3P Type3R 600VAC/DC Heavy Duty Non-Fusible Safety Switch

Main

Product or component type	Single Throw Safety Switch
Disconnector device type	Non-fusible disconnect
Number of poles	3
Electrical connection	Lugs
Series name	Heavy duty

Complementary

Line Rated Current	60 A
Device composition	None
Device mounting	Surface
System Voltage	600 V AC/DC
AWG gauge	AWG 14...AWG 3 (copper or aluminium)

Environment

Product certifications	CSA
NEMA degree of protection	NEMA 3R galvannealed steel

Offer Sustainability

SCHEDULE "C"

FORM OF ANNUAL OPERATING PLAN

DATE: _____, 20__.

TO: Yukon Energy Corporation ("Buyer")

RE: Electricity Purchase Agreement between Nomad Contracting & Electrical Services Ltd. ("Seller") and Buyer dated the 27th day of August, 2020 (the "EPA")

The following sets out the Annual Operating Plan of Seller for the 12 months commencing on January 1, 20__ (the "**Applicable Period**").

(a) The following (from Table E-1 of Schedule "E" of the EPA) is the schedule of the expected total deliveries of Energy at the POI in each month of the Applicable Period:

	Projected Hourly Energy (KWh/h) **(A)**	**Projected Monthly Energy (KWh)** **(B)**
January		
February		
March		
April		
May		
June		
July		
August		
September		
October		
November		
December		

(b) The following is the schedule of any Planned Outages of the Seller's Plant expected by Seller for the Applicable Period:

[to come]

(c) The following is the schedule of operations and maintenance activities planned for the Seller's Plant expected by Seller for the Applicable Period:

[to come]

Dated effective as of the date set forth above.

1. Introduction

Teshmont was requested to perform a grid impact and interconnection study for the connection of the 200 kW Nomad solar plant to the existing Yukon electric system. The proposed plant will be connected to one of the ATCO Electric's 25 kV distribution feeders originating at their MacRae Substation

The system impact study will include:

- Load flow study
- Short circuit study
- Protection assessment

2. ETAP Modelling and Study Assumptions

2.1. Modelling

Teshmont used the ETAP power system analysis software to model the 200 kW Nomad solar plant and the 25 kV feeder to which it will be connected. The feeder was modeled starting at YEC's Whitehorse (S150) Substation, to ATCO's MacRae Substation at downstream to the location where the solar plant will be connected. The model was prepared based on the following information received from YEC:

1. MacRae Substation is approx. 7.6 km downstream from Whitehorse Substation. The solar plant will be connected approximately 1.1 km downstream from MacRae Substation.
2. Construction details.
    a) Line 9L from Whitehorse substation to MacRae Substation is constructed of 267 ACSR (Partridge)
    b) MacRae substation to Nomad solar plant interconnection point is approximately:
        i. 1.1 km of 2/0 ACSR (Quail),
        ii. 0.6 km of 1/0 ACSR (Raven)
3. Load data: Summer Peak (SP) and Winter Peak (WP) load data at S6839, S6840, S9833 and S5953 metering points are prepared as shown in Table 2-1 and Table 2-2 based on the information received from YEC.

Table 2-1: S6839, S6840 and S9833 Meter Data Modeling

Metering Points of Feeder 9L	Summer Peak (SP) Load			Winter Peak (WP) Load		
	MW	Power Factor* (%)	MVA	MW	Power Factor (%)	MVA
S6839	0.196	90	0.218	2.423	90	2.692
S6840	0.441	90	0.49	2.348	90	2.609
S9833	0.702	90	0.78	3.492	90	3.880

*Assumed

Table 2-2: S5953 Load Distribution Across 5L649 Feeder

S5953 Load Distribution	Summer Peak (SP)			Winter Peak (SP)		
	MW	Power Factor (%)	MVA	MW	Power Factor (%)	MVA
5L649 downstream load	0.125	90	0.139	0.417	90	0.463
Nomad solar plant tap line load	0.175	90	0.194	0.583	90	0.647

4. Settings of the voltage regulators in MacRae Substation as shown in Table 2-3.

Table 2-3: R61/R62/R63 Regulator Settings

Function	Setting
Control Mode	Forward
Set Voltage	124 V
Bandwidth, Volts	2 V
Time Delay, Initial	60 Sec
Time Delay, Operating	60 Sec

1. Solar PV Model: Teshmont used a typical PV Panel and Inverter model from the ETAP library and configured it to model a 200 kW solar plant.

The modeled feeder and downstream equipment in ETAP are shown in Figure 1.

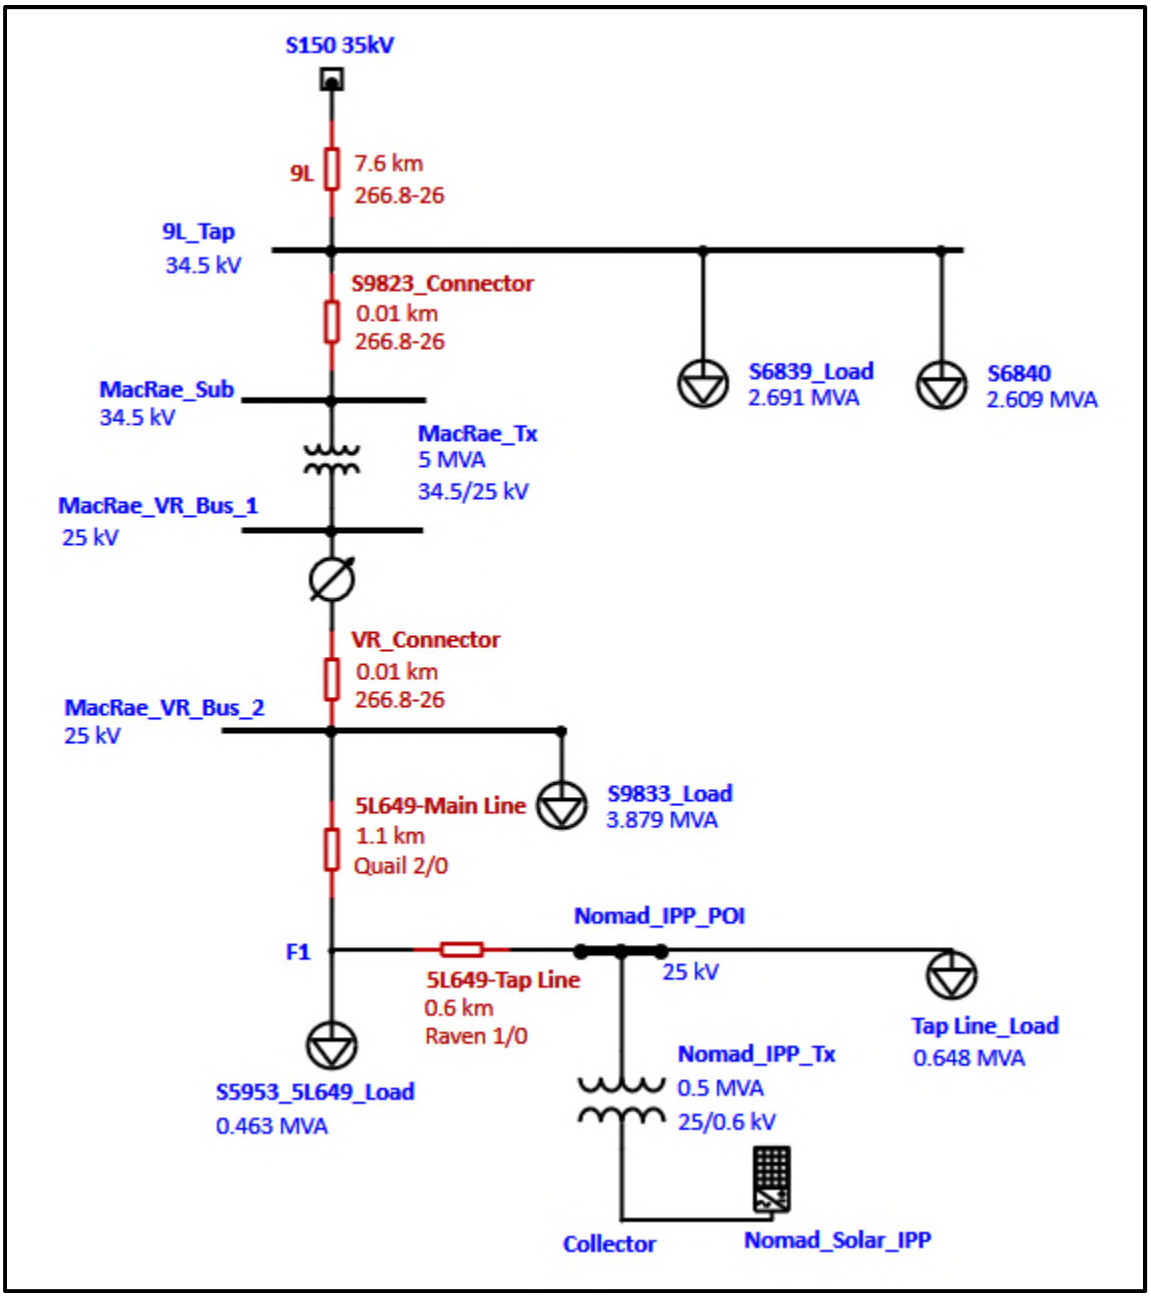

Figure 1: ETAP Single Line Diagram of 9L Feeder

2.2. Assumptions

The following assumptions are taken for this project:

1. The SP and WP loads at S6839, S6840, S9833 and S5953 metering points were prepared and modeled as directed by YEC. The maximum loads during the winter season are assumed as cold load and a 50% reduction factor is applied to obtain the WP loads.

2. The short circuit contribution of the solar plant is assumed to be 150% of the full load current.
3. The Nomad solar plant will be set in power factor control mode at unity power factor.
4. Typical values for settings and assumed configurations are used to model the downstream feeder and associated equipment where data is not available.

3. Analysis

3.1. Short Circuit Study and Protection Coordination Review

Teshmont modeled the solar plant short circuit contribution as 150% of its full load current. As such, the 200 kW solar plant will contribute 7 A of constant fault current.

For a three-phase fault at the solar plant, the estimated minimum three phase fault current is 799 A and maximum three phase fault current is 1156 A.

For a 40 ohm fault impedance, the estimated minimum ground fault current is 317 A and a maximum ground fault current is 331 A.

3.1.1. Equipment Ratings

Existing equipment ratings are adequate.

3.1.2. Overcurrent Protection Settings

The downstream OCR S5953 phase current pickup setting is 140 A and the ground current pick up setting is 110 A.

For 1 MW of downstream load, the load current is 23 A. The relay overcurrent pickup setting is approximately six times the load current. The magnitude of downstream fault currents will remain sufficient to be seen by the OCR.

OCR S5953 will continue to detect and operate for downstream faults at the Solar Plant.

3.1.3. Anti-Islanding Protection

To meet the anti-islanding requirements of IEEE 1547, the solar plant inverters must detect an islanding event and safely separate from the grid within 2 seconds.

The existing first reclose interval for OCR S5953 is set for 0.6 seconds. This will need to be reset to 2 seconds or greater to allow the solar plant to disconnect before the first reclose attempt.

3.2. Load Flow Study and Assessment of Voltage Regulator Settings

The load data provided by YEC/ATCO confirms that the output of the solar plant will always be less than the feeder load. Therefore there will always be forward load flow in the regulators and they can continue to be set in locked-forward mode.

The MacRae substation voltage regulator (VR) settings were modeled according to the settings provided by YEC/ATCO. The voltage regulator is set to control the secondary 25 kV bus at the load side.

Using the study case "VG_S6"case, regulator improves the voltage from 98.52% (source side) to 103.1% at the MacRae 25 kV bus (load side). At Nomad solar plant point of interconnection (POI), the voltage is noted 102.8% in pre-project scenario and 102.9% in post-project scenario.

Using the study case "VG_W6"case, regulator improves the voltage from 94.91% (source side) to 101.4% at the MacRae 25 kV bus (load side). At Nomad solar plant POI, the voltage is noted 101.2% in pre-project scenario and 101.3% in post-project scenario.

4. Conclusion

The connection of the 200 kW Nomad solar plant to the YEC/ATCO distribution feeder 5L649 out of MacRae Substation will have no negative impact on the YEC grid.

Existing equipment ratings and feeder protection settings are adequate, other than a change will be required to OCR5953 reclose interval to allow for the operation of the Nomad solar plant islanding detection.

SCHEDULE "E"

MONTHLY ENERGY SHORTFALL PAYMENT

Monthly Energy Shortfall Payments

In any calendar month in which there has occurred a Non-Permitted Distribution/Transmission Constraint then Buyer shall pay Seller Monthly Energy Shortfall Payment,

where:

"**Monthly Energy Shortfall Payment**" means the Monthly Constraint Shortfall multiplied by the price which is payable for Delivered Energy under Section 5.1 of the EPA; and

"**Monthly Constraint Shortfall**" (expressed in KWh) means, for each calendar month, means the aggregate of the duration of each Non-Permitted Distribution/Transmission Constraint (measured as a fraction determined as the aggregate number of minutes in such Non-Permitted Distribution/Transmission Constraint divided by 60) multiplied by the "Non-Permitted Distribution/Transmission Constraint Hourly Deemed Energy" set out in Table E-1 below for the applicable calendar month.

Table E-1

	Projected Hourly Energy (KWh/h) (A)	**Projected Monthly Energy (KWh) (B)**	**Non-Permitted Distribution/Transmission Constraint Factor (F1)**	**Non-Permitted Distribution/Transmission Constraint Hourly Deemed Energy (KWh/h) (A x F1)**
January	4.20	3,126	_%	
February	19.69	13,232	_%	
March	37.92	28,210	_%	
April	51.37	36,988	_%	
May	50.89	37,861	__%	
June	50.27	36,194	__%	
July	46.93	34,919	__%	
August	44.00	32,737	__%	
September	33.09	23,825	__%	
October	22.04	16,397	__%	
November	6.71	4,834	__%	
December	2.34	1,743	__%	

Revisions to Projected Hourly Energy and Projected Monthly Energy

Within 90 days following the end of the 2nd year after Buyer's COD, the Parties shall review and revise the values in Table E-1 above for Projected Hourly Energy and Projected Monthly Energy to reflect the

average actual amount of Delivered Energy sold to Buyer in the 2 years following Buyer's COD for the applicable months.

SCHEDULE "F"

TERMINATION PAYMENT

The "**Termination Payment**" at any time shall be equal to (a) the Gross Termination Payment set out below for the Contract Year in which the termination occurred, less (b) the actual amounts paid or owing by Buyer to Seller for Delivered Energy for the Contract Year in which the termination occurred.

Table F-1

Termination Year	Gross Termination Payment
Year 1	$477,336
Year 2	$474,530
Year 3	$471,081
Year 4	$466,934
Year 5	$462,026
Year 6	$456,293
Year 7	$449,663
Year 8	$442,059
Year 9	$433,397
Year 10	$423,588
Year 11	$412,533
Year 12	$400,128
Year 13	$386,259
Year 14	$370,801
Year 15	$353,622
Year 16	$334,577
Year 17	$313,511
Year 18	$290,254
Year 19	$264,624
Year 20	$236,423
Year 21	$205,439
Year 22	$171,441
Year 23	$134,179
Year 24	$93,383
Year 25	$48,762

Executive Summary

The purpose of the Interconnection Technical Guide is to provide guidelines for Independent Power Producers (IPP) who wish to interconnect a generation facility of greater than 50 kW and up to 10 MW to the Yukon Integrated System (YIS) via the Yukon Energy Corporation (YEC) or ATCO Electrical Yukon (AEY) distribution systems. The maximum allowable generation at the Point of Interconnection (POI) between the distribution system and IPP will depend on the results of a system impact study conducted by YEC. This guide details the technical and operational requirements of the facility and is not intended to be used as a design guide.

The purpose of this document is to:

- Provide technical specifications for the interconnection of IPP generation to the YIS (via YEC or AEY distribution systems).
- Clarify, where necessary, the technical requirements in CSA Standard C22.3 No. 9-08 (R2015) “Interconnection of Distributed Resources and Electricity Supply Systems” [1] and to provide an outline for how each section applies to interconnections with the YIS.

1. Introduction and Scope

1.1. Purpose

This guide establishes criteria and technical requirements for Independent Power Producers (IPP) who wish to interconnect generation, with a net capacity greater than 50 kW and up to 10 MW, to the Yukon Integrated System (YIS), at the distribution level (35 kV and below), or at the transmission level (above 35 kV). This guide has been developed considering CSA Standard C22.3 No. 9-08 (R2015) [1] and IEEE Standard 1547-2018 [2] and is subject to regular review and revision due to evolving standards.

The technical guide is intended to assist IPPs who apply to connect to the YIS through the Standing Offer Program, Call for Power, or through other unsolicited requests to connect.

1.2. Limitations

The criteria and technical requirements described within this section apply to the following generation interconnections:

- Interconnections to the Yukon Energy Corporation (YEC) and ATCO Electric Yukon (AEY) distribution systems at voltages of 34.5 kV and below, and
- Interconnections to the YEC transmission system at voltages over 34.5 kV by means of an existing or new substation. Transmission interconnections will require specific detailed review and approval by YEC and all interconnection costs will be borne by the IPP.

This Guide establishes the minimum requirements for the Point of Interconnection (POI). The IPP generation may be subject to additional requirements to ensure the project meets all applicable standards.

This Guide is not to be used:

- As an Operating Agreement and does not address the following:
    - Joint operating agreements
    - Costs
    - Tariffs
    - Other contractual issues
- As an Interconnection Process and Procedures Guide, and does not include the following:
    - Protection of the IPP's generation facilities
    - Transmission system impact and upgrades
    - System planning and design
    - Operation of the distribution system
    - Other system related issues
- As a design handbook for a generation facility.
- For any IPP generation not connected indirectly or directly to the YIS, i.e. an island grid.

2. Terms, Definitions, and Abbreviations

2.1. Definitions

Accredited Certification Organization – An organization that has been accredited by the Standards Council of Canada to operate a certification program for electrical equipment, such as the Canadian Standards Association (CSA).

Anti-islanding – A means of detecting and preventing a DR from energizing a part of the distribution system that becomes disconnected from the grid.

ATCO Electric Yukon – A private investor-owned utility, and member of the ATCO Group of Companies.

Automatic Circuit Recloser (ACR) – An overcurrent protection device used by utilities to detect faults on distribution system feeders, which has the ability to open and then reclose after a specified time delay allowing adequate time for temporary faults to clear.

Bi-directional Meter – A meter that measures real and reactive power and energy in both directions.

Cease to Energize – The cessation of energy outflow capability.

Clearing Time – The time from the start of the abnormal condition to when the distributed resource ceases to energize the distribution system.

Dispensated Metering Equipment – Any metering equipment that has received Measurement Canada approval under Section 9(2) or 9(3) of the Electricity & Gas Inspection Act.

Disconnecting Means – A device or group of devices that allows the conductors of a circuit to be disconnected from their source of supply.

Distributed Generation (DG) – Small, decentralized electric power generation facilities, typically interconnected to the distribution system.

Distribution System – The portion of the electrical system that operates at a nominal voltage of 34.5 kV line to line and below, and which distributes electric power between distribution substations and customers.

Effectively Grounded Distribution System – Distribution facilities where the neutral conductor is solidly grounded and the ratio of the zero sequence reactance to the positive sequence reactance is less than or equal to 3 and the ratio of the zero sequence resistance to the positive sequence reactance is less than 1.

Electromagnetic Interference (EMI) – Any electromagnetic disturbance that interrupts, obstructs, or otherwise degrades or limits the effective performance of a device, equipment or system.

Exporting – supplying power into the distribution system through the POI.

Facilities – A physical plant including, without limitation, generating plants, transmission and distribution lines, transformers, meters, equipment and machinery.

Flicker – The subjective impression of fluctuating luminance caused by voltage fluctuations.

Frequency – The number of cycles through which an alternating current passes in a second. The North American standard is 60 cycles per second, known as 60 hertz (Hz).

Generation – The process of converting solar, thermal, wind, hydro, or chemical energy into electric energy.

Independent Power Producer (IPP) – An agency or individual other than a public utility (as defined by the Public Utilities Act) who generates electricity to sell (to the utilities). An independent power producer does not own transmission facilities and is dependent on the utilities to purchase and distribute the power it produces.

Interconnection – The physical connection of DG to YEC's distribution system so that parallel operation can occur.

Island Grid – A community power system which is energized solely by one or more local power producers and is separated electrically from the YIS.

Islanding – A condition where a portion of the utility's distribution system is energized exclusively by one or more power producers through their DR interconnection.

Operating Interface Point – See Point of Interconnection.

Parallel Operation – the simultaneous energization at a POI by the generating facility and the utility distribution system.

Point of Interconnection (POI) – The location of the electrical connection between an IPP facility and the utility's distribution system. This will be the point where the ownership changes from the utility to the IPP.

Power Factor – The ratio of active power to apparent power. It is the cosine of the phase angle difference between the current and voltage of a given phase.

Protection Scheme – The protection functions, including associated sensors, relays, and power supplies, intended to protect a distribution system or interconnection equipment.

Public Utility – As defined by the Public Utilities Act and Regulations (i.e., YEC and/or AEY).

Ride-through – The ability to withstand voltage or frequency disturbances inside defined limits and to continue operating as specified.

Secondary Injection Testing – A method in which low level signals obtained from current and voltage signal generators are injected into a power system protective device to test device response.

Stabilized – The state of the distribution system after voltage and frequency has returned to normal range for a period of at least five minutes (or another period of time, as agreed with YEC) following a disturbance.

Stand Alone – The state where a distributed generation can operate by controlling the frequency and voltage of their facility while in islanded or isolated mode.

Telemetering – Transmission of measurable quantities using telecommunications systems.

Total Demand Distortion (TDD) – The ratio of the root mean square of the harmonic content, considering harmonic components up to the 50th order and specifically excluding interharmonics, expressed as a percent of the maximum demand current. Harmonic components of order greater than 50 may be included when necessary.

Total Harmonic Distortion (THD) –The ratio of the root mean square of the harmonic content, considering harmonic components up to the 50th order and specifically excluding interharmonics, expressed as a percent of the fundamental. Harmonic components of order greater than 50 may be included when necessary.

Transfer Trip – A remote signal directed from an upstream device to command a DG to cease to energize the distribution system upon detection of an islanding condition and to prevent re-energization.

Transmission System –The portion of the system that operates above a nominal voltage of 34.5 kV line to line and transmits electric power between YEC substations.

Trip Time – The time between the start of the abnormal condition and the interconnection device ceasing to energize the distribution system.

Type Test – A test performed on a sample of a particular model of a device to verify specific aspects of its design, construction and performance.

Utility – See Public Utility (i.e., YEC and/or AEY).

Visible-Break Disconnect – A switch or circuit breaker by means of which the generator and all protective devices and control apparatus can be simultaneously disconnected under full load entirely from the circuits supplied by the generator. All blades or moving contacts must be connected to the generator side, and the design of the disconnect switch must allow adequate visible inspection of all contacts in the open position.

Voltage Flicker – A condition of fluctuating voltage on a power system that can lead to noticeable fluctuations in the output of lighting systems.

Yukon Energy Corporation (YEC) – A publicly-owned electrical utility that is the main generator and transmitter of electrical energy in Yukon.

Yukon Integrated System – The integrated Whitehorse-Aishihik-Faro and Mayo-Dawson electrical grids which are owned by YEC.

2.2. Abbreviations

ACR	Automatic Circuit Recloser
AEY	ATCO Electric Yukon
AEUC	Alberta Electrical Utility Code
CEA	Canadian Electricity Association
CEC	The Canadian Standards Association's C22.1-98 Safety Standard for Electrical Installations Part 1, also known as the Canadian Electrical Code
CSA	Canadian Standards Association
IEC	International Electrotechnical Commission
IEEE	Institute of Electrical and Electronics Engineers, Inc.
IPP	Independent Power Producer
LTC	Load Tap Changer
NEMA	National Electrical Manufacturers Association
POI	Point Of Interconnection
RTU	Remote Terminal Unit
SCADA	Supervisory Control and Data Acquisition
SCC	System Control Center
SIS	System Impact Study
YEC	Yukon Energy Corporation
YIS	Yukon Integrated System
YUB	Yukon Utilities Board

3. Party Responsibilities

Refer to the IPP Policy as released in January 2019 for the individual responsibilities of the Government of Yukon, utilities (YEC and AEY), Yukon Utilities Board and the IPP during the generation interconnection process.

3.1. IPP Responsibilities

The IPP is responsible to:

- Provide technical information to the utility as specified in Appendix A and Appendix B;
- Assume ownership of the facility including the design, installation, operation, and maintenance of all equipment, station and distribution line facilities from the POI to the IPP facility, unless otherwise agreed to in writing;
- Pay the costs of system interconnection in accordance with the commercial terms established by the utilities;
- Obtain all regulatory approvals, including environmental assessment approvals, if necessary, for the construction and operation of its facilities. The IPP facilities shall be designed, constructed, operated and maintained in compliance with the applicable statutes, regulations, by-laws, codes and technical requirements specified by the utility (e.g. remote monitoring etc.);
- Submit all specifications of its facilities and detailed plans to the utility for review prior to receiving permission to connect to their distribution system;
- Ensure the technical requirements given in the standards and codes in Appendix D are met;
- Ensure metering requirements are met (see section 12); and
- Negotiate the timing and any testing requirements for the commissioning process with YEC

3.2. YEC Responsibilities

YEC is responsible for the operation of the Yukon Integrated System (YIS) and for certain local distribution systems interconnected with the YIS. This guide applies to all transmission and YEC distribution system interconnections.

YEC is responsible for all system studies performed on the YIS. The IPP and AEY, in the case of an AEY interconnection, shall provide all necessary information to YEC for the interconnection of the IPP facility. The system studies conducted by YEC will be paid for by the IPP.

After receiving the application for interconnection, YEC shall provide the IPP, at the IPP's cost, the information specified in Appendix C.

3.3. AEY Responsibilities

AEY is responsible for the operation of certain local distribution systems interconnected with the YIS. This guide applies to these AEY distribution system interconnections.

After receiving the application for interconnection, AEY shall, in consultation with YEC, provide the IPP, at the IPP's cost, the information specified in Appendix C.

4. General Requirements

4.1. Standards

When planning, designing, and operating an IPP Generation Facility, the IPP shall meet all applicable national, territorial and local construction and safety codes and standards.

The interconnection facility must comply, as a minimum, with the following:

- All CSA Standards, including the Canadian Electrical Code (CEC),
- Applicable YEC and AEY standards and the requirements set forth in this Guide,
- National, Territorial and local Governing law, acts, by-laws and codes, and
- Alberta Electrical Utility Code (AEUC) [4].

Applicable standards are located in Appendix D, however not all may be applicable for the IPP facility and additional standards may apply.

The interconnection of new generation can adversely affect the electric service to existing or future customers. The IPP must work with the utility to mitigate any adverse effects.

The facility must be constructed and maintained to provide a safe environment for employees as well as the public. If the generation facility adversely affects other customers, the utility may disconnect it until such time as the concern has been mitigated. The IPP is responsible for any costs incurred as a result.

The IPP is required to install, operate and maintain the facility and to ensure it is in sufficiently good order and repair at all times. Maintenance shall conform to good electrical practice, adequate for safe parallel operation when connected to the YIS. The utility and the IPP shall share commissioning reports, operating procedures and annual shutdown, maintenance, and inspection reports.

4.2. Operating Requirements

A joint operating agreement template will be developed in conjunction with the utility. The agreement requirements are not included within the scope of this Guide. A sample operating agreement is located in Appendix E.

5. Site Specific Conditions and Capacity Limitations

During the preliminary stage of project development any limitations regarding the proposed interconnection, and any additional system upgrades required, will be determined in consultations between the IPP, YEC and AEY, if interconnected via an AEY distribution system.

A system impact study will be necessary to identify any site-specific conditions and capacity limitations of the distribution and/or transmission system. To facilitate the study, the utility and the IPP will exchange information concerning load, feeder characteristics, protection philosophies, station layouts, capacities, ratings and other relevant information of the distribution and/or transmission system. The utility controls reliability design and reliability standards.

Under certain circumstances, YEC and AEY may limit the size or reconfigure the proposed connection arrangement of the IPP facility in order to maintain the integrity of their system.

6. YIS Transmission and Distribution System Characteristics

6.1. YEC Transmission System

6.1.1. General System Configuration

The YIS is an 'Islanded grid' which has no interconnection with the main North American electric grid. The Yukon must produce all of its own power, and cannot generate more electricity than is there is load, since there are no neighboring markets into which to sell surplus energy.

The YIS includes the 138 kV Whitehorse – Aishihik – Faro (WAF) grid, the 69 kV Mayo-Dawson-Keno (MD) grid, and the 138 kV Carmacks-Stewart Transmission Line (CSTL) which interconnects the WAF and MD grids. YEC provides power to major industrial customers connected to the 69 kV and 138 kV grids.

A map of the YIS is shown in Figure 6–1.

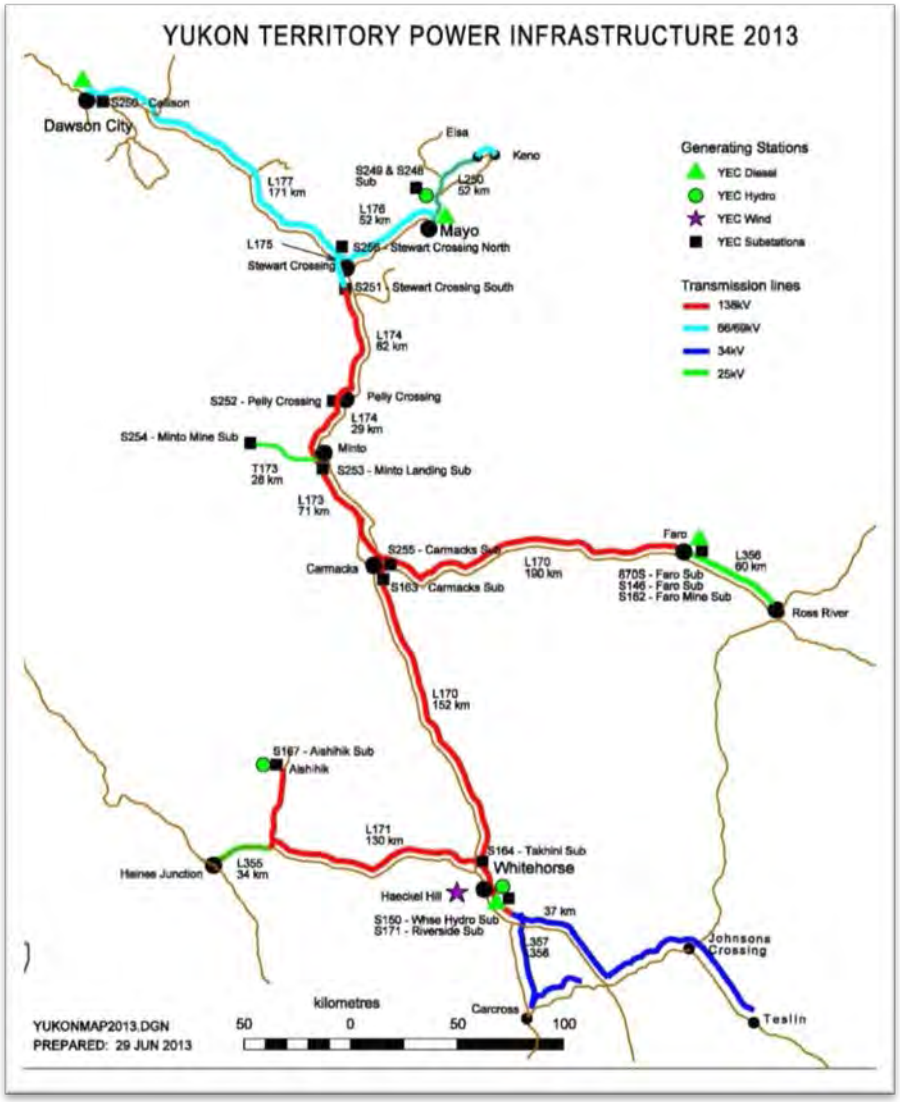

Figure 6–1: YIS Map

6.1.2. System Unbalance

Voltage unbalance on the transmission system is minimal during normal operation. The voltage unbalance under normal operating conditions will be less than three (3) percent. The IPP facilities may be subjected to voltage unbalance and negative sequence current during system disturbances. The generation connected to the transmission system must be able to withstand significantly unbalanced voltages with high negative phase sequence currents for short periods of time.

6.1.3. Frequency

The YEC transmission system operates at 60 Hertz (Hz) Alternating Current (AC) with equipment standard for this frequency. Frequency variations are typically in the range between 59.0 Hz to 61.0 Hz for small contingencies that cause modest disturbances, however variations between 58 Hz to 66 Hz or greater can occur for larger contingencies.

The frequency of the electric system is controlled by synchronous generator governor systems. Such governor systems respond automatically to changes in system frequency to prevent further deviation. These variations are system dependent and subject to change.

6.1.4. Steady State Voltage Levels

During normal steady state conditions, the 69 kV and 138 kV systems can vary between 90% and 105% of nominal voltage. However, under extreme conditions, the 69 kV and 138 kV systems can vary between 85% and 110% of nominal voltage with some 138 kV facilities designed to operate continuously up to 110% of nominal voltage.

6.1.5. System Fault Levels and System Impedances

The IPP generation facilities connecting directly to the transmission system shall be designed for operation at short circuit (fault) levels that take into account reasonable future development of the YIS transmission system. The short circuit levels to be used in the design depend on the point(s) of interconnection and future planned development and are available on request from YEC.

6.1.6. Fault Clearing and Automatic Reclosing

The YIS does not implement auto-reclosing at the transmission level.

6.1.7. System Grounding

The transmission system is effectively grounded.

6.2. YIS Distribution System Characteristics

6.2.1. General

Both YEC and AEY operate distribution systems in the Yukon which are interconnected with the YIS. The systems are predominantly three phase, wye connected, with nominal voltages of 4.16/2.4 kV, 6.9/4 kV, 12.5/7.2 kV, 13.8/8 kV, 25.00/14.4 kV and 34.5/20 kV.

AEY also operates a number of distribution systems which are not interconnected to the YIS, and are not covered by this Guide:

- Watson Lake
- Old Crow
- Beaver Creek
- Destruction Bay / Burwash Landing
- Swift River

For information on connecting to the AEY distribution systems which are isolated from the YIS, refer to AEY's document entitled, "ATCO Electric Yukon's Isolated Community Generation System Interconnection Guidelines".

6.2.2. Voltage Levels

The YEC and AEY distribution systems operate to meet CSA Standard CAN3 C235.83 – "Preferred Voltage Levels for AC Systems 0 to 50,000V" which defines the preferred operating voltage levels for normal and extreme operating conditions. The distribution system steady state voltage is typically maintained between + 5% to 7% and - 5% to 7%.

6.2.3. Power Quality (Harmonics and Voltage Flicker)

The YEC and AEY distribution systems operate to limit the maximum individual frequency voltage harmonics to 3% of the fundamental frequency and the voltage total harmonic distortion (THD) to 5% on the utility side of the POI.

6.2.4. Voltage Regulation

The operating voltages on the low voltage buses of YEC distribution substations are generally regulated by transformer automatic load tap changers (LTC), bus voltage regulators or feeder voltage regulators. YEC will provide set-points for the equipment upon request.

6.2.5. Voltage Unbalance

Distribution facilities are typically three-phase systems, incorporating single-phase distribution taps. The voltage unbalance on a distribution system under normal operating conditions may exceed 3%, due to the unbalanced loading and single-phase regulation. Voltage unbalance will be calculated using the following formula, as derived from CSA Standard C22.3 No. 9-08 (R2015) [1]:

Voltage Unbalance (%) = 100 x (negative sequence voltage of the fundamental frequency component) / (positive sequence voltage of the fundamental frequency component)

6.2.6. Fault Levels

Fault levels and maximum allowable fault currents vary significantly through the distribution system and must be considered in the design of the IPP interconnection.

6.2.7. System Grounding

The utility distribution facilities are typically three phase, four wire, multi-grounded systems that incorporate single phase distribution taps. The lines are normally operated as effectively (solidly) grounded with grounded-wye connected sources at the distribution substation secondary bus.

6.2.8. Phasing

The phase sequence on the utility system may vary, and must be confirmed between the IPP and the utility during the design phase of the installation.

6.2.9. Fault and Line Clearing and Automatic Reclosing

The YEC distribution systems do not currently include auto reclosing. The AEY distribution systems may have auto reclosing and this will be confirmed during the design phase of the application.

7. Power Quality Requirements for the System Interconnection

7.1. Harmonics

The following industry standards may provide guidance for appropriate performance.

- IEEE 1547-2018 – IEEE Standard for Interconnection and Interoperability of Distributed Energy Resource with Associated Electric Power Systems Interfaces, IEEE, 2018 [2]
- IEEE 519-2014 – IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems [5]
- IEC 61000-4-15 – Testing and Measurement Techniques – Flickermeter - Functional and Design Specifications [6]

The generation facility shall not inject harmonic currents such that will cause objectionable voltage distortion as per standard IEEE 519 Harmonic current injections cause intolerable voltage distortions on the distribution system and may damage equipment.

The Utility, at the IPP's expense, shall conduct a Power Quality Assessment of the distribution system in the immediate vicinity of the interconnection using a measurement technique compliant with IEC 61000-4-7.

When performing a Power Quality Benchmark, the measurements at the customer's POI shall be taken over a one week (168 hour) period during typical production load levels.

7.2. Flicker

The generation facility shall meet the requirements of Section 6.2.3 and shall not cause unacceptable levels of flicker on the distribution system. The utility, at the IPP's expense, shall measure the flicker level using a power quality measuring device that meets the requirements of the IEC Flickermeter Standard 61000-4-15.

When performing a Flicker assessment, the measurements at the customer POI shall be taken over a representative load cycle of one day or greater.

7.3. Speed Regulation and Frequency Control

The frequency of the YIS is controlled by the generators operated by YEC.

The YIS operates at 60 Hertz (Hz) Alternating Current (AC). The nominal frequency variations are typically 59.0 Hz to 61.0 Hz for small contingencies that cause modest disturbances, and the frequency may drop to 58 Hz or rise to 66 Hz or higher for larger contingencies.

The frequency of the YIS is automatically controlled by the governor systems of the generators operated by YEC, within the specified limits.

IPP generators rated at 1 MVA and greater are required to have a governor system, capable of operating in droop mode, to respond to system frequency changes. The droop setting of the governor will typically be in the range of 5%.

IPP generators rated less than 1 MVA may operate in base load mode rather than in frequency control mode.

The utility will define frequency requirements on a project by project basis and may require the control of these parameters directly via the YEC SCC.

Equipment connected to the YIS shall be capable of withstanding the dynamic frequency performance criteria listed in Table 1.

Table 1: Transmission Minimum Frequency Performance

Under Frequency Limit	Over Frequency Limit	Minimum Time
60.0-59.0 Hz	60.0-61.0 Hz	N/A (continuous operating range)
58.9-58.5 Hz	61.1-61.5 Hz	3 minutes
58.4-57.9 Hz	61.6-61.7 Hz	30 seconds
57.8-57.4 Hz		7.5 seconds
57.3-56.9 Hz		45 cycles
56.8-56.5 Hz		7.2 cycles
less than 56.4 Hz	greater than 61.7 Hz	Instantaneous trip

Under-frequency and over-frequency relaying that automatically disconnects generators from YIS must not operate for frequencies in the range of 59.0 to 61.0 Hz if no other abnormal system event is underway.

7.4. Voltage Regulation and Power Factor

The IPP is responsible for ensuring that the voltage levels at the POI are maintained within this guidelines prescribed by the utility. The IPP interconnection must maintain the voltage levels, under all feeder load conditions, at the same values as they were prior to the interconnection.

Synchronous generators connected to the distribution system must be equipped with adequate excitation controllers. The IPP shall operate generators with Automatic Voltage Regulators (AVR) adjustable from 95% to 105% of nominal bus voltage. The Generation should be run in Voltage control unless required to run in power factor (pf) mode by the Utility. Operation in MW or MVAR control is not acceptable. The AVR response should with no intentional delay when in Voltage Control mode.

Induction generators do not have voltage or reactive power control capability and consume reactive power (VAR). In this case, the generator must provide reactive compensation to correct the power factor to 0.9 lagging or better at the POI, unless other terms are specified by the utility.

Inverter type generating equipment can control the power factor over a wide range, typically ± 0.75. An inverter type generator connected to the distribution facility must be capable of adjusting the power factor in the range of ± 0.9. The IPP may operate outside that range only by prior agreement with the utility.

The utility will define voltage and reactive power requirements on a project by project basis and may require the control of these parameters directly via the YEC SCC. The IPP and utility will identify and

agree on the exact transformer ratio to allow optimal voltage regulation on the system and the IPP will determine whether an on-load tap changer is needed.

In order to coordinate with its existing voltage control devices, the utility may require that the generator operate in a power factor control mode. This means operating within a constant power factor set point range. The voltage/power factor regulator must be capable of controlling the power factor of the generator. The utility shall determine the actual set point between these limits.

In power factor control mode, the voltage regulator must have a voltage override that causes it to reduce excitation if the voltage at the POI exceeds an upper limit to be specified by the utility. The normal upper limit is 105% of nominal; however, the voltage regulator shall have the provision to adjust this upper limit between 100% and 110% of nominal. The voltage regulator must also have provision for a time delay between sensing an excursion of the upper voltage and initiating control action. The power factor control equipment must have the capability to allow for the adjustment of this time delay from between 0 and 180 seconds. The utility will specify the required time delay for each project.

7.5. Voltage Unbalance

Unbalanced phase voltages and currents can affect protective relay coordination and cause high neutral currents and thermal overloading of transformers. Of particular concern is negative sequence voltage and the resulting effect, particularly on rotating generators and motors connected to the system.

To protect the utility and the IPP equipment, the 3-phase generation contribution at the POI should not cause a voltage unbalance greater than 1% or a current unbalance greater than 5%.

If the existing unbalance at the POI is shown to be already close to the maximum unbalance condition, the IPP contribution may cause the unbalance to exceed the specified amount. This will be considered on a case-by-case basis.

7.6. Voltage and Frequency Transients

The IPP is responsible for the cost of any necessary transient or dynamic stability studies, which must be performed in a manner approved by YEC.

7.7. Resonance and Self-Excitation of Induction Generators

The potential effects of resonance should be considered as part of the design of the generating facility. The effects include:

- Ferro-resonance in the transformer,
- Sub-synchronous resonance due to the presence of capacitor banks, and
- Harmonic resonance with other customers when capacitors are being added as part of the installation.

When induction generators are used, the potential for self-excitation should be assessed and addressed as part of the system impact study and mitigated accordingly.

The IPP shall be responsible for the engineering analysis as part of the design process to evaluate the existence of, and to eliminate the harmful effects of resonance and the assessment of the self-excitation effects of induction generators. The engineering analysis of resonance and the assessment of the self-excitation effects of induction generators must be submitted to YEC for approval or further evaluation.

7.8. DC Current Injection

The IPP facility system shall not inject a dc current at the POI.

7.9. Fault Levels

The utility will provide the IPP with the anticipated fault levels or the data necessary for the IPP to calculate the distribution system fault contributions at the POI.

The IPP facility must not increase the fault levels on the utility distribution or transmission system above their design levels for maximum faults.

8. Physical Interconnection

8.1. Safety

The safety of the public, operating personnel and the environment is of primary concern in the design, construction, operation and maintenance of the interconnection facilities.

8.2. Point of Interconnection (POI)

The POI is the point at which the utility (YEC or AEY) distribution facilities or conductors are connected to the IPP's facilities or conductors, and where any transfer of electric power between the IPP and the utility takes place. The POI must be identified in the design and on the Single Line Diagram (SLD).

Depending on ownership, YEC or AEY will coordinate the design, construction, maintenance and operation of the facility on the distribution system side of the POI. The IPP is responsible to coordinate the design, construction, maintenance and operation of the facility on the generation side of the POI.

All voltage and frequency parameters specified in this section must be met at the POI unless otherwise stated.

The IPP is responsible for any incremental costs to the electric systems caused by the interconnection. The responsible utility will carry out the engineering, design and construction required for these installations and charges those costs back to the IPP. Ongoing O&M costs incurred on the distribution feeder side will also be recovered by the utility.

There may be cases where either the utility or the IPP may own equipment located on the other's side of the POI. For example, the utility may own and operate communications, supervisory, or metering equipment, which is located on the IPP side of the POI. The IPP must provide a site with the necessary space for utility to install current transformers, potential transformers, switching equipment, meters, and any other AC and DC auxiliaries, protection and controls, SCADA or communications equipment required to interconnect with the generating facility. The site is to be approved by the utility and a 120-volt AC power service is to be available for the use of portable tools.

8.3. Point of Disconnection

For transmission interconnections, the visible-break disconnect switch shall be located on the high voltage side of the interconnection transformer.

For distribution interconnections, the visible-break disconnect switch may be located on the high or low voltage side of the interconnection transformer.

The disconnect switch must be gang operated to simultaneously isolate all three phases.

If the IPP site interconnects multiple generators, one disconnect switch must be capable of isolating all of the generators simultaneously. There may be other means of meeting this requirement; however the approval of the utility must be obtained before using other means.

The IPP must follow the utility switching, clearance and tagging procedures. The utility is responsible to instruct the IPP in this regard.

8.3.1. High Side and Low Side Disconnect Switches

For transmission interconnections the disconnect switch on the high voltage side of the interconnection transformer shall be installed, owned and maintained by the IPP.

For distribution interconnections the disconnect switch, if on the high voltage side of the interconnection transformer shall be installed, owned and maintained by the utility, and if on the low voltage side of the interconnection transformer shall be installed, owned and maintained by the IPP.

8.3.2. Disconnect Switch Specification

The disconnect switch must be a manual, visible-break disconnect that provides safe isolation for the utility's personnel from the generators and all other possible customer sources of energy.

The disconnect switch must:

- Be adequately rated to break the connected generation/load;
- Be located within five meters (horizontal) of the POI, unless otherwise approved by the utility;
- Provide a direct, visible means to verify contact operation;
- Allow simultaneous disconnection of all ungrounded conductors of the circuit;
- Plainly indicate whether the switch is in the "open" or "closed" position;
- Be lockable in the "open" position;
- Be capable of being energized from both sides;
- Be readily accessible to the utility's operating personnel;
- Be externally operable without exposing the operator to contact with live parts;
- Be capable of being closed without risk to the operator while there is a fault on the system;
- Be labeled with utility's switch number;
- Meet all applicable CSA Part II standards and all applicable codes; and
- Undergo annual inspections and maintenance, with reports submitted to the utility for approval.

8.4. Interconnection Transformer

A generator step-up transformer boosts the voltage of the DG to match the voltage of the utility distribution feeder. The transformer winding configuration impacts how system faults are detected and what type of protection is required (see Section 9.10). The IPP must submit their transformer connection proposal to the utility for review and approval prior to placing an order for purchase.

8.5. Interconnection Grounding

The IPP facility must be grounded in accordance with the latest revisions of the CEC and AEUC. A ground grid of sufficient size to handle the maximum available ground fault current must be designed and installed in order to limit ground potential rise (GPR) step and touch potentials to safe levels as set forth in ANSI/IEEE Std. 80 IEEE Guide for Safety in AC Substation Grounding.

The ground grid will be designed for foreseeable future fault levels obtainable from the System Impact Study.

Grounding of the interconnection shall be designed to provide:

- Solid grounding of the distribution feeder neutral connection,
- Fault detection that isolates all sources of ground fault contribution,
- A circuit to block the transmission of harmonic currents and voltages, and
- Protection of the low voltage side from damage due to high side faults.

The preferred configuration, for an IPP owned interconnection transformer, is delta connection on the generator side of the transformer and a grounded-wye configuration on the utility's side of the transformer. If this configuration is not technically feasible, the configuration chosen must still address the above concerns. Grounding must conform to the AEUC [4].

Sample single line diagrams are shown in Appendix F.

8.6. Phasing and Phasing Sequence

Since phasing is not standardized across distribution facilities, the phase sequence must be coordinated between the IPP and utility's distribution system.

8.7. Interrupting Device Ratings

The design of the generation facility must consider the fault contributions from both the distribution system and the IPP generation facility, to ensure that all circuit fault interrupters are adequately sized. The utility will inform the IPP of the present and anticipated future fault contribution from the interconnected electric system.

9. Interconnection Protection

9.1. General

The purpose of the IPP facility protection is to reduce the risk of damage to IPP and utility equipment and maintain the reliability of supply.

The protection scheme shall be designed to detect the following conditions at the POI:

- Balanced and unbalanced system faults (i.e. line-ground, line-line and three phase faults)
- Frequency variations
- Voltage variations
- Reverse power flow
- Islanding conditions
- Out of synchronism

Depending upon location, the protection scheme may be required to detect additional conditions such as open phase, ferro-resonance, negative sequence voltage, or zero sequence currents.

The protection scheme must fully coordinate with any existing distribution system protective devices. The IPP must submit a complete protection design package, including all relay settings, tripping schemes and schematics, to the utility for review and approval prior to installation. Both existing and ultimate bus fault levels should be considered. A sample Protective Setting Commissioning Sheet with guideline limits is included in Appendix G.

The point of measurement for voltage and frequency shall be at the POI or as agreed upon with the utility.

The IPP must revise and re-submit the protection information for any proposed modification.

9.2. Device Ratings

Equipment shall be rated to carry and interrupt the fault levels that are, or will be, present at the IPP facility - this includes the ultimate fault currents specified by the utility. The IPP's equipment covers all station and distribution facilities, including but not limited to all protection equipment forming the entrance and distribution line protection: circuit breakers, current transformers, potential transformers, secondary cabling, dc system/battery charger, switchboard wiring and protective relays.

9.3. Minimum Protection Requirements

The following minimum protection requirements shall be provided for an interconnected IPP facility:

- Overcurrent
- Over-frequency
- Under-frequency
- Over-voltage
- Under-voltage

Additional protection requirements are dependent upon the transformer configuration and the distribution system characteristics.

9.4. Phase and Ground Fault Protection

The IPP must install utility grade protective devices to detect and promptly isolate the generation facility for faults occurring either in the DG facility itself or on the distribution system. Virtual devices (i.e., computer or programmable-logic controller systems) are acceptable provided they meet standard utility practice for system protection and they have been type tested and approved by an independent testing laboratory.

The protective devices in the IPP generation facility must fully coordinate with the protective relays on the distribution system unless otherwise agreed. The IPP must calculate the protective device settings and submit the relay characteristics and settings to YEC for review and approval.

The generation facility must be able to detect the following situations and isolate itself from the distribution system:

- A short circuit between any phase(s) and ground (if distribution system is a grounded system)
- A short circuit between phase(s)

9.5. Over-Frequency and Under-Frequency Protection

Each synchronous generator must be capable of continuous operation between 59.0 Hz and 61.0 Hz and of limited time operation for larger deviations from normal frequency, as shown in Table 1.

Over/under frequency relays are normally installed to protect the generators from extended off-nominal operation. It is expected that larger (> 1 MW) synchronous generators shall remain connected to the system during frequency excursions. To ensure that the generator is not tripped prematurely, YEC will specify the minimum required time delays and levels for setting the IPP over/under frequency protection relays.

9.6. Over-Voltage and Under-Voltage Protection

The IPP must operate its generation facility such that the voltage levels on the utility's system are not significantly altered by the connection of the generation facility. IPP facility paralleling shall not cause voltage fluctuations of more than ± 5% at the POI.

The IPP must install necessary relays to trip the circuit breaker when the phase-to-ground voltage, measured on any one of the three phases, deviates outside predetermined limits. Under-voltage relays should be adjustable and should have a settable time delay to prevent unnecessary tripping of the generator on external faults. Over-voltage relays should be adjustable and may be instantaneous.

The interconnection facility must cause the generator to cease to energize the utility's system within the trip times indicated in Table 2. "Trip time" refers to the period of time between the start of the abnormal condition and the moment the interconnection device ceases to energize YEC's system.

To ensure that the generator is not tripped prematurely, the utility will specify the minimum required time delays and levels for setting the IPP over/under frequency protection relays.

Table 2: Response to Abnormal Voltages

RMS Voltage (based on 120V nominal)	Trip Time
RMS Voltage: V=<50%	Trip time: Instantaneous

RMS Voltage (based on 120V nominal)	Trip Time
RMS Voltage: 50% < V < 90%	Trip time: 120 cycles
RMS Voltage: 90% < V < 105%	Normal Operation
RMS Voltage: 105% < V < 120%	Trip time: 30 cycles
RMS Voltage: V >= 120%	Trip time: Instantaneous

The IPP may reconnect when the system is stabilized (i.e. voltage and frequency have returned to normal range for a time as identified by the utility).

9.7. Additional Protection

The utility may require additional protection on a case by case basis. Possible protection may include:

- **Unbalance or negative sequence protection**: The IPP generator is tripped on excessive current unbalance. This is important if fuse protection is used on the primary of the generator step-up transformer or for any other open phase condition
- **Broken delta protection (59G)**: Using a grounded wye-broken delta potential transformer, this protection can facilitate detection of ground faults on ungrounded systems.
- **Rate of change of frequency**: Protection to detect a power island condition.
- **Reverse power protection**: Protection to detect a generator motoring condition.

9.8. Anti-Islanding Protection

Islanding is the condition where the generation facilities and a portion of the distribution system have become isolated from the rest of the system, and continue to operate in isolated mode. Unless agreed upon by the utility, generating facilities shall not be permitted to remain connected to an islanded system, i.e. islanding is not generally allowed. Generation facilities may continue to supply station service loads while disconnected from the interconnection system.

Anti-islanding protection is required to:

- Prevent power quality issues to customers connected to the island,
- Avoid out-of-phase reclosing between the utility and the DR facility, and
- Prevent safety hazards created as a result of back feeding isolated portions of the utility distribution system.

For rotating generators, the IPP must install a transfer tripping scheme using tele-protection signals from the system to separate the DG facility from the distribution system in the event of an islanding condition.

Transfer tripping requirements are also applicable to induction generators, unless the IPP can demonstrate that that there is no potential for self-excitation. For inverter-based generation a detection scheme designed in accordance with the requirements of IEEE 1547 [2] may be acceptable.

The IPP is responsible for damage to the YIS caused as a result of failure to safely separate from the system during an islanding event or subsequently during reconnection to the system following the event.

9.9. Transformer Winding Configuration

The winding configuration of any three phase transformer will have an influence on the location of the protection measurement points and the level of protection required for the IPP interconnection. See Appendix F for examples for typical synchronous generator protection single line diagrams for different transformer configurations.

9.10. Conditions for Connecting to an Energized Distribution System

The IPP system must not energize the utility distribution system when the distribution system is de-energized or following the operation of any interconnection protection functions. The utility will inform the IPP facility when it is safe to reconnect to the distribution system.

Where transfer trip protection is installed, the transfer trip protection must ensure that the generator disconnects before a substation feeder breaker or intermediate automatic circuit reclose (ACR) operation. General requirements are:

- Generator lockout within 0.6 seconds of breaker or ACR opening; and
- Fail-safe lockout within 6 seconds of communication loss.

These conditions will be finalized via the operating agreement between the utility and the IPP.

9.11. Synchronization

Any DG facility able to generate voltage while disconnected from the YIS requires synchronization facilities before connection is permitted.

The IPP facility shall maintain in synchronism with the system while operating in parallel. The generating facility has the responsibility of maintaining synchronization with the system. The utility cannot synchronize to the generating facility. Any proposed synchronizing scheme must be submitted to the utility, prior to the installation.

For synchronous generators, an approved automatic synchronizing device must be provided in all cases where the plant is to be operated unattended. Automatic synchronizing shall be supervised by a synchronizing check relay. Synchronizing controls should satisfy the conditions in Table 3 for synchronous generators.

Table 3: Synchronization Criteria for Synchronous Generators

Aggregate Rating of Generators (kVA)	Frequency Difference (Hz)	Voltage Difference (%)	Phase Angle Difference (degrees)
0-500	0.3	10	20
>500 – 1500	0.2	5	15
>1500	0.1	3	10

Induction generators do not require synchronization since there is no generated voltage prior to connecting to the distribution system. The generator speed shall be brought to within 0.5% of its rated value. These units may be started as induction motors using power from the distribution system provided that these units do not cause unacceptable voltage flicker as specified in Section 7.2 on start - up or on connect/disconnect. The interconnection process of the induction generator shall not create a voltage drop pf greater than 5 percent.

Inverter-type or line-commutating voltage-following equipment does not require synchronization facilities. Operation of the interconnection (or disconnecting of the DR facility) shall not cause voltage drop greater that 5 percent and shall meet the flicker requirements

9.12. Protection from Electromagnetic Interference (EMI)

The influence of EMI must not result in a change in state or mis-operation of the interconnection facility.

9.13. Surge Withstand Performance

The interconnection facility must have the capability to withstand voltage and current surges in accordance with the environments described in IEEE/ANSI C62.41 or C37.90.1

9.14. Batteries and Auxiliaries

Batteries and auxiliaries shall have sufficient capacity to ensure the operation of all DC loads during loss of AC supply. Typically the batteries must be capable of supplying the substation DC load for 8 hours.

9.15. Mitigation of Protection Scheme Failure

Relays with self-diagnostic features, which provide information on the integrity of the protection scheme, should be used whenever possible.

The protection scheme must be designed by a qualified professional engineer, or a competent technical person working with the utility's engineers, to ensure that the self-diagnostic feature is integrated into the overall protection scheme for the safe and reliable operation of the system.

Depending on the scheme and its design, where relays with the self-diagnostic feature do not trip the appropriate breaker(s), sufficient redundant or backup protection must be provided for the system. The malfunctioning relay must also send a signal to notify operating personnel to investigate the malfunction.

9.16. Instrument Transformers used for Protection

Instrument transformers used for protection must comply with CAN/CSA-C60044-6 or IEEE C57.13 [8].

10. Remote Monitoring and Information Exchange

The IPP facility shall provide information in real-time to YEC SCC regarding:

a. Connection or circuit breaker status,
b. Real and reactive power output in kW and kVAR,
c. Load Tap Changer (LTC) position of the interconnecting transformer,
d. Communication and RTU failure alarm,
e. Intelligent Electronic Device (IED)/Relay failed status, and
f. Voltage at the POI.

The communication protocol and the equipment required will be specified by YEC.

The IPP facility shall log the operation of any protective device, including which protection elements operated, and the status of the DG facility including power output, voltage, and current waveforms.

YEC may have additional requirements on a case by case basis.

If it is determined that the IPP facility will have an impact on YEC's Transmission Network, the IPP will be required to provide a Remote Terminal Unit (RTU) or Data Link to a YEC RTU capable of exchanging Supervisory Control and Data Acquisition (SCADA) information with the YEC Control Centre. The protocol for data exchange via the RTU shall be compatible with that used for communications used by YEC. The communication protocol and the equipment required will be specified by YEC.

The IPP will be required to provide the following typical data needed by the (SCADA) system:

a. Individual generator(s) MW and MVAR
b. Individual generator(s) MWh and MVARh
c. Generator(s) breaker status
d. Individual generator on/off status, if no generator breaker exists
e. Total station MW and MVAR
f. Station service MW, MVAR, hourly MWh and MVARh
g. Generator transformer(s) high voltage side breaker(s) and isolator(s) status
h. Bus voltage at high voltage bus
i. PSS status, if applicable
j. AVR status, if applicable
k. AVR voltage setpoint, if requested
l. Total plant MW setpoint, if requested
m. Generator step-up transformer tap setting, if requested

11. Construction

The construction and installation of the IPP's generating facility must meet all applicable statutes, regulations, by-laws and codes. The IPP is responsible for obtaining all permits and complying with all safety and environmental regulations, codes and assessment approvals, if necessary, for the construction and operation of its facilities. Copies of all permits, compliance reports and inspection documents must be provided to the utility prior to energizing the POI.

All single line diagrams provided to the utility must be drawn in accordance with IEEE standards and conventions, and must be stamped by a professional engineer assuming responsibility for the design.

12. Metering

12.1. General

Two meters, primary meter and backup meter, will be required at the IPP facility:

- The utility shall install, own, operate and maintain one meter (primary) necessary for measuring the energy and demand supplied to the YIS, unless otherwise specifically provided in a contract with the IPP. This meter shall remain the sole property of YEC. The meter will comply with Measurement Canada requirements and will be owned and maintained by YEC.
- The IPP shall install, own, operate and maintain the other meter (backup) which does not necessarily have to comply with Measurement Canada requirements.

Generators exporting power onto the distribution system shall be equipped with bi-directional meters with four-quadrant measurement capability. An appropriate number of channels are required for four-quadrant meters to separately record active and reactive power in both the export and the import directions.

The high voltage side of the interconnection transformer is designated as the Measured Billing Point for all energy imported and exported from the IPP facility.

The metering equipment will be:

- Suitable for use in the environmental conditions reasonably expected to occur at the installation site; and
- Appropriate for measuring the power system characteristics reasonably expected to exist at the installation under all power system conditions and events.

The IPP shall provide Measurement Canada Approved instrument transformers. Each meter shall be connected to its own individual core/winding. For the utility meter the IPP shall wire from the instrument transformers to the meter receptacle using CSA-approved tamper resistant conduit and accessories suitable for the utility meter or metering equipment.

For transmission interconnections the IPP will provide burden calculations for proposed instrument transformer secondary wiring, for approval by YEC. If necessary the wiring burden may have to be reduced, by increasing the CT secondary conductor size, to meet Revenue Meter requirements.

The IPP shall supply and install the meter base to meet the utility requirements. The utility will provide the specifications for the meter base during the design phase.

12.2. Meter Requirements

The primary meter supplied by the utility will:

- Be Measurement Canada Approved for revenue metering;
- Be dispensated, with accuracy class ratings for active and reactive energy management as per Table 4;
- Be verified and sealed in accordance with the Electricity and Gas Inspection Act;
- Be capable of maintaining the interval boundaries within 60 seconds of the hour and every quarter hour thereafter;

- Measure all quantities required to determine active energy and reactive energy transferred in the required directions at the Measured metering point;
- Provide a separate register to maintain the continuously cumulative readings of the active energy and reactive energy transferred in the required directions at the Measured metering Point;
- Retain readings and, if applicable, all clock functions for at least 14 days in the absence of line power;
- Be equipped with meter failure alarm and communication failure alarm;
- Communicate all metering and equipment status to the YEC system control centre via the IPP's communication equipment;
- Apply loss compensation (such as line losses) factors where applicable to the revenue meters; and
- The meter shall have an accuracy class of 0.2% or better.

The backup meter supplied by IPP will:

- The backup metering will be of the same accuracy class and capability as the primary metering and shall include all equipment to provide the necessary billing data.
- Be non- dispensated, with accuracy class ratings for active and reactive energy management as per Table 5;
- .

Table 4: Schedule of Accuracies for Dispensated Metering Equipment Approved Under Section 9(2) or Section 9(3) of the Electricity and Gas Inspection Act

Metering Point Capacity (MVA)	Points of Delivery	Points of Supply	Measurement Transformers Accuracy Class
10 and above	1.0%	1.0%	0.3%
10	1.0%	1.0%	0.3%

Table 5: Schedule of Accuracies for Non-Dispensated Metering Equipment Approved Under Section 9(2) or Section 9(3) of the Electricity and Gas Inspection Act

Metering Point Capacity (MVA)	Watthour Meter Accuracy Class	Varhour Meter Accuracy Class
10 and above	0.2%	0.5%
10	0.5%	1.0%

12.3. Measurement Transformers

The applicable winding(s) of the current and potential instrument transformers supplied and installed by the IPP must:

- Be approved by Measurement Canada for revenue metering.
- Be burdened to a degree that does not compromise the accuracy required by this guideline.
- Have a minimum of two cores per instrument transformer. One core connection for the utility meter and the other core connection for the IPP meter.
- Be used solely for metering and not to be used for any other purposes.
- Have an accuracy class rating that equals or exceeds the values specified in Table 4.

12.4. Remote Communications Equipment

The remote communications equipment may or may not be an integral part of the meter or the recorder. However, it must incorporate protocol schemes that will prevent the corruption of data during interval data transmission. The protocol must be suitable for the communications equipment type and nature of the communications media and path.

12.5. Password Protection

Two or more levels of password protection will be required for each meter data collection agency. One level is for full access to set time functions and a second level is for read only access to interval data and event logs.

12.6. Safety Requirements

The facility installation must conform to:

- Measurement Canada Standard Drawings;

- AEUC [4];
- CSA Standard C22.2 General requirements - Canadian electrical code, part II [7] ; and
- ANSI/IEEE C57.13-2016 IEEE Guide for Grounding of Instrument Transformers [8].

13. Interconnection Tests

13.1. General Testing Requirements

The IPP must notify YEC (and AEY if the interconnection is via the AEY distribution system) in writing at least three weeks prior to the initial energization and start-up testing of the IPP generation facility. YEC may witness any testing of the equipment and protection schemes associated with the interconnection. Tests must align with the requirements specified in IEEE 1547 and CSA 22.3 No 9-08.

13.2. Type Testing

Type testing is considered an acceptable method of verification where suitable and applicable equipment standards exist, and must be performed once for each specific protection scheme. All interconnection equipment must include a type testing procedure as part of the documentation in order to determine the protection settings meet the requirements set forth within this technical guide. A type test may be performed on one device of a combination of devices. In a case of a combination of devices which comprise a system, the testing will demonstrate that the devices are able to operate as a system.

The type tests shall be performed on a representative unit or system, either in a factory, testing laboratory, or in the field. Results from a resource within a similar product family or design, including hardware or software, shall be acceptable as a representative within the same product family where ratings are within 50% to 200% of the tested resource.

The following type tests must be performed in accordance with IEEE 1547.1 [9]:

- Temperature stability
- Response to abnormal frequency
- Response to abnormal voltage
- Synchronization
- Interconnection integrity
- Unintentional islanding
- Open phase
- Reconnect following abnormal condition disconnect
- DC injection (for inverters without interconnection transformers)
- Harmonics

13.2.1. Temperature Stability

The temperature stability test verifies the interconnection equipment maintains measurement accuracy of parameters over its specified voltage range.

13.2.2. Response to Abnormal Frequency

This test verifies the interconnected generation facility ceases to energize the connected system as specified to IEEE 1547.1 with regards to abnormal frequency.

13.2.3. Response to Abnormal Voltage

This test verifies the interconnected generation facility ceases to energize the connected system as specified to IEEE 1547.1 with regards to abnormal voltage.

13.2.4. Synchronization

This test verifies the interconnected IPP facility will accurately and reliably synchronize with the utility as per IEEE 1547.1.

13.2.5. Interconnection Integrity

The interconnection integrity test verifies the IPP facility meets the surge withstand requirements as specified in Section 9.14 when tested in accordance with IEEE 1547.1.

13.2.6. Unintentional Islanding

Where YEC requires an anti-islanding protection function (other than transfer trip) or minimum import power levels, this test verifies that an IPP facility will cease to energize in accordance with IEEE 1547.1.

13.2.7. Open Phase

The open phase test verifies that the IPP facility will cease to energize the utility interconnection upon the loss of an individual phase on the distribution network when tested in accordance with IEEE 1547.1.

13.2.8. Reconnect following Abnormal Condition Disconnect

This test verifies the functionality of the IPP facility interconnection component or system reconnect timer, which shall delay the reconnection to the utility following a trip event prior to the distribution system stabilization, as specified in Section 9.11.

13.2.9. DC Injection (for Inverters without interconnection transformers)

This test verifies that an inverter-based IPP facility will comply with the DC current inject limit specified in Section 7.9 when tested in accordance with IEEE 1547.1.

13.2.10. Harmonics

The individual current harmonics and the total demand distortion (TDD) of the IPP facility shall be measured and recorded under normal operating conditions to ensure the values are within the limits specified in Section 7.1

13.3. Production Tests

Production tests shall be conducted on each IPP generating unit and interconnection equipment prior to delivery to verify they meet the applicable standards and verify the operability of every generating unit manufactured for customer use.

The tests assume the equipment has met the applicable interconnection and interoperability requirements of the applicable standards and may be conducted as a factory test or performed as part of an evaluation or commissioning test. Facilities with adjustable set points shall be tested at a single

series of test points specified by the manufacturer. The summary report must provide a list of normal and abnormal performance category capability, final function settings, and final operating mode settings.

The following production tests are specified within IEEE 1547.1:

1. Response to abnormal frequency
2. Response to abnormal voltage
3. Synchronization

14. Commissioning Tests and Verifications

14.1. General

Commissioning tests are tests and verification on the IPP facility equipment to confirm the system as delivered, designed, and installed meets the interconnection and interoperability requirements of this guide and the applicable standards. These tests include visual inspections, and may include operability and functional performance tests as required.

Prior to the energization of the IPP facility, or changes to the facility, verification testing must be performed and coordinated with the utility. After the equipment is installed and ready for operation, the testing must be performed by a qualified individual in accordance the manufacturer's published test procedures, or IPP developed procedures that have been approved by the utility. Qualified individuals include: licensed, professional engineers; factory-trained and certified technicians and licensed electricians experienced in testing protective equipment. The utility reserves the right to witness the verification test or to require written certification that the test was performed.

Verification testing must also be performed annually or when major system upgrades or modifications are carried out.

14.2. Interconnection Verifications and Inspections

The following commissioning tests and inspections shall take place:

a. Final IPP facility protection settings shall be verified, recorded, and provided to the utility. A sample protective settings commissioning report is located in Appendix G.

b. Visual inspection shall ensure the grounding coordination requirements in Section 8.5 have been met.

c. Visual inspection shall ensure the presence of a disconnecting means in accordance with Section 8.3 has been met.

d. The polarities, burdens, and ratios of field wired instrument transformers shall be verified as correct and in accordance with the design documentation.

e. Field installed power and control wiring shall be verified to be in compliance with drawings and manufacturer requirements.

f. For three-phase systems, the phase rotation of the distribution system and the IPP facility as installed shall be verified as compatible.

g. All monitoring and information exchange provisions shall be verified as functional in accordance with Section 10.

h. Calibration checks of each protective relay or the equivalent protection device shall be performed using injection of appropriate ac quantities, secondary injection, or set-point adjustment verification.

i. Functionality of the protective relays or the equivalent protection device, circuit breakers, and telecommunications equipment shall be tested to verify the system operates as intended.

j. Load tests of protective relays or the equivalent shall be conducted immediately after energization, where applicable.

k. The ohmic value and connection of the transformer neutral impedance grounding device shall be verified as correct.

l. Upon loss of DC power supply to the protective relays or the equivalent protection device, it shall be verified the protection scheme activates the interconnection circuit breaker.

m. Upon loss of a communication signal, it shall be verified the fail-safe transfer trip occurs when required by the utility in accordance with Section 9.8.

n. Inverter operation must be verified annually by operating the load break disconnect switch and verifying the generation facility shuts down and does not restart for five minutes after the disconnect switch has closed.

o. Any system depending on a battery for trip power must be checked for proper voltage and logged monthly. Once every four years, the battery must be replaced or a discharge test performed.

p. The IPP shall submit to the utility the station LAN design architecture for review during the conceptual design phase of the project.

q. The IPP is responsible for all hardware design, RTU drawings, installation, testing and commissioning.

r. The IPP shall prepare a preliminary but tested version of the RTU Configuration and a preliminary version of the Point Assignment, and send them to the YEC SCC, together with all RTU drawings, P&C drawings and DNP point lists of all LAN devices, at least ten weeks before the in service date.

s. The IPP and YEC SCC shall jointly test all control, status and analog points and confirm visibility at the SCC.

14.3. Disconnection Means Operability

Prior to the operation of the IPP facility, the disconnecting means provided in accordance with Section 8.3 operates as intended.

14.4. Energization Cessation

Tests shall be conducted in accordance with IEEE 1547.1 to verify the functionality of the protection that ensures the IPP facility does not energize the utility under the following conditions described within this standard:

1. Abnormal frequency
2. Abnormal voltage
3. Protection scheme failure

Additional protection functions shall also be verified in accordance with IEEE 1547.1 as needed. The following protective functions must be verified if used at the IPP facility:

1. If available, the anti-islanding function must be checked by operating a load break disconnect switch and verifying that the IPP facility ceases to energize the output terminals and does not restart once the load break disconnect switch has reclosed.
2. If reverse power or minimum power function is used to meet the interconnection requirements, the functionality must be tested using secondary injection techniques. Alternatively, this

function can be tested by the means of a local trip test or by adjusting the IPP output and local loads to verify that the applicable non-export criterion are met.

14.5. Re-Verification

Re-verification of the interconnection and interoperability requirements may be required when any of the following occurs:

- Functional software of firmware changes have been made to the IPP facility equipment;
- Any hardware component of the facility has been modified in the field, been replaced or repaired with parts that are not substitutive components compliant with the applicable standards;
- Protection settings have been changed after factory testing; or
- Protection functions have been adjusted after the initial commissioning / verification process.

15. Maintenance

The IPP has full responsibility for the maintenance of its equipment, up to the Point-of-Interconnection, consistent with the Interconnection Agreement and this Guide. The IPP shall maintain the facilities in accordance with Rule 2-300 of the Canadian Electrical Code to ensure safe parallel operation with the YEC or AEY system. Failure to do so may result in disconnection of the IPP generation facility.

The IPP must present to the utility the planned maintenance procedures and a maintenance schedule for the interconnection protection equipment, and keep records of such maintenance.

The utility reserves the right to periodically inspect the interconnection protection system to verify that it meets the requirements outlined in this document.

Maintenance procedures up to the POI will be performed in accordance with good utility practice and the utility's policies and procedures.

16. Marking and Tagging

The disconnect switch must be clearly marked as the "IPP Disconnect Switch" and tagged with an identification number approved by the utility. The IPP must follow the utility's switching, clearance and tagging procedures. The utility is responsible to instruct the IPP in this regard.

The IPP switchgear equipment must include the manufacturer name and the manufacturer's serial number.

17. Modification of Installation

The IPP shall obtain written approval from the utility before commencing any modification to the generation facility. If the change requires the installation or modification of equipment, the IPP shall provide documentation that the new equipment meets the requirements of Type and Production tests.

If the changes require modifications to the protection and controls information the IPP must obtain approval from the utility for the proposed modifications. Whenever changes are made to interconnection hardware or software that can affect the functions listed below, the potentially affected functions must be retested:

- Over-voltage and under-voltage
- Over-frequency and under-frequency
- Non-islanding function (if applicable)
- Reverse or minimum power function (if applicable)
- Inability to energize dead line
- Time delay restart after utility outage
- Fault detection, if used
- Synchronizing controls (if applicable)

To ensure that commissioning tests are performed correctly, the utility may require the ability to witness the tests and receive written certification of the results.

18. Technical Data Requirements

The following outlines the minimum data required at various stages for planning, design and commissioning the IPP's project. This data is required by YEC (and AEY if connected to AEY distribution system) to ensure suitable steps are taken to interconnect the IPP facility to the YEC system. Expanded data requirements for the proposal and design stages are located in Appendix A and Appendix B. The IPP Policy (in development as of June 2018) shall apply.

18.1. Proposal Stage

During the proposal stage the IPP Facility conceptual design must be submitted before any further detailed studies is approved by the utility. The list of information to be provided for this approval may be the result of preliminary discussions with the utility. Based on the information provided by the IPP, the utility will provide their proposition, their commitment and their own requirements concerning the connection of the IPP facility.

The following list of drawings and data required for the proposal stage of the project includes, but is not limited to:

- A Single Line Diagram (SLD)showing the following :
    - The proposed protection relays, circuit and fuses with fuse type and rating,
    - The connections of all substation equipment with voltage levels and equipment ratings
    - The location of the revenue metering equipment.
- Description of protection scheme
- Generating station site plan showing the layout and location (coordinates) of the generating plant and the location of lockable, "visible" disconnect device
- Based on the size of the project the utility may require more additional generator, exciter and speed governor data for a preliminary interconnection study.

18.2. Approval (Design) Stage

Once the project has been approved by the utility the IPP will proceed to submit the facility detailed design.

The following list of drawings and data required for approval stage of the project includes, but is not limited to:

- Single Line Diagram
- Description of protection scheme
- Control schematic
- Protection and control philosophy
- Major equipment nameplate schedules and statements
- Fuse and protective relay coordination study and settings
- Current transformer characteristic curve
- Measurement Canada approval numbers for instrument transformers

- Generating station site plan showing the layout and land location coordinates and legal description. The drawing should also show the proposed terminal pole or service manhole with the routing of aerial line or underground cables from utility to the generating station.
- SCADA Diagram
- Obtaining all permits and complying with all safety and environmental regulations, codes and assessment approvals, if necessary, for the construction and operation of its facilities.
- Proposed In-Service Date

18.3. Verified Stage

When the project is nearing completion, the IPP must submit the proposed testing, commissioning and start-up procedures to be performed before the facility is connected to the YIS.

The following list of drawings and data required for commissioning and verification stages of the project includes, but is not limited to:

- Commissioning report
- Copies of all permits, compliance reports and inspection documents
- Final Single Line Diagram
- Final protection scheme
- Final control schematic
- Protection and control philosophy
- Major equipment nameplate schedules, statements, test reports and data sheets
- Final fuse and protective relay coordination settings
- Current transformer characteristic curve
- Final generating station site plan showing the layout and land location coordinates and legal description

D.1 Modelling Information

In some cases, a generator (or the aggregate generation on a line) is large enough that adjacent customers or the dynamic stability of utility's distribution system could be affected. The IPP is responsible for the cost of any required transient or dynamic stability studies, and the studies must be done in a manner suitable to, and approved by, the utility.

IPPs are responsible for ensuring the data they submit provides an adequate mathematical representation of the facility's electric behavior. If the data is not available prior to purchasing equipment, it must be submitted as soon as it becomes available.

The studies must accurately determine:

1. The impact of the IPP's facility on adjacent customers of the utility.
2. The dynamic stability, in aggregate, of the utility system.

Data may be supplied by the manufacturer or acquired directly by testing. It must include generator characteristics (i.e., speed, reactance, resistance, excitation system etc.) and governor characteristics (i.e., lead time/lag time constants, valve or gate opening data etc.).

The information requirements vary for induction generators and inverter generators, and for hydro or thermal systems.

Appendix C

Information Provided by the Utility

Appendix C

Information Provided by the Utility

After receiving the application for interconnection, the utility will provide the following information to the IPP, if required:

a. Single Line Diagram or maps of the system up to the POI.
b. Minimum and maximum 60 Hz source impedances (positive-sequence, negative- sequence and zero-sequence) at the POI.
c. Maximum and minimum normal and emergency system operating voltage ranges at the POI.
d. Harmonic impedance envelope at the POI if available.
e. Planning, operating and reliability criteria, standards and policies.
f. The results of a planning study (e.g. the System Impact Study) documenting the availability of the requested amount of system capacity and any other specific technical issues to be addressed.
g. Cost estimates and time schedule to build the upstream facilities.
h. Characteristics and settings of protection on the distribution system.
i. Costs to implement any required changes to the distribution system that are identified by the System Impact Study.

Some or all of this information will be required by the IPP to properly design the interconnection protection. The utility will identify when the costs of producing this information are to be assigned to the IPP.

Appendix D

Applicable Codes and Standards

Appendix D
Applicable Codes and Standards

D.1 Primary Standards

CSA Standard C22.3 No. 9-08 (R2015) Interconnection of Distributed Resources and Electricity Supply Systems

IEEE Standard 1547-2018 Standard for Interconnecting Distributed Resources with Electric Power Systems with Associated Electric Power Systems Interfaces

Power Quality Standards

ANSI C84.1-2016 American National Standards for Electric Power Systems and Equipment Ratings (60 Hertz). Establishes nominal voltage ratings and operating tolerances for 60 Hz electric power systems from 100 V through 1200kV.

IEEE Std. 493-2007 IEEE Recommended Practice for Design of Reliable Industrial and Commercial Power Systems (IEEE Gold Book).

IEEE Std. 519-2014 IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems.

IEEE Std. 1100-2005 IEEE Recommended Practice for Powering and Grounding Sensitive Electronic Equipment (IEEE Emerald Book).

IEEE Std. 1159-2009 IEEE Recommended Practice for Monitoring Electric Power Quality.

IEEE Std. 1250-2011 IEEE Guide for Identifying and Improving Voltage Quality in Power Systems.

In addition to the power quality standards, the following standards are applicable to the interconnection of generation facilities to YEC's system:

IEEE Std. 100 - 2000 IEEE Standard Dictionary of Electrical and Electronics Terms.

IEEE Std 315-1975 (Reaffirmed 1993) ANSI Y32.3-1975 (R1989) CSA Z99-1975 Graphic Symbols for Electrical and Electronics Diagrams (including Reference Designation Letters).

IEEE Std 929-2000 IEEE Recommended Practice for Utility Interface of Residential and Intermediate Photovoltaic (PV) Systems.

C37.1-2007 ANSI/IEEE Standard Definitions, Specifications and Analysis of Systems Used for Supervisory Control, Data Acquisition and Automatic Control.

C37.2-2008 IEEE Standard Electrical Power System Device Function Numbers, Acronyms, and Contact Designations.

C37.18-1979 ANSI/IEEE Standard Enclosed Field Discharge Circuit Breakers for Rotating Electric Machinery.

C37.20.1-2015 ANSI/IEEE Standard for Metal-Enclosed Low-Voltage (1000 Vac and below, 3200 Vdc and below) Power Circuit Breakers Switchgear.

C37.20.3-2001 ANSI/IEEE Standard for Metal-Enclosed Interrupter Switchgear.

C37.24-2017 ANSI/IEEE Standard for Evaluating the Effect of Solar Radiation on Outdoor Metal-Enclosed Switchgear.

C37.27-2015 ANSI/IEEE Standard Application Guide for Low-Voltage AC (635 V and below) Power Circuit Breakers with Separately Mounted Current-Limiting Fuses.

C37.29-1981 ANSI/IEEE Standard for Low-Voltage AC Power Circuit Protectors Used in Enclosures.

C37.50-1989 ANSI Standard Test Procedures for Low-Voltage AC Circuit Breakers Use In Enclosures.

C37.51-1989 ANSI Standard Conformance Test Procedure for Metal Enclosed Low- Voltage AC Power Circuit-Breaker Switchgear Assemblies.

C.52-1974 ANSI Standard Test Procedures for Low-Voltage AC Power Circuit Protectors Used in Enclosures.

C57.12-2015 IEEE Standard General Requirements for Liquid Immersed Distribution, Power and Regulating Transformers.

C57.12.13-1982 Conformance Requirements for Liquid Filled Transformers Used in Unit Installations including Unit Substations.

C57.13.1-2006 IEEE Guide for Field Testing of Relaying Current Transformers.

C57.13.2-2005 IEEE Standard Conformance Test Procedures for Instrument Transformers.

C37.58-2003 (R2010) ANSI Standard Conformance Test Procedures for Indoor AC Medium- Voltage Switches for Use in Metal-Enclosed Switchgear.

C37.90-2005 ANSI/IEEE Standard for Relays and Relay Systems Associated with Electric Power Apparatus.

C37.90.1-2002 ANSI/IEEE Standard Surge Withstand Capability (SWC) Tests for Protective Relays and Relay Systems.

C37.90.2-2004 ANSI/IEEE Standard Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Transceivers.

C37.95-2014 IEEE Guide for Protective Relaying of Utility Consumer Interconnections.

C37.98-2013 ANSI/IEEE Standard for Seismic Testing of Relays.

IEC 1000-3-3 Limitation of Voltage Fluctuations and Flicker in Low-Voltage Supply Systems for Equipment with Rated Current Less than 16A.

IEC1000-3-5 Limitation of Voltage Fluctuations and Flicker in Low-Voltage Supply Systems for Equipment with Rated Current Greater than 16A.

UL1008 Transfer Switch Equipment.

UL 1741 Standard for Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources

IEEE P1547, DRAFT Standard for Distributed Resources Interconnected with Electric Power Systems. Canadian Electrical Code, CSA no. C22-1, latest version.C22.2 No. 31- M89 (R2000) Switchgear Assemblies.

Can/CSA - C22.2 No. 1071 95Commercial and Industrial Power Supplies.

Can/CSA - C22.2 No. 1010.1-92 Safety Requirements For Electrical Equipment for Measurement, Control and Laboratory Use.

NEMA LA 1-2009 Surge Arresters.

NEMA MG 1-2016 Motors and Generators

Appendix E

Sample Operating Agreement

Appendix E
Sample Operating Agreement

1. Purpose

This agreement outlines the steps to take to ensure a reliable and safe interconnection between the IPP and YEC and/or AEY through a variety of circumstances.

2. Definitions

Operating Authority: The organizational unit assigned responsibility for operating a portion of the electrical system. For each utility the YEC System Control Center (SCC) operator is the operating authority. For the IPP, the *<IPP Contact>* is the operating authority.

Operational Boundary/Interface Point or Point of Interconnection: The location on the electrical system at which responsibilities between Operating Authorities meet. The breaker *<Breaker ID>* is the interface point between the IPP and the utility.

3. Operational Information

Circuit Breaker Identification

List circuit breakers providing interconnection between IPP and the utility.

3.1 Interlocks

List identified circuit breaker interlocks with sequence information

3.2 Contact Information

SCC – Phone (867) *XXX-XXXX* or (867) *XXX-XXXX* (recorded lines)

Contact Name	Title	Phone Number
<Utility Contact>	Leadhand SCC	(867) *XXX-XXXX*
<Utility Contact>	Operation Coordinator	(867) *XXX-XXXX*
<Utility Contact>	Manager Operations	(867) *XXX-XXXX*
<Utility Contact>	Director of Operations	(867) *XXX-XXXX*
<IPP Contact>	<Contact Position>	(867) *XXX-XXXX*

3.3 Normal Operation

Under normal operating conditions the IPP facility will be connected to the utility grid. The breakers status under normal operating conditions is as follows.

Breaker	**Status**
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*

4. Operating Procedures

4.1. Line L### (<Utility Line> to <IPP Facility>) Isolation

L### isolation requires the minimum notification defined in section 4.3, with the exception of emergency repairs. The utility will provide a Condition Guarantee on breaker <Breaker ID>. The Condition Guarantee is used in communications between external parties. It is a formal method of communication that switching has been completed. It ensures the status of the breaker/device will not change until the work is complete, the lock out tag out is surrendered and all workers are clear.

4.2. Voltage Support

Based on the power quality conditions defined in Schedule <*X*> of the Power Purchase Agreement (PPA) and system security requirements, SCC may request voltage support. Voltage support can be accomplished by placing IPP generation on line, or other means such as capacitor banks or transformer tap changing. If such support is part of the operating agreement then:

- When the IPP has generation online, the generators regulate the generator bus voltage between 100 and 105% of nominal and the utility shall have control of this set-point. Generators reactive output will be adjusted by the utility in real time, to regulate the system voltage, by pulsing the AVR voltage set-points. The IPP sets the acceptable range within which the utility can adjust voltage.
- The utility must have full SCADA visibility of the IPP substation and control of critical elements.

4.3. SCC Remote Monitoring and Control

- SCC will have visual indication of the IPP breakers, generator status, capacitor status and electrical measurement information for the IPP facility.
- The utility control will be limited to:
    - Approving requests from the IPP to connect and disconnect from the utility system
    - Approving requests from the IPP for changes in generation output
    - Requesting the IPP to disconnect from the utility system for operational and safety reasons
- All IPP requests must be communicated and approved by the utility
- The utility shall have control (open and close) of incoming line breaker <*Breaker ID*> at the IPP facility.

5. Operational Notification

5.1. Daily Operating Communications

Under normal operating conditions IPP will be supplying <*XXX*> kW to the YIS. Generation changes of more than <*XXX*> kW must be communicated and approved by the utility.

5.2. The transition from winter to summer and conversely summer to winter generation levels must be established with SCC with a minimum of 30 days' notice.

5.3. IPP Facility Planned Maintenance and Scheduling

The IPP shall operate under the utility approved maintenance procedures established.

To meet changing operating conditions and coordinate maintenance efforts, maintenance shutdowns by the IPP need to be communicated to SCC at least one week in advance for shutdowns of up to 12 hours and 30 days for shutdowns longer than 12 hours. Changes in the availability and capacity of the onsite generation need to be communicated to SCC. The utility and the IPP shall share annual shutdown/maintenance plans in February of each year.

5.4. Transmission and Distribution Maintenance and Scheduling

The utility performs annual line maintenance on its transmission and distribution lines, during which grid power to the IPP facility may be curtailed or suspended. The duration of this annual maintenance can be up to 14 days per calendar year.

The utility will provide a minimum of 30 days' notice of the start date and expected duration of work that will curtain or otherwise interrupt the supply of grid power to the IPP facility.

6. Loss of Supply Procedures

6.1. Loss of Supply - Short Term

In the event of a disturbance that results in the loss of grid power to the IPP facility, SCC will make one attempt to re-energize the line to the IPP facility. If successful the following steps apply to resume the IPP facility operation with grid power.

a) SCC will confirm the status of the breakers located at the IPP's POI.

b) SCC will request closed breaker <Breaker ID>.

c) Once complete and with confirmation from SCC the IPP facility may proceed with the restarting of their operation. The IPP will communicate to SCC on generation greater than <XXX> kW. The request to increase generation may be communicated verbally or via SCADA.

6.2. Loss of Supply - Long Term

In the event of a disturbance that results in the loss of grid power to the IPP facility and SCC is unsuccessful in re-energizing the line the following steps will apply.

a) SCC will confirm the status of the breakers.

b) At the direction of SCC the IPP personnel will start and stage their generation on line supplying power to the IPP facility.

c) Once the line to the IPP facility has been re-energized, SCC will request the IPP synchronize and close its POI breaker.

d) The IPP facility is now connected to YEC system. Once complete and with confirmation from SCC the IPP facility may proceed with resuming generation. The IPP will communicate to SCC on generation increases greater than *<XXX>* kW. The request to load up may be communicated verbally or via SCADA.

7. Revision and Approval

7.1. This Agreement comes into effect once it is signed by the IPP and the utility.

7.2. This Agreement will remain in effect unless cancelled upon the mutual agreement of both Parties.

7.3. The Parties shall provide 90 days' notice in writing of the intention to modify the Agreement.

7.4. The Agreement may be revised upon mutual agreement of both Parties. The agreement will be formally reviewed every two (2) years.

JOINT OPERATING PROCEDURE

(Please see attached)

JOINT OPERATING PROCEDURE	DEPARTMENT:	INQUIRIES TO:	TOPIC:
	Operations	Guy Morgan, VP, Operations	IPP / AEY / YEC Operating Agreement
	ISSUED DATE:	REVIEW DATE:	APPROVED BY:
	August __ 2020	September 1, 2021	President & CEO

1.0 Purpose

1.1 This agreement defines the operating arrangement between the **Nomad Contracting & Electrical Services.** (IPP), ATCO Electric Yukon (AEY) and Yukon Energy Corporation (YEC). This agreement defines the roles and responsibilities for each entity to allow the IPP to operate reliably and safely on the Yukon Power System (YPS).

2.0 General Information

2.1 Breaker Identification

Breaker	Description
S6423	Connection between the IPP and AEY distribution

2.2 Definitions

a) **Operating Authority** The organizational unit assigned responsibility for operating a portion of the electrical system.

- For YEC the SCC operator is the operating authority and is responsible for the system generation and security.
- For AEY the Supervisor of Operations is the operating authority and is responsible for the distribution system and security.
- For the IPP the Technical Coordinator is the operating authority of their generation and associated equipment.

b) **Operator in Charge (OIC)** The worker designated by the Operating Authority to coordinate control of the power system or portion thereof, in accordance with the requirements of established operating standards and procedures.

c) Power Systems Work Standards (PSWS) The standards that workers will utilize for establishing conditions on the power system that will, when combined with appropriate work standards, procedures and methods, provide a safe work area.

d) **Condition Guarantee (COG)** Formal assurance to another Operating Authority or Operator in Charge (OIC) that identified devices are in the position requested and will not change status until the device status request is formally released by the requestor.

e) **Point of Interconnection (POI)** The location on the electrical system at which responsibilities between Operating Authorities meet. The IPP Switch – S6359 is the interface point between IPP and AEY.

2.3 YEC Contact Information

- SCC (System Control Center) – phone (recorded lines) 393-5355 or 393-5324
- Mike Hannah (Leadhand SCC) 393-5399, cell 334-6759
- Myles O'Brien (Operation Coordinator) 393-5352
- Ed Peake (Manager Operations) 393-5383, cell 334-6586
- Guy Morgan (Director of Operations) 393-5366, cell 334-6904
- YEC Group Email – SCC@yec.yk.ca

AEY Contact Information

- Tony Badry - Supervisor of Operations 633-7057, cell 335-4002
- Matt Johnson – Operator in Charge 633-7009, cell 334-3145

IPP Control Room Desk

- Sebastien Roy 335-0177

IPP Contact Information

- Sebastien Roy nomad_electric@outlook.com

2.4 Normal Operation

Under normal operating conditions the IPP will generate into the Yukon Power Grid. The breakers status under normal operating conditions are as follows.

Breaker	**Status**
S6423	Closed

3.0 Operating Procedures

3.1 Planned 5L649 (IPP to AEY) Isolation

5L649 isolation requires the minimum notification defined in section 5.1, except for emergency repairs. AEY will provide a condition guarantee on S6423 - Condition Guarantee will be issued in accordance with **Section 800** of the PSWS – **Operating Interface Points.**

3.2 Planned 5L649 (AEY to IPP) Isolation
5L649 isolation requires the minimum notification defined in section 5.2, except for emergency repairs. IPP will provide a condition guarantee on S6423 - Condition Guarantee will be issued in accordance with **Section 800** of the PSWS – **Operating Interface Points**

3.3 SCC Remote Monitoring
SCC will have visual indication of IPP breakers, PV status, and electrical measurement information from the IPP site.

4.0 Power Quality Requirements

4.1 IPP will operate IPP Facilities in accordance with the power quality requirements of YEC as set out in the System Interconnection Guidelines (Schedule D).

5.0 Operational Notification

5.1 IPP Planned Maintenance and Scheduling

To meet changing operating conditions and coordinate maintenance efforts, maintenance shutdowns by the IPP need to be communicated to SCC / ATCO OIC at least one week in advance for shutdowns of up to 12 hours and 30 days for shutdowns longer than 12 hours.

Planned changes in the availability and capacity of the onsite generation needs to be communicated to SCC / ATCO OIC at least 30 days in advance of such changes.

Unplanned availability should be conveyed as soon as possible.

The Parties will share annual shutdown/maintenance plans in February of each year and plan to minimize the impact on IPP generation potential by scheduling outages during off-peak generation months where practicable.

5.2 AEY Distribution Maintenance and Scheduling:

a) AEY performs annual line maintenance on the distribution lines, during which connection to the IPP may be curtailed or suspended. The duration of this annual maintenance can be up to 14 days per calendar year.

b) AEY will provide a minimum of 5 working days' notice of the start date and expected duration of work that will curtain or otherwise interrupt the supply of IPP generation to the YPS.

6.0 Loss of Supply Procedures

6.1 Loss of Supply - Short Term

In the event of a disturbance that results in the loss of the grid connection to the IPP the IPP generation will remain off-line until approval from AEY and YEC.

The following steps apply to resume IPP operation with Grid Electricity.

a) SCC will confirm the status of the breaker located at IPP site. If SCADA communications are down the switch status will be physically verified and reported to AEY before 5L649 will be energized.

Breaker	**Expected Status**
S6423	Open

b) The following switching sequence will be followed to re-energize 5L649 and synchronize IPP back to grid supply.

Step	Switch Sequence	Operation
1	Confirm 5L649 Energized	IPP/AEY
2	S6423 Closed	IPP
3	IPP starts system	IPP/YEC

c) Once complete and with confirmation from SCC**,** IPP may proceed with the restarting of their operation. IPP Group will communicate to SCC once their system is back on line.

6.2 Loss of Supply - Long Term

In the event of a disturbance that results in the loss of the grid connection to the IPP the IPP generation will remain offline until approval from AEY and YEC.

a) SCC will confirm the status of the breaker located at IPP site. If SCADA communications are down the switch status will be physically verified and reported to AEY before 5L649 will be energized.

Breaker	**Expected Status**
S6423	Open

b) The following switching sequence will be followed to re-energize 5L649 and synchronize IPP back to grid supply.

Step	Switch Sequence	Operation
1	Confirm 5L649 Energized	IPP/AEY
2	S6423 Closed	IPP
3	IPP starts system	IPP/YEC

7.0 Revision and Approval

7.1 This Agreement comes into effect once it is signed by IPP, AEY and YEC.

7.2 This Agreement will remain in effect unless cancelled upon the mutual agreement of both Parties.

7.3 The Parties will provide 90 days' notice in writing of the intention to modify this Agreement.

7.4 The Agreement may be revised at any time if operational needs require and are mutually agreed to by all Parties. This agreement will be formally reviewed every two (2) years.

A MESSAGE FROM THE OPERATING AUTHORITY

Work on or near the power system involves inherent risks to employees, system security and customer supply. Strict adherence to appropriate work standards, procedures and methods minimizes those risks and allows employees to work safely.

Power System Work Standards (PSWS) was developed by a team of experienced employees, including Operators-in-Charge of the transmission and distribution systems, to complement and support other ATCO Electric safety standards. All employees working on or near the ATCO Electric power system are required to:

- Meet applicable training, knowledge and skill requirements, as per HS&E Practice 1101: Power System Worker Authorization.
- Understand and consistently follow the standards in this document.
- Perform work, only as authorized by their supervisor and the Operator-in-Charge.

Your commitment will help to ensure employee safety and the efficient operation of the power system.

SECTION 100: HOW TO USE THIS DOCUMENT

101 Purpose

Power System Work Standards provides ATCO Electric employees with standards to establish conditions on the power system that will – when combined with appropriate work standards, procedures and methods – allow work to take place on or near the power system.

Employees must obtain permission from the Operator-in-Charge (OIC) before starting any work on the power system.

NO PERMISSION = NO WORK

101.1 Limitations

It is important to note that this document only provides a process for establishing required power system conditions through Worker-Administered switching or the OIC permitting process. Employees must implement barriers to protect against all hazards identified in the job planning process.

102 Scope

Power System Work Standards applies to all employees authorized to work on or near ATCO Electric's power system apparatus and/or supporting control and communication apparatus.

103 Document Compliance

Power System Work Standards complies with the following:

- Alberta Electrical Utility Code (AEUC)
- Occupational Health & Safety Act, Regulation and Code
- ATCO Electric Corporate Health, Safety and Environment Principles and Policies
- Operations HS&E Management System and Best Practices
- Operations HS&E Safety Standards Manual.

104 Definitions

Apparatus – Equipment of every kind and description used in the generation, transformation, distribution, delivery or use of electrical power or energy. The term also includes the supporting control and communication equipment used to manage the delivery and use of electrical power.

Charged – Containing stored electrical energy.

Condition Guarantee (COG) – Formal declaration that a device is in a specific state, tagged to identify that state and guarantee is given that the device will not be operated until the Condition Guarantee is released. This is not a work permit.

Control System Permit (CSP) – Allows work to be performed on apparatus under 750 V that directly impacts or could impede operation of the power system.

De-energized (Dead) – At a potential equal to or not significantly different from that of ground (earth) at the work site.

Device – A type of electrical apparatus used as a switch or control mechanism (e.g., gang switch, recloser, auto-sectionalizing scheme).

Disable – To make a device inoperable.

Do Not Operate Tag– See Appendix B.

Employee – For the purposes of this document, any individual employed by or contracted to ATCO Electric who is competent to perform assigned duties.

Employee-in-Charge – Individual responsible for all employees in a work group or groups working on or near the same related power system apparatus. An employee who works alone is considered the Employee-in-Charge.

Enable – To make a device operable.

Energized (Live) – At a potential that is significantly different from that of ground (earth) at the work site and that presents an electrical hazard.

> ***Note***: A part is energized when it is electrically connected to a source of electric energy. It can also be energized when it is electrically charged under the influence of an electric or magnetic field. Apparatus must be considered energized unless confirmed to be isolated and grounded.

Guarantee of Isolation (GOI) Permit – Allows work on a line or apparatus that has been isolated from all power system sources of potential above 750 volts.

Human Machine Interface (HMI) – A software-based local control and monitoring system.

Hold-Off Permit (HOP) – Prevents automatic or manual restoration following an unplanned circuit outage.

Isolate – To completely disconnect a device or circuit from other devices or circuits, separating it physically, electrically and mechanically from all sources of electrical energy.

> ***Note***: Such separation may not eliminate all the effects of electromagnetic induction.

Live Line Work – All work performed on energized electrical equipment or lines, using protective insulating devices, live line tools or bare-hand techniques.

Locked – Physically secured with a keyed padlock. (This definition only applies to devices where provision for locking is provided.)

Near – For the purposes of electrical operations, distance at which there is a possibility of contacting energized lines or equipment.

Operating Authority – Person designated by ATCO Electric to make policy decisions that affect operations of the power system. Also known as the Operator of a Utility System, as defined in the AEUC.

Operating Interface Point – Location on the power system that separates the responsibilities of respective Operators-in-Charge. Operating interface points are identified on switching diagrams. See Appendix A.

Operator-in-Charge (OIC) – Qualified Worker designated by the Operating Authority to coordinate control of the power system or a portion thereof, in accordance with the requirements of established safety standards, operating standards and procedures.

OIC-Administered Switching – Switching directed by the Operator-in-Charge, in accordance with switching orders developed by the Operator-in-Charge.

Permit – Portion of the switch order that provides authorization to work under established power system conditions.

Permit Holder – Employee to whom authorization has been issued to work on the power system.

Potential – Voltage**,** in the context of electricity.

Power System – All electrical apparatus that comprise the transmission and distribution systems.

Qualified Worker – Worker(s) who, through possession of a recognized degree, certificate, professional standing or through extensive knowledge and training experience, has successfully demonstrated the ability to perform the required duties and tasks of the work.

Release – Surrender of the permit.

Requester – Employee who initiates a work permit.

Return to Normal – Restoration of the power system or apparatus to a desired operating state.

Supervisory Control and Data Acquisition (SCADA) – Computer system that transfers field data and operating control to a centralized location.

Software Tags – Tags applied to computer-based systems by the Operator-in-Charge to prevent the operation of devices by those systems.

Switching – Process by which the electrical configuration of a system is changed, usually through the operation of devices designed for this action, but may also include the removal or installation of jumpers and the making or breaking of normally permanent connections.

Single Line Diagram (SLD) – Simplified electrical representation of substations or power system switch maps or any part thereof.

Switch Order – Documentation that describes the specific switching sequence required to place power system devices in a desired operating state.

System Switching Information (SSI) – Form that contains information required for conditioning the power system.

Switchman – Employee who operates electrical apparatus and performs switching and tagging of devices under the direction of or with the permission of the Operator-in-Charge.

System Security – Integrity of the power system. It is maintained by identifying the next contingency related to the work being considered that could impact power system operations and/or customer supply.

Tailboard – Conversation between Operators-in-Charge, Switchmen and/or Permit Holders that transpires before any switching action or issuing of permits.

Test and Operate (T&O) Permit – Allows apparatus to be operated or energized, without impacting the power system,

so adjustments, repairs, maintenance or commissioning tests can be performed.

Transfer of Authority – Formal transfer of duties, responsibilities or jurisdiction (temporary work zone) from one Operator-in-Charge to another.

Unqualified Worker – Worker(s) who is not a qualified worker; i.e., does not possess a recognized degree or certificate, professional standing or the knowledge/experience to successfully demonstrate the ability to perform the required duties and tasks of the work.

Worker-Administered switching (WA) – Switching performed by an employee who has received permission from the Operator-in-Charge to establish the power system conditions required to work on or near the power system.

Working Day – (for scheduling purposes) Monday through Friday inclusive, excluding statutory holidays.

SECTION 200: RESPONSIBILITIES

201 Operating Authority

The Operating Authorities are responsible for the operation of the transmission and distribution systems. The Operating Authority is also responsible for ensuring the Operator-in-Charge (OIC) responsibility is assigned.

202 Operator-in-Charge

The **Distribution Operator-in-Charge** (DOIC) is responsible for all power system apparatus rated 36 kV and below, excluding that portion shown on transmission Single Line Diagrams.

The **Transmission Operator-in-Charge** (TOIC) is responsible for all power system apparatus rated 72 kV and above and substation equipment rated below 72 kV, as shown on transmission Single Line Diagrams or switching maps. Exceptions to this requirement are identified as interface points on affected switching maps.

The **Operator-in-Charge** must:

- Coordinate the day-to-day operation of the transmission or distribution system, in compliance with approved standards and procedures.
- Establish power system conditions that will – when combined with appropriate work standards, procedures and methods – allow work to take place on or near the power system.
- Issue permits, as required, for all work on the transmission or distribution systems, including the attachment and detachment of apparatus.
- Maintain operational documentation for a minimum of three years.

203 Permit Holder

The Permit Holder is normally the Employee-in-Charge of a single work group or multiple work groups, as applicable.

The Permit Holder must be a Qualified Worker.

The Permit Holder is required to:

- Request and hold the permits that will – when combined with appropriate work standards, procedures and methods – allow work to take place on or near the power system.
- Notify the Operator-in-Charge (OIC) prior to starting work.
- Provide all employees and work groups under their direction permission to work under the permits held.
- Stop work and promptly notify the OIC in the event of any unscheduled occurrence or incident related to the power system that may affect:
  - employee safety
  - power system security
  - continuity of customer supply.
- Release all permits to the OIC when the work is complete.

204 Switchman

The Switchman must be a Qualified Worker.

The Switchman is responsible to:

- Perform switching at the direction of the OIC, or
- Establish their own protection under Worker-Administered (WA) switching , with permission of the OIC.

205 Employees

Employees have a responsibility to comply with all standards provided in the *Power System Work Standards*.

SECTION 300: NOTIFICATION AND PERMISSIONS TO ESTABLISH REQUIRED CONDITIONS

301 Notification and Permission Requirements

301.1 Substation Entry

All persons entering a substation must be a Qualified Worker or be escorted by a Qualified Worker.

The Employee-in-Charge (EIC) must notify the Transmission Operator-in-Charge (TOIC) prior to entering or departing a substation. The EIC must provide the following information:

- first and last name
- substation name or number
- reason for entering
- risks associated with the work
- expected duration of work (and, as applicable, the need for an extension).

This information allows the OIC to contact the EIC, if necessary (e.g., to gather information, to respond to an unplanned outage).

If an entry alarm is received from a remotely-monitored substation without a confirming call, the OIC must:

- Call the substation.
- Contact a local employee to investigate, if no one answers the call.
- Request police assistance, as required.

If the EIC fails to report back after completing the work, the OIC must initiate an investigation.

Note:

- Employees are also required to check in and out of unmanned Isolated Generation Sites (IGS) sites.
- The TOIC is responsible for monitoring entry into IGS sites.
- The preceding section shall also apply to IGS entry.

301.2 Work on the Power System

NO PERMISSION = NO WORK.

Necessary permit request (s) must be sent, in writing, to either the Transmission or Distribution Operations scheduling group.

- Equipment rated 25 kV or less, including apparatus under 750 V that directly impacts or could impede operation of the power system (e.g., relays, voice and data communication systems, protection circuits), requires a minimum notice of:
  - three working days when one OIC is involved
  - five working days when two or more OIC's are involved.
- Equipment rated 72 kV and above requires a minimum notice of 30 days; approval is required from the Alberta Electric System Operator (AESO).

The OIC (s) must review the permit request with the employee to identify any concerns.

The OIC (s) must advise the employee if the permit can be issued, as requested, as soon as possible.

302 Permission to Establish Required Conditions

After considering system security, customer supply and current permits, the OIC will schedule the work and provide permission to establish the required conditions through either OIC-Administered switching or Worker-Administered switching.

302.1 OIC-Administered Switching

The OIC cannot direct any switching without a written switching order, except in the following situations:

- A switch order is not required to operate a device for voltage control (e.g., Static VAR Compensator (SVCs), tap changers, synchronous condensers, capacitors or reactors, regulator banks and auto boosters).
- A switch order is not required in an emergency situation. See Section 1001.
- During troubleshooting situations, the OIC must document each switching step prior to completing that action. All troubleshooting actions must be transferred to the switch order and a second approval received before a permit is issued.

The Switchman must obtain the switch order from the OIC before performing the switching and must verify the switching instructions against the Single Line Diagram (SLD) or switching map. If the written switch order is not available onsite, the OIC will summarize the overall process and will provide the Switchman with step-by-step switching instructions pertinent to the switching location. The Switchman must:

- Record the switching steps, exactly as stated.
- Repeat the switching steps back to the OIC.

Upon completion of the switching, the OIC will issue a permit (e.g., Hold-off, GOI, Test and Operate, CSP) to the Qualified Worker or a Condition Guarantee to a Qualified Worker or to an adjacent OIC who requested the operation or confirmation of devices in order to establish a safe work area.

302.2 Worker-Administered Switching

The Operator-in-Charge (OIC) gives permission to a Qualified Worker to establish their own protection. This only applies to workers establishing protection for themselves or for a crew that is supervised by a Qualified Worker.

NO PERMIT IS ISSUED.

Worker-Administered (WA) switching can only occur with the authorization of the OIC. The OIC gives permission for the Qualified Worker to do the switching, allowing them to work on or near the power system.

WA switching may occur where a single device or multiple devices can easily establish protection and when risk to the power system is minimal (e.g., single- or three-phase radial distribution lines), provided the following conditions are met:

- Status of affected devices must be communicated to the OIC.
- All devices are under the authority of one OIC (e.g., no distribution-connected generation, no operating Rural Electrification Association (REA).
- There is only one Employee-in-Charge (EIC) of the work.
- The work is limited to one continuous work period. (The length of time required to complete the work at a specific work site. Issuance and release of daily permission will still be required.)
- There will be no overlapping WA switching permissions.

The following rules pertain to the administration of WA switching:

- The OIC will give permission for a Qualified Worker to establish their own protection under WA switching.
- The OIC will issue a unique reference number for the WA switching.

- The Qualified Worker will conduct a risk assessment of the work.
- The Qualified Worker will write up the switch order/tag.
- The Qualified Worker will advise the OIC when the work is complete.
- The Qualified Worker and the OIC will document the time of switching.

SECTION 400: ESTABLISHING REQUIRED CONDITIONS

401 Conducting a Power System Risk Assessment

401.1 General

To minimize hazardous situations and/or adverse effects on the power system, the Operator-in-Charge (OIC) must conduct a thorough risk assessment:

- before switching
- during switching
- after switching.

The risk assessment must include a review of the following, as applicable:

- system voltages and line flows
- status of adjacent substations
- status of interconnected utilities and customer loads
- apparatus and system capabilities
- effect of the next worst contingency
- conflicting scheduled outages
- current permits.

401.2 Distribution Tie Switches

Before operating distribution switches that tie different distribution feeders or transmission substations together, the Distribution OIC and/or Transmission OIC must consider:

- the possibility of inadvertently bypassing regulators
- settings and control of voltage regulators
- load shift
- the state of the transmission system
- system capabilities
- protection settings
- settings and switching of capacitors
- existing permits.

402 Switching

402.1 Communicating During Switching

The OIC must communicate switching instructions directly to the Switchman at the worksite. All parties must use full name identification when relaying switching instructions.

Verbal communications must be:

- Repeated back by the receiving party, as heard.
- Verified against the switch order.

402.2 General Switching Procedures

- A tailboard must occur between the OIC and the Switchman immediately before any switching to review the switching steps and to make sure that the switch order is complete, correct, understood and that all related hazards are identified.
- When possible, preference will be to perform switching remote from the device. Remote operation refers to offsite control, using Supervisory Control and Data Acquisition (SCADA), or onsite control, using the

Human Machine Interface (HMI) in the substation control building.

- The Switchman is required to inspect local devices and apparatus and report any deficiencies that could impact the switching to the OIC.
- The switching steps provided on the switch order must be followed.
- If there are inconsistencies or concerns – at any time – about the switching instructions, the switching must be stopped. Switching cannot proceed until the identified concerns are addressed.
- The Switchman must have the switch order in their possession when performing the switching and must record the time each switching step is successfully completed.
- Before operating any switch, the Switchman and OIC must ensure the device is rated for the operation.
- Any device that can be locked shall be locked, using a company system lock.

403 Isolating Apparatus

Isolation points must be fully opened and must be confirmed to have an adequate visible air gap on all phases.

- Where no visible air gap exists, isolated apparatus must be tested for potential and the isolating device must be locked and tagged as inoperable (e.g., padmount transformer with live front bushings and internal switchgear). Isolators and/or open jumpers can be used as isolation points.
- When motor-operated switches or circuit switchers are used as isolation points, the isolation procedure must include disabling the motor mechanism.
- When a normally open switch is used as an isolation point, the switch must be confirmed open onsite and tagged.
- When isolating a portion of the system where a Potential Transformer (PT) or station service is

connected, the PT or station service must also be isolated, using the secondary or primary disconnects, unless it is confirmed to have no known or potential power system source.

- When isolating an indoor switch gear:
  - The breaker must be removed from the cubicle or racked out to the disconnect position and tagged to create the isolation point.
  - If the breaker is not removable, the associated solid blade disconnects or bus switches must be opened and tagged to create the isolation point.

404 Tagging

Employees must understand and utilize the following tagging procedures:

- To prevent unauthorized operation of devices, standard ATCO Electric Do Not Operate tags (or software tags, where available) must be installed, as directed by the Operator-in-Charge (OIC), or, in the case of Worker-Administered (WA) switching, as directed by the employee performing the switching.
- Each active permit must have a corresponding tag at each location that is required to be tagged. Five active GOIs would require five tags on each isolation point.
- Where a Condition Guarantee has been issued, the OIC who receives the Condition Guarantee is allowed to install additional locks and tags on associated isolating devices.
- An OIC who receives a Condition Guarantee can use the associated tags to form part of the permit(s) issued.
- Where possible, a software tag must be installed on the equipment associated with each tag installed on a device in the field.

- Only a Qualified Worker may install or supervise the installation or removal of tags – as directed by the OIC – or, in the case of WA switching, at the direction of the employee who installed the tags.
- When installing tags on field devices, only one tag will be utilized per bag.
- Tags must be installed on the same side as the switch identification number and as close as possible to the switching device (e.g., on the operating handles or, in the case of solid blade disconnects, on the associated structure – preferably at eye level).
- The OIC must be notified if:
  - a tag is discovered on any device or apparatus that appears unsupported by a switch order
  - an employee suspects a device has been operated without a tag or switch order.

  The OIC will initiate an investigation and take appropriate action (e.g., direct removal of the tag, direct tagging and issue a permit or energize), as applicable.
- All tags placed on power system devices and apparatus must be associated with a:
  - unique switch order reference number or
  - WA switching reference/event number.

  Only standard ATCO Electric Do Not Operate tags or OIC-Administered software tags may be used.
- The following information must be legibly recorded on the ATCO Electric Do Not Operate tag:
  - identifying number of the line or apparatus on which work is being done
  - identifying number or legal location of the device to which the tag is applied
  - reason for the isolation or condition
  - switching step(s), if the tag is being used as a switching order
  - person (WA) or OIC requesting the tag

- full name of the Switchman
  - time and date of the tag installation and removal
  - Reference/Event number (e.g., 12345).

  For a sample tag, see Appendix B.

SECTION 500: PERMIT PROCESS

501 Single Line Diagrams

501.1 General

Before performing any switching, the Switchman must have, in their possession: a valid, approved, up-to-date Single Line Diagram (SLD) or switch map that accurately details the apparatus contained within that system.

Copies of interim SLDs or switching maps may be obtained through the Transmission Control Centre (transmission system) or Distribution Control Centre (distribution system) and then authorized by the appropriate Operator-in-Charge (OIC).

501.2 Revisions

Verified and approved interim SLDs or switch maps (i.e., checked, dated and signed by the Employee-in-Charge) must be provided to the OIC whenever modifications are made to the power system.

The OIC may accept verbal notification of a change to an SLD or switch map from an Employee-in-Charge (EIC) if the change is minor and easily understood (e.g., a change to a switch number) and if the EIC commits to provide the OIC with a verified and approved interim SLD or switch map as soon as possible.

The OIC has the discretion to deny the verbal notification and to request a verified and approved interim SLD or switch map before accepting the change.

- Interim and revised SLDs or switch maps used to operate the power system must be authorized by the appropriate OIC.
- The OIC must obtain approval from the affected Operating Authority to change an operating interface point.

502 Permit Scheduling

502.1 General

In preparing to establish the required conditions to work on or near the power system, employees must complete the following seven steps, as applicable:

1. Provide Project Outage Plans and System Switching Information (SSI), as necessary.
2. Submit current SLDs or switch maps.
3. Determine the power system conditions required to accommodate the work.
4. Notify or request permission from the appropriate OIC to establish those conditions.
5. Receive permission to establish required conditions through OIC-Administered switching or Worker-Administered (WA) switching.
6. Obtain or develop switch orders.
7. Establish an onsite means of communication with the OIC.

502.2 System Switching Information/Permit Request

System Switching Information (SSI)/permit requests and work orders on request must include the following:

- line or apparatus affected and the work location
- type of permit(s) required
- dates and times the permit(s) is required and the anticipated duration of the work

- estimated time needed to release the permit in a critical situation
- description of the work
- required isolation points, as applicable
- risks the Permit Holder is able to identify (e.g., local impacts if something goes wrong with the work)
- means of communication to be used between the Permit Holder and OIC
- name of the Permit Holder or Requestor
- updated switch map or SLD.

503 Switch Order/Permit Form

503.1 General

Using the information on the System Switching Information (SSI) request, the OIC will conduct a power system risk assessment, schedule the work and prepare a switching order/permit form with the following information:

- unique reference number
- dates, times and duration the required power system conditions will be in effect
- switching sequence to be used to create those conditions
- switching sequence to be used to return to normal
- permit issuance and release documentation.

503.2 Numbering Switching Steps

Switching step numbers must be sequential at each switch location. To add switching steps to an existing switching order, use alphabetical suffixes to preserve the existing sequence (e.g., 36A, 36B, 36C).

503.3 Numbering Permits

The OIC must assign each permit a unique number.

- A reference number (e.g., 12345) will be generated when a new switching order is documented on the system (e.g., CROW, Maximo, OMS). For each required permit, the OIC will create a unique permit number, using the reference number as a base, followed by a unique alphabetical suffix (e.g., 12345A, 12345B).
- Where an electronic system is not available to assign a unique reference number, the OIC must use the following format: initials-year/month/day-sequence. *The date reflects the work start date. The month must be expressed as a three-letter abbreviation.* For example, reference number LJD-01Aug20-1 would have a permit number of LJD-01Aug20-1A.

504 Issuing and Holding Permits

504.1 General

The permit is the employee's assurance that the power system conditions defined by the switch order will not change until the permit is released. This assurance requires strict adherence to the following:

- In planned situations where switching is involved in establishing the required conditions, the Permit Holder should have, in their possession, a current copy of the Single Line Diagram (SLD) or switch map and the switch order prepared by the Operator-in-Charge (OIC) before the permit is issued.

  If the written switch order is not available onsite, the OIC will verbally provide the portion that contains the permit to the Permit Holder. The Permit Holder must:

  - Record the permit exactly as stated.
  - Repeat the permit back to the OIC.

A tailboard discussion must be held between the Permit Holder and the OIC prior to:

- Issuing a permit to verify required power system conditions have been established through the switch order.
- Releasing a permit to confirm established conditions can be returned to normal.

- All parties must use full name identification and repeat-back procedures whenever issuing, receiving or releasing permits.
- All required switching and tagging on the switch order must be completed before the associated permit is issued.
- The Employee-in-Charge (EIC) may accept a permit only for the work group(s) under their direction.
- If the Permit Holder must leave the work location, he or she must either release the permit(s) or arrange to maintain established conditions with the permission of the OIC (e.g., by providing a means of contact while offsite or changing Permit Holder s). See Section 504.2.
- Permits must be released when no longer required.
  - If permits are not released and the Permit Holder cannot be contacted, the OIC must contact the Permit Holder's immediate supervisor. The supervisor, if unable to locate the Permit Holder, must contact the Operating Authority for approval to release the permits.
- If continuous or scheduled communications cannot be maintained with the OIC, all applicable permits must be released.
- During critical situations, permits must be released as soon as possible at the request of the OIC.

504.2 Changing Permit Holders

If a Permit Holder must leave a site before the work is complete, established conditions can be maintained (with the permission of the OIC) by briefly overlapping the original permit with a new permit issued to another employee.

- The original Permit Holder must personally advise the OIC and everyone working under the permit of the proposed change.
- The new Permit Holder must review and confirm the established conditions with the OIC.
- The OIC will issue the new permit before releasing the original permit.

Note: If a tag is used for Worker-Administered Switching, the new Qualified Worker must place their tag on the device before the original tag is removed.

504.3 Expanding or Contracting Isolated Work Zone

If a work zone has to be expanded or contracted from an existing permit, the OIC must:

- Direct installation of tags on the new devices that are required to be isolated/opened to establish the new work zone.
- Transfer the required existing tags and reference numbers defined in the previous switching order to the new switch order, if a new switching order is required.
- Check that all devices have been identified and tagged to establish required conditions on the new permit.
- Issue the new permit to the Permit Holder.
- Release the previous permit.
- Direct removal of tags from the previous permit that are no longer required.

505 Return to Normal

When the work is complete, the Permit Holder must inform the OIC and – when applicable – provide the appropriate OIC (s) with suitable written documentation (e.g., final inspection, commissioning report stating “Approved to Energize”).

Devices within the confines of the permit will be returned to their original operating state or placed in the operating state desired by the OIC, as applicable.

In the case of Worker-Administered (WA) switching, the Permit Holder must remove all tags and document the time the switching action was completed (and the tag removed).

Return to normal switching may proceed after all permits have been released.

SECTION 600: PERMITS

601 Guarantee of Isolation Permit

The Guarantee of Isolation (GOI) permit allows work on isolated apparatus and guarantees:

- The line or apparatus has been isolated from all known or potential power system sources and has been tagged on all boundaries of isolation.
- Isolation from all known or potential power system sources above 750 V**,** substation Potential Transformers (PT) and station service disconnects, as applicable.
- The operating state of the isolating devices will not change until the permit is released.

601.1 Restrictions and Requirements

- A GOI Permit may be held by any Qualified Worker.
- When a device is being used as an isolation point for a GOI Permit, a Test and Operate (T&O) will not be allowed on that device.
- Before a GOI Permit is issued, tags must be securely placed on all isolating devices.
- Devices located within the isolation points of a GOI Permit – that are not tagged – may be operated by the Permit Holder with the understanding that before the permit is released the devices will be returned to their original operating state or placed in the operating state desired by the Operator-in-Charge (OIC) as applicable.

- When applied potential (e.g., Doble testing, Hypot testing, primary injections) is being used to test apparatus within a GOI zone, the Permit Holder must inform the OIC that such testing will be taking place. No additional GOIs are to be issued within the same zone of isolation while injection testing is in progress.
- In the case of two or more work groups working under the same GOI Permit, the Permit Holder must:
    - Provide each work group with permission to establish their own work protection (e.g., install grounds).
    - Check all grounds are removed when work is completed and before the work zone is restored to normal.

601.2 Issuing a Guarantee of Isolation Permit

When all conditions have been met, the OIC issues the GOI Permit to the Permit Holder, using the following words:

This is (name) informing (name) that (device or line) is now (isolated between/opened at) (location or locations). You may proceed with your work under GOI Permit # _____ Date_____.

601.3 Releasing a Guarantee of Isolation Permit

Before releasing the GOI Permit, the OIC and Permit Holder must verify that the switch order tailboard has been completed.

The Permit Holder releases the GOI Permit to the OIC with these words:

This is (name) informing (name) that I have completed my work on (device or line) and I am releasing my GOI Permit # _____ Date _____.

602 Test and Operate Permit

The Test and Operate (T&O) Permit provides assurance the OIC has assessed system security and that adjustments, repairs or tests can be performed on apparatus that may or may not be energized – as covered by the permit. It allows apparatus to be operated or energized so that adjustments, repairs, maintenance or commissioning tests can be performed.

A Test and Operate Permit is NOT intended to serve as a form of personal protection.

602.1 Restrictions and Requirements

- A T&O Permit may be held by any Qualified Worker.
- Only one T&O Permit will be issued on a single apparatus at any time.
- A T&O Permit will not be issued on any device defined as an isolation point for a GOI Permit.
- A T&O Permit will not be issued on any device that is part of a Hold-Off Permit.
- Before a T&O Permit is issued, tags must be securely placed on the switching devices that create the test condition.
- If a device or apparatus is required to be operated during tests, it may be operated only on instructions from the Permit Holder (e.g., opening/closing a circuit breaker).

602.2 Issuing a Test and Operate Permit

After all requirements have been met, the OIC issues the T&O Permit to the Permit Holder, using the following words:

> *This is (name) informing (name) that it is okay to test and operate (device) at (location) under Test and Operate Permit # ____ Date_____.*

602.3 Releasing a Test and Operate Permit

Before releasing a T&O Permit, the Permit Holder must verify the work has been completed and that devices associated with the permit are in their original operating state or the operating state desired by the OIC, as applicable.

The Permit Holder releases the T&O Permit to the OIC with these words:

> *This is (name) informing (name) that I have completed my work on (device) at (location) and I am releasing my Test and Operate Permit #_____ Date _____.*

603 Hold-Off Permit

A Hold-Off Permit (HOP) prevents automatic or manual restoration after an unplanned circuit outage, preventing further exposure of apparatus and employees to electrical potential. It confirms that restoration and reclosing schemes are disabled.

Normal Open (NO) switches in the field will not be tagged for HOPs.

603.1 Restrictions and Requirements

- A HOP may be held by any Qualified Worker.
- Tags must be placed on devices required to create the HOP, including the:
  - Control Panel – control switches of circuit breakers associated with the electrical apparatus covered by the HOP
  - Control Panel/Structures – control switches of any auto-sectionalizing, auto-transfer or automatic reclosing schemes that could re-energize the apparatus covered by the HOP.
- If the HOP is established through supervisory control, field tags referenced in paragraph one above do not have to be installed; however, the OIC must apply software tags to all devices associated with the permit.

- If the OIC receives an alarm indicating the associated protection may fail to operate under fault conditions (e.g., alarm for loss of DC), the OIC must notify the Permit Holder. The Permit Holder and OIC must then determine if the HOP can continue.
- If the associated protection operates or a loss of potential is suspected, the Permit Holder must notify the OIC or the OIC must notify the Permit Holder, as applicable.
- The Permit Holder must notify the OIC if a contact or incident occurs.
- Any device or line covered by the HOP that becomes de-energized will not be re-energized without the consent of the Permit Holder. (It is permissible to leave insulating equipment and tools connected to the line during the re-energization process).

603.2 Issuing a Hold-Off Permit

After all requirements have been met, the OIC issues the HOP to the Permit Holder, using the following words:

> *This is (name) informing (name) that reclosing has been disabled on (device or line) at (location) and (location) under Hold-Off Permit #_____ Date _____.*

603.3 Releasing a Hold-Off Permit

Before releasing the permit, the Permit Holder must verify the work has been completed and that devices associated with the permit are in their original operating state or the operating state desired by the OIC, as applicable (e.g., as required for attaching or detaching apparatus).

The Permit Holder releases the HOP to the OIC with these words:

> *This is (name) informing (name) that I have completed my work on (device or line) and I am releasing my Hold-Off Permit #_____ Date_____.*

604 Control System Permit

The Control System Permit (CSP) allows the OIC to assess risks and to condition the system to minimize the impact to system security, customer supply and other permits before work is performed on apparatus under 750 V that directly impacts or could impede operation of the power system. A CSP shall be initiated for work on the following apparatus:

- relays
- voice and data communication systems
- protection circuits
- DC systems
- Substation AMR.

If there is any doubt about whether a CSP is required, the employee should contact the OIC.

604.1 Restrictions and Requirements

- A CSP may be held by any Qualified Worker.
- A CSP will not be issued on protective relays or any other apparatus associated with the devices covered by a HOP.
- Before receiving a CSP, the Permit Holder must describe to the OIC what they are doing and outline any local impacts if something goes wrong with the work.
- If unexpected problems are encountered, the Permit Holder must report to the OIC before proceeding.
- If conditions on the power system change and continuation of the work will jeopardize system security or customer supply, the OIC must request the release of the CSP.

604.2 Issuing a Control System Permit

The OIC will review the information provided by the Permit Holder, conduct a power system risk assessment, document any operational impacts and consider other existing permits before issuing a CSP.

The OIC issues the CSP to the Permit Holder, using the following words.

This is (name) informing (name) that it is ok to proceed with your work under Control System Permit # _____ Date_____.

604.3 Releasing a Control System Permit

Before releasing the permit, the Permit Holder must verify that the apparatus associated with the permit is in its original operating state or the operating state desired by the OIC, as applicable.

The Permit Holder releases the CSP to the OIC with these words:

This is (name) informing (name) that I have completed my work and it is ok to close Control System Permit #_____ Date _____.

SECTION 700: CONSTRUCTION – ATTACHING AND DETACHING APPARATUS

701 Procedure

When new construction is physically close to the point where it will eventually be tapped onto the existing electrical system, a tag may be installed on the open span or open jumpers to prevent inadvertent connection to the electrical system. Jumpers and open spans used for isolation purposes shall be assigned a unique identifier. The tag can be installed as part of the Condition Guarantee or alternatively installed as part of Worker-Administered (WA) switching.

When new construction is physically close to the existing electrical system and is only separated by a switch, a lock and/or tag must be installed on the open switch. The lock and/or tag can be installed as part of the Condition Guarantee or alternatively installed as part of WA switching.

To attach or detach apparatus from the energized power system, the Employee-in-Charge (EIC) must:

1. Provide the appropriate OIC with suitable written documentation (e.g., final inspection, commissioning report stating “Approved to Energize” or de-commissioning report stating “Approved to De-Energize”).
2. Provide the OIC (s) with an interim Single Line Diagram (SLD) or switch map, verified and approved by the EIC.
3. Identify the power system conditions required to complete the work and request permission to establish those conditions from the OIC (s).

4. Release associated WA switching permissions, permits or Condition Guarantees.

Note: When a project requires energization in stages, the EIC must:

- Identify isolation points that define each stage in the project work plan and provide a copy of the work plan to the OIC (s).
- Provide the OIC (s) with an interim SLD or switch map (that has been verified and approved by the EIC) before each segment is energized.

SECTION 800: OPERATING INTERFACE POINTS

801 Location of Operating Interface Points

To determine the location of operating interface points, refer to the table provided in Appendix A.

802 Condition Guarantee

The Condition Guarantee (COG) provides the formal assurance to another Operating Authority or Operator-in-Charge (OIC) that identified devices are in the position requested and will not change status until the device status request is formally released by the requestor.

A Condition Guarantee is not a permit.

802.1 Restrictions and Requirements

The OIC must give adjoining OICs prior notification of any action or condition that could impact their system, including, as applicable:

- changes to operating conditions
- operation of adjacent devices
- any work being performed that could present a risk to their system.

When establishing conditions that require switching beyond an operating interface point, the OIC must:

- Exchange copies of corresponding switching orders with the adjoining OIC when coordinated switching is required with the other party.

- Receive, before completing the switching process, a verbal COG from the adjoining OIC that required switching and tagging has been performed on their system and established conditions will not change until released by the OIC making the request.

802.2 Issuing a Condition Guarantee

When all conditions have been met, the OIC issues the COG to the adjacent OIC, using the following words:

This is (name) at the ATCO Electric SOC informing (name) at (company or organizational name) you have a Condition Guarantee that (describe condition) on/at (line number or substation name and number) . Reference # _____, Date_____.

802.3 Releasing a Condition Guarantee

Once the adjacent OIC no longer requires the Condition Guarantee, they release it with these words:

This is (name) at (company or organizational name) informing (name) at the ATCO Electric SOC that work is completed on (line or equipment number and location). I am releasing my Condition Guarantee Reference # _____, Date_____. (line or equipment) can be returned to normal.

SECTION 900: PROCEDURAL TOOLS

901 Voice Communications

Voice communication systems must be available for use between the Permit Holder and the Operator-in-Charge (OIC), and the Switchman and the OIC.

- Employees may use the following devices for communication:
  - cell/satellite phone
  - land line phone
  - company radio.
- All transmission substations must have one or more voice communication systems available for use at all times. If there is any doubt as to the effect of a portable radio or cell phone on apparatus in the building (e.g., a warning sign is posted), it must not be used.
- Where continuous communication is not possible, due to the site location, the OIC may allow scheduled communications. Consideration must be given to the:
  - impact on system security, due to the communication delays
  - possibility that customer outages may be extended, due to the communication delays.

902 Record Keeping

All switch orders for Worker-Administered (WA) switching shall be kept locally for a minimum of one year.

The OIC must maintain the following records for a minimum of three years:

- all switching orders (e.g., electronic, paper) used to issue permits
- documentation of any investigations regarding tagging or unauthorized operation of power system devices or apparatus
- logs – electronic or paper – including:
    - all permit information, including reference numbers
    - all Condition Guarantee information
    - Operator-Administered switching
    - Worker-Administered switching.

SECTION 1000: SPECIAL SITUATIONS

1001 Emergency Situations

Power System Work Standards (PSWS) provides ATCO Electric employees with standards for establishing conditions on the power system that will – when combined with appropriate work standards, procedures and methods – allow work to take place on or near the power system.

In an emergency, (a present or imminent event that requires prompt coordination of action to protect the health, safety or welfare of people or to limit damage to property and/or the environment), a Qualified Worker may take action to remove apparatus from service without prior authorization.

- ALWAYS protect yourself.
- NEVER put yourself in imminent danger or do anything that causes you to doubt your decision – call for help.

After emergency action has been taken, the Qualified Worker must report the action and the reason for the action to the appropriate Operator-in-Charge (OIC) as soon as possible.

The OIC will review the action and take the necessary steps to restore the power system.

Note: An investigation must be completed when emergency action has been taken.

1002 Inadvertent Operation of Apparatus

If an employee inadvertently operates any component of the power system, the employee must NOT attempt to correct the error. The employee must immediately notify the OIC.

The OIC will review the inadvertent operation and take the necessary steps to restore the power system, as applicable.

All employees must realize the potential results of their actions – all incidents must be reported and investigated.

APPENDIX A – Operating Interface Points

	Transmission	Distribution
Transmission	Not Applicable	Any distribution system apparatus downstream from the apparatus shown on the substation switching diagram.
Distribution	Any distribution system apparatus downstream from the apparatus shown on the substation switching diagram.	Not Applicable
Generation	As agreed to by the Operating Authorities and clearly defined on the single line diagrams. Where there is a direct interconnection, a Joint Operating Procedure must be established .	Located on the distribution system apparatus electrically closest to the unit breaker, unit transformer or station auxiliary transformer.
Customer	As agreed to by the Operating Authorities and clearly defined on associated customer and company single line diagrams. Where there is a direct interconnection, a Joint Operating Procedure must be established .	As agreed to by the Operating Authorities and clearly defined on associated customer and company single line diagrams and/or distribution switching maps. Where there is a direct interconnection, a Joint Operating Procedure must be established).
Other Utility	As agreed to by the Operating Authorities and clearly defined on associated utility, company and transmission single line diagrams. Where there is a direct interconnection, a Joint Operating Procedure must be established .	As agreed to by the Operating Authorities and clearly defined on associated utility, company and distribution single line diagrams.

APPENDIX B – Do Not Operate Tag

SCHEDULE "I"

DELIVERY TIME ADJUSTMENT TABLE

Seasonal Adjustment is subject to change.

Month	Seasonal Adjustment
January	100%
February	100%
March	100%
April	100%
May	100%
June	100%
July	100%
August	100%

YUKON ENERGY CORPORATION

STANDARD FORM ELECTRICITY PURCHASE AGREEMENT

STANDING OFFER PROGRAM

THIS ELECTRICITY PURCHASE AGREEMENT ("**EPA**") is made as of the 5th day of June, 2020

BETWEEN:

536774 YUKON INC., a corporation incorporated under the laws of the Yukon ("**Seller**")

- and -

YUKON ENERGY CORPORATION, a corporation incorporated under the laws of the Yukon ("**Buyer**")

WHEREAS:

A. The Government of Yukon issued the *Energy Strategy for Yukon* in January 2009 and in October 2015 issued the *Independent Power Production Policy* as reviewed and updated in October, 2018 (the "**IPP Policy**") as part of the strategy's priority action to "update and develop a policy framework for electricity that emphasizes efficiency, conservation and renewable energy". The IPP Policy created a framework for the development of the Standing Offer Program. In support of the objectives of the IPP Policy, the Government of Yukon issued the SOP OIC and, together with the Utilities, developed the SOP Rules;

B. Seller has proposed the development of the Project on the Electrical Grid pursuant to the Standing Offer Program and such Project has been reviewed and approved in accordance with the SOP Rules; and

C. This EPA is being entered into by the Parties in respect of the Project under the Standing Offer Program in accordance with the SOP Rules.

NOW THEREFORE Seller and Buyer agree as follows:

ARTICLE 1
DEFINITIONS, INTERPRETATION AND SCHEDULES

1.1 Definitions and Interpretation

The definitions and certain principles of interpretation that apply to this EPA are set out in Schedule "A".

1.2 Schedules

The following Schedules attached hereto are incorporated into and made a part of this EPA:

Schedule "A"	-	Definitions and Interpretation
Schedule "B"	-	Project Description

Schedule "C"	-	Form of Annual Operating Plan
Schedule "D"	-	System Interconnection Study Report
Schedule "E"	-	Monthly Energy Shortfall Payment
Schedule "F"	-	Termination Payment
Schedule "G"	-	System Interconnection Guidelines
Schedule "H"	-	Joint Operating Procedure
Schedule "I"	-	Delivery Time Adjustment Table

ARTICLE 2
CONDITIONS PRECEDENT AND TERM

2.1 Conditions Precedent

(a) Except as provided in this Section, this EPA has no legal force until the Conditions Precedent described in Schedule "B" are satisfied by Seller or waived by Buyer. The Conditions Precedent may only be waived by Buyer by notice in writing to Seller.

(b) Seller will:

(i) seek to satisfy each of the Conditions Precedent on or before the Condition Date;

(ii) keep Buyer informed of any circumstances which may result in any of those Conditions Precedent not being satisfied in accordance with their terms; and

(iii) promptly notify Buyer upon satisfaction of any of those Conditions Precedent and provide such supporting evidence as may be reasonably required by Buyer.

(c) If the Conditions Precedent are not satisfied or waived on or before the Condition Date, or it becomes apparent that the Conditions Precedent will not, in the reasonable opinion of Buyer, be satisfied by the Condition Date, the Conditions Precedent will be taken to have failed and Buyer shall be entitled to terminate this EPA, in which event each Party shall release the other from any and all claims, damages, costs, expenses or liabilities whatsoever incurred by it and its Affiliates in relation this EPA provided that (i) Seller shall remain liable for all costs incurred by Buyer in respect of the System Interconnection Study Report, System Upgrade Costs or New Interconnection Facilities Costs and (ii) otherwise each Party shall be responsible for its own costs incurred by it in connection with this EPA.

(d) Section 2.1(a) does not apply to this Article 2, Section 3.5 and Articles 10, 11, 12, 13 and 15 which shall be in full force and effect from the date of this EPA.

2.2 Term

Subject to Section 2.1, this EPA shall commence on the Effective Date and continues for the period specified in Schedule "B", unless it is terminated earlier in accordance with this EPA.

ARTICLE 3
CONSTRUCTION AND OPERATION

3.1 Construction and Operation Costs, Liabilities and Actions

Seller will be fully responsible for the permitting, design, engineering, construction, Interconnection, commissioning, operation, maintenance, reclamation and decommissioning of the Seller's Plant and shall be responsible for all costs, expenses, liabilities and other obligations associated with such activities.

3.2 Standard of Construction and Operation

Except as otherwise consented to in writing by Buyer, such consent not to be unreasonably withheld, conditioned or delayed, Seller will ensure that the location, design, engineering, construction, Interconnection, commissioning, operation and maintenance of the Seller's Plant, are and will be carried out at all times during the Term:

(a) in accordance with the description of the Seller's Plant in Schedule "B" and the information in the Application in all material respects;

(b) in compliance with the Project Standards; and

(c) by qualified and experienced individuals.

The Parties shall conduct their respective operations in accordance with the Joint Operating Procedure.

3.3 Project Changes

Without Buyer's prior written consent, not to be unreasonably withheld, conditioned or delayed Seller will not make any change to:

(a) the Seller's Plant as described in Schedule "B"; or

(b) any other aspects of the Seller's Plant or the information in any System Interconnection Study Report completed for Seller's Plant prior to the Effective Date which would require changes by Buyer to the System Upgrades where such change would increase Buyer's liability for any costs or otherwise increase the obligations or risks of Buyer with respect to the Seller's Plant or any other project.

Seller acknowledges that Buyer may require, as a condition of its consent to any change described in this Section, that Seller agree in writing to reimburse Buyer for any reasonable incremental liability for any losses, costs and damages incurred by Buyer or any third party, with respect to the Seller's Plant or any other project, as a result of any change described in this Section. Buyer may also require that Seller provide performance assurance or security to Buyer in order to ensure that Buyer has no financial exposure in respect of such reimbursement obligation.

3.4 Development Progress Reports

Seller will deliver a Development Progress Report to Buyer on each January 1, April 1, July 1 and October 1 after the Effective Date until Seller's COD. Buyer shall be entitled to request such

additional information as it may reasonably require from time to time in respect of Seller's development of Seller's Plant.

3.5 Responsibility for Upgrade Costs

Seller will be responsible for and shall pay Buyer for all System Upgrade Costs and New Interconnection Facilities Costs in accordance with the following:

(a) the System Interconnection Study Report sets out Buyer's estimate of System Upgrade Costs and the New Interconnection Facilities Costs. Seller shall (i) pay to Buyer in advance an amount equal to such estimate of System Upgrade Costs and New Interconnection Facilities Costs ("**Upgrade Costs Advance**") and/or (ii) provide such other security in form, substance and amount as may be acceptable to Buyer in its Discretion to secure the obligation of Seller to pay such costs ("**Upgrade Costs Security**"). Buyer shall not be required in any circumstances to accept Upgrade Costs Security except in its Discretion. Buyer shall not be required to perform any work or incur any System Upgrade Costs or New Interconnection Facilities Costs where Buyer determines in its Discretion that the amount of Upgrade Costs Advance it has received together with any Upgrade Costs Security is not sufficient to adequately secure the obligation of Seller to pay all System Upgrade Costs and New Interconnection Facilities Costs and Seller shall forthwith provide to Buyer such additional Upgrade Costs Advance and/or Upgrade Costs Security as may be reasonably required by Buyer;

(b) Buyer will exercise Good Industry Practice to perform, or cause to be performed, the work required in respect of the System Upgrades and the New Interconnection Facilities for the Project. Buyer shall be entitled to draw upon the Upgrade Costs Advance and Upgrade Costs Security from time to time in its Discretion to satisfy any System Upgrade Costs and New Interconnection Facilities Costs as and when incurred by Buyer; and

(c) notwithstanding the estimate of System Upgrade Costs and New Interconnection Facilities Costs provided by Buyer to Seller contemplated in Section 3.5(a) or the amount of any Upgrade Costs Advance and Upgrade Costs Security provided by Seller, Seller shall be responsible for and shall pay Buyer the actual System Upgrade Costs relating to the System Upgrades incurred by Buyer. Following the completion of the System Upgrades and the payment in full by Seller of all System Upgrade Costs incurred by Buyer for such work, Buyer shall release to Seller any undrawn portion of the Upgrade Costs Advance and Upgrade Costs Security**.**

3.6 Metering

As part of the System Upgrades and New Interconnection Facilities, Buyer will install and maintain an appropriate Meter installation at the POI, and ensure that such Meter is tested and sealed according to any Measurement Canada standards. Seller will allow Buyer to access the Seller's Plant as may be necessary from time to time to install and maintain the Meter at the POI. If there is any dispute regarding the accuracy of the Meter, either Party may give notice to the other Party of the dispute. In that case, the Parties will resolve the matter in accordance with the *Electricity and Gas Inspection Act* (Canada).

3.7 Insurance

Seller will, at its cost, obtain and maintain (a) policies of commercial general liability insurance with a per occurrence limit of liability not less than $5,000,000, and (b) property insurance, with limits of liability and deductibles consistent with those a prudent owner of a facility similar to the Seller's Plant would maintain and those the Facility Lender may require. All commercial general liability policies must include Buyer, its directors, officers, employees and agents as additional insureds and must contain a cross liability and severability of interest clause. All policies of insurance must include a waiver of subrogation in favour of Buyer. All policies of insurance must be placed with insurers that have a minimum rating of A- (or equivalent) by A.M. Best Company and are licensed to transact business in the Yukon and must be endorsed to provide to Buyer 30 days' prior written notice of cancellation, non-renewal or any material amendment that results in a reduction in coverage. Seller will give Buyer a copy of the insurance certificate(s) for the insurance required to be maintained by Seller under this Section not more than 30 days after the effective date of coverage and promptly upon renewal thereafter. Seller will be responsible for the full amount of all deductibles under all insurance policies required to be maintained by Seller under this Section.

3.8 Seller's COD

(a) Except with Buyer's prior written consent, Seller's COD may not occur earlier than 90 days prior to Target Seller's COD.

(b) Buyer will not be required to incur any incremental expense or other liability of any kind to enable Seller's COD to occur prior to Target Seller's COD.

3.9 Change in Target Seller's COD

If the estimated date for completing the System Upgrades or the New Interconnection Facilities as required to achieve Buyer's COD is later than 90 days prior to the Target Seller's COD, Buyer shall provide notice to Seller of such delay and, provided Seller is not responsible for any delay in completing the System Upgrades or the New Interconnection Facilities (including a failure to pay amounts contemplated in Section 3.5), upon Seller's written request that the Target Seller's COD be postponed, Buyer will postpone the Target Seller's COD to the estimated date for completing the System Upgrades and the New Interconnection Facilities plus 90 days.

3.10 No Liability For Delay

Buyer shall exercise reasonable commercial efforts to achieve Buyer's COD prior to Target Buyer's COD. Buyer will have no liability under this EPA for delays in completion of (a) any System Upgrades or the New Interconnection Facilities, or (b) other work undertaken by Buyer or any of Buyer's Affiliates on the Seller's Plant side of the POI, in each case howsoever arising.

3.11 Outages

(a) **Notice of Seller's Outage** - Seller will notify Buyer of any Outages in Seller's Plant, or changes in any such Outages, by delivering to Buyer an Outage Notice or revised Outage Notice:

(i) promptly in the case of a Forced Outage or a Maintenance Outage;

(ii) not less than 90 days in advance of any Planned Outage, or such shorter time period with Buyer's written consent, such consent not to be unreasonably withheld, delayed or conditioned; and

(iii) promptly in the case of any changes to the duration, start time or end time of any Outage.

(b) **Notice of Buyer's Outage** - In addition to Buyer's reporting requirements under Section 4.8(d), Buyer will notify Seller of any Planned Outages that will result in a Buyer's Distribution/Transmission Constraint or changes in any such Planned Outages, by delivering to Seller an Outage Notice or revised Outage Notice:

(i) not less than 90 days in advance of any such Planned Outage, or such shorter time period with Seller's written consent, such consent not to be unreasonably withheld, delayed or conditioned; and

(ii) promptly in the case of any changes to the duration, start time or end time of any Outage.

(c) **Coordination and Scheduling of Outages -** Seller will coordinate all Planned Outages or Maintenance Outages with Buyer's maintenance schedule or other requirements where such schedule or requirements are publicly available or otherwise notified to Seller.

3.12 Annual Operating Plan

On or before October 31 in each year during the Term, Seller will provide to Buyer its Annual Operating Plan, including any required update to the then current Annual Operating Plan, for the 12-month period commencing on January 1 of the next year. Seller will promptly provide Buyer with a revised Annual Operating Plan from time to time upon Seller becoming aware of any expected material change in the original Annual Operating Plan for that period. The Parties agree the Annual Operating Plan is provided for planning purposes and does not guarantee or limit the quantity or timing of Delivered Energy to the POI.

ARTICLE 4
PURCHASE AND SALE OBLIGATIONS

4.1 Energy prior to Buyer's COD

Subject to satisfaction of all obligations of Seller under this EPA, upon the occurrence of Seller's COD but prior to the occurrence of Buyer's COD, Buyer will not be obligated to purchase, or accept delivery from Seller of, any Energy, provided if Buyer does accept, in its sole discretion, delivery of Energy at the POI, Buyer will pay for such Energy accepted by Buyer prior to Buyer's COD in accordance with Section 5.1.

4.2 Energy after Buyer's COD

From and after Buyer's COD for the remainder of the Term, Seller will sell and deliver all Energy to Buyer at the POI and Buyer will, subject to Sections 4.3 and 4.4, purchase and accept delivery of all Delivered Energy. Buyer will pay for Delivered Energy from and after Buyer's COD in accordance with Section 5.1.

4.3 Limit on Delivered Energy and Capacity

Notwithstanding the foregoing provisions of this Article 4:

(a) in any hour, Buyer will not be obligated at any time to purchase or accept delivery from Seller at the POI of any Energy generated in excess of the Seller's Plant Capacity in such hour (as measured in kWh) and no amount will be payable by Buyer for Delivered Energy in excess of the Seller's Plant Capacity in such hour, whether prior to or after COD, and regardless of whether Buyer consented to and accepted delivery of such Energy at the POI;

(b) in any calendar year, Buyer will not be obligated to purchase or accept delivery from Seller at the POI of any Energy generated in excess of the Project Energy Volume and no amount will be payable by Buyer for Delivered Energy in any such calendar year in excess of the Project Energy Volume in such calendar year, whether prior to or after COD, and regardless of whether Buyer consented to and accepted delivery of such Energy at the POI; and

(c) in determining the total amount of Delivered Energy for a year, month, hour or any other time period under this EPA for any purpose, the amount of Delivered Energy in each hour of such time period will not exceed the Seller's Plant Capacity in such hour, even if Seller delivered to the POI Energy in excess of such amounts, or the Seller's Plant was capable of generating Energy in excess of such amounts.

4.4 Distribution/Transmission Constraints

Buyer will not be in breach or default of its obligations under Sections 4.1, 4.2 or 5.1 if Buyer is not able to accept delivery of Energy at the POI as a result of a Distribution/Transmission Constraint. Buyer will have no liability with respect to a Distribution/Transmission Constraint, except as set out in Section 4.8, if applicable.

4.5 Exclusivity

(a) Seller will not at any time during the Term commit, sell or deliver any Energy (or related Environmental Attributes) to any Person other than Buyer under this EPA. Seller will not use any Energy (or related Environmental Attributes) for any purpose whatsoever except for sale to Buyer under this EPA. These prohibitions do not apply if, and for so long as, Buyer is in breach of its obligations under Section 4.2.

(b) Seller shall not be entitled to interconnect a generating facility to the Seller's Plant and transmit electricity via the Seller's Plant to the POI.

4.6 Custody, Control, Risk of and Title To Energy

Custody, control, risk of, and title to, all Energy (including any Delivered Energy exceeding the limits set out in Section 4.3 even where Buyer has not paid for such excess Delivered Energy) shall pass from Seller to Buyer at the POI. Seller will ensure that all Energy delivered to Buyer under this EPA is free and clear of all liens, claims, charges and encumbrances.

4.7 Line Losses

Seller will be responsible for all Line Losses, costs and liabilities relating to the transmission of Energy and other electricity, if applicable, from the POI to the interconnection point between the New Interconnection Facilities and the Electrical Grid. Such Line Losses shall be determined in accordance with the Line Loss Methodology.

4.8 Distribution/Transmission Constraint

(a) If, in any month after Buyer's COD, Seller is unable to deliver Energy at the POI or Seller's ability to deliver Energy at the POI is reduced solely as a result of a continuous Distribution/Transmission Constraint which exceeds 30 minutes in duration and which:

(i) is not caused by a Planned Outage by Buyer of the Distribution System or Transmission System;

(ii) is not caused by an event beyond the reasonable control of Buyer; and

(iii) is not caused by Seller, the Seller's Plant or anything on Seller's side of the POI;

(a "**Non-Permitted Distribution/Transmission Constraint**") then, notwithstanding that Buyer is excused under Section 4.4 from its obligations under Section 4.2, Buyer shall pay Seller, for each calendar month in which the Non-Permitted Distribution/Transmission Constraint has occurred, the Monthly Energy Shortfall Payment calculated in accordance with Schedule "E" less any costs Seller avoided or, acting reasonably, could have avoided during the Non-Permitted Distribution/Transmission Constraint.

(b) Buyer will not be required to pay any Monthly Energy Shortfall Amount under this Section in any of the following circumstances:

(i) during any period specified as a Seller's Outage in any Outage Notice, revised Outage Notice or in the Annual Operating Plan or during any other period where the Seller's Plant would otherwise not have been operating;

(ii) during any period when either Party is or would be excused, in accordance with Section 14.1, from its obligation to deliver or to accept delivery of Energy as a result of Force Majeure; or

(iii) if Seller has not provided Buyer with an Annual Operating Plan in accordance with Section 3.12 for the year in which the Non-Permitted Distribution/Transmission Constraint occurs.

(c) Seller will maintain accurate and complete Records of all costs Seller avoided or, acting reasonably, could have avoided during the Non-Permitted Distribution/Transmission Constraint and will report all such costs to Buyer and provide Buyer with all information required to calculate such costs.

(d) Buyer will give Seller notice of all Distribution/Transmission Constraints in each month which individually exceed 30 minutes in duration when it provides its monthly statements in accordance with Section 5.3.

(e) In the event of a Dispute by the Parties in respect of the amount of any Monthly Energy Shortfall Amount, the matter shall be resolved in accordance with Article 12.

4.9 Buyer Dispatch/Turn-Down Right

(a) Buyer may at any time during the Term deliver notice to Seller requiring Seller to Dispatch/Turn-Down and Seller will promptly comply with any such direction except to the extent that any operational, technical or regulatory constraint prevents or limits Seller's ability to comply with such direction.

(b) For each hour of the applicable Dispatch/Turn-Down, Buyer will pay Seller an amount equal to:

(i) the price payable for post-COD Delivered Energy under Section 5.1 multiplied by (A) the aggregate of the duration of the applicable Dispatch/Turn-Down (measured as a fraction determined as the aggregate number of minutes in such Dispatch/Turn-Down period divided by 60) multiplied by (B) an amount equal to the positive difference, if any, of (1) the "Non-Permitted Distribution / Transmission Constraint Hourly Deemed Energy" set out in Table E-1 of Schedule "E" for the applicable calendar month less (2) the amount of Delivered Energy in such hour of Dispatch/Turn-Down (the positive difference being the "**Dispatch/Turn-Down Deemed Energy**"); less

(ii) any costs Seller avoided or, acting reasonably, could have avoided during the period of the Dispatch/Turn-Down.

(c) Buyer will not be required to pay any amount in respect of Dispatch/Turn-Down Deemed Energy under this Section in any of the following circumstances:

(i) during any period specified as a Seller's Outage in any Outage Notice, revised Outage Notice or in the Annual Operating Plan or during any other period where the Seller's Plant would otherwise not have been operating;

(ii) during any period when either Party is or would be excused, in accordance with Section 14.1, from its obligation to deliver or to accept delivery of Energy as a result of Force Majeure;

(iii) if Seller has not provided Buyer with an Annual Operating Plan in accordance with Section 3.12 for the year in which the Dispatch/Turn-Down occurs;

(iv) during any other hour when the Seller's Plant would otherwise not have been operating if there had been no Dispatch/Turn-Down notice; or

(v) where Buyer's requirement for Seller to Dispatch/Turn Down is the result of the operation of the Seller's Plant in a manner inconsistent with Section 3.2.

(d) Where Buyer requires the Dispatch/Turn-Down as result of a Non-Permitted Distribution/Transmission Constraint, Section 4.8 will apply.

4.10 Electric Service to Seller

If at any time Buyer delivers electrical energy to service Seller's Plant Load, then such electrical energy shall be accounted and paid for separately under the applicable agreement for such electricity energy services and will not be netted off of Delivered Energy for the purposes of determining amounts payable by Buyer in accordance with Section 5.1.

ARTICLE 5
PRICE AND PAYMENT TERMS

5.1 Energy Price

In each billing period, Seller shall pay to Buyer, for each kWh of Delivered Energy, the Energy Price calculated in accordance with Schedule "B".

5.2 No Further Payment

The amount payable by Buyer as specified in Section 5.1 is the full and complete payment and consideration payable by Buyer for Delivered Energy and for Environmental Attributes.

5.3 Statements and Payment

(a) **Statements**

(i) Buyer will, by the 15th day of each month after the Buyer's COD, deliver to Seller a statement for the preceding month. The statement must indicate, among other things:

(A) the amount of, and price payable for, Delivered Energy for that month;

(B) any amount owing by Buyer in respect of a Non-Permitted Distribution/Transmission Constraint pursuant to Section 4.8;

(C) any Final Amounts owing by either Party to the other Party.

Where there has been any Delivered Energy purchased by Buyer in the period prior to Buyer's COD, the first statement following Buyer's COD shall also account for all amounts payable by Buyer to Seller for such period prior to Buyer's COD. The statement must set out in reasonable detail the manner by which the statement and the amounts shown thereon were computed and be accompanied by sufficient data to enable Seller, acting reasonably, to satisfy itself as to the accuracy of the statement.

(ii) Either Party may give notice to the other Party of an error, omission or disputed amount on a statement within 36 months after the statement was first issued together with reasonable detail to support its claim. After expiry of that 36 month period, except in the case of willful misstatement, fraud or concealment, amounts on a previously issued statement will be considered accurate and amounts which were omitted will be considered to be nil, other than amounts disputed in accordance with this Section within the 36 month period, which will be resolved in accordance with this EPA.

(iii) If Seller gives notice to Buyer of an error, omission or disputed amount on a statement as described in Section 5.3(a)(ii), Seller may direct Buyer to promptly produce new statements for the relevant month(s). The new statements will show the undisputed amount and disputed amount each in a separate statement or will otherwise separate the amounts in a single statement in a manner acceptable to Seller, acting reasonably.

(b) **Payment**

(i) Within 30 days after receipt of a statement delivered under Section 5.3(a), and subject to Section 5.5, Buyer will pay to Seller or Seller will pay to Buyer the amount set out in the statement, except to the extent Seller in good faith disputes all or part of the statement by notice to Buyer as described in Section 5.3(a)(ii).

(ii) If Seller disputes any portion of a statement, the applicable Party must pay the undisputed net amount payable by it pursuant to the statement or, if applicable, the new statement of the undisputed amount described in Section 5.3(a)(iii).

(iii) The Parties will endeavor to resolve any error, omission or disputed amount on a statement amount within 30 days of the notice described in Section 5.3(a)(ii).

(iv) Any amount required to be paid in accordance with this EPA, but not paid by either Party when due, will accrue interest at an annual rate equal to the Prime Rate plus 2%, compounded monthly. Any disputed amount that is found to be payable will be deemed to have been due within 30 days after the date of receipt of the statement which included or should have included the disputed amount.

(c) **Payment Calculations**

(i) For the purpose of all payment calculations under this EPA:

(A) all payment calculations will be rounded to the nearest cent; and

(B) Energy will be expressed in kWh rounded to two decimal places.

(ii) For the purpose of all payment calculations under this EPA, where CPI is to apply, if Statistics Canada (or the then recognized statistical branch of the Canadian Government):

(A) computes, at any time after the Effective Date, the CPI on a basis different to that employed at the Effective Date, then the CPI will be converted using the appropriate formula recommended by Statistics Canada (or the then recognized statistical branch of the Canadian Government);

(B) at any time ceases to publish or provide the CPI, then the provisions of Section 2.7 of Schedule "A" will apply;

(C) has not published the CPI for a relevant period at the time Buyer is required to provide Seller with a statement, Seller will prepare the invoice based on the CPI in effect at the time the invoice is issued and when the CPI for the relevant period is published, Buyer will recalculate the invoice amounts in

the next succeeding invoice and will include a credit or debit, without interest, in the next succeeding invoice based on the results of the recalculation; or

(D) recalculates the CPI within 36 months after an invoice affected by that CPI calculation has been issued, then Buyer will recalculate the invoice amounts for the relevant period in the next succeeding invoice and will include a credit or debit, without interest, in the next succeeding invoice based on the results of the recalculation.

5.4 Taxes

All dollar amounts in this EPA do not include any value added, consumption, commodity or similar taxes, including GST and any successor thereto, which, if applicable, will be added to each statement and paid by Buyer.

5.5 Set-off

If Buyer and Seller each owe the other an amount under this EPA in the same month, then such amounts with respect to each Party will be aggregated and the Parties may discharge their obligations to pay through netting, in which case the Party, if any, owing the greater aggregate amount will pay to the other Party the difference between the amounts owed, provided that this Section applies only to any purchase price for Delivered Energy and any Final Amount owing by either Party to the other Party. Except as otherwise expressly provided herein, each Party reserves all rights, counterclaims and other remedies and defenses which such Party has, or may be entitled to, arising from or related to this EPA.

5.6 Change in Law and GRA Cost Recovery

(a) If at any time after the Effective Date:

(i) the costs to Buyer of complying with its obligations under this EPA are, as a result of one or more Changes in Law, increased or decreased (including, for greater certainty, any increase of the obligations or risks of Buyer with respect to the Seller's Plant, but excluding any increase of the obligations or risks of Buyer with respect to the System Upgrades or New Interconnection Facilities); or

(ii) the costs to Buyer of complying with its obligations under this EPA which were of a category or type previously recovered under a General Rate Application are determined under a General Rate Application to no longer be approved for recovery from Buyer's customers in such General Rate Application;

then, to the extent that Buyer would not have incurred such costs except for the Seller's Project and/or the entering into of this EPA, the amount payable by Buyer as specified in Section 5.1 shall be adjusted by the amount necessary to reflect those changed costs which Buyer is unable to recover from Buyer's customers in a General Rate Application.

(b) For each relevant event in Section 5.6(a)(i) or 5.6(a)(ii), Buyer shall provide Seller with a statement setting out such information as is reasonably necessary to demonstrate that such an event has occurred, the reasonableness and necessity of the measures taken by Buyer in relation to the event, its efforts to mitigate the costs associated with such event including

reasonable efforts of Buyer to recover such costs from its customers in a General Rate Application, the nature and extent of any increase or decrease in the amount payable by Seller as specified in Section 5.1, and any such other information as may be reasonably requested by Seller.

(c) If in Seller's view there has been a Change in Law that may decrease Buyer's costs, Seller may request Buyer to demonstrate how such Change in Law has affected its costs under this EPA by providing the applicable information contemplated in Section 5.6(b).

(d) The payments between the Parties shall thereafter be adjusted effective as of the date such event in Section 5.6(a)(i) or 5.6(a)(ii) affects the costs of Buyer hereunder.

(e) If there is any Dispute between the Parties with respect to this Section 5.6, including as to the appropriate increase or decrease in any payments between the Parties under this Agreement, the Dispute shall be resolved in accordance with Article 12.

ARTICLE 6
ENVIRONMENTAL ATTRIBUTES

6.1 Environmental Attributes

Seller hereby transfers, assigns and sets over to Buyer all right, title and interest in and to the Environmental Attributes. Seller will ensure that all Environmental Attributes transferred to Buyer under this EPA are free and clear of all liens, claims, charges and encumbrances. Seller shall use commercially reasonable efforts to (i) provide information reasonably requested by Buyer in relation to such Environmental Attributes, including as may be required to allow Buyer to verify or certify that such Environmental Attributes exist or have been created and (ii) assist in having Seller's Plant certified, licensed, qualified or approved under any rules, regulations, programs or applicable Laws of any Governmental Authority or independent certification agency in respect of Environmental Attributes, provided that Buyer shall pay Seller all costs reasonably incurred by Seller in respect of the same. Any failure by Seller to exercise such commercially reasonable efforts under this Section 6.1 is a "material default" for the purposes of this EPA, and Buyer may terminate this EPA under Section 9.1(j).

ARTICLE 7
EPA ADMINISTRATION, RECORDS AND AUDITS

7.1 Records

Each of Buyer and Seller will prepare and maintain all Records, or duplicates of such Records, at Buyer's head office or local Yukon office or the Seller's Plant, as applicable, or following the expiry of the Term or the earlier termination of this EPA, at such other location as may be agreed in writing between the Parties, for a period of not less than 7 years from the date on which each such Record is created. The Audit Parties may take copies of such Records for the purposes of an inspection or audit under Section 7.2.

7.2 Inspection and Audit Rights

For the sole purpose of verifying:

(a) compliance with this EPA;

(b) the accuracy of statements, supporting information and calculations delivered by a Party under this EPA;

(c) the qualification of the Seller's Plant and the Energy for the Environmental Certification; or

(d) the liability of Seller for System Upgrades Costs and New Interconnection Facilities Costs,

Buyer or Seller, as applicable, will, on reasonable prior written notice from either Party desiring to conduct an audit, provide the Audit Parties with prompt access during normal business hours to (i) in respect of Buyer, Buyer's records solely relating to this EPA, or (ii) in respect of Seller, Seller's Plant and all records relating to the Seller's Plant, including any Seller Confidential Information, as applicable, to enable the Audit Parties to conduct an inspection or audit thereof. The Audit Parties will exercise any access and audit rights under this Section in a manner that minimizes disruption to the operation of the Party subject to the audit. The audit rights contained in this Section 7.2 shall be subject to the limitations set forth in Section 5.3.

7.3 Seller Consents

Seller will promptly provide any consents required to enable any of the Audit Parties to make enquiries with any Governmental Authority or any Person administering the Environmental Certification concerning any or all of the following: (a) the qualification of the Seller's Plant and the Energy for Environmental Certification, the status of the Environmental Certification and copies of any audits, inspections or reports prepared in connection with the Environmental Certification; and (b) compliance by Seller with Laws and Permits applicable to the Seller's Plant.

ARTICLE 8
FIRST NATION CLAIMS

8.1 Notification of First Nation Claim

Given the ownership and location of the Project, Seller and Buyer do not expect any First Nation Claims. However, if Buyer or Seller receives or obtains evidence of a First Nations Claim, it will notify the other Party as soon as practicable.

8.2 Obligation to Consult

If Buyer receives, obtains evidence or becomes aware of a First Nations Claim, it may direct Seller, at Seller's cost, to:

(a) consult with the First Nations making the First Nation Claim, or, if requested by Buyer, assist Buyer in the consultation process;

(b) take any measures Seller deems necessary to address, prevent, mitigate, compensate or otherwise accommodate any Potential Impacts provided the measures are consented to in advance by Buyer and the First Nations making the First Nation Claim; and

(c) provide regular written reports to Buyer concerning Seller's compliance with this Section, as may be reasonably requested by Buyer.

8.3 Seller Termination for First Nation Claim

At any time prior to Buyer's COD, if:

(a) within 60 days of Buyer receiving, obtaining evidence or becoming aware of a First Nations Claim, Buyer does not make a direction to Seller as contemplated in Section 8.2;

(b) Buyer notifies Seller in writing that it will not make a direction to Seller as contemplated in Section 8.2; or

(c) after consultation with the First Nations making the First Nation Claim it becomes clear that the measure(s) necessary for Seller to resolve the First Nation Claim or to address, prevent, mitigate, compensate or otherwise accommodate any Potential Impacts would, in Seller's discretion, impose a commercially unreasonable cost on Seller, or would require the consent of Buyer under this EPA or agreement by Buyer to amend this EPA in order to address any Potential Impacts and such consent or agreement to amend is not provided within 60 days after Seller's request to Buyer,

then Seller may terminate this EPA on notice to Buyer. Such termination will be effective 30 days after the date of delivery of such notice of termination unless otherwise agreed by the Parties. A termination by Seller under this Section will, for all purposes of this EPA, be treated in the same manner as a termination by Seller under Section 9.3(c) of this EPA (including the obligations of Seller under Section 9.7). The termination of this EPA is the exclusive remedy to which Seller may be entitled to if Seller elects to terminate this EPA under this Section.

8.4 Buyer Termination for First Nation Claim

At any time prior to Buyer's COD, if Buyer receives, obtains evidence or becomes aware of a First Nations Claim, Buyer may, at its sole discretion, terminate this EPA on notice to Seller. Such termination will be effective 30 days after the date of delivery of such notice of termination unless otherwise agreed by the Parties. Upon a termination by Buyer under this Section 8.4, Seller shall reimburse Buyer for costs or liabilities described in Sections 9.7(a), (b) and (c). The reimbursement by Seller of such costs or liabilities, the indemnification by Seller contemplated in Section 8.5 and the termination of this EPA are the exclusive remedies to which Buyer may be entitled to if Buyer elects to terminate this EPA under this Section.

8.5 Seller Indemnity for First Nation Claim

Seller shall indemnify and hold Buyer and its Affiliates harmless from any and all claims, damages, costs, expenses, or liabilities whatsoever incurred by Buyer and its Affiliates in relation to such First Nation Claim and such indemnity shall survive termination of this EPA.

ARTICLE 9
TERMINATION

9.1 Termination by Buyer

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Buyer may have under this EPA or at law or in equity in respect of any of the following events, Buyer may terminate this EPA by notice to Seller if:

(a) Seller's COD does not occur within 730 days following Target Seller's COD for any reason whatsoever (including Force Majeure), provided that Buyer may terminate this EPA under this provision only if Buyer delivers a termination notice prior to Seller's COD; or

(b) at any time after Buyer's COD, Seller fails to deliver at least an average of 25% of the aggregate Projected Monthly Energy as set out in Schedule "E" to Buyer over all hours in a period of 730 continuous days for any reason whatsoever (including Force Majeure, a Distribution/Transmission Constraint), but excluding a Non-Permitted Distribution/ Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(c) at any time after Buyer's COD, Buyer is unable to accept delivery of Energy at the POI for a period of 730 continuous days due to Force Majeure invoked by Buyer or a Distribution/ Transmission Constraint other than a Non-Permitted Distribution/ Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(d) Seller breaches Section 4.5; or

(e) Seller fails to complete any application, payment, filing, study, document or other step in the process for interconnecting the Seller's Plant to the Distribution System, Transmission System or New Interconnection Facilities, as applicable, in accordance with the requirements of, and within the time limits, including any cure periods, specified by Buyer, and such failure could reasonably be expected to have an adverse impact on Buyer or any third party; or

(f) any System Interconnection Study Report completed after the Effective Date contains information that is inconsistent with the description of the Seller's Plant in Schedule "B" and Seller has not received Buyer's consent under Section 3.3 for the change to Schedule "B"; or

(g) Seller is Bankrupt or Insolvent; or

(h) Seller, as a result of an act or omission of Seller, ceases to be exempt from regulation as a "public utility" as defined in the *Public Utilities Act* with respect to the Seller's Plant and the sale of Energy to Buyer under this EPA, and the loss of such exemption could reasonably be expected to have an adverse effect on the benefit to Buyer of this EPA; or

(i) an amount due and payable by Seller to Buyer under this EPA remains unpaid for 30 days after its due date and such default has not been cured within 30 days after Buyer has given notice of the default to Seller; or

(j) Seller is in material default of any of its covenants, representations and warranties or other obligations under this EPA (other than as set out above), unless within 30 days after the date of notice by Buyer to Seller of the default Seller has cured the default or, if the default cannot be cured within that 30 day period, Seller demonstrates to the reasonable satisfaction of Buyer that Seller is working diligently and expeditiously to cure the default and the default is cured within a further reasonable period of time. A "material default" includes any purported Assignment of this EPA without the consent of Buyer.

Any termination pursuant to this Section will be effective immediately upon delivery of the notice of termination to Seller.

9.2 Notice of Termination Event

Seller will notify Buyer promptly if Seller is Bankrupt or Insolvent or if there is a material risk that Seller will become Bankrupt or Insolvent or if Seller has defaulted under any agreement with a Facility Lender or if any Permit or land tenure agreement for the Seller's Plant is terminated or expires.

9.3 Termination by Seller

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Seller may have under this EPA or at law or in equity in respect of any of the following events, Seller may terminate this EPA by notice to Buyer if:

(a) after Buyer's COD, Buyer has not accepted delivery of Energy for a period of 730 continuous days due to an event described in Section 4.4 or any event of Force Majeure and Seller is not entitled to receive any payment pursuant to Section 4.8 in respect of that period; or

(b) the Seller's Plant has suffered major damage where the cost to repair the damage exceeds the net present value (using the Present Value Rate) of the expected revenues under the EPA for the remainder of the Term less the net present value (using the Present Value Rate) of the estimated operating and maintenance costs for the Seller's Plant for the remainder of the Term; or

(c) Seller has been unable to achieve Seller's COD for a period of 730 days after Target Seller's COD or has been unable to deliver Energy to the POI for a period of 730 continuous days after Seller's COD in either case solely as a result of Force Majeure invoked by Seller or a Distribution/Transmission Constraint other than a Non-Permitted Distribution/Transmission Constraint for which Seller is entitled to receive payment under Section 4.8; or

(d) Buyer is Bankrupt or Insolvent; or

(e) except where an amount has been disputed in the manner specified in Section 5.3(a)(ii), an amount due and payable by Buyer to Seller under this EPA remains unpaid for 30 days after its due date and such default has not been cured within 30 days after Seller has given notice of the default to Buyer; or

(f) Buyer is in material default of any of its covenants, representations and warranties or other obligations under this EPA (other than as set out above), unless within 30 days after the date of notice by Seller to Buyer of the default Buyer has cured the default or, if the default cannot be cured within that 30 day period, Buyer demonstrates to the reasonable satisfaction of Seller that Buyer is working diligently and expeditiously to cure the default and the default is cured within a further reasonable period of time.

Any termination pursuant to this Section will be effective immediately upon delivery of the notice of termination to Buyer.

9.4 Termination by Buyer for Convenience

In addition to any other right to terminate this EPA expressly set out in any other provision of this EPA and in addition to all other rights and remedies Buyer may have under this EPA or at law or in equity in respect of any of the following events, Buyer may terminate this EPA for convenience upon 90 days prior notice to Seller.

9.5 Effect of Termination

Upon expiry of the Term or earlier termination of this EPA in accordance with its terms:

(a) the Parties may pursue and enforce any rights and remedies permitted by law or equity in respect of any prior breach or breaches of this EPA and may enforce any liabilities and obligations that have accrued under this EPA prior to the expiry of the Term or the date of termination or that are stated to arise on termination of this EPA, subject to any express restrictions on remedies and limitations or exclusions of liability set out in this EPA;

(b) both Parties will remain bound by Section 3.5 with respect to the satisfaction of residual obligations for the period prior to termination or that are specified to arise on, or continue following, termination, and Sections 12.1 and 13.1 associated with Delivered Energy prior to termination of this EPA; and

(c) Seller will remain bound by Sections 7.1 and 7.2 for a period of 36 months following expiry or termination of this EPA;

and, in all such cases, both Parties will remain bound by any other provisions necessary for the interpretation and enforcement of the foregoing provisions.

9.6 Buyer Payment on Termination

If Seller terminates this EPA under any of Sections 9.3(d), 9.3(e) or 9.3(f) or Buyer terminates this EPA for convenience under Section 9.4, Buyer will pay to Seller an amount equal to the applicable Termination Payment due at the time of termination determined in accordance with Schedule "F".

9.7 Seller Payment on Termination

If Buyer terminates this EPA on or before 90 days after Seller's COD or Seller terminates this EPA on or before Buyer's COD under any of Sections 9.3(a), 9.3(b) or 9.3(c), Seller will, within 30 days after receipt of an invoice from Buyer, reimburse Buyer for:

(a) all System Upgrade Costs and New Interconnection Facilities Costs incurred by Buyer, or which Buyer has become contractually obligated to pay, prior to the termination of the EPA including System Upgrade Costs and New Interconnection Facilities Costs Seller would otherwise be responsible for under Section 3.5;

(b) any incremental liability for System Upgrade Costs and New Interconnection Facilities Costs which Buyer will incur as a result of the termination of this EPA; and

(c) any System Upgrade Costs and New Interconnection Facilities Costs which Seller is responsible for under any reimbursement agreement pursuant to Section 3.3.

9.8 Calculation and Payment

Buyer will pay any amount which it owes under Section 9.6 within 30 Business Days after the date of delivery of an invoice by Seller to Buyer. Any amounts owing by Seller to Buyer under this EPA will be netted against any amount owing by Buyer to Seller under Section 9.6.

9.9 Exclusive Remedies

Payment by Buyer of the amount determined under Section 9.6 is the exclusive remedy to which Seller is entitled, and Buyer's limit of liability, for termination of this EPA by Seller pursuant to any of Sections 9.3(d), 9.3(e) or 9.3(f). Subject to Section 9.4 and 9.7, termination of this EPA is the exclusive remedy to which Buyer or Seller, as the case may be, is entitled if Buyer or Seller elects to exercise its right to terminate this EPA under any of Section 9.1, 9.3(a), 9.3(b) or 9.3(c). For greater certainty, subject to Section 9.4 and 9.7, Seller will not be required to pay any termination payment on termination by Buyer of this EPA. Neither Party will have any right to terminate this EPA except as expressly set out herein.

ARTICLE 10
REPRESENTATIONS AND WARRANTIES

10.1 Seller's Representations

Seller represents and warrants to Buyer, and acknowledges that Buyer is relying on those representations and warranties in entering into this EPA, as follows:

(a) Seller is a corporation formed under the laws of the Yukon, is validly existing and is in good standing under the laws of the Yukon, is lawfully authorized to carry on business in the Yukon, and has full corporate power, capacity and authority to enter into and to perform its obligations under this EPA;

(b) this EPA constitutes a valid and binding obligation of Seller enforceable against Seller in accordance with its terms; and

(c) this EPA has been duly authorized, executed and delivered by Seller.

10.2 Buyer's Representations

Buyer represents and warrants to Seller, and acknowledges that Seller is relying on those representations and warranties in entering into this EPA, as follows:

(a) Buyer is a corporation formed under the laws of the Yukon, is validly existing and is in good standing under the laws of the Yukon, is lawfully authorized to carry on business in the Yukon, and has full corporate power, capacity and authority to enter into and to perform its obligations under this EPA;

(b) this EPA constitutes a valid and binding obligation of Buyer enforceable against Buyer in accordance with its terms; and

(c) this EPA has been duly authorized, executed and delivered by Buyer.

ARTICLE 11
LIABILITY LIMITATIONS

11.1 Limit of Liability

Buyer's liability for damages for any failure to take or pay for Delivered Energy under this EPA is limited to the amount payable by Buyer for that Delivered Energy under Article 5, amounts owing under Sections 4.8 and any interest thereon calculated under this EPA.

11.2 Consequential Damages

Neither Party will be liable to the other Party for any special, incidental, exemplary, punitive or consequential damages with respect to, arising out of, relating to or in any way connected with a Party's performance or non-performance under this EPA.

ARTICLE 12
DISPUTES

12.1 Dispute Resolution Procedure

Any dispute, controversy or claim arising out of or relating to this EPA ("**Dispute**") shall be exclusively and finally resolved in accordance with the dispute resolution procedure set forth in this Article 12 (the "**Dispute Resolution Procedure**").

12.2 Commencement of the Dispute Resolution Procedure

The Parties shall make reasonable efforts to first resolve any Dispute. If a Dispute cannot be resolved by the Parties, then either Party may initiate the Dispute Resolution Procedure by giving notice of the Dispute to the other Party (the "**Notice of Dispute**"). The Notice of Dispute shall contain a brief statement of the nature of the Dispute, set out the relief requested, and request that the Dispute Resolution Procedure be commenced.

12.3 Negotiations

Upon the submission of a Notice of Dispute pursuant to Section 12.2, each of the Parties shall refer the Dispute to a designated senior management executive with the authority to negotiate a settlement of the Dispute for that Party (the "**Senior Management Executives**"). The Senior Management Executives of the Parties shall attempt to resolve the Dispute within 30 days from the date on which the Notice of Dispute was issued, or such longer period as the Senior Management Executives may otherwise unanimously agree. If the Senior Management Executives unanimously agree upon a resolution of the Dispute, such resolution shall be memorialized in a written settlement agreement mutually acceptable to the Parties and shall be binding on the Parties.

12.4 Arbitration

If a Dispute is not resolved by Senior Management Executives within 30 days from receipt of a Notice of Dispute (or such longer period as the Senior Management Executives may otherwise agree in writing), the Dispute shall, at the request of either Party, be resolved by binding arbitration under the Rules of Arbitration of the International Chamber of Commerce (the "**ICC Rules**"), except to the extent of conflicts between the ICC Rules and the provisions of this EPA, in which

event the provisions of this EPA shall prevail. The following provisions shall apply to an arbitration commenced pursuant to this Section 12.4:

(a) the number of arbitrators shall be one;

(b) the place, or legal seat, of the arbitration shall be Whitehorse, Yukon;

(c) the language to be used in the arbitral proceedings shall be English;

(d) all awards issued by the arbitrator shall be final, non-appealable and binding on the Parties. Any award may be filed in any court of competent jurisdiction and may be enforced by a Party as a final judgment in such court. The Parties expressly waive, to the maximum extent permitted by law, any right of appeal of any award or reference of any matter to any court, other than as may be necessary to recognize or enforce an award;

(e) the arbitrator shall be guided by the International Bar Association's Rules on the Taking of Evidence in International Commercial Arbitration;

(f) the Parties shall request that the arbitrator render its final award within 12 months of the commencement of the arbitration, or as soon as possible thereafter, provided that no award shall be invalid if it is not rendered within the time period herein specified;

(g) any award for monetary damages shall be made and payable in Canadian Dollars and may include interest from the date of any breach or violation of this EPA until paid in full at the rate determined by the arbitrator;

(h) the Parties agree that any arbitration carried out hereunder shall be kept private and confidential, and that the existence of the proceedings and any element of it (including all awards, the identity of the Parties and all witnesses and experts, all materials created for the purposes of the arbitration, all testimony or other oral submissions, and all documents produced by a Party that were not already in the possession of the other Party) shall be kept confidential, except (i) with the consent of the Parties, (ii) to the extent disclosure may be lawfully required in bona fide judicial proceedings relating to the arbitration, (iii) where disclosure is lawfully required by a legal duty, and (iv) where such information is already in the public domain other than as a result of a breach of this clause. The Parties also agree not to use any information disclosed to them during the arbitration for any purpose other than in connection with the arbitration;

(i) where a Dispute relates to the EPA, the Parties shall agree to consolidate the matters in Dispute under such agreements in a single arbitration;

(j) the Parties agree that during the resolution of a Dispute pursuant to this Article 12, the Parties shall continue to perform their obligations under this EPA, provided that such performance shall be without prejudice to the rights and remedies of the Parties and shall not be read or construed as a waiver of a Party's right to claim for recovery of any loss, costs, expenses or damages suffered as a result of the continued performance of this EPA; and

(k) each Party will be responsible for its own costs under this Article 12, subject to the award of an arbitrator.

ARTICLE 13
CONFIDENTIALITY

13.1 Confidentiality

(a) **Additional Confidentiality Obligation** - During the Term and for two years thereafter:

(i) Buyer will treat as confidential, and will not disclose to any third Person, Seller Confidential Information, and

(ii) Seller will treat as confidential, and will not disclose to any third Person, Buyer Confidential Information.

(b) **Disclosure of Confidential Information** - Notwithstanding Section 13.1(a) above:

(i) Seller may also disclose Buyer Confidential Information and Buyer may disclose Seller Confidential information in the following circumstances:

(A) disclosures expressly authorized under this EPA or otherwise set out in this EPA;

(B) disclosures to enable a Party to fulfill its obligations under the EPA;

(C) disclosure in any arbitration or legal proceedings for the enforcement of the EPA;

(D) disclosure to the Party's directors, officers, employees, Facility Lenders, consultants and advisors, and purchasers of the Environmental Attributes, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality;

(E) subject to Section 13.1(b)(ii)(D), disclosure required to be made by a Party by an order of a court, a regulatory agency or a tribunal or under any law, regulatory requirements or any requirement of any stock exchange that is binding upon a Party, provided that (i) to the extent reasonably practicable, the Party intending to make such disclosure gives reasonable notice to the other Party before make the disclosure, and (ii) limits the disclosure to that required by the applicable order, Laws or regulatory or stock exchange requirement;

(F) disclosure to a third Person if such information was known by that third Person before disclosure by Buyer or Seller, as the case may be, provided the third Person did not know of the information as a result of a breach of the non-disclosure obligations in this EPA; or

(G) disclosure with the consent of Buyer, in the case of Buyer Confidential Information, or Seller, in the case of Seller Confidential Information.

(ii) Buyer may disclose Seller Confidential Information in the following circumstances:

(A) disclosure to Buyer's Affiliates or to a third Person, and their respective employees, consultants and advisors, for the purpose of reselling or marketing any Energy, including disclosure of Seller Confidential Information by such Affiliate or third Person to those who have purchased or may purchase the Energy;

(B) for purposes other than those described in Section 13.1(b)(i), to Buyer's Affiliates and to any directors, officers, employees, consultants and advisors of any Affiliates, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality;

(C) to any ministers, deputy ministers, servants or employees of the Yukon or the federal government, provided each of them is advised of the confidential nature of the information and agrees to respect such confidentiality; or

(D) disclosure in any regulatory proceeding, whether related to this EPA or not, to the extent that Buyer considers disclosure is necessary or desirable to support its position in such proceeding.

ARTICLE 14
FORCE MAJEURE

14.1 Force Majeure

(a) If there is a Force Majeure affecting a Party's ability to perform an obligation under this EPA, and that Party wishes to declare a Force Majeure, that Party will promptly notify the other Party of the Force Majeure. The notice of Force Majeure must identify the nature of the Force Majeure, the date the Force Majeure commenced, the expected duration of the Force Majeure, and the particular obligations affected by the Force Majeure. If (i) a notice of Force Majeure is provided in accordance with this Section, (ii) the event in question is in fact an event of Force Majeure as defined in this EPA, and (iii) the event of Force Majeure commenced on the commencement date in the notice of Force Majeure, then the Force Majeure will be deemed to have been invoked as of the commencement date stated in the notice.

(b) Neither Party will be in default of any obligation under this EPA if a Party is unable to perform that obligation due to an event or circumstance of Force Majeure, provided notice is delivered in accordance with this Section and the circumstances are, in fact, an event or circumstance of Force Majeure.

(c) Subject to any limitations expressly set out in this EPA, the time for performance of such obligation will be extended by the number of days that Party is unable to perform such obligation as a result of the event or circumstance of Force Majeure. The Party invoking Force Majeure will make commercially reasonable efforts to promptly remove the Force Majeure and will promptly respond to any inquiry from the other Party regarding the efforts

being undertaken to remove the Force Majeure and will give prompt notice of the end of the Force Majeure.

ARTICLE 15
GENERAL PROVISIONS

15.1 Independence

The Parties are independent contractors, and nothing in this EPA or its performance creates a partnership, joint venture or agency relationship between the Parties.

15.2 Enurement

This EPA enures to the benefit of the Parties, their successors and their permitted assigns.

15.3 Assignment

(a) Seller may not assign this EPA except with the prior consent of Buyer, which consent may not be unreasonably withheld, conditioned or delayed provided such Assignment is to a Facility Lender. Any Assignment (other than an Assignment to a Facility Lender) is subject to the assignee entering into and becoming bound by this EPA, assuming all the obligations and liabilities of Seller under this EPA arising both before and after the Assignment, and providing the representations and warranties set out in Section 10.1 effective as at the time of Assignment, and Seller not being in default under this EPA. Unless agreed to in writing by Buyer, Seller shall remain jointly and severally liable with the assignee for all obligations of Seller under this EPA.

(b) Any request by Seller for Buyer's consent under Section 15.3(a) must be delivered to Buyer not less than 30 days before the date of the proposed Assignment. A request under this Section must be accompanied by such information as reasonably required by Buyer to assess the request for consent including the name, address and ownership structure of the assignee, details of any consultation with First Nations that may be impacted by the Seller's Plant or the Assignment with respect to the proposed Assignment, list of the directors and officers of the assignee and information concerning the assignee's operations, experience and financial status.

(c) If Seller seeks consent to Assign this EPA to a Facility Lender, Buyer may require, as a condition of its consent to the Assignment, that Seller and the Facility Lender enter into a Lender Consent Agreement with Buyer containing customary provisions. If required by a Facility Lender, Buyer will enter into a Lender Consent Agreement with the Facility Lender and Seller containing customary provisions. Seller will reimburse Buyer for all costs reasonably incurred by Buyer in connection with any request by Seller for Buyer's consent pursuant to Section 15.3(a).

15.4 Entire Agreement

This EPA contains the entire agreement between the Parties with respect to the purchase and sale of Energy and supersedes all previous communications, understandings and agreements between the Parties with respect to the subject matter hereof. There are no representations, warranties, terms, conditions, undertakings or collateral agreements express, implied or statutory between the Parties other than as expressly set out in this EPA.

15.5 Amendment

This EPA may not be amended except by an agreement in writing signed by both Parties.

15.6 No Waiver

Other than in respect of the specific matter or circumstance for which a waiver is given, and except as otherwise specified in this EPA, no failure by a Party to enforce, or require a strict observance and performance of, any of the terms of this EPA will constitute a waiver of those terms or affect or impair those terms or the right of a Party at any time to enforce those terms or to take advantage of any remedy that Party may have in respect of any other matter or circumstance.

15.7 Notices

Any notice, consent, waiver, declaration, request for approval or other request, statement or bill that either Party may be required or may desire to give to the other Party under this EPA must be in writing addressed to the other Party at the address for that Party stated in Schedule "A" and:

(a) notices under Section 14.1, Article 8 and Article 9 must be delivered by hand or by a courier service during normal business hours on a Business Day and a notice so delivered will be deemed to have been delivered on that Business Day;

(b) all notices other than notices described in Section 15.7(a) may be delivered by email during normal business hours on a Business Day and a notice so delivered will be deemed to have been delivered on that Business Day; and

(c) either Party may change its address for notices under Section 3 of Schedule "A" to this EPA by notice to the other Party.

15.8 Interconnection Notices

Nothing in the System Interconnection Guidelines and no exercise of any right thereunder, restricts or otherwise affects any right, obligation or liability of either Party under this EPA, except to the extent set out expressly herein, and no notice, consent, approval or other communication or decision under or in relation to the System Interconnection Guidelines will constitute or be relied upon as a notice, consent, approval or communication or decision under this EPA.

15.9 Commodity Contract/Forward Contract

The Parties agree and intend that this EPA constitutes an "eligible financial contract" under the *Bankruptcy and Insolvency Act* (Canada) and *Companies' Creditors Arrangement Act* (Canada).

15.10 Further Assurances

Each Party will, upon the reasonable request of the other Party, do, sign or cause to be done or signed all further acts, deeds, things, documents and assurances required for the performance of this EPA including, in the case of Seller, completing any registration process required in respect of Environmental Attributes as requested by Buyer.

15.11 Severability

Any provision of this EPA which is illegal or unenforceable will be ineffective to the extent of the illegality or unenforceability without invalidating the remaining provisions of this EPA.

15.12 Counterparts

This EPA may be executed in counterparts, each of which is deemed to be an original document and all of which are deemed one and the same document.

SCHEDULE "A"

DEFINITIONS AND INTERPRETATION

1. DEFINITIONS

References in a Schedule to a section or Section mean a section or Section of this EPA, and not a Schedule, unless otherwise stated. The following words and expressions wherever used in this EPA have the following meaning:

1.1 "**Affiliate**" means, with respect to any Party or any third Person, any Person directly or indirectly Controlled by, Controlling, or under common Control with, such Party or the third Person.

1.2 "**Annual Operating Plan**" means a 12-month operating plan for the Seller's Plant that includes for term of each operating plan, (a) a schedule of the expected total deliveries of Energy at the POI in each month and (b) a schedule of any Planned Outages of the Seller's Plant expected by Seller. The Annual Operating Plan will be consistent with Good Industry Practice and shall be substantially in the form attached hereto as Schedule "C", subject to such modifications thereto as may be reasonably required by Buyer.

1.3 "**Application**" means the application and all supporting documents and information with respect to the Seller's Plant filed by Seller with Buyer in the Standing Offer Program.

1.4 "**Assign**" or "**Assignment**" means to assign or dispose of this EPA or any direct or indirect interest in this EPA, in whole or in part, for all or part of the Term and, without limiting the foregoing, each of the following is deemed to be an Assignment of this EPA by Seller:

(a) any sale or other disposition of all or a substantial part of Seller's ownership interest in the Seller's Plant, or of all or any interest of Seller in this EPA or revenue derived from this EPA;

(b) any mortgage, pledge, charge or grant of a security interest in all or any part of the Seller's Plant or Seller's ownership interest therein; and

(c) any change of Control, merger, amalgamation or reorganization of Seller.

1.5 "**Audit Parties**" means the applicable Party conducting an audit under this EPA and its Affiliates, representatives, consultants, advisors and any other third Person retained in respect of the applicable audit.

1.6 "**Bankrupt or Insolvent**" means, with respect to a Person:

(a) the Person has started proceedings to be adjudicated a voluntary bankrupt or consented to the filing of a bankruptcy proceeding against it;

(b) the Person has filed a petition or similar proceeding seeking reorganization, arrangement or similar relief under any bankruptcy or insolvency law;

(c) a receiver, liquidator, trustee or assignee in bankruptcy has been appointed for the Person or the Person has consented to the appointment of a receiver, liquidator, trustee or assignee in bankruptcy;

(d) the Person has voluntarily suspended the transaction of its usual business; or

(e) a court of competent jurisdiction has issued an order declaring the Person bankrupt or insolvent.

1.7 "**Business Day**" means any calendar day which is not a Saturday, Sunday or Yukon statutory holiday.

1.8 "**Buyer**" means Yukon Energy Corporation and its successors and permitted assigns.

1.9 "**Buyer Confidential Information**" means technical or commercial information disclosed by Buyer to Seller that Buyer directs, and clearly marks, as confidential, including the System Interconnection Guidelines and this EPA but excluding information that (i) is or becomes in the public domain, other than as a result of a breach of this EPA by Seller, or (ii) is known to Seller before disclosure to it by Buyer, or becomes known to Seller, thereafter by way of disclosure to Seller by any other Person who is not under an obligation of confidentiality with respect thereto.

1.10 "**Buyer's COD**" shall occur when the System Upgrades have been completed and Buyer provides a notice of completion of the same to Seller.

1.11 "**Change in Law**" means (a) the enactment, adoption, promulgation, modification or repeal of any applicable Laws or any change in the interpretation or administration of any applicable Laws resulting from a decision of a Governmental Authority which occurs after the Effective Date; but in each case excluding a Change in Law relating to income tax, or (b) the requirement for a new Permit (including due to a change in the circumstances in which a Permit is required), a change in the terms of any Permit after the date such Permit is granted, or any change in the interpretation or administration of any Permits resulting from a decision of a Governmental Authority.

1.12 "**Condition Date**" means the date specified as such in Schedule "B".

1.13 "**Conditions Precedent**" means those conditions precedent set out in Schedule "B".

1.14 "**Control**" of any Person means:

(a) with respect to any corporation or other Person having voting shares or the equivalent, the ownership or power to vote, directly or indirectly, shares, or the equivalent, representing 50% or more of the power to vote in the election of directors, managers or Persons performing similar functions;

(b) ownership of 50% or more of the equity or beneficial interest in that Person; or

(c) the ability to direct the business and affairs of any Person by acting as a general partner, manager or otherwise.

1.15 "**CPI**" means the "Canada All Items (Not Seasonally Adjusted)" Consumer Price Index as published by Statistics Canada or any successor agency thereto.

1.16 "**Delivered Energy**" means in each month after Buyer's COD the amount of Energy delivered by Seller at the POI in that month as recorded by Buyer's Meter less the applicable Line Losses.

1.17 "**Development Progress Report**" means a report describing the progress of the financing, design, engineering, construction, Interconnection, and commissioning of the Seller's Plant, that is in form and content acceptable to Buyer, acting reasonably.

1.18 "**Discretion**" (whether or not capitalized) means sole, absolute and unfettered discretion unless this EPA expressly states otherwise.

1.19 "**Dispatch/Turn-Down**" means for Seller to turn down or shut off the Seller's Plant.

1.20 "**Dispatch/Turn-Down Deemed Energy**" has the meaning given to such term in Section 4.9(b)(i).

1.21 "**Distribution System**" means the distribution, protection, control and communication facilities in the Yukon that are or may be used in connection with, or that otherwise relate to, the transmission of electrical energy at 35 kilovolts or less, and includes all additions and modifications thereto and repairs or replacements thereof.

1.22 "**Distribution/Transmission Constraint**" means any disconnection of the Seller's Plant from the Distribution System or Transmission System, or any outage, suspension, constraint or curtailment in the operation of the Distribution System or Transmission System preventing or limiting deliveries of Energy at the POI or within the Distribution System or Transmission System or any direction from Buyer to reduce generation of the Seller's Plant as a result of any outage, suspension, constraint or curtailment in the operation of the Distribution System or Transmission System.

1.23 "**Effective Date**" shall mean the date on which all Conditions Precedent have been satisfied or waived in accordance with Section 2.1.

1.24 "**Electrical Grid**" means the electrical grid into which the Seller's Plant will be interconnected, as identified in Schedule "B"**.**

1.25 "**Eligible Clean Energy**" means wind, hydro, geothermal, biomass and solar energy sources permitted under the IPP Policy for the SOP generated by a Project located in Yukon which is directly connected into the YIS or the WLG through the New Interconnection Facilities.

1.26 "**Energy**" means all electrical energy expressed in kWh generated by the Seller's Plant, excluding electrical energy generated by the Seller's Plant which is required to service the Seller's Plant Load.

1.27 "**Energy Price**" has the meaning given to such term in Schedule "B".

1.28 "**Environmental Attributes**" means the following as attributable to Energy delivered to Buyer under this EPA:

(a) all attributes directly associated with, or that may be derived from, the Energy delivered to Buyer under this EPA having decreased environmental impacts relative to certain other generation facilities or technologies including any existing or future credit, allowance, "green" tag, ticket, certificate or other "green" marketing attribute or proprietary or contractual right, whether or not tradeable;

(b) any credit, reduction right, offset, allowance, allocated pollution right, certificate or other unit of any kind whatsoever, whether or not tradeable and any other proprietary or contractual right, whether or not tradeable, resulting from, or otherwise related to the actual or assumed reduction, displacement or offset of emissions at any location other than the

Seller's Plant as a result of the generation, purchase or sale of the Energy delivered to Buyer under this EPA;

(c) any credit, reduction right, off-set, allowance, allocated pollution right, certificate or other unit of any kind whatsoever whether or not tradeable resulting from or otherwise related to the reduction, removal, or sequestration of emissions at or from the Seller's Plant; and

(d) all revenues, entitlements, benefits and other proceeds arising from or related to the foregoing, but for certainty not including:

i. benefits or proceeds from environmental incentive programs offered by Governmental Authorities that do not require a transfer of the attributes in (a) to (c) above; and

ii. benefits or proceeds from social programs, including programs relating to northern or rural development, employment or skills training, or First Nations, that do not require a transfer of the attributes in Sections (a) to (c) above.

1.29 "**Environmental Certification**" means any certification Buyer requires Seller to obtain under Section 6.1.

1.30 "**Facility Lender**" means any lender(s) providing any debt financing or debt hedging facilities for the design, engineering, construction and/or operation of the Seller's Plant and any successors or assigns thereto and any Person taking any mortgage, pledge, charge or grant of a security interest in all or any part of the Seller's Plant.

1.31 "**Final Amount**" means an amount owing by either Party to the other Party under this EPA, including as a result of a breach of this EPA, where such amount is: (a) undisputed by the Party owing such amount; or (b) has been finally determined by an arbitration award under Section 12.1 of this EPA or by a court order and all rights of appeal in respect of such award or order have been exhausted or have expired.

1.32 "**First Nation Claim**" means a legal claim or proceeding or written threat to commence a legal claim or proceeding from or on behalf of First Nations where such claim or threat alleges a breach or potential breach of, or an impact to: any First Nations' Treaty rights, rights under a Settlement Agreement (as that term is defined in the Yukon Umbrella Final Agreement), or rights under section 35 of the *Constitution Act*, 1982, by (a) this EPA, (b) the Seller's Plant, (c) the Interconnection or any works related to the Interconnection, or (d) any authorization granted by the Yukon or federal government relating to the Seller's Plant and its operations.

1.33 "**First Nations**" means any one of the 14 First Nations in the Yukon.

1.34 "**Force Majeure**" means any event or circumstance not within the control of the Party, or any of its Affiliates, claiming Force Majeure, but does not include:

(a) any economic hardship or lack of money, credit or markets;

(b) an event or circumstance that is the result of a breach by the Party seeking to invoke Force Majeure of a Permit or of any applicable Laws;

(c) a mechanical breakdown or control system hardware or software failure, unless the Party seeking to invoke Force Majeure can demonstrate by clear and convincing evidence that the breakdown or failure was caused by a latent defect in the design or manufacture of the equipment, hardware or software, which could not reasonably have been identified by normal inspection or testing of the equipment, hardware or software;

(d) an event or circumstance caused by a breach of, or default under, this EPA or a willful or negligent act or omission by the Party seeking to invoke Force Majeure;

(e) any Distribution/Transmission Constraint unless such event is caused by an event or circumstance not within the control of Buyer; or

(f) any acts or omissions of: (i) any Affiliate, employee, director, officer, agent or other representative of the Party invoking Force Majeure; (ii) any vendor, supplier, contractor, subcontractor, consultant or customer of or to the Party invoking Force Majeure; or (iii) any other Person for whom the Party invoking Force Majeure is responsible at law, unless the act or omission is caused by an event or circumstance that would constitute Force Majeure if the Person described above was a party to this EPA in place of a Party invoking Force Majeure.

1.35 "**Forced Outage**" means the immediate removal of one or more generating units of the Seller's Plant or transmission or distribution infrastructure of the Seller's Plant from service in response to equipment alarms or any damage identified during a Planned Outage or Maintenance Outage requiring extension of those Planned Outage or Maintenance Outage.

1.36 "**General Rate Application**" means any application, review, process, or procedure in which the YUB sets and approves rates to be charged by Buyer for the supply of the service for which it is franchised in accordance with the *Public Utilities Act*.

1.37 "**Good Industry Practice**" means:

(a) in respect of Buyer, any of the practices, methods and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition; provided such practices, methods and acts are not intended to be limited to the optimum practice, method or act to the exclusion of all others, but rather to be acceptable practices, methods or acts generally accepted in the Yukon; and provided that Buyer shall be in compliance with Good Industry Practice in respect of any equipment comprising the Distribution System or Transmission System, if it operates such equipment in accordance with all applicable original equipment manufacturer guidelines and requirements provided to Buyer by supplier of such equipment; and

(b) in respect of Seller, any of the practices, methods and acts engaged in or approved by a significant portion of the electric generation industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition; provided such practices, methods and acts are not intended to be limited to the optimum practice, method or act to the exclusion of all others,

but rather to be acceptable practices, methods or acts generally accepted in Western Canada.

1.38 "**Governmental Authority**" means any federal, provincial, local or foreign government or any of their boards or agencies, or any regulatory authority other than Buyer and Seller and entities controlled by Buyer or Seller.

1.39 "**GST**" means the goods and services tax imposed under the *Excise Tax Act* (Canada) as that Act may be amended or replaced from time to time.

1.40 "**Interconnection"** means the POI.

1.41 "**IPP Policy**" has the meaning given to such term in the recitals to this EPA.

1.42 "**Joint Operating Procedure**" means the joint operating procedure attached as Schedule "H" as may be modified by Buyer from time to time.

1.43 "**KW**" means kilowatt.

1.44 "**kWh**" means kilowatt-hour.

1.45 "**Laws**" means any and all statutes, laws (including common law), ordinances, rules, regulations, codes, orders, bylaws, policies, directions, standards, guidelines, protocols and other lawful requirements of any Governmental Authority in effect from time to time.

1.46 "**Lender Consent Agreement**" means a lender consent agreement in the form and substance acceptable to Buyer, acting reasonably.

1.47 "**Line Losses**" means losses of electricity associated with the transmission and transformation of Energy and other electricity, if applicable, from the Seller's Plant to the POI that are recorded by the Meter or reasonably estimated by Buyer.

1.48 "**Line Loss Methodology**" means the Line Loss Methodology set forth in the System Interconnection Study Report for the purposes of this Project.

1.49 "**Maintenance Outage**" means any outage of Buyer's Distribution System or Transmission System or the Seller's Plant that is not a Planned Outage or a Forced Outage that typically has a flexible start and end time and of shorter duration than a Planned Outage.

1.50 "**Meter**" means a meter owned by Buyer that is: (a) capable of accurately measuring the quantity of Energy generated by the Seller's Plant and delivered to the POI independent of all other generation equipment or facilities, (b) capable of being remotely interrogated; and (b) calibrated to measure on an hourly basis the quantity of Energy delivered by Seller to the POI.

1.51 "**Monthly Energy Shortfall Payment**" has the meaning given to such term in Schedule "E".

1.52 "**New Interconnection Facilities**" means those additions, modifications and upgrades required to interconnect the Project to the Electrical Grid which are identified in the System Interconnection Study Report (and as further refined in subsequent interconnection studies, if required by Buyer) and approved by Buyer, but excluding any System Upgrades.

1.53 "**New Interconnection Facilities Costs**" means all costs incurred by Buyer for the design, engineering, procurement, construction, installation and commissioning of the New Interconnection Facilities, including applicable studies required by Buyer, an estimate of which is set out in the System Interconnection Study Report.

1.54 "**Non-Permitted Distribution/Transmission Constraint**" has the meaning given to such term in Section 4.8(a).

1.55 "**Outage**" means a Forced Outage, Maintenance Outage, or Planned Outage of Buyer's Distribution System or Transmission System or Seller's Plant.

1.56 "**Outage Notice**" means a notification of any Outage or revised notification of any Outage required to be delivered by Seller to Buyer or Buyer to Seller under this EPA that describes the timing, frequency, nature and duration of the Outage and that is in a format that may be prescribed by Buyer from time to time.

1.57 "**Party**" means Buyer or Seller, and "**Parties**" means both Buyer and Seller.

1.58 "**Permits**" means permits, certificates, licences, approvals and other authorizations issued by any Governmental Authorities as may be required for the design, construction, ownership, operation, maintenance and decommissioning of (i) the Seller's Plant and the delivery of Energy to the POI, and (ii) the System Upgrades and the New Interconnection Facilities.

1.59 "**Person**" means an individual, body corporate, firm, partnership, joint venture, trust, legal representative or other legal entity.

1.60 "**Planned Outage**" means an outage that is scheduled well in advance for purposes of inspections, maintenance, or repair of Buyer's Distribution System or Transmission System or Seller's Plant, that typically has a predetermined duration and scope of work, occurs only once or twice per year, and may last for several days.

1.61 "**POI**" or "**Point of Interconnection**" means the point at which the Seller's Plant interconnects with the Distribution System or Transmission System, as identified on the Single Line Diagram.

1.62 "**Potential Impacts**" means any adverse or potentially adverse impact on the established or potential aboriginal rights (including title) of First Nations as a result of:

(a) this EPA;

(b) the Project;

(c) the interconnection of the Seller's Plant to the Distribution System or Transmission System; or

(d) any activities directly related to the Seller's Plant that enable Seller to comply with its obligations under this EPA that are carried out by Seller, any Affiliate, consultant or contractor of Seller, or any other Person for whom Seller is responsible at law.

1.63 "**PPT**" means Pacific Prevailing Time, which means Pacific Daylight Time or Pacific Standard Time as applicable.

1.64 "**Present Value Rate**" means the annual yield on a Government of Canada bond having a term and maturity date that most closely matches the remaining Term (as at the date of the applicable calculation) and expiry date of this EPA, plus 3%.

1.65 "**Prime Rate**" means the floating prime interest rate announced from time to time by the main branch of Bank of Montreal in Whitehorse, Yukon, or any successor thereto, expressed as an annual rate, as the reference rate it will use to determine rates of interest payable on Canadian dollar commercial loans made in Canada.

1.66 "**Project**" means the financing, design, engineering, procurement, construction, commissioning, operation and maintenance of the Seller's Plant.

1.67 "**Project Cluster**" means two or more existing or proposed Projects under the SOP Rules that Buyer determines in its Discretion are so closely related to each other that they should be considered a project cluster for the purposes of the Standing Offer Program.

1.68 "**Project Energy Volume**" (in kWh) means the maximum annual Energy which Buyer may sell to Seller from the Project in any calendar year as set out in Schedule "B"; provided that where the Term does not commence on January 1, such amount shall be prorated for the first and last contract year which do not reflect a full calendar year.

1.69 "**Project Standards**" means:

(a) all applicable Laws;

(b) the terms and conditions of all Permits, including land tenure agreements, issued in connection with the Seller's Plant;

(c) Good Industry Practice;

(d) the description of the Seller's Plant in Schedule "B";

(e) the requirement that Energy must qualify as Eligible Clean Energy; and

(f) the terms and conditions of this EPA (including the System Interconnection Guidelines).

1.70 "**Public Utilities Act**" means the *Public Utilities Act* (Yukon) and any successor or replacement legislation.

1.71 "**Records**" means all records and logs required to properly administer this EPA, including:

(a) Energy generation records and operating logs;

(b) Meter readings;

(c) maintenance reports;

(d) invoice support records;

(e) documents concerning compliance with Project Standards, but excluding any such documents that are protected by solicitor-client privilege;

(f) records related to System Upgrade Costs and New Interconnection Facilities Costs;

(g) all information reasonably required to establish the amount of Energy Seller could have sold during a Distribution/Transmission Constraint including logs of all Outages of the Seller's Plant and other reductions in Energy output (specifying the date, time, duration and reasons for each such outage and each reduction in Energy output); and

(h) information relating to the Environmental Certification, information relating to the existence, nature and quality of Environmental Attributes, information required for the purposes of any Environmental Attributes or energy certification or tracking system, and any other information Buyer requires to enable it or any of its Affiliates to obtain and realize the benefit of the Environmental Attributes,

all consistent with Good Industry Practice.

1.72 "**Regulatory Agency Authorizations**" means the issuance of those Permits which are specified as required for the Project in the YESAB assessment report recommendation to proceed issued in respect of the Project.

1.73 "**Seller**" means the Party so identified on page one of this EPA, and its successors and permitted assigns.

1.74 "**Seller Confidential Information**" means any of Seller's confidential technical or financial information provided by Seller to Buyer in confidence with express written notice to Buyer of the confidential nature of the information, but excluding:

(a) this EPA; and

(b) information that (i) is or becomes in the public domain, other than as a result of a breach of this EPA by Buyer, or (ii) is known to Buyer before disclosure to it by Seller, or becomes known to Buyer thereafter by way of disclosure to Buyer by any other Person who is not under an obligation of confidentiality with respect thereto.

1.75 "**Seller's COD**" means the commercial operation date of Seller's Plant which is the date on which all of the following conditions have been satisfied in respect of the Seller's Plant:

(a) Seller has obtained all Permits required for the construction, commissioning, and operation of the Seller's Plant and all such Permits are in full force and effect;

(b) the Seller's Plant has been fully constructed in accordance with the Project Standards;

(c) Seller is not: (A) Bankrupt or Insolvent; (B) in default of any payment obligation or requirement to post security under this EPA; (C) in material default of any of its other covenants, representations, warranties or obligations under this EPA; or (D) in material default under any Permit or Law applicable to the construction, commissioning or operation of the Seller's Plant or under any land tenure agreement for the site on which the Seller's Plant is located;

(d) a Meter has been installed at the POI in accordance with Section 3.6 of this EPA;

(e) Seller has delivered to Buyer a written notice together with certificate of Seller's professional registered engineer confirming that Seller's COD has been achieved; and

(f) Buyer has delivered a Commission Notice to Operate, or such other document(s) of similar effect as may be substituted therefor, which evidences no material deficiencies, in respect of the Seller's Plant Capacity and Seller's Plant operations;

and for purposes of this EPA, Seller's COD will be deemed to have occurred at 24:00 PPT on the later of the dates set out above.

1.76 "**Seller's Plant**" means Seller's plant described in Schedule "B" and all assets required to interconnect that plant to the Distribution System or Transmission System; all rights, property, facilities, assets, equipment, materials, Permits and contracts required to design, engineer, procure, construct, commission, operate and maintain the plant described in Schedule "B" and to interconnect that plant to the Distribution System or Transmission System, whether real or personal and whether tangible or intangible including all land tenure and all books, Records and accounts with respect to the Seller's Plant described in Schedule "B"; and shall include replacement parts or equipment which are of the same or similar nature as the parts or equipment being replaced and which do not materially increase the amount of Energy available from Seller's Plant.

1.77 "**Seller's Plant Capacity**" means the electrical generating capacity of the Seller's Plant set out in Schedule "B".

1.78 "**Seller's Plant Load**" means any electrical energy consumed by Seller's Plant.

1.79 "**Single Line Diagram**" means the simplified electrical representations of the Seller's Plant, the Interconnection, the Distribution System and Transmission System attached hereto in Schedule "B".

1.80 "**SOP OIC**" means that Order in Council issued by the Government of Yukon on January 24, 2019 regarding, among other things, the Standing Offer Program.

1.81 "**SOP Rules**" means the Standing Offer Program Rules developed by the Government of Yukon which governed this EPA as at the date of this EPA.

1.82 "**Standing Offer Program**" or "**SOP**" means the Standing Offer Program as described in the IPP Policy.

1.83 "**System Interconnection Guidelines**" means those system interconnection guidelines in the form attached as Schedule "G" hereto, as amended or replaced by Buyer from time to time.

1.84 "**System Interconnection Study Report**" means the detailed interconnection study issued to Seller by Buyer which, among other things, (i) evaluates the impact of the Project on the reliability of Buyer's system, (ii) provides a planning-level estimate of the required System Upgrades and New Interconnection Facilities and associated costs, and (iii) establishes the Line Loss Methodology for this Project, a copy of which is attached as Schedule "D".

1.85 "**System Upgrades**" means additions, modifications and upgrades to the Distribution System, Transmission System or any portion of Buyer's generation system that are determined by Buyer to be required in order to facilitate the interconnection and to allow such Distribution System, Transmission System or any portion of Buyer's generation system to support the integration of the

Energy produced by the Seller's Plant in accordance with this EPA and the System Interconnection Guidelines, which are identified in the System Interconnection Study Report (and as further refined in subsequent interconnection studies, if required by Buyer) and approved by Buyer, but excluding any New Interconnection Facilities.

1.86 "**System Upgrade Costs**" means all costs incurred by Buyer for the design, engineering, procurement, construction, installation and commissioning of the System Upgrades, including applicable studies required by Buyer, an estimate of which is set out in the System Interconnection Study Report.

1.87 "**Target Buyer's COD**" means the target date for achieving Buyer's COD, being the date specified for such term in Schedule "B", as may be extended pursuant to Section 3.9, if applicable.

1.88 "**Target Seller's COD**" means the target date for achieving Seller's COD, being the date specified for such term in Schedule "B", as may be extended pursuant to Section 3.9, if applicable.

1.89 "**Term**" has the meaning given to such term in Section 2.1.

1.90 "**Termination Payment**" has the meaning given to such term in Schedule "F".

1.91 "**Transmission System**" means the transmission, substation, protection, control and communication facilities owned and operated by Buyer, and includes all additions and modifications to those facilities and repairs or replacements of those facilities.

1.92 "**Upgrade Costs Advance**" has the meaning given to such term in Section 3.5(a).

1.93 "**Upgrade Costs Security**" has the meaning given to such term in Section 3.5(a).

1.94 "**Utilities**" means both Yukon Energy Corporation or Yukon Electrical Company, doing business as ATCO Electric Yukon, as applicable.

1.95 "**YESAA**" means the *Yukon Environmental and Socio-economic Assessment Act,* SC 2003, c 7.

1.96 "**YESAB**" means the Yukon Environmental and Socio-economic Assessment Board.

1.97 "**YUB**" means the Yukon Utilities Board and any successor thereto appointed from time to time under the *Public Utilities Act*.

2. INTERPRETATION

2.1 **Headings** - The division of this EPA into Articles, sections, Sections, paragraphs and Schedules and the insertion of headings are for convenience of reference only and do not affect the interpretation of this EPA.

2.2 **Plurality and Gender** - Words in the singular include the plural and vice versa. Words importing gender include the masculine, feminine and neuter genders.

2.3 **Governing Law** - This EPA is made under, and will be interpreted in accordance with, the Laws of the Yukon. Subject to Section 12.1, any suit, action or proceeding (a "**Proceeding**") arising out of or relating to this EPA may be brought in the courts of the Yukon at Whitehorse, and those courts

have non-exclusive jurisdiction in respect of any Proceeding and the Parties hereby irrevocably attorn to the jurisdiction of such courts in respect of any Proceeding.

2.4 **Industry Terms** - Technical or industry specific phrases or words not otherwise defined in this EPA have the well-known meaning given to those terms as of the date of this EPA in the industry or trade in which they are applied or used.

2.5 **Statutory References** - Reference to a statute means, unless otherwise stated, the statute and regulations, if any, under that statute, in force from time to time, and any statute or regulation passed and in force which has the effect of supplementing or superseding that statute or those regulations.

2.6 **Currency** - References to dollars or $ means Canadian dollars, unless otherwise stated.

2.7 **Reference Indices** - If any index, tariff or price quotation referred to in this EPA ceases to be published, or if the basis therefor is changed materially, there will be substituted an available replacement index, tariff or price quotation that most nearly, of those then publicly available, approximates the intent and purpose of the index, tariff or quotation that has so ceased or changed. This EPA will be amended as necessary to accommodate such replacement index, tariff or price quotation, all as determined by written agreement between the Parties, or failing agreement, by arbitration under Section 12.1 of this EPA.

2.8 **Conversions** - If a value used in a calculation in this EPA must be converted to another unit of measurement for purposes of consistency or to achieve a meaningful answer, the value will be converted to that different unit for purposes of the calculation.

2.9 **Additional Interpretive Rules** - For the purposes of this EPA, except as otherwise expressly stated:

(a) "this EPA" means this EPA as it may from time to time be supplemented or amended and in effect, and includes the Schedules attached to this EPA;

(b) the words "herein", "hereof" and "hereunder" and other words of similar import refer to this EPA as a whole and not to any particular section, Section or other subdivision;

(c) the word "including" or "includes" is not limiting whether or not non-limiting language (such as "without limitation" or "but not limited to" or words of similar import) is used with reference thereto;

(d) the words "year" and "month" refer to a calendar year and a calendar month;

(e) any consent, approval or waiver contemplated by this EPA must be in writing and signed by the Party against whom its enforcement is sought, and may be given, withheld or conditioned in the unfettered discretion of the Party of whom it is requested, unless otherwise expressly stated;

(f) all rights and remedies of either Party under this EPA are cumulative and not exclusive of any other remedies to which either Party may be lawfully entitled, and either Party may pursue any and all of its remedies concurrently, consecutively and alternatively; and

(g) any notice required to be given, or other thing required to be done, under this EPA on or before a day that is not a Business Day, will be deemed to be given or done when required hereunder if given or done on or before the next following Business Day.

3. ADDRESSES FOR NOTICES

3.1 **Notices to Buyer** - Except as noted below, all notices addressed to Buyer will be delivered to the following address:

To: Yukon Energy Corporation
#2 Miles Canyon Road
Box 5920
Whitehorse, YT Y1A 6S7
Attention: IPP Manager
Email: ipp@yec.yk.ca

3.2 **Notices to Seller** - All notices addressed to Seller will be delivered to the following address:

To: 536774 Yukon Inc.
110 Titanium Way, Whitehorse, YT, Y1A 0E8
Attention: Attention: Ben Power
Email: bpower@solvest.ca

SCHEDULE "B"

PROJECT DESCRIPTION

CONTRACT PARTICULARS:

1. **Condition Date:**

   Not Applicable.

2. **Conditions Precedent:**

   None.

3. **Term:**

   The "**Term**" of this EPA commences on the Effective Date and continues for a period of 25 years following Buyer's COD.

4. **Energy Price and Seasonal Adjustment:**

   (a) In each billing period, Seller shall pay to Buyer, for each kWh of Delivered Energy the "**Energy Price**" calculated as follows:

   $$\text{Energy Price}_n = (.5 * \$0.158/\text{ kWh} * \text{CPI}_{\text{January 1, n}} / \text{CPI}_{\text{January 1, 2020}}) + (.5 * \$__/\text{kWh})$$

   Where:

   n = the year for which the relevant calculation is being conducted; and

   $\text{CPI}_{\text{January 1, n}}$ = the CPI for December in the year immediately prior to the year for which the relevant calculation is being conducted.

   (b) For each hour, the Energy Price determined above for Delivered Energy during that hour will be adjusted to an amount (expressed in $/kWh) equal to the percentage of that Energy Price applicable for that hour as set out in the table in Schedule "I".

SELLER'S PLANT

1. **Location of Control Building:** 60.946N -135.160W, being Lot 1297-02 on the North Klondike Highway.

2. **Eligible Clean Energy Type:** Solar Photovoltaic

3. **Seller's Plant Capacity:** 1MW AC

4. **Project Energy Volume:** 1,840,200 kWh per year

5. **Seller's Plant Description:**

   Please refer to Seller's single line diagram in Exhibit B-1. *1.72 MW DC -1 MW AC Ground Mount solar farm located on the north Klondike highway consisting of 4000 x 430W bi-facial solar*

modules mounted on fixed 35-degree angle racking. Strings of 25 modules will connect to Huawei 50 kW inverters with an AC output voltage of 600V for combined capacity of 1 MW AC at Power Factor 1.0. The inverters will terminate at 1200A CDP + metering cabinet connecting to the low voltage side of the ATCO transformer.

Total AC Power:	1000 kW
Primary AC line voltage:	600V AC
Total AC line current:	962A
Total DC power:	1560 kW
Open-circuit DC voltage:	1500A
Operating DC voltage:	1100V
Total DC operating current:	1563A

6. **Target Seller's COD:** November 1st, 2020

7. **Electrical Grid:** Yukon Integrated System (YIS)

BUYER'S SYSTEM UPGRADES

1. **System Upgrades:**

   No System Upgrades are required.

2. **New Interconnection Facilities:**

   The Seller is connecting to YIS at ATCO Electric Yukon. Please see the System Interconnection Study Report attached as Schedule "D".

   Please refer to Buyer's single line diagram in Exhibit B-2.

3. **Target Buyer's COD:** November 1st, 2020

BREAKERS/SWITCHES AND SYNCHRONIZATION

A SW Fusible HD 600V 1200A NEMA3R/Neutral and 60A 3P Type 3R 600VAC/DC Heavy Duty Non-Fusible Safety Switch will be used. The specifications of such switches are attached.

After voltage is restored after an outage no reconnections will be attempted until the Seller has permission to reconnect from the System Control Center (as identified in Schedule "H"). After permission is given, the Seller must check that voltage and frequency are stable and within 10% of nominal values before closing in to reconnect:

- A plus or minus 10% voltage range is acceptable; and
- A plus or minus 10% frequency range is acceptable.

SWITCHING DIAGRAM

Scale: NTS

Drawn by: R.Williamson, C.E.T.

Checked by:

Approved by:

PLAN NO: WN-20001

File: WN-20001-SLD.dgn Rev: V

THIS DRAWING IS THE PROPERTY OF YUKON ELECTRICAL CO. LTD. AND CONTAINS PROPRIETARY AND CONFIDENTIAL INFORMATION WHICH MUST NOT BE DUPLICATED, USED OR DISCLOSED WITHOUT PRIOR WRITTEN CONSENT OF YUKON ELECTRICAL CO. LTD.

SCHEDULE "C"

FORM OF ANNUAL OPERATING PLAN

DATE: June 5, 2020.

TO: Yukon Energy Corporation ("Buyer")

RE: Electricity Purchase Agreement between 536774 Yukon Inc ("Seller") and Buyer dated the 5th day of June, 2020 (the "EPA")

The following sets out the Annual Operating Plan of Seller commencing on June 5, 2020 (the "**Applicable Period**").

(a) The following (from Table E-1 of Schedule "E" of the EPA) is the schedule of the expected total deliveries of Energy at the POI in each month of the Applicable Period:

	Projected Hourly Energy (kWh/h) **(A)**	**Projected Monthly Energy (kWh)** **(B)**
January	400 kWh/h peak	21,000
February	779 kWh/h peak	100,800
March	850 kWh/h peak	198,300
April	801 kWh/h peak	251,600
May	821 kWh/h peak	263,300
June	814 kWh/h peak	241,100
July	815 kWh/h peak	231,600
August	818 kWh/h peak	216,200
September	862 kWh/h peak	155,400
October	836 kWh/h peak	108,400
November	692 kWh/h peak	40,200
December	347 kWh/h peak	12,500

(b) The following is the schedule of any Planned Outages of the Seller's Plant expected by Seller for the Applicable Period:

The Seller has no Planned Outages for the Applicable Period.

(c) The following is the schedule of operations and maintenance activities planned for the Seller's Plant expected by Seller for the Applicable Period:

The Seller will perform bi-annual maintenance on the Seller's Plant in the first week of March and last week of April. The Seller's Plant will not be shut down during this maintenance activity, however one inverter at a time may be brought offline for thermal scans. This would decrease the output of the Seller's Plant by no more than 45 kW ac.

Dated effective as of the date set forth above.

DISTRIBUTED GENERATION FEASIBILITY RESULTS

Project #: n/a
Customer: Solvest Inc.
ISD: TBD
Location: Whitehorse
Substation: Laberge
Feeder: 5L645
Author: Alexandre Nassif, P.Eng.
Reviewed by: John Williams, P.Eng.
Revision: R0
Date: July 30, 2019

ATCO Electric Ltd.
APEGA Permit to Practice
P850

DG Description

Total Generation Requested	1 MW
Type of Generation	Solar
Maximum Allowable Generation	It is possible to accommodate up to 1MW of generation with required system upgrades. The solar farm will need to operate under constant unity power factor (100%)
Number and Size of Units	Eight (8) inverters, 125 kW each
Site Load	No
Transformer Ownership	It is assumed the customer will install a three-phase 1MVA transformer.
PCC Transformer Size and Winding Configuration	25kV-600V with a grounded wye winding configuration on ATCO's side.

DTT Assessment

DTT Required (Y/N)	Not required. It is a pre-requisite that the solar inverters meet all specifications of UL1741 SA

	and IEEE 1547-2018, including the provisions for anti-islanding and open-phase detection and disconnection. If these requirements are met, existing inline reclosers will not need to be retrofitted and no DTT scheme will be required.
Scope	N/A

AESO Requirement Assessment

SCADA Visibility Required? (Y/N)	It is assumed SCADA visibility is not required. The transmission authority must be consulted.

Distribution Assessment

Feeder and Conductor Size	From Laberge to the possible tie-in point, feeder 5L645 consists of: - 1km of 3 x 1/0 ACSR - 4.7km of 3 x #6 ACSR - 2km of 3 x #4 ACSR - 8.2km of 3 x 1/0 ACSR - 5.6km of 3 x 266ACSR It is assumed about 400m of new conductor will be required and will be 3x1/0 ACSR.
Substation rating	Labarge contains a 10MVA 35kV-25kV substation
Maximum generation without upgrades:	1 MW The existing Voltage Regulator (R113 R114 R115) must be reprogramed to operate in co-generation model with forward settings of 124V (existing) and reverse settings of 122V. If the voltage regulator does not allow co-generation operation, it must be replaced.
Feeder 5L645 Loading	Feeder Loading: Max = 4,055 KW Average = 1,758 kW 10th percentile = 997 kW Min (1st percentile; excluding outages) = 745 kW
Substation (Laberge) Loading	Max = 5,512 kW Average = 2,480 kW 10th percentile = 1,446 kW Min (1st percentile) = 1,000 KW
Circuit Distance from the substation	About 22 km

Existing DG on this feeder? (Y/N)	There are other solar generators in the feeder. They are assumed to be very small.
Alternate Feed? (Y/N)	UNKNOWN. If supplied by an alternate feed, this generator will need to be directed offline by the control center.
New Build Required? (Y/N, distance and conductor)	It is assumed about 400m of new line (3 x 1/0 ACSR) will be required.
Reconductoring Required? (Y/N, distance and conductor)	No.
Consideration of ATCO's System's Power Factor	It is expected that the Solar generator will not negatively and substantially impact the substation power factor under peak load condition.
Upstream Regulator Setting Changes Required? (Y/N)	YES: - Voltage regulator R113 R114 R115 will need to be reprogramed or upgraded to operate under co-generation mode. Forward settings can remain at 124V, but reverse settings need to be changed to 122V. - Voltage regulator R50R51R52 at Laberge will need to be reprogramed or upgraded to operate under co-generation mode. Forward settings can remain at 126V, but reverse settings need to be changed to 125V
Upstream Distribution recloser equipment change? (Y/N)	No changes required, as long as the solar inverters comply with all anti-islanding and open-phase detection clauses of UL 1741 SA and IEEE 1547-2018.
Power Transfer to other feeders? (Y/N and amount)	YES Power transfer during feeder max/average/10th percentile /min loading are: Max = no transfer Average = no transfer 10th percentile = very small Min = 255 kW

Power Transfer to 35kV? (Y/N and amount)	Potentially. The minimum load is about 1MW, which is the size of the proposed generation.
Power Transfer to Transmission? (Y/N and amount)	No.

Distribution Scope of Work

Local Scope

1. Build about 400m (to be confirmed by field check) of 3 x 1/0 ACSR line to the PCC.
2. Tie customer transformer to the distribution system
3. Install Bi-Directional Meter with power quality meter
4. Install a three-phase fault interrupter with voltage sensors and a controller that allows for directional protection.

Upgrade Scope

1. Reprogram the existing Voltage Regulator (R113 R114 R115) to operate in co-generation mode. If the voltage regulator does not allow co-generation operation, it must be replaced.
2. Reprogram the existing Voltage Regulator (R50R51R52) to operate in co-generation mode. If the voltage regulator does not allow co-generation operation, it must be replaced.

Assumptions:

- DG will be operating at 100% power factor (unity)
- 25kV-600V transformer will be customer owned
- Routing is assumed

Transmission Assessment (to be completed by the Transmission Authority)

SCHEDULE "D"

SYSTEM INTERCONNECTION STUDY REPORT

(Continued)

Line Losses

ATCO Electric Yukon has established that the only Line Losses will be transformer losses which will be fully quantified upon commissioning.

Initial estimated transformer losses based on the specifications of the transformer to be ordered is approximately 0.5%, but it has been recommend to use 0.75% for budgeting purposes.

SCHEDULE "E"

MONTHLY ENERGY SHORTFALL PAYMENT

Monthly Energy Shortfall Payments

In any calendar month in which there has occurred a Non-Permitted Distribution/Transmission Constraint then Buyer shall pay Seller Monthly Energy Shortfall Payment,

where:

"**Monthly Energy Shortfall Payment**" means the Monthly Constraint Shortfall multiplied by the price which is payable for Delivered Energy under Section 5.1 of the EPA; and

"**Monthly Constraint Shortfall**" (expressed in kWh) means, for each calendar month, means the aggregate of the duration of each Non-Permitted Distribution/Transmission Constraint (measured as a fraction determined as the aggregate number of minutes in such Non-Permitted Distribution/Transmission Constraint divided by 60) multiplied by the "Non-Permitted Distribution/Transmission Constraint Hourly Deemed Energy" set out in Table E-1 below for the applicable calendar month.

Table E-1

	Projected Hourly Energy (kWh/h) (A)	**Projected Monthly Energy (kWh) (B)**	**Non-Permitted Distribution/Transmission Constraint Factor (F1)**	**Non-Permitted Distribution/Transmission Constraint Hourly Deemed Energy (kWh/h) (A x F1)**
January	28.23	21,000	_%	
February	150.00	100,800	_%	
March	266.53	198,300	_%	
April	349.44	251,600	_%	
May	353.90	263,300	__%	
June	334.86	241,100	__%	
July	311.29	231,600	__%	
August	290.59	216,200	__%	
September	215.83	155,400	__%	
October	145.70	108,400	__%	
November	55.83	40,200	__%	
December	16.80	12,500	__%	

Revisions to Projected Hourly Energy and Projected Monthly Energy

Within 90 days following the end of the 2nd year after Buyer's COD, the Parties shall review and revise the values in Table E-1 above for Projected Hourly Energy and Projected Monthly Energy to reflect the average actual amount of Delivered Energy sold to Buyer in the 2 years following Buyer's COD for the applicable months.

SCHEDULE "F"

TERMINATION PAYMENT

The "**Termination Payment**" at any time shall be equal to (a) the Gross Termination Payment set out below for the Contract Year in which the termination occurred, less (b) the actual amounts paid or owing by Buyer to Seller for Delivered Energy for the Contract Year in which the termination occurred.

Table F-1

Termination Year	Gross Termination Payment
Year 1	$3,252,880
Year 2	$3,233,759
Year 3	$3,210,258
Year 4	$3,181,994
Year 5	$3,148,552
Year 6	$3,109,482
Year 7	$3,064,300
Year 8	$3,012,480
Year 9	$2,953,453
Year 10	$2,886,607
Year 11	$2,811,275

Executive Summary

The purpose of the Interconnection Technical Guide is to provide guidelines for Independent Power Producers (IPP) who wish to interconnect a generation facility of greater than 50 kW and up to 10 MW to the Yukon Integrated System (YIS) via the Yukon Energy Corporation (YEC) or ATCO Electrical Yukon (AEY) distribution systems. The maximum allowable generation at the Point of Interconnection (POI) between the distribution system and IPP will depend on the results of a system impact study conducted by YEC. This guide details the technical and operational requirements of the facility and is not intended to be used as a design guide.

The purpose of this document is to:

- Provide technical specifications for the interconnection of IPP generation to the YIS (via YEC or AEY distribution systems).
- Clarify, where necessary, the technical requirements in CSA Standard C22.3 No. 9-08 (R2015) "Interconnection of Distributed Resources and Electricity Supply Systems" [1] and to provide an outline for how each section applies to interconnections with the YIS.

1. Introduction and Scope

1.1. Purpose

This guide establishes criteria and technical requirements for Independent Power Producers (IPP) who wish to interconnect generation, with a net capacity greater than 50 kW and up to 10 MW, to the Yukon Integrated System (YIS), at the distribution level (35 kV and below), or at the transmission level (above 35 kV). This guide has been developed considering CSA Standard C22.3 No. 9-08 (R2015) [1] and IEEE Standard 1547-2018 [2] and is subject to regular review and revision due to evolving standards.

The technical guide is intended to assist IPPs who apply to connect to the YIS through the Standing Offer Program, Call for Power, or through other unsolicited requests to connect.

1.2. Limitations

The criteria and technical requirements described within this section apply to the following generation interconnections:

- Interconnections to the Yukon Energy Corporation (YEC) and ATCO Electric Yukon (AEY) distribution systems at voltages of 34.5 kV and below, and
- Interconnections to the YEC transmission system at voltages over 34.5 kV by means of an existing or new substation. Transmission interconnections will require specific detailed review and approval by YEC and all interconnection costs will be borne by the IPP.

This Guide establishes the minimum requirements for the Point of Interconnection (POI). The IPP generation may be subject to additional requirements to ensure the project meets all applicable standards.

This Guide is not to be used:

- As an Operating Agreement and does not address the following:
    - Joint operating agreements
    - Costs
    - Tariffs
    - Other contractual issues
- As an Interconnection Process and Procedures Guide, and does not include the following:
    - Protection of the IPP's generation facilities
    - Transmission system impact and upgrades
    - System planning and design
    - Operation of the distribution system
    - Other system related issues
- As a design handbook for a generation facility.
- For any IPP generation not connected indirectly or directly to the YIS, i.e. an island grid.

2. Terms, Definitions, and Abbreviations

2.1. Definitions

Accredited Certification Organization – An organization that has been accredited by the Standards Council of Canada to operate a certification program for electrical equipment, such as the Canadian Standards Association (CSA).

Anti-islanding – A means of detecting and preventing a DR from energizing a part of the distribution system that becomes disconnected from the grid.

ATCO Electric Yukon – A private investor-owned utility, and member of the ATCO Group of Companies.

Automatic Circuit Recloser (ACR) – An overcurrent protection device used by utilities to detect faults on distribution system feeders, which has the ability to open and then reclose after a specified time delay allowing adequate time for temporary faults to clear.

Bi-directional Meter – A meter that measures real and reactive power and energy in both directions.

Cease to Energize – The cessation of energy outflow capability.

Clearing Time – The time from the start of the abnormal condition to when the distributed resource ceases to energize the distribution system.

Dispensated Metering Equipment – Any metering equipment that has received Measurement Canada approval under Section 9(2) or 9(3) of the Electricity & Gas Inspection Act.

Disconnecting Means – A device or group of devices that allows the conductors of a circuit to be disconnected from their source of supply.

Distributed Generation (DG) – Small, decentralized electric power generation facilities, typically interconnected to the distribution system.

Distribution System – The portion of the electrical system that operates at a nominal voltage of 34.5 kV line to line and below, and which distributes electric power between distribution substations and customers.

Effectively Grounded Distribution System – Distribution facilities where the neutral conductor is solidly grounded and the ratio of the zero sequence reactance to the positive sequence reactance is less than or equal to 3 and the ratio of the zero sequence resistance to the positive sequence reactance is less than 1.

Electromagnetic Interference (EMI) – Any electromagnetic disturbance that interrupts, obstructs, or otherwise degrades or limits the effective performance of a device, equipment or system.

Exporting – supplying power into the distribution system through the POI.

Facilities – A physical plant including, without limitation, generating plants, transmission and distribution lines, transformers, meters, equipment and machinery.

Flicker – The subjective impression of fluctuating luminance caused by voltage fluctuations.

Frequency – The number of cycles through which an alternating current passes in a second. The North American standard is 60 cycles per second, known as 60 hertz (Hz).

Generation – The process of converting solar, thermal, wind, hydro, or chemical energy into electric energy.

Independent Power Producer (IPP) – An agency or individual other than a public utility (as defined by the Public Utilities Act) who generates electricity to sell (to the utilities). An independent power producer does not own transmission facilities and is dependent on the utilities to purchase and distribute the power it produces.

Interconnection – The physical connection of DG to YEC's distribution system so that parallel operation can occur.

Island Grid – A community power system which is energized solely by one or more local power producers and is separated electrically from the YIS.

Islanding – A condition where a portion of the utility's distribution system is energized exclusively by one or more power producers through their DR interconnection.

Operating Interface Point – See Point of Interconnection.

Parallel Operation – the simultaneous energization at a POI by the generating facility and the utility distribution system.

Point of Interconnection (POI) – The location of the electrical connection between an IPP facility and the utility's distribution system. This will be the point where the ownership changes from the utility to the IPP.

Power Factor – The ratio of active power to apparent power. It is the cosine of the phase angle difference between the current and voltage of a given phase.

Protection Scheme – The protection functions, including associated sensors, relays, and power supplies, intended to protect a distribution system or interconnection equipment.

Public Utility – As defined by the Public Utilities Act and Regulations (i.e., YEC and/or AEY).

Ride-through – The ability to withstand voltage or frequency disturbances inside defined limits and to continue operating as specified.

Secondary Injection Testing – A method in which low level signals obtained from current and voltage signal generators are injected into a power system protective device to test device response.

Stabilized – The state of the distribution system after voltage and frequency has returned to normal range for a period of at least five minutes (or another period of time, as agreed with YEC) following a disturbance.

Stand Alone – The state where a distributed generation can operate by controlling the frequency and voltage of their facility while in islanded or isolated mode.

Telemetering – Transmission of measurable quantities using telecommunications systems.

Total Demand Distortion (TDD) – The ratio of the root mean square of the harmonic content, considering harmonic components up to the 50th order and specifically excluding interharmonics, expressed as a percent of the maximum demand current. Harmonic components of order greater than 50 may be included when necessary.

Total Harmonic Distortion (THD) –The ratio of the root mean square of the harmonic content, considering harmonic components up to the 50th order and specifically excluding interharmonics, expressed as a percent of the fundamental. Harmonic components of order greater than 50 may be included when necessary.

Transfer Trip – A remote signal directed from an upstream device to command a DG to cease to energize the distribution system upon detection of an islanding condition and to prevent re-energization.

Transmission System –The portion of the system that operates above a nominal voltage of 34.5 kV line to line and transmits electric power between YEC substations.

Trip Time – The time between the start of the abnormal condition and the interconnection device ceasing to energize the distribution system.

Type Test – A test performed on a sample of a particular model of a device to verify specific aspects of its design, construction and performance.

Utility – See Public Utility (i.e., YEC and/or AEY).

Visible-Break Disconnect – A switch or circuit breaker by means of which the generator and all protective devices and control apparatus can be simultaneously disconnected under full load entirely from the circuits supplied by the generator. All blades or moving contacts must be connected to the generator side, and the design of the disconnect switch must allow adequate visible inspection of all contacts in the open position.

Voltage Flicker – A condition of fluctuating voltage on a power system that can lead to noticeable fluctuations in the output of lighting systems.

Yukon Energy Corporation (YEC) – A publicly-owned electrical utility that is the main generator and transmitter of electrical energy in Yukon.

Yukon Integrated System – The integrated Whitehorse-Aishihik-Faro and Mayo-Dawson electrical grids which are owned by YEC.

YIS	Yukon Integrated System
YUB	Yukon Utilities Board

3. Party Responsibilities

Refer to the IPP Policy as released in January 2019 for the individual responsibilities of the Government of Yukon, utilities (YEC and AEY), Yukon Utilities Board and the IPP during the generation interconnection process.

3.1. IPP Responsibilities

The IPP is responsible to:

- Provide technical information to the utility as specified in Appendix A and Appendix B;
- Assume ownership of the facility including the design, installation, operation, and maintenance of all equipment, station and distribution line facilities from the POI to the IPP facility, unless otherwise agreed to in writing;
- Pay the costs of system interconnection in accordance with the commercial terms established by the utilities;
- Obtain all regulatory approvals, including environmental assessment approvals, if necessary, for the construction and operation of its facilities. The IPP facilities shall be designed, constructed, operated and maintained in compliance with the applicable statutes, regulations, by-laws, codes and technical requirements specified by the utility (e.g. remote monitoring etc.);
- Submit all specifications of its facilities and detailed plans to the utility for review prior to receiving permission to connect to their distribution system;
- Ensure the technical requirements given in the standards and codes in Appendix D are met;
- Ensure metering requirements are met (see section 12); and
- Negotiate the timing and any testing requirements for the commissioning process with YEC

3.2. YEC Responsibilities

YEC is responsible for the operation of the Yukon Integrated System (YIS) and for certain local distribution systems interconnected with the YIS. This guide applies to all transmission and YEC distribution system interconnections.

YEC is responsible for all system studies performed on the YIS. The IPP and AEY, in the case of an AEY interconnection, shall provide all necessary information to YEC for the interconnection of the IPP facility. The system studies conducted by YEC will be paid for by the IPP.

After receiving the application for interconnection, YEC shall provide the IPP, at the IPP's cost, the information specified in Appendix C.

3.3. AEY Responsibilities

AEY is responsible for the operation of certain local distribution systems interconnected with the YIS. This guide applies to these AEY distribution system interconnections.

After receiving the application for interconnection, AEY shall, in consultation with YEC, provide the IPP, at the IPP's cost, the information specified in Appendix C.

4. General Requirements

4.1. Standards

When planning, designing, and operating an IPP Generation Facility, the IPP shall meet all applicable national, territorial and local construction and safety codes and standards.

The interconnection facility must comply, as a minimum, with the following:

- All CSA Standards, including the Canadian Electrical Code (CEC),
- Applicable YEC and AEY standards and the requirements set forth in this Guide,
- National, Territorial and local Governing law, acts, by-laws and codes, and
- Alberta Electrical Utility Code (AEUC) [4].

Applicable standards are located in Appendix D, however not all may be applicable for the IPP facility and additional standards may apply.

The interconnection of new generation can adversely affect the electric service to existing or future customers. The IPP must work with the utility to mitigate any adverse effects.

The facility must be constructed and maintained to provide a safe environment for employees as well as the public. If the generation facility adversely affects other customers, the utility may disconnect it until such time as the concern has been mitigated. The IPP is responsible for any costs incurred as a result.

The IPP is required to install, operate and maintain the facility and to ensure it is in sufficiently good order and repair at all times. Maintenance shall conform to good electrical practice, adequate for safe parallel operation when connected to the YIS. The utility and the IPP shall share commissioning reports, operating procedures and annual shutdown, maintenance, and inspection reports.

4.2. Operating Requirements

A joint operating agreement template will be developed in conjunction with the utility. The agreement requirements are not included within the scope of this Guide. A sample operating agreement is located in Appendix E.

5. Site Specific Conditions and Capacity Limitations

During the preliminary stage of project development any limitations regarding the proposed interconnection, and any additional system upgrades required, will be determined in consultations between the IPP, YEC and AEY, if interconnected via an AEY distribution system.

A system impact study will be necessary to identify any site-specific conditions and capacity limitations of the distribution and/or transmission system. To facilitate the study, the utility and the IPP will exchange information concerning load, feeder characteristics, protection philosophies, station layouts, capacities, ratings and other relevant information of the distribution and/or transmission system. The utility controls reliability design and reliability standards.

Under certain circumstances, YEC and AEY may limit the size or reconfigure the proposed connection arrangement of the IPP facility in order to maintain the integrity of their system.

6. YIS Transmission and Distribution System Characteristics

6.1. YEC Transmission System

6.1.1. General System Configuration

The YIS is an 'Islanded grid' which has no interconnection with the main North American electric grid. The Yukon must produce all of its own power, and cannot generate more electricity than is there is load, since there are no neighboring markets into which to sell surplus energy.

The YIS includes the 138 kV Whitehorse – Aishihik – Faro (WAF) grid, the 69 kV Mayo-Dawson-Keno (MD) grid, and the 138 kV Carmacks-Stewart Transmission Line (CSTL) which interconnects the WAF and MD grids. YEC provides power to major industrial customers connected to the 69 kV and 138 kV grids.

A map of the YIS is shown in Figure 6–1.

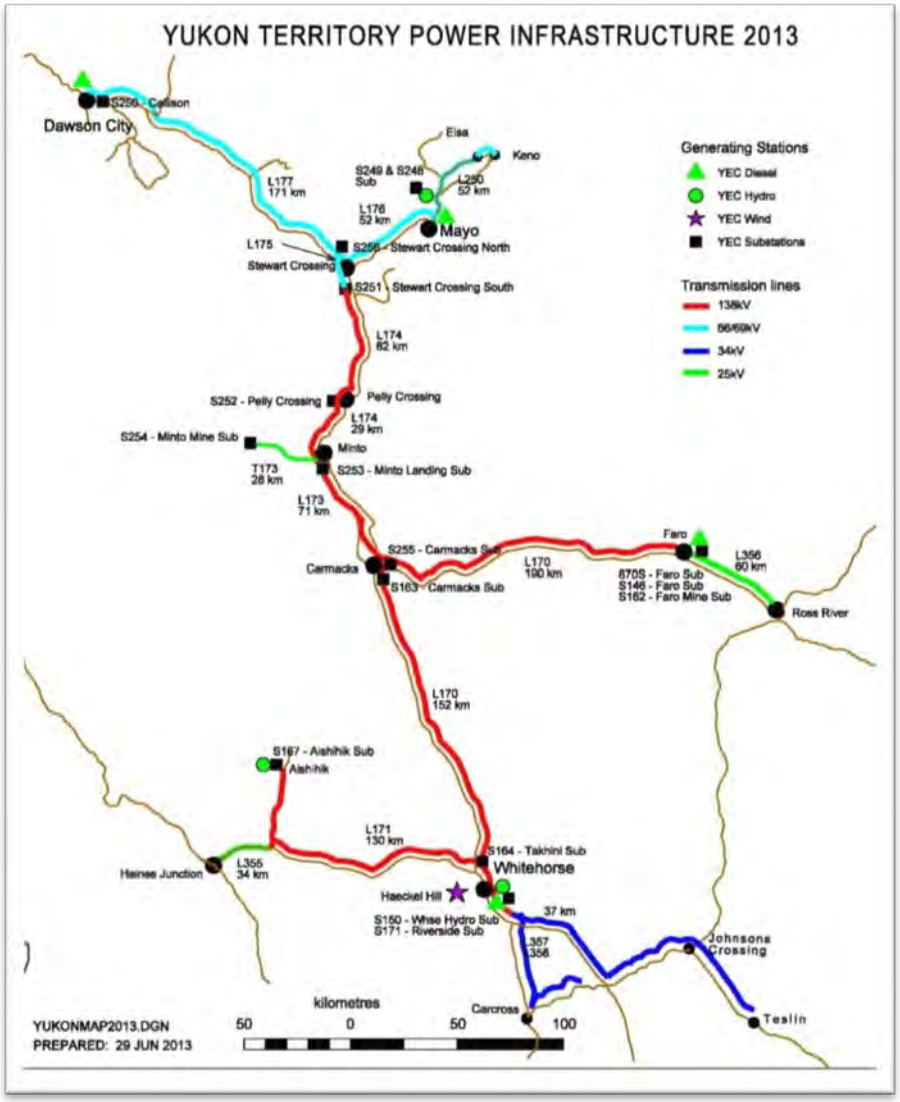

Figure 6–1: YIS Map

6.1.2. System Unbalance

Voltage unbalance on the transmission system is minimal during normal operation. The voltage unbalance under normal operating conditions will be less than three (3) percent. The IPP facilities may be subjected to voltage unbalance and negative sequence current during system disturbances. The generation connected to the transmission system must be able to withstand significantly unbalanced voltages with high negative phase sequence currents for short periods of time.

6.1.3. Frequency

The YEC transmission system operates at 60 Hertz (Hz) Alternating Current (AC) with equipment standard for this frequency. Frequency variations are typically in the range between 59.0 Hz to 61.0 Hz for small contingencies that cause modest disturbances, however variations between 58 Hz to 66 Hz or greater can occur for larger contingencies.

The frequency of the electric system is controlled by synchronous generator governor systems. Such governor systems respond automatically to changes in system frequency to prevent further deviation. These variations are system dependent and subject to change.

6.1.4. Steady State Voltage Levels

During normal steady state conditions, the 69 kV and 138 kV systems can vary between 90% and 105% of nominal voltage. However, under extreme conditions, the 69 kV and 138 kV systems can vary between 85% and 110% of nominal voltage with some 138 kV facilities designed to operate continuously up to 110% of nominal voltage.

6.1.5. System Fault Levels and System Impedances

The IPP generation facilities connecting directly to the transmission system shall be designed for operation at short circuit (fault) levels that take into account reasonable future development of the YIS transmission system. The short circuit levels to be used in the design depend on the point(s) of interconnection and future planned development and are available on request from YEC.

6.1.6. Fault Clearing and Automatic Reclosing

The YIS does not implement auto-reclosing at the transmission level.

6.1.7. System Grounding

The transmission system is effectively grounded.

6.2. YIS Distribution System Characteristics

6.2.1. General

Both YEC and AEY operate distribution systems in the Yukon which are interconnected with the YIS. The systems are predominantly three phase, wye connected, with nominal voltages of 4.16/2.4 kV, 6.9/4 kV, 12.5/7.2 kV, 13.8/8 kV, 25.00/14.4 kV and 34.5/20 kV.

AEY also operates a number of distribution systems which are not interconnected to the YIS, and are not covered by this Guide:

- Watson Lake
- Old Crow
- Beaver Creek
- Destruction Bay / Burwash Landing
- Swift River

For information on connecting to the AEY distribution systems which are isolated from the YIS, refer to AEY's document entitled, "ATCO Electric Yukon's Isolated Community Generation System Interconnection Guidelines".

6.2.2. Voltage Levels

The YEC and AEY distribution systems operate to meet CSA Standard CAN3 C235.83 – "Preferred Voltage Levels for AC Systems 0 to 50,000V" which defines the preferred operating voltage levels for normal and extreme operating conditions. The distribution system steady state voltage is typically maintained between + 5% to 7% and - 5% to 7%.

6.2.3. Power Quality (Harmonics and Voltage Flicker)

The YEC and AEY distribution systems operate to limit the maximum individual frequency voltage harmonics to 3% of the fundamental frequency and the voltage total harmonic distortion (THD) to 5% on the utility side of the POI.

6.2.4. Voltage Regulation

The operating voltages on the low voltage buses of YEC distribution substations are generally regulated by transformer automatic load tap changers (LTC), bus voltage regulators or feeder voltage regulators. YEC will provide set-points for the equipment upon request.

6.2.5. Voltage Unbalance

Distribution facilities are typically three-phase systems, incorporating single-phase distribution taps. The voltage unbalance on a distribution system under normal operating conditions may exceed 3%, due to the unbalanced loading and single-phase regulation. Voltage unbalance will be calculated using the following formula, as derived from CSA Standard C22.3 No. 9-08 (R2015) [1]:

Voltage Unbalance (%) = 100 x (negative sequence voltage of the fundamental frequency component) / (positive sequence voltage of the fundamental frequency component)

6.2.6. Fault Levels

Fault levels and maximum allowable fault currents vary significantly through the distribution system and must be considered in the design of the IPP interconnection.

6.2.7. System Grounding

The utility distribution facilities are typically three phase, four wire, multi-grounded systems that incorporate single phase distribution taps. The lines are normally operated as effectively (solidly) grounded with grounded-wye connected sources at the distribution substation secondary bus.

6.2.8. Phasing

The phase sequence on the utility system may vary, and must be confirmed between the IPP and the utility during the design phase of the installation.

6.2.9. Fault and Line Clearing and Automatic Reclosing

The YEC distribution systems do not currently include auto reclosing. The AEY distribution systems may have auto reclosing and this will be confirmed during the design phase of the application.

7. Power Quality Requirements for the System Interconnection

7.1. Harmonics

The following industry standards may provide guidance for appropriate performance.

- IEEE 1547-2018 – IEEE Standard for Interconnection and Interoperability of Distributed Energy Resource with Associated Electric Power Systems Interfaces, IEEE, 2018 [2]
- IEEE 519-2014 – IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems [5]
- IEC 61000-4-15 – Testing and Measurement Techniques – Flickermeter - Functional and Design Specifications [6]

The generation facility shall not inject harmonic currents such that will cause objectionable voltage distortion as per standard IEEE 519 Harmonic current injections cause intolerable voltage distortions on the distribution system and may damage equipment.

The Utility, at the IPP's expense, shall conduct a Power Quality Assessment of the distribution system in the immediate vicinity of the interconnection using a measurement technique compliant with IEC 61000-4-7.

When performing a Power Quality Benchmark, the measurements at the customer's POI shall be taken over a one week (168 hour) period during typical production load levels.

7.2. Flicker

The generation facility shall meet the requirements of Section 6.2.3 and shall not cause unacceptable levels of flicker on the distribution system. The utility, at the IPP's expense, shall measure the flicker level using a power quality measuring device that meets the requirements of the IEC Flickermeter Standard 61000-4-15.

When performing a Flicker assessment, the measurements at the customer POI shall be taken over a representative load cycle of one day or greater.

7.3. Speed Regulation and Frequency Control

The frequency of the YIS is controlled by the generators operated by YEC.

The YIS operates at 60 Hertz (Hz) Alternating Current (AC). The nominal frequency variations are typically 59.0 Hz to 61.0 Hz for small contingencies that cause modest disturbances, and the frequency may drop to 58 Hz or rise to 66 Hz or higher for larger contingencies.

The frequency of the YIS is automatically controlled by the governor systems of the generators operated by YEC, within the specified limits.

IPP generators rated at 1 MVA and greater are required to have a governor system, capable of operating in droop mode, to respond to system frequency changes. The droop setting of the governor will typically be in the range of 5%.

IPP generators rated less than 1 MVA may operate in base load mode rather than in frequency control mode.

The utility will define frequency requirements on a project by project basis and may require the control of these parameters directly via the YEC SCC.

Equipment connected to the YIS shall be capable of withstanding the dynamic frequency performance criteria listed in Table 1.

Table 1: Transmission Minimum Frequency Performance

Under Frequency Limit	Over Frequency Limit	Minimum Time
60.0-59.0 Hz	60.0-61.0 Hz	N/A (continuous operating range)
58.9-58.5 Hz	61.1-61.5 Hz	3 minutes
58.4-57.9 Hz	61.6-61.7 Hz	30 seconds
57.8-57.4 Hz		7.5 seconds
57.3-56.9 Hz		45 cycles
56.8-56.5 Hz		7.2 cycles
less than 56.4 Hz	greater than 61.7 Hz	Instantaneous trip

Under-frequency and over-frequency relaying that automatically disconnects generators from YIS must not operate for frequencies in the range of 59.0 to 61.0 Hz if no other abnormal system event is underway.

7.4. Voltage Regulation and Power Factor

The IPP is responsible for ensuring that the voltage levels at the POI are maintained within this guidelines prescribed by the utility. The IPP interconnection must maintain the voltage levels, under all feeder load conditions, at the same values as they were prior to the interconnection.

Synchronous generators connected to the distribution system must be equipped with adequate excitation controllers. The IPP shall operate generators with Automatic Voltage Regulators (AVR) adjustable from 95% to 105% of nominal bus voltage. The Generation should be run in Voltage control unless required to run in power factor (pf) mode by the Utility. Operation in MW or MVAR control is not acceptable. The AVR response should with no intentional delay when in Voltage Control mode.

Induction generators do not have voltage or reactive power control capability and consume reactive power (VAR). In this case, the generator must provide reactive compensation to correct the power factor to 0.9 lagging or better at the POI, unless other terms are specified by the utility.

Inverter type generating equipment can control the power factor over a wide range, typically ± 0.75. An inverter type generator connected to the distribution facility must be capable of adjusting the power factor in the range of ± 0.9. The IPP may operate outside that range only by prior agreement with the utility.

The utility will define voltage and reactive power requirements on a project by project basis and may require the control of these parameters directly via the YEC SCC. The IPP and utility will identify and

agree on the exact transformer ratio to allow optimal voltage regulation on the system and the IPP will determine whether an on-load tap changer is needed.

In order to coordinate with its existing voltage control devices, the utility may require that the generator operate in a power factor control mode. This means operating within a constant power factor set point range. The voltage/power factor regulator must be capable of controlling the power factor of the generator. The utility shall determine the actual set point between these limits.

In power factor control mode, the voltage regulator must have a voltage override that causes it to reduce excitation if the voltage at the POI exceeds an upper limit to be specified by the utility. The normal upper limit is 105% of nominal; however, the voltage regulator shall have the provision to adjust this upper limit between 100% and 110% of nominal. The voltage regulator must also have provision for a time delay between sensing an excursion of the upper voltage and initiating control action. The power factor control equipment must have the capability to allow for the adjustment of this time delay from between 0 and 180 seconds. The utility will specify the required time delay for each project.

7.5. Voltage Unbalance

Unbalanced phase voltages and currents can affect protective relay coordination and cause high neutral currents and thermal overloading of transformers. Of particular concern is negative sequence voltage and the resulting effect, particularly on rotating generators and motors connected to the system.

To protect the utility and the IPP equipment, the 3-phase generation contribution at the POI should not cause a voltage unbalance greater than 1% or a current unbalance greater than 5%.

If the existing unbalance at the POI is shown to be already close to the maximum unbalance condition, the IPP contribution may cause the unbalance to exceed the specified amount. This will be considered on a case-by-case basis.

7.6. Voltage and Frequency Transients

The IPP is responsible for the cost of any necessary transient or dynamic stability studies, which must be performed in a manner approved by YEC.

7.7. Resonance and Self-Excitation of Induction Generators

The potential effects of resonance should be considered as part of the design of the generating facility. The effects include:

- Ferro-resonance in the transformer,
- Sub-synchronous resonance due to the presence of capacitor banks, and
- Harmonic resonance with other customers when capacitors are being added as part of the installation.

When induction generators are used, the potential for self-excitation should be assessed and addressed as part of the system impact study and mitigated accordingly.

The IPP shall be responsible for the engineering analysis as part of the design process to evaluate the existence of, and to eliminate the harmful effects of resonance and the assessment of the self-excitation effects of induction generators. The engineering analysis of resonance and the assessment of the self-excitation effects of induction generators must be submitted to YEC for approval or further evaluation.

7.8. DC Current Injection

The IPP facility system shall not inject a dc current at the POI.

7.9. Fault Levels

The utility will provide the IPP with the anticipated fault levels or the data necessary for the IPP to calculate the distribution system fault contributions at the POI.

The IPP facility must not increase the fault levels on the utility distribution or transmission system above their design levels for maximum faults.

8. Physical Interconnection

8.1. Safety

The safety of the public, operating personnel and the environment is of primary concern in the design, construction, operation and maintenance of the interconnection facilities.

8.2. Point of Interconnection (POI)

The POI is the point at which the utility (YEC or AEY) distribution facilities or conductors are connected to the IPP's facilities or conductors, and where any transfer of electric power between the IPP and the utility takes place. The POI must be identified in the design and on the Single Line Diagram (SLD).

Depending on ownership, YEC or AEY will coordinate the design, construction, maintenance and operation of the facility on the distribution system side of the POI. The IPP is responsible to coordinate the design, construction, maintenance and operation of the facility on the generation side of the POI.

All voltage and frequency parameters specified in this section must be met at the POI unless otherwise stated.

The IPP is responsible for any incremental costs to the electric systems caused by the interconnection. The responsible utility will carry out the engineering, design and construction required for these installations and charges those costs back to the IPP. Ongoing O&M costs incurred on the distribution feeder side will also be recovered by the utility.

There may be cases where either the utility or the IPP may own equipment located on the other's side of the POI. For example, the utility may own and operate communications, supervisory, or metering equipment, which is located on the IPP side of the POI. The IPP must provide a site with the necessary space for utility to install current transformers, potential transformers, switching equipment, meters, and any other AC and DC auxiliaries, protection and controls, SCADA or communications equipment required to interconnect with the generating facility. The site is to be approved by the utility and a 120-volt AC power service is to be available for the use of portable tools.

8.3. Point of Disconnection

For transmission interconnections, the visible-break disconnect switch shall be located on the high voltage side of the interconnection transformer.

For distribution interconnections, the visible-break disconnect switch may be located on the high or low voltage side of the interconnection transformer.

The disconnect switch must be gang operated to simultaneously isolate all three phases.

If the IPP site interconnects multiple generators, one disconnect switch must be capable of isolating all of the generators simultaneously. There may be other means of meeting this requirement; however the approval of the utility must be obtained before using other means.

The IPP must follow the utility switching, clearance and tagging procedures. The utility is responsible to instruct the IPP in this regard.

8.3.1. High Side and Low Side Disconnect Switches

For transmission interconnections the disconnect switch on the high voltage side of the interconnection transformer shall be installed, owned and maintained by the IPP.

For distribution interconnections the disconnect switch, if on the high voltage side of the interconnection transformer shall be installed, owned and maintained by the utility, and if on the low voltage side of the interconnection transformer shall be installed, owned and maintained by the IPP.

8.3.2. Disconnect Switch Specification

The disconnect switch must be a manual, visible-break disconnect that provides safe isolation for the utility's personnel from the generators and all other possible customer sources of energy.

The disconnect switch must:

- Be adequately rated to break the connected generation/load;
- Be located within five meters (horizontal) of the POI, unless otherwise approved by the utility;
- Provide a direct, visible means to verify contact operation;
- Allow simultaneous disconnection of all ungrounded conductors of the circuit;
- Plainly indicate whether the switch is in the "open" or "closed" position;
- Be lockable in the "open" position;
- Be capable of being energized from both sides;
- Be readily accessible to the utility's operating personnel;
- Be externally operable without exposing the operator to contact with live parts;
- Be capable of being closed without risk to the operator while there is a fault on the system;
- Be labeled with utility's switch number;
- Meet all applicable CSA Part II standards and all applicable codes; and
- Undergo annual inspections and maintenance, with reports submitted to the utility for approval.

8.4. Interconnection Transformer

A generator step-up transformer boosts the voltage of the DG to match the voltage of the utility distribution feeder. The transformer winding configuration impacts how system faults are detected and what type of protection is required (see Section 9.10). The IPP must submit their transformer connection proposal to the utility for review and approval prior to placing an order for purchase.

8.5. Interconnection Grounding

The IPP facility must be grounded in accordance with the latest revisions of the CEC and AEUC. A ground grid of sufficient size to handle the maximum available ground fault current must be designed and installed in order to limit ground potential rise (GPR) step and touch potentials to safe levels as set forth in ANSI/IEEE Std. 80 IEEE Guide for Safety in AC Substation Grounding.

The ground grid will be designed for foreseeable future fault levels obtainable from the System Impact Study.

Grounding of the interconnection shall be designed to provide:

- Solid grounding of the distribution feeder neutral connection,
- Fault detection that isolates all sources of ground fault contribution,
- A circuit to block the transmission of harmonic currents and voltages, and
- Protection of the low voltage side from damage due to high side faults.

The preferred configuration, for an IPP owned interconnection transformer, is delta connection on the generator side of the transformer and a grounded-wye configuration on the utility's side of the transformer. If this configuration is not technically feasible, the configuration chosen must still address the above concerns. Grounding must conform to the AEUC [4].

Sample single line diagrams are shown in Appendix F.

8.6. Phasing and Phasing Sequence

Since phasing is not standardized across distribution facilities, the phase sequence must be coordinated between the IPP and utility's distribution system.

8.7. Interrupting Device Ratings

The design of the generation facility must consider the fault contributions from both the distribution system and the IPP generation facility, to ensure that all circuit fault interrupters are adequately sized. The utility will inform the IPP of the present and anticipated future fault contribution from the interconnected electric system.

9. Interconnection Protection

9.1. General

The purpose of the IPP facility protection is to reduce the risk of damage to IPP and utility equipment and maintain the reliability of supply.

The protection scheme shall be designed to detect the following conditions at the POI:

- Balanced and unbalanced system faults (i.e. line-ground, line-line and three phase faults)
- Frequency variations
- Voltage variations
- Reverse power flow
- Islanding conditions
- Out of synchronism

Depending upon location, the protection scheme may be required to detect additional conditions such as open phase, ferro-resonance, negative sequence voltage, or zero sequence currents.

The protection scheme must fully coordinate with any existing distribution system protective devices. The IPP must submit a complete protection design package, including all relay settings, tripping schemes and schematics, to the utility for review and approval prior to installation. Both existing and ultimate bus fault levels should be considered. A sample Protective Setting Commissioning Sheet with guideline limits is included in Appendix G.

The point of measurement for voltage and frequency shall be at the POI or as agreed upon with the utility.

The IPP must revise and re-submit the protection information for any proposed modification.

9.2. Device Ratings

Equipment shall be rated to carry and interrupt the fault levels that are, or will be, present at the IPP facility - this includes the ultimate fault currents specified by the utility. The IPP's equipment covers all station and distribution facilities, including but not limited to all protection equipment forming the entrance and distribution line protection: circuit breakers, current transformers, potential transformers, secondary cabling, dc system/battery charger, switchboard wiring and protective relays.

9.3. Minimum Protection Requirements

The following minimum protection requirements shall be provided for an interconnected IPP facility:

- Overcurrent
- Over-frequency
- Under-frequency
- Over-voltage
- Under-voltage

Additional protection requirements are dependent upon the transformer configuration and the distribution system characteristics.

9.4. Phase and Ground Fault Protection

The IPP must install utility grade protective devices to detect and promptly isolate the generation facility for faults occurring either in the DG facility itself or on the distribution system. Virtual devices (i.e., computer or programmable-logic controller systems) are acceptable provided they meet standard utility practice for system protection and they have been type tested and approved by an independent testing laboratory.

The protective devices in the IPP generation facility must fully coordinate with the protective relays on the distribution system unless otherwise agreed. The IPP must calculate the protective device settings and submit the relay characteristics and settings to YEC for review and approval.

The generation facility must be able to detect the following situations and isolate itself from the distribution system:

- A short circuit between any phase(s) and ground (if distribution system is a grounded system)
- A short circuit between phase(s)

9.5. Over-Frequency and Under-Frequency Protection

Each synchronous generator must be capable of continuous operation between 59.0 Hz and 61.0 Hz and of limited time operation for larger deviations from normal frequency, as shown in Table 1.

Over/under frequency relays are normally installed to protect the generators from extended off-nominal operation. It is expected that larger (> 1 MW) synchronous generators shall remain connected to the system during frequency excursions. To ensure that the generator is not tripped prematurely, YEC will specify the minimum required time delays and levels for setting the IPP over/under frequency protection relays.

9.6. Over-Voltage and Under-Voltage Protection

The IPP must operate its generation facility such that the voltage levels on the utility's system are not significantly altered by the connection of the generation facility. IPP facility paralleling shall not cause voltage fluctuations of more than ± 5% at the POI.

The IPP must install necessary relays to trip the circuit breaker when the phase-to-ground voltage, measured on any one of the three phases, deviates outside predetermined limits. Under-voltage relays should be adjustable and should have a settable time delay to prevent unnecessary tripping of the generator on external faults. Over-voltage relays should be adjustable and may be instantaneous.

The interconnection facility must cause the generator to cease to energize the utility's system within the trip times indicated in Table 2. "Trip time" refers to the period of time between the start of the abnormal condition and the moment the interconnection device ceases to energize YEC's system.

To ensure that the generator is not tripped prematurely, the utility will specify the minimum required time delays and levels for setting the IPP over/under frequency protection relays.

Table 2: Response to Abnormal Voltages

RMS Voltage (based on 120V nominal)	Trip Time
RMS Voltage: V=<50%	Trip time: Instantaneous

RMS Voltage (based on 120V nominal)	Trip Time
RMS Voltage: 50% < V < 90%	Trip time: 120 cycles
RMS Voltage: 90% < V < 105%	Normal Operation
RMS Voltage: 105% < V < 120%	Trip time: 30 cycles
RMS Voltage: V >= 120%	Trip time: Instantaneous

The IPP may reconnect when the system is stabilized (i.e. voltage and frequency have returned to normal range for a time as identified by the utility).

9.7. Additional Protection

The utility may require additional protection on a case by case basis. Possible protection may include:

- **Unbalance or negative sequence protection**: The IPP generator is tripped on excessive current unbalance. This is important if fuse protection is used on the primary of the generator step-up transformer or for any other open phase condition
- **Broken delta protection (59G)**: Using a grounded wye-broken delta potential transformer, this protection can facilitate detection of ground faults on ungrounded systems.
- **Rate of change of frequency**: Protection to detect a power island condition.
- **Reverse power protection**: Protection to detect a generator motoring condition.

9.8. Anti-Islanding Protection

Islanding is the condition where the generation facilities and a portion of the distribution system have become isolated from the rest of the system, and continue to operate in isolated mode. Unless agreed upon by the utility, generating facilities shall not be permitted to remain connected to an islanded system, i.e. islanding is not generally allowed. Generation facilities may continue to supply station service loads while disconnected from the interconnection system.

Anti-islanding protection is required to:

- Prevent power quality issues to customers connected to the island,
- Avoid out-of-phase reclosing between the utility and the DR facility, and
- Prevent safety hazards created as a result of back feeding isolated portions of the utility distribution system.

For rotating generators, the IPP must install a transfer tripping scheme using tele-protection signals from the system to separate the DG facility from the distribution system in the event of an islanding condition.

Transfer tripping requirements are also applicable to induction generators, unless the IPP can demonstrate that that there is no potential for self-excitation. For inverter-based generation a detection scheme designed in accordance with the requirements of IEEE 1547 [2] may be acceptable.

The IPP is responsible for damage to the YIS caused as a result of failure to safely separate from the system during an islanding event or subsequently during reconnection to the system following the event.

9.9. Transformer Winding Configuration

The winding configuration of any three phase transformer will have an influence on the location of the protection measurement points and the level of protection required for the IPP interconnection. See Appendix F for examples for typical synchronous generator protection single line diagrams for different transformer configurations.

9.10. Conditions for Connecting to an Energized Distribution System

The IPP system must not energize the utility distribution system when the distribution system is de-energized or following the operation of any interconnection protection functions. The utility will inform the IPP facility when it is safe to reconnect to the distribution system.

Where transfer trip protection is installed, the transfer trip protection must ensure that the generator disconnects before a substation feeder breaker or intermediate automatic circuit reclose (ACR) operation. General requirements are:

- Generator lockout within 0.6 seconds of breaker or ACR opening; and
- Fail-safe lockout within 6 seconds of communication loss.

These conditions will be finalized via the operating agreement between the utility and the IPP.

9.11. Synchronization

Any DG facility able to generate voltage while disconnected from the YIS requires synchronization facilities before connection is permitted.

The IPP facility shall maintain in synchronism with the system while operating in parallel. The generating facility has the responsibility of maintaining synchronization with the system. The utility cannot synchronize to the generating facility. Any proposed synchronizing scheme must be submitted to the utility, prior to the installation.

For synchronous generators, an approved automatic synchronizing device must be provided in all cases where the plant is to be operated unattended. Automatic synchronizing shall be supervised by a synchronizing check relay. Synchronizing controls should satisfy the conditions in Table 3 for synchronous generators.

Table 3: Synchronization Criteria for Synchronous Generators

Aggregate Rating of Generators (kVA)	Frequency Difference (Hz)	Voltage Difference (%)	Phase Angle Difference (degrees)
0-500	0.3	10	20
>500 – 1500	0.2	5	15
>1500	0.1	3	10

Induction generators do not require synchronization since there is no generated voltage prior to connecting to the distribution system. The generator speed shall be brought to within 0.5% of its rated value. These units may be started as induction motors using power from the distribution system provided that these units do not cause unacceptable voltage flicker as specified in Section 7.2 on start - up or on connect/disconnect. The interconnection process of the induction generator shall not create a voltage drop pf greater than 5 percent.

Inverter-type or line-commutating voltage-following equipment does not require synchronization facilities. Operation of the interconnection (or disconnecting of the DR facility) shall not cause voltage drop greater that 5 percent and shall meet the flicker requirements

9.12. Protection from Electromagnetic Interference (EMI)

The influence of EMI must not result in a change in state or mis-operation of the interconnection facility.

9.13. Surge Withstand Performance

The interconnection facility must have the capability to withstand voltage and current surges in accordance with the environments described in IEEE/ANSI C62.41 or C37.90.1

9.14. Batteries and Auxiliaries

Batteries and auxiliaries shall have sufficient capacity to ensure the operation of all DC loads during loss of AC supply. Typically the batteries must be capable of supplying the substation DC load for 8 hours.

9.15. Mitigation of Protection Scheme Failure

Relays with self-diagnostic features, which provide information on the integrity of the protection scheme, should be used whenever possible.

The protection scheme must be designed by a qualified professional engineer, or a competent technical person working with the utility's engineers, to ensure that the self-diagnostic feature is integrated into the overall protection scheme for the safe and reliable operation of the system.

Depending on the scheme and its design, where relays with the self-diagnostic feature do not trip the appropriate breaker(s), sufficient redundant or backup protection must be provided for the system. The malfunctioning relay must also send a signal to notify operating personnel to investigate the malfunction.

9.16. Instrument Transformers used for Protection

Instrument transformers used for protection must comply with CAN/CSA-C60044-6 or IEEE C57.13 [8].

10. Remote Monitoring and Information Exchange

The IPP facility shall provide information in real-time to YEC SCC regarding:

a. Connection or circuit breaker status,
b. Real and reactive power output in kW and kVAR,
c. Load Tap Changer (LTC) position of the interconnecting transformer,
d. Communication and RTU failure alarm,
e. Intelligent Electronic Device (IED)/Relay failed status, and
f. Voltage at the POI.

The communication protocol and the equipment required will be specified by YEC.

The IPP facility shall log the operation of any protective device, including which protection elements operated, and the status of the DG facility including power output, voltage, and current waveforms.

YEC may have additional requirements on a case by case basis.

If it is determined that the IPP facility will have an impact on YEC's Transmission Network, the IPP will be required to provide a Remote Terminal Unit (RTU) or Data Link to a YEC RTU capable of exchanging Supervisory Control and Data Acquisition (SCADA) information with the YEC Control Centre. The protocol for data exchange via the RTU shall be compatible with that used for communications used by YEC. The communication protocol and the equipment required will be specified by YEC.

The IPP will be required to provide the following typical data needed by the (SCADA) system:

a. Individual generator(s) MW and MVAR
b. Individual generator(s) MWh and MVARh
c. Generator(s) breaker status
d. Individual generator on/off status, if no generator breaker exists
e. Total station MW and MVAR
f. Station service MW, MVAR, hourly MWh and MVARh
g. Generator transformer(s) high voltage side breaker(s) and isolator(s) status
h. Bus voltage at high voltage bus
i. PSS status, if applicable
j. AVR status, if applicable
k. AVR voltage setpoint, if requested
l. Total plant MW setpoint, if requested
m. Generator step-up transformer tap setting, if requested

11. Construction

The construction and installation of the IPP's generating facility must meet all applicable statutes, regulations, by-laws and codes. The IPP is responsible for obtaining all permits and complying with all safety and environmental regulations, codes and assessment approvals, if necessary, for the construction and operation of its facilities. Copies of all permits, compliance reports and inspection documents must be provided to the utility prior to energizing the POI.

All single line diagrams provided to the utility must be drawn in accordance with IEEE standards and conventions, and must be stamped by a professional engineer assuming responsibility for the design.

12. Metering

12.1. General

Two meters, primary meter and backup meter, will be required at the IPP facility:

- The utility shall install, own, operate and maintain one meter (primary) necessary for measuring the energy and demand supplied to the YIS, unless otherwise specifically provided in a contract with the IPP. This meter shall remain the sole property of YEC. The meter will comply with Measurement Canada requirements and will be owned and maintained by YEC.
- The IPP shall install, own, operate and maintain the other meter (backup) which does not necessarily have to comply with Measurement Canada requirements.

Generators exporting power onto the distribution system shall be equipped with bi-directional meters with four-quadrant measurement capability. An appropriate number of channels are required for four-quadrant meters to separately record active and reactive power in both the export and the import directions.

The high voltage side of the interconnection transformer is designated as the Measured Billing Point for all energy imported and exported from the IPP facility.

The metering equipment will be:

- Suitable for use in the environmental conditions reasonably expected to occur at the installation site; and
- Appropriate for measuring the power system characteristics reasonably expected to exist at the installation under all power system conditions and events.

The IPP shall provide Measurement Canada Approved instrument transformers. Each meter shall be connected to its own individual core/winding. For the utility meter the IPP shall wire from the instrument transformers to the meter receptacle using CSA-approved tamper resistant conduit and accessories suitable for the utility meter or metering equipment.

For transmission interconnections the IPP will provide burden calculations for proposed instrument transformer secondary wiring, for approval by YEC. If necessary the wiring burden may have to be reduced, by increasing the CT secondary conductor size, to meet Revenue Meter requirements.

The IPP shall supply and install the meter base to meet the utility requirements. The utility will provide the specifications for the meter base during the design phase.

12.2. Meter Requirements

The primary meter supplied by the utility will:

- Be Measurement Canada Approved for revenue metering;
- Be dispensated, with accuracy class ratings for active and reactive energy management as per Table 4;
- Be verified and sealed in accordance with the Electricity and Gas Inspection Act;
- Be capable of maintaining the interval boundaries within 60 seconds of the hour and every quarter hour thereafter;

- Measure all quantities required to determine active energy and reactive energy transferred in the required directions at the Measured metering point;
- Provide a separate register to maintain the continuously cumulative readings of the active energy and reactive energy transferred in the required directions at the Measured metering Point;
- Retain readings and, if applicable, all clock functions for at least 14 days in the absence of line power;
- Be equipped with meter failure alarm and communication failure alarm;
- Communicate all metering and equipment status to the YEC system control centre via the IPP's communication equipment;
- Apply loss compensation (such as line losses) factors where applicable to the revenue meters; and
- The meter shall have an accuracy class of 0.2% or better.

The backup meter supplied by IPP will:

- The backup metering will be of the same accuracy class and capability as the primary metering and shall include all equipment to provide the necessary billing data.
- Be non- dispensated, with accuracy class ratings for active and reactive energy management as per Table 5;
- .

Table 4: Schedule of Accuracies for Dispensated Metering Equipment Approved Under Section 9(2) or Section 9(3) of the Electricity and Gas Inspection Act

Metering Point Capacity (MVA)	Points of Delivery	Points of Supply	Measurement Transformers Accuracy Class
10 and above	1.0%	1.0%	0.3%
10	1.0%	1.0%	0.3%

Table 5: Schedule of Accuracies for Non-Dispensated Metering Equipment Approved Under Section 9(2) or Section 9(3) of the Electricity and Gas Inspection Act

Metering Point Capacity (MVA)	Watthour Meter Accuracy Class	Varhour Meter Accuracy Class
10 and above	0.2%	0.5%
10	0.5%	1.0%

12.3. Measurement Transformers

The applicable winding(s) of the current and potential instrument transformers supplied and installed by the IPP must:

- Be approved by Measurement Canada for revenue metering.
- Be burdened to a degree that does not compromise the accuracy required by this guideline.
- Have a minimum of two cores per instrument transformer. One core connection for the utility meter and the other core connection for the IPP meter.
- Be used solely for metering and not to be used for any other purposes.
- Have an accuracy class rating that equals or exceeds the values specified in Table 4.

12.4. Remote Communications Equipment

The remote communications equipment may or may not be an integral part of the meter or the recorder. However, it must incorporate protocol schemes that will prevent the corruption of data during interval data transmission. The protocol must be suitable for the communications equipment type and nature of the communications media and path.

12.5. Password Protection

Two or more levels of password protection will be required for each meter data collection agency. One level is for full access to set time functions and a second level is for read only access to interval data and event logs.

12.6. Safety Requirements

The facility installation must conform to:

- Measurement Canada Standard Drawings;

- AEUC [4];
- CSA Standard C22.2 General requirements - Canadian electrical code, part II [7] ; and
- ANSI/IEEE C57.13-2016 IEEE Guide for Grounding of Instrument Transformers [8].

13. Interconnection Tests

13.1. General Testing Requirements

The IPP must notify YEC (and AEY if the interconnection is via the AEY distribution system) in writing at least three weeks prior to the initial energization and start-up testing of the IPP generation facility. YEC may witness any testing of the equipment and protection schemes associated with the interconnection. Tests must align with the requirements specified in IEEE 1547 and CSA 22.3 No 9-08.

13.2. Type Testing

Type testing is considered an acceptable method of verification where suitable and applicable equipment standards exist, and must be performed once for each specific protection scheme. All interconnection equipment must include a type testing procedure as part of the documentation in order to determine the protection settings meet the requirements set forth within this technical guide. A type test may be performed on one device of a combination of devices. In a case of a combination of devices which comprise a system, the testing will demonstrate that the devices are able to operate as a system.

The type tests shall be performed on a representative unit or system, either in a factory, testing laboratory, or in the field. Results from a resource within a similar product family or design, including hardware or software, shall be acceptable as a representative within the same product family where ratings are within 50% to 200% of the tested resource.

The following type tests must be performed in accordance with IEEE 1547.1 [9]:

- Temperature stability
- Response to abnormal frequency
- Response to abnormal voltage
- Synchronization
- Interconnection integrity
- Unintentional islanding
- Open phase
- Reconnect following abnormal condition disconnect
- DC injection (for inverters without interconnection transformers)
- Harmonics

13.2.1. Temperature Stability

The temperature stability test verifies the interconnection equipment maintains measurement accuracy of parameters over its specified voltage range.

13.2.2. Response to Abnormal Frequency

This test verifies the interconnected generation facility ceases to energize the connected system as specified to IEEE 1547.1 with regards to abnormal frequency.

13.2.3. Response to Abnormal Voltage

This test verifies the interconnected generation facility ceases to energize the connected system as specified to IEEE 1547.1 with regards to abnormal voltage.

13.2.4. Synchronization

This test verifies the interconnected IPP facility will accurately and reliably synchronize with the utility as per IEEE 1547.1.

13.2.5. Interconnection Integrity

The interconnection integrity test verifies the IPP facility meets the surge withstand requirements as specified in Section 9.14 when tested in accordance with IEEE 1547.1.

13.2.6. Unintentional Islanding

Where YEC requires an anti-islanding protection function (other than transfer trip) or minimum import power levels, this test verifies that an IPP facility will cease to energize in accordance with IEEE 1547.1.

13.2.7. Open Phase

The open phase test verifies that the IPP facility will cease to energize the utility interconnection upon the loss of an individual phase on the distribution network when tested in accordance with IEEE 1547.1.

13.2.8. Reconnect following Abnormal Condition Disconnect

This test verifies the functionality of the IPP facility interconnection component or system reconnect timer, which shall delay the reconnection to the utility following a trip event prior to the distribution system stabilization, as specified in Section 9.11.

13.2.9. DC Injection (for Inverters without interconnection transformers)

This test verifies that an inverter-based IPP facility will comply with the DC current inject limit specified in Section 7.9 when tested in accordance with IEEE 1547.1.

13.2.10. Harmonics

The individual current harmonics and the total demand distortion (TDD) of the IPP facility shall be measured and recorded under normal operating conditions to ensure the values are within the limits specified in Section 7.1

13.3. Production Tests

Production tests shall be conducted on each IPP generating unit and interconnection equipment prior to delivery to verify they meet the applicable standards and verify the operability of every generating unit manufactured for customer use.

The tests assume the equipment has met the applicable interconnection and interoperability requirements of the applicable standards and may be conducted as a factory test or performed as part of an evaluation or commissioning test. Facilities with adjustable set points shall be tested at a single

series of test points specified by the manufacturer. The summary report must provide a list of normal and abnormal performance category capability, final function settings, and final operating mode settings.

The following production tests are specified within IEEE 1547.1:

1. Response to abnormal frequency
2. Response to abnormal voltage
3. Synchronization

14. Commissioning Tests and Verifications

14.1. General

Commissioning tests are tests and verification on the IPP facility equipment to confirm the system as delivered, designed, and installed meets the interconnection and interoperability requirements of this guide and the applicable standards. These tests include visual inspections, and may include operability and functional performance tests as required.

Prior to the energization of the IPP facility, or changes to the facility, verification testing must be performed and coordinated with the utility. After the equipment is installed and ready for operation, the testing must be performed by a qualified individual in accordance the manufacturer's published test procedures, or IPP developed procedures that have been approved by the utility. Qualified individuals include: licensed, professional engineers; factory-trained and certified technicians and licensed electricians experienced in testing protective equipment. The utility reserves the right to witness the verification test or to require written certification that the test was performed.

Verification testing must also be performed annually or when major system upgrades or modifications are carried out.

14.2. Interconnection Verifications and Inspections

The following commissioning tests and inspections shall take place:

a. Final IPP facility protection settings shall be verified, recorded, and provided to the utility. A sample protective settings commissioning report is located in Appendix G.

b. Visual inspection shall ensure the grounding coordination requirements in Section 8.5 have been met.

c. Visual inspection shall ensure the presence of a disconnecting means in accordance with Section 8.3 has been met.

d. The polarities, burdens, and ratios of field wired instrument transformers shall be verified as correct and in accordance with the design documentation.

e. Field installed power and control wiring shall be verified to be in compliance with drawings and manufacturer requirements.

f. For three-phase systems, the phase rotation of the distribution system and the IPP facility as installed shall be verified as compatible.

g. All monitoring and information exchange provisions shall be verified as functional in accordance with Section 10.

h. Calibration checks of each protective relay or the equivalent protection device shall be performed using injection of appropriate ac quantities, secondary injection, or set-point adjustment verification.

i. Functionality of the protective relays or the equivalent protection device, circuit breakers, and telecommunications equipment shall be tested to verify the system operates as intended.

j. Load tests of protective relays or the equivalent shall be conducted immediately after energization, where applicable.

k. The ohmic value and connection of the transformer neutral impedance grounding device shall be verified as correct.

l. Upon loss of DC power supply to the protective relays or the equivalent protection device, it shall be verified the protection scheme activates the interconnection circuit breaker.

m. Upon loss of a communication signal, it shall be verified the fail-safe transfer trip occurs when required by the utility in accordance with Section 9.8.

n. Inverter operation must be verified annually by operating the load break disconnect switch and verifying the generation facility shuts down and does not restart for five minutes after the disconnect switch has closed.

o. Any system depending on a battery for trip power must be checked for proper voltage and logged monthly. Once every four years, the battery must be replaced or a discharge test performed.

p. The IPP shall submit to the utility the station LAN design architecture for review during the conceptual design phase of the project.

q. The IPP is responsible for all hardware design, RTU drawings, installation, testing and commissioning.

r. The IPP shall prepare a preliminary but tested version of the RTU Configuration and a preliminary version of the Point Assignment, and send them to the YEC SCC, together with all RTU drawings, P&C drawings and DNP point lists of all LAN devices, at least ten weeks before the in service date.

s. The IPP and YEC SCC shall jointly test all control, status and analog points and confirm visibility at the SCC.

14.3. Disconnection Means Operability

Prior to the operation of the IPP facility, the disconnecting means provided in accordance with Section 8.3 operates as intended.

14.4. Energization Cessation

Tests shall be conducted in accordance with IEEE 1547.1 to verify the functionality of the protection that ensures the IPP facility does not energize the utility under the following conditions described within this standard:

1. Abnormal frequency
2. Abnormal voltage
3. Protection scheme failure

Additional protection functions shall also be verified in accordance with IEEE 1547.1 as needed. The following protective functions must be verified if used at the IPP facility:

1. If available, the anti-islanding function must be checked by operating a load break disconnect switch and verifying that the IPP facility ceases to energize the output terminals and does not restart once the load break disconnect switch has reclosed.
2. If reverse power or minimum power function is used to meet the interconnection requirements, the functionality must be tested using secondary injection techniques. Alternatively, this

function can be tested by the means of a local trip test or by adjusting the IPP output and local loads to verify that the applicable non-export criterion are met.

14.5. Re-Verification

Re-verification of the interconnection and interoperability requirements may be required when any of the following occurs:

- Functional software of firmware changes have been made to the IPP facility equipment;
- Any hardware component of the facility has been modified in the field, been replaced or repaired with parts that are not substitutive components compliant with the applicable standards;
- Protection settings have been changed after factory testing; or
- Protection functions have been adjusted after the initial commissioning / verification process.

15. Maintenance

The IPP has full responsibility for the maintenance of its equipment, up to the Point-of-Interconnection, consistent with the Interconnection Agreement and this Guide. The IPP shall maintain the facilities in accordance with Rule 2-300 of the Canadian Electrical Code to ensure safe parallel operation with the YEC or AEY system. Failure to do so may result in disconnection of the IPP generation facility.

The IPP must present to the utility the planned maintenance procedures and a maintenance schedule for the interconnection protection equipment, and keep records of such maintenance.

The utility reserves the right to periodically inspect the interconnection protection system to verify that it meets the requirements outlined in this document.

Maintenance procedures up to the POI will be performed in accordance with good utility practice and the utility's policies and procedures.

16. Marking and Tagging

The disconnect switch must be clearly marked as the "IPP Disconnect Switch" and tagged with an identification number approved by the utility. The IPP must follow the utility's switching, clearance and tagging procedures. The utility is responsible to instruct the IPP in this regard.

The IPP switchgear equipment must include the manufacturer name and the manufacturer's serial number.

17. Modification of Installation

The IPP shall obtain written approval from the utility before commencing any modification to the generation facility. If the change requires the installation or modification of equipment, the IPP shall provide documentation that the new equipment meets the requirements of Type and Production tests.

If the changes require modifications to the protection and controls information the IPP must obtain approval from the utility for the proposed modifications. Whenever changes are made to interconnection hardware or software that can affect the functions listed below, the potentially affected functions must be retested:

- Over-voltage and under-voltage
- Over-frequency and under-frequency
- Non-islanding function (if applicable)
- Reverse or minimum power function (if applicable)
- Inability to energize dead line
- Time delay restart after utility outage
- Fault detection, if used
- Synchronizing controls (if applicable)

To ensure that commissioning tests are performed correctly, the utility may require the ability to witness the tests and receive written certification of the results.

18. Technical Data Requirements

The following outlines the minimum data required at various stages for planning, design and commissioning the IPP's project. This data is required by YEC (and AEY if connected to AEY distribution system) to ensure suitable steps are taken to interconnect the IPP facility to the YEC system. Expanded data requirements for the proposal and design stages are located in Appendix A and Appendix B. The IPP Policy (in development as of June 2018) shall apply.

18.1. Proposal Stage

During the proposal stage the IPP Facility conceptual design must be submitted before any further detailed studies is approved by the utility. The list of information to be provided for this approval may be the result of preliminary discussions with the utility. Based on the information provided by the IPP, the utility will provide their proposition, their commitment and their own requirements concerning the connection of the IPP facility.

The following list of drawings and data required for the proposal stage of the project includes, but is not limited to:

- A Single Line Diagram (SLD)showing the following :
    - The proposed protection relays, circuit and fuses with fuse type and rating,
    - The connections of all substation equipment with voltage levels and equipment ratings
    - The location of the revenue metering equipment.
- Description of protection scheme
- Generating station site plan showing the layout and location (coordinates) of the generating plant and the location of lockable, "visible" disconnect device
- Based on the size of the project the utility may require more additional generator, exciter and speed governor data for a preliminary interconnection study.

18.2. Approval (Design) Stage

Once the project has been approved by the utility the IPP will proceed to submit the facility detailed design.

The following list of drawings and data required for approval stage of the project includes, but is not limited to:

- Single Line Diagram
- Description of protection scheme
- Control schematic
- Protection and control philosophy
- Major equipment nameplate schedules and statements
- Fuse and protective relay coordination study and settings
- Current transformer characteristic curve
- Measurement Canada approval numbers for instrument transformers

- Generating station site plan showing the layout and land location coordinates and legal description. The drawing should also show the proposed terminal pole or service manhole with the routing of aerial line or underground cables from utility to the generating station.
- SCADA Diagram
- Obtaining all permits and complying with all safety and environmental regulations, codes and assessment approvals, if necessary, for the construction and operation of its facilities.
- Proposed In-Service Date

18.3. Verified Stage

When the project is nearing completion, the IPP must submit the proposed testing, commissioning and start-up procedures to be performed before the facility is connected to the YIS.

The following list of drawings and data required for commissioning and verification stages of the project includes, but is not limited to:

- Commissioning report
- Copies of all permits, compliance reports and inspection documents
- Final Single Line Diagram
- Final protection scheme
- Final control schematic
- Protection and control philosophy
- Major equipment nameplate schedules, statements, test reports and data sheets
- Final fuse and protective relay coordination settings
- Current transformer characteristic curve
- Final generating station site plan showing the layout and land location coordinates and legal description

D.1 Modelling Information

In some cases, a generator (or the aggregate generation on a line) is large enough that adjacent customers or the dynamic stability of utility's distribution system could be affected. The IPP is responsible for the cost of any required transient or dynamic stability studies, and the studies must be done in a manner suitable to, and approved by, the utility.

IPPs are responsible for ensuring the data they submit provides an adequate mathematical representation of the facility's electric behavior. If the data is not available prior to purchasing equipment, it must be submitted as soon as it becomes available.

The studies must accurately determine:

1. The impact of the IPP's facility on adjacent customers of the utility.
2. The dynamic stability, in aggregate, of the utility system.

Data may be supplied by the manufacturer or acquired directly by testing. It must include generator characteristics (i.e., speed, reactance, resistance, excitation system etc.) and governor characteristics (i.e., lead time/lag time constants, valve or gate opening data etc.).

The information requirements vary for induction generators and inverter generators, and for hydro or thermal systems.

Appendix C

Information Provided by the Utility

Appendix C

Information Provided by the Utility

After receiving the application for interconnection, the utility will provide the following information to the IPP, if required:

a. Single Line Diagram or maps of the system up to the POI.
b. Minimum and maximum 60 Hz source impedances (positive-sequence, negative- sequence and zero-sequence) at the POI.
c. Maximum and minimum normal and emergency system operating voltage ranges at the POI.
d. Harmonic impedance envelope at the POI if available.
e. Planning, operating and reliability criteria, standards and policies.
f. The results of a planning study (e.g. the System Impact Study) documenting the availability of the requested amount of system capacity and any other specific technical issues to be addressed.
g. Cost estimates and time schedule to build the upstream facilities.
h. Characteristics and settings of protection on the distribution system.
i. Costs to implement any required changes to the distribution system that are identified by the System Impact Study.

Some or all of this information will be required by the IPP to properly design the interconnection protection. The utility will identify when the costs of producing this information are to be assigned to the IPP.

Appendix D

Applicable Codes and Standards

Appendix D
Applicable Codes and Standards

D.1 Primary Standards

CSA Standard C22.3 No. 9-08 (R2015) Interconnection of Distributed Resources and Electricity Supply Systems

IEEE Standard 1547-2018 Standard for Interconnecting Distributed Resources with Electric Power Systems with Associated Electric Power Systems Interfaces

Power Quality Standards

ANSI C84.1-2016 American National Standards for Electric Power Systems and Equipment Ratings (60 Hertz). Establishes nominal voltage ratings and operating tolerances for 60 Hz electric power systems from 100 V through 1200kV.

IEEE Std. 493-2007 IEEE Recommended Practice for Design of Reliable Industrial and Commercial Power Systems (IEEE Gold Book).

IEEE Std. 519-2014 IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems.

IEEE Std. 1100-2005 IEEE Recommended Practice for Powering and Grounding Sensitive Electronic Equipment (IEEE Emerald Book).

IEEE Std. 1159-2009 IEEE Recommended Practice for Monitoring Electric Power Quality.

IEEE Std. 1250-2011 IEEE Guide for Identifying and Improving Voltage Quality in Power Systems.

In addition to the power quality standards, the following standards are applicable to the interconnection of generation facilities to YEC's system:

IEEE Std. 100 - 2000 IEEE Standard Dictionary of Electrical and Electronics Terms.

IEEE Std 315-1975 (Reaffirmed 1993) ANSI Y32.3-1975 (R1989) CSA Z99-1975 Graphic Symbols for Electrical and Electronics Diagrams (including Reference Designation Letters).

IEEE Std 929-2000 IEEE Recommended Practice for Utility Interface of Residential and Intermediate Photovoltaic (PV) Systems.

C37.1-2007 ANSI/IEEE Standard Definitions, Specifications and Analysis of Systems Used for Supervisory Control, Data Acquisition and Automatic Control.

C37.2-2008 IEEE Standard Electrical Power System Device Function Numbers, Acronyms, and Contact Designations.

C37.18-1979 ANSI/IEEE Standard Enclosed Field Discharge Circuit Breakers for Rotating Electric Machinery.

C37.20.1-2015 ANSI/IEEE Standard for Metal-Enclosed Low-Voltage (1000 Vac and below, 3200 Vdc and below) Power Circuit Breakers Switchgear.

C37.20.3-2001 ANSI/IEEE Standard for Metal-Enclosed Interrupter Switchgear.

C37.24-2017 ANSI/IEEE Standard for Evaluating the Effect of Solar Radiation on Outdoor Metal-Enclosed Switchgear.

C37.27-2015 ANSI/IEEE Standard Application Guide for Low-Voltage AC (635 V and below) Power Circuit Breakers with Separately Mounted Current-Limiting Fuses.

C37.29-1981 ANSI/IEEE Standard for Low-Voltage AC Power Circuit Protectors Used in Enclosures.

C37.50-1989 ANSI Standard Test Procedures for Low-Voltage AC Circuit Breakers Use In Enclosures.

C37.51-1989 ANSI Standard Conformance Test Procedure for Metal Enclosed Low- Voltage AC Power Circuit-Breaker Switchgear Assemblies.

C.52-1974 ANSI Standard Test Procedures for Low-Voltage AC Power Circuit Protectors Used in Enclosures.

C57.12-2015 IEEE Standard General Requirements for Liquid Immersed Distribution, Power and Regulating Transformers.

C57.12.13-1982 Conformance Requirements for Liquid Filled Transformers Used in Unit Installations including Unit Substations.

C57.13.1-2006 IEEE Guide for Field Testing of Relaying Current Transformers.

C57.13.2-2005 IEEE Standard Conformance Test Procedures for Instrument Transformers.

C37.58-2003 (R2010) ANSI Standard Conformance Test Procedures for Indoor AC Medium- Voltage Switches for Use in Metal-Enclosed Switchgear.

C37.90-2005 ANSI/IEEE Standard for Relays and Relay Systems Associated with Electric Power Apparatus.

C37.90.1-2002 ANSI/IEEE Standard Surge Withstand Capability (SWC) Tests for Protective Relays and Relay Systems.

C37.90.2-2004 ANSI/IEEE Standard Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Transceivers.

C37.95-2014 IEEE Guide for Protective Relaying of Utility Consumer Interconnections.

C37.98-2013 ANSI/IEEE Standard for Seismic Testing of Relays.

IEC 1000-3-3 Limitation of Voltage Fluctuations and Flicker in Low-Voltage Supply Systems for Equipment with Rated Current Less than 16A.

IEC1000-3-5 Limitation of Voltage Fluctuations and Flicker in Low-Voltage Supply Systems for Equipment with Rated Current Greater than 16A.

UL1008 Transfer Switch Equipment.

UL 1741 Standard for Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources

NEMA LA 1-2009 Surge Arresters.

NEMA MG 1-2016 Motors and Generators

Appendix E

Sample Operating Agreement

Appendix E
Sample Operating Agreement

1. Purpose

This agreement outlines the steps to take to ensure a reliable and safe interconnection between the IPP and YEC and/or AEY through a variety of circumstances.

2. Definitions

Operating Authority: The organizational unit assigned responsibility for operating a portion of the electrical system. For each utility the YEC System Control Center (SCC) operator is the operating authority. For the IPP, the *<IPP Contact>* is the operating authority.

Operational Boundary/Interface Point or Point of Interconnection: The location on the electrical system at which responsibilities between Operating Authorities meet. The breaker *<Breaker ID>* is the interface point between the IPP and the utility.

3. Operational Information

Circuit Breaker Identification

List circuit breakers providing interconnection between IPP and the utility.

3.1 Interlocks

List identified circuit breaker interlocks with sequence information

3.2 Contact Information

SCC – Phone (867) *XXX-XXXX* or (867) *XXX-XXXX* (recorded lines)

Contact Name	Title	Phone Number
<Utility Contact>	Leadhand SCC	(867) *XXX-XXXX*
<Utility Contact>	Operation Coordinator	(867) *XXX-XXXX*
<Utility Contact>	Manager Operations	(867) *XXX-XXXX*
<Utility Contact>	Director of Operations	(867) *XXX-XXXX*
<IPP Contact>	<Contact Position>	(867) *XXX-XXXX*

3.3 Normal Operation

Under normal operating conditions the IPP facility will be connected to the utility grid. The breakers status under normal operating conditions is as follows.

Breaker	**Status**
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*
<Breaker ID>	*Open/Closed*

4. Operating Procedures

4.1. Line L### (<Utility Line> to <IPP Facility>) Isolation

L### isolation requires the minimum notification defined in section 4.3, with the exception of emergency repairs. The utility will provide a Condition Guarantee on breaker <Breaker ID>. The Condition Guarantee is used in communications between external parties. It is a formal method of communication that switching has been completed. It ensures the status of the breaker/device will not change until the work is complete, the lock out tag out is surrendered and all workers are clear.

4.2. Voltage Support

Based on the power quality conditions defined in Schedule <*X*> of the Power Purchase Agreement (PPA) and system security requirements, SCC may request voltage support. Voltage support can be accomplished by placing IPP generation on line, or other means such as capacitor banks or transformer tap changing. If such support is part of the operating agreement then:

- When the IPP has generation online, the generators regulate the generator bus voltage between 100 and 105% of nominal and the utility shall have control of this set-point. Generators reactive output will be adjusted by the utility in real time, to regulate the system voltage, by pulsing the AVR voltage set-points. The IPP sets the acceptable range within which the utility can adjust voltage.
- The utility must have full SCADA visibility of the IPP substation and control of critical elements.

4.3. SCC Remote Monitoring and Control

- SCC will have visual indication of the IPP breakers, generator status, capacitor status and electrical measurement information for the IPP facility.
- The utility control will be limited to:
    - Approving requests from the IPP to connect and disconnect from the utility system
    - Approving requests from the IPP for changes in generation output
    - Requesting the IPP to disconnect from the utility system for operational and safety reasons
- All IPP requests must be communicated and approved by the utility
- The utility shall have control (open and close) of incoming line breaker <*Breaker ID*> at the IPP facility.

5. Operational Notification

5.1. Daily Operating Communications

Under normal operating conditions IPP will be supplying <*XXX*> kW to the YIS. Generation changes of more than <*XXX*> kW must be communicated and approved by the utility.

5.2. The transition from winter to summer and conversely summer to winter generation levels must be established with SCC with a minimum of 30 days' notice.

5.3. IPP Facility Planned Maintenance and Scheduling

The IPP shall operate under the utility approved maintenance procedures established.

To meet changing operating conditions and coordinate maintenance efforts, maintenance shutdowns by the IPP need to be communicated to SCC at least one week in advance for shutdowns of up to 12 hours and 30 days for shutdowns longer than 12 hours. Changes in the availability and capacity of the onsite generation need to be communicated to SCC. The utility and the IPP shall share annual shutdown/maintenance plans in February of each year.

5.4. Transmission and Distribution Maintenance and Scheduling

The utility performs annual line maintenance on its transmission and distribution lines, during which grid power to the IPP facility may be curtailed or suspended. The duration of this annual maintenance can be up to 14 days per calendar year.

The utility will provide a minimum of 30 days' notice of the start date and expected duration of work that will curtain or otherwise interrupt the supply of grid power to the IPP facility.

6. Loss of Supply Procedures

6.1. Loss of Supply - Short Term

In the event of a disturbance that results in the loss of grid power to the IPP facility, SCC will make one attempt to re-energize the line to the IPP facility. If successful the following steps apply to resume the IPP facility operation with grid power.

a) SCC will confirm the status of the breakers located at the IPP's POI.

b) SCC will request closed breaker <Breaker ID>.

c) Once complete and with confirmation from SCC the IPP facility may proceed with the restarting of their operation. The IPP will communicate to SCC on generation greater than <XXX> kW. The request to increase generation may be communicated verbally or via SCADA.

6.2. Loss of Supply - Long Term

In the event of a disturbance that results in the loss of grid power to the IPP facility and SCC is unsuccessful in re-energizing the line the following steps will apply.

a) SCC will confirm the status of the breakers.

b) At the direction of SCC the IPP personnel will start and stage their generation on line supplying power to the IPP facility.

c) Once the line to the IPP facility has been re-energized, SCC will request the IPP synchronize and close its POI breaker.

d) The IPP facility is now connected to YEC system. Once complete and with confirmation from SCC the IPP facility may proceed with resuming generation. The IPP will communicate to SCC on generation increases greater than *<XXX>* kW. The request to load up may be communicated verbally or via SCADA.

7. Revision and Approval

7.1. This Agreement comes into effect once it is signed by the IPP and the utility.

7.2. This Agreement will remain in effect unless cancelled upon the mutual agreement of both Parties.

7.3. The Parties shall provide 90 days' notice in writing of the intention to modify the Agreement.

7.4. The Agreement may be revised upon mutual agreement of both Parties. The agreement will be formally reviewed every two (2) years.

JOINT OPERATING PROCEDURE

(Please see attached)

		DEPARTMENT:	INQUIRIES TO:	TOPIC:
yukon energy	**JOINT OPERATING PROCEDURE**	Operations	Guy Morgan, Director, Operations	IPP / AEY / YEC Operating Agreement
		ISSUED DATE:	**REVIEW DATE:**	**APPROVED BY:**
		May x, 2020	May 3, 2021	President & CEO

1.0 Purpose

1.1 This agreement defines the operating arrangement between the **536774 Yukon Inc. dba Solvest Inc.** (IPP), ATCO Electric Yukon (AEY) and Yukon Energy Corporation (YEC). This agreement defines the roles and responsibilities for each entity to allow the IPP to operate reliably and safely on the Yukon Power System (YPS).

2.0 General Information

2.1 Breaker Identification

Breaker	Description
Switch #1	Connection between the IPP and AEY distribution

2.2 Definitions

a) **Operating Authority** The organizational unit assigned responsibility for operating a portion of the electrical system.

- For YEC the SCC operator is the operating authority and is responsible for the system generation and security.
- For AEY the Supervisor of Operations is the operating authority and is responsible for the distribution system and security.
- For the IPP the Technical Coordinator is the operating authority of their generation and associated equipment.

b) **Operator in Charge (OIC)** The worker designated by the Operating Authority to coordinate control of the power system or portion thereof, in accordance with the requirements of established operating standards and procedures.

c) Power Systems Work Standards (PSWS) The standards that workers will utilize for establishing conditions on the power system that will, when combined with appropriate work standards, procedures and methods, provide a safe work area.

d) **Condition Guarantee (COG)** Formal assurance to another Operating Authority or Operator in Charge (OIC) that identified devices are in the position requested and will not change status until the device status request is formally released by the requestor.

e) **Point of Interconnection (POI)** The location on the electrical system at which responsibilities between Operating Authorities meet. The IPP Switch – S6359 is the interface point between IPP and AEY.

2.3 YEC Contact Information

- SCC (System Control Center) – phone (recorded lines) 393-5355 or 393-5324
- Mike Hannah (Leadhand SCC) 393-5399, cell 334-6759
- Myles O'Brien (Operation Coordinator) 393-5352
- Ed Peake (Manager Operations) 393-5383, cell 334-6586
- Guy Morgan (Director of Operations) 393-5366, cell 334-6904
- YEC Group Email – SCC@yec.yk.ca

AEY Contact Information

- Tony Badry - Supervisor of Operations 633-7057, cell 335-4002
- Matt Johnson – Operator in Charge 633-7009, cell 334-3145

Control Room Desk

- Dispatch 633-7022
- Brock Kelsch 334-7239

IPP Contact Information

- Brock Kelsch bkelsch@solvest.ca

2.4 Normal Operation

Under normal operating conditions the IPP will generate into the Yukon Power Grid. The breakers status under normal operating conditions are as follows.

Breaker	Status
Switch #1	Closed

3.0 Operating Procedures

3.1 Planned 5L645 (IPP to AEY) Isolation

5L645 isolation requires the minimum notification defined in section 5.1, except for emergency repairs. AEY will provide a condition guarantee on S6359 - Condition Guarantee will be issued in accordance with **Section 800** of the PSWS – **Operating Interface Points.**

3.2 Planned 5L645 (AEY to IPP) Isolation
5L645 isolation requires the minimum notification defined in section 5.2, except for emergency repairs. IPP will provide a condition guarantee on S6359 - Condition Guarantee will be issued in accordance with **Section 800** of the PSWS – **Operating Interface Points**

3.3 SCC Remote Monitoring
SCC will have visual indication of IPP breakers, PV status, and electrical measurement information from the IPP site.

4.0 Power Quality Requirements

4.1 IPP will operate IPP Facilities in accordance with the power quality requirements of YEC as set out in the System Interconnection Guidelines (Schedule D).

5.0 Operational Notification

5.1 IPP Planned Maintenance and Scheduling

To meet changing operating conditions and coordinate maintenance efforts, maintenance shutdowns by the IPP need to be communicated to SCC / ATCO OIC at least one week in advance for shutdowns of up to 12 hours and 30 days for shutdowns longer than 12 hours.

Planned changes in the availability and capacity of the onsite generation needs to be communicated to SCC / ATCO OIC at least 30 days in advance of such changes.

Unplanned availability should be conveyed as soon as possible.

The Parties will share annual shutdown/maintenance plans in February of each year and plan to minimize the impact on IPP generation potential by scheduling outages during off-peak generation months where practicable.

5.2 AEY Distribution Maintenance and Scheduling:

a) AEY performs annual line maintenance on the distribution lines, during which connection to the IPP may be curtailed or suspended. The duration of this annual maintenance can be up to 14 days per calendar year.

b) AEY will provide a minimum of 5 working days' notice of the start date and expected duration of work that will curtain or otherwise interrupt the supply of IPP generation to the YPS.

6.0 Loss of Supply Procedures

6.1 Loss of Supply - Short Term

In the event of a disturbance that results in the loss of the grid connection to the IPP the IPP generation will remain off-line until approval from AEY and YEC.

The following steps apply to resume IPP operation with Grid Electricity.

a) SCC will confirm the status of the breaker located at IPP site. If SCADA communications are down the switch status will be physically verified and reported to AEY before 5L645 will be energized.

Breaker	Expected Status
Switch #1	Open

b) The following switching sequence will be followed to re-energize L### and synchronize IPP back to grid supply.

Step	Switch Sequence	Operation
1	Confirm 5L645 Energized	IPP/AEY
2	Switch #1 Closed	IPP
3	IPP starts system	IPP/YEC

c) Once complete and with confirmation from SCC**,** IPP may proceed with the restarting of their operation. IPP Group will communicate to SCC once their system is back on line.

6.2 Loss of Supply - Long Term

In the event of a disturbance that results in the loss of the grid connection to the IPP the IPP generation will remain offline until approval from AEY and YEC.

a) SCC will confirm the status of the breaker located at IPP site. If SCADA communications are down the switch status will be physically verified and reported to AEY before 5L645 will be energized.

Breaker	Expected Status
Switch #1	Open

b) The following switching sequence will be followed to re-energize 5L645 and synchronize IPP back to grid supply.

Step	Switch Sequence	Operation
1	Confirm 5L645 Energized	IPP/AEY
2	Switch #1 Closed	IPP
3	IPP starts system	IPP/YEC

7.0 Revision and Approval

7.1 This Agreement comes into effect once it is signed by IPP, AEY and YEC.

7.2 This Agreement will remain in effect unless cancelled upon the mutual agreement of both Parties.

7.3 The Parties will provide 90 days' notice in writing of the intention to modify this Agreement.

7.4 The Agreement may be revised at any time if operational needs require and are mutually agreed to by all Parties. This agreement will be formally reviewed every two (2) years.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application 3-8**

TAB 3 - REVENUE REQUIREMENT

1 Labour expense is generally a function of the following factors:
2 **Labour Rates** – This includes factors such as base pay, benefit cost, annual increments
3 (performance increments, cost of living adjustments), etc.

QUESTION:

a) Please explain how performance increments are assessed and valued.

ANSWER:

(a)

Yukon Energy Corporation employs two employee groups: In Scope and Out of Scope.

Performance increments are applied to these groups according to their applicable agreement. In Scope employees' pay, performance and job evaluation are governed by the Collective Agreement between Yukon Energy Corporation and P.S.A.C. Y024 as well as Human Resource Policy HR-003 (excerpted below). Management and Professional employees' pay and performance are administered according to the agreement between Yukon Energy Corporation and Management and Professional Employees.

It is noted that both of these agreements expired December 31, 2019. The Union and Yukon Energy Corporation agreement will be going to Interest Arbitration on April 6 – 7, 2021 to facilitate ratification of the contract.

In Scope (Unionized employees)

Yukon Energy relies on an established procedure within its Collective Agreement to guide both the percentage and timing of performance increments. Article 14: Wage Administration is the established agreement for these increments.

At time of hire, management offers a salary within the wage band of the position evaluation, based on the individual's experience and time in the trade or industry they are

entering at Yukon Energy. Then, the Corporation stewards to the expectations of Article 14.02 (below) whereby an employee is advanced 3% in the wage range subject to satisfactory performance. Then, 3% increments are earned every six months, based on satisfactory performance, until the employee reaches the top of the pay band.

Once at the top of the pay band, an employee receives any yearly negotiated economic increase.

Additional increments can occur when:

- An employee is promoted (see Article 14:04)
- A position is re-evaluated (see Article 22)

Yukon Energy reviews the performance of all employees on a yearly basis.

Out of Scope (Management and Professional Employees)

YEC relies on an established procedure within its Management and Professionals Agreement to guide both the percentage and timing of performance increments. This is found in Section 9 and Section 10 of the Management and Professionals Agreement (excerpted below). Management and Professional Employees' performance is evaluated based on the level of performance in relation to performance objectives and job responsibilities.

Job Evaluation

In Scope

Yukon Energy relies on the procedures are set out in the collective agreement with respect to Job Evaluation. This procedure is stated in Article 22: Job Evaluation (below).

Out of Scope

Yukon Energy relies on Korn Ferry, an independent contractor, for the evaluation of all jobs. Yukon Energy participates in the salary benchmarking service provided by Korn Ferry whereby our jobs are compared against the market and our peers (utilities), adjusted

for our geographical location.
The Korn Ferry Hay Job Evaluation Method relies on these principles in determining a job profile:

- Know-How
  - Practical / technical knowledge
  - Planning, organizing and integrating (managerial) knowledge
  - Communicating and influencing skills
  - Scope of knowledge required and the depth of understanding needed for the job
- Problem Solving
  - Thinking environment – freedom to think
  - Thinking challenge – complexity of the problems encountered and the extent to which original thinking must be employed to reach decision
- Accountability
  - Freedom to act
  - Nature of impact
  - Magnitude of impact
- Working conditions
  - Physical demands
  - Mental pressures

Article 14
Wage Administration

14.01 New employees entering the service of the Corporation will be appropriately placed within the wage range at the discretion of the Corporation.

14.02 On the first of the month following successful completion of the probationary period, an employee will be advanced 3% in the wage range subject to satisfactory performance. Thereafter, 3% increments reflecting progression through the range will be semi-annually based on the employee's anniversary date, subject to satisfactory performance.

14.03 The Employer acknowledges the value and importance of timely performance evaluations, and further agrees to maintain a performance evaluation policy through the Joint Consultation Committee.

14.04 When a promotion occurs, the employee concerned shall be placed in that position within the new range which reflects an increase in wage which shall be no less than 3% in the range from which they were promoted up to the maximum of the new pay range.

14.05 If an employee is accepted under a posting for a lower level job or is transferred at their own request, they will be appropriately placed within the wage range for such job at the discretion of the Corporation.

14.06 An employee temporarily assigned, in writing, for a period of more than two (2) continuous working days to a position of higher classification shall, from the first day, be paid;

a) The minimum wage for the temporary position where that minimum is more than four percent (4%) above their present wage; or
b) Receive four percent (4%) where their wage or temporary assignment does not exceed the maximum of the range for the temporary position; or
c) Where the application of (b) above would provide for a temporary assignment which would exceed the maximum of the range for the temporary position, the employee would receive the maximum rate in the range for the temporary position.

Article 22
Job Evaluation

22.01 a) The parties agree the Job Evaluation Plan developed jointly and signed-off shall form part of the Collective Agreement.

b) The Employer agrees that any changes to the Plan factor or factor weightings shall be subject to agreement between the parties.

22.02 a) When new positions are established, an independent consultant trained in job evaluation and mutually agreed upon by both parties, shall evaluate the jobs and shall notify the parties thereof within fifteen working (15) days of the evaluation being completed.

b) When significant differences, or changes, in job content effect the existing job evaluation to the extent that the Union or an employee request that the job be re-evaluated, the following procedure shall be followed:

(i) An employee or the Union shall initiate a written request to HR for a job

to be re-evaluated within fifteen working (15) days of significant changes in job content arising.

(ii) An employee initiating a written request for re-evaluation must file a copy of the request with the Union.

(iii) An independent consultant trained in job evaluation and mutually agreed upon by both parties shall complete the re-evaluation as soon as possible but not later than ninety (90) working days upon receipt of the written request for review.

(iv) HR shall notify the Union and the employee of the results of the re-evaluation and provide a copy of the evaluation within fifteen (15) working days of the completion of any evaluation.

(v) If the re-evaluation results in a higher pay level, it shall be retroactive to the date that HR received the written request for review.

(vi) If the re-evaluation results in a lower pay level, the employee shall retain their current rate of pay and any adjustments negotiated by the parties for as long as they remain in that position.

c) When significant differences or changes, in job content affect the existing job evaluation to the extent that the Employer requests that the job be re-evaluated, the following procedure shall be followed:

(i) The Employer shall initiate a request for re-evaluation within fifteen (15) working days of the significant changes in job content arising.

(ii) The Employer shall notify the Union of the initiation of the review.

(iii) An independent consultant trained in job evaluation and mutually agreed upon by both parties shall complete the re-evaluation as soon as possible but not later than ninety (90) working days upon receipt of the written request for review.

(iv) HR shall notify the Union and the employee of the results and provide a copy of the evaluation within fifteen (15) working days of the completion of any evaluation.

(v) If the re-evaluation results in a higher pay level, it shall be retroactive to the date the Employer initiated the request for re-evaluation.

(vi) If the re-evaluation results in a lower pay level, the employee shall retain their current rate of pay and any adjustments negotiated by the parties for as long as they remain in that position.

d) Where an employee and the Union are not satisfied with the independent consultant's evaluation decision, and the Union agrees to represent the employee, the Union may refer the independent consultant's decision to arbitration by letter within thirty (30) working days of receipt of the re-evaluation decision. The letter shall state the matter sought to be arbitrated and the names of proposed arbitrators. The Corporation shall, within thirty (30) days of the receipt of such letter notify the first party in writing of the acceptance of one of the arbitrators named or propose others. The Corporation also has the right to appeal under this process.

e) An independent Arbitrator trained in job evaluation, mutually agreed upon by both parties, will hear appeals of the independent consultant's decisions within one hundred and twenty (120) working days or at the earliest mutually agreed upon date by both parties. A decision of the Arbitrator is final and binding. Each party shall pay one half (1/2) of the fees and expenses of the Arbitrator.

f) The Union may withdraw the appeal from the arbitration process at any time.

g) Unless the parties agree otherwise, the time lines in this article are mandatory.

Human Resource Policy HR-003

1.1 Performance management is intended to be an ongoing process of communication between the immediate supervisor and the employee, focused on helping the employee achieve their best workplace results. An effective performance management system accomplished the following goals:

- Provides direction and clarifies performance expectations;
- Provides feedback and coaching to employees concerning job performance, identifying both what is being done well and what needs improvement;
- Identifies training and professional development needs;
- Documents performance; and
- Substantiates performance increments.

2.0 Policy Guidelines

2.1 Yukon Energy supports a performance management system that should include the four components listed below:

1) Performance Planning:

Clear performance expectations should be communicated to the employee. These expectations should provide the employee with a clear understanding of what is required for the employee to successfully fulfill job responsibilities. These expectations should also help the employee align individual goals and objectives with those of the department and Yukon Energy.

2) Coaching:
Coaching employees for improved performance is an integral part of performance management. Coaching should occur on a regular basis and may take various forms, from observation and informal direction to formal meetings and written documentation.

3) Multiple Sources of Feedback:
To increase the potential for improvement, in some cases, it may be helpful to receive feedback from customers, peers, and direct reports.

4) Performance Review:
This is the culminating communication of the performance cycle, focusing on areas of achievement, areas for improvement and goals for the future.

3.0 Performance Review Guidelines

3.1 All probationary employees should have their performance reviewed with them prior to the final thirty (30) days of the probation period.

3.2 All employees should have their performance reviewed with them semi-annually, based on their anniversary date if there is room for an increment in the salary range for their position. All other employees should have their performance reviewed at least once a year.

3.3 Performance Reviews should have the following characteristics:

- Results Oriented – Goals should specify an end result to be accomplished. For goals to be evaluated there must be a clear understanding of what is to be achieved.
- Measurable – Goals should contain appropriate measurement criteria such as quantity, quality, time or cost. These criteria are necessary for the monitoring of progress toward or accomplishment of the goals. Where the goals cannot be measured in quantitative terms, there should be a statement specifying what constitutes acceptable performance.
- Clear and Concise – Goals should be written so as to eliminate misunderstanding between the employee and the supervisor. The commitment to action is basic to the formulation of goals and therefore, the expectation should be prefaced with an action verb whenever possible.
- Timeframe – Goals should specify a target date for completion.

- Realistic – Goals should take into account both the abilities and competence of the employee, and the goals of the department.

3.4 Performance review forms should be discussed and signed by both the supervisor and employee. An employee's signature indicates only that the form has been reviewed and discussed with them. It does not imply agreement with the review.

3.5 Employees submitting concerns relating to their performance review will receive a written response from their supervisor in a timely manner. A copy of the employee's concerns and the supervisor's response will be placed on the employee's personnel file.

3.6 The original performance review must be forwarded to Human Resources and placed on employees' personnel file. Employees should receive a copy of the form, and other copies should be retained at the supervisory level.

3.7 Human Resources will process authorized performance increments in accordance with the terms set out in the collective agreement.

Management and Professional's Agreement

Section 9
Performance Reviews

9.1 The Corporation recognizes that performance reviews provide feedback to employees on their job performance and assists them in becoming more effective in their jobs.

9.2 Performance reviews will be conducted at least once each year. Completed performance reviews will be retained in the employee's personnel file.

Section10
Performance Increments

10.1 Following the successful completion of the probationary period and on January 1st of each year thereafter, the employee may be awarded a performance increment based on the supervisor's assessment of their performance during the previous year, up to the maximum of their salary range. When an employee has received a performance increment following their probation, and that increment occurs at any time other than January 1st, the performance increment on the following January 1st will be prorated to reflect the number of months since the last increase.

10.2 Performance increments for Management & Professional employees will be based on the level of performance in relation to performance objectives and job responsibilities. The annual increment will not exceed 9% of current salary and will be guided by the following table. The maximum of the salary range applicable to the position shall not be exceeded.

Rating	% Performance Reward
Unacceptable	0%
Needs Development	0%
Meets Expectations	1% - 3%
Occasionally Exceeds Expectations	4% - 6%
Consistently Exceeds Expectations	7% - 9%

10.3 An employee who is rated as “Unacceptable” or “Needs development” is expected to improve their performance. The employee’s supervisor along with the employee will create an appropriate development plan to assist the employee with improving their performance. Unacceptable performance will not be permitted to continue and appropriate steps up to and including termination will be taken.

10.4 The completed performance review and recommended salary adjustment must be approved by the President & CEO prior to communication to the employee by the immediate supervisor.

10.5 Performance increments will be rolled into base salary.

Collective Agreement between Yukon Energy and P.S.A.C. Y024 - Article 14: Wage Administration.

- Management and Professionals’ Agreement Section 10
- Yukon Energy Human Resource Policy HR-03

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application 3-8**

Head Count – This relates to the number of full time equivalent positions. The Yukon Energy employee complement is shown in Table 3.4.
Of the total labour expense increase from 2018 approved, approximately $0.882 million relates to additional headcount and $0.740 million relates to labour rate increases. The balance is made up of other factors impacting labour costs such as changes in overtime, vacancies and capital allocation.

QUESTION:

a) Since labour head count costs are proposed to increase more than $1.6 million, explain.

ANSWER:

(a)

Breakdowns of expenditures for all labour forecast costs are provided in the Application, starting at section 3.3.2 (page 3-13) through 3.3.8 (page 3-20). Reasons for the increase are provided in the Application at Section 3.3.1.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application 3-8**

Table 3.4:
Employee Complement History 2018Approved Actual2018 Actual2019 Forecast 2020 Proposed2021

President	4.16	5 .14	4.82	4.01	4.16
First Nation Relations - - - -				1.00	
Communications, Cust. Acctg.	1.00	1 .00	1.00	3.10	4.60
Human Resources & Info. Mgmt.	5.25	5 .27	5.34	5.32	5.25
Resource Planning and Environment	5.00	5 .00	5.75	5.51	7.05
Finance, Cust. Acctg. & Purchasing	16.79	1 6.89	17.24	13.54	14.79
Operations	44.50	4 6.58	47.12	48.75	49.25
Engineering Services	15.00	1 3.03	15.16 1	5.63	15.50
Health, Safety & Environment	2.00	2 .00	2.00	2.00	2.00
Total	93.70	94.91	98.44	9 7.86	103.60

Note:
1. The employee complement numbers are net of allocation to YDC.
2. Customer Accounting was transferred from Finance to Communications in 2020.
Table 3.4 shows that the total position count is forecast to increase by 9.90 positions since 2018 approved to 2021 test year.

QUESTION:

a) Why are Approved 2018 compliments different from Actual 2018?

b) Explain what positions make up the four employee complement with job description in the presidents office.

c) Explain why the vice president cannot do the job of FN relations?

d) What exactly is the VP job description?

e) Explain the 3.6 positions added in communications, customer Acctg.

f) Explain the 2 positions added in resource planning and environment.

g) Explain why environment is in two locations in this above chart.

h) Provide a chart giving each of the YEC positions (management and non-management) pay grade/scale and performance bonus.

i) Explain how each of these compare with other utilities in Canada.

ANSWER:

(a)

Approved 2018 compliments are what was approved by the YUB for rate-setting purposes. Actual 2018 compliments represent what YEC required operationally.

(b)

The employee complement of the President category consists of the following:

- **President and Chief Executive Officer -** The President and CEO has the authority, and is accountable to the Board of Directors, for the Yukon Energy Corporation's achievement of corporate goals and objectives within the established authority delegated by the Board. This includes providing leadership and direction regarding the following daily organizational activities of the Yukon Energy Corporation to ensure the achievement of reasonable organizational results, benefits and cost effectiveness within the established corporate goals, objectives and priorities; and to ensure the avoidance of unacceptable conditions and actions.

- **Vice-President, Business and Corporate Development -** In conjunction with the President, liaises with key stakeholders to promote positive relationships and strong partnerships for the benefit of the corporation. Ensures that the Human Resources, IT, Health and Safety and Communications departments corporate objectives are met and in line with Yukon Energy's mission and vision. Contributes in the development of corporate goals, business plans, and strategies to ensure the effective planning and delivery of programs and services to achieve the Corporate mandate Contributes to the vision, mission and values of Yukon Energy through responsible, accountable and effective work performance. As a key

member of the senior management team is accountable for overall organizational performance.

- **Corporate Secretary -** This position provides executive support to Yukon Energy's Board of Directors (Board), the President and CEO (President) and the Sr. Management Team, and is responsible preparation of board meetings including the drafting of agendas, resolutions, and board material as well as the drafting of board and committee minutes in accordance with Yukon Energy's policies, guidelines and procedures. The position is responsible for all Access to Information and Protection of Privacy (ATIPP) matters on behalf of the corporation.

- **Records Management Analyst -** Performs a range of records management activities for the Corporation. Maintains and controls the use, protection and disposition of corporate records and information and provides library support services in accordance with Yukon Energy's policies, guidelines and procedures.

(c) and **(d)**

The questions are unclear; each department at YEC has a vice president as the department head. The question is not clear which vice president is being referred to.

(e)

The explanation for the 3.6 positions added in Communications, Customer Billing/Accounting is provided in the Application under the heading Communications, Customer Billing/Accounting on page 3-10.

(f)

The explanation for the 2.0 positions added in Resource Planning and Environment is provided in the Application under the heading Resource Planning and Environment starting on page 3-10.

(g)

For the years provided in Table 3.4, there are no Environmental employees allocated to the Health & Safety department. Therefore, it would be more appropriate for the department labelled “Health, Safety & Environment’ to be changed to “Health & Safety”.

(h)

Please see the Table below.

Table 1: Union Pay Grants (2019)

2019 Rates	Steps	1	2	3	4	5	6
Level	Hourly Min	0.5 Year	1 Year	1.5 Year	2 Year	2.5 Year	3 Year

* Annual Economic Increase 2.0%.
* Performance Increase 3% up to max of pay grade.

(i)

YEC does not have (management and non-management) pay grade/scale and performance bonus information of other utilities in Canada to provide.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application**

SUPPORTING DOCUMENTS PAGE 3-9
TAB 3 - REVENUE REQUIREMENT
At the historic staff level, 1 employees were finding it difficult to keep pace with increased demands, more 2 so as additional assets are added and increasing burden for planning and executing capital works.

QUESTION:

a) Please identify any/each consultant/contract hiring and cost amounts for planning and executing capital works.

ANSWER:

(a)

The request is unreasonably broad. YEC is not able to provide the detailed information requested given the considerable time and effort it would take to collect and summarize this information.

TOPIC: Revenue Requirement Requests

REFERENCE: November 2020 Application

SUPPORTING DOCUMENTS PAGE 3-9
TAB 3 - REVENUE REQUIREMENT

6 There are a number of corporate factors that directly affect employee complement:
7 * Increasing assets;
8 * Strategic importance of improving First Nation and public engagement, relationships and
9 communications;
10 Steady growth in customer accounts;
11 Increased planning requirements for projects recommended through the 2020 Ten Year
12 Renewable Electricity Plan; and
13 Continuing high capital demands to maintain existing aging assets.
14 To combat the above issues, YEC is forecasting an increased employee complement. The increase in
15 employee complement has resulted in a significant decrease in forecast overtime costs for 2021. Also, the
16 increased employee complement in 2019 through 2021 is due to an effort, where possible, to do more
17 work internally as opposed to hiring outside consultants and contractors. YEC has made a conscience
18 effort to limit increases to only those areas where required as reviewed below.

QUESTION:

a) Please identify the decrease in actual and forecast overtime costs for each of the years since 2018.

b) Please identify all cost savings for doing work internally as opposed to hiring outside consultants and contractors.

ANSWER:

(a)

YEC did not state that overtime costs decreased for each of the years since 2018; YEC stated “the increase in employee complement has resulted in a significant decrease in forecast overtime costs for 2021. For details of overtime costs, see CW-YEC-1-14 (b).

(b)

It is not possible to identify all cost savings for doing work internally as opposed to hiring outside consultants or contractors. As indicated in the Application, some new positions are being created to help reduce external costs in 2021 and the future such as those mentioned for Operations and Engineering. In reality, almost all work could be outsourced so all labour costs contribute to reduced outside consultants or contractors.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application Tab 3**

3.3.6 Administration

As shown in Table 3.9, Administration expense is forecast to increase $1.640 million (18%) in 2021 over 2018 approved primarily due to increase in labour costs by $0.783 million (13%) in 2021 over 2018 approved reflecting labour cost changes as well as functional changes noted in section 3.3.1. Non-labour costs are forecast to increase $0.856 million (29%) in 2021 over 2018 approved.

Table 3.9:12 Administration ($000) 2018Approved Actual2018 Actual2019 Forecast 2020 Existing 2021 Proposed 2021

Labour	$ 5,916	$ 5,949	$ 5,835	$ 6,113	$ 6,699	$ 6,699
Resource Planning	48	48	29	174	84	84
Communications	130	126	129	125	155	155
Customer Accounting	225	208	244	206	240	240
Environmental Mgmt	238	184	197	259	535	535
General	662	688	742	620	790	790
Information Systems	645	555	771	803	741	741
Fish Hatchery	168	158	169	200	210	210
Safety	182	210	168	168	226	226
Training	175	173	131	124	200	200
Recruitment	229	245	379	323	255	255
Board of Directors	182	246	280	274	252	252
Union	20	119	60	148	90	90
Regulatory Affairs	33	26	11	15	20	20
Material Management	37	9	31	32	32	32
Contracting	12	5	7	12	12	12
Professional Development	15	15	17	7	15	15
Total Administration	$ 8,917	$ 8,966	$ 9,201	$ 9,603	$ 10,557	$ 10,557

The increase in Administration costs 1 reflect ongoing cost pressusre [sic] related to recruitment, training, safety and other cost categories, including: Environmental Management expenses are forecast to increase by $0.297 million (124%) in 2021 over 2018 approved due to increased environmental monitoring activities associated with the new 3 year water license of the Aishihik Generating Station.

General administration expenses are forecast to increase by $0.129 million (19%) in 2021 over 2018 approved primarily due to new licenses required for the new asset management software.

Information Systems expenses are forecast to increase by $0.096 million (15%) in 2021 over 2018 approved due to increased costs for data circuits.

Union expenses are forecast to increase by $0.070 million (350%) in 2021 over 2018 approved but is $0.029 less than 2018 actual. Fluctuations in Union expenses are due to cyclical renegotiation of the Collective Bargaining Agreement, which expired December 31, 2019.

Board of Directors expenses are forecast to increase by $0.069 million (38%) in 2021 over 2018 approved due to additional training and increased meeting costs, as reflected in 2018 actuals.

QUESTION:

a) Please explain what is meant by administration labour costs and breakdown the cost for each of these admin labour costs.

b) Was/were outside consultants hired for resource planning. If so, please name the contractor/s and provide costs?

c) Was/were outside consultants hired for environmental management. If so, please name the contractor/s and provide costs.

d) Breakdown general administration expenses with costs.

e) Provide each new license required and final costs for the new asset management software.

f) Explain what function the communications have and how they are cost/accounted.

g) Explain what material management is and how it is cost/accounted.

h) Explain how you know you will need new data circuits until need?

i) If you do not have to purchase any/some of new circuit boards how will this discrepancy be accounted?

ANSWER:

(a)

Administration labour costs means the cost of YEC employees to perform work categorized as Administration. A breakdown of Administration labour costs forecast for 2021 is provided in the table below:

	($M)
Engineering Services	$ 1.008
Board of Directors	0.083
President's Office	0.899
Corporate Communications	0.125
Corporate Services	0.193
Customer Billing	0.318
Environment	0.202
Finance & Regulatory Affairs	1.267
Health & Safety	0.317
Human Resources	0.304
Information Technology	0.662
Materials Management	0.264
Procurement	0.583
Resource Planning	0.473
	$ 6.699

(b)

In 2020, the Resource Planning department spent $90,000 on outside consultants (Sussex Group).

(c)

In 2020, the Environmental department spent $176,000 on outside consultants, including $113,000 paid to Environmental Dynamics, $25,000 paid to Canadian Wildlife Federation and $20,000 paid to Hemmera Envirochem.

(d)

Below is a breakdown of general Administration costs forecast for 2021:

	($M)
Engineering Services	$ 0.287
President's Office	0.109
Corporate Services	0.136
Finance & Regulatory Affairs	0.258
	$ 0.790

(e)

Forecast 2021 license cost relating to the new asset management software is $0.108 million. The $0.108 million can be broken down as follows:

- $0.093 million for annual vendor support and software upkeep.
- $0.015 million for User Acceptance Platform software. This software is used for training and testing; it is used to test scenarios and to train others through a view and walkthrough process, and will also support onboarding of new employees in the future.

(f)

See also the response to YUB-YEC-1-39(g). The function includes the following activities:

- **Corporate/ strategic communications** - includes activities to build and protect Yukon Energy's corporate reputation;
- **Engagement** - includes providing communications support and direction on all Yukon Energy major capital projects; and
- **Leading the customer service team** - includes directly supervising Yukon Energy's Customer Service Team in Dawson City, and managing Yukon Energy customer accounting and billing function.

Costs are accounted for in accordance with International Financial Reporting Standards.

(g)

Materials Management represents costs to operate the inventory at the warehouse in Kulan Industrial Park in Whitehorse. Operations include supply chain management, receipt, stocking and issuance of materials to O&M and capital jobs throughout the YEC franchise area. Material management[1] also indirectly supports materials warehousing in the communities of Faro, Mayo and Dawson. Costs to manage the warehouse include materials, contractors (e.g. snow removal) and utilities. Costs are accounted for in accordance with International Financial Reporting Standards.

[1] Note currently "materials" relates almost exclusively to transmission and distribution line poles, wire, transformers and hardware.

(h)

Data circuits are required primarily for SCADA (system Control and Data Acquisition), Corporate applications, grid protection (Remedial Action Scheme), Revenue Metering and voice services. The number of devices and the volume of data moving over the network is driven by new assets, locations and services. Communications requirements are a common element. This necessitates additional data circuits as the service provider (Northwestel) does not offer bulk (dark fiber) communications service.

(i)

The circuits are purchased in response to growing needs in volume and speed of data. The data circuits are a service paid monthly (not hardware or an asset) and are a growing O&M line item. Communications requirements are assessed on a long term basis to standardize technology and make the best capital investments possible to support current and future needs. Communications are also assessed on a case-by-case basis in response to equipment or facility upgrades or new capital projects.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application, Table 3.13:**

5 **Mid-Year Net Rate Base6 ($000)**
Approved 2018 Actual 2018 Actual 2019 Forecast 2020 Existing 2021 Proposed 2021
Year-End:
Net plant in service1 $ 278,702 $ 287,713 $ 293,199 $ 303,158 $ 323,642 $ 322,649
Mid-Year:
Net plant in service
Before contributions $ 445,367 $ 449,441 $ 458,678 $ 475,781 $ 498,719 $ 498,223
Less contributions 167,112 166,677 168,222 177,603 185,319 185,319
Net plant in service 278,255 282,764 290,456 298,178 313,400 312,904
Mid-year regulatory deferral2 3,879 3,805 3,009 2,484 2,732 2,732
Working capital 5,344 5,617 5,935 6,592 6,985 7,141
Net Rate Base $ 287,478 $ 292,186 $ 299,399 $ 307,255 $ 323,117 $ 322,777
Notes:
2 This reflects the regulatory deferred costs, excluding DSM and the balance of the hearing reserve account.
1 Net plant in service at year end is gross property, plant and equipment plus deferred study and relicensing costs,
less work in progress, depreciation, amortization, customer contributions, reserve for future removal and site restoration, deferred fire gain, and disallowed assets.
Forecast
8 Yukon Energy's 2021 mid-year forecast rate base in this Application is $322.777 million (an increase of
9 $35.3 million or 12% from 2018 approved mid-year rate base of $287.5 million).

QUESTION:

a) Is this proposed $35.3 million increase in rate base since the last GRA only for plants that are now providing a service?

b) If no, identify cost amounts separating plants now providing a service from other costs not providing a service.

c) Explain what mid-year regulatory deferral means.

d) Please provide a chart identifying the approved rate base for each GRA year since 1998.

e) Identify and explain each separate contribution donor and amount for all years in chart.

f) Explain why 2018 actual rate base is different from 2018 approved?

g) Explain why difference between existing 2021 and proposed 2021?

h) Since $11.861M 2019 increase, $7.856 M 2020 increase, $35.3M increase in rate base since 2018 approved, identify amounts for each year already approved. Identify where and when these were approved.

ANSWER:

(a) and **(b)**

$35.3 million is the increase in mid-year rate base in 2021 test year over 2018 test year. This includes increase in property, plant and equipment [in-service or forecast to be in-service by end of 2021], closed deferred project costs as well as provision for working capital requirements. Please see Schedule 1 in Tab 7 for details.

(c)

The mid-year balance of regulatory deferred projects [e.g., Resource Plan, IFRS transition costs, etc.].

(d)

This question is unclear as to what chart is being requested, as well as to any relevance to the current 2021 GRA of charting approved revenue requirements for prior years going back to 1998. Accordingly, YEC has not provided the requested information.

(e)

As indicated in the Table, the amounts are mid-year balances, so they are not the actual amount of contributions received in the year. Also as indicated in the Table, the amounts are for assets in-service, so the Table does not include contributions received for assets that remain as work in progress. Finally, as these amounts are asset in-service, they include amortization of the contributions. The Table represents the balance of all current and historical contributions at their net book value. New contributions since 2018 include $11.5 million from VGC Group to fund McQuesten Substation and system improvement

capital costs. YEC is also forecasting $23.7 million in 2020 and 2021 from the Federal government for the Mayo to McQuesten Transmission Line.

(f)

Actual vs approved rate base for 2018 simply reflects the extent that actual numbers varied from the forecast approved by the Board.

(g)

Existing vs proposed for 2021 mainly reflects the impact of adjusted depreciation rates. See working capital tables in Tab 7 for review of adjustments to this element.

(h)

The Application focuses on changes to rate base and identifies specific capital, deferred and other rate base cost changes for review and approval. YEC is not able to respond to the question as it seeks a broad review as to all costs approved in the past that would require considerable effort to address without providing any assistance to the 2021 GRA approvals sought in this application.

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application, Appendix 3.1 2017-19 KPI Report:**

Generation Source
Hydro 441,048 413,052 370,819
% of Total 96.8% 91.7% 84.1%
Diesel 4,618 7,186 3,793
% of Total 1.0% 1.6% 0.9%
LNG 9,856 30,130 66,065
% of Total 2.2% 6.7% 15.0%
Wind 32.582 0 0
% of Total 0.0% 0.0% 0.0%

QUESTION:

a) Is the LNG still classed as back-up with this amount of usage? Explain.

b) How much is wind expected to replace diesel and LNG in 2021?

c) Identify how each SAIDI,SAIFI and CADI compare to Fortis BC (Electric) in 2019.

ANSWER:

(a)

Yes; LNG is available to support grid load under unusual circumstances, e.g., low water, cold temperature, loss of renewable generation. The high loads in 2018 and 2019 are examples of higher generation due to low reservoir conditions.

(b)

No wind generation is forecast for 2021 as shown in Table 2.2.

(c)

YEC was not able to find CAIDI for Fortis (BC). Other stats are below:

	SAIFI	SAIDI	CAIDI
Yukon Energy	12.39	6.88	0.56
Fortis BC	1.21	2.45	Not reported

1

TOPIC: **Revenue Requirement Requests**

REFERENCE: **November 2020 Application, Return on Common Equity Tab 3-27**

Risk Premium Adder for YEC: Order 2018-10 established a 45 basis point risk premium for YEC over the BCUC benchmark ROE. A 45 basis point risk premium for YEC was considered to be fair and reasonable based on: (1) recognition of small size and principles established for AEY in Order 2017-01;7 and (2) recognition of YEC risk related to generation, isolated grid, and customer diversity.8 As noted in Tab 8, there are no new issues or material changes in circumstance at this time that would alter the basis for approving a risk premium of 45 basis points for Yukon Energy

QUESTION:

a) Does Fortis BC (Electric) borrow the majority of its' money/debt from a government mother corporation?

b) Does Fortis BC (Electric) receive federal and provincial contributions for various programs? Explain.

c) Does Fortis BC (Electric) have a rider or mechanism for Fuel price changes, a Low Water Reserve Fund/ similar mechanism, or any other mechanism for stabilizing rates?

d) Identify the gross margin for YEC in 2019 and 2020.

e) Identify the earnings before interest, taxes and amortization for YEC in 2019 and 2020.

f) Compare the numbers in 113 [d] and 114 [e] for the YEC to those of Fortis BC (Electric).

ANSWER:

(a) through **(f)**

Tab 8 of the GRA Application provides information relevant to the Board's assessment of comparative ROE risk for YEC and Fortis BC (Electric). The GRA also provides detailed

reporting on YEC's actual earnings in 2019 and forecast earnings in 2020, summarized as regards ROE in Table 1-1. The comparative risks of YEC and Fortis BC (Electric) (FBC) were extensively reviewed during the 2017-18 YEC GRA proceedings, with follow up questions on YEC Undertakings [YUB-YEC-3-5] providing additional detail related to FBC's power supply context and arrangements with BC Hydro and information showing that the context for FBC is very different and less risky than YEC. The power supply context for FBC was also reviewed in the 2017-18 GRA Undertaking #38 and Undertaking #39 as well as the following follow-up questions on YEC Undertakings: YUB-YEC-3-3,[1] YUB-YEC-3-4,[2] and YUB-YEC-3-6.[3] In summary, it has been well documented in YEC proceedings that FBC is not on an isolated grid, and is not exposed to the same thermal cost risks that YEC is exposed to given that FBC has access to renewable generation resource options available on BC's integrated grid system.

Additional information requested by UCG in this information request will not change the assessments already provided, or assist the Board in this proceeding.

[1] Reviews the Power Purchase Expense Variance Deferral Account [PPEVDA] and clarifies that the relevant provisions continue to operate in non-test years. The response notes that the account was discontinued by Decision G-138-14, but that per the Decision, the expenses and revenues related to the PPEVDA would continue to be flowed through to ratepayers each year through the annual flow-through mechanism.

[2] In addressing variances due to water variability for FBC, it is necessary to understand the context of FBC's hydro power supply arrangements with BC Hydro, the BCUC-approved cost flow through mechanisms and the extent that these arrangements collectively remove risk from FBC related to water variability cost impacts.

[3] Notes that FBC is not exposed to water risks that would merit or require a specific and separate deferral or contingency account mechanism similar to the DCF. Accordingly, the absence of a specific FBC deferral account similar to the DCF is of no importance when comparing risks for FBC relative to YEC.

TOPIC: **Capital Projects**

REFERENCE: **November 2020 Application, p. 5-1**

21 Total spending on PP&E projects in the 2021 test year as shown in Table 5.1 totals $61.767 million, with
22 91% of this spending in major projects over $1 million ($56.266 million) and 48% ($29.801 million, Table
23 5.2-1) included in 2021 rate base. Total PP&E spending was $21.300 million in 2018, $31.154 million in
24 2019, and is forecast at $36.171 million in 2020. Overall, PP&E transfers to rate base since the end of
25 2018 approximate $92 million. Contributions transferred to rate base to offset some of these
26 expenditures since the end of 2018 approximate $37 million (Table 5.1).
27 Deferred cost capital spending (including Work in Progress [WIP] and after contributions) was $4.3
28 million in 2018 (Table 5.3), $3.7 million in 2019 (Table 5.4), and is forecast at $5.4 million in 2020 (Table
29 5.5) and $10.5 million in 2021 (Table 5.6). The current GRA results in approximately $7.4 million of
1 Deferred costs being brought into rate base in the current GRA (including relevant test year spending and
2 before transfers to the Hearing Reserve Account), with approximately $1.5 million for 2019, $4.0 million
3 for 2020, and $1.9 million for 2021.
4 Actual and forecast intangible asset spending (including WIP) over 2018 to 2021 is $6.062 million, all of
5 which is forecast to be brought into rate base by 2021, as illustrated in Table 5.7

QUESTION:

a) Are PP&E spending for 2018, 2019 and 2020 assumed approved or will they have to wait the outcome of this hearing?

b) Do the PP&E requested transfers to rate base since the end of 2018 approximate $92 million include the 2021 test year? Explain.

c) Are total deferred capital costs for 2018, 2019 and 2020 assumed approved or will they have to wait the outcome of this hearing?

d) If only $7.4 million of deferred capital costs requested into rate base, would the remaining $7.5 million go into WIP? Explain.

e) Provide a table identifying (PP&E, deferred and intangible) approved capital costs that were placed into rate base for each GRA year since 1990, including requested 2021 amounts.

ANSWER:

(a) and **(c)**

The GRA provides PP&E, deferred cost and other cost forecasts for the Board's approval of the revenue requirement used to determine changes to rates.

(b)

The $92 million includes transfers to rate base (actual or forecast) for 2019, 2020 and 2021 as documented in Table 5.1.

(d)

The referenced information indicates $19.6 million of (actual or forecast) deferred cost capital spending (including WIP, and net of contributions) for 2019, 2020 and 2021 with approximately $7.4 million being brought into rate base. The balance of $12.2 million would remain in WIP.

(e)

YEC is not able to provide the detailed information requested given the considerable time and effort it would take to collect and summarize this information and its limited relevance to the current review process.

TOPIC: **Capital Projects**

REFERENCE: **November 2020 Application,5-1 Capital Projects**

2 Capital project investments in rate base are generally grouped in one of three categories: capital works
3 on property, plant and equipment; deferred cost studies (including new supply and other feasibility
4 studies, studies required by regulation or relicensing and dam safety works); and intangible assets.

QUESTION:

a) Provide all related stages a capital project undergoes from concept planning to a plant in use. Include all regulatory stages as well.

b) Identify how each stage cost is accounted for.

c) Provide a table/chart demonstrating stages for each capital project greater than $1 million applied for in this application rate base[1] since 2017/18 approved. On this chart for each stage, identify all consultant firm/s name and cost, all contract firm name and cost, all in-house costs with reason, a total of each stage cost. Provide and identify all contributions amounts (government, mining, others) for each stage.

d) Identify any cost overruns and amounts for each stage of each project in #8 above.

ANSWER:

(a)

YEC follows a stagegate process. Depending on the complexity of the project, multiple gates may be initiated. Each stage has deliverables, timelines and responsibilities assigned as well as an estimated cost to reach the next stagegate. Upon successful completion of deliverables through each gate, a final project charter is drafted which encompasses the construction aspect of the project and is approved by Sr Management

[1] Capital Projects > $1 million to include: LNG 3rd.Turbine; N-1 Capacity Shortage Whitehorse site; N-1 Capacity Shortage Faro site; Mayo to McQuesten Transmission Line; McQeusten Sub-Station; Transmission Line Refurbishment; Transmission Line 178 Refurbishment; Breaker Replacement Program; Replace P125 Headgate; WH2 Uprate; WH4Upr.

as well as the Board of Directors. The project is executed and when completed is transitioned to Operations for operation and maintenance.

Regulatory tasks may or may not have separate stagegates. They are typically combined with other deliverables within a gate however treated like any other deliverable such that should the regulatory task not be completed, the project will not pass through the associated gate.

(b)

Costs for each stagegate are tracked separately and are included in the total project cost upon completion.

(c) and **(d)**

The detailed information requested cannot be reasonably provided in the time available. Information regarding project costs breakdowns for major capital projects is provided in a number of information requests, including the response to YUB-YEC-1-49.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

21 **LNG Third Engine/ Critical Spares** – actual cost of approximately $8.261 million,
22 completed and in service in 2018, but not included in rate base approved in 2017/18
23 GRA.

REFERENCE: June 22, 2017 Application, page 5-26

LNG Third Engine ($6.2 million)

QUESTION:

a) Is $8.261million actual cost or approximate cost?

b) Exactly what was the projected cost for this project from the 2017/18 GRA.

c) If different from the above $8.261 million, explain cost overruns.

ANSWER:

(a) to **(c)**

As noted in Tab 5, Section 5.2.1.1 the project was completed and in service in 2018. Page 5-6 of the GRA specifically notes, “the project was completed on schedule with total actual project costs for the LNG Third Engine of $8.261 million. This was below the 2017/18 forecast budget of $8.9 million.”

TOPIC: Capital Projects

REFERENCE: GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5

1 5.2.1.2 N-1 Capacity Shortage Thermal Rental Site Infrastructure
2 N-1 Capacity Shortage Whitehorse Thermal Rental Site Infrastructure6 ($0.227 million in
3 WIP at end of 2018 and $1.070 million in 2019)
4 The 2016 Resource Plan identified a dependable capacity shortfall for the Yukon Integrated System under
5 its single contingency (N-1) capacity reliability criterion that approximated 6 MW in 2017, increasing to
6 10-11 MW by 2019. Yukon Energy is required to provide sufficient dependable winter capacity to meet
7 the single contingency capacity reliability criterion, i.e., there is no acceptable "do nothing" option given
8 the need to maintain reliable service and to address an ongoing and growing dependable capacity
9 shortfall.
10 The project involved the design of infrastructure to accommodate temporary rented thermal generators
11 at Whitehorse substation to address the capacity shortfall projected under the N-1 for 2018/19 and
12 2019/20 winters.
13 In winter 2018/19 six temporarily rented 1.8 MW units were installed in the proximity of S150 Whitehorse
14 Rapids Substation. The 2019 project included installation of two additional temporarily rented 1.8 MW
15 units in the area between P126 Whitehorse Diesel and S150 Whitehorse Substation. The project scope
16 included planning support, limited engineering design assistance, protection settings and installation
17 support temporary seasonal diesel power generators to meet seasonal N-1 load requirements and assist
18 with meeting winter system peaks. Total project cost was approximately $1.298 million.
19 **N-1 Capacity Shortage Faro Thermal Rental Site Infrastructure7 ($2.037 million forecast in**
20 **2020)**
21 The project involves the design and installation of temporary rental site electrical infrastructure at Faro
22 (870S) to ensure Yukon Energy can continue to meet its N-1 capacity planning requirements.
23 The project scope includes engineering and design, procurement of materials, installation and
24 construction and other internal and project management costs. Specifically, the major scopes of work
25 include:
26 Preliminary design and feasibility studies (system impact study and grounding studies); and
6 Table 5.2-1 references this project as "N-1 Capacity Shortage Mobile Genset."
7 Table 5.2-1 references this project as "N-1 Capacity Shortage Thermal Rental Site Electrical Infrastructure".
Faro 870S 1 temporary diesel generator infrastructure – design, procurement, construction and
2 commissioning, including: civil/ structural work; 138 kV line tap and substation work; 4160V
3 collection system; fuel system; stations service power; protection, control, communication and
4 SCADA integration.
5 The project is expected to be completed in 2020 at an estimated budget of $2.037 million. The project is
6 on track for a mid-November 2020 in service date.

REFERENCE: YUB's Order 2009-8 directions to YEC

"In future GRA applications, YEC to include business cases for major capital projects that included the following information: • descriptions of the project • economic analysis

including preliminary engineering estimates • discussion of alternatives and how the chosen option was determined • discussion of the risks of proceeding with the chosen alternative • discussion of risks of not proceeding with the chosen alternative; and • discussion of assumptions included in the business case including escalation factors, loading, financial measures, term of project and associated ancillary costs."

QUESTION:

a) Chart all YEC diesels with capacity amounts available in Whitehorse, Faro, Mayo, Dawson, and other towns. Identify for each unit when last retrofitted and at what cost. Identify for each unit when end of life.

b) Chart all ATCO Electric Yukon diesels with capacity amounts, on the grid.

c) Chart natural gas units with each unit capacity.

d) Since these two project are jointly concerned and YEC is now requesting to place costs of over $3 million onto the rate base for 2021 test year, with the very limited information for each of these projects, provide the businesses case for each following the above Board directives.

e) In which year did YEC first rent gensets? How many?

f) Explain when and why YEC chose to move 7 generators to Faro.

g) Explain precisely why so much was expended to accommodate these rentals.

ANSWER:

(a) and **(c)**

Please see page 11 of 10-Year Renewable Electricity Plan provided in CW-YEC-1-36 (a) Attachment 1 for the map that shows generation facilities and Appendix A for the list of generation facilities with capacity information.

Please see table below for overhauls.

	2012 (+)	2013 (+)	2014 (+)	2015 (+)	2016 (+)	2017 (+)	2018 (+)	2019 (+)	2020 (+)
(P09-092) DD5 Bottom End Overhaul - (-)	696,893.47	358,797.07	39,843.64	24,819.12	24,508.20	.00			
(P11-008) DD2 Engine Overhaul - (-)	338,707.43	362,386.95	13,236.00	8,254.30	8,070.72	.00			
(P11-009) WD4 Engine Overhaul - (-)			506,717.60	12,348.98	12,074.04	.00			
(P11-012) DD3 Engine Overhaul - (-)			374,408.12	9,174.70	8,970.60	.00			
(P13-004) WD-5 Engine Overhaul - (-)		348,387.19	16,618.11	8,400.36	8,213.52	.00			
(P13-070) Whitehorse Spillway Diesel Overhaul - (+)			145,025.18						
(P13-088) Faro FD7 - 16K Hours Overhaul - (-)					120,657.77	.00			

(b)

AEY would be in a better position to provide the requested information. This information as required for the N-1 capacity criteria is provided in Tab 2 of the Application.

(d)

As reviewed in the referenced Tab 5 information on each of these projects, YEC must provide reliable firm capacity to the Yukon. New firm capacity requirements are assessed based on a “N-1” contingency, meaning the generating capacity must supply the Yukon load in the event that its largest generating facility is lost. YECs largest facility is Aishihik and has a capacity of 37MW.

Available information and forecasts since YEC’s 2016 Resource Plan have documented an N-1 dependable capacity shortfall. Section 2.4 of the 2021 GRA updated this information for 2021, showing the determination of a forecast N-1 dependable capacity shortfall of 25.75 MW in 2021 without the rented diesels and a surplus of 1.25 MW with the 15 rented diesel units (27 MW).

YEC continues to examine and pursue a range of non-rental options to address the forecast N-1 dependable capacity shortfall, including diesel retirement replacement, the Battery Energy Storage System project, the Atlin Hydro EPA, and pumped storage. Until such time as sufficient new dependable capacity can be developed through one or more of these non-rental options, rented diesel units continue to be the only cost effective option for YEC to adopt to ensure that sufficient dependable capacity is connected to the Yukon Integrated System to meet firm reliability standards during the peak load winter months. The referenced diesel rental infrastructure is required to accommodate the required diesel rental units.

(e)

2017/2018 - 4 rentals
2018/2019 – 6 rentals
2019/2020 – 9 rentals
2020/2021 - 17 rentals

(f)

When YEC determined that 17 rentals would be required for 2020/21, it was concluded that some of these additional rentals would be located at Faro. This decision reflected the following:

- Whitehorse is at capacity and could not accept any more rentals.

- Faro has established diesel infrastructure from the time of the Faro mine, and could accommodate cost effectively the required diesel rental units, i.e., the Faro facility air emission permit allowed for added generation; transformation, control and communication was available; and YEC owned land accommodated the infrastructure and rentals.

(g)

This was the least cost option considering the available infrastructure at Faro and the existence of the air emission permit that allowed for the addition of the rental fleet.

TOPIC: **Capital Projects**

REFERENCE: **Mayo to Keno Transmission Line and McQuesten Sub- Station**

QUESTION:

a) Identify forecast 2021 kWhr. usage for all non-government and government residential and commercial ratepayers on grid from Mayo to Keno (do not include Mayo).

b) Identify forecast 2021 kWhr. usage for each of the two mines, VCG and Alexco.

ANSWER:

(a)

The load forecast is prepared at the community level. YEC does not prepare forecast sales at non-government and government customer level, and therefore is unable to provide the requested information.

(b)

Victoria Gold forecast load at 43.1 GW.h for 2021 and Alexco forecast load at 24.1 GW.h for 2021 as provided on page 1-7 of the Application.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5-11**

11 Table 5.2.1-2: Project Cost and Contributions

	Actual2018	*Actual2019*	*Forecast2020*	*Forecast2021*
MMTL Upgrade ($000)	0	501	20,000	11,200
MMTL Contribution ($000)	0	274	15,000	8,400
Net Expense	**0**	**227**	**5,000**	**2,800**

12 The total spending of $20.501 million for 2019 and 2020 is offset by $15.274 million in contributions [net
13 $5.227 million] and is forecast to be closed and included in rate base in December 2020; the spending of
14 $11.200 million in 2021 is offset by $8.400 million in contributions [net $2.800 million] and is forecast to
15 be closed and included in rate base in December 2021.

QUESTION:

a) Identify contribution amount and contributor for each year and explain precisely what used for. (Not adequately explained in business profile).

b) If none of these contributions were from Alexco please explain why not?

ANSWER:

(a)

See Tab 5, Section 5.2.1.3 of the Application. As noted at Tab 5, page 5-11, the project received a Federal Government contribution of $23.674 million which covers 75% of the eligible project budget. The contributions for 2019 (of $0.274 million), 2020 (of $ 15 million) and 2021 (of $8.4 million) total to this amount. Contributions are applied against total project costs in each year in order to reduce the impact on rates.

(b)

Industrial mine connections are subject to Power Purchase Agreements (PPAs) as approved by the Board. The PPA for Alexco Resources (as well as the PPA for VGC Group) sets out when contributions are required up front from the customer to cover all costs for the installation of transmission facilities used only for each mine. No such up

front contributions are required for transmission facilities (such as the Mayo-McQuesten new transmission) that also service other customers on the Yukon Integrated System.

The Alexco and VGC Group PPA provisions also provide for industrial customers that connect to the Mayo to Keno common transmission facilities that service this region to make significant contributions (i.e., 85%) through the Fixed Charge towards the annual YEC depreciation and return expenses related to the rate base cost for these Transmission Facilities. These provisions will result in these two industrial customers paying for 85% of the annual depreciation and return expenses for the new Mayo-McQuesten transmission facilities

Yukon Energy has been pursuing the SKTP to improve electrical transmission infrastructure in central Yukon between Stewart Crossing and Keno City; reinforce and strengthen the grid between Stewart Crossing and Mayo; and replace and remove deteriorated and “end of life” transmission infrastructure between Mayo and Keno City. With regard to the line segment between Mayo and Keno City, it has been well documented that the line facilities are significantly deteriorated and need to be rebuilt due to safety and reliability concerns. As such, recent capital costs related to these facilities are not directly due to the VGC Group Mine or the Alexco mine facilities.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5-12**

22 5.2.1.4 McQuesten Substation (including Asset Contribution) – ($0.123 million in 2018 and
23 $11.496 million in 2019; with $10.688 million contribution)

QUESTION:

a) Identify contribution amount and contributor for each year and explain precisely what each was used for. (Not adequately explained in business profile).

b) If none of these contributions were from Alexco please explain why not?

ANSWER:

(a) and **(b)**

See Tab 5, Section 5.2.1.4 of the Application. Pursuant to the VGC Group PPA, the McQuesten Substation was developed by VGC Group and YEC, with the intention that it would be owned and operated by YEC. Except as otherwise specified in the PPA, VGC Group was responsible for all capital costs related to the McQuesten Substation development.

YEC has received an asset contribution from VGC Group valued at $10.688 million, and has incurred a net cost of $0.931 million (related to added facilities to enable future 138 kV service operation if required).

Development of this facility did not involve Alexco.

TOPIC: **Capital Project**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.2.1.5 Transmission Line Refurbishment - L70, L171 and L172 in 2018 and 2019 ($4.272 15 million in 2019)

Yukon Energy's 138 kV Whitehorse-Aishihik-Faro (WAF) transmission system was constructed in the late 1960's and early 1970's, and plays a critical role linking key hydro generation sources to load centres in Whitehorse and on the northern grid. Recent studies as well as a detailed line assessment in 2017 indicated that key components of the WAF system were at end of life, in poor condition, and required replacement.

This project was initiated to address replacement of key components of the following YEC transmission lines which are approaching the end of their economic life.

At the time future Step Down transformer costs were estimated at $1.34 million.

QUESTION:

a) Who made and why was the decision made to expense this money all at once rather than stepping-up the yearly maintenance program utilizing in-house personnel?

b) Does this $4.272 million cost in 2019 include the $1.34 costs for Step Down transformers.

c) If yes, demonstrate that this work was done.

ANSWER:

(a)

The project review committee made the decision. The results from the transmission test and treat and line assessments defined the scope of work. The scope of the work and YEC's capacity to perform the work in house dictated the decision to make TLR a large project. YEC has one line crew consisting of four personnel.

The assessment determined that a number of transmission line components were end of life. There is no accepted practice to life extending these components (e.g., cracked laminar beams, cracked ceramic insulation).

(b) and **(c)**

TLR did not include any work on stepdown transformers.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.2.1.6 Transmission Line Refurbishment – L178 (forecast $1.3 million in 2021)

The final phase of the Transmission Line Refurbishment Project will commence in 2021 for the Carmacks to Faro Transmission Line (L178), as refurbishment has been completed for L170, L171 and L172 (see Section 5.2.1.5).

Outages on the L178 currently trip at S164 (Takhini Substation) and can result in an outage on the Takhini-Carmacks L170 transmission line. Failure to complete this element of the refurbishment project would increase the risk of component failure on L178 resulting in a split in the North-South grid and significant thermal generation costs in the northern gird to maintain supply to all customers

QUESTION:

a) Has outages of the L178 line ever caused a failure on the grid?

b) If so, how often and when?

c) Has utilizing the yearly maintenance in-house team considered as a viable alternative. If not, why not?

ANSWER:

(a)

Yes. Outages of the L178 line have caused multiple events. See also response to YUB-YEC-1-54.

(b)

See response to YUB-YEC-1-54(a).

(c)

YEC has one transmission crew comprised of four staff. The primary responsibility of the in house crew is minor transmission maintenance, outage response and customer connects. Work on the transmission system requires the line to be isolated, and this results

in customer outages and diesel generation for the duration of the work. Operating agreements with commercial customers typically allow for two weeks disruption (off grid power). Due to the quantity of work and the short timelines to complete the work, YEC must supplement the YEC crew with contractors or project manage the work of the selected contractor.

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.2.1.8 Replacement of P125 Head Gate ($0.093 million in 2019, $2.300 million forecast in 2020, and $3.500 million forecast in 2021)

QUESTION:

a) If an adequate response charting breakdown is met in UCG-IR Capital 8 and 9 includes this project, then UCG has no further questions for now.

ANSWER:

(a)

No question is being posed above and no response appears to be required. A cost breakdown for the P125 Head Gate Project is provided in YUB-YEC-1-49.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.2.1.10 WH4 Uprate - Servomotor Replacement ($0.052 million in 2018; $0.079 million in 2019; $0.400 million forecast in 2020; and $1.000 million forecast in 2021)
The total project budget is $1.531 1 million and includes work from 2018 through to project completion 2 (expected in Q3 2021).

QUESTION:

a) Provide all prior work done on WH4, years work completed, along with each cost for the WH4 Uprate program, that have been already been approved and placed in rate base.

ANSWER:

(a)

In 2017, YEC performed a major overhaul on hydro unit #WH4 including replacement of both the exciter and rotor spider. This work was unrelated to the current servomotor replacement uprate project. The Hydro Unit #WH4 Overhaul was reviewed as part of the 2017/18 General Rate Application (see Tab 5, Section 5.2.1.5 of the 2017/18 GRA and Board Order 2018-10, paragraph 421).

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.3.1 Major Projects >$1 Million – Rate Base Additions

Aishihik Relicensing (Three Year Licence Renewal) - ($1.004 million net increase in rate base by the end of 2021, excluding reductions due to amortization).

5.3.1.1 Aishihik Generating Station Three Year Licence Renewal – ($0.805 million to end of 2019; and $0.200 million in 2020)

Costs for the 3-year AGS licence renewal were incurred from January 2019 through to end of February 2020 (when the 3-year licence renewal was obtained). Costs over this period include regulatory costs for the Designated Office review; costs related to the preparation of the Yukon Water Board Application for the 3-year renewal and for the 60-day renewal and for the related review processes; and costs related to preparation of an application to extend the DFO Fisheries Act Authorization and related review processes;
and costs related to negotiations with CAFN and for negotiation of compensation with claimants pursuant to the Waters Act .

The DFO evaluation concluded in August 2019 with the issuance of an Evaluation Report. Decision Documents were
issued in September 2019.

Issued December 24, 2019.

A 60-day renewal was issued in December 2019 extending the licence to February 29, 2020, and a 3-Year renewal was
issued on February 19, 2020.

QUESTION:

a) Provide all costs allocated for AGS YESAB review (each consultant name, work done and cost for each. Provide all inhouse costs with work done.

b) Provide all costs allocated for AGS Water Board review (any and all consultant costs and in-house costs).

c) Were both these licenses granted?

d) How much did it cost for FN negotiations and compensation and how was this accounted for?

ANSWER:

(a) and **(b)**

Please note AGS YESAB review and AGS Water Board review costs cannot be readily broken out in the time available. Both cost items were included in permitting activities for this project. Permitting activities broken out by consultant are summarized in Table 1 below. Table 2 provides YEC internal costs.

Table 1: AGS Three Year Licence Renewal Permitting Activities Costs by Consultant

Consultant	2019	2020
DLA Piper (Canada) LLP	148,265.52	
Environmental Dynamics Inc.	52,869.26	7,588.09
Intergroup Consultants Ltd.	109,017.75	77,819.75
Morrison Hershfield Limited	48,293.25	
	358,445.78	85,407.84

Table 2: YEC Internal Costs for AGS Three Year Licence Renewal

Internal Costs	2019	2020
Internal Labour	17,236.99	
Other Internal Costs	667.74	3,062.09
AFUDC	122.47	2,314.17
Grand Total	**18,027.20**	**5,376.26**

(c)

All regulatory authorizations required to operate the project until December 31, 2022 were issued. The YESAA Designated Office review was completed in 2019 with issuance of the YESAA Report and Recommendations on September 4, 2019. Decision Documents were issue October 21, 2019. The Fisheries Act Authorization extension was issued December 20, 2019 and the three year Water Use Licence renewal was issued February 19, 2020.[1]

(d)

See response to YUB-YEC-1-59(a) which provides a breakdown Three-Year Licence Renewal Project Costs.

[1] A 60-day renewal was also issued on December 19, 2019 [Water Use Licence HY-19-057].

TOPIC: **Capital Projects**

REFERENCE: **June 22, YEC 2017 Application, page 5-31 and Table 5.3, page 5-56Aishihik**

Relicensing ($2.899 million) $2.899 million cost identified at page 5-31 and $8.9 million cost identified on Table 5.3 at page 5-56.

QUESTION:

a) Identify which amount was approved as a WIP for 2017/2018 GRA.

b) What portion of these costs allocated from WIP to rate base?

c) Identify how these costs were different from the ones now requested to place into rate base.

d) Identify any and all consultant firms, work performed and each cost for this phase of the relicensing.

e) Please confirm that costs related to the Aishihik Relicensing will not be recovered in rates until approved by the YUB this general rates application process.

ANSWER:

(a) through **(e)**

The Board approves costs that affect rates – and costs allocated to WIP in the last GRA did not affect rates. All cost forecast to be added to rate base in the current GRA will not be recovered in rates until approved by the Board in the GRA process.

Please see response to YUB-YEC-1-90 for review of this project's changes since the 2017-18 GRA.

TOPIC: Capital Projects

REFERENCE: GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5

17 o Demand Side Management (DSM) – ($1.737 million net increase in rate base by the
18 end of 2021, excluding reductions due to amortization).
5.3.1.2 Demand Side 1 Management – ($0.833 million to the end of 2019; $0.375 million
2 forecast in 2020 and $0.894 million forecast in 2021, with contributions of $0.365
3 million).
The Board made the following DSM related determination in Board Order 2018-10
6 (paragraph 482):
7 "The Board is not persuaded that YEC should continue to operate DSM projects. YEC has
8 indicated the benefits of expanding the program and submitted that its programs have
9 met or exceeded key performance indicators. However, the Board notes that the Yukon
10 government has DSM incentive programs in place, and the Board is of the view that it is
11 better to leave DSM projects to government, rather than having ratepayers fund these
12 projects. For these reasons, the Board is of the view that continuation of DSM programs
13 by YEC is not necessary."
22 DSM Program Development
A Capacity DSM Feasibility Study and an updated CPR model,35 to design 1 a suite of new DSM
2 programs to complement the existing inCharge program. This work was completed in early 2019. Minimal costs to provide
brand and education continuity have also been incurred since early
5 2019 to maintain the inCharge program in the local market. Project expenditures to be included in rate
6 base of $1.279 million ($0.385 in 2019 and $0.894 million in 2021) are amortized over 10 years.

Board Order 2013-01 Appendix A determined:

"that it was not approving the DSM program for the five-year term and that YEC was to make a formal application to the Board before expanding the DSM program elements beyond that approved or beyond 2015."

QUESTION:

a) Has there been a court determination on the YEC request to Review and Vary Board Decision 2018-10?

b) If the courts have not rendered a favourable decision on this matter, why is YEC still proceeding with DSM expenditures?

c) Did YEC get prior authorization from the Board to proceed with new DSM programming as directed by the Board to undergo these studies and models with costs of $1.279 million?

d) What are the programs complementing the inCharge that have been implemented?

e) Confirm that YEC requires acceptance from the YUB before rates can be set which recover any expenditures for energy efficiency or conservation (DSM measures).

ANSWER:

(a), **(b)** and **(c)**

The Court of Appeal of Yukon dismissed the appeal in a written decision on February 5, 2021. The Appeal addressed historic DSM costs (2016-2018) and in no way precluded YEC from advancing new DSM programming. With respect to the balance of the referenced questions, please see response to YUB-YEC-1-46 (a to f).

(d)

YEC has not yet initiated the implementation of any complimentary DSM programs. Continued work on DSM programming, including potential complimentary programs, will now be advanced given OIC 2021/16 directions enabling YEC to recover through rates the costs reasonably incurred to provide or participate in a demand side management program.

(e)

YEC confirms that rates cannot be adjusted without prior authorization from the YUB.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

17 **Demand Side Management (DSM)** – ($1.737 million net increase in rate base by the
18 end of 2021, excluding reductions due to amortization).
7 **DSM Residential Demand Response Pilot**
20 Yukon Energy has pursued a pilot program testing internet connected, wifi enabled
21 demand response technology designed to control residential baseboard and hot water heating during
22 winter peak periods to help reduce system peak and reduce reliance on thermal generation such as
diesel
23 or natural gas.
34 Yukon Energy also noted plans to undertake a Capacity DSM Feasibility Study to quantify the potential
cost and
achievable uptake
of capacity-focused DSM programs such as demand response, behaviour change and other demand-
focused measures.
35 At the time Yukon Energy also noted plans to update the Conservation Potential Review (CPR) model
used to inform DSM
program design, to better match the inputs needed for resource planning; and to develop in house capacity
to use the CPR
model
to extract data for resource planning and program design purposes.
The objective of the program is to: 1 evaluate the technical feasibility of the demand response technology;
2 model and test the peak shifting effect of the pilot; test the reliability of the peak shifting effects of the
3 pilot; and evaluate customer acceptance of the demand response events.
4 The project is managed by Yukon Energy with funding support from Atco Electric Yukon (AEY), Yukon
5 Development Corporation (YDC) and Natural Resources Canada (NRCan). Project expenditures of $0.809
6 million ($0.434 million in 2019 and $0.375 million in 2020) are to be included in rate base, offset by
7 contributions of $0.365 million in 2019, are amortized over 10 years.

REFERENCE: https://www.yukon-news.com/news/smart-grid-pilot-project-announced/

"It's worth $1.3 million, with the federal government chipping in $650,000 and the Yukon government contributing $250,000.
ATCO and Yukon Energy cover the rest — $300,000 and $100,000, respectfully."

QUESTION:

a) Explain precisely what the $0.809 million costs are for?

b) How much exactly is YEC requesting to rate base?

c) Why is YEC costing any of this to the ratepayer rate base when all of the costs were to be recovered from contributions (see above)?

d) Confirm that YEC requires acceptance from the YUB before rates can be set which recover any expenditures on this demand response program.

ANSWER:

(a)

Please see response to YUB-YEC-1-59.

(b) and **(c)**

As quoted in the preamble, the DSM net addition to rate base (after contributions) is $1.737 million. The quoted announcement did not reference all of the DSM activities included in this project.

(d)

The Board must approve costs prior to such costs being included in rates.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

8 LED Streetlight Retrofit Program

The 2017/18 GRA outlined the basis for the LED Streetlight Replacement program noting that Yukon Energy decided to move forward with the retrofit of streetlight assets with LEDs.37 Streetlights in downtown Dawson and Mayo were retrofit in 2016 with plans to retrofit the remaining streetlights in Faro, Mendenhall and Champagne in 2018. As illustrated in Table 5.3, $0.273 million was added to rate base in 2018.

REFERENCE: **Appendix A to Board Order 2018-10 Reasons, p.91 #480 and 481**

Board determined as a result of above: “The Board considers that retrofitting streetlights at end of life with LED lights were prudent expenditures. Any LED installations that are not end-of-life conversions are not to be included in rate base.”

QUESTION:

a) Did YEC receive prior authorization from the Board to spend the $0.273 million demonstrating end-of-life conversions?

b) Confirm that YEC requires acceptance from the YUB before rates can be set which recover any expenditures on this streetlight conversion.

ANSWER:

(a) and **(b)**

The Board must approve costs prior to their inclusion in rates. The Board does not provide “prior authorization” for project costs, and YEC did not therefore seek or receive any prior authorizations for the referenced costs.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.4-1: FEASIBILITY STUDIES – POTENTIAL RENEWABLE GENERATION OPTIONS
IPP Standing Offer Program Implementation

2018WIP	2019 Addition	2020Addition 2	021Addition
$48,127	$183,912		

Yukon Energy and ATCO Electric Yukon (AEY) are responsible for implementing the Yukon Government's Independent Power Producers (IPP) Policy. The Standing Offer Program (SOP) was developed based on the model used in British Columbia.

The utilities were directed to implement the policy by the Yukon Government and are required to execute the policy.

OIC 2019-25 requires that utility costs be recovered in rates. With total expenditures of $232,039 to be amortized over five years.

QUESTION:

a) If the YEC model was based on one produced in British Columbia, explain why a quarter million dollars in cost be needed to re-invent the template?

b) Identify the section of OIC 2019-25 that states precisely that the utilities costs be recovered from rates for developing an IPP standing offer program.

c) Why could not the Yukon Energy staff implement this policy in-house?

ANSWER:

(a)

YEC received formal permission from BC Hydro to utilize their Standing Offer Program documents as a starting point for Yukon's program. The permission came with the full recognition that significant changes would be required to be make it useful in the Yukon context. The number of documents required to launch the Standing Offer Program is significant. The program was a collaboration between YEC and ATCO Electric Yukon which required shared learning to firstly understand the BC program and then make

modifications that would work with Yukon Government policy and the Yukon context. This was a daunting task for both Utilities to understand a model Standing Offer Program and then customize it for the Yukon.

There are significant differences between BC's and Yukon's Standing Offer Program. However, it was much more efficient to start from a working model than try developing this program "from scratch".

(b)

The utilities were directed to implement the IPP policy by the Government of Yukon.

While the costs for developing an IPP standing offer program are not specifically referenced in OIC 2019/25 – the OIC specifies costs that the Board must allow the utility to recover in relation to electricity purchase agreements which include: (a) the cost of purchasing electricity under an electricity purchase agreement; (b) third party consultant costs, including legal fees, incurred by an electrical utility in relation to the development and implementation of the agreement; and (c) the cost of maintaining or replacing equipment or infrastructure necessary to purchase electricity under the agreement.

(c)

YEC and ATCO Electric Yukon are both signatories to the Standing Offer Program. The sheer volume of documents required to implement this policy is a testament to the technical and legal work that was required to develop it. Compounded by the need to collaborate and the significance of contracting for 20 GWh (now expected to increase to 40 GWh) of renewable electricity from Independent Power Producers for 25 years, the investment in third party legal and technical support was necessary.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab**

FACTORS DRIVING THE 2021 RATE INCREASE REQUIREMENT

Other Cost Changes ($0.7 million impact, 6.0% of shortfall): Other cost changes affecting the 2021 GRA revenue shortfall include depreciation rate changes ($0.6 million increase), Reserve for Injuries and Damages (RFID) updates ($0.4 million increase), and new Independent Power Production (IPP) costs ($0.3 million).

QUESTION:

a) Explain the difference in the business case cost of $232,039 million for IPP and the impact to rates of $0.3 million for new IPP costs.

b) Which is relevant and how is this reflected in application costs?

ANSWER:

(a) and **(b)**

The question references two different IPP cost items included in the 2021 test year:

1. Costs for power purchased from IPPs (per Table 3.2 in Application, and page 3-6, lines 8 to 12) – this is $0.314 million forecast for 2021 purchase cost for 1.983 GWh forecast to be supplied by IPPs. All of this cost is included in 2021 revenue requirement.

2. Costs for IPP Standing Offer Program Implementation (per Appendix 5.4, section 5.4-1, page 5.4-2) – deferred studies cost of $232,039 (not $232,039 million as shown in question) incurred in 2018 and 2019, that was closed and included in rate base in 2020 and is being amortized over five years. The 2021 revenue requirement includes annual amortization costs plus return on 2021 mid-year rate base amount.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab**

Mt Sumanik Wind Feasibility Studies

2018WIP	2019Addition	2020Addition	2021Addition
$694,427	$31,155	$50,000	

Mt Sumanik was identified as a particular site of interest for wind development given the advantages of its proximity to Whitehorse. From 2014 to 2015, work on this project focused on the siting, engineering, environmental assessment, permitting and installation of wind monitoring equipment at Mt Sumanik. This included completion of applicable studies such as a grid impact study and wind integration study. A Lidar unit and power supply system was installed on Mt Sumanik to track wind data.

From 2016 to 2017, the project work consisted mostly of data collection and management, as well as evaluating upgrades to the power system for the monitoring equipment which experienced difficulties. In 2018 work was conducted to repair the laser of the Lidar unit as the equipment was malfunctioning. Yukon Energy's 2016 Resource Plan identified a potential energy gap under the High Industrial Activity scenario. The Action Plan identified one wind supply option under this scenario. Accordingly, as wind was still a resource of interest, Yukon Energy considered whether further data monitoring should be conducted given missing data from the malfunctioning equipment. The need for Yukon Energy to directly conduct resource wind monitoring and site assessments has since been eliminated due to the high likelihood that future wind resources will be developed by Independent Power Producers. As such, the project was decommissioned in 2020 with total expenditures of $775,581 to be amortized over five years.

QUESTION:

a) Breakdown all costs associated, including consultant firms and costs for each; i.e. for siting, engineering, environmental assessment, permitting and installation of wind monitoring equipment on Mt. Sumanik.

b) In what year was IPP policy presented by YTG to Yukon Energy for implementation?

c) In what year was YEC first made aware that Northern Energy was planning a wind farm in the Whitehorse area?

ANSWER:

(a)

Please see YUB-YEC-1-96.

(b)

The current IPP policy was implemented in 2019 through OIC 2019/25 and 2019/26.

(c)

2018.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

WH2 Uprate Engineering1

2018WIP	2019Addition	2020Addition	2021Addition
$207,944	$44,448	$6,679	

In 2016, Hatch assessed the uprate options at the WRGS. Uprate of the WH2 was considered the most economically attractive option. The WH2 Uprate project would include completion of the WH2 unit's rehabilitation, replacement of the turbine runner and stator rewind and rotor refurbishment. The WH2 uprate engineering study was the first stage of a multi-year, phased project. The initial stage involved selection of an Owners Engineer to conduct preliminary design work (commenced in 2018 and completed in 2020). An external engineer was required to undertake this work as uprate studies are a specialized skillset that YEC does not employ internally. By end of 2021 WH2 Uprate Engineering costs will be transferred to Property, Plant and Equipment and added to WH2 Uprate total cost [amortized over 72 years starting in 2022]. However, this requires replacement of the existing stator winding and refurbishment of the rotor field poles and windings. before the end of 2021. The project is to be closed in 2021 with total expenditures of $259,072 to be amortized over 72 years.

QUESTION:

a) Was the total cost of $250K for work given to Hatch?'

b) If not, which engineering firm did study and at what cost?

c) If not, were there additional costs?

d) Confirm that existing WH2 stator has been replaced, winding and refurbishment of rotor field poles and windings complete.

e) At what cost?

ANSWER:

(a)

The assessment work completed by Hatch in 2016 was prior to the WH2 Uprate project. Hatch did not complete any work included in the $259,071 spent on WH2 Uprate Engineering between 2018 and 2020.

(b)

In 2018, YEC spent $165,646.78 on consultants (SNC Lavalin). The remainder was internal labor, legal fees (for contract negotiation), AFUDC and materials.

(c)

There were no other additional costs.

(d)

The original stator has not been replaced, nor have the refurbishment of rotor poles and windings. This work is a part of the WH2 uprate project.

(e)

The cost of the stator rewind and refurbishment of the rotor poles are part of the overall project cost of $12,257,000. The cost of the rewind is $601,857. Refurbishment of the stator frame is $24,457. Overall, YEC is spending $972,440 on the WH2 generator rewind/refurbish during the WH2 Uprate. This is included in the overall project budget of $12.257 Million.

TOPIC: **Capital Projects**

REFERENCE: **5.2.1.9 WH2 Uprate ($3.044 million in 2019, $1.693 million forecast in 2020, and $7.300 million forecast in 2021)**

In 2017, Hatch completed an economic assessment of various uprate options at the Whitehorse Rapids 24 Generating Station (WRGS).
28 The project is planned to be implemented over a three year period (2019-21).
The WH2 uprate scope 1 of work will include unit rehabilitation, runner replacement, generator stator and 2 rotor re-winding, governor replacement, exciter replacement and upgrading of the control and condition 3 monitoring systems.
4 Yukon Energy contracted Litostroj Power to undertake the runner fabrication with the following 5 concurrent activities planned for 2020: governor fabrication, balance of plant civil construction; balance of 6 plant P&C design completion, relace of balance of plant request for proposal, and delivery of materials to 7 Whitehorse. The balance of plant civil scope work included rehabilitation of the tailrace crane 8 superstructure and concrete piers. Due to significant new damage to the WH1 and WH2 penstocks 9 discovered in 2020, the planned penstock work was cancelled and will be completed as part of the 10 penstock repairs.
11 The WH2 uprate project is currently expected to be delivered on time with total project cost of $12.038 12 million.28

QUESTION:

a) Further to reference above giving WH2 business plan, is the first reference engineering costs of $259,039 included in this business plan?

b) If not, why not?

c) WH2 scope of work include unit rehabilitation, runner replacement, rotor re-winding, governor replacement, exciter replacement and upgrading of the control and condition monitoring systems. Did Listostroj Power do all the work in scope above and at what cost.

d) If Listostroj Power did not do all the work outlined above to the cost of $12,038 million, identify which firm/s was/were hired, what work done and at what cost.

e) Identify work done in-house and at what cost.

f) Identify any costs above associated with the balance of work identified above including rehab of tail race crane and concrete piers.

g) Identify all costs and for what work completed to WH2 for 2018 and any prior years.

h) Confirm that $12.038 million is the total amount for overhaul of WH2.

ANSWER:

(a)

No, the costs are not included in the 2019-21 spending identified in Tab 5, Section 5.2.1.9.

(b)

These costs were considered a Feasibility Study before the actual fix was determined. In accordance with YEC's policy, the project will be kept open and added to the 'Asset' when in-service.

(c) and **(d)**

This work has not yet been completed.

Litostroj has been contracted to complete all of the aforementioned deliverables at a contract value of $6,806,558.

(e)

Internal work includes: YEC engineering, Project Management, procurement, health and safety, operations, and site construction monitoring support. The estimated cost of YEC internal support is $500,000.

(f)

There is no additional work outside what has been defined above. Rehab of tailrace cranes and concrete piers are not a part of this Project.

(g)

No WH2 Uprate project work was completed prior to 2018. The 2018 work included developing project specifications and tendering as well as internal PM and engineering work.

(h)

Total Amount for this project is $12.297 million as per footnote 28 on Tab 5, page 5-19 of the Application, i.e., this includes the engineering related costs shown in Appendix 5.4 of $0.259 million.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.2.1.10 WH4 Uprate - Servomotor Replacement ($0.052 million in 2018; $0.079 million in 2019; $0.400 million forecast in 2020; and $1.000 million forecast in 2021)
The project involves detailed design, procurement and installation of two new Servomotors for Whitehorse Hydro Unit 4 (WH4) wicket gate operation.
Contracts with Andritz (OEM), L&S Electric (to review documentation and develop a governor commissioning plan) and Hatch (owners engineer) have been finalized. Procurement has not yet been undertaken for testing services and installation of a lifting device.
Yukon Energy entered into a contract with ANDRITZ Hydro for the design and supply of two new servo motors. Final design is nearing completion and manufacturing is expected to commence in Q3 2020.
Other work is proceeding in parallel including planning for changes to the governor, signature testing and characteristic testing with assistance from Hatch and L&S Electric. Delivery of the Servos is expected by January 2021. Contractor mobilization and installation, testing and commissioning is expected to occur in June 2021. The project is expected to be in service in June 2021.

QUESTION:

a) Detail which contracts and work performed with costs to Andritz(OEM), L&S Electric, and Hatch.

b) Identify any other contracts with work performed and costs.

c) Identify all work performed and costs for in-house.

d) Identify all costs and for what work completed to WH4 for 2018 and prior years.

e) Give total cost of WH4 overhaul to date.

ANSWER:

(a)

This project is not yet complete. YEC currently has a contract with Andtridtz for $744,000. L&S Electric will support with governor work, tuning and commissioning at a cost of $70,000. Hatch is acting as owner’s engineer at a cost of $35,000.

(b)

No additional contracts have been put in place at this point in time.

(c)

This project is not yet complete. The work YEC will be performing includes, Engineering, Operations, Procurement, Health and Safety, and Project Management support. It is estimated that YEC internal cost will be $153,000.

(d)

Total costs for 2018 and prior were $51,894.08. This covered initial feasibility studies and specification development.

(e)

Total costs up to December 31st, 2020 are $385,000.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-1: GENERATION PROJECTS
Dam Safety Review
Dam Safety Program

2019Actual	2020Forecast	2021Forecast
		$300,000

A full dam safety review (DSR) is performed every 5 years by an external consultant as recommended by the Canadian Dam Association (CDA).

A DSR was completed in 2020 and included an extensive inspection of all water control facilities, underwater inspection of structural elements by divers, geotechnical investigation of the Whitehorse power canal, and research into historical records of YEC assets. The 2020 DSR resulted in a detailed report that prioritized recommendations for work to be completed in future years. Spending in 2021 is required to address 2020 DSR outcomes and priorities identified for 2021. Some of the high priority items that will be addressed include:

- Wareham dam spillway design
- Warning and danger signage around the six dams
- Public safety around Marsh Lake

Dam Safety Recommendations 2017/18

2019Actual	2020Forecast	2021Forecast
$272,000	$300,000	

The 2015 DSR resulted in a detailed report that outlined a list of observed deficiencies and corresponding recommended actions to address identified deficiencies and eliminate hazardous conditions which could adversely affect the safety of the public and YEC staff. 2019 spending included required maintenance around the Marsh Lake control structure, and replacement of Whitehorse piezometers; while planned 2020 activities include replacement of the Mayo Lake Dam wood planking, Wareham Dam seismic upgrades, and the implementation of a public safety plan at the Marsh Lake control structure.

QUESTION:

a) Confirm all projects listed in Appendix 5.2 need to undergo a prudence test and approval from the Board before any/all can be entered into rate base.

b) Confirm the last DSR was done in 2015.

c) Confirm each project must be confirmed to be 'used and useful' before it can be entered into rate base.

d) Why were the 2015 recommendation of DSR not done until 2019 and forecast 2020, if they are so hazardous?

e) Are not some of the forecast work for 2021 the same as the 2021 safety recommendations?

ANSWER:

(a) and **(c)**

Projects are included in rate base the year they are completed and in service. Project costs must be reviewed and approved by the Board before being included in rates. The Board's review and approval process includes assessment of cost prudence and that assets are used and useful.

(b)

The last DSR was performed in 2015.

(d)

YEC plans and prioritizes projects throughout the year, taking into account any actions needed to reduce or remove hazardous conditions that could potentially pose a threat to the public, YEC staff, or property. At times, projects are shifted due to unforeseen events which results in project deferral.

(e)

Forecasted 2021 work was driven from the 2020 Dam Safety Reviews. The 2015 Dam Safety recommendations and the 2020 Dam Safety review both flagged work to be undertaken to address public safety at Marsh Lake – this appears to be the only common element between the 2017/18 Dam Safety Recommendations and the 2020 Dam Safety Review. The response to YUB-YEC-1-75 provides an update the 2017/18 Dam Safety Recommendations Project. This response notes that the Public Safety Plan was not completed due to the fact that YEC was waiting for results from the 2020 Dam Safety Review for inclusion into the Public Safety Plan.

P126 LNG Boil-Off Gas Heat Exchanger

2019Actual	**2020Forecast**	**2021Forecast**
$194,000		

Prior to decommissioning of the Mirrlees diesel generators, LNG boil off gas was piped to P126 and burned in the P126 plant boiler and/or dissipated through the WD1 jacket water heat exchanger. With retirement and removal of the three Mirrlees gensets at the Whitehorse Diesel Plant (P126) there was a requirement to replace this heat dissipation function and to design, supply and install a new heat exchanger at the plant to dissipate extra heat from the combustion of LNG boil off gas. Work related to the installation of the heat exchanger included hiring an owners engineer to prepare design, drawings and specifications for the new heat exchanger, piping, a new pump with VFD, and a temperature sensing device, and provide mechanical and electrical drawings and technical specifications for equipment and piping installation for tendering the construction work.

QUESTION:

a) Confirm this work has been completed and operational.

b) Why is this extra heat not utilized to heat buildings or some other cross purpose?

ANSWER:

(a)

This work has been completed.

(b)

The extra heat is typically available only during summer months (when the LNG plant is offline). The heat can be used for building heat or dyke heat if needed, but this is rarely the case.

Wareham Gate Heater

2019Actual	2020Forecast	2021Forecast
$574,000	$100,000	

The Wareham Gate Heating project replaced an old and ineffective heating system on both Wareham Spillway Gates. The new system is designed to keep both spillway gates operational through the winter. Passing flows during outages and times of high inflows is a critical function of the spillway.

QUESTION:

a) Confirm this work has been completed and operational.

ANSWER:

(a)

The project is complete and operational.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-1: GENERATION PROJECTS

Wareham Gate Refurbishment

2019Actual	2020Forecast	2021Forecast
		$250,000

The Wareham Dam impounds Wareham Lake and is classified as an extreme hazard Dam.1 The Wareham Spillway Gates have been in service since 1953 and are critical infrastructure for the Wareham Dam. The spillway gates at Wareham Dam have had significant leakage problems over a number of years, primarily due to age-related wear and corrosion. Recent observations, including an external engineering assessment, indicated that the gates were deteriorating in several ways. Specifically, the skinplates were experiencing pitting corrosion2 and needed to be repaired by sandblasting, adding additional plates and plug welding and seal welding the plates in an array to add strength. During testing of the hoist following repairs in 2019, extremely high friction forces were also observed acting on the gate; the wheel bushing was worn; and there was evidence of fretting wear on the wheel paths. Side seals were also leaking at a high rate at times; and copper staunching rod links and retaining clips required refurbishment with new self lubricated bushings to allow them to seal smoothly. Spending in 2020 was focused on undertaking work as identified above to address each of these issues.

QUESTION:

a) Confirm this work has been completed and operational.

ANSWER:

(a)

This work has not been completed.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-1: GENERATION PROJECTS

Whitehorse Diesel System Grounding for Generators

2019Actual	2020Forecast	2021Forecast
$218,000	$10,000	

This project prepared grounding calculations and installed acceptable grounding equipment for all Whitehorse diesel generators in order to address the following issues: (1) WD4 and WD5 generators were ungrounded and in the case of a ground fault there was risk of significant damage to this equipment; and (2) the grounding for WD6 and WD7 generators was not identical, and this was an inadequate configuration when several generators were running in parallel.

a) Confirm this work has been completed and operational.

b) Why would Yukon Energy have any facility that is not properly grounded?

ANSWER:

(a)

This work has been completed and is operational.

(b)

Standards and system site conditions change over time. It is prudent for YEC to continuously assess its grounding systems to ensure design functionality is being realized as expected. YEC determines if there are any issues resulting from the assessments and puts a plan in place to fix.

TOPIC: Capital Projects

REFERENCE: APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE

5.2-1: GENERATION PROJECTS

WH1 and WH2 Design and Install Dewatering System
2019Actual 2020Forecast 2021Forecast
$137,000

A suitable system was not in place to automatically control the water levels in the WH1 and WH2 draft tube during dewatering activities. This project installed a redundant and automatic dewatering system integrated with the station PLC to provide visibility and status alarms to increase safety and reduce the risk of a flood in the P125 plant. Prior to implementation of the project, the existing system was oversized, and required large volumes of makeup water to be.

a) Confirm this work has been completed and operational.

b) Why would the existing system be oversized in the first place?

ANSWER:

(a)

The project is completed and is operational.

(b)

It is unknown as to why the existing system is oversized.

5.2-1: GENERATION PROJECTS

WH4 Ventilation

2019Actual	2020Forecast	2021Forecast
		$750,000

The WH4 plant is overheating during the summer. Given that YEC is adding additional capacity to the WH4 hydro unit with new servo motors in 2021, removing the restriction placed on output by the overheating issue will enable the extra capacity to be used reliably throughout the year.

QUESTION:

a) Why is this program not included in the WH4 overhaul?

b) Confirm this work has been completed and operational.

ANSWER:

(a)

Both the ventilation and uprate projects are different in nature and as a result YEC decided to keep them separate.

(b)

This project has not started. Engineering, estimating and planning will occur in 2021 with project commencement and completion in 2022.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-2: TRANSMISSION PROJECTS

Alexco Mobile Substation Connection

2019 Actual	**2020Forecas**	**2021Forecast**
$178,000		
($178,000contribution)		

Alexco plans to use a 3 MVA, 69 kV/4.16 kV mobile self-contained substation to feed their Birmingham site at Keno. The substation must be connected to the McQuesten-Keno 69 kV line. The project includes supply, installation and commissioning of the new line tap including connection to existing 69 KV line, engineering and commissioning support for the new mobile substation. YEC has engaged Chimax to complete a 69 kV line tap design to connect the Alexco mobile substation to the McQuesten-Keno 69 kV line. The actual project costs will be fully recovered from the customer.

QUESTION:

a) Is this to be included in the rate base account and how is this accommodated?

ANSWER:

(a)

This project is included in rate base. With the contribution there is no net impact to rate base. Costs are not included in rates until approved by the Board.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

Line 177 Re Route

2019Actual	**2020Forecast**	**2021Forecast**
	$105,000	$250,000

Some areas of L177 are on the border, or within, the highway right of way (ROW). The Yukon Highways Department is undertaking road construction upgrades; and the design will have cuts for a new ditch starting where some YEC poles are currently located. Three poles fall within a highway cut and at least one will be within 2 m of a highway cut. As a condition of our permit with YG, YEC is required to move the affected poles, and poles adjacent, in order to meet Yukon Government's construction requirements.

QUESTION:

a) Why would Yukon Energy not be liable for this error?

b) Should not Yukon Energy or their contractor absorb this cost?

c) Confirm this work completed and operational.

ANSWER:

(a) and **(b)**

Portions of L177 are within the highway ROW and the terms and conditions of the YEC permit require YEC to move assets at YEC's expense when directed to by YG. This is a regulatory requirement. As such, Yukon Energy considers it a prudent expenditure that should be considered recoverable in rates.

The existing location of the L177 reflects assessments and action done when the facilities were originally installed, and does not confirm any "error" or liability as assumed in the question.

(c)

Work is complete and operational.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

Minto Mine Substation – Neutral Ground Resistor

2019 Actual	**2020Forecast**	**2021Forecast**
$105,000		
($184,000 contribution3)		

The Minto mine requires that the following equipment be installed at the S254 Minto mine substation to be in compliance with regulatory direction: 25 kV recloser c/w bypass switch, instrument transformers, protection and controls; and 5 kV NGR c/w instrument transformers, protection and control. As this equipment is being installed at the customer's request, the full cost of the work will be recovered from the customer.

QUESTION:

a) Is this to be included in the rate base account and how is this accommodated?

ANSWER:

(a)

Projects are included in ratebase the year they come into service. The project was completed in 2019. The project includes a contribution amount that exceeds the cost incurred in 2019 due to the contribution also addressing a cost incurred in a prior year – the net impact will therefore reduce rate base. Project costs are not included in rates until reviewed and approved by the Board.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-1: GENERATION PROJECTS

Line 177 Re Route
Protection and Control Program

2019 Actual	2020Forecast	2021Forecast
		$300,000

The protection and control program is a capital replacement program under development as part of the Asset Management Framework. YEC has engaged SNC to conduct an asset condition assessment for all protection and control equipment in all generating plants and substations throughout the YEC system. The protection and control review will develop a 20-year capital plan to prioritize the replacement of aging protection and control assets throughout the YEC grid. The program is being undertaken to improve system reliability, protect generating and transmission assets, and reduce outage frequency.

QUESTION:

a) Since the YEC has spent millions on a Asset Management Program, explain why Yukon Energy would need to hire an outside consultant to do this work?

ANSWER:

(a)

This is an output of the Asset Management Program. Protection and Control is a specialized industry and as a result, consultants with this expertise are required to support YEC in development and implementation.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

Line 177 Re Route Transmission Line Access

2019 Actual	2020Forecast	2021Forecast
$324,000	$300,000	

YEC requires access to transmission lines for maintenance, inspection, and brushing activities. A number of temporary access points lacked the necessary permitting and were potentially not constructed to an acceptable standard. The Yukon government authority has indicated this situation is no longer acceptable and must be rectified. 3The project included the completion of a management plan for transmission access points including current condition, work and permits required, and estimated costs, specifically for accesses required to complete the Transmission Line Refurbishment project (see Section 5.2.1.5). It also included construction of new accesses and upgrades to existing accesses. Completion is expected to result in faster response times for emergency line work, avoidance of potential YG penalties and reliable access to key YEC assets.

QUESTION:

a) Is this not included in another area of capital works?

b) Since the YEC has spent millions on a Asset Management Program, explain why Yukon Energy would need to hire an outside consultant to do this work?

ANSWER:

(a)

No. It is not included in any other area of capital works.

(b)

This requires the support from a consultant with the expert skillset to develop a program which will be a component of the Asset Management system.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

Van Gorda Substation

2019Actual	**2020Forecast**	**2021Forecast**
$54,000	$199,000	
($188,000 contribution)		

Crown Indigenous Relations and Northern Affairs Canada (CIRNAC) is responsible for the Faro Mine Site; they are working to design, supply, install and commission a substation at the Van Gorda mine which is part of the Faro mine complex. CIRNAC has also expressed interest in transferring ownership of an existing stepdown transformer (138kV: 4.16 kV / 12 MVA) at the Faro substation which is currently out of service. CIRNAC has requested that Yukon Energy support their project. Yukon Energy's role in the project would be to support CIRNAC and its technical consultants with respect to technical and operational matters, support transfer of ownership of the T1 Transformer, supply YEC approved meters, complete SCADA works for YEC monitoring, and monitor commissioning activities. YEC will witness all commissioning and start up activities.

QUESTION:

a) Why is this not fully recovered from CIRNAC?

b) Is this to be included in the rate base account and how is this accommodated.

ANSWER:

(a)

CIRNAC is making a full contribution for costs related to YEC supporting CIRNAC and its technical consultants with respect to technical and operational matters, support transfer of ownership of the T1 Transformer, supply YEC approved meters, complete SCADA works for YEC monitoring, and monitor commissioning activities. The application included a forecast contribution of $188k for this work in 2020 in error. It should have shown a contribution of $54k in 2019 and $134k in 2020 (total forecast contribution for both years of $188k).

The variance in forecast costs in 2020 of $65k ($199k forecast spending -134k contribution from CIRNAC) relates to additional costs incurred by YEC to complete SCADA works for

YEC monitoring that were not part of the CIRNAC scope of work. The scope of this work included the following:

- Installation/commissioning of radio communication equipment at the Faro diesel plant and the CKRW tower to ensure YEC has the ability to send and receive SCADA information from Vangorda substation and Faro mine;

- A new revenue meter and CTs for the revenue meter purchased and installed at Faro mine; and

- Replacement of the revenue meter PTs at Vangorda to meet ATCO's metering system requirements.

(b)

The project was completed in 2020 and included in rate base. Contributions would reduce the impact on rate base. Costs are not included in rates until approved by the Board.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

WAF Transmission Upgrades

2019Actual	**2020Forecast**	**2021Forecast**
$793,000		

The WAF transmission system allows low cost hydro generation supplied from Aishihik, Whitehorse, or Faro to be transmitted to other locations on the grid. Failure of a transmission line structure would interrupt this supply, potentially resulting in a wider grid collapse. The structures on this transmission line were built in the 1960s through 1970s and were in various stages of deterioration. 2019 project work focused on L178 (Carmacks to Faro). The remainder of the WAF line was addressed as part of the Transmission Line Refurbishment (TLR) project (see Tab 5, Section 5.2.1.5); and the remainder of the deficient L178 structures will be replaced as part of the L178 portion of the TLR project (see Tab 5, Section 5.2.1.6).

QUESTION:

a) Appears to be a duplicate of the L178 capital request? Explain.

ANSWER:

(a)

The 2019 WAF Transmission Upgrades project work focused on L178 (Carmacks to Faro). This work was completed separately from the L178 portion of the TLR project.

The excerpt referenced in the preamble to this question specifies that the remainder of the WAF line upgrade work (not included in the WAF Transmission Upgrades) was addressed as part of the Transmission Line Refurbishment (TLR) project (see Tab 5, Section 5.2.1.5); and the remainder of the deficient L178 structures will be replaced as part of the L178 portion of the TLR project (see Tab 5, Section 5.2.1.6). Table 5.2-1 in Tab 5 of the Application does not show spending on the L178 portion of the TLR project prior to 2021.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-3: DISTRIBUTION PROJECTS

Customer Extensions

2019Actual	2020Forecast	2021Forecast
$626,000		
($698,000 contribution)		
	$600,000	
	($426,000 contribution)	
		$600,000
		($400,000 contribution)

Yukon Energy is required to provide service to new customers connecting to the grid system. Customer extensions are forecast and budgeted as capital items without identifying specific projects. Most costs of customer extensions are covered by customer contributions pursuant to the Terms and Conditions of Service.

QUESTION:

a) Explain how you forecast extensions and contribution?

ANSWER:

(a)

YEC uses a rolling average for the customer extensions budget. It is difficult to predict the number and type projects YEC may see on an annual basis (e.g., commercial projects where contributions can be quite high). The number of customer connects can be quite variable year to year.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

L355 Voltage Regulator

2019Actual	2020Forecast	2021Forecast
$144,000	$35,000	

Atco Electric Yukon (AEY) has reported low voltage levels (below CSA standards) at the AEY Haines Junction substation, which is supplied from Aishihik via distribution line L355. The project identified the voltage profile of L355, determined the appropriate location and settings of voltage regulators, and completed all installation and commissioning work.

QUESTION:

a) Were these new voltage regulators and are they now in use?

b) What is the forecast work for 2020? And why to rate base?

ANSWER:

(a)

These are new voltage regulators and are now in use.

(b)

The forecast work in 2020 was to install additional ground conductor and to commission once complete. This was a capital expenditure.

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

System Improvements for Eagle Gold Mine

2019 Actual	**2020Forecast**	**2021Forecast**
$487,000		
($487,000		
Contribution)		

The VGC Group PPA provides for development on the Yukon grid of the McQuesten Substation plus the Initial YEC Facilities Improvements, as described in Schedule C of the VGC Group PPA, prior to Commencement of Delivery to the Eagle Gold Mine. These Yukon grid enhancements and facilities are required to connect the Mine to the existing transmission grid, to maintain acceptable system voltages while supplying this new load, and to address potential contingent operating conditions such as loss of generation at Mayo or loss of the transmission connection between Mayo and Whitehorse. The VGC Group PPA provides in Section 6.1 for YEC to recover from the mine the reasonably incurred capital costs for the Initial YEC System Improvements as set out in Schedule C of the PPA.

QUESTION:

a) How is this accounted for in the rate base?

ANSWER:

(a)

Project costs are included in rate base the year the project is completed. With the contribution there is no net addition to ratebase. Costs are not included in rates until approved by the Board.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-4: GENERAL PLANT AND EQUIPMENT PROJECTS

Communications Upgrades

2019Actual	**2020Forecast**	**2021Forecast**
$801,000		

The project completed a number of recommendations that resulted from a Communications Needs Assessment undertaken by an independent consultant that were required to achieve necessary improvements in security, integration, performance and redundancy. The project was reviewed in detail in the 2017/18 GRA.4 YEC noted at the time that the project was planned to be executed over multiple years –"The 2017/18 review noted that satellite installations for SCADA and fibre communications upgrades were required to create redundancy for disaster planning; network access controls were needed due to changes resulting from the satellite installations, and that the SCADA communications upgrades would facilitate satellite communication at YEC's various sites. Key projects completed in 2019 included: fibre communication upgrades; SCADA upgrades, the Takhini Redundant Datacentre; Satellite installations for SCADA.

QUESTION:

a) Identify the independent consultant for the Communications Needs Assessment, work completed and cost.

b) Identify the contractor/s who did the upgrades, work completed and costs.

c) Are all these upgrades now operating efficiently?

ANSWER:

(a)

The Communications Needs Assessment was completed by BBA to provide a holistic assessment of YEC's communications infrastructure and a guide to evolving it to meet future needs and requirements. The BBA assessment was completed in 2016 at an approximately cost of $60,000. A review/ update of this work was undertaken in 2018 to finalize the scope of the capital project at a cost of $10,788.

The study looked at both information technology and operations technology and addressed the following:

- SCADA and remote data collection
- Corporate data, voice and video communications
- Cost Effectiveness over life-cycle
- Reliability and Redundancy
- Security
- Safety
- Accessibility and availability
- Future needs: new plants, future data collection strategies, bandwidth requirements, protocol migration, backup control center, disaster recovery, etc.
- Review of current network topography
- Review of existing SCADA, data, voice and video communications infrastructure
- Risk identification and qualification
- Identification of gaps with equipment capabilities
- Maintenance requirements and life cycle estimates
- Limitations and risks summary
- Available Technology, options.
- Simple cost/benefit/risk analysis.
- Office and mobile workforce equipment requirements.
- Substation and plant equipment requirements.
- Bridging strategies in existing facilities and requirements in new plant.
- Overall Data Communications strategy.
- Opportunities for improvement.
- Opportunities for joint-ventures (Government, First Nations, Northwestel, Private)
- Growth strategy including an examination of maintenance workforce requirements.

(b)

The project was completed at a total cost of $1.152 million.[1] 2019 actual spending was $0.801. million.

[1] $0.351 million was included in ratebase as part of the 2017/18 GRA Application; and $0.801 million was incurred in 2019. The project was completed in 2019.

A summary of costs by contractor is as follows:

Table 1: Project Cost by Contractor

Vendor	Note	Activity	2017	2018	2019	Total
Charter Telecom	A	Data Centre materials and some network programming	25,097	145,072	354,611	524,780
Northwestel Inc.	B	Fiber work for Takhini and Mayo			208,350	208,350
Total North Communications	C	Satellite equipment and installations (includes costs related ot UPH Networks)			49,596	49,596
Dell Computer Corporation	D	Dawson and Mayo Community Servers	30,415			30,415
Westower Communications Ltd	E	New Ashihik Headgate Tower			26,490	26,490
BBA Engineering Ltd.	F	Update to original communications needs assessment		10,953		10,953
McWatters Network Engineering LTD	G	Nwtel Service Upgrade Project Management and Fiber Design consulting	5,700	17,550		23,250
Alpha Technologies	H	Radio equipment for Ashihik	189		7,348	7,537
CDW Canada	I	Radio equipment for Ashihik			7,517	7,517
Walters Construction & Industrial Corp	J	Aishihik Tower pad construction costs			6,670	6,670
Teshmont Consultants LP	K	Aishihik Tower erection costs			4,708	4,708
R.C. Crane and Construction	L	Aishihik Tower erection costs			4,130	4,130
IBEX Construction Ltd.	M	Aishihik Tower erection costs			1,487	1,487
Maven Consulting Limited	N	Aishihik Tower engineering costs			1,063	1,063
			61,401	**173,574**	**671,971**	**906,946**
YEC Materials, Overhead and Other		Labour, design, materials , and Mayo Communiations Shack	**34,463**	**81,175**	**129,324**	**244,961**
Total			**95,864**	**254,749**	**801,294**	**1,151,907**

(c)

Yes, these upgrades have been installed successfully and are delivering the functionality and benefits as per the objectives of the program.

TOPIC: **Capital Projects**

Building Upgrades

2019Actual	**2020Forecast**	**2021Forecast**
$370,000	$275,000	

In 2016, an external consultant was hired to perform an asset assessment on YEC-owned buildings and facilities, mainly consisting of staff houses and administration buildings.

2019 work included: exterior works,7 HVAC retrofits,8 flooring replacement,9 electrical panel replacements,10 and equipment replacement. 2020 costs relate to replacement of the WH4 hydro plant (P127 roof). During 2019 the roof membrane failed, and an interim patch was installed to address a leak. If the roof was not repaired additional leaks would develop and need to be addressed at a much higher cost.

QUESTION:

a) Identify the external consultant hired to perform asset assessment and costs associated.

b) Is all the work now completed?

c) Does Yukon Energy have a maintenance person for its buildings?

ANSWER:

(a)

Golder Associates Ltd was hired to perform the asset assessment. The cost for this work was $131,350 + GST.

(b)

Work was completed as per priorities identified and budgeting, another assessment was due to be done in 2020 as part of a 5 year renewal plan. This has yet to occur as there are still some outstanding deficiencies being addressed in 2021.

(c)

A property manager is in place. There is no maintenance personnel dedicated to buildings, and the work is primarily outsourced.

Compact Digger Truck

2019Actual	**2020Forecast**	**2021Forecast**
		$185,000

The purchase of a 4 to 5 ton chassis compact digger truck for use in Dawson...

QUESTION:

a) Is this digger truck now purchased and operating in Dawson?

ANSWER:

(a)

No. Procurement will happen in 2021.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

Crane Inspection

2019Actual	**2020Forecast**	**2021Forecast**
	$165,000	$400,000

During an annual crane inspection, three YEC cranes (Aishihik service building, P127 powerhouse, & P127 stop log hoist) were identified as needing significant structural, electrical, and mechanical repairs in order remain in acceptable working condition. 2020 spending will provide for a detailed assessment of each crane to determine an engineered plan for replacement or refurbishment as required. Actual construction activities are planned for 2021.

QUESTION:

a) Has this inspection and construction been completed and now operating?

ANSWER:

(a)

The inspection has been completed and the cranes are functional. However, there is work still to be completed.

TOPIC: **Capital Projects**

5.2-4: GENERAL PLANT AND EQUIPMENT PROJECTS

Mayo Earthworks
2019Actual 2020Forecast 2021Forecast
$300,000

A number of issues at and around the Mayo Hydro facilities have been identified. These include slope instability and erosion issues near access roads (Mayo A, Mayo B, and Wareham dam), both powerhouse buildings, surge tank, and both substations. During 2019 a complete site inventory of civil issues was undertaken to identify and prioritize embankments. 2020 spending developed a detailed work plan for identified issues including a geotechnical assessment, topographic survey, detailed engineering design (including drawings and specifications), construction methodology, and project scope, schedule & budget development.

QUESTION:

a) Is this earthworks all completed or was this just for the assessment work?

b) Identify contractor, work completed and cost for each job.

ANSWER:

(a)

Only assessment work has been completed.

(b)

Assessment and engineering work was completed by CAP Engineering at a total cost of $101,985.

TOPIC: **Capital Projects**

5.2-4: GENERAL PLANT AND EQUIPMENT PROJECTS

New Mobile Office Unit – IT

2019Actual	2020Forecast	2021Forecast
		$230,000

The existing IT trailer houses five offices and a closed storage space. It is aging and requires additional O&M support each year. The project involves replacement of the aging, undersized IT trailer with a larger unit able to accommodate eight office spaces and storage. Additional office spacing would allow for staff expansion as a less costly solution than building onto the main building.

QUESTION:

a) Has this IT trailer been bought, set up and operational?

ANSWER:

(a)

No. The procurement process has not started for the new IT trailer.

Water Improvement Upgrades

2019Actual	**2020Forecast**	**2021Forecast**
$150,000		

The cooling water and potable water systems in the YEC main corporate office have experienced pre-mature piping failure and select cooling coil leaks for at least the past 10 years. An external engineering firm was engaged to assess the current systems and provide recommendations to address the issues. The project will implement those recommendations including the installation of a particulate filter, a VFD drive for the existing pump, a heat exchanger, new cooling water piping and valves, and fan coil drip pans with leak detection.

QUESTION:

a) Which firm did assessment, and at what cost?

b) Are the necessary changes made and operational?

ANSWER:

(a)

Stantec Architecture Ltd. was retained to do the assessment at a cost of $7,450.00 + GST.

(b)

With the exception of an exchanger all changes have been made, and the water system is currently functional.

TOPIC: **Capital Projects**

5.2-5: OVERHAULS & RESERVE FOR SITE RESTORATION PROJECTS

FD7 Overhaul

2019Actual	2020Forecast	2021Forecast
		$580,000

Faro Diesel #7 (FD7) is located at the Faro Diesel Plant and uses as 12-cylinder Caterpillar Model 3612 diesel engine as its prime mover (vintage 1992).

QUESTION:

a) Is FD7 overhauled and now operational?

ANSWER:

(a)

FD7 has not been overhauled. It is operational.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

5.2-5: OVERHAULS & RESERVE FOR SITE RESTORATION PROJECTS

Decommissioning on WD3

2019Actual	2020Forecast	2021Forecast
		$999,000

After removing the third Mirrlees engines from service, all three units were fully decommissioned. Decommissioning included disassembly and removal of all ancillary equipment and piping, asbestos abatement as required, separation and hoisting of major engine components, and backfill and compaction of the engine pits. All decommissioned equipment was removed from site and appropriately disposed of.

QUESTION:

a) Is this work complete or is it forecast?

b) Identify contractor and cost for each project.

ANSWER:

(a)

This work is complete.

(b)

The contractor for this project was Klondike Welding and the total cost for the project was $999,000.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.2: CAPITAL PROJECTS TO RATE BASE**

Site Restoration Transmission Lines
2019Actual 2020Forecast 2021Forecast
$174,000

The Utility maintains a regulatory provision for future removal and site restoration related to property, plant and equipment. Costs of dismantling capital assets, including site remediation, are applied to this account. In 2019, YEC spent $0.174 million on site remediation relating to the L178 and L355 Transmission Lines.

QUESTION:

a) Identify contractor/s work completed and costs.

ANSWER:

(a)

In 2019, YEC spent $0.174 million on site remediation relating to the L178 and L355 Transmission Lines. Work included site restoration after the structure repairs and or replacement. Some of the work was related to failed test and treat structures where the pole shell thickness was less than 2 inches, this requires a pole change out. Work on structures included:

- 61 structures L178
- 15 structures L355

Costs were allocated as follows:

- Ibex Construction performed the work on L178 ($122,436);
- YEC performed the work on L355 (approximately $52,000).

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

1. Aishihik Generating Station (AGS) Long Term Year Water Use Licence Renewal

2018 WIP	2019Additions	2020Additions	2021Additions
$4,957,199	$512,755	$1,488,000	$960,000

The planned long term AGS Water Use Licence renewal project and related costs were initially reviewed as part of the 2017/18 GRA. At that time, it was noted that the total forecast budget for the project was $3.569 million spread over five years (2015-2019). Project expenditures to support the long term licence renewal were reviewed in detail in the 2017/18 GRA (See Section 5.3.1.2 and response to YUB-YEC-1-77 in that GRA). Total deferred costs to the end of 2018 were forecast at $2.899 million.

In 2018, Yukon Energy prepared a long-term Project Proposal application for filing with YESAA Designated Office in December 2018, prior to Yukon Energy's decision in early 2019 to secure a three-year licence renewal.1 The longterm Project Proposal document was updated over Q1 and Q2 2020 and filed with the Haines Junction Designated Office in July 2020. It is expected that the Designated Office review process will be completed in Q2 2021. Yukon Energy expects to prepare and file its long term water use licence renewal application with the Yukon Water Board in early 2021, and that a hearing regarding the licence renewal would occur sometime in 2022. The deferred costs forecast in the Application include spending in WIP increasing from $4.957 million at the end of 2018 to $7.918 million by the end of 2021. The project is forecast to be complete by the end of 2022. A three-year licence renewal was secured in February 2020, extending the licence to December 31, 2022.

QUESTION:

a) Outline project related work completed, costs and contracts awarded, as prepared for 2017/18 GRA.

b) Were these approved? If so, give relevant Board decision.

c) If forecast cost to end of 2018 were forecast at $2.899 million, why is the 2018 WIP listed at $4.957,199 million.

d) Identify firms hired, contract amount and work completed for the $512,755, 2019 additions.

e) Identify in-house work completed and costs for 2019 additions.

f) Identify firms hired, contract amount and work completed for the $1.488 million 2020 additions.

g) Identify in-house work completed and costs for 2020 additions.

h) Identify firms hired, contract amount and work completed for the $0.966 million 2021 additions.

i) Identify in-house work completed and costs for 2021 additions.

ANSWER:

(a)

In the 2017/18 GRA, the total budget for the project was forecast at $3.569 million spread over five years (2015 – 2019). The information prepared for the 2017/18 GRA with regards to the work is detailed in YUB-YEC-1-77 from the 2017/2018 GRA (see Attachment 1 to this response).

(b)

This was a deferred project in the 2017/18 GRA. The project was not forecast at that time to be completed until the end of 2019. As such these costs were not approved as part of that prior proceeding.

(c)

The 2018 costs were forecast costs at the time of the GRA filing; actual 2018 costs as reported in the 2021 GRA are higher than the 2017-18 GRA forecast. In both GRA's, these costs remain in WIP.

(d)

Table 1 below provides the contractors, work completed, and costs incurred in 2019 for the project. YEC internal costs incurred in 2019 are addressed in response to part (e).

Table 1: Contractor Costs and Work Completed (2019)

Contractor	Cost	Work Completed
Ecofor Consulting Ltd	$90,923	Archaeological and heritage resources technical support
Environmental Dynamics Inc.	$80,631	Support of YESAB DO Assessment Project Proposal development, Biophysical technical work, Canyon Lake monitoring
InterGroup Consultants Ltd.	$113,479	Project management, Preparation of YESAA Project Proposal, YESAB DO Assessment Support, Preparation of Monitoring & Adaptive Management Plan, Participation in technical working group, support to compensation and other project negotiations
Morrison Hershfield Limited	$85,124	MAMP Technical Development, YESAB DO Assessment Support, Responses to Information Requests, Downstream technical work.
Total	**$370,157**	

(e)

Table 2 below provides YEC internal costs incurred in 2019 for the project.

Table 2: Yukon Energy Internal Costs (2019)

Element	Cost	Description
Internal Labour	$4,023	Project Management, Development of Project Proposal
Other Internal Costs	$3,046	Materials, travel, communications
AFUDC	$135,528	Accrual of AFUDC
Total	**$142,597**	

(f)

Table 3 below provides the contractors, work completed, and updated costs incurred in 2020 for the project (the updated costs are higher than the forecast in the Application).

Table 3: Contractor Costs and Work Completed (2020 Forecast)

Consultants	Cost	Work Completed
Aasman Brand Communications Inc.	11,469	Communications and materials development, graphic design
Daryn R.Leas Law Corporation	87,211	Consulting and advisory services for Project Agreement negotiation
DLA Piper (Canada) LLP	172,305	Legal support
Ecofor Consulting Ltd	18,705	Archaeological and heritage resources technical support
Environmental Dynamics Inc.	175,238	MAMP Technical Development, YESAB DO Assessment Support, Biophysical technical work, Canyon Lake monitoring,
InterGroup Consultants Ltd.	340,517	Project management, Preparation of YESAA Project Proposal, YESAB DO Assessment Support, Preparation of Monitoring & Adaptive Management Plan, Participation technical working group, support to compensation and other project negotiations.
Morrison Hershfield Limited	303,389	MAMP Technical Development, YESAB DO Assessment Support, Responses to Information Requests, Downstream technical work, Technical Support for Water Board Application
Champagne & Aishihik First Nations	770,510	Contributions to support technical review of project; Chemi narrows payment from 2002 relicensing process
Total	**$1,879,433**	

(g)

Table 4 below provides updated YEC internal costs incurred in 2020 for the project.

Table 4: Yukon Energy Internal Costs (2020 Forecast)

Element	Cost	Description
Internal Labour	67,201	Project Management, Development of Project Proposal, Attendance at Technical Working Group meetings, Attendance at Technical Subgroup Meetings, Attendance at Steering Committee Meetings, disbursements for printing, venue rental, telecommunications, etc.
Other Internal Costs	27,594	Materials, printing, travel, communications
AFUDC	164,665	Accrual of AFUDC
Total	**$259,460**	

(h) and **(i)**

Table 5 below provides the costs for the 2021 current contracts budgeted to the end of March 2021. Additional work for the remainder of 2021 has not been contracted or completed.

Table 5: Contractor Costs and Work Budgeted to end of March 2021 (Forecast)

Contractor	Cost	Work Anticipated
Morrison Hershfield Limited	$59,945	MAMP Technical Development, YESAB DO Assessment Support, Responses to Information Requests, Downstream technical work, Technical Support for Water Board Application
Environmental Dynamics Inc.	$89,528	MAMP Technical Development, YESAB DO Assessment Support, Responses to Information Requests, Biophysical technical work, Technical support for Fisheries Act Authorization
InterGroup Consultants Ltd.	$129,320	Project management, YESAB DO Assessment Support, Preparation of Monitoring & Adaptive Management Plan, Participation in technical working group, Support for Water Board Application development; support to compensation and other project negotiations
Ecofor	$6,600	Heritage and socio-cultural technical support
Champagne & Aishihik First Nations	$90,000	Contributions to support technical review and participation in project committees

To date, YEC has incurred $18,389 of internal labour costs in 2021 for project management and technical resources to support the YESAB DO Assessment development of the Monitoring and Adaptive Management Plan.

Please see response to YUB-YEC-1-90 for a review of updated project costs by activity through to forecast completion at the end of 2022.

Yukon Energy Corporation
2017 – 2018 General Rate Application
YUB-YEC-1-77

TOPIC: **Aishihik Generating Station Water Use Licence Renewal, Section 5.3.1.2**

REFERENCE: Application, pages 5-33 to 5-34. PDF pages 204 to 205

QUOTE: "A licence renewal is required for the continued operation of the 37 MW hydro facility, which provides the only multi-year hydro storage and the largest winter peak hydro generation capability on the Yukon Integrated System. Yukon Energy plans to seek a 25-year licence renewal (the maximum allowed term).

"The total budget for the project is forecast at $3.569 million spread over five years (2015 – 2019). Total deferred costs to the end of 2018 are forecast at $2.899 million. The last Aishihik licence renewal project cost approximately $8.791 million.

"The licence renewal process will include undertaking environmental and socio-economic studies required to support a YESAA Project Proposal (currently targeted for a Designated Office filing in mid-2018), followed by the development and securing of a Yukon Water Board Application and an application for a Fisheries Act Authorization."

QUESTION:

a) Please provide a detailed breakdown and explanation of the actual costs from 2015 and 2016 and forecast costs from 2017 onwards for the Aishihik licence renewal project.

b) Considering that the above is a five-year project, please describe and explain what has been accomplished from 2015 to date, with respect to this project.

c) Please explain what is meant by a "Designated Office filing".

d) Have issues arisen as a result of working with the Champagne and Aishihik First Nations (CAFN) towards a water license use renewal? If so please explain.

e) Considering that YEC is almost three years into the project, are there updates to the total forecast cost of $3.569 million for this project?

ANSWER:

(a)

Table 1 provides a breakdown of the actual and forecast expenditures per spending category for the Aishihik water use license renewal project. The actual expenditures for 2015 and 2016 are combined since the expenditures were minimal in 2015 due to a delay in the project start. The delay was caused by longer than expected negotiations with the Champagne and Aishihik First Nations (CAFN) related to the novel co-management approach in developing the regulator submissions. The co-management approach is discussed in more detailed in answer to YUB-YEC-77(b).

The total project expenditure forecast, as presented in column 2015-2019 in Table 1, is based on the budget approved by YEC's Board of Directors in September 2015. As discussed in more details in the answer to YUB-YEC-77(e), the 2015-2019 forecast is expected to increase.

The project management costs are YEC internal costs related to the work on planning and executing the project.

The CAFN and stakeholder engagement costs are related to: 1) engagement with the CAFN, including funding the Champagne and Aishihik Community Advisory Committee (CACAC) and traditional knowledge project, discussed in more details in the answer to YUB-YEC-77(b); and 2) public engagement, discussed in more details in the answer to YUB-YEC-77(b).

The Aishihik Advisory Committee (AAC) costs are related to the activities of AAC discussed in more details in the answer to YUB-YEC-77(b).

The Impact assessment studies costs are related to the planning and execution of the environmental and social impact assessment studies discussed in more details in the answer to YUB-YEC-77(b).

The permitting process costs are related to development of: 1) the project proposal to the Yukon Environmental and Socio-economic Assessment Board (YESAB); 2) regulatory application to the Department of Fisheries and Oceans (DFO); and 3) regulatory application to the Yukon Water Board (YWB).

The CAFN compensation costs are related to: 1) the compensation to the CAFN due to the loss of use of the lake for the duration of the future water use license; and 2) negotiation costs to reach a compensation agreement with the CAFN.

Table 1: Actual and Forecast Expenditures for the Aishihik Water Use License Renewal Project

Expenses in $'000	Actual 2015-2016	Actual Jan - Jun 2017	Forecast Jul 2017 - Dec 2019	Forecast 2015-2019
Project management	79	34	440	553
CAFN and stakeholder engagement	126	36	222	384
Aishihik Advisory Committee (AAC)	81	6	66	153
Impact assessment studies	703	426	630	1759
Permitting process			300	300
Total	**989**	**502**	**1658**	**3149**

In addition to the above forecast, YEC anticipates payment of compensation to affected lake users, however, the quantum is not known at this time.

(b)

Project accomplishments since its inception until the end of August 2017 are presented in the following categories: establishment of co-management framework; establishment and activities of the AAC; planning and execution of environmental and social impact assessment studies; public engagement; and building relationship with the CAFN. Each of those categories is discussed in the following paragraphs.

Establishment of co-management framework.
Considering the importance of the Aishihik Generating Station (AGS), the fact that the facility is located at the CAFN traditional territory, and complexities encountered during the previous water use licence renewal process due to misaligned expectations between the CAFN and YEC, YEC deemed it prudent to engage the CAFN at the beginning of the

current water use license renewal process. The objective of engagement was to increase participation by the CAFN in the water use relicensing regulatory process, increasing collaboration between YEC and CAFN and reducing the risk of conflict and/or adversarial legal action during the formal regulatory proceedings. As a consequence, CAFN and YEC signed the Aishihik Hydroelectric Power Generation License Renewal Co-Management Protocol Agreement that provided a formal framework for the co-management of the water use licence renewal process between CAFN and YEC. The document stipulates the roles and responsibilities of the parities in the relicensing process, as well as the governing and advisory bodies, such as the Steering Committee, AAC, and CACAC. As a part of the co-management process to develop the assessment and permitting regulatory submissions, CAFN set up the CACAC to provide advice on the introduction of CAFN's values and traditional knowledge to the process to influence the scope and interpretation of the environmental and social impact assessment studies. In the spirit of the co-management agreement, YEC provided funding for the CACAC, as well as the CAFN-led traditional knowledge project that will be a part of the regulatory submissions.

Establishment and activities of AAC.

Since, in addition to CAFN, the water use licence renewal process includes external stakeholders, YEC also engaged the major stakeholders in the process through the AAC. The AAC is co-chaired by the CAFN and YEC.

The AAC's role is to provide ongoing advice and feedback as Yukon Energy and CAFN develop a project proposal targeted for submission to the Yukon Environmental and Socio-economic Assessment Board (YESAB), as well as regulatory applications to the Department of Fisheries and Oceans (DFO) and Yukon Water Board (YWB). In addition, the AAC reconciles potential opposing interests and values of the YEC, CAFN, external stakeholders, and public related to the use of Aishihik Lake.

Eight AAC meetings have been held since the beginning of the project until the beginning of August 2017, and all the major project activities have been proposed, discussed and approved at AAC meetings.

The activities of the AAC included:

1. Consideration of the Federal and Yukon Government policies and regulations related to the water use license renewal process;

2. Building a common understanding of inputs, analysis methodologies, and deliverables related to the water use license renewal process;
3. Development of potential AGS operational alternatives;
4. Identification of potential information gaps to define required environmental and social impact assessment studies and their scopes, impact assessment planning, mitigation and monitoring plans;
5. Development of the list of the environmental and social impact assessment studies required for the regulatory submissions;
6. Development of the list of valued components to be used to evaluate operational alternatives; and
7. Preliminary evaluation of the operational alternatives.

Planning and execution of environmental and social impact assessment studies.
As a consequence of the AAC activities, environmental and social impact assessment studies are being executed. To inform the execution of the impact assessment studies, three technical groups were established to execute the decisions made by the AAC. The activities of the technical groups are related to lake issues, downstream river issues and the traditional knowledge project, all of which create a base for development of the documents needed for the regulatory submissions. The technical groups consist of members from YEC, CAFN, and subject matter experts.

Public engagement.
As a part of the public engagement strategy, two public meetings, one in Whitehorse, another in Haines Junction, were jointly planned, organized and held by YEC and CAFN. The goal of the meetings was to inform public on the objectives and progress of the project, co-management process and to solicit feedback.

Building relationship with the CAFN.
In addition to joint YEC and CAFN activities discussed in paragraphs on establishment of co-management framework, establishment and activities of AAC, planning and execution of environmental and social impact assessment studies, and public engagement, as a part of building relationship with the CAFN, YEC participated in two culture camps organized by the CAFN. The objective of the participation was to familiarize with CAFN values related to water, land and fish.

(c)

A 'Designated Office Filing' refers to a project proposal submitted to a Designated Office for an assessment pursuant to the Yukon Environmental and Socio-economic Assessment Act (YESAA). In this case, the Haines Junction Designated Office is expected to conduct the project evaluation. This level of assessment differs from a project proposal required to be submitted to the more intensive Executive Committee Screening or Panel Review processes of Yukon Environmental and Socio-Economic Assessment Board.

(d)

Please refer to the answer to YUB-YEC-77(b) for details related to relationship with the CAFN.

(e)

Largely due to the known increased quantum and scope of the impact assessment studies required for the project proposal to YESAB, as well as the funding of the CACAC and CAFN traditional knowledge project, the project is expected to exceed the initial budget of $3.569 million. Due to unknown costs related to potential increase in the scope of regulatory proceedings, and compensation to the CAFN, the final project cost cannot be accurately estimated at this time. YEC will continue to monitor the development of costs related to unknowns and adjust the budget accordingly.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

2. Whitehorse Generating Station Water Use Licence Renewal

2018 WIP	2019Additions	2020Additions	2021Additions
			$260,000

The existing water use licence for the Whitehorse Rapids Generating Station (WRGS) expires at end of 2025 and must be renewed in order to ensure ongoing, lawful operation of the WRGS hydro facilities. This is a multi-year project to renew the existing long-term project authorizations for the WRGS Hydro Plants and associated infrastructure. Project activities include conducting required baseline studies (e.g., environmental, socio-economic, engineering), and undertaking environmental and socio-economic effects assessment, First Nation engagement and consultation, other stakeholder engagement as required to submit a YESAA project proposal to the Whitehorse Designated Office. Project activities will also include completing the YESAA review process, the water use renewal process with the Yukon Water Board, and Fisheries Act Authorization (DFO) regulatory process.

QUESTION:

a) Identify firms hired, contract amount and work completed for the $0.260 million 2021 additions.

b) Identify in-house work completed and costs for 2021 additions.

ANSWER:

(a) and **(b)**

No work on this project has been initiated to date.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

Diesel Retirement Replacement (12.5 MW)

2018 WIP	2019Additions	2020Additions	2021Additions
$41,007	$554,224	$800,000	$5,000,000

it was determined that considering the results of the technical, environmental and socio-economic research, as well as public feedback, YEC would focus potential options to add or replace capacity at existing generation facilities on an incremental basis as diesel engines are retired. This includes consideration of the following near term activities:

- Installation of 5 MW of thermal capacity at the Whitehorse Diesel Plant (P126);
- Replacement of 5.1 MW of diesel to be retired at the Faro Diesel Plant with a 5 MW diesel unit;
- Retirement of the existing 2.5 MW of diesel capacity in Dawson City with installation of 2.5 MW of diesel capacity at the Callison Substation.

Efforts in 2020 have focused on preliminary engineering and finalizing a procurement strategy, defining vendor contracts and milestones, and updating the overall project schedule.
The deferred costs forecast in the Application assume that the project continues, with spending in WIP increasing from $0.041 million at the end of 2018 to $6.395 million by the end of 2021. Dependable capacity from these projects is expected to be available by winter 2023/24. In the interim, Yukon Energy will continue to rent diesel generators each winter to ensure an adequate supply of back-up power in case of an emergency.

QUESTION:

a) Identify all diesels with capacity now retired.

b) Identify all consultant firms hired, work performed and each cost for 2018WIP, 2019 and 2020 years totaling $1,395.231 million.

c) Identify all in house work performed and cost for these years.

d) Is the $5 million for 2021 for a new diesel generator? Explain.

ANSWER:

(a)

WD3 in Whitehorse was retired in March 2019. In addition, Yukon Energy plans to retire the following diesel units as follows:

- Faro Diesel 1 (FD1) - March 2022;
- Dawson Diesel 2 (DD2) - March 2023; and
- Dawson Diesel 5 (DD5) - March 2023.

(b)

Please see Table 1 below.

Table 1: Summary of Consultant Firms Hired and Work Performed - 2018 to 2020

Consulting Firm	Work Conducted	2018 Costs	2019 Costs	2020 Costs
Aasman Brand Communications Inc.	Consulting for public communications and engagement		$89,931.57	
ArticCan Energy Services	GHG Lifecycle Analysis		$31,130	
Asher Engineering Ltd.	Initiation work for generator technical specification engineering			$4,749.76
Associated Engineering	Road upgrade estimates		$4,930	
Associated Environmental Consultants Inc.	YESAA DO Level Assessment preparation for Dawson project			$8,777.64
BBA Engineering Ltd.	P126 Building Retrofit engineering		$12,423.37	$60,067.16
Core Geosciences Services	Air Quality Modeling			$1,757.50
DLA Piper (Canada) LLP	Legal support			$3,576.64
Environmental Dynamics Inc.	Environmental Attributes desktop review			$10,344.85
Geotech Drilling Services Ltd.	P126 geotechnical drilling			$50,403.93
Hatch Ltd.	Technical study support		$44,800	$19,200
Hemmera Envirochem Inc.	Noise monitoring for Whitehorse project			$38,000
IBEX Construction Ltd.	Construction support for geotechnical drilling			$3,784.5
InterGroup Consultants Ltd.	Socioeconomic Attributes report support and project regulatory analysis		$18,611.5	$12,905

Consulting Firm	Work Conducted	2018 Costs	2019 Costs	2020 Costs
Laberge Environmental Services	Vegetation mapping and rare plant survey		$7,670.56	
Maven Consulting Limited	Procurement scope development support			$1,537.5
Midgard Consulting Inc	Feasibility engineering	$6,775	$221,659.70	$117,566.30
Orbis Engineering Field Service Ltd.	Public engagement technical support		$2,572.50	
Teshmont Consultants LP	System Impact Study support		$9,017.25	
Tetra Tech Canada Inc.	Geotechnical reporting		$7,152.36	
Vector Research	Participation on Advisory Committee		$1,837.5	
WSP Canada Inc.	Air quality and plume modeling		$12,870	$16,330

(c)

In-house work conducted on the project consisted primarily of project management for the feasibility engineering and support of the public engagement activities. Internal labour costs for the project are summarized in the table that follows:

Table 2: Internal Labour Costs

2018	2019	2020
$19,533.50	$108,294.96	$61,131.57

(d)

Please response to YUB-YEC-1-92.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.2-3: SPENDING TO MAXIMIZE RENEWABLE GENERATION FROM EXISTING FACILITIES

4. Southern Lakes Enhanced Storage (Marsh Lake Storage Project)

2018 WIP	2019Addition	2020Additions	2021Additions
$7,319,000	$374,899	$485,000	$1,200,000

Forecast MLSEP project costs and actual expenditures were reviewed in detail in the 2012/13 and the 2017/18 GRAs. The 2012/13 GRA, identified the project as a relatively small project, with earliest in-service assumed in 2014 (first full year 2015) at a capital cost (2010$) of $10.5 million, with mitigation design (shoreline erosion and surface water) expected to comprise about one-half of this total cost (actual costs for mitigation were stated in the 2012/13 GRA as an item that at that time could not be known with any certainty). In the 2017/18 GRA, forecast total project costs increased to $15.377 million ($9.795 million forecast for effects assessment; $0.300 million forecast for YESAA assessment and permitting; and $7.127 million forecast for mitigation implementation).3 Annual incremental hydro generation was estimated at 6.4 GW.h on average, focused in winter months at the current Whitehorse plant. Annual operating cost (2010$) was estimated at $8/MW.h. Full Utilization LCOE (2010$) was estimated at 8.5 cents/ kW.h. Marsh Lake Storage was also assumed in the 2012/13 GRA.

Project Update

During the 2017/18 GRA, Yukon Energy indicated that the next major milestone was obtaining First Nation support for the project in order to progress to the YESAB assessments stage. The deferred costs forecast in the Application assumes that the project continues, with spending in WIP increasing from $7.319 million at the end of 2018 to $9.379 million by the end of 2021. Potential in service for the Project is 2023.

QUESTION:

a) Does Yukon Energy now have all involved First Nations and Southern Lakes property owners on board with this project. Provide documents demonstrating this.

b) Identify all consultant firms hired, work performed and each cost for 2018WIP, 2019, 2020 and 2021 years totaling $9.319 million.

c) Identify all in-house work performed and cost for these years.

d) What is the new estimated cost to do the construction and mitigation for this project?

e) What would be the updated LCOE?

ANSWER:

(a)

YEC is committed to continuing to work with all affected First Nations and impacted property owners as part of advancing the project. Engagement with First Nations and impacted property owners will be a key element of the workplan in drafting of a YESAA Designated Office Project Proposal in 2021. The outcomes of the engagement will inform YEC's Board of Directors on its decision on whether to submit the Project Proposal to YESAB.

(b)

The consultant firms, work performed, and cost for 2018WIP, 2019 and 2020 are shown in the table below. Costs for the project have not yet been incurred in 2021.

Table 1: Southern Lakes Enhanced Storage Costs: 2018 to 2020

Contractor	2018 WIP Cost	2019 Costs	2020 Costs	Work Performed
1140609 Alberta Ltd.	6,600			Consultant engaged by TKC to conduct technical review on items including ice hydraulics and downstream impacts in Yukon River of project.
Aasman Brand Communications Inc.		65,313	7,491	Communications support, development of ads, development of online and print materials, graphic design.
AECOM Canada Ltd.	1,133,551			Prime project consultant 2009 through 2013. Baseline biophysical and engineering studies, preliminary effects assessments, conceptual mitigation design and comparative analysis, support for community/government engagement and consultation.
Ben's Electric	935			Army Beach pump
Bill Slater Environmental Consulting	2,220			Technical consultant engaged by TKC to review Project

Contractor	2018 WIP Cost	2019 Costs	2020 Costs	Work Performed
Brimar and Associates Survey Ltd	20,013			Army Beach Drainage/Ditch mitigation design
Canada Post Corporation		2,837		Mailouts
Carcross Tagish Renewable Resource Council	5,500			Contribution for Cisco Fish Study
Carcross/Tagish First Nation	41,207			Contribution Agreement for workshops, meetings, and consultation in support of technical review of project.
DataPath Systems			600	Hosting of Southern Lakes Water Level Committee's website
Dexter Kotylak	160			Army Beach honorarium
Environmental Dynamics Inc.	27,201			Lake trout beach seining data collection, miscellaneous mapping of Southern Lakes, Army Beach draining frog salvage
GW Solutions Inc.	7,998			Groundwater technical support
Hemmera Envirochem Inc.	1,437,068	14,977	21,434	Technical support, workplan development, erosion/groundwater/other technical studies, First Nations engagement support, technical reviews, support of public engagement sessions
Horizon Helicopters	2,278			Helicopter for Southern Lakes erosion recon
Industrial Electric Services Ltd.	133			Technical contractor work on the mitigation trial of the drainage control valve and water pump at the end of the Army Beach Road.
Keith' Plumbing & Heating Co. Ltd	42,810			Sump pump and related hardware supply and installation
Kwanlin Dun First Nation	25,104			Contribution Agreement for workshops, meetings, consulting services for technical reviews
M.Miles & Associates Ltd	34,640			Technical advisory services for Water Level Committee, technical review of river geomorphology
Morrison Hershfield Limited	4,994			Minor consulting services to transition from AECOM to new prime consultant

Contractor	2018 WIP Cost	2019 Costs	2020 Costs	Work Performed
Northwest Hydraulic Consultants			2,425	Follow up questions and request for information on previous technical work NHC completed on the project related to erosion impact assessment and mitigation design.
Nunatak Contracting & Construction	270			Installation of Army Beach pump
Stantec Consulting Ltd. (Vancouver)		51,746	25,728	Technical consulting services; Public Engagement planning, facilitation and support, preparation of What We Heard report
Toews, Don	1,500			Senior review of Project Proposal
Wildstone Industrial Ltd	52,307			Mash Lake Army Beach Drainage Mitigation
Yukon Bureau of Statistics		46,170		Southern Lakes and Yukon-wide surveys
Yukon Conservation Society	117,697			SLWLC contribution agreement funding and acting as treasury for Committee
Earlier work without easy record access*	2,684,603			
Grand Total	**5,648,788**	**181,043**	**57,677**	

*Earlier work done prior to current financial reporting. Given that this project remains in WIP for the 2021 GRA, the effort to try and secure information from prior records was not feasible for the current IR response process.

(c)

Internal costs for 2018 WIP, 2019, 2020, and 2021 to date are provided in Table 2 below.

Table 2: Southern Lakes Enhanced Storage Internal Costs

	2018 WIP	2019	2020	2021

Please see response to YUB-YEC-1-93.

TOPIC: **Capital Projects**

REFERENCE: **5. Mayo Lake Storage Enhancement Project – including Mayo Lake Outlet Dredging**

2018 WIP	2019Additions	2020Additions	2021Additions
$3,373,374	$262,379	$460,000	$525,000

E (2010$) of 6.3 centres/kWh

[6] Section 5.3.1.4 of the 2012/13 GRA Application reviewed the project concept, work completed to date (including environmental and socio-economic fieldwork activities, analysis and assessment, project proposal preparation, engineering support, and public consultation), and project risks, costs and benefits. The project was included in the 2012/13 GRA under Relicensing rather than Feasibility Study deferred cost projects, reflecting the central objective to modify the current water licence affecting water storage at Mayo Lake.

[7] Section 5.3.1.9 of the 2017/18 GRA provided an update on the project progress, costs, and potential in service. Further detail was provided in response to YUB-YEC-1-85 in the 2017/18 GRA. In Order 2018-10, the Board noted that it had approved the Mayo Lake storage enhancement in Order 2013-01, and that given that sediment removal was necessary to realize any benefits from this project it was prudent to expand the scope of work for this project accordingly.

Project Update
In 2018, Northwest Hydraulic Consultants (NHC) was retained to provide a technical assessment regarding whether sediment remediation steps in the Mayo Outlet Channel were feasible and cost effective. The deferred costs forecast in the Application assume that the project continues, with spending in WIP increasing from $3.373 million at the end of 2018 to $4.621 million by the end of 2021.

QUESTION:

a) Confirm the N'acho Nyak Dun has been in favour of this proposal from the start and continuing until this day. Provide documents demonstrating this.

b) What is the estimated total cost to complete this project?

c) What is the updated LCOE?

ANSWER:

(a)

YEC continues to work with the First Nation of Na-Cho Nayak Dun to obtain their feedback on the project and their specific input into the YESAA Project Proposal and the Monitoring and Adaptive Management Plan. The FNNND supported the prior YESAA Project Proposal submission on this project that YEC had to withdraw to address Mayo outlet channel dredging planning. Obtaining FNNND's support to move forward to a YESAA Designated Office assessment is an objective of YEC's project plan.

(b)

Please refer to YUB-YEC-1-94.

(c)

Please refer to YUB-YEC-1-94.

TOPIC: Capital Projects

REFERENCE: GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5

5.4-2: FEASIBILITY STUDIES – CONTINUED RELIABILITY & ASSET IMPROVEMENTS

Building Condition Reports 2020-2024

2018WIP	**20192020Addition**	**2021Addition**
		$175,000

Building condition reports are required to formally document the structure and fabric of a property, describe the construction of the building and its current condition, and outline work required, timing and costs for completion.

An external engineering firm will undertake site visits for all owned YEC properties and provide an assessment of the condition of each site that outlines requirements for immediate maintenance and repairs; maintenance and repairs required over the next five years; code violations; and cost estimates for required work. The building condition report will be used to forecast O&M projects building condition assessment capital works over 2020-2024. The project is to be closed in 2021 with total expenditures of $175,000 to be amortized over five years.

QUESTION:

a) Why does Yukon Energy not simply get a building inspector from the YTG or Whitehorse to building inspections as that is what they do, instead of hiring an expensive engineer, most of who are even not qualified to do all the necessary tasks.

b) Identify which engineering firm received contract.

ANSWER:

(a)

Regulatory building inspectors only review assets for compliance with code; YEC required an asset health assessment which is not a service offered by compliance authorities.

(b)

Please see response to UCG-YEC-1-73.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

Business Continuity Plan

2018WIP	2019Addition	2020Addition	2021Addition
		$80,000	$75,000

A gap analysis was undertaken by a third party consultant regarding Yukon Energy's current Business Continuity Plan (BCP). This identified substantial work required to address the identified gaps in order to meet current industry standards. This includes development of technical recovery procedures, based on identified Recovery Time Objectives (RTO) for the various business processes related to IT applications and infrastructure components; developing a defined methodology for evaluating the criticality of vendors, establishing vendor Business Continuity/Disaster Recovery (BC/DR) requirements, and monitoring vendor BC/DR compliance; and developing a formal BC/DRP/Emergency Response Planning training program or exercise and testing program. If the current BC/DR program deficiencies are not addressed, YEC will face a number of risks in the event of an actual emergency. This includes delays in poorly defined Incident Command System, unclear priorities for returning critical support systems to service, lack of adequate employee training or potential communication breakdowns. The project is to be closed in 2020 and 2021 with total expenditures of $155,000 to be amortized over five years.

QUESTION:

a) How did Yukon Energy identify this was a problem?

b) Identify which consultant firm/s got contracts for what work and what cost.

ANSWER:

(a)

Historically, YEC has run formal disaster recovery scenarios to ensure appropriate response procedures were in place and staff understood their responsibilities in various emergency situations. These scenarios tended to focus on front-line operational readiness especially IT systems to deal with a given situation in a short time. In working with consultants and discussing with peer organizations, it was concluded that a comprehensive BCP/DRP program is a normal risk management tool used by entities similar to YEC and that YEC could improve its current approach.

(b)

The work planned for 2020 was delayed due to internal resource constraints. As a result, no contractors were awarded for this work. The timeline for completion will slip to 2021/22 so there is no impact to rates from this project in 2021.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

Mayo and Aishihik Hydro Climate Change

2018WIP	2019Addition	2020Addition	2021Addition
	$474,313	$124,249	$40,000

A partnership was developed in 2016 between Yukon College and INRS, a university institution which developed a successful joint ARD/CRD proposal to leverage funding from NSERC. The project is to be closed in 2020 with total expenditures of $638,562 to be amortized over five years.

QUESTION:

a) Does Yukon Energy have engineers in their personnel?

b) Does Yukon Energy have a hydrologist in their personnel?

c) If Yukon Energy aligned with Yukon College and INRS why would YEC need an expensive independent consultant?

d) Identify which consultant firm/s received contracts for this study and at what cost.

ANSWER:

(a)

Yes.

(b)

No.

(c)

Yukon Energy's alignment with Yukon College and Institut national de la recherche scientifique (INRS) included funding the work conducted by both academic institutions, which made up the majority of the external costs. An independent consultant was also

engaged to verify the study methodology and review the model to ensure it was of appropriate quality and standards for YEC's continued future use.

(d)

See Table 1 below.

Table 1: Mayo and Aishihik Hydro Climate Change Study Costs

Contractor	**Total Cost**
Aasman Brand Communications Inc.	849.49
INRS	316,073.77
Rousseau, Alain	1,761.10
Smith, Douglas Ian	25,652.26
Yukon University	112,500.00
Total	**456,836.62**

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

PMF Flood Study

2018WIP	2019Addition	2020Addition	2021Addition
			$150,000

A Probable Maximum Flood (PMF) study is required for Aishihik Lake and Canyon Lake. The project is to be closed in 2021 with total expenditures of $150,000 to be amortized over five years.

QUESTION:

a) Does Yukon Energy have a hydrologist on staff?

b) Why would this project not be included in the Aishihik Water License costs?

c) Which consultant firm/s did this project work and at what cost?

d) Provide latest Hydrology Report.

ANSWER:

(a)

YEC does not have a hydrologist on staff.

(b)

The PMF study is a separate project related to dam safety.

(c)

YEC will be hiring a consultant in 2021 through a competitive process to perform the study.

(d)

Please see Attachment 1 to this response.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

Transmission Access Road Program Study

2018WIP	2019Addition	2020Addition	2021Addition
		$132,787	$200,000

Yukon Energy does not have a proper inventory of all the road accesses for transmission line access; and does not know the status of all the accesses that are required to maintain approximately 1,110 km of transmission line. The objective of the study is to engage an external consultant to provide a GIS database outlining access locations; the current status of accesses; and to prepare a GIS data base and report that includes a gap analysis of what needs to be addressed to complete the GIS database. The project is to be closed in 2020 and 2021 with total expenditures of $332,787 to be amortized over five years.

QUESTION:

a) Does Yukon Energy personnel not routinely inspect and work on all transmission line locations?

b) Why would these staff workers not be able to inventory locations, need and GPS these locations?

c) Which consultant firm/s did this expensive work and at what cost?

ANSWER:

(a)

YEC routinely inspects all of its transmission lines both aerially and by use of Snow machines, UTVs, trucks and on foot. These various types of inspections drive the maintenance program. Lines receive maintenance based on priority and available budget. Not every line gets worked on every year as it much more efficient to focus work in a particular area.

(b)

An initial assessment was completed by YEC staff to inventory existing access trails along transmission lines that were coming up for priority maintenance. To maintain or modify these trails in any way requires proper permitting and many of them require modification to make them suitable for YEC equipment. Due to the level of assessment needed to meet highways permitting requirements and due to the amount of permitting required, outside support was needed. Additionally, this assessment identifies gaps where we do not have appropriate access which can be due to a variety of reasons including sensitive lands interests. This level of assessment gives us a comprehensive data base that will help us assess future maintenance programs.

(c)

The firm that did this work is Tetra Tech. The final invoice was $87,526.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.4-2: FEASIBILITY STUDIES – CONTINUED RELIABILITY & ASSET IMPROVEMENTS

Whitehorse Diesel Rental Substation Improvements

2018WIP	2019Addition	2020Addition	2021Addition
		$100,000	

The temporary substation behind the diesel plant is the grid connection point for the rental diesel fleet, was built using repurposed/ savaged equipment, and has temporary fencing. The cables for the temporary substation were reused from the WD1 and WD2 units and are aged. Cabling from this substation to S150 is a direct connection, and a cable fault will result in the shutdown of S150, which is the primary generating and distribution station on the grid. In order to prevent risk of such a failure, the cables, breakers, and enclosures must be replaced and a permanent fence must be installed. The natural gas pipe and regulator must also be relocated and cable protection at S150 must be installed. Spending in 2021 relates to developing an engineered solution, including a budget and risk analysis. The project is to be closed in 2021 with total expenditures of $100,000 to be amortized over 45 years.

QUESTION:

a) From Yukon Energy preamble above it appears as if YEC knew all of the relevant problems existed from their own staff and engineers. As such, explain why an independent study was necessary?

b) Which firm received this study contract?

ANSWER:

(a)

An engineered solution is required to validate what has been identified and detect any additional items that were not previously discovered.

(b)

The IR “quote” above shows the project cost in 2020, which is not accurate – Section 5.4-2 of the application shows this cost in 2021. At this time, it has not been determined which firm will receive this study contract.

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

5.4-2: FEASIBILITY STUDIES – CONTINUED RELIABILITY & ASSET IMPROVEMENTS

10 Year Renewable Energy Plan

2018WIP	2019Addition	2020Addition	2021Addition
	$310,842	$402,125	

A desktop update of the 2016 Resource Plan was completed with additional renewable energy project considerations. The update consisted of a new long term load forecast, expansion of existing hydro inventory, update of financial resource attributes, portfolio analysis and an action plan charting the path for resource development and implementation over the next 10 years. The outcome of this project and its acceptance will allow YEC to establish and follow a plan to ensure that reliability criteria are met. The project is to be closed in 2020 with total expenditures of $712,967 to be amortized over five years.

The Tab 5 test year forecasts include capital costs for the Ten Year Renewable Energy Plan which addresses resource planning updates as required for current YEC resource planning. This includes consideration of impacts on future peak load growth and energy generation requirements as a result of Yukon's strategy for climate change, energy and a green economy, particularly as regards IPP policy resource project development impacts on energy and capacity resource balances, and policy impacts on future peak loads related to ongoing initiatives for electrification, electric vehicles, and heat pumps.

Directive #62 (paragraph 490) – Resource Plan Update

* However, the Board is of the view that it is not prudent for YEC to continue with these significant expenses to update the resource plan every five years. Accordingly, the Board directs YEC to seek Board approval prior to any future updates of its resource plan. Any such application must be accompanied by a detailed proposal for both costs and scope of work, including a description of work to be carried out internally and by consultants. YEC must also include an explanation of why any work to be done by consultants cannot be carried out by internal staff.

QUESTION:

a) Did Yukon Energy seek prior approval of the Board and was this approval given? Identify Board decision

b) If no, as this was almost three quarters of million dollars update, should not Yukon Energy have followed Board directions?

c) Identify which consultant firm/s received contracts, for what work to be done and at what cost.

ANSWER:

(a) and **(b)**

The Board's mandate relates to approval of rates, and does not include approval of public utility programs, plans or projects. Yukon Energy did not seek prior Board approval to update its resource plan in response to new conditions and Yukon Government policy requirements related to its Climate Change policy initiative. The expenditures for this resource plan update were prudently incurred and modest compared with the 2016 Resource Plan costs.

(c)

Please see Table 1 below for a summary of work completed by consultant and costs.

Table 1: Summary of 10-Year Renewable Energy Plan Costs by Consultant

Consultant	Work Completed	Total Cost
Aasman Brand Communications Inc.	Communications & engagement materials; Graphic design & formatting	$ 52,842.81
Campbells North Consulting	Technical and project management support	$ 3,822.50
DLA Piper LLP	Legal support	$ 44,706.99
Itron Canada Inc.	Load Forecast Modeling; Electric Vehicle Load Update	$ 36,646.10
InterGroup Consultants	Strategic studies, Southern Lakes Transmission Investment and development options	$ 59,487
Knight Piesold Limited	Technical Attribute & Cost Studies for Resources	$ 99,064.62
Midgard Consulting Inc	Resource Options & Market Assessment Update; Technical Report	$ 129,751.95
Northern Governance Institute (nGI)	Public engagement facilitation and organization; What We Heard Report	$ 70,576.06

TOPIC: **Capital Projects**

REFERENCE: **GENERAL RATE APPLICATION NOVEMBER 2020 Tab 5**

Atlin Hydro EPA Preparation

2018WIP	2019Addition	2020Addition	2021Addition
			$200,000

The Atlin (Pine Creek) Hydro Expansion project was selected as a key project in the 10 Year Renewable Electricity Plan, given its relatively advanced stage of development as a brown-field expansion project, when compared to other potential greenfield hydro developments. The project also has a lower Levelized Cost of Energy (LCOE) than the Drury Lake project. In 2020, YEC engaged in discussions with Xeitl Limited Partnership (Xeitl LP) (Taku River Tlingit development corporation) regarding the Atlin project being planned by Xeitl LP, and key principles and terms for an Agreement-in-Principle (AIP), as well as potential IPP contract provisions. An AIP has been signed, and discussions towards an EPA are underway. The project is to be closed in 2020 with total expenditures of $200,000 to be amortized over five years.

QUESTION:

a) Explain exactly what study is needed here?

b) Identify which consultant firm/s performed tasks, what work done and costs.

ANSWER:

(a)

As noted, the project relates to negotiation key principles and terms for an Agreement-in-Principle (AIP) and IPP contract provisions with Xeitl Limited Partnership (Xeitl LP) (Taku River Tlingit development corporation) regarding the Atlin project being planned by Xeitl LP. An AIP has been signed, and discussions towards an EPA are underway.

(b)

The work is forecast to occur in 2021 and has not been completed. Consultant work to date has primarily been undertaken by DLA Piper and InterGroup Consultants Ltd. InterGroup has provided support related to financial analysis and EPA development; and DLA Piper has provided support related to EPA development and negotiation. Costs to the extent that they are readily available are provided in UCG-YEC-1-104.

5.4-2: FEASIBILITY STUDIES – CONTINUED RELIABILITY & ASSET IMPROVEMENTS

Dam Safety Review

2018WIP	2019Addition	2020Addition	2021Addition
			$315,000

A full dam safety review (DSR) is performed every 5 years by an external consultant as recommended by the Canadian Dam Association (CDA). Reporting on outcomes of this review is also required by each Yukon Energy generating facility water use licence. The DSR includes a comprehensive review of all of Yukon Energy's dam structures, and includes consideration of all civil, structural, geotechnical, electrical, mechanical and safety issues that may affect YEC personnel and the general public. The review identifies hazards and potential problems of high risk that require immediate attention (within one year) as well as lower risk items that can be performed over time. The project is to be closed in 2020 with total expenditures of $315,000 to be amortized over five years.

QUESTION:

a) Identify which firm/s performed these reviews, work performed and what cost.

ANSWER:

(a)

Encora performed this work at a cost of $139,510.

TOPIC: **Capital Projects**

REFERENCE: **5.4 INTANGIBLE ASSETS**

Intangible assets are reviewed in Table 5.7 and include financial software, customer service costs and costs related to development of an asset management framework (i.e., Enterprise Asset Management Purchase and Implementation).

5.4.1.1 Enterprise Asset Management (EAM) System Purchase 1 and Implementation – ($0.809 million in 2019, $3.854 million forecast in 2020, and $0.275 million forecast in 2021)[38]

The 2017/18 GRA included feasibility costs for development of an Asset Management Program that would document plans to systematically assess major asset groups (hydro, substations and transmission and distribution) and manage the planning of investments to meet overall corporate goals.[39]

The existing Computerized Maintenance Management System (CMMS) does not meet Yukon Energy's current or future asset management needs. An EAM system is an enterprise level software application that enables an organization – particularly an asset intensive organization – to manage and optimize its assets throughout the entire asset lifecycle including asset needs identification, asset investment planning and prioritization, advanced asset maintenance management and asset performance tracking.

EAM project activities since 2018 relate to the selection, purchase, planning and implementation of an EAM system. A procurement process to evaluate and select a replacement system was initiated in 2018; and selection of a replacement EAM system was completed in 2019. The tool will be integrated with the Microsoft Dynamics GP, YEC's financial management solution, and other legacy applications to provide an integrated solution that ties to YEC's financial and inventory management systems.

The following project activities have been completed:

$0.276 million was spent in 2018 under PP&E and transferred to Intangibles in 2019. The 2019 spending was $0.533 million to total 2019 cost to rate base at $0.809 million.

[39] 2017/18 GRA, Appendix 5.4, page 5.4-2 provides a summary of this project, with forecast spending of $0.200 million in 2017 and$0.150 million in 2018. In Order 2018-10, the Board found the project reasonable and the associated costs prudent and approved the deferred costs as filed.

[40] The ISO 55000 standard is an international standard covering management of assets of any kind.

Procurement of Project 1 Management Services: In 2019, YEC issued a Request for Proposals (RFP) for project management of the EAM implementation, and KPMG was selected as the proponent for this work. The KPMG team is well qualified and experienced and its team members successfully implemented a similar EAM system at NTPC (demonstrating knowledge and competence to deal with issues faced by small, northern Crown utilities).

Procurement of Software Solution: A multi-stage competitive procurement was administered in 2018. A total of 27 potential suppliers were invited to participate in a request for information process. From this, 8 vendors were invited to a full request for proposal (RFP) process. As a final step, three vendors were invited to participate in vendor presentations and site visits and full cost work up. Based on this extensive process, YEC awarded a time and materials contract to Infor ERP Software.

Over 2020, YEC has worked towards implementation of the software solution provided by Infor. This has

included the following:
Inception (completed in 2020): Undertaking activities related to project kickoff; training workshops by vendor (Infor) with YEC team members; workshops conducted by Infor to define as-is process models, technical strategy and architecture and KPIs as a basis for the EAM solution; workshop conducted by KPMG (OCM lead) to gather YEC executive input on expected organizational challenges and ensure alignment project objectives; and prioritization requirements for next phase.
Elaboration (commenced in 2020 and ongoing): Involves detailed scoping and finalization of business requirements and integration design, advanced training for core team members, development of a testing strategy, scope and defining data structures and plan integration strategy and requirements.
Construction (commenced in Q2 2020 and Completed in Q4 2020): Development of user acceptance testing plan, initial testing and final data conversion preparation by vendor. This includes development of training curriculum and methodology and approach; assessment of impact of EAM project on YEC; test all modules of AEM solution, going through business processes and verifying functionality; determine if designed and configured solution meets YEC's requirements and specifications; build EAM integrations with YEC legacy systems; local testing of integrations developed; and end to end system testing of AEM system and integrations.
Transition (commenced in Q4 2020 and ongoing): Finalization 1 of EAM solution and preparation to launch into production; including preparing for training for broader YEC users; outline and convert data from non-EAM systems to EAM systems and checking redundancies involved while going live; change impact assessment based on enhanced understanding of project; assessment of readiness for launch and finalize EAM for users and convert to production 'live' environment.
Optimize (commence late Q4 2020 and complete early 2021): After launch into production review of project successes and lessons learned, including limited support work from vendor as required.
Total costs to complete the project are currently estimated at $4.938 million. The project is expected to be fully implemented in early 2021.

QUESTION:

a) Identify which firm did the feasibility plan and at what cost.

b) Identify where Yukon Energy received approval to add 2019 costs of $0.809 million to rate base.

c) Reconcile the difference in the approved 2017/18 deferred costs of $0.350 million and the $0.276 million 2018 spending and transfer to intangibles.

d) Provide breakdown of 2019 spending of $0.533 million, i.e. job description, consultant/s firms hired and cost for each.

e) Identify which firm/consultant received contract for project management services and at what cost.

f) Provide cost for actual Enterprise Asset Management System and related software.

g) Provide breakdown of costs for Inception project kickoff, various training workshops, etc.

h) Provide costs for Elaboration finalization, integration, advanced training, etc.

i) Provide a breakdown of all costs with reasons for Construction, Transition and Optimize phases of program.

j) Provide any in-house costs for all of this project phases.

k) Is this new model of EAM now fully implemented and operational?

l) If some of total cost of $4.938 million for EAM already on approved rate base?

m) If yes, identify amount and Board reference decision.

ANSWER:

(a)

Hatch was retained to undertake a CMMS current state assessment and market survey at a total cost of $46,400.

(b)

The 2019 costs are included in the Application for approval with the 2021 GRA.

(c)

The actual costs in 2018 were $0.276 million. The $0.350 million cost was an early estimate in 2017 to perform the work.

(d)

Please see the information provided in the table below for break out of the $0.533 million cost for the project.

UCG-YEC-1-97 Section C: #172 (1 of 2)

Cost Code		Sum of Amount
1-Labor	$	80,561.03
2-Travel Exp	$	22,279.64
3-Matl, Supl, Inv	$	172.49
4-Contractors	$	419,568.83
5-Rental	$	240.00
8-AFUDC	$	10,691.33
Grand Total	**$**	**533,513.32**

A summary of contractors hired and description of work and costs is as follows:

Vendor		Sum of Amount
Charter Telecom	$	1,080.00
eCorall Solutions Inc.	$	7,412.80
Hatch Ltd.	$	77,662.72
Infor (Canada) Ltd.	$	100,000.00
KPMG LLP (Vancouver)	$	233,413.31
Grand Total	**$**	**419,568.83**

(e)

KPMG received the contract for PM services, at a cost of $133,972. As noted in part (d) final costs for KPMG were $233,413. Added costs for KMPG relate to an expansion of scope to establish more firm pricing of the implementation estimate, and extensions to the project deadline.

(f)

The Cost of the EAM Software System at time of purchase is as follows:

1. $464,789 – Software; and

2. $113,450 (annual Licensing and upkeep fees).

(g), (h) and **(i)**

There is no specific breakdown of costs to this detail. For a project cost breakdown please see response to YUB-YEC-1-64(c).

(j)

The YEC internal costs are estimated to be $462,000.

(k)

The EAM system is not yet in service. The system will be in service Q1 2021.

(l) and **(m)**

No costs for the EAM project as presented in the Application are currently included in rate base or approved by the Board to include in rates.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.5: DEFERRED STUDIES**

Deferred cost projects with total spending since 2018 greater than $100,000 million and less than $1 million that remain in WIP in 2021, excluding General Rate Application costs in WIP, have total expenditures of $0.400 million and EV Infrastructure Project

2018WIP	2019Addition	2020Addition	2021Addition
			$200,000

Strategy development will assess the potential impact of electric vehicles on the Yukon electrical system and identify a path forward for YEC to meet these challenges.

QUESTION:

a) Has this assessment been completed?

b) If this cost is for strategy development why is this not done inhouse with the many personnel on staff?

c) Identify which firm/s performed tasks concerning this assessment, what work was done and at what cost?

ANSWER:

(a)

No.

(b)

The costs of internal labour and consulting for the project have not yet been determined. Limited resources are available to complete this work, as a result of the large number of ongoing projects outlined in YUB-YEC-1-39.

(c)

The work has not been initiated and is no longer planned to be done in 2021.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.5: DEFERRED STUDIES**

P125 Trashrack Study

2018WIP	2019Addition	2020Addition	2021Addition
		$200,000	

The P125 intake is becoming blocked with debris and frazil ice. These blockages are currently being removed manually by divers and plant operators. This results in multiple outages each year to address blockages. Not addressing this issue will mean continued outages and requirement for divers to address the issue manually. A track rack must be installed that can permanently address the variety of debris encountered at the intake. The study will confirm the deck structural capacity and other details such as power supply and trash rack geometry.

QUESTION:

a) Confirm that this cost and work is not identified in another area of work to be performed.

b) Has this work been completed and finalized?

ANSWER:

(a)

This is a standalone project. The cost and work is not identified in any other area of work to be performed.

(b)

This work is in the assessment phase and has not been completed nor finalized.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.6: INTANGIBLE ASSETS >$100,000 AND<$1 MILLION ADDED**

TO RATE BASE
ERP System Upgrades

2019Actual	**2020Forecast**	**2021Forecast**
$200,000		

Given Yukon Energy's role as the primary generator of electricity for an isolated grid, it is critical to maintain a modern and robust Enterprise Resource Planning (ERP) system. ERP system refers to a type of software that organizations use to manage day-to-day business activities such as accounting, procurement, project management, maintenance management and supply chain operations. Best practice is to update systems regularly to ensure that the systems are up to date. The project involves upgrades to the ERP system components to the recommended latest stable versions. System experts are contracted to help with individual components as these are critical systems and Yukon Energy has no inhouse expertise.

QUESTION:

a) Given the cost of this program upgrade, will Yukon Energy now use this in-house capability instead of hiring your consultant?

ANSWER:

(a)

To be clear, this is not a new system with new in-house capabilities.

As described in the Application, this is an upgrade to the existing system. YEC performs upgrades as considered necessary. As with any software, external consulting will be used as necessary. As noted in YUB-YEC-1-103, one of risks of not doing an upgrade is that there will be no support for the software.

TOPIC: **Capital Projects**

REFERENCE: **Feasibility Study**

Table 5.4 2017-18
Total Feasibility Study WIP 8,589,838 1,090,716 (132,667) 9,547,887
Table 5.6 2021
Total Feasibility Study WIP 9,833,270 7,370,000 (979,072) 16,224,199

QUESTION:

a) Confirm increase in WIP Feasibility Studies from 2017-18 to 2021 is $6,676,312.

b) Confirm increase in Total WIP from 201-18 GRA to 2021 is $11,394,258.

ANSWER:

(a)

The increase in feasibility study WIP noted in the question [$6.676 million] is the increase in 2021 test year over 2018 actuals. The feasibility study WIP in 2021 test year is reduced from the 2018 test year by $5.565 million mostly due to delays with Energy Storage System Assessment and YEC's decision not to go ahead with 20 MW thermal plant assessment assumed in the 2017/18 GRA.

(b)

The increase in total WIP in 2021 test year over 2018 test year is $9.468 million [net of contributions] that reflects increase PP&E WIP by $29.769 million plus increase in deferred cost WIP by $0.475 million offset by increase in contributions WIP by $20.776 million as illustrated in Tab 7, Schedule 1.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.3: DEFERRED PROJECTS >$1 MILLION NOT ADDED TO RATEBASE**

Deferred expenditure test year spending on major projects (i.e., expenditures over $1 million) retained in WIP is focused on projects required to address sustaining capital requirements (i.e., required to replace, repair or enhance/ improve components of the existing system to ensure continued reliability, safety and environmental or regulatory compliance),investments to ensure sufficient dependable capacity for the integrated grid, and continued planning expenditures to meet other potential future generation and transmission requirements. Approximately $28.573 million of deferred costs are forecast to be incurred in WIP for major projects by the end of 2021. Details on actual and forecast expenditures by year are reviewed in Tables 5.2 to 5.6.
Spending on Sustaining Capital: Net deferred costs in WIP by end of 2021 of approximately$8.178 million:
1. Aishihik Generating Station Water Use 25 Year Licence Renewal – (forecast WIP cost of approximately $7.918 million by end of 2021 - project planned for completion in2022).
2.Whitehorse Rapids Generating Station Water Use Licence Renewal - (forecast Spending to address Capacity
Planning Requirements: Net deferred costs in WIP by end of 2021 of approximately $6.395 million:
3. Diesel Retirement Replacement (12.5 MW) – (forecast WIP cost of approximately $6.395 million by end of 2021 planning, engineering, permitting, long-lead equipment procurement – total project planned for completion by 2024, with certain portions completed and in service starting in 2022).
Spending on planning to maximize renewable energy generation from existing facilities: Net deferred costs in WIP by end of 2018 of approximately $14.000 million:
4. Southern Lakes Storage (Marsh Lake Storage Enhancement Project) – (forecast WIP cost of approximately $9.379 million by end of 2021 - project subject to ongoing review, potential in-service by 2023).
5. Mayo Lake Storage Enhancement Project (including Mayo Lake Outlet Channel) – (forecast WIP cost of approximately $4.621 million

QUESTION:

a) Although it appears Yukon Energy will not place these projects onto the rate base for the test year, is Yukon Energy now using this process to get regulatory approval for all of these projects liningup for $28.573 million in the WIP? Explain.

b) As Aishihik relicencing is lining up for almost $8 million in the WIP, explain how Yukon Energy justifies this cost?

c) Identify which firm/s managed/is managing this Aishihik license renewal from the beginning until now, what work was performed and at what cost

d) Identify which firm/s managed/is managing the Whitehorse Station license renewal from the beginning until now, what work was performed and at what cost.

e) Does the Diesel Retirement Replacement cost of $6.395 million include the purchasing of any new generators? Explain.

f) Justify the costs for Southern Lakes Storage and Mayo Lake Enhancement, for each, including discussion of risks of not proceeding with these projects as well as discussion of assumptions included in the business case for escalation factors, loading, financial measures, term of project and associated ancillary costs, as per Board Order 2009-8.

ANSWER:

(a)

The projects identified in Appendix 5.3 are forecast to remain in WIP during the 2021 test year. As noted in the response to YUB-YEC-1-89 the purpose of this appendix is to identify major projects with costs that will not affect forecast test year rate base and therefore do not require detailed review at this time for the purpose of the 2021 GRA Application. As such, Yukon Energy is not using this process to get regulatory approval for these projects. They will be brought to the regulator for a prudence review at a later date.

(b)

The Aishihik hydro facility is a key power plant in Yukon's electricity system, providing 25% of the renewable electricity available on the Yukon grid. It also plays an important role in winter months, providing 40% of the energy Yukoners need when demand for electricity is greatest. Although the 40-megawatt Whitehorse Rapids hydro facility is larger than Aishihik, the effective capacity of the Whitehorse plant is reduced by close to half during the coldest months of the year because of reduced water flow on the Yukon River. Aishihik is the only hydroelectric facility in Yukon that can store energy in the summer when demand is low to be used in the winter when demand is high. It can also store energy during wet years to be used in dry years when the levels of the lake water are lower. Replacement of the energy and capacity provided by the Aishihik facility would cost significantly more than the referenced $8 million for the 25 year relicensing process. Please see response to YUB-YEC-1-90 (b through e) for added detail.

(c)

Morrison Hershfield, working with other consultants (InterGroup, EDI, Palmer, Ecofor) was the lead consultant through 2018. Since then, YEC has contracted each firm separately to carry out the required work, and InterGroup has been the key technical leading consulting firm. Please refer to UCG-YEC-1-83 for cost information.

(d)

Work on this project has not commenced.

(e)

Please refer to YUB-YEC-1-92.

(f)

The project justifications are based on an incremental savings on an LCOE basis compared to the next best alternative (thermal energy generation). Both of these projects remain in WIP and are not part of forecast revenue requirement for 2021.

Please see responses to YUB-YEC-1-93 and YUB-YEC-1-94 for more detailed information on updated justification for continuing to pursue each of these projects.

TOPIC: **Capital Projects**

REFERENCE: **APPENDIX 5.1: CAPITAL PROJECTS > $1 MILLION NOT IMPACTING RATE BASE**

Appendix 5.1 provides project summaries for capital projects with spending over the period from 2019 to 2021 exceeding $1 million that remain in WIP at the end of 2021 (and therefore do not affect the 2021 GRA revenue requirement). Total forecast spending on these projects is forecast to grow from $1.129 million in 2019, to $2.860 million in 2020 to $31.966 in 2021. The forecast material increase in 2021 spending relates largely to the Battery Energy Storage System project which has $25 million forecast spending in 2021. However, it is noted that spending for this project will be offset by a $16.5 million contribution. Further details on annual spending are summarized in Table 5.2-2.

As outlined below, spending for these projects is largely focused on: (1) capital works to address sustaining capital requirements (i.e., required to replace, repair or enhance/ improve components of the existing system to ensure continued reliability, safety and environmental or regulatory compliance); (2) investments to ensure sufficient dependable capacity for the integrated grid; and other projects.

Capital Works to Address Sustaining Capital Requirements:
1. Dawson Voltage Conversion
2. MH0 (Mayo A) Generating Station Slope Stability
3. Replacement of Mayo A Surge Chamber
4. Stop Log Crane WH Main Spillway
5. Asset Management Framework

Investments to Ensure Dependable Capacity:
6. Battery Energy Storage System (transfer from Feasibility)
7. Pumped Storage
8. Southern Lakes Transmission Line
9. Whitehorse Interconnection

Other:
10. Aishihik Contract DisputeWIP cost of approximately $0.260 million by end of 2021 - project planned for completion in 2025)

QUESTION:

a) Is the total spending requested to go in WIP $31.966 million, or is this just forecast 2021?

b) Although it appears Yukon Energy will not place these projects onto the rate base for the test year, is Yukon Energy planning to use this process to get regulatory approval for all of these projects lining up for at least $31.966 million in the WIP? Explain.

c) Does Yukon Energy consider this a complete final capital review for each of these these above projects, to then transfer into rate base next rate hearing?

ANSWER:

(a)

Projects included in Appendix 5.1 are currently in WIP will remain in WIP at the end of 2021. The total includes actual amounts incurred to the end of 2019 and forecast amounts for 2020 and 2021.

(b) and **(c)**

See YUB-YEC-1-89 (a) to (c). Appendices 5.1 and 5.3 review Major Projects (i.e., projects with forecast costs exceeding $1 million) for PPE (Appendix 5.1) and deferred costs (Appendix 5.3) that are forecast to remain in WIP during the 2021 test year. The purpose of these appendices is to clearly identify major projects with costs that will not affect forecast test year rate base and therefore do not require detailed review at this time for the purpose of the 2021 GRA Application. Accordingly, it is confirmed that no costs for projects listed in these appendices have been added to rate base or revenue requirement for 2021.

Costs for these projects will be fully reviewed at a subsequent proceeding when YEC applies to have the costs included in rates.

TOPIC: **Capital Projects**

REFERENCE: **Sole-Sourced Contracts**

QUESTION:

a) Since 2018, including the 2017-18 regulatory proceedings before the Yukon Utilities Board, identify all expenditures related to work completed by InterGroup Consultants Ltd. on behalf of Yukon Energy Corporation.

b) Identify any of the above contracts given through a request for proposal or tender/bidding process.

c) Since 2018, including the 2017-18 regulatory proceedings before the Yukon Utilities Board, identify all expenditures related to work completed by John Landry LLB /DLAPiper on behalf of Yukon Energy Corporation.

d) Identify any of the above contracts given through a request for proposal or tender/bidding process.

ANSWER:

(a)

Department/Project	Amount
Aishihik Generating Station Water Use Licence Renewal	814,564.82
General Rate Application 2019-2020	273,326.93
Mayo Lake Storage	121,208.71
Atlin Hydro EPA Preparation	79,693.27
10 Year Renewable Energy Plan	59,487.97
BESS	48,847.50
Finance	42,190.59
Thermal Replacement	31,516.50
Resource Planning	4,532.75
Vista Integration	3,614.07

(b)

Formal tender processes were issued for the original contracts awarded for involvement in the largest projects:

- Aishihik Generating Station Water Use Licence Renewal; and

- General Rate Application 2019-20.

Note these tenders do not explicitly cover all spending to date; extensions to scope and budget occurred in both cases as project plans were developed and changed based on circumstances. YEC issues extensions for work based on successful delivery to date and reasonable estimates for the expanded scope.

(c)

Department/Project	Amount
AH3 Legal Defense	496,919.05
Aihsihik Relicencing	421,626.21
Human Resources	292,571.83
Finance	237,013.25
Executive	91,726.97
2017/18 GRA R&V	91,556.50
Atlin Hydro EPA	71,673.00
IPP Program Implementation	76,984.88
MMTP	41,106.93
Ten Year Renewable Energy Plan	44,706.99
2021 GRA	25,508.00
WH2 Uprate	21,332.67
IPP - Other	18,995.50
WH4 Uprate	12,117.77
Victoria Gold PPA Review	9,122.60
EAM	7,170.45
BESS	6,247.50
LNG Third Engine	4,075.40
Thermal Plant	3,576.64
Corporate Administration	2,046.56
Residential Demand Response Pilot	1,984.50
Communications	1,682.00

(d)

YEC does not tender legal services.

Yukon Utilities Board
(YUB)

REFERENCE: **Application - Overview, Energy & Peak Load Changes, pages 1 to 4**

ISSUE: **Energy and Peak Load Changes (8.4% of revenue shortfall)**

QUOTE: "Dependable capacity requirements caused by peak load growth for non-industrial sales drives diesel rental costs that account for $3.8 million (34.9%) of the 2021 GRA revenue shortfall."

PREAMBLE:

QUESTION:

a) Based on the current load forecast, please provide the incremental costs on a per kWh basis for the diesel rental units using only the rental and set-up costs.

b) Based on the current load forecast, please provide the incremental variable costs on a per kWh basis for the diesel rental units.

c) Considering YEC's current load forecast, does the sum of the rental costs (response to part (a)) and the variable costs (response to part (b)) equal YEC's incremental cost of generation? If not, please explain and provide the incremental cost for generation, separately identifying the portion based on fixed costs, variable costs and total costs on a per kWh basis.

ANSWER:

(a), **(b)** and **(c)**

Dependable capacity requirements caused by peak load growth lead to requirements for dependable capacity to be in place during the critical winter grid peak period. Options to meet this requirement are assessed based on fixed costs (capital and fixed non-fuel O&M costs) without any focus on variable fuel costs, i.e., the facilities are primarily in place to provide for the N-1 contingency event and would not normally be called upon to use fuel in order to generate electricity. Accordingly, dependable capacity options are assessed based on cost per kW of dependable capacity rather than based on costs per kWh of possible generation.

The identified $3.8 million of diesel rental costs for 2021 represent the incremental rental costs for 17 units (15 units, each 1.8 MW to provide 27 MW as required for the N-1 dependable capacity shortfall, plus 2 spare units for reliability). These are fixed costs, i.e., they remain regardless of any generation; however, the units are rented and therefore the costs can be removed when the rental period ends.

Please also see response to NY-YEC-1-3 (a) and CW-YEC-1-17 for details on diesel rental unit costs.

REFERENCE: **Application – Overview: PDF pgs. 2-5; Summary of Requested Orders: PDF pgs. 5-7; Retail & Industrial: PDF pg. 62**

ISSUE: **2021 Rates**

QUOTE: "Approval of an increase of the current YEC Rider J by 15.01 percentage points, starting no later than December 1, 2021 applicable to all YEC and AEY retail firm rates (all AEY recoveries from this rider would flow through to YEC) and to all major industrial firm rates, including the fixed Rider F charge of 0.211 cents/kWh."

PREAMBLE:

QUESTION:

a) Please provide a discussion of rebasing, and not rebalancing, the rates — by incorporating Rider J into base rates, for example — in a potential compliance filing to any decision on this application. Include a discussion of any challenges and benefits to implementing a rebasing of rates.

ANSWER:

(a)

In order to comply with OIC 1995/090, Section 2.1(1), any rate adjustments must apply equally, when measured as percentages, to all classes of retail customers and to the class of major industrial customers; this direction includes the customers of both YEC and AEY.

Accordingly, simple rebasing of rates in practice would require adjusting all base rates for all retail and industrial customers by the same percentage increase to cover all existing YEC and AEY percentage rate riders (excluding Rider F and any Rider E). Individual ratepayers, and each customer class, would then see no change to bills as a result of this rate rebasing. In addition, added measures would be required to ensure that YEC and AEY each continued to secure rate rider revenues recovered from the other utility's customers but due to be passed through to the utility with the current rate rider.

In summary, simple rate rebasing as described above would provide little real benefit but would add complexities in that all base rates for both utilities must then be changed each time rates change, as compared with the current efficient process of charging specific rate riders that may be adjusted as required from time-to-time.

Historically, rate rebasing has been accomplished whereby rate revenues for each retail and industrial customer class remains unchanged as required by OIC 1995/90, but rates within each customer class are restructured in response to an updated cost of service study (COSS) assessment. This option would require the involvement of both utilities, based on a common approved test year revenue requirement for the two utilities and a joint COSS. It would result in changes to wholesale rates to address revenue allocation between the two utilities in the absence of rate riders, and would remove each utility's direct rate rider revenue access to the other utility's' customers, e.g., YEC rate riders apply to all AEY customers in the hydro and diesel rate zones, and AEY rate riders apply to all YEC customers (including major industrial customers where load growth has been material since the last AEY GRA). This more complex rate rebasing would require a separate joint YEC/ AEY proceeding and could not be implemented through a compliance filing for any decision on the current YEC GRA.

REFERENCE: **Application, Section 1.1, Need, context and proposed approach for 2021 GRA, Table 1.1, page 1-1**

ISSUE: **YEC Return on Equity**

QUESTION:

a) Please revise Table 1.1 to include 10 years of historical information on both an approved and actual basis commencing with the year 2012. Please state all assumptions relied on as a result of the requested revision.

ANSWER:

(a)

Please see Table 1 for the requested information.

Table 1: YEC Historical ROE: Approved and Actuals/Forecasts

	Approved	Actual	Note for Approved
2012	8.25%	6.75%	2012/13 GRA
2013	8.25%	7.42%	
2014	8.25%	8.44%	
2015	8.25%	8.10%	
2016	8.25%	8.69%	
2017	8.70%	8.72%	2017/18 GRA
2018	8.70%	6.25%	
2019	8.70%	3.81%	
2020 F	8.70%	3.88%	
2021 F		3.10%	

Notes:

1. The Yukon Utilities Board (YUB) uses the benchmark ROE from the British Columbia Utilities Commission (BCUC). However, at the time of filing 2012/13 GRA a low-risk utility ROE benchmark from the BCUC was not available. Therefore, in 2012/13 GRA YEC proposed an ROE at 8.77% based on Alberta Utilities Commission (AUC) ROE benchmark of 8.75% plus 52-basis-point risk

premium as was applied in YEC's 2008-09 GRA, and subtract 50 basis points pursuant to the direction provided in OIC 1995/90. In its Order 2013-01 [Appendix A, Reasons for Decision] the YUB approved an ROE for YEC at 8.25% for the 2012/13 GRA noting that "the AUC model does not allow for an equity premium, and since it is the model that is followed, no equity premium is allowed".

2. In 2017/18 GRA YEC proposed an ROE at 8.82% based on the BCUC low-risk utility benchmark ROE at 8.75% plus 57-basis-point risk premium, and subtract 50 basis points pursuant to the direction provided in OIC 1995/90. In its Order 2018-10 [Appendix A, Reasons for Decision] the YUB approved an ROE for YEC at 8.70% noting that the Board awards YEC 25 basis points for its small size plus "in recognition of YEC's risks for generation, isolated grid and customer diversity, the YUB awards YEC an additional 20 basis points" for a total risk premium of 45 basis points above the BCUC benchmark utility. The YUB also noted that "the additional 20 basis points acknowledges the overall risk of YEC as being greater than that of FortisBC (Electric) and greater than that of AEY."

REFERENCE: **Application, Section 1.3, Changes in Forecast Loads, page 1-7**

ISSUE: **Industrial Load**

QUOTE: "Forecast firm Yukon Energy sales to industrial customers for the 2021 test year is 102.9 GW.h."

PREAMBLE:

QUESTION:

a) The 2021 load increase over 2018 approved load forecast for Victoria Gold Group and Alexco Resources is 67.2 GWh. Please provide the 2018 approved load forecast for Minto mine.

ANSWER:

(a)

The 2018 Minto mine load forecast approved in YEC's 2017-18 GRA compliance filing is 32,193 MWh, i.e., this was the only mine load included in the approved 2018 forecast.

REFERENCE: **Application, Section 1.3, Peak Capacity and N-1/LOLE requirements in test years, page 1-8**

ISSUE: **Diesel Rental Units**

QUOTE: "Diesel rental unit costs of approximately $3.8 million are forecast for the diesel rental units expected to be required for the 2021 GRA test year."

PREAMBLE:

QUESTION:

a) Please provide the additional firm capacity of the diesel rental units.

b) For 2021, how much energy is forecast to be generated from the diesel rental units?

ANSWER:

(a)

The firm capacity provided by the 15 diesel rental units for 2021 is 27 MW (1.8 MW per unit). Note the contract price includes two additional 1.8 MW units for reliability.

(b)

The forecasted 2021 energy to be generated by temporary rented diesel units is 2.5 GWh.

REFERENCE: **Application, Section 1.4, pages 1-8, 1-9**

ISSUE: **VGC Group and Alexco Fixed Charge**

QUOTE: "As reviewed in Appendix 4.3 of this Application, YEC expects to file with the Board in late November/ early December 2020 for approval of an amended Transmission Facilities Fixed Cost effective January 1, 2021 of $428,812, resulting in an interim Fixed Charge (85% of the Transmission Facilities Fixed Cost) effective January 1, 2021 of $35,734 per month, with allocation of the interim Fixed Charge between VCG Group and Alexco [Table 4.3-2, Appendix 4.3 of this Application]."

QUESTION:

a) Please confirm that the amended Transmission Facilities Fixed Cost application is part of this application. If not confirmed, then please explain when the application will be filed with the Board.

ANSWER:

(a)

The amended Transmission Facilities Fixed Cost application and related interim Fixed Charge are required to be filed within 60 days of the Transmission Facilities Development Operation Date as directed by YUB in Order 2018-04. This requirement exists separate from the 2021 GRA application, and was therefore assumed not to be part of the 2021 GRA application.

Since drafting of the 2021 GRA, the Transmission Facilities Development Operation Date has been delayed to March 2021. YEC therefore now expects to file the amended Transmission Facilities Fixed Cost application in March 2021, requesting an interim Fixed Charge adjustment effective May 1, 2021.

Please also see response to YUB-YEC-1-45.

REFERENCE: **Application, Section 2.1, pages 2-1**

ISSUE: **Sales – Overview**

QUOTE: "Yukon Energy directly serves about 2,300 customers at the distribution (retail) level, most of whom live in and around Dawson City, Mayo and Faro. Indirectly, Yukon Energy also provides power to Yukon retail customers served on the Integrated System (including those located in Whitehorse, Carcross, Carmacks, Haines Junction, Ross River and Teslin, Pelly Crossing, Keno and Stewart Crossing) through its wholesale sales to ATCO Electric Yukon (AEY)."

QUESTION:

a) Please provide the incremental per unit ($/kWh) of sales revenue YEC would receive for the next kWh of energy sold above the forecast: 1) Using a blended rate based on this application that incorporates retail, wholesale and industrial customers; and 2) including and specifying all applicable riders. Please explain any assumptions that are necessary in your response.

ANSWER:

(a)

Incremental per unit ($/kWh) of sales revenue that YEC would receive for the next kWh of energy sold above the 2021 forecast based on the Application will vary considerably depending on the customer class and the customer group within each customer class (i.e., which rate block is affected).

An overall blended average rate is about 13 cents per kWh before 2021 GRA rate increases [9.7 cents/kW.h before rider as shown in Tab 7, Schedule 9, line 45 plus 3.2 cents/kW.h Rider J revenues] and about 15 cents per kWh with 2021 GRA increases which adds about 2.2 cents/kW.h [$10.971 million GRA shortfall in Schedule 9, line 48 divided by 495.151 GW.h sales shown in line 43].

Blended incremental energy-only revenue rates per kWh resulting from added energy sales will be lower than the averages shown above for all rate revenues (which include

customer charges, demand charges and varying retail energy rates for different customers). Based on last block energy rates applicable to YEC sales for different customer groups, a blended incremental YEC energy sales revenue of about 13 cents per kWh is estimated for forecast 2021 sales assuming Rider J as proposed in the Application.

REFERENCE: **Application, Appendix 2.1, Table 2.1-1, page 2.1-1**

ISSUE: **Expected Thermal Generation**

QUESTION:

a) Please expand Table 2.1-1 down to grid load of 350 GWh.

ANSWER:

(a)

Please see Table 1 for extended version of Table 2.1-1. Please note that the table is extended to minimum 385 GW.h compared to 350 GW.h requested in the question as the LTA thermal generation for the loads lower than 385 GW.h is insignificant.

Table 1: Expected Thermal Generation Based on LTA Hydro Generation (2021)

Line Number	YEC Grid Load Net of Wind (GWh)	YEC Hydro Generation (GWh)	YEC Thermal Generation (GWh)	Increase in Load (GWh)	Increase in Thermal Generation (GWh)	Thermal as % of Increased Load
	Column A	Column B	Column C	Column D	Column E	Column F = E/D
1	385.0	383.525	1.475			
2	390.0	387.708	2.292	5.0	0.817	16%

41	585.0	455.085	129.915	5.0	4.434	89%

Notes:

1. "YEC Grid Load" is annual YEC generation load on the Integrated Grid net of IPP generation, secondary sales related generation and Fish Lake hydro generation. The load will also be adjusted for WH2 and WH4 uprates as noted in #7 below.
2. The thermal generation and increase for the added load are based on a polynomial equation derived from "YECSIM" - the simulation model developed for the Integrated Grid by KGS Group.
3. The model calculates expected hydro plant generation for each load scenario. It incorporates, on a weekly time step, 38 "water years" on record (1981-2018) and 20 "load years" (each examines a different hypothetical scenario to evaluate generation under different sequences of the recorded water years), of which 13 load years (load years 7-19) are used for the final averaging (this removes results distorted by starting or ending year volumes). "Hydro Generation" is long-term average hydro generation as estimated by YECSIM.
4. The simulation model results used for this table assume the current operation rule in effect at Aishihik Lake (i.e., 10-year rolling average spring elevation no lower than 913.7 m), current Mayo Lake operation rule (no additional storage, impact of sedimentation at the outlet of Mayo Lake) and restricted Mayo GS winter flows (based on new Mayo Ice Protocol Mayo GS outflows are restricted at max 19 cms in November and 15 cms in December, after which restrictions are relaxed by 1.75 cms/week reaching 20 cms by early January and 24 cms by February [compared to 20 cms restriction through winter used in the 2017/18 GRA]).
5. The simulation model results are based on 2021 forecast load and IPP distributions, and requires modifications when new mines, industrial loads or IPP generation are connected to [or disconnected from] the grid.
6. The table assumes max YEC Grid Load (i.e., excluding IPP generation) at 585 GW.h and minimum YEC Grid Load at 385 GW.h. If the YEC Grid Load exceeds these limits then the table needs to be updated.
7. YEC is undertaking capital projects that will increase hydro generation output in Whitehorse GS [WH2 and WH4 uprates]. The preliminary estimates show that these capital projects will increase generation output by 7.1 GW.h/year [4.2 GW.h for 2021 considering expected in service date effective July 1, 2021 - monthly allocation based on Whitehorse GS monthly generation forecast]. Therefore, the YEC Grid Load is reduced to reflect increased output from these capital projects [not all incremental generation will directly displace LTA thermal].
8. Numbers are subject to rounding.

Example

Expected YEC Thermal Generation for the YEC generation at 536.743 GW.h (net of expected IPP & Fish Lake)

Remove Expected Generation for WH uprates [estimate for 2021 at 4.213 GW.h] to get net load at 532.530 GW.h

Step 1. Find the closest load from Column A that is less than 532.530 GW.h = 530 GW.h (Line 12).

Step 2. Find the thermal generation from Column C = 82.231 GW.h (Line 12).

Step 3. Find the difference between the given load (532.530 GW.h) and load from Step 1 (530 GW.h) = 2.530 GW.h

Step 4. Apply the percentage from Column F (Line 12, 82%) to the difference from Step 3 (2.530 GW.h) = 2.075 GW.h

Step 5. Add numbers from Step 2 (82.231 GW.h) and Step 4 (2.075 GW.h) = 84.306 GW.h

19 The expected thermal generation at 536.743 GW.h load [net of Fish Lake and IPPs] is 84.306 GW.h.

REFERENCE: **Application, Tab 2, page 2-2, line 16**

ISSUE: **Total Firm Generation Load**

QUOTE: "Overall, **total firm generation load** to be supplied by Yukon Energy on the Yukon Integrated System was forecast at 420.3 GW.h in the 2018 Compliance Filing. Actual total firm generation load was 450.1 GW.h in 2018 reflecting higher sales compared to the forecast. Actual total firm generation load in 2019 was 440.7 GW.h, and full year forecast for 2020 is 508.0 GW.h. Forecast total firm generation load for the 2021 test year is 538.7 GW.h."

QUESTION:

a) What was the forecast total firm generation load on the Yukon Integrated System for 2019?

ANSWER:

(a)

The 2017-18 GRA proceeding did not provide any forecast for 2019 load on the YIS. Aside from YEC internal business plan forecasts, the only public forecast was provided in YEC's 2016 Resource Plan where the forecast total firm generation load on the Yukon Integrated System for 2019 was 443 GW.h, which compared relatively well with the actual 440.7 GWh.

REFERENCE: **Application, Tab 2, page 2-3, line 19**

ISSUE: **Independent Power Production**

QUOTE: "Independent Power Production (IPP) renewable generation is forecast to commence in November 2020 with less than 0.4% of forecast generation impact for 2021."

QUESTION:

a) What is YEC's level of certainty regarding the forecast IPP amounts for 2021? Please explain.

b) How have IPP projects been affected to date by the COVID-19 pandemic? Did the IPP commence in November 2020, as scheduled?

ANSWER:

(a)

YEC has considerable uncertainty as to timing for forecast IPP amounts for 2021. The first project that was to be operational in November 2020 has been delayed into spring 2021.

(b)

We do not know how IPP projects have been affected to date by the COVID-19 pandemic. The IPP did not commence in 2020 as scheduled.

REFERENCE: **Application, Tab 2, page 2-4, line 2**

ISSUE: **Forecast Renewable Generation**

QUOTE: "This impact is starting to be offset by new renewable generation planned as part of Yukon Energy's 10 Year Renewable Electricity Plan, commencing with the new IPP generation forecast to provide 0.06 GW.h of solar generation in 2020 and 2.0 GW.h of new renewable generation in 2021 based on information available at the time of filing."

PREAMBLE: The Board requires additional information with respect to YEC's forecasts being based on "information available at the time of filing."

QUESTION:

a) What specific information did YEC rely on to forecast the new renewable generation?

b) To what date was information available in preparing these forecasts?

ANSWER:

(a) and **(b)**

The information available on IPPs when the generation forecasts were finalized for the 2021 GRA Application in September/ early October 2020 was the forecast IPP deliveries and target dates noted in the following two agreements signed with potential IPP projects:

- North Klondike Highway Solar PV Project with target commercial operation date of November 1, 2020 with 1,840 MWh annual energy delivered.

- Mount Sima Solar Project with target commercial operation date of June 1, 2021 with 270 MWh annual energy delivered.

REFERENCE: **Application, Tab 2, page 2-5, line 21**

ISSUE: **Working with ATCO Electric Yukon on Forecasts**

QUOTE: "YUB Order 2018-10 directed YEC to refine its methodology of forecasting Wholesale Sales to ensure its forecasts align closely with the AEY forecasts in future applications. To develop YEC's Wholesale Sales forecasts for the test years, YEC worked closely with AEY. YEC reached out to the AEY Regulatory team and YEC and AEY staff worked closely to understand forecasting methodology and inputs into the respective forecasts. AEY cautioned YEC that AEY's forecast is for business plan purposes and it did not necessarily undergo the same rigor as a forecast that AEY would file in a GRA.

QUESTION:

a) Please explain how the forecasting process for business planning is different from the forecasting process for a GRA.

ANSWER:

(a)

Based on YUB Order 2018-10 YEC communicated with AEY during the development of wholesale forecast for the test year. YEC's forecast wholesales sales for 2021 test year are very close to the power purchase forecast provided by AEY [as reviewed in section 2.2.1 of the Application the AEY forecast for 2021 is 0.7% higher than YEC's forecast].

During the forecast exchanges AEY cautioned YEC that AEY's forecast is for business plan purposes and it did not necessarily undergo the same rigor as a forecast that AEY would file in a GRA. Beyond this, YEC does not have specific information on how AEY's forecasting process for business planning is different from its forecasting process for an AEY GRA.

REFERENCE: **Application, Tab 2, page 2-5, footnote 4**

ISSUE: **Information Provided by Energy, Mines and Resources**

QUOTE: "YEC has forecast a micro-generation impact of about 1.5 GW.h for 2021. The micro-generation forecasts are based on information available from Energy Mines & Resources of the Yukon government."

QUESTION:

a) Please provide the source information provided to YEC by the Department of Energy, Mines and Resources and any other information from the Department that informed or influenced YEC's micro-generation forecasts for this application.

ANSWER:

(a)

The Micro-generation data below was provided by the Manager, Energy Programs in the Energy Branch at Energy Mines & Resources. The actual 2020 program total is embedded in historical sales and is included in the regressed forecasted load. Only the 2021 incremental program total of 1.5 GWh has been used to reduce the 2021 load. No adjustments were made to the peak forecast related to microgen as solar installations do not provide energy during peak winter hours.

	Installed DC Capacity At Year End [kWdc]	Capacity Added This Year [kWdc]	Exported Energy [kWh]	Payout Value	Forecasted Payout Value
2014	31		2,484	$1,643	$535
2015	83	51	16,576	$4,768	$3,573
2016	424	341	66,586	$16,925	$14,352
2017	972	549	259,673	$57,028	$55,970
2018	2,135	1,163	666,333	$143,623	$143,623
2019	3,058	923	1,357,079	$285,000	$292,508
2020	4,500	1,442	1,951,685	TBD	$420,671
2021	5,918	1,418	2,826,307	TBD	$609,188

	Installed DC Capacity At Year End [kWdc]	Capacity Added This Year [kWdc]	Exported Energy [kWh]	Payout Value	Forecasted Payout Value
2022	6,917	999	3,660,798	TBD	$789,057
2023	7,530	613	4,242,805	TBD	$914,504
2024	7,877	346	4,597,937	TBD	$991,050

1

REFERENCE: **Application, Tab 2, page 2-7, line 5**

ISSUE: **Potential Mine Load Additions**

QUOTE: "Yukon Energy continues to monitor the situation with respect to prospects for additional connected industrial mine loads within the next few years. Yukon Energy is not aware of any other potential near term mine loads that could be connected to the grid."

QUESTION:

a) Please explain how and using what methods YEC monitors for potential additional industrial connections.

ANSWER:

(a)

YEC keeps abreast of developments in the mining sector through direct contact with key stakeholders (e.g., Chamber of Mines, YG Energy Mines & Resources), monitoring of media disclosure on new developments, participation in and monitoring of key mining forums/conferences in Whitehorse (Geoscience) and Vancouver (Roundup) and monitoring of regulatory proceedings (YESAB, Water Board). Potential mining customers will also contact the utility directly with questions regarding interconnection to the YEC system; YEC tracks these contacts and confirms the stage of development. While YEC keeps track of most major mining development projects in Yukon, for obvious reasons the utility focus is on those developments with a likely potential to connect to the YEC grid.

REFERENCE: **Application, Tab 2, Section 2.2, page 2-4**

ISSUE: **Sales Forecast**

QUESTION:

a) How does YEC incorporate new residential and commercial construction into its sales forecasts?

b) How has YEC incorporated the effect of increased numbers of people working from home, due to the COVID-19 pandemic, into its sales forecasts?

ANSWER:

(a)

Finance reaches out to staff in each community who provides Finance with an update of activity in the area (for example, new residential projects and commercial activity). For larger commercial customers, Finance receives power consumption forecasts from the commercial customer.

(b)

For residential and commercial sales forecasts, YEC has not incorporated the effect of increased numbers of people working from home. This is primarily due to uncertainty and, at the time of preparation of the residential and commercial sales forecasts, Yukon people working from home were starting to go back to working at work. For residential and commercial sales, YEC uses a three year average to forecast sales, subject to other adjustments as considered necessary such as those that result from part (a) above.

REFERENCE: **Application, Tab 2, page 2-7, line 15**

ISSUE: **Residential Sales Forecasts**

QUOTE: "Actual firm residential retail sales were 15.6 GW.h in 2018 and 15.4 GW.h in 2019; the full year forecast for 2020 is 16.7 GW.h and for the 2021 test year is 16.2 GW.h. The higher forecast sales in 2020 reflect colder than normal weather and modest growth in the number of customers. Residential sales forecasts are done on a community by community basis and are based on historical averages and input from YEC staff that is obtained through their work in the communities."

QUESTION:

a) With respect to YEC's statement that "higher forecast sales in 2020 reflect colder than normal weather", what is the time period used by YEC to determine "normal weather"?

b) With respect to YEC's statement that higher forecast sales in 2020 reflect modest growth in the total number of customers, please provide the number of customers served by AEY and YEC for the last ten years, along with forecast customer counts for 2020 and 2021.

c) What input from YEC staff was obtained from work in the communities?

d) Please provide tables showing actual and forecast residential sales for the past ten years, both with and without demand side management. In your response, please comment on the YEC's residential sales forecasting accuracy for those years.

ANSWER:

(a)

The time period used by YEC to determine "normal weather" is ten years. YEC uses the Environment Canada Canadian Climate Normal for Whitehorse Airport found at the link below:

https://climate.weather.gc.ca/climate_normals/results_1981_2010_e.html?searchType=stnProv&lstProvince=&txtCentralLatMin=0&txtCentralLatSec=0&txtCentralLongMin=0&txtCentralLongSec=0&stnID=1617&dispBack=0

YEC uses the daily average monthly temperature and the most current data set is 1981 to 2020. The analysis is updated once every 10 years (industry standard) and includes a full statistical update of temperatures and Heating Degree Days.

(b)

AEY customers on the grid are supplied by YEC through Wholesales, and are not included in YEC residential customers. Average annual YEC residential customers for the last ten years, along with forecast counts for 2021 are as follows:

Table 1: Summary of Average Annual YEC Residential Customers (2011-2021)

Year	Customers
2011	1515
2012	1529
2013	1559
2014	1561
2015	1588
2016	1609
2017	1653
2018	1689
2019	1730
2020	1778
2021	1780

(c)

As noted in YUB-YEC-1-15 (a), Finance reaches out to staff in each community who provide Finance with an update of activity in the area (for example, new residential projects and commercial activity). YEC does not have a record of specific adjustments that were tied to this information.

(d)

Below is a table showing actual and forecast (annual budgeted) residential sales generation for the past 10 years. Sales are not calculated with or without demand side management. YEC's forecasting accuracy is very strong as evidenced by 4 years being below business plan and 6 years being above business plan.

Table 2: Actual and Forecast Residential Sales

Year	Forecast (MWh)	Actuals (MWh)
2011	11,601	12,710
2012	12,325	13,102
2013	12,639	13,385
2014	13,596	13,327
2015	13,625	13,121
2016	13,441	13,390
2017	13,480	14,965
2018	14,607	15,626
2019	15,705	15,384
2020	16,730	15,646

REFERENCE: **Application, Tab 2, page 2-8, line 5**

ISSUE: **Sales for Lighting**

QUOTE: "Actual firm retail sales for lighting were 235 MW.h in 2018, 178 MW.h in 2019 and forecast to remain at 178 MW.h for 2020 and for the 2021 test year. The decrease in lighting sales in 2019 was primarily due to conversion to LED street lights."

QUESTION:

a) Please provide the quantity, type and power consumption of all lights for the past ten years.

ANSWER:

(a)

YEC does not have the level of detail requested. Available information on sales for lighting is below. From project records, YEC notes 429 streetlights were retrofitted from High Pressure Sodium to LED between 2016 and 2018.

	Street Lights		Sentinel Lights		Total	
Year	Sales (MWh)	Number of Lights	Sales (MWh)	Number of Lights	Sales (MWh)	Number of Lights
2010	282.8	576	14.3	25	297	601
2011	283.0	577	13.9	25	297	602
2012	283.1	577	14.0	25	297	602
2013	283.2	578	14.1	25	297	603
2014	286.7	584	14.1	25	301	609
2015	291.8	594	14.3	25	306	619
2016	263.3	604	14.3	27	278	631
2017	228.2	614	11.6	26	240	640
2018	227.0	623	11.2	25	238	648
2019	167.8	632	10.1	23	178	655
2020	167.6	632	9.8	24	177	656

REFERENCE: **Application, Tab 2, page 2-8, line 21**

ISSUE: **Loses**

QUOTE: "Total generation is based on the sum of total sales plus losses. The 2018 approved forecast losses were 8.8%. Actual losses were 9.2% in 2018 and 2019, and full year forecast for 2020 is 9.1%. The losses are forecast at 8.8% for the 2021 test year which is the same as the 2018 approved level in the 2017/18 GRA and also within the range of historical losses for last three years, from 2017 (at 8.1%) through 2018 and 2019 (each at 9.2%)."

QUESTION:

a) Please provide the detailed working document, with formulas intact, used to determine and justify YEC's forecast for losses in the test year.

ANSWER:

(a)

The losses for the 2021 test year are forecast at 8.8% which is the same as the 2018 approved level in the 2017/18 GRA. It is also within the range of historical losses for the last three years as illustrated in Table 1 below. Attachment 1 to this response provides an excel copy of the calculations.

Table 1: Line Losses for 2017, 2018 and 2019 Years (GWh)

Year	Firm Generation (GWh)	Firm Sales (GWh)	Losses (GWh)	Losses as % of Sales
2017	446.5	413.2	33.3	8.1%
2018	450.1	412.2	37.9	9.2%
2019	440.7	403.5	37.2	9.2%
Average				8.8%

Table 1: Line Losses for 2017, 2018 and 2019 Years

Year	Firm Generation (GWh)	Firm Sales (GWh)	Losses (GWh)	Losses as % of Sales
2017	446.5	27.3	419.2	1538.3%
2018	450.1	27.6	422.5	1532.4%
2019	440.7	27.5	413.2	1502.0%
Average				1524.3%

REFERENCE: **Application, Tab 2, page 2-11, line 23**

ISSUE: **Thermal Generation Forecast and Weather**

QUOTE: "For the 2020 full year forecast actual LNG is forecast to be about 74% of the total thermal due to colder-than-normal weather (specifically January 2020 was colder than normal weather) that resulted in high loads with diesel generation being required to supply baseload energy as LNG units were running at max output."

QUESTION:

a) Please explain what constitutes "colder-than-normal weather" and how it is determined (e.g. coldest temperature during the month, average temperature, number of days below a certain temperature).

b) Please outline the performance of the LNG facility in 2020, including any mechanical issues or outages, and any increased costs resulting from failures due to burning diesel required to make up for any loss or shortfall in LNG output.

ANSWER:

(a)

Yukon Energy historically uses a peak design mean temperature of -35 deg C at Whitehorse Airport. On Jan 13, 2020, the daily average temperature at the Whitehorse Airport was -37.8 deg C and this resulted in a 'colder-than-normal' or colder than design event.

(b)

Mechanical issues include premature wear of valves, failures of exhaust valves, failures of heat exchangers and premature wear of engine block. There was 2.6 GWh of added diesel generation due to LNG outages. The net increase in fuel cost due to burning

diesel was $303,160 based on the 2018 approved GRA forecast average fuel costs per kWh for diesel ($0.2633/kWh) and LNG ($0.1467/kWh).[1]

[1] LNG costs of $381,420 at 14.67 c/kWh, compared to Diesel costs of $684,580 at 26.33 c/kWh, results in difference of $303,160.

REFERENCE: **Application, Tab 2, page 2-12, footnote 14**

ISSUE: **Hydro Generation**

QUOTE: "This reflects 37 MW at Aishihik, 6.5 MW at Mayo and 27 MW at Whitehorse. The Mayo GS dependable capacity has been reduced from 9 MW assumed in the 2017-18 GRA to reflect updated winter downstream flow restrictions and Whitehorse GS increased from 24.5 MW to 27 MW to reflect increased winter max flows."

PREAMBLE: YEC's website states: "The Mayo A hydro facility has served Yukoners since 1951. It was developed to supply electricity to the United Keno Hill Mine at Elsa, about 45 kilometres north of Mayo. It also generates power for other Yukon communities via Yukon Energy's transmission system.

The Mayo B hydro project, completed in 2011, involved building a new powerhouse 3.7 kilometres downstream from the existing hydro plant (Mayo A). This increased our capacity to generate additional renewable energy at the existing site from five megawatts to 15 megawatts, without the need for a new dam or reservoir.

Together the two plants can supply electricity to as many as 7,000 non electrically heated homes."

QUESTION:

a) Please explain the changes, and when the changes occurred, which led to the increased winter max flows for Whitehorse GS.

b) Please provide the dependable capacity and the energy generated per year of Mayo A and Mayo B (each shown separately) from the time period previous to the re-runnering of Mayo A.

c) Please compare the results provided in part (b) to the expected performance of Mayo A and B as stated in the preamble to this question. Please explain any variances.

d) If there is a deviation between the expected performance of Mayo A and B and actual performance, please explain if this will be an issue with the re-runnering project for the Whitehorse GS. If it will not be an issue, then explain how the issue will be avoided.

ANSWER:

(a)

The maximum flows for Whitehorse GS are limited to the ice conditions in Marwell area in Whitehorse. After reviewing the past data, Yukon Energy was able to increase the maximum allowable flow without causing problems in Marwell.

(b) to **(d)**

Mayo Generation has not recently been re-runnered.[1] Dependable capacity at Mayo has therefore not been recently affected by re-runnering.

Mayo was expanded in 2011 with a new plant (Mayo B) which has a higher head and efficiency from Mayo A. The dependable winter capacity from the combined Mayo facility was always expected to be well under the 15 MW of installed capacity. As noted in the Application, Mayo dependable winter capacity in the 2017-18 GRA was estimated at 9 MW.

In recent years a Mayo River ice protocol has been implemented to reduce the risk of flooding in the town of Mayo due to ice jams. This protocol limits the flow to 15 CMS (6.5MW) until an ice cover is formed. Once the Ice is formed the river flows can increase by 0.5CMS every 2 days to the maximum output.

Without the flow restriction, Mayo has a 9MW dependable capacity. With the flow restriction Mayo can provide 6.5MW of N-1 dependable capacity. YEC does ramp up Mayo to maximum flows by the end of each winter.

[1] Mayo B is a new facility developed in 2011. Mayo was developed in 1951, and two units were re-runnered in 2001.

REFERENCE: **Application, Tab 2, page 2-13**

ISSUE: **Dependable Capacity Requirements**

QUESTION:

a) In YEC's view, are revisions to the loss of load expectation and emergency N-1 standard warranted? Please explain why or why not.

ANSWER:

(a)

The loss of load expectation and emergency N-1 standards were first developed as part of the 2006 Resource Plan, and were reconfirmed with the 2016 Resource Plan. YEC is not aware of any basis to seek revisions to these standards at this time. The N-1 dependable capacity standard continues to be very relevant for non-industrial load reliability during winter months on this isolated Yukon grid. Consideration of an N-1 contingency is standard in the industry.

REFERENCE: **Application, Tab 2, Table 2-1 and Table 2-2, pages 2-16 and 2-17**

ISSUE: **Additional Historical Information**

QUESTION:

a) Please provide new versions of Table 2-1 and Table 2-2 that include the previous ten years.

ANSWER:

(a)

Please see Attachment 1 to this response for the requested information.

Table 2.1
Summary of Customers, Energy Sales and Revenues

Line No.	Description	2012 Actual	2013 Actual	2014 Actual	2015 Actual	2016 Actual	2017 Actual	2018 Actual	2019 Actual	2020 Forecast	Forecast 2021

Notes:

1 Actual thermal generation reflects actual generation required for maintenance, capital, RFID and all other generation, e.g., peaking. Forecast Actual Generation includes peaking, maintenance (diesel of 0.198 GW.h in 2021, and LNG of 0 MW.h) and capital (0.234 GW.h diesel) requirements reflecting short-term hydro generation forecasts.

2 Peak load is one-hour maximum load on the grid (forecasts assume weather normalized temperature).

REFERENCE: **Application, Tab 2, Table 2-2, line 7, page 2-17**

ISSUE: **Whitehorse Hydro Generation**

QUESTION:

a) Please explain why Whitehorse hydro generation is forecast to decrease from 2020 to 2021.

ANSWER:

(a)

The year 2020 is a partial forecast and part actuals. In 2020, freshet started a month early which increased the generation in May and June. 2021 is based on long-term average inflows and does not assume a similar high-water year such as that experienced in 2020.

REFERENCE: **Application, Section 3.5.1, page 3-27**

ISSUE: **Cost of debt**

QUOTE: "As per Board Order 2018-10, the interest rate is a formulaic approach based on the long-term Canada Bonds rate plus 120 basis points (Government of Canada Long-Term Bond Benchmark at 0.99% as of June 30, 2020)."

QUESTION:

a) Please provide the long-term Canada Bonds rate as of September 30, 2020 and December 31, 2020.

ANSWER:

(a)

The long-term Canada Bonds rate as of September 30, 2020 was 1.11%, and as of December 31, 2020 was 1.21%.

REFERENCE: **Application, Section 3.5.2, Return on Common Equity, page 3-27**

ISSUE: **BCUC Benchmark ROE**

QUOTE: "The current BCUC benchmark ROE continues to be 8.75%."

QUESTION:

a) Please identify the most recent BCUC decision approving a BCUC benchmark ROE of 8.75%. Please identify the date the decision was issued and relevant paragraph(s) and page reference(s) regarding the BCUC benchmark ROE in the response.

b) Is YEC aware of any generic cost of capital (GCOC) or equivalent proceedings currently before the BCUC? If so, please provide further context.

ANSWER:

(a)

The current low-risk utility ROE benchmark at 8.75% was approved by the BCUC Order G-75-13[1] effective January 1, 2013. The BCUC by its Order G-129-16[2] reaffirmed the benchmark ROE at 8.75% and stated that it remains in effect until otherwise determined by the BCUC.

(b)

Yukon Energy is aware that the BCUC issued a notice of Initiating a Generic Cost of Capital Proceeding by letter dated January 18, 2021.

[1] 1 BCUC, Generic Cost of Capital, Order G-75-13 dated May 10, 2013, page 3, paragraph 2 https://www.bcuc.com/Documents/Proceedings/2013/DOC_34699_BCUC-GCOC-Stage1DecisionWEB.pdf [accessed on February 12, 2021].

[2] 2 FortisBC Energy Inc. Application for its Common Equity Component and Return on Equity for 2016, Order G-129-16 dated August 10, 2016, page 1, paragraphs 2 and 5 https://www.ordersdecisions.bcuc.com/bcuc/orders/en/item/169143/index.do [accessed on February 12, 2021].

However, it is unlikely the new benchmark ROE will be approved before YEC's 2021 GRA proceeding is completed. The 2013 Generic Cost of Capital Proceeding was initiated in February 2012 and final order by the BCUC was issued in May 2013, i.e., it took more than a year to complete the review.

REFERENCE: **Application, Section 3.2, page 3-3**

ISSUE: **Fuel and Purchased Power**

QUOTE: "As reviewed in Section 2.3.2, Yukon Energy's annual fuel costs are based on forecast hydro and thermal generation determined on a long-term average basis. This analysis applies only to firm load requirements."

QUESTION:

a) Please confirm that the long-term average forecast hydro and thermal generation used in the forecast includes industrial load. If not included, please explain.

ANSWER:

(a)

Confirmed that the forecast 2021 firm load used to determine the 2021 long-term average forecast hydro and thermal generation used in the Application forecast in Table 2.2 includes the forecast industrial load for 2021.

REFERENCE: **Application, Section 2.3.2, page 2-11**

ISSUE: **Diesel and LNG Thermal Generation**

QUOTE: "The forecast 2021 LTA thermal generation for the Application is 84.3 GW.h. The forecast for the test year is based on proposed updates to the determination of LTA annual hydro availability for the current GRA as outlined in Appendix 2.1…"

QUESTION:

a) Relative to LTA water flows, is YEC expecting water levels to be higher than LTA for 2021 and therefore higher than LTA hydro generation for 2021? Please explain why or why not.

ANSWER:

(a)

Based on available information at the time of drafting, YEC expects water levels to be higher than LTA. Table 2.2 in the Application shows forecast ST 2021 hydro generation at 506.5 GWh, and shows LTA hydro generation for 2021 at the lower level of 452.4 GWh. The ST forecast reflects conditions in the fall of 2020, following high inflows to Aishihik and Mayo during the preceding summer that reversed the prior year's low water conditions.

As shown in prior years, water availability forecasts provided in the fall for the following year are subject to review in following spring and again during the following summer – and can display material changes as actual conditions unfold. For example, snowpack measurements are not available until Q2; these measurements can have a significant impact on the inflow expectations for the reservoirs.

REFERENCE: **Appendix A to Board Order 2018-10, paragraphs 76 and 77; Application, Section 3.2, page 3-3; Application - Overview, pages 2 to 5; Application, Section 1.1, Need, Context and Proposed Approach for 2021 GRA, page 1-3**

ISSUE: **Short-term Versus Long-Term Average Hydro Generation Forecast**

QUOTE: From Appendix A to Board Order 2018-10:

"76. The Board recognizes that each method of forecasting, being LTA or ST, has advantages and disadvantages for GRA purposes. As submitted by YEC, during a period of favorable water conditions an ST hydro generation forecast would have a lower revenue requirement than one based on an LTA hydro generation forecast. The converse holds for periods when water conditions are unfavorable. With ST hydro generation forecasts, the impacts on revenue requirements, rate changes and resulting bills will change with each GRA depending on changes in ST water conditions and forecasts. LTA hydro generation forecasts will tend to be more stable for revenue requirements from GRA to GRA. However, items affected by this forecast may not be as accurate or representative of current GRA circumstances. For the current GRA, major differences in ratepayer bill impacts with ST versus LTA hydro generation forecasts are likely to be limited if the current rate stabilization mechanism is retained. The Board accepts that short-term thermal generation may vary materially between GRAs due to changes in actual water conditions. LTA hydro generation forecasts are based on available historic annual water records as well as current grid conditions and generation facilities to indicate ongoing average hydro generation capability over a longer period of the hydro asset life.

77. Given the above-noted advantages and disadvantages of LTA and ST hydro generation forecasts, the Board finds that, for purposes of this proceeding, it will not use the ST forecast for forecasting levels of hydro electric generation and thermal generation nor direct its use for future GRAs. In determining the revenue requirements for these and future test years, the Board is focusing on the reasonableness of the forecasts

and forecasting accuracy. Further, the onus is on YEC to adequately explain any variance between actual results and its forecast amounts. For these reasons, the Board directs YEC in future GRA filings to show actual hydro and thermal generation results when comparing previous and forecast test years." (footnotes removed; underlining added)

From page 3-3 of the Application:

"Fuel and Purchased Power costs as set out in Table 3.2 for the 2021 test year increase to $15.897 million (from $2.677 million in 2018 approved), reflecting primarily both increased load and higher fuel prices, as well as added purchased power cost [$0.314 million] for Independent Power Production (IPP)."

From page 2 of the Application:

"Yukon ratepayers have also experienced large bill increases in late 2019 and many are now experiencing ongoing disruptions due to the COVID-19 pandemic."

From page 1-3 of the Application:

"Yukon ratepayer bills – Concurrent with Yukon Energy's dilemma, Yukon ratepayers now are experiencing ongoing disruptions from the impacts of COVID-19. Any material increases to ratepayer bills at this time (and in the near future) would raise concerns."

PREAMBLE: There have been instances in the past where LTA was not used to determine YEC's thermal generation forecast costs. Most recently, this occurred when the Board directed YEC to use actual thermal costs for the 2017 test year.

QUESTION:

If water levels and the concomitant hydro generation are expected to be higher in 2021, for customer rate relief, should YEC utilize a ST hydro forecast thus reducing the upward

pressure of increased thermal generation costs for this test period? In the response, please address the following:

a) For YEC's revenue requirement forecasts, the Board focuses on reasonableness of the forecasts and the forecasting accuracy;

b) YEC, in the past, has stated that its LTA forecast cannot be retroactively verified;

c) If ST hydro forecasts are used, what the impact would be on required revenue; and

d) The ongoing impacts of COVID-19 and related costs pressures on Yukon ratepayers.

ANSWER:

(a) through **(d)**

YEC does not recommend using a short-term (ST) hydro forecast for the 2021 GRA as a means for customer rate relief that reduces "the upward pressure of increased thermal generation costs for this test period". The 2021 GRA already proposes specific measures that will prevent any material increase in customer bills during 2021 in recognition of ongoing impacts of COVID-19 and related cost pressures on Yukon ratepayers (see Sections 1.1 and 4.5 of Application). Increased thermal generation costs outlined in the Application are also already being fully funded by increased revenues from higher loads and/or by Rider F adjustments for higher fuel prices (see Table 1-2 in Application).
